# What Is AWS Config?

AWS Config provides a detailed view of the configuration of AWS resources in your AWS account. This includes how the resources are related to one another and how they were configured in the past so that you can see how the configurations and relationships change over time.

An AWS *resource* is an entity you can work with in AWS, such as an Amazon Elastic Compute Cloud (EC2) instance, an Amazon Elastic Block Store (EBS) volume, a security group, or an Amazon Virtual Private Cloud (VPC). For a complete list of AWS resources supported by AWS Config, see [Supported Resource Types](#) (p. 9).

With AWS Config, you can do the following:

- Evaluate your AWS resource configurations for desired settings.
- Get a snapshot of the current configurations of the supported resources that are associated with your AWS account.
- Retrieve configurations of one or more resources that exist in your account.
- Retrieve historical configurations of one or more resources.
- Receive a notification whenever a resource is created, modified, or deleted.
- View relationships between resources. For example, you might want to find all resources that use a particular security group.

## Ways to Use AWS Config

When you run your applications on AWS, you usually use AWS resources, which you must create and manage collectively. As the demand for your application keeps growing, so does your need to keep track of your AWS resources. AWS Config is designed to help you oversee your application resources in the following scenarios:

### Resource Administration

To exercise better governance over your resource configurations and to detect resource misconfigurations, you need fine-grained visibility into what resources exist and how these resources are configured at any time. You can use AWS Config to notify you whenever resources are created, modified, or deleted without having to monitor these changes by polling the calls made to each resource.

You can use AWS Config rules to evaluate the configuration settings of your AWS resources. When AWS Config detects that a resource violates the conditions in one of your rules, AWS Config flags the resource as noncompliant and sends a notification. AWS Config continuously evaluates your resources as they are created, changed, or deleted.

### Auditing and Compliance

You might be working with data that requires frequent audits to ensure compliance with internal policies and best practices. To demonstrate compliance, you need access to the historical configurations of your resources. This information is provided by AWS Config.

## Managing and Troubleshooting Configuration Changes

When you use multiple AWS resources that depend on one another, a change in the configuration of one resource might have unintended consequences on related resources. With AWS Config, you can view how the resource you intend to modify is related to other resources and assess the impact of your change.

You can also use the historical configurations of your resources provided by AWS Config to troubleshoot issues and to access the last known good configuration of a problem resource.

## Security Analysis

To analyze potential security weaknesses, you need detailed historical information about your AWS resource configurations, such as the AWS Identity and Access Management (IAM) permissions that are granted to your users, or the Amazon EC2 security group rules that control access to your resources.

You can use AWS Config to view the IAM policy that was assigned to an IAM user, group, or role at any time in which AWS Config was recording. This information can help you determine the permissions that belonged to a user at a specific time: for example, you can view whether the user `John Doe` had permission to modify Amazon VPC settings on Jan 1, 2015.

You can also use AWS Config to view the configuration of your EC2 security groups, including the port rules that were open at a specific time. This information can help you determine whether a security group blocked incoming TCP traffic to a specific port.

## Concepts

AWS Config provides a detailed view of the resources associated with your AWS account, including how they are configured, how they are related to one another, and how the configurations and their relationships have changed over time. Let's take a closer look at the concepts of AWS Config.

## AWS Config

Understanding the basic components of AWS Config will help you track resource inventory and changes and evaluate configurations of your AWS resources.

### AWS Resources

*AWS resources* are entities that you create and manage using the AWS Management Console, the AWS Command Line Interface (CLI), the AWS SDKs, or AWS partner tools. Examples of AWS resources include Amazon EC2 instances, security groups, Amazon VPCs, and Amazon Elastic Block Store. AWS Config refers to each resource using its unique identifier, such as the resource ID or an [Amazon Resource Name \(ARN\)](#). For details, see [Supported Resource Types](#) (p. 9).

### Configuration History

A configuration history is a collection of the configuration items for a given resource over any time period. A configuration history can help you answer questions about, for example, when the resource was first created, how the resource has been configured over the last month, and what configuration changes were introduced yesterday at 9 AM. The configuration history is available to you in multiple formats. AWS Config automatically delivers a configuration history file for each resource type that is being recorded to an Amazon S3 bucket that you specify. You can select a given resource in the AWS Config console and navigate to all previous configuration items for that resource using the timeline. Additionally, you can access the historical configuration items for a resource from the API.

### Configuration Items

A *configuration item* represents a point-in-time view of the various attributes of a supported AWS resource that exists in your account. The components of a configuration item include metadata, attributes, relationships, current configuration, and related events. AWS Config creates a configuration item whenever it detects a change to a resource type that it is recording. For example, if AWS Config is recording Amazon S3 buckets, AWS Config creates a configuration item whenever a bucket is created, updated, or deleted.

For more information, see [Components of a Configuration Item](#) (p. 37).

### Configuration Recorder

The configuration recorder stores the configurations of the supported resources in your account as configuration items. You must first create and then start the configuration recorder before you can start recording. You can stop and restart the configuration recorder at any time. For more information, see [Managing the Configuration Recorder](#) (p. 60).

By default, the configuration recorder records all supported resources in the region where AWS Config is running. You can create a customized configuration recorder that records only the resource types that you specify. For more information, see [Selecting Which Resources AWS Config Records](#) (p. 62).

If you use the AWS Management Console or the CLI to turn on the service, AWS Config automatically creates and starts a configuration recorder for you.

## Configuration Snapshot

A configuration snapshot is a collection of the configuration items for the supported resources that exist in your account. This configuration snapshot is a complete picture of the resources that are being recorded and their configurations. The configuration snapshot can be a useful tool for validating your configuration. For example, you may want to examine the configuration snapshot regularly for resources that are configured incorrectly or that potentially should not exist. The configuration snapshot is available in multiple formats. You can have the configuration snapshot delivered to an Amazon Simple Storage Service (Amazon S3) bucket that you specify. Additionally, you can select a point in time in the AWS Config console and navigate through the snapshot of configuration items using the relationships between the resources.

## Configuration Stream

A configuration stream is an automatically updated list of all configuration items for the resources that AWS Config is recording. Every time a resource is created, modified, or deleted, AWS Config creates a configuration item and adds to the configuration stream. The configuration stream works by using an Amazon Simple Notification Service (Amazon SNS) topic of your choice. The configuration stream is helpful for observing configuration changes as they occur so that you can spot potential problems, generating notifications if certain resources are changed, or updating external systems that need to reflect the configuration of your AWS resources.

## Resource Relationship

AWS Config discovers AWS resources in your account and then creates a map of relationships between AWS resources. For example, a relationship might include an Amazon EBS volume `vol-123ab45d` attached to an Amazon EC2 instance `i-a1b2c3d4` that is associated with security group `sg-ef678hk`.

For more information, see [Supported Resource Types \(p. 9\)](#).

## AWS Config Managed and Custom Rules

An AWS Config rule represents your desired configuration settings for specific AWS resources or for an entire AWS account. AWS Config provides customizable, predefined rules to help you get started. If a resource violates a rule, AWS Config flags the resource and the rule as noncompliant, and AWS Config notifies you through Amazon SNS.

## AWS Config Custom Rules

With AWS Config you can also create custom rules. While AWS Config continuously tracks your resource configuration changes, it checks whether these changes violate any of the conditions in your rules.

After you activate a rule, AWS Config compares your resources to the conditions of the rule. After this initial evaluation, AWS Config continues to run evaluations each time one is triggered. The evaluation triggers are defined as part of the rule, and they can include the following types:

- Configuration changes – AWS Config triggers the evaluation when any resource that matches the rule's scope changes in configuration. The evaluation runs after AWS Config sends a configuration item change notification.
- Periodic – AWS Config runs evaluations for the rule at a frequency that you choose (for example, every 24 hours).

For more information, see [Evaluating Resources with AWS Config Rules \(p. 96\)](#).

## Multi-Account Multi-Region Data Aggregation

Multi-account multi-region data aggregation in AWS Config allows you to aggregate AWS Config configuration and compliance data from multiple accounts and regions into a single account. Multi-account multi-region data aggregation is useful for central IT administrators to monitor compliance for multiple AWS accounts in the enterprise.

### Source Account

A source account is the AWS account from which you want to aggregate AWS Config resource configuration and compliance data. A source account can be an individual account or an organization in AWS Organizations. You can provide source accounts individually or you can retrieve them through AWS Organizations.

### Source Region

A source region is the AWS region from which you want to aggregate AWS Config configuration and compliance data.

### Aggregator

An aggregator is a new resource type in AWS Config that collects AWS Config configuration and compliance data from multiple source accounts and regions. Create an aggregator in the region where you want to see the aggregated AWS Config configuration and compliance data.

### Aggregator Account

An aggregator account is an account where you create an aggregator.

### Authorization

As a source account owner, authorization refers to the permissions you grant to an aggregator account and region to collect your AWS Config configuration and compliance data. Authorization is not required if you are aggregating source accounts that are part of AWS Organizations.

For more information, see topics in [Multi-Account Multi-Region Data Aggregation \(p. 3262\)](#) section.

## Managing AWS Config

### AWS Config Console

You can manage the service using the AWS Config console. The console provides a user interface for performing many AWS Config tasks such as:

- Specifying the types of AWS resources for recording.
- Configuring resources to record, including:
  - Selecting an Amazon S3 bucket.
  - Selecting an Amazon SNS topic.
  - Creating AWS Config role.
- Creating managed rules and custom rules that represent desired configuration settings for specific AWS resources or for an entire AWS account.

- Creating and managing configuration aggregators to aggregate data across multiple accounts and regions.
- Viewing a snapshot of current configurations of the supported resources.
- Viewing relationships between AWS resources.

For more information about the AWS Management Console, see [AWS Management Console](#).

## AWS Config CLI

The AWS Command Line Interface is a unified tool that you can use to interact with AWS Config from the command line. For more information, see the [AWS Command Line Interface User Guide](#). For a complete list of AWS Config CLI commands, see [Available Commands](#).

## AWS Config APIs

In addition to the console and the CLI, you can also use the AWS Config RESTful APIs to program AWS Config directly. For more information, see the [AWS Config API Reference](#).

## AWS SDKs

As an alternative to using the AWS Config API, you can use one of the AWS SDKs. Each SDK consists of libraries and sample code for various programming languages and platforms. The SDKs provide a convenient way to create programmatic access to AWS Config. For example, you can use the SDKs to sign requests cryptographically, manage errors, and retry requests automatically. For more information, see the [Tools for Amazon Web Services](#) page.

## Control Access to AWS Config

AWS Identity and Access Management is a web service that enables Amazon Web Services (AWS) customers to manage users and user permissions. Use IAM to create individual users for anyone who needs access to AWS Config. Create an IAM user for yourself, give that IAM user administrative privileges, and use that IAM user for all of your work. By creating individual IAM users for people accessing your account, you can give each IAM user a unique set of security credentials. You can also grant different permissions to each IAM user. If necessary, you can change or revoke an IAM user's permissions at any time. For more information, see [AWS Identity and Access Management \(p. 3279\)](#).

## Partner Solutions

AWS partners with third-party specialists in logging and analysis to provide solutions that use AWS Config output. For more information, visit the AWS Config detail page at [AWS Config](#).

## How AWS Config Works

When you turn on AWS Config, it first discovers the supported AWS resources that exist in your account and generates a [configuration item \(p. 3\)](#) for each resource.

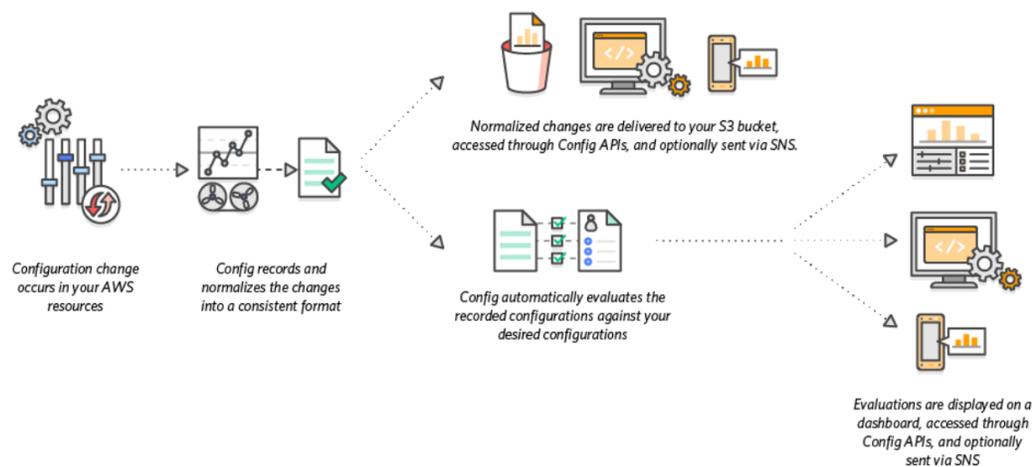

AWS Config also generates configuration items when the configuration of a resource changes, and it maintains historical records of the configuration items of your resources from the time you start the configuration recorder. By default, AWS Config creates configuration items for every supported resource in the region. If you don't want AWS Config to create configuration items for all supported resources, you can specify the resource types that you want it to track.

AWS Config keeps track of all changes to your resources by invoking the Describe or the List API call for each resource in your account. The service uses those same API calls to capture configuration details for all related resources.

For example, removing an egress rule from a VPC security group causes AWS Config to invoke a Describe API call on the security group. AWS Config then invokes a Describe API call on all of the instances associated with the security group. The updated configurations of the security group (the resource) and of each instance (the related resources) are recorded as configuration items and delivered in a configuration stream to an Amazon Simple Storage Service (Amazon S3) bucket.

AWS Config also tracks the configuration changes that were not initiated by the API. AWS Config examines the resource configurations periodically and generates configuration items for the configurations that have changed.

If you are using AWS Config rules, AWS Config continuously evaluates your AWS resource configurations for desired settings. Depending on the rule, AWS Config will evaluate your resources either in response to configuration changes or periodically. Each rule is associated with an AWS Lambda function, which contains the evaluation logic for the rule. When AWS Config evaluates your resources, it invokes the rule's AWS Lambda function. The function returns the compliance status of the evaluated resources. If a resource violates the conditions of a rule, AWS Config flags the resource and the rule as noncompliant. When the compliance status of a resource changes, AWS Config sends a notification to your Amazon SNS topic.

## Deliver Configuration Items

AWS Config can deliver configuration items through one of the following channels:

### Amazon S3 Bucket

AWS Config tracks changes in the configuration of your AWS resources, and it regularly sends updated configuration details to an Amazon S3 bucket that you specify. For each resource type that AWS Config records, it sends a *configuration history file* every six hours. Each configuration history file contains details about the resources that changed in that six-hour period. Each file includes resources of one type, such as Amazon EC2 instances or Amazon EBS volumes. If no configuration changes occur, AWS Config does not send a file.

AWS Config sends a *configuration snapshot* to your Amazon S3 bucket when you use the `deliver-config-snapshot` command with the AWS CLI, or when you use the `DeliverConfigSnapshot` action with the AWS

Config API. A configuration snapshot contains configuration details for all resources that AWS Config records in your AWS account. The configuration history file and configuration snapshot are in JSON format.

**Note**

AWS Config only delivers the configuration history files and configuration snapshots to the specified S3 bucket; AWS Config doesn't modify the lifecycle policies for objects in the S3 bucket. You can use lifecycle policies to specify whether you want to delete or archive objects to Amazon S3 Glacier. For more information, see [Managing Lifecycle Configuration](#) in the *Amazon Simple Storage Service Console User Guide*. You can also see the [Archiving Amazon S3 Data to S3 Glacier](#) blog post.

## Amazon SNS Topic

An Amazon Simple Notification Service (Amazon SNS) topic is a communication channel that Amazon SNS uses to deliver messages (or *notifications*) to subscribing endpoints such as an email address or clients. Other types of Amazon SNS notifications include push notification messages to apps on mobile phones, Short Message Service (SMS) notifications to SMS-enabled mobile phones and smart phones, and HTTP POST requests. For best results, use Amazon SQS as the notification endpoint for the SNS topic and then process the information in the notification programmatically.

AWS Config uses the Amazon SNS topic that you specify to send you notifications. The type of notification that you are receiving is indicated by the value for the `messageType` key in the message body, as in the following example:

```
"messageType": "ConfigurationHistoryDeliveryCompleted"
```

The notifications can be any of the following message types:

`ComplianceChangeNotification`

The compliance type of a resource that AWS Config evaluates has changed. The compliance type indicates whether the resource complies with a specific AWS Config rule, and it is represented by the `ComplianceType` key in the message. The message includes `newEvaluationResult` and `oldEvaluationResult` objects for comparison.

`ConfigRulesEvaluationStarted`

AWS Config started evaluating your rule against the specified resources.

`ConfigurationSnapshotDeliveryStarted`

AWS Config started delivering the configuration snapshot to your Amazon S3 bucket. The name of the Amazon S3 bucket is provided for the `s3Bucket` key in the message.

`ConfigurationSnapshotDeliveryCompleted`

AWS Config successfully delivered the configuration snapshot to your Amazon S3 bucket.

`ConfigurationSnapshotDeliveryFailed`

AWS Config failed to deliver the configuration snapshot to your Amazon S3 bucket.

`ConfigurationHistoryDeliveryCompleted`

AWS Config successfully delivered the configuration history to your Amazon S3 bucket.

`ConfigurationItemChangeNotification`

A resource has been created, deleted, or changed in configuration. This message includes the details of the configuration item that AWS Config creates for this change, and it includes the type of change. These notifications are delivered within minutes of a change and are collectively known as the *configuration stream*.

#### OversizedConfigurationItemChangeNotification

This message type is delivered when a configuration item change notification exceeded the maximum size allowed by Amazon SNS. The message includes a summary of the configuration item. You can view the complete notification in the specified Amazon S3 bucket location.

#### OversizedConfigurationItemChangeDeliveryFailed

AWS Config failed to deliver the oversized configuration item change notification to your Amazon S3 bucket.

For example notifications, see [Notifications that AWS Config Sends to an Amazon SNS topic \(p. 82\)](#).

For more information about Amazon SNS, see the [Amazon Simple Notification Service Developer Guide](#).

## Supported Resource Types

AWS Config supports the following AWS resources types and resource relationships.

### Amazon API Gateway

AWS Service	Resource Type Value	Relationship	Related Resource
API Gateway	AWS::ApiGateway::Stage	is contained in	ApiGateway Rest Api
		is associated with	WAFRegional WebACL
	AWS::ApiGatewayV2::Stage	is contained in	ApiGatewayV2 Api
	AWS::ApiGateway::Resource	contains	ApiGateway Stage
	AWS::ApiGatewayV2::Api	contains	ApiGatewayV2 Stage

To learn more about how AWS Config integrates with Amazon API Gateway, see [Monitoring API Gateway API Configuration with AWS Config](#).

### Amazon CloudFront

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon CloudFront *	AWS::CloudFront::Distribution	is associated with	AWS WAF WebACL
			ACM Certificate
			S3 Bucket
			IAM Server Certificate
	AWS::CloudFront::StreamIngestion	is associated with	AWS WAF WebACL
			ACM Certificate
			S3 Bucket
			IAM Server Certificate

\*AWS Config support for Amazon CloudFront is available only in the US East (N. Virginia) region.

## Amazon CloudWatch

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon CloudWatch	AWS::CloudWatch::Alarm	NA	NA

## Amazon DynamoDB

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon DynamoDB	AWS::DynamoDB::Table	NA	NA

## Amazon Elastic Block Store

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Elastic Block Store	AWS::EC2::Volume	is attached to	EC2 instance

## Amazon Elastic Compute Cloud

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Elastic Compute Cloud	AWS::EC2::Host*	contains	EC2 instance
	AWS::EC2::EIP	is attached to	EC2 instance
			Network interface
	AWS::EC2::Instance	contains	EC2 network interface
		is associated with	EC2 security group
		is attached to	Amazon EBS volume
			EC2 Elastic IP (EIP)
		is contained in	EC2 Dedicated host
	AWS::EC2::NetworkInterface	is associated with	Route table
			Subnet
AWS::EC2::NetworkInterface	is associated with	Virtual private cloud (VPC)	
		EC2 security group	
	is attached to	EC2 Elastic IP (EIP)	

AWS Service	Resource Type Value	Relationship	Related Resource
			EC2 instance
		is contained in	Route table
			Subnet
			Virtual private cloud (VPC)
	AWS::EC2::SecurityGroups	is associated with	EC2 instance
			EC2 network interface
			Virtual private cloud (VPC)
	AWS::EC2::NatGateway	is contained in	Virtual private cloud (VPC)
		is contained in	Subnet
	AWS::EC2::EgressOnlyInternetGateway	is attached to	Virtual private cloud (VPC)
	AWS::EC2::FlowLog	NA	NA
	AWS::EC2::VPCEndpoint	is contained in	Virtual private cloud (VPC)
		is attached to	Network interface
		is contained in	Subnet
		is contained in	Route table
	AWS::EC2::VPCEndpoint	is associated with	ElasticLoadBalancingV2 LoadBalancer
	AWS::EC2::VPCPeeringConnection	is associated with	Virtual private cloud (VPC)

\*AWS Config records the configuration details of Dedicated hosts and the instances that you launch on them. As a result, you can use AWS Config as a data source when you report compliance with your server-bound software licenses. For example, you can view the configuration history of an instance and determine which Amazon Machine Image (AMI) it is based on. Then, you can look up the configuration history of the host, which includes details such as the numbers of sockets and cores, to verify that the host complies with the license requirements of the AMI. For more information, see [Tracking Configuration Changes with AWS Config](#) in the *Amazon EC2 User Guide for Linux Instances*.

## Amazon Elastic Container Registry

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Elastic Container Registry	AWS::ECR::Repository	NA	NA

## Amazon Elastic Container Service

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Elastic Container Service	AWS::ECS::Cluster	NA	NA
	AWS::ECS::TaskDefinition	NA	ECR Repository
			IAM Role
	AWS::ECS::Service*	NA	ECS Cluster
			ECS TaskDefinition
			IAM role
	AWS::ECS::TaskSet	NA	ECS Cluster
			ECS Service
			ECS TaskDefinition

\*This service currently only support the new Amazon Resource Name (ARN) format. For more information, see [Amazon Resource Names \(ARNs\) and IDs](#) in the ECS developer guide.

Old (not supported): `arn:aws:ecs:region:aws_account_id:service/service-name`

New (supported): `arn:aws:ecs:region:aws_account_id:service/cluster-name/service-name`

## Amazon Elastic Kubernetes Service

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Elastic Kubernetes Service	AWS::EKS::Cluster	NA	NA

## Amazon Elasticsearch Service

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Elasticsearch Service	AWS::Elasticsearch::Domain	Associated with	KMS Key
			EC2 security group
			EC2 subnet
			Virtual private cloud (VPC)

## Amazon Quantum Ledger Database (QLDB)

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon QLDB	AWS::QLDB::Ledger	NA	NA

## Amazon Redshift

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Redshift	AWS::Redshift::Cluster	is associated with	Cluster parameter group
			Cluster security group
			Cluster subnet group
			Security group
			Virtual private cloud (VPC)
	AWS::Redshift::ClusterParameterGroup	NA	NA
	AWS::Redshift::ClusterSecurityGroup	NA	NA
	AWS::Redshift::ClusterSubnetGroup	is associated with	Cluster
AWS::Redshift::ClusterSubnetGroup	is associated with	Virtual private cloud (VPC)	Virtual private cloud (VPC)
			Subnet
AWS::Redshift::ClusterSubnetGroup	is associated with	Virtual private cloud (VPC)	
AWS::Redshift::EventSubscription	NA	NA	

## Amazon Relational Database Service

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Relational Database Service	AWS::RDS::DBInstance	is associated with	EC2 security group
			RDS DB security group
			RDS DB subnet group
	AWS::RDS::DBSecurityGroup	is associated with	EC2 security group
	AWS::RDS::DBSecurityGroup	is associated with	Virtual private cloud (VPC)

AWS Service	Resource Type Value	Relationship	Related Resource
	AWS::RDS::DBSnapshot	is associated with	Virtual private cloud (VPC)
	AWS::RDS::DBSubnetGroup	is associated with	EC2 security group
			Virtual private cloud (VPC)
	AWS::RDS::EventSubscription	NA	NA
	AWS::RDS::DBCluster	contains	RDS DB instance
		is associated with	RDS DB subnet group
			EC2 security group
	AWS::RDS::DBClusterSnapshot	is associated with	RDS DB cluster
			Virtual private cloud (VPC)

## Amazon S3 Bucket Attributes

AWS Config also records the following attributes for the Amazon S3 bucket resource type.

Attributes	Description
AccelerateConfiguration	Transfer acceleration for data over long distances between your client and a bucket.
BucketAcl	Access control list used to manage access to buckets and objects.
BucketPolicy	Policy that defines the permissions to the bucket.
CrossOriginConfiguration	Allow cross-origin requests to the bucket.
LifecycleConfiguration	Rules that define the lifecycle for objects in your bucket.
LoggingConfiguration	Logging used to track requests for access to the bucket.
NotificationConfiguration	Event notifications used to send alerts or trigger workflows for specified bucket events.
ReplicationConfiguration	Automatic, asynchronous copying of objects across buckets in different AWS Regions.
RequestPaymentConfiguration	Requester pays is enabled.
TaggingConfiguration	Tags added to the bucket to categorize. You can also use tagging to track billing.
WebsiteConfiguration	Static website hosting is enabled for the bucket.
VersioningConfiguration	Versioning is enabled for objects in the bucket.

For more information about the attributes, see [Bucket Configuration Options](#) in the *Amazon Simple Storage Service Developer Guide*.

## Amazon Simple Notification Service

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Simple Notification Service	AWS::SNS::Topic	NA	NA

## Amazon Simple Queue Service

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Simple Queue Service	AWS::SQS::Queue	NA	NA

## Amazon Simple Storage Service

AWS Service	Resource Type Value	Relationship	Related Resource
Amazon Simple Storage Service	AWS::S3::Bucket*	NA	NA
	AWS::S3::AccountPublicAccessBlock	NA	NA

\* If you configured AWS Config to record your S3 buckets, and are not receiving configuration change notifications, verify your S3 bucket policies have the required permissions. For more information, see [Managing Permissions for S3 Bucket Recording](#) (p. 3292).

## Amazon Virtual Private Cloud

AWS Service	Resource Type Value	Relationship	Related Resource	
Amazon Virtual Private Cloud	AWS::EC2::CustomerGateway	is attached to	VPN connection	
	AWS::EC2::InternetGateway	is attached to	Virtual private cloud (VPC)	
	AWS::EC2::NetworkACL	NA	NA	
	AWS::EC2::RouteTable		contains	EC2 instance
				EC2 network interface
				Subnet
VPN gateway				
		is contained in	Virtual private cloud (VPC)	

AWS Service	Resource Type Value	Relationship	Related Resource
	AWS::EC2::Subnet	contains	EC2 instance
			EC2 network interface
		is attached to	Network ACL
		is contained in	Route table
			Virtual private cloud (VPC)
	AWS::EC2::VPC	contains	EC2 instance
			EC2 network interface
			Network ACL
			Route table
			Subnet
		is associated with	Security group
	is attached to	Internet gateway	
		VPN gateway	
	AWS::EC2::VPNConnection	is attached to	Customer gateway
			VPN gateway
AWS::EC2::VPNGateway	is attached to	Virtual private cloud (VPC)	
		VPN connection	
	is contained in	Route table	

## AWS Auto Scaling

AWS Service	Resource Type Value	Relationship	Related Resource
Auto Scaling	AWS::AutoScaling::AutoScalingGroup	contains	Amazon EC2 instance
		is associated with	Classic Load Balancer
			Auto Scaling launch configuration
			Subnet
	AWS::AutoScaling::LaunchConfiguration	is associated with	Amazon EC2 security group
	AWS::AutoScaling::ScalingPolicy	is associated with	Auto Scaling group
			Alarm

AWS Service	Resource Type Value	Relationship	Related Resource
	AWS::AutoScaling::ScalingGroup	is associated with	Auto Scaling group

## AWS Certificate Manager

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Certificate Manager	AWS::ACM::Certificate	NA	NA

## AWS CloudFormation

AWS Service	Resource Type Value	Relationship	Related Resource
AWS CloudFormation	AWS::CloudFormation::Stack	contains*	Supported AWS resource types

\*AWS Config records configuration changes to AWS CloudFormation stacks and supported resource types in the stacks. AWS Config does not record configuration changes for resource types in the stack that are not yet supported. Unsupported resource types appear in the supplementary configuration section of the configuration item for the stack.

## AWS CloudTrail

AWS Service	Resource Type Value	Relationship	Related Resource
AWS CloudTrail	AWS::CloudTrail::Trail	NA	NA

## AWS CodeBuild

AWS Service	Resource Type Value	Relationship	Related Resource
AWS CodeBuild	AWS::CodeBuild::Project	is associated with	S3 bucket IAM role

\*To learn more about how AWS Config integrates with AWS CodeBuild, see [Use AWS Config with AWS CodeBuild Sample](#).

## AWS CodePipeline

AWS Service	Resource Type Value	Relationship	Related Resource
AWS CodePipeline	AWS::CodePipeline::Pipeline	is attached to*	S3 bucket

AWS Service	Resource Type Value	Relationship	Related Resource
		is associated with	IAM role
			Code project
			Lambda function
			Cloudformation stack
			ElasticBeanstalk application

\*AWS Config records configuration changes to CodePipeline pipelines and supported resource types in the pipelines. AWS Config does not record configuration changes for resource types in the pipelines that are not yet supported. Unsupported resource types such as CodeCommit repository, CodeDeploy application, ECS cluster, and ECS service appear in the supplementary configuration section of the configuration item for the stack.

## AWS Config

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Config	AWS::Config::ResourceCompliance	is associated with*	All resources*
	AWS::Config::ConformancePackCompliance	NA	NA

\*The relationship between AWS::Config::ResourceCompliance and a related resource depends on how AWS::Config::ResourceCompliance reports compliance for that specific resource type.

**Note**

Recording for the AWS::Config::ConformancePackCompliance resource type is available at no additional charge.

## AWS Elastic Beanstalk

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Elastic Beanstalk	AWS::ElasticBeanstalk::Application	contains	Elastic Beanstalk Application Version
			Elastic Beanstalk Environment
		is associated with	IAM role
	AWS::ElasticBeanstalk::ApplicationVersion	is contained in	Elastic Beanstalk Application
		is associated with	Elastic Beanstalk Environment
			S3 bucket
AWS::ElasticBeanstalk::Environment	is contained in	Elastic Beanstalk Application	

AWS Service	Resource Type Value	Relationship	Related Resource
		is associated with	Elastic Beanstalk Application Version
			IAM role
		contains	CloudFormation Stack

## AWS Identity and Access Management

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Identity and Access Management	AWS::IAM::User <sup>*</sup>	is attached to	IAM group
			IAM customer managed policy
	AWS::IAM::Group <sup>*</sup>	contains	IAM user
			is attached to
	AWS::IAM::Role <sup>*</sup>	is attached to	IAM customer managed policy
	AWS::IAM::Policy	is attached to	IAM user
			IAM group
			IAM role

<sup>\*</sup> AWS Identity and Access Management (IAM) resources are *global resources*. Global resources are not tied to an individual region and can be used in all regions. The configuration details for a global resource are the same in all regions. For more information, see [Selecting Which Resources AWS Config Records](#) (p. 62).

AWS Config includes inline policies with the configuration details that it records.

## AWS Key Management Service

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Key Management Service	AWS::KMS::Key	NA	NA

## AWS Lambda Function

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Lambda Function	AWS::Lambda::Function	is associated with	IAM role

AWS Service	Resource Type Value	Relationship	Related Resource
			EC2 security group
		contains	EC2 subnet

## AWS Network Firewall

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Network Firewall	AWS::NetworkFirewall	is attached to	EC2 Subnet
		is associated with	NetworkFirewall FirewallPolicy
	AWS::NetworkFirewall	is associated with	NetworkFirewall RuleGroup
	AWS::NetworkFirewall	is associated with	NA

AWS Config support for Network Firewall is available only in the US East (N. Virginia), Europe (Ireland) and US West (Oregon) regions.

## AWS Secrets Manager

AWS Service	Resource Type Value	Relationship	Related Resource
AWS SecretsManager	AWS::SecretsManager	is associated with	Lambda function
		is associated with	KMS Key

## AWS Service Catalog

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Service Catalog	AWS::ServiceCatalog	contains	Portfolio
		is associated with	CloudFormationProvisionedProduct
	AWS::ServiceCatalog	is associated with	Portfolio
			CloudFormationProduct
			CloudFormationStack
AWS::ServiceCatalog	contains	CloudFormationProduct	

## AWS Shield

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Shield*	AWS::Shield::Protection	is associated with	Amazon CloudFront distribution
	AWS::ShieldRegional::Protection	is associated with	EC2 EIP
		is associated with	ElasticLoadBalancing Balancer
		is associated with	ElasticLoadBalancingV2 LoadBalancer

\* AWS Config support for AWS::Shield::Protection is available only in the US East (N. Virginia) region. The AWS::ShieldRegional::Protection is available in all regions where AWS Shield is supported.

## AWS Systems Manager

AWS Service	Resource Type Value	Relationship	Related Resource
AWS Systems Manager	AWS::SSM::ManagedInstance	is associated with*	EC2 instance
	AWS::SSM::PatchCompliance	is associated with	Managed Instance Inventory
	AWS::SSM::Association	is associated with	Managed Instance Inventory
	AWS::SSM::FileData	is associated with	Managed Instance Inventory

\* To learn more about managed instance inventory, see [Recording Software Configuration for Managed Instances](#) (p. 65).

## AWS WAF

AWS Service	Resource Type Value	Relationship	Related Resource
AWS WAF*	AWS::WAF::RateBasedRule	NA	NA
	AWS::WAF::Rule	NA	NA
	AWS::WAF::WebACL	is associated with	WAF Rule
			WAF rate based rule
			WAF Rulegroup
AWS::WAF::RuleGroup	is associated with	WAF Rule	

AWS Service	Resource Type Value	Relationship	Related Resource
	AWS::WAFRegional::RateBasedRule	NA	NA
	AWS::WAFRegional::Rule	NA	NA
	AWS::WAFRegional::WebACL	is associated with	ElasticLoadBalancingV2 LoadBalancer
			WAFRegional Rule
			WAFRegional rate based rule
			WAFRegional Rulegroup
	AWS::WAFRegional::RuleGroup	is associated with	WAFRegional Rule

\*The AWS WAF resource type values are available only in the US East (N. Virginia) Region. The AWS::WAFRegional::RateBasedRule, AWS::WAFRegional::Rule, AWS::WAFRegional::WebACL, and AWS::WAFRegional::RuleGroup are available in all regions where AWS WAF is supported.

AWS Service	Resource Type Value	Relationship	Related Resource
AWS WAFv2*	AWS::WAFv2::WebACL	is associated with	ElasticLoadBalancingV2 LoadBalancer
			ApiGateway Stage
			WAFv2 IPSet
			WAFv2 RegexPatternSet
			WAFv2 RuleGroup
			WAFv2 ManagedRuleSet
	AWS::WAFv2::RuleGroup	is associated with	WAFv2 IPSet
			WAFv2 RegexPatternSet
	AWS::WAFv2::ManagedRuleSet	is associated with	WAFv2 RuleGroup

\*The AWS WAFv2 resource type values are available in all the AWS Regions where AWS WAFv2 is supported.

## AWS X-Ray

AWS Service	Resource Type Value	Relationship	Related Resource
AWS X-Ray	AWS::XRay::EncryptionConfig	NA	NA

## Elastic Load Balancing

AWS Service	Resource Type Value	Relationship	Related Resource
Elastic Load Balancing	Application Load Balancer	is associated with	EC2 security group
		is attached to	Subnet
	AWS::ElasticLoadBalancingV2::LoadBalancer	is contained in	Virtual private cloud (VPC)
	Classic Load Balancer	is associated with	EC2 security group
		is attached to	Subnet
	AWS::ElasticLoadBalancing::LoadBalancer	is contained in	Virtual private cloud (VPC)
Network Load Balancer	NA	NA	
AWS::ElasticLoadBalancingV2::LoadBalancer			

## Service Limits

The following table describes limits within AWS Config. Unless noted otherwise, the quotas can be increased upon request. You can [request a quota increase](#).

For information about other limits in AWS, see [AWS Service Limits](#).

### AWS Config Service Limits

Description	Limit Value	Can be increased
Maximum number of AWS Config Rules per Region per account	250	Yes
Maximum number of configuration aggregators	50	Yes
Maximum number of accounts in an aggregator	10000	No
Maximum number of accounts added or deleted per week for all aggregators	1000	Yes
Maximum number of Tags	50	No
Maximum number of saved queries in a single account and a Region	300	Yes

### Single Account Conformance Packs

Description	Limit Value	Can be increased
Maximum number of conformance packs per account	50	No
Maximum number of AWS Config Rules per conformance pack	100	No
Maximum number of AWS Config Rules per account across all conformance packs	150	No

### Organization Conformance Packs

Description	Limit Value	Can be increased
Maximum number of conformance packs per organization	50	No
Maximum AWS Config Rules per organization conformance pack	25	No
Maximum number of AWS Config Rules per account across all organization conformance packs	150	No

### Organization Config Rules

Description	Limit Value	Can be increased
Maximum number of organization AWS Config rules per organization	150	No

# Getting Started with AWS Config

When you sign up for AWS, your account has access to all AWS services. You pay only for the services that you use.

If you do not have an AWS account, complete the following steps to create one.

## To sign up for an AWS account

1. Open <https://portal.aws.amazon.com/billing/signup>.
2. Follow the online instructions.

Part of the sign-up procedure involves receiving a phone call and entering a verification code on the phone keypad.

After you sign up for an AWS account, you can get started with AWS Config with the AWS Management Console, AWS CLI, or the AWS SDKs. Use the console for a quick and streamlined process.

When you set up AWS Config, you can complete the following:

- Specify the resource types that you want AWS Config to record.
- Set up an Amazon S3 bucket to receive a configuration snapshot on request and configuration history.
- Set up an Amazon SNS topic to send configuration stream notifications.
- Grant AWS Config the permissions it needs to access the Amazon S3 bucket and the SNS topic.
- Specify the rules that you want AWS Config to use to evaluate compliance information for the recorded resource types.

For more information about using the AWS CLI, see [Setting Up AWS Config with the AWS CLI \(p. 27\)](#).

For more information about using the AWS SDKs, see [AWS Software Development Kits for AWS Config \(p. 3321\)](#).

## Topics

- [Setting Up AWS Config with the Console \(p. 25\)](#)
- [Setting Up AWS Config with the AWS CLI \(p. 27\)](#)
- [Setting Up AWS Config Rules with the Console \(p. 33\)](#)
- [Viewing the AWS Config Dashboard \(p. 33\)](#)

## Setting Up AWS Config with the Console

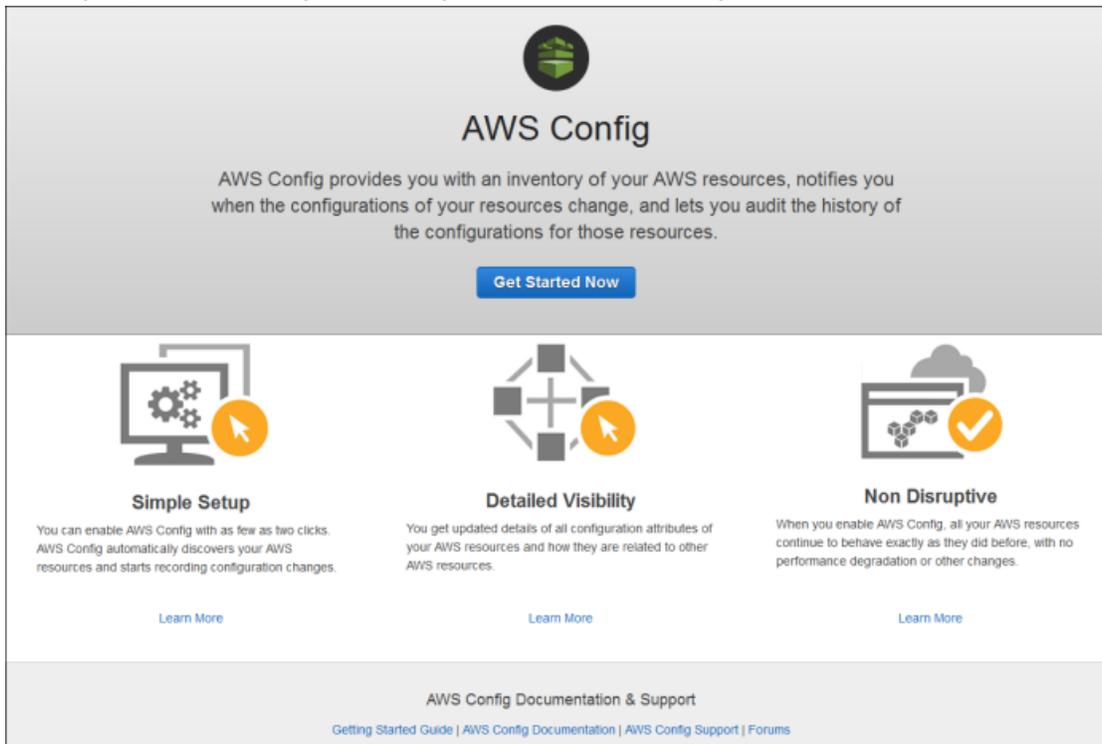

You can use the AWS Management Console to get started with AWS Config to do the following:

- Specify the resource types you want AWS Config to record.
- Set up Amazon SNS to notify you of configuration changes.
- Specify an Amazon S3 bucket to receive configuration information.
- Add AWS Config managed rules to evaluate the resource types.

If you are using AWS Config for the first time or configuring AWS Config for a new region, you can choose managed rules to evaluate resource configurations. For regions that support AWS Config and AWS Config Rules, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.

## To set up AWS Config with the console

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. If this is the first time you are opening the AWS Config console or you are setting up AWS Config in a new region, the AWS Config console page looks like the following:

3. Choose **Get Started Now**.
  4. On the **Settings** page, for **Resource types to record**, specify all the resource types you want AWS Config to record. These resource types are AWS resources or third-party resources or custom resources.
    - **All resources** – AWS Config records all supported resources with the following options:
      - **Record all resources supported in this region** – AWS Config records configuration changes for supported AWS resource types as well as third-party resource types registered in AWS CloudFormation registry. AWS Config automatically starts recording new supported AWS resource types. It also automatically starts recording third-party resource types that are managed (i.e. created/updated/deleted) through AWS CloudFormation.
      - **Include global resources** – AWS Config includes supported types of global resources with the resources that it records (for example, IAM resources). When AWS Config adds support for a new global resource type, AWS Config automatically starts recording resources of that type.
    - **Specific types** – AWS Config records configuration changes for only the resource types that you specify.
- For more information about these options, see [Selecting Which Resources AWS Config Records](#) (p. 62).
5. For **Amazon S3 Bucket**, choose the Amazon S3 bucket to which AWS Config sends configuration history and configuration snapshot files:
    - **Create a new bucket** – For **Bucket Name**, type a name for your Amazon S3 bucket.

The name that you type must be unique across all existing bucket names in Amazon S3. One way to help ensure uniqueness is to include a prefix; for example, the name of your organization. You can't change the bucket name after it is created. For more information, see [Bucket Restrictions and Limitations](#) in the *Amazon Simple Storage Service Developer Guide*.

- **Choose a bucket from your account** – For **Bucket Name**, choose your preferred bucket.
- **Choose a bucket from another account** – For **Bucket Name**, type the bucket name.

If you choose a bucket from another account, that bucket must have policies that grant access permissions to AWS Config. For more information, see [Permissions for the Amazon S3 Bucket](#) (p. 3292).

6. For **Amazon SNS Topic**, choose whether AWS Config streams information by selecting the **Stream configuration changes and notifications to an Amazon SNS topic**. AWS Config sends notifications such as configuration history delivery, configuration snapshot delivery, and compliance.
7. If you chose to have AWS Config stream to an Amazon SNS topic, choose the target topic:
  - **Create a new topic** – For **Topic Name**, type a name for your SNS topic.
  - **Choose a topic from your account** – For **Topic Name**, select your preferred topic.
  - **Choose a topic from another account** – For **Topic ARN**, type the Amazon Resource Name (ARN) of the topic. If you choose a topic from another account, the topic must have policies that grant access permissions to AWS Config. For more information, see [Permissions for the Amazon SNS Topic](#) (p. 3295).

**Note**

The Amazon SNS topic must exist in the same region as the region in which you set up AWS Config.

8. For **AWS Config role**, choose the IAM role that grants AWS Config permission to record configuration information and send this information to Amazon S3 and Amazon SNS:
  - **Create a role** – AWS Config creates a role that has the required permissions. For **Role name**, you can customize the name that AWS Config creates.
  - **Choose a role from your account** – For **Role name**, choose an IAM role in your account. AWS Config will attach the required policies. For more information, see [Permissions for the IAM Role Assigned to AWS Config](#) (p. 3289).

**Note**

Check the box if you want to use the IAM role as is. AWS Config will not attach policies to the role.

9. If you are setting up AWS Config in a region that supports rules, choose **Next**. See [Setting Up AWS Config Rules with the Console](#) (p. 33).

Otherwise, choose **Save**. AWS Config displays the **Resource inventory** page.

For information about looking up the existing resources in your account and understanding the configurations of your resources, see [View, and Manage Your AWS Resources](#) (p. 43).

You can also use Amazon Simple Queue Service to monitor AWS resources programmatically. For more information, see [Monitoring AWS Resource Changes with Amazon SQS](#) (p. 3314).

## Setting Up AWS Config with the AWS CLI

You can use the AWS Command Line Interface to control and automate the services from AWS.

For more information about the AWS CLI and for instructions on installing the AWS CLI tools, see the following in the *AWS Command Line Interface User Guide*.

- [AWS Command Line Interface User Guide](#)
- [Getting Set Up with the AWS Command Line Interface](#)

See the following topics to set up AWS Config with the AWS CLI. After you set up AWS Config, you can add rules to evaluate the resource types in your account. For more information about setting up rules with AWS Config, see [View, Update, and Delete Rules \(AWS CLI\)](#) (p. 208).

#### Topics

- [Prerequisites](#) (p. 28)
- [Turning on AWS Config](#) (p. 30)
- [Verify that AWS Config Is On](#) (p. 31)

## Prerequisites

Follow this procedure to create an Amazon S3 bucket, an Amazon SNS topic, and an IAM role with attached policies. You can then use the AWS CLI to specify the bucket, topic, and role for AWS Config.

#### Contents

- [Creating an Amazon S3 Bucket](#) (p. 28)
- [Creating an Amazon SNS Topic](#) (p. 29)
- [Creating an IAM Role](#) (p. 29)

## Creating an Amazon S3 Bucket

If you already have an Amazon S3 bucket in your account and want to use it, skip this step and go to [Creating an Amazon SNS Topic](#) (p. 29).

To create an Amazon S3 bucket with the AWS CLI, use the [create-bucket](#) command.

#### To create an Amazon S3 bucket with the console

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. Choose **Actions** and then choose **Create Bucket**.
3. For the **Bucket Name**, type a name for your Amazon S3 bucket, such as *my-config-bucket*.

#### Note

Make sure the bucket name you choose is unique across all existing bucket names in Amazon S3. You cannot change the name of a bucket after it is created. For more information on bucket naming rules and conventions, see [Bucket restrictions and Limitations](#) in the *Amazon Simple Storage Service Developer Guide*.

4. Choose **Create**.

#### Note

You can also use an Amazon S3 bucket from a different account, but you may need to create a policy for the bucket that grants access permissions to AWS Config. For information on granting permissions to an Amazon S3 bucket, see [Permissions for the Amazon S3 Bucket](#) (p. 3292), and then go to [Creating an Amazon SNS Topic](#) (p. 29).

## Creating an Amazon SNS Topic

If you already have an Amazon SNS topic in your account and want to use it, skip this step and go to [Creating an IAM Role \(p. 29\)](#).

To create an Amazon SNS topic with the AWS CLI, use the `create-topic` command.

### To create an Amazon SNS topic with the console

1. Sign in to the AWS Management Console and open the Amazon SNS console at <https://console.aws.amazon.com/sns/v3/home>.
2. Choose **Create New Topic**.
3. For **Topic Name**, type a name for your SNS topic, such as *my-config-notice*.
4. Choose **Create Topic**.

The new topic appears in the **Topic Details** page. Copy the **Topic ARN** for the next task.

For more information, see [ARN Format](#) in the *AWS General Reference*.

To receive notifications from AWS Config, you must subscribe an email address to the topic.

### To subscribe an email address to the SNS topic

1. In the Amazon SNS console, choose **Subscriptions** in the navigation pane.
2. On the **Subscriptions** page, choose **Create Subscription**.
3. For **Topic ARN**, paste the topic ARN you copied in the previous task.
4. For **Protocol**, choose **Email**.
5. For **Endpoint**, type an email address that you can use to receive the notification and then choose **Subscribe**.
6. Go to your email application and open the message from **AWS Notifications**. Choose the link to confirm your subscription.

Your web browser displays a confirmation response from Amazon SNS. Amazon SNS is now configured to receive notifications and send the notification as an email to the specified email address.

#### Note

You can also use an Amazon SNS topic in a different account, but in that case you might need to create a policy for topic that grants access permissions to AWS Config. For information on granting permissions to an Amazon SNS topic, see [Permissions for the Amazon SNS Topic \(p. 3295\)](#) and then go to [Creating an IAM Role \(p. 29\)](#).

## Creating an IAM Role

You can use the IAM console to create an IAM role that grants AWS Config permissions to access your Amazon S3 bucket, access your Amazon SNS topic, and get configuration details for supported AWS resources. After you create the IAM role, you will create and attach policies to the role.

To create an IAM role with the AWS CLI, use the `create-role` command. You can then attach a policy to the role with the `attach-role-policy` command.

### To create an IAM role with the console

1. Sign in to the AWS Management Console and open the IAM console at <https://console.aws.amazon.com/iam/>.

2. In the IAM console, choose **Roles** in the navigation pane, and choose **Create New Role**.
3. For **Role Name**, type a name that describes the purpose of this role. Role names must be unique within your AWS account. Because various entities might reference the role, you cannot edit the name of the role after you create it.

Choose **Next Step**.

4. Choose **AWS Service Roles**, and then choose **Select for AWS Config**.
5. On the **Attach Policy** page, select **AWS\_ConfigRole**. This AWS managed policy grants AWS Config permission to get configuration details for supported AWS resources. Then, choose **Next Step**.
6. On the **Review** page, review the details about your role, and choose **Create Role**.
7. On the **Roles** page, choose the role that you created to open its details page.

You will expand the permissions in the role by creating inline policies that allow AWS Config to access your Amazon S3 bucket and your Amazon SNS topic.

### To create an inline policy that grants AWS Config permission to access your Amazon S3 bucket

1. In the **Permissions** section, expand the **Inline Policies** section, and choose **click here**.
2. Choose **Custom Policy**, and choose **Select**.
3. For **Policy Name**, type a name for your inline policy.
4. Copy the example Amazon S3 bucket policy in [IAM Role Policy for Amazon S3 Bucket \(p. 3290\)](#) and paste it in the **Policy Document** editor.

#### Important

Before you proceed to the next step, replace the following values in the policy. If you do not replace the values, your policy will fail.

- *myBucketName* – Replace with the name of your Amazon S3 bucket.
- *prefix* – Replace with your own prefix or leave blank by removing the trailing '/'.
- *myAccountID-WithoutHyphens* – Replace with your AWS account ID.

5. Choose **Apply Policy**.

### To create an inline policy that grants AWS Config permissions to deliver notifications to your Amazon SNS topic

1. In the **Permissions** section, expand the **Inline Policies** section, and choose **click here**.
2. Choose **Custom Policy**, and choose **Select**.
3. For **Policy Name**, type a name for your inline policy.
4. Copy the Amazon SNS topic example policy in [IAM Role Policy for Amazon SNS Topic \(p. 3291\)](#) and paste it in the **Policy Document** editor.

#### Important

Before you proceed to the next step, replace *arn:aws:sns:region:account-id:myTopic* with the ARN you saved when you created your Amazon SNS topic.

5. Choose **Apply Policy**.

## Turning on AWS Config

You can use the AWS CLI to turn on AWS Config with the `subscribe` command and a few parameters.

You can use the `subscribe` command to have AWS Config start recording configurations of all supported AWS resources in your account. The `subscribe` command creates a configuration recorder, a delivery channel using a specified Amazon S3 bucket and Amazon SNS topic, and starts recording the configuration items. You can have one configuration recorder and one delivery channel per region in your account.

To turn on AWS Config, use the `subscribe` with the following parameters:

The `subscribe` command uses the following options:

`--s3-bucket`

Specify the name of an Amazon S3 bucket existing in your account or existing in another account.

`--sns-topic`

Specify the Amazon Resource Name (ARN) of an SNS topic existing in your account or existing in another account.

`--iam-role`

Specify the Amazon Resource Name (ARN) of an existing IAM Role.

The specified IAM role must have policies attached that grant AWS Config permissions to deliver configuration items to the Amazon S3 bucket and the Amazon SNS topic, and the role must grant permissions to the `Describe` APIs of the supported AWS resources.

Your command should look like the following example:

```
$ aws configservice subscribe --s3-bucket my-config-bucket --sns-topic arn:aws:sns:us-east-2:012345678912:my-config-notice --iam-role arn:aws:iam::012345678912:role/myConfigRole
```

After you run the `subscribe` command, AWS Config records all supported resources that it finds in the region. If you don't want AWS Config to record supported resources, specify the types of resources to record by updating the configuration recorder to use a recording group. For more information, see [Selecting Resources \(AWS CLI\)](#) (p. 63).

## Verify that AWS Config Is On

Once you have turned on AWS Config, you can use AWS CLI commands to verify that the AWS Config is running and that the `subscribe` command has created a configuration recorder and a delivery channel. You can also confirm that AWS Config has started recording and delivering configurations to the delivery channel.

### Contents

- [Verify that the Delivery Channel Is Created](#) (p. 31)
- [Verify that the Configuration Recorder Is Created](#) (p. 32)
- [Verify that AWS Config has started recording](#) (p. 32)

## Verify that the Delivery Channel Is Created

Use the `describe-delivery-channels` command to verify that your Amazon S3 bucket and Amazon SNS topic is configured.

```
$ aws configservice describe-delivery-channels
```

```
{
  "DeliveryChannels": [
    {
      "snsTopicARN": "arn:aws:sns:us-west-2:0123456789012:my-config-topic",
      "name": "my-delivery-channel",
      "s3BucketName": "my-config-bucket"
    }
  ]
}
```

When you use the CLI, the service API, or the SDKs to configure your delivery channel and do not specify a name, AWS Config automatically assigns the name "default".

## Verify that the Configuration Recorder Is Created

Use the `describe-configuration-recorders` command to verify that a configuration recorder is created and that the configuration recorder has assumed an IAM role. For more information, see [Creating an IAM Role \(p. 29\)](#).

```
$ aws configservice describe-configuration-recorders
{
  "ConfigurationRecorders": [
    {
      "roleARN": "arn:aws:iam::012345678912:role/myConfigRole",
      "name": "default"
    }
  ]
}
```

## Verify that AWS Config has started recording

Use the `describe-configuration-recorder-status` command to verify that the AWS Config has started recording the configurations of the supported AWS resources existing in your account. The recorded configurations are delivered to the specified delivery channel.

```
$ aws configservice describe-configuration-recorder-status
{
  "ConfigurationRecordersStatus": [
    {
      "name": "default",
      "lastStatus": "SUCCESS",
      "lastStopTime": 1414511624.914,
      "lastStartTime": 1414708460.276,
      "recording": true,
      "lastStatusChangeTime": 1414816537.148,
      "lastErrorMessage": "NA",
      "lastErrorCode": "400"
    }
  ]
}
```

The value `true` in the `recording` field confirms that the configuration recorder has started recording configurations of all your resources. AWS Config records the time in UTC. The output is displayed as a Unix timestamp.

For information about looking up the resources existing in your account and understanding the configurations of your resources, see [View, and Manage Your AWS Resources \(p. 43\)](#).

## Setting Up AWS Config Rules with the Console

The **Rules** page provides initial AWS managed rules that you can add to your account. After set up, AWS Config evaluates your AWS resources against the rules that you choose. You can update the rules and create additional managed rules after set up.

To see the complete list of AWS managed rules, see [List of AWS Config Managed Rules \(p. 103\)](#).

For example, you can choose the **cloudtrail-enabled** rule, which evaluates whether your account has a CloudTrail trail. If your account doesn't have a trail, AWS Config flags the resource type and the rule as noncompliant.

On the **Rules** page, you can do the following:

- Type in the search field to filter results by rule name, description, or label. For example, type **EC2** to return rules that evaluate EC2 resource types or type **periodic** to return rules that have a periodic trigger. Type "new" to search for newly added rules. For more information about trigger types, see [Specifying Triggers for AWS Config Rules \(p. 101\)](#).
- Choose a rule to view its specific details. You can also reorder the results alphabetically by choosing the arrow by the **Rule name** label.
- Choose the arrow icon to see the next page of rules.
- See recently added rules that are marked as **New**.
- See labels to identify the resource type that a rule evaluates and if the rule has a periodic trigger.

### To set up AWS Config rules

1. On the **Rules** page, choose the rules that you want. You can customize these rules and add other rules to your account after set up.
2. Choose **Next**.
3. On the **Review** page, verify your setup details, and then choose **Confirm**.

The **Rules** page shows your rules and their current compliance results in the table. The result for each rule is **Evaluating...** until AWS Config finishes evaluating your resources against the rule. You can update the results with the refresh button. When AWS Config finishes evaluations, you can see the rules and resource types that are compliant or noncompliant. For more information, see [Viewing Configuration Compliance \(p. 98\)](#).

#### Note

AWS Config evaluates only the resource types that it is recording. For example, if you add the **cloudtrail-enabled** rule but don't record the CloudTrail trail resource type, AWS Config can't evaluate whether the trails in your account are compliant or noncompliant. For more information, see [Selecting Which Resources AWS Config Records \(p. 62\)](#).

You can view, edit, and delete your existing rules. You can also create additional AWS managed rules or create your own. For more information, see [Managing your AWS Config Rules \(p. 207\)](#).

## Viewing the AWS Config Dashboard

Use the **Dashboard** to see an overview of your resources, rules, and their compliance state. This page helps you quickly identify the top resources in your account, and if you have any rules or resources that are noncompliant.

After setup, AWS Config starts recording the specified resources and then evaluates them against your rules. It may take a few minutes for AWS Config to display your resources, rules, and their compliance states on the **Dashboard**.

### To use the AWS Config Dashboard

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Dashboard**.
3. Use the **Dashboard** to see an overview of your resources, rules, and their compliance state. You can do the following:
  - View the total number of resources that AWS Config is recording.
  - View the resource types that AWS Config is recording, in descending order (the number of resources). Choose a resource type to go to the **Resources inventory** page.
  - View the number of noncompliant rules.
  - View the number of noncompliant resources.
  - View the top noncompliant rules, in descending order (the number of resources).
  - Choose **View all noncompliant rules** to go to the **Rules** page.

The **Dashboard** shows the resources and rules specific to your region and account. It does not show resources or rules from other regions or other AWS accounts.

#### Note

The **Evaluate your AWS resource configuration using Config rules** message can appear on the **Dashboard** for the following reasons:

- You haven't set up AWS Config Rules for your account. You can choose **Add rule** to go to the **Rules** page.
- AWS Config is still evaluating your resources against your rules. You can refresh the page to see the latest evaluation results.
- AWS Config evaluated your resources against your rules and did not find any resources in scope. You can specify the resources for AWS Config to record in the **Settings** page. For more information, see [Selecting Which Resources AWS Config Records \(p. 62\)](#).

# Viewing AWS Resource Configurations and Managing AWS Config

Use AWS Config for the following:

- View all the resources that AWS Config is recording in your account.
- Customize the types of resources that AWS Config records.
- View configuration changes over a specific period of time for a resource in AWS Config console and AWS CLI.
- View AWS resource configuration history
- View AWS resource compliance history
- View all the notifications that AWS Config sends to an Amazon SNS topic.
- Modify settings for your IAM role
- Modify or delete your delivery channels

## Topics

- [Region Support \(p. 35\)](#)
- [Components of a Configuration Item \(p. 37\)](#)
- [Record Configurations for Third-Party Resources \(p. 38\)](#)
- [Viewing AWS Resource Configurations and History \(p. 43\)](#)
- [Managing AWS Config \(p. 56\)](#)
- [Notifications that AWS Config Sends to an Amazon SNS topic \(p. 82\)](#)

## Region Support

Currently, AWS Config is supported in the following regions:

Region Name	Region	Endpoint	Protocol
Africa (Cape Town)	af-south-1	config.af-south-1.amazonaws.com	HTTPS
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (Osaka)	ap-northeast-3	config.ap-northeast-3.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Milan)	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS

## Components of a Configuration Item

A configuration item consists of the following components.

Component	Description	Contains
Metadata	Information about this configuration item	<ul style="list-style-type: none"> <li>Version ID</li> <li>Time when the configuration item was captured</li> <li>Status of the configuration item indicating whether the item was captured successfully</li> <li>State ID indicating the ordering of the configuration items of a resource</li> </ul>
Attributes <sup>1</sup>	Resource attributes	<ul style="list-style-type: none"> <li>Resource ID</li> <li>List of key–value tags<sup>2</sup> for this resource</li> <li>Resource type; see <a href="#">Supported Resource Types (p. 9)</a></li> <li>Amazon Resource Name (ARN)</li> <li>Availability Zone that contains this resource, if applicable</li> <li>Time the resource was created</li> </ul>
Relationships	How the resource is related to other resources associated with the account	Description of the relationship, such as Amazon EBS volume <code>vol-1234567</code> is attached to an Amazon EC2 instance <code>i-a1b2c3d4</code>
Current configuration	Information returned through a call to the Describe or List API of the resource	<p>For example, <code>DescribeVolumes</code> API returns the following information about the volume:</p> <ul style="list-style-type: none"> <li>Availability Zone the volume is in</li> <li>Time the volume was attached</li> <li>ID of the EC2 instance it is attached to</li> <li>Current status of the volume</li> <li>State of <code>DeleteOnTermination</code> flag</li> <li>Device the volume is attached to</li> <li>Type of volume, such as <code>gp2</code>, <code>io1</code>, or <code>standard</code></li> </ul>

### Notes

1. A configuration item relationship does not include network flow or data flow dependencies. Configuration items cannot be customized to represent your application architecture.
2. AWS Config does not record key–value tags for CloudTrail trail, CloudFront distribution, and CloudFront streaming distribution.
3. As of Version 1.3, the `relatedEvents` field is empty. You can access the [LookupEvents API](#) in the *AWS CloudTrail API Reference* to retrieve the events for the resource.
4. As of Version 1.3, the `configurationItemMD5Hash` field is empty. You can use the `configurationStateId` field to ensure you have the latest configuration item.

# Record Configurations for Third-Party Resources

Record configurations for third-party resources or custom resource types such as on premise servers, SAAS monitoring tools, and version control systems (like GitHub). You can publish the configuration data of third-party resources into AWS Config and view and monitor the resource inventory and configuration history using AWS Config console and APIs. Now, you can use AWS Config to manage all your resources and evaluate resource configuration for compliance against best practices using AWS Config rules. You can also create AWS Config rules or conformance packs to evaluate these third-party resources against best practices, internal policies, and regulatory policies.

## Note

This feature is only available in the redesigned AWS Config console.

If you have configured AWS Config to record all resource types, then third-party resources that are managed (i.e. created/updated/deleted) through AWS CloudFormation are automatically tracked in AWS Config as configuration items.

**Prerequisite:** The third-party resources or custom resource type must be registered using AWS CloudFormation.

## Topics

- [Step 1: Setup Your Development Environment \(p. 38\)](#)
- [Step 2: Model Your Resource \(p. 38\)](#)
- [Step 3: Generate Artifacts \(p. 40\)](#)
- [Step 4: Register Your Resource \(p. 40\)](#)
- [Step 5: Publish Resource Configuration \(p. 40\)](#)
- [Record and Delete a Configuration State for Third-Party Resources Using AWS CLI \(p. 40\)](#)
- [Managing a Configuration State for Third-Party Resources Type Using APIs \(p. 42\)](#)
- [Region Support \(p. 42\)](#)

## Step 1: Setup Your Development Environment

Install and configure AWS CloudFormation AWS CLI. The AWS CLI allows you to model and register your custom resources. For more information, see [Custom Resources](#) and [What Is the CloudFormation Command Line Interface?](#).

## Step 2: Model Your Resource

Create a resource provider schema that conforms to and validates the configuration of the resource type.

1. Use the `init` command to create your resource provider project and generate the files it requires.

```
$ cfn init
Initializing new project
```

2. The `init` command launches a wizard that walks you through setting up the project, including specifying the resource name. For this walkthrough, specify `MyCustomNamespace::Testing::WordPress`.

```
Enter resource type identifier (Organization::Service::Resource):
MyCustomNamespace::Testing::WordPress
```

3. Enter a package name for your resource.

```
Enter a package name (empty for default 'com.custom.testing.wordpress'):  
com.custom.testing.wordpress  
Initialized a new project in /workplace/user/custom-testing-wordpress
```

### Note

In order to guarantee that any project dependencies are correctly resolved, you can import the generated project into your IDE with Maven support.

For example, if you are using IntelliJ IDEA, you would need to do the following:

- From the **File** menu, choose **New**, then choose **Project From Existing Sources**.
  - Navigate to the project directory
  - In the **Import Project** dialog box, choose **Import project from external model** and then choose **Maven**.
  - Choose **Next** and accept any defaults to complete importing the project.
4. Open the `mycustomnamespace-testing-wordpress.json` file that contains the schema for your resource. Copy and paste the following schema into `mycustomnamespace-testing-wordpress.json`.

```
{  
  "typeName": "MyCustomNamespace::Testing::WordPress",  
  "description": "An example resource that creates a website based on WordPress  
5.2.2.",  
  "properties": {  
    "Name": {  
      "description": "A name associated with the website.",  
      "type": "string",  
      "pattern": "^[a-zA-Z0-9]{1,219}\\Z",  
      "minLength": 1, "maxLength": 219  
    },  
    "SubnetId": {  
      "description": "A subnet in which to host the website.",  
      "pattern": "^(subnet-[a-f0-9]{13})|(subnet-[a-f0-9]{8})\\Z",  
      "type": "string"  
    },  
    "InstanceId": {  
      "description": "The ID of the instance that backs the WordPress site.",  
      "type": "string"  
    },  
    "PublicIp": {  
      "description": "The public IP for the WordPress site.",  
      "type": "string"  
    }  
  },  
  "required": [ "Name", "SubnetId" ],  
  "primaryIdentifier": [ "/properties/PublicIp", "/properties/InstanceId" ],  
  "readOnlyProperties": [ "/properties/PublicIp", "/properties/InstanceId" ],  
  "additionalProperties": false  
}
```

5. Validate the schema.

```
$ cfn validate
```

6. Update the auto-generated files in the resource provider package to view the resource provider schema updates. Upon initiation of the resource provider project, the AWS CLI generates supporting files and code for the resource provider. Regenerate the code to see the updated schema.

```
$ cfn generate
```

**Note**

When using Maven, as part of the build process the `generate` command is automatically run before the code is compiled. So your changes will never get out of sync with the generated code.

Be aware the CloudFormation CLI must be in a location Maven/the system can find. For more information, see [Setting up your environment for developing extensions](#).

For more information on the whole process, see [Modeling Resource Providers for Use in AWS CloudFormation](#).

## Step 3: Generate Artifacts

Run the following command to generate artifacts for `cfn submit`.

```
$ mvn package
```

## Step 4: Register Your Resource

AWS Config does not require resource provider handlers to perform configuration tracking for your resource. Run the following command to register your resource.

```
$ cfn submit
```

For more information, see [Registering Resource Providers for Use in AWS CloudFormation Templates](#).

## Step 5: Publish Resource Configuration

Determine the configuration for `MyCustomNamespace::Testing::WordPress`.

```
{
  "Name": "MyWordPressSite",
  "SubnetId": "subnet-abcd0123",
  "InstanceId": "i-01234567",
  "PublicIp": "my-wordpress-site.com"
}
```

Determine the schema version id from AWS CloudFormation `DescribeType`.

In the AWS Config see if this resource configuration is accepted. To evaluate compliance you can write AWS Config rules using this resource. For additional information, see [Record and Delete a Configuration State for Third-Party Resources Using AWS CLI](#).

Optional: To automate recording of configuration, implement a periodic or change-based configuration collectors.

## Record and Delete a Configuration State for Third-Party Resources Using AWS CLI

The AWS CLI is a unified tool to manage your AWS services. With just one tool to download and configure, you can control multiple AWS services from the command line and use scripts to automate them.

To install the AWS CLI on your local machine, see [Installing the AWS CLI](#) in the *AWS CLI User Guide*.

If necessary, type `aws configure` to configure the AWS CLI.

### Topics

- [Record a Configuration Item \(p. 41\)](#)
- [Read the Configuration Item using AWS Config APIs \(p. 41\)](#)
- [Delete the Third-Party Resource \(p. 42\)](#)

## Record a Configuration Item

Record a configuration item for a third-party resource or a custom resource type using the following procedure:

Ensure you register the resource type `MyCustomNamespace::Testing::WordPress` with its matching schema.

1. Open a command prompt or a terminal window.
2. Type the following command:

```
aws configservice put-resource-config --resource-type
MyCustomNamespace::Testing::WordPress --resource-id resource-001 --schema-version-id
00000001 --configuration '{
  "Id": "resource-001",
  "Name": "My example custom resource.",
  "PublicAccess": false
}'
```

### Note

As defined in the type schema, `writeOnlyProperties` will be removed from the configuration prior to being recorded by AWS Config. This means that these values will not be present when the configuration is obtained via read APIs. For more information on `writeOnlyProperties`, see [Resource type schema](#).

## Read the Configuration Item using AWS Config APIs

1. Open a command prompt or a terminal window.
2. Type the following command:

```
aws configservice list-discovered-resources --resource-type
MyCustomNamespace::Testing::WordPress
```

3. Press Enter.

You should see output similar to the following:

```
{
  "resourceIdentifiers": [
    {
      "resourceType": "MyCustomNamespace::Testing::WordPress",
      "resourceId": "resource-001"
    }
  ]
}
```

4. Type the following command:

```
aws configservice batch-get-resource-config --resource-keys '[ { "resourceType":  
  "MyCustomNamespace::Testing::WordPress", "resourceId": "resource-001" } ]'
```

5. Press Enter.

You should see output similar to the following:

```
{  
  "unprocessedResourceKeys": [],  
  "baseConfigurationItems": [  
    {  
      "configurationItemCaptureTime": 1569605832.673,  
      "resourceType": "MyCustomNamespace::Testing::WordPress",  
      "resourceId": "resource-001",  
      "configurationStateId": "1569605832673",  
      "awsRegion": "us-west-2",  
      "version": "1.3",  
      "supplementaryConfiguration": {},  
      "configuration": "{\\"Id\\":\\"resource-001\\",\\"Name\\":\\"My example custom  
resource.\",\\"PublicAccess\\":false}",  
      "configurationItemStatus": "ResourceDiscovered",  
      "accountId": "AccountId"  
    }  
  ]  
}
```

## Delete the Third-Party Resource

You can record the configuration state for a third-party resource or custom resource type that you want to delete.

- Type the following command:

```
aws configservice delete-resource-config --resource-type  
  MyCustomNamespace::Testing::WordPress --resource-id resource-002
```

If successful, the command executes with no additional output.

## Managing a Configuration State for Third-Party Resources Type Using APIs

You can manage a configuration state for third-party resources or custom resource type using **PutResourceConfig** and **DeleteResourceConfig** APIs. For more information, see the API Reference.

- [PutResourceConfig](#)
- [DeleteResourceConfig](#)

## Region Support

This feature is supported in the following regions:

Region Name	Region	Endpoint	Protocol
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS

## Viewing AWS Resource Configurations and History

You can view all of the resources that AWS Config is recording in your account, the configuration changes that took place for a resource over a specified time period, and the relationships of the selected resource with all the related resources. You can also view compliance state changes for resources as evaluated by AWS Config Rules displayed in a timeline.

### Topics

- [Looking Up Resources That Are Discovered by AWS Config \(p. 44\)](#)
- [Viewing Configuration Details \(p. 45\)](#)
- [Viewing Compliance History Timeline for Resources \(p. 49\)](#)
- [Delivering Configuration Snapshot to an Amazon S3 Bucket \(p. 51\)](#)

## Looking Up Resources That Are Discovered by AWS Config

You can use the AWS Config console, AWS CLI, and AWS Config API to look up the resources that AWS Config has taken an inventory of, or *discovered*, including deleted resources and resources that AWS Config is not currently recording. AWS Config discovers supported resource types only. For more information, see [Supported Resource Types \(p. 9\)](#).

### Looking Up Resources (AWS Config Console)

You can use resource types or tag information to look up resources in the AWS Config console.

#### To look up resources

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. On the **Resource inventory** page, specify the search options for the resources that you want to look up:
  - Choose **Resources** and then choose one or more resource types in the list. This list includes resource types that AWS Config supports. To narrow results, type a resource ID or, if applicable, a resource name in the next box. You can also choose **Include deleted resources**.
  - Choose **Tag** and type a tag key that is applied to your resources, such as **CostCenter**. To narrow results, type a tag value in the next box.
3. After you specify the search options, choose **Look up**.
4. AWS Config lists the resources that match your search options. You can see the following information about the resources:
  - **Resource identifier** – The resource identifier might be a resource ID or a resource name, if applicable. Choose the resource identifier link to view the resource details page.
  - **Resource type** – The type of the resource is listed.
  - **Compliance** – The status of the resource that AWS Config evaluated against your rule.

For more information, see [Viewing Configuration Details \(p. 45\)](#).

### Looking Up Resources (AWS CLI)

You can use the AWS CLI to list resources that AWS Config has discovered.

#### To look up resources (AWS CLI)

- Use the `aws configservice list-discovered-resources` command:

#### Example

```
$ aws configservice list-discovered-resources --resource-type "AWS::EC2::Instance"
```

```
{
  "resourceIdentifiers": [
    {
      "resourceType": "AWS::EC2::Instance",
      "resourceId": "i-nnnnnnnn"
    }
  ]
}
```

To view the configuration details of a resource that is listed in the response, use the `get-resource-config-history` command, and specify the resource type and ID. For an example of this command and the response from AWS Config, see [Viewing Configuration History \(p. 45\)](#).

## Looking up Resources (AWS Config API)

You specify a resource type, and AWS Config returns a list of resource identifiers for resources of that type. For more information, see [ResourceIdentifier](#) in the *AWS Config API Reference*.

### To look up resources (AWS Config API)

- Use the [ListDiscoveredResources](#) action.

To get the configuration details of a resource that is listed in the response, use the [GetResourceConfigHistory](#) action, and specify the resource type and ID.

## Viewing Configuration Details

You can view the configuration, relationships, and number of changes made to a resource in the AWS Config console. You can view the configuration history for a resource using AWS CLI.

### Viewing Configuration Details (Console)

When you look up resources on the **Resource inventory** page, choose the resource name or ID in the resource identifier column to view the resource's details page. The details page provides information about the configuration, relationships, and number of changes made to that resource.

To access the resource timeline from the resource details page, choose the **Resource Timeline** button.

### Viewing Configuration Details (AWS CLI)

The configuration items that AWS Config records are delivered to the specified delivery channel on demand as a configuration snapshot and as a configuration stream. You can use the AWS CLI to view history of configuration items for each resource.

### Viewing Configuration History

Type the `get-resource-config-history` command and specify the resource type and the resource ID, for example:

```
$ aws configservice get-resource-config-history --resource-type AWS::EC2::SecurityGroup --
resource-id sg-6fbb3807
{
  "configurationItems": [
    {
      "configurationItemCaptureTime": 1414708529.9219999,
      "relationships": [
        {
```

```

        "resourceType": "AWS::EC2::Instance",
        "resourceId": "i-7a3b232a",
        "relationshipName": "Is associated with Instance"
    },
    {
        "resourceType": "AWS::EC2::Instance",
        "resourceId": "i-8b6eb2ab",
        "relationshipName": "Is associated with Instance"
    },
    {
        "resourceType": "AWS::EC2::Instance",
        "resourceId": "i-c478efe5",
        "relationshipName": "Is associated with Instance"
    },
    {
        "resourceType": "AWS::EC2::Instance",

For detailed explanation of the response fields, see [Components of a Configuration Item \(p. 37\)](#) and [Supported Resource Types \(p. 9\)](#).

## Example Amazon EBS Configuration History from AWS Config

AWS Config generates a set of files that each represent a resource type and lists all configuration changes for the resources of that type that AWS Config is recording. AWS Config exports this resource-centric configuration history as an object in the Amazon S3 bucket that you specified when you enabled AWS Config. The configuration history file for each resource type contains the changes that were detected for the resources of that type since the last history file was delivered. The history files are typically delivered every six hours.

The following is an example of the contents of the Amazon S3 object that describes the configuration history of all the Amazon Elastic Block Store volumes in the current region for your AWS account. The

volumes in this account include `vol-ce676ccc` and `vol-cia007c`. Volume `vol-ce676ccc` had two configuration changes since the previous history file was delivered while volume `vol-cia007c` had one change.

```

## Viewing Compliance History Timeline for Resources

AWS Config supports storing compliance state changes of resources as evaluated by AWS Config Rules. The resource compliance history is presented in the form of a timeline. The timeline captures changes as `ConfigurationItems` over a period of time for a specific resource. The resource timeline is available in the AWS Config console adjacent to the Configuration timeline.

You can opt in or out to record all resource types in AWS Config. If you have opted to record all resource types, AWS Config automatically begins to recording the resource compliance history as evaluated by AWS Config Rules. By default, AWS Config records the configuration changes for all supported resources. You can also select only the specific resource compliance history resource type: `AWS::Config::ResourceCompliance`. For more information, see [Selecting Which Resources AWS Config Records](#).

## Viewing Resource Timeline Using Resources

Access the resource timeline by selecting a specific resource from the Resource inventory page.

1. Select the **Resources** from the left navigation.
2. On the Resource inventory page, select all the existing resources from the drop-down and if appropriate, select include deleted resources.

The table displays the resource identifier for the resource type and the resource compliance status for that resource. The resource identifier might be a resource ID or a resource name, if applicable.

3. Select the resource from the resource identifier column.
4. Select the **Resource Timeline** button.

**Note**

Alternatively, on the Resource inventory page, you can directly choose the resource name. To access the resource timeline from the resource details page, choose the **Resource Timeline** button.

## Viewing Resource Timeline Using Rules

Access the resource timeline by selecting a specific rule from the Rule page.

1. Select the **Rules** from the left navigation.
2. On the Rule page, choose a rule evaluating your relevant resources. If no rules are displayed on the screen, add rules using the **Add rule** button.
3. On the Rule details page, select the resources from the Resources evaluated table.
4. Select the **Resource Timeline** button. The resource timeline is displayed.

## Querying Compliance History

Query the resource compliance history using `get-resource-config-history` using the resource type `AWS::Config::ResourceCompliance`.

```
aws configservice get-resource-config-history --resource-type  
AWS::Config::ResourceCompliance --resource-id AWS::S3::Bucket/configrules-bucket
```

You should see output similar to the following:

```
{  
  "configurationItems": [  
    {  
      "configurationItemCaptureTime": 1539799966.921,  
      "relationships": [  
        {  
          "resourceType": "AWS::S3::Bucket",  
          "resourceId": "configrules-bucket",  
          "relationshipName": "Is associated with "  
        }  
      ]  
    },  
    {  
      "tags": {},  
      "resourceType": "AWS::Config::ResourceCompliance",  
      "resourceId": "AWS::S3::Bucket/configrules-bucket",  
      "ConfigurationStateId": "1539799966921",  
      "relatedEvents": [];  
      "awsRegion": "us-west-2",  
      "version": "1.3",  
      "configurationItemMD5Hash": "",  
      "supplementaryConfiguration": {},  
      "configuration": "{\"complianceType\":\"COMPLIANT\", \"targetResourceId\":\"configrules-  
bucket\", \"targetResourceType\":\"AWS::S3::Bucket\", \"configRuleList\":[{\"configRuleArn  
\": \"arn:aws:config:us-west-2:AccountID:config-rule/config-rule-wlgogw\", \"configRuleId\":  
\"config-rule-wlgogw\", \"configRuleName\":\"s3-bucket-logging-enabled\", \"complianceType\":  
\"COMPLIANT\"}]}",
```

```
"configurationItemStatus": "ResourceDiscovered",  
"accountId": "AccountID"  
}  
]  
}
```

## Delivering Configuration Snapshot to an Amazon S3 Bucket

AWS Config delivers configuration items of the AWS resources that AWS Config is recording to the Amazon S3 bucket that you specified when you configured your delivery channel.

### Topics

- [Delivering Configuration Snapshot \(p. 51\)](#)
- [Example Configuration Snapshot from AWS Config \(p. 51\)](#)
- [Verifying Delivery Status \(p. 55\)](#)
- [Viewing Configuration Snapshot in Amazon S3 bucket \(p. 55\)](#)

## Delivering Configuration Snapshot

AWS Config generates configuration snapshots when you invoke the [DeliverConfigSnapshot](#) action or you run the AWS CLI `deliver-config-snapshot` command. AWS Config stores configuration snapshots in the Amazon S3 bucket that you specified when you enabled AWS Config.

Type the `deliver-config-snapshot` command by specifying the name assigned by AWS Config when you configured your delivery channel, for example:

```
$ aws configservice deliver-config-snapshot --delivery-channel-name default  
{  
  "configSnapshotId": "94ccff53-83be-42d9-996f-b4624b3c1a55"  
}
```

## Example Configuration Snapshot from AWS Config

The following is an example of the information that AWS Config includes in a configuration snapshot. The snapshot describes the configuration for the resources that AWS Config is recording in the current region for your AWS account, and it describes the relationships between these resources.

### Note

The configuration snapshot can include references to resources types and resource IDs that are not supported.

```

      },
      "association": {
        "publicIp": "54.218.4.189",
        "publicDnsName": "ec2-54-218-4-189.us-
west-2.compute.amazonaws.com",
        "ipOwnerId": "amazon"
      },
      "privateIpAddresses": [
        {
          "privateIpAddress": "172.31.21.63",
          "privateDnsName": "ip-172-31-21-63.us-
west-2.compute.internal",
          "primary": true,
          "association": {
            "publicIp": "54.218.4.189",
            "publicDnsName": "ec2-54-218-4-189.us-
west-2.compute.amazonaws.com",
            "ipOwnerId": "amazon"
          }
        }
      ]
    }
  ]
}
```

```
    ]
  },
  "ebsOptimized": false
}
]
```

The next step is to verify that configuration snapshot was delivered successfully to the delivery channel.

## Verifying Delivery Status

Type the `describe-delivery-channel-status` command to verify that the AWS Config has started delivering the configurations to the specified delivery channel, for example:

```
$ aws configservice describe-delivery-channel-status
{
  "DeliveryChannelsStatus": [
    {
      "configStreamDeliveryInfo": {
        "lastStatusChangeTime": 1415138614.125,
        "lastStatus": "SUCCESS"
      },
      "configHistoryDeliveryInfo": {
        "lastSuccessfulTime": 1415148744.267,
        "lastStatus": "SUCCESS",
        "lastAttemptTime": 1415148744.267
      },
      "configSnapshotDeliveryInfo": {
        "lastSuccessfulTime": 1415333113.4159999,
        "lastStatus": "SUCCESS",
        "lastAttemptTime": 1415333113.4159999
      },
      "name": "default"
    }
  ]
}
```

The response lists the status of all the three delivery formats that AWS Config uses to deliver configurations to your bucket and topic.

Take a look at the `lastSuccessfulTime` field in `configSnapshotDeliveryInfo`. The time should match the time you last requested the delivery of the configuration snapshot.

### Note

AWS Config uses the UTC format (Coordinated Universal Time) to record the time.

## Viewing Configuration Snapshot in Amazon S3 bucket

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
2. In the Amazon S3 console **All Buckets** list, click the name of your Amazon S3 bucket.
3. Click through the nested folders in your bucket until you see the `ConfigSnapshot` object with a snapshot ID that matches with the ID returned by the command. Download and open the object to view the configuration snapshot.

The S3 bucket also contains an empty file named `ConfigWritabilityCheckFile`. AWS Config creates this file to verify that the service can successfully write to the S3 bucket.

## Managing AWS Config

At any time, you can change the settings for your IAM role and modify or delete your delivery channel (that is, the Amazon Simple Storage Service bucket and the Amazon Simple Notification Service topic). You can start or stop the configuration recorder associated with your account, and you can customize which types of resources are recorded.

### Topics

- [Managing the Delivery Channel \(p. 56\)](#)
- [Updating the IAM Role Assigned to AWS Config \(p. 59\)](#)
- [Managing the Configuration Recorder \(p. 60\)](#)
- [Selecting Which Resources AWS Config Records \(p. 62\)](#)
- [Recording Software Configuration for Managed Instances \(p. 65\)](#)
- [Querying the Current Configuration State of AWS Resources \(p. 66\)](#)
- [Deleting AWS Config Data \(p. 80\)](#)

## Managing the Delivery Channel

As AWS Config continually records the changes that occur to your AWS resources, it sends notifications and updated configuration states through the *delivery channel*. You can manage the delivery channel to control where AWS Config sends configuration updates.

You can have only one delivery channel per region per AWS account, and the delivery channel is required to use AWS Config.

When AWS Config detects a configuration change for a resource and the notification exceeds the maximum size allowed by Amazon SNS, the notification includes a brief summary of the configuration item. You can view the complete notification in the Amazon S3 bucket location specified in the `s3BucketLocation` field. For more information, see [Example Oversized Configuration Item Change Notification](#).

### Note

AWS Config does not support the delivery channel to an Amazon S3 bucket where object lock is enabled. For more information, see [How S3 Object Lock works](#).

## Updating the Delivery Channel

When you update the delivery channel, you can set the following options:

- The Amazon S3 bucket to which AWS Config sends configuration snapshots and configuration history files.
- How often AWS Config delivers configuration snapshots to your Amazon S3 bucket.
- The Amazon SNS topic to which AWS Config sends notifications about configuration changes.

### To update the delivery channel (console)

- You can use the AWS Config console to set the Amazon S3 bucket and the Amazon SNS topic for your delivery channel. For steps to manage these settings, see [Setting Up AWS Config with the Console \(p. 25\)](#).

The console does not provide options to rename the delivery channel, set the frequency for configuration snapshots, or delete the delivery channel. To do these tasks, you must use the AWS CLI, the AWS Config API, or one of the AWS SDKs.

## To update the delivery channel (AWS CLI)

1. Use the `put-delivery-channel` command:

```
$ aws configservice put-delivery-channel --delivery-channel file://deliveryChannel.json
```

The `deliveryChannel.json` file specifies the delivery channel attributes:

```
{
  "name": "default",
  "s3BucketName": "config-bucket-123456789012",
  "snsTopicARN": "arn:aws:sns:us-east-2:123456789012:config-topic",
  "configSnapshotDeliveryProperties": {
    "deliveryFrequency": "Twelve_Hours"
  }
}
```

This example sets the following attributes:

- `name` – The name of the delivery channel. By default, AWS Config assigns the name `default` to a new delivery channel.

You cannot update the delivery channel name with the `put-delivery-channel` command. For the steps to change the name, see [Renaming the Delivery Channel \(p. 58\)](#).

- `s3BucketName` – The name of the Amazon S3 bucket to which AWS Config delivers configuration snapshots and configuration history files.

If you specify a bucket that belongs to another AWS account, that bucket must have policies that grant access permissions to AWS Config. For more information, see [Permissions for the Amazon S3 Bucket \(p. 3292\)](#).

- `snsTopicARN` – The Amazon Resource Name (ARN) of the Amazon SNS topic to which AWS Config sends notifications about configuration changes.

If you choose a topic from another account, that topic must have policies that grant access permissions to AWS Config. For more information, see [Permissions for the Amazon SNS Topic \(p. 3295\)](#).

- `configSnapshotDeliveryProperties` – Contains the `deliveryFrequency` attribute, which sets how often AWS Config delivers configuration snapshots.

2. (Optional) You can use the `describe-delivery-channels` command to verify that the delivery channel settings are updated:

```
$ aws configservice describe-delivery-channels
{
  "DeliveryChannels": [
    {
      "configSnapshotDeliveryProperties": {
        "deliveryFrequency": "Twelve_Hours"
      },
      "snsTopicARN": "arn:aws:sns:us-east-2:123456789012:config-topic",
      "name": "default",
      "s3BucketName": "config-bucket-123456789012"
    }
  ]
}
```

## Renaming the Delivery Channel

To change the delivery channel name, you must delete it and create a new delivery channel with the desired name. Before you can delete the delivery channel, you must temporarily stop the configuration recorder.

The AWS Config console does not provide the option to delete the delivery channel, so you must use the AWS CLI, the AWS Config API, or one of the AWS SDKs.

### To rename the delivery channel (AWS CLI)

1. Use the `stop-configuration-recorder` command to stop the configuration recorder:

```
$ aws configservice stop-configuration-recorder --configuration-recorder-name configRecorderName
```

2. Use the `describe-delivery-channels` command, and take note of your delivery channel's attributes:

```
$ aws configservice describe-delivery-channels
{
  "DeliveryChannels": [
    {
      "configSnapshotDeliveryProperties": {
        "deliveryFrequency": "Twelve_Hours"
      },
      "snsTopicARN": "arn:aws:sns:us-east-2:123456789012:config-topic",
      "name": "default",
      "s3BucketName": "config-bucket-123456789012"
    }
  ]
}
```

3. Use the `delete-delivery-channel` command to delete the delivery channel:

```
$ aws configservice delete-delivery-channel --delivery-channel-name default
```

4. Use the `put-delivery-channel` command to create a delivery channel with the desired name:

```
$ aws configservice put-delivery-channel --delivery-channel file://deliveryChannel.json
```

The `deliveryChannel.json` file specifies the delivery channel attributes:

```
{
  "name": "myCustomDeliveryChannelName",
  "s3BucketName": "config-bucket-123456789012",
  "snsTopicARN": "arn:aws:sns:us-east-2:123456789012:config-topic",
  "configSnapshotDeliveryProperties": {
    "deliveryFrequency": "Twelve_Hours"
  }
}
```

5. Use the `start-configuration-recorder` command to resume recording:

```
$ aws configservice start-configuration-recorder --configuration-recorder-name configRecorderName
```

## Updating the IAM Role Assigned to AWS Config

You can update the IAM role assumed by AWS Config any time. Before you update the IAM role, ensure that you have created a new role to replace the old one. You must attach policies to the new role that grant permissions to AWS Config to record configurations and deliver them to your delivery channel. In addition, make sure to copy the Amazon Resource Name (ARN) of your new IAM role. You will need it to update the IAM role. For information about creating an IAM role and attaching the required policies to the IAM role, see [Creating an IAM Role \(p. 29\)](#).

### Note

To find the ARN of an existing IAM role, go to the IAM console at <https://console.aws.amazon.com/iam/>. Choose **Roles** in the navigation pane. Then choose the name of the desired role and find the ARN at the top of the **Summary** page.

## Updating the IAM Role

You can update your IAM role using the AWS Management Console or the AWS CLI.

### To update the IAM role in a region where rules are supported (console)

If you are using AWS Config in a region that supports AWS Config rules, complete the following steps. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Settings** in the navigation pane.
3. In the **AWS Config role**, section, choose the IAM role:
  - **Create a role** – AWS Config creates a role that has the required permissions. For **Role name**, you can customize the name that AWS Config creates.
  - **Choose a role from your account** – For **Role name**, choose an IAM role in your account. AWS Config will attach the required policies. For more information, see [Permissions for the IAM Role Assigned to AWS Config \(p. 3289\)](#).

### Note

Check the box if you want to use the IAM role as it. AWS Config will not attach policies to the role.

4. Choose **Save**.

### To update the IAM role in a region where rules are not supported (console)

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. On the **Resource inventory** page, choose the settings icon (⚙️).
3. Choose **Continue**.
4. In the **AWS Config is requesting permissions to read your resources' configuration** page, choose **View Details**.
5. In the **Role Summary** section, choose the IAM role:
  - If you want to create a role, for **IAM Role**, choose **Create a new IAM Role**. Then type a name for **Role Name**.
  - If you want to use an existing role, select it for **IAM Role**. Then, for **Policy Name**, select an available policy or create one by selecting **Create a new Role Policy**.

6. Choose **Allow**.

### To update the IAM role (AWS CLI)

- Use the `put-configuration-recorder` command and specify the Amazon Resource Name (ARN) of the new role:

```
$ aws configservice put-configuration-recorder --configuration-recorder  
name=configRecorderName,roleARN=arn:aws:iam::012345678912:role/myConfigRole
```

## Managing the Configuration Recorder

AWS Config uses the *configuration recorder* to detect changes in your resource configurations and capture these changes as configuration items. You must create a configuration recorder before AWS Config can track your resource configurations.

If you set up AWS Config by using the console or the AWS CLI, AWS Config automatically creates and then starts the configuration recorder for you. For more information, see [Getting Started With AWS Config \(p. 25\)](#).

By default, the configuration recorder records all supported resources in the region where AWS Config is running. You can create a customized configuration recorder that records only the resource types that you specify. For more information, see [Selecting Which Resources AWS Config Records \(p. 62\)](#).

You are charged service usage fees when AWS Config starts recording configurations. For pricing information, see [AWS Config Pricing](#). To control costs, you can stop recording by stopping the configuration recorder. After you stop recording, you can continue to access the configuration information that was already recorded. You will not be charged AWS Config usage fees until you resume recording.

When you start the configuration recorder, AWS Config takes an inventory of all AWS resources in your account.

## Managing the Configuration Recorder (Console)

You can use the AWS Config console to stop or start the configuration recorder.

### To stop or start the configuration recorder

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Settings** in the navigation pane.
3. Stop or start the configuration recorder:
  - If you want to stop recording, under **Recording is on**, choose **Turn off**. When prompted, choose **Continue**.
  - If you want to start recording, under **Recording is off**, choose **Turn on**. When prompted, choose **Continue**.

## Managing the Configuration Recorder (AWS CLI)

You can use the AWS CLI to stop or start the configuration recorder. You can also rename or delete the configuration recorder using the AWS CLI, the AWS Config API, or one of the AWS SDKs. The following steps help you use the AWS CLI.

### To stop the configuration recorder

- Use the `stop-configuration-recorder` command:

```
$ aws configservice stop-configuration-recorder --configuration-recorder-  
name configRecorderName
```

### To start the configuration recorder

- Use the `start-configuration-recorder` command:

```
$ aws configservice start-configuration-recorder --configuration-recorder-  
name configRecorderName
```

### To rename the configuration recorder

To change the configuration recorder name, you must delete it and create a new configuration recorder with the desired name.

1. Use the `describe-configuration-recorders` command to look up the name of your current configuration recorder:

```
$ aws configservice describe-configuration-recorders  
{  
  "ConfigurationRecorders": [  
    {  
      "roleARN": "arn:aws:iam::012345678912:role/myConfigRole",  
      "name": "default"  
    }  
  ]  
}
```

2. Use the `delete-configuration-recorder` command to delete your current configuration recorder:

```
$ aws configservice delete-configuration-recorder --configuration-recorder-name default
```

3. Use the `put-configuration-recorder` command to create a configuration recorder with the desired name:

```
$ aws configservice put-configuration-recorder --configuration-recorder  
name=configRecorderName,roleARN=arn:aws:iam::012345678912:role/myConfigRole
```

4. Use the `start-configuration-recorder` command to resume recording:

```
$ aws configservice start-configuration-recorder --configuration-recorder-  
name configRecorderName
```

### To delete the configuration recorder

- Use the `delete-configuration-recorder` command:

```
$ aws configservice delete-configuration-recorder --configuration-recorder-name default
```

## Selecting Which Resources AWS Config Records

AWS Config continuously detects when any resource of a supported type is created, changed, or deleted. AWS Config records these events as configuration items. You can customize AWS Config to record changes for all supported types of resources or for only those types that are relevant to you. To learn which types of resources AWS Config can record, see [Supported Resource Types \(p. 9\)](#).

### Recording All Supported Resource Types

By default, AWS Config records the configuration changes for all supported types of *regional resources* that AWS Config discovers in the region in which it is running. Regional resources are tied to a region and can be used only in that region. Examples of regional resources are EC2 instances and EBS volumes.

You can also have AWS Config record supported types of *global resources*. Global resources are not tied to a specific region and can be used in all regions. The global resource types that AWS Config supports are IAM users, groups, roles, and customer managed policies.

#### **Important**

The configuration details for a specific global resource are the same in all regions. If you customize AWS Config in multiple regions to record global resources, AWS Config creates multiple configuration items each time a global resource changes: one configuration item for each region. These configuration items will contain identical data. To prevent duplicate configuration items, you should consider customizing AWS Config in only one region to record global resources, unless you want the configuration items to be available in multiple regions.

### Recording Specific Resource Types

If you don't want AWS Config to record the changes for all supported resources, you can customize it to record changes for only specific types. AWS Config records configuration changes for the types of resources that you specify, including the creation and deletion of such resources.

If a resource is not recorded, AWS Config captures only the creation and deletion of that resource, and no other details, at no cost to you. When a nonrecorded resource is created or deleted, AWS Config sends a notification, and it displays the event on the resource details page. The details page for a nonrecorded resource provides null values for most configuration details, and it does not provide information about relationships and configuration changes.

The relationship information that AWS Config provides for recorded resources is not limited because of missing data for nonrecorded resources. If a recorded resource is related to a nonrecorded resource, that relationship is provided in the details page of the recorded resource.

You can stop AWS Config from recording a type of resource any time. After AWS Config stops recording a resource, it retains the configuration information that was previously captured, and you can continue to access this information.

AWS Config rules can be used to evaluate compliance for only those resources that AWS Config records.

### Selecting Resources (Console)

You can use the AWS Config console to select the types of resources that AWS Config records.

#### **To select resources**

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Open the **Settings** page:

- If you are using AWS Config in a region that supports AWS Config rules, choose **Settings** in the navigation pane. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
  - Otherwise, choose the settings icon (⚙️) on the **Resource inventory** page.
3. In the **Resource types to record** section, specify which types of AWS resources you want AWS Config to record:
    - **All resources** – AWS Config records all supported resources with the following options:
      - **Record all resources supported in this region** – AWS Config records configuration changes for every supported type of regional resource. When AWS Config adds support for a new type of regional resource, it automatically starts recording resources of that type.
      - **Include global resources** – AWS Config includes supported types of global resources with the resources that it records (for example, IAM resources). When AWS Config adds support for a new type of global resource, it automatically starts recording resources of that type.
    - **Specific types** – AWS Config records configuration changes for only those types of AWS resources that you specify.
  4. Save your changes:
    - If you are using AWS Config in a region that supports AWS Config rules, choose **Save**.
    - Otherwise, choose **Continue**. In the **AWS Config is requesting permissions to read your resources' configuration** page, choose **Allow**.

## Selecting Resources (AWS CLI)

You can use the AWS CLI to select the types of resources that you want AWS Config to record. You do this by creating a configuration recorder, which records the types of resources that you specify in a recording group. In the recording group, you specify whether all supported types or specific types of resources are recorded.

### To select all supported resources

1. Use the following `put-configuration-recorder` command:

```
$ aws configservice put-configuration-recorder --configuration-recorder
name=default,roleARN=arn:aws:iam::123456789012:role/config-role --recording-group
allSupported=true,includeGlobalResourceTypes=true
```

This command uses the following options for the `--recording-group` parameter:

- `allSupported=true` – AWS Config records configuration changes for every supported type of *regional resource*. When AWS Config adds support for a new type of regional resource, it automatically starts recording resources of that type.
- `includeGlobalResourceTypes=true` – AWS Config includes supported types of global resources with the resources that it records. When AWS Config adds support for a new type of global resource, it automatically starts recording resources of that type.

Before you can set this option to `true`, you must set the `allSupported` option to `true`.

If you do not want to include global resources, set this option to `false`, or omit it.

2. (Optional) To verify that your configuration recorder has the settings that you want, use the following `describe-configuration-recorders` command:

```
$ aws configservice describe-configuration-recorders
```

The following is an example response:

```
{
  "ConfigurationRecorders": [
    {
      "recordingGroup": {
        "allSupported": true,
        "resourceTypes": [],
        "includeGlobalResourceTypes": true
      },
      "roleARN": "arn:aws:iam::123456789012:role/config-role",
      "name": "default"
    }
  ]
}
```

### To select specific types of resources

1. Use the `aws configservice put-configuration-recorder` command, and pass one or more resource types through the `--recording-group` option, as shown in the following example:

```
$ aws configservice put-configuration-recorder --configuration-recorder
name=default,roleARN=arn:aws:iam::012345678912:role/myConfigRole --recording-
group file://recordingGroup.json
```

The `recordingGroup.json` file specifies which types of resources AWS Config will record:

```
{
  "allSupported": false,
  "includeGlobalResourceTypes": false,
  "resourceTypes": [
    "AWS:EC2:EIP",
    "AWS:EC2:Instance",
    "AWS:EC2:NetworkAcl",
    "AWS:EC2:SecurityGroup",
    "AWS:CloudTrail:Trail",
    "AWS:EC2:Volume",
    "AWS:EC2:VPC",
    "AWS:IAM:User",
    "AWS:IAM:Policy"
  ]
}
```

Before you can specify resource types for the `resourceTypes` key, you must set the `allSupported` and `includeGlobalResourceTypes` options to `false` or omit them.

2. (Optional) To verify that your configuration recorder has the settings that you want, use the following `describe-configuration-recorders` command:

```
$ aws configservice describe-configuration-recorders
```

The following is an example response:

```
{
  "ConfigurationRecorders": [
    {
      "recordingGroup": {
        "allSupported": false,
```

```
    "resourceTypes": [
      "AWS::EC2::EIP",
      "AWS::EC2::Instance",
      "AWS::EC2::NetworkAcl",
      "AWS::EC2::SecurityGroup",
      "AWS::CloudTrail::Trail",
      "AWS::EC2::Volume",
      "AWS::EC2::VPC",
      "AWS::IAM::User",
      "AWS::IAM::Policy"
    ],
    "includeGlobalResourceTypes": false
  },
  "roleARN": "arn:aws:iam::123456789012:role/config-role",
  "name": "default"
}
]
```

## Recording Software Configuration for Managed Instances

You can use AWS Config to record software inventory changes on Amazon EC2 instances and on-premises servers. This enables you to see the historical changes to software configuration. For example, when a new Windows update is installed on a managed Windows instance, AWS Config records the changes and then sends the changes to your delivery channels, so that you are notified about the change. With AWS Config, you can see the history of when Windows updates were installed for the managed instance and how they changed over time.

You must complete the following steps to record software configuration changes:

- Turn on recording for the managed instance inventory resource type in AWS Config.
- Configure EC2 and on-premises servers as *managed instances* in AWS Systems Manager. A managed instance is a machine that has been configured for use with Systems Manager.
- Initiate collection of software inventory from your managed instances using the Systems Manager Inventory capability.

You can also use AWS Config rules to monitor software configuration changes and be notified whether the changes are compliant or noncompliant against your rules. For example, if you create a rule that checks whether your managed instances have a specified application, and an instance doesn't have that application installed, AWS Config flags that instance as noncompliant against your rule. For a list of AWS Config managed rules, see [List of AWS Config Managed Rules \(p. 103\)](#).

### To enable recording of software configuration changes in AWS Config:

1. Turn on recording for all supported resource types or selectively record the managed instance inventory resource type in AWS Config. For more information, see [Selecting Which Resources AWS Config Records \(p. 62\)](#).
2. Launch an Amazon EC2 instance with an instance profile for Systems Manager that includes the **AmazonSSMManagedInstanceCore** managed policy. This AWS managed policy enables an instance to use Systems Manager service core functionality.

For information about other policies you can add to the instance profile for Systems Manager, see [Create an IAM Instance Profile for Systems Manager](#) in the *AWS Systems Manager User Guide*.

### Important

SSM Agent is Amazon software that must be installed on a managed instance in order to communicate with the Systems Manager in the cloud. If your EC2 instance was created from an AMI for one of the following operating systems, the agent is preinstalled:

- Windows Server 2003-2012 R2 AMIs published in November 2016 or later
- Windows Server 2016 and 2019
- Amazon Linux
- Amazon Linux 2
- Ubuntu Server 16.04
- Ubuntu Server 18.04

On EC2 instances that were not created from an AMI with the agent preinstalled, you must install the agent manually. For information, see the following topics in the *AWS Systems Manager User Guide*:

- [Installing and Configuring SSM Agent on Windows Instances](#)
- [Installing and Configuring SSM Agent on Amazon EC2 Linux Instances](#)

3. Initiate inventory collection as described in [Configuring Inventory Collection](#) in the *AWS Systems Manager User Guide*. The procedures are the same for Linux and Windows instances.

AWS Config can record configuration changes for the following inventory types:

- **Applications** – A list of applications for managed instances, such as antivirus software.
- **AWS components** – A list of AWS components for managed instances, such as the AWS CLI and SDKs.
- **Instance information** – Instance information such as OS name and version, domain, and firewall status.
- **Network configuration** – Configuration information such as IP address, gateway, and subnet mask.
- **Windows Updates** – A list of Windows updates for managed instances (Windows instances only).

### Note

AWS Config doesn't support recording the custom inventory type at this time.

Inventory collection is one of many Systems Manager capabilities, which are grouped in the categories *Operations Management*, *Actions & Change*, *Instances & Nodes*, and *Shared Resources*. For more information, see [What is Systems Manager?](#) and [Systems Manager Capabilities](#) in the *AWS Systems Manager User Guide*.

## Querying the Current Configuration State of AWS Resources

You can use AWS Config to query the current configuration state of AWS resources based on configuration properties for a single account and Region or across multiple accounts and Regions. You can perform ad hoc, property-based queries against current AWS resource state metadata across all resources that AWS Config supports. The **advanced query** feature provides a single query endpoint and a powerful query language to get current resource state metadata without performing service-specific describe API calls. You can use configuration aggregators to run the same queries from a central account across multiple accounts and AWS Regions.

AWS Config uses a subset of structured query language (SQL) `SELECT` syntax to perform property-based queries and aggregations on the current configuration item (CI) data. The queries range in complexity from simple matches against tag and/or resource identifiers, to more complex queries, such as viewing all Amazon S3 buckets that have versioning disabled. This allows you to query exactly the current resource state you need without performing AWS service-specific API calls.

You can use advanced query for:

- Inventory management; for example, to retrieve a list of Amazon EC2 instances of a particular size.
- Security and operational intelligence; for example, to retrieve a list of resources that have a specific configuration property enabled or disabled.
- Cost optimization; for example, to identify a list of Amazon EBS volumes that are not attached to any EC2 instance.
- Compliance data; for example, to retrieve a list of all your conformance packs and their compliance status.

### Topics

- [Features \(p. 67\)](#)
- [Limitations \(p. 67\)](#)
- [Region Support \(p. 68\)](#)
- [Query Using the SQL Query Editor \(Console\) \(p. 70\)](#)
- [Query Using the SQL Query Editor \(AWS CLI\) \(p. 71\)](#)
- [Example Queries \(p. 74\)](#)
- [Example Relationship Queries \(p. 78\)](#)
- [Query Components \(p. 79\)](#)

## Features

The query language supports querying AWS resources based on CI properties of all AWS resource types supported by AWS Config, including configuration data, tags, and relationships. It is a subset of SQL `SELECT` command with limitations, as mentioned in the following section. It supports aggregation functions such as `AVG`, `COUNT`, `MAX`, `MIN`, and `SUM`.

## Limitations

As a subset of SQL `SELECT`, the query syntax has following limitations:

- No support for `ALL`, `AS`, `DISTINCT`, `FROM`, `HAVING`, `JOIN`, and `UNION` keywords in a query. `NULL` value queries are not supported.
- No support for querying on third-party resources. Third-party resources retrieved using advanced queries will have the configuration field set as `NULL`.
- No support for nested structures (such as tags) to be unpacked with SQL queries.
- When querying against multiple properties within an array of objects, matches are computed against all the array elements. For example, for a resource R with rules A and B, the resource is compliant to rule A but noncompliant to rule B. The resource R is stored as:

```
{
  configRuleList: [
    { configRuleName: 'A', complianceType: 'compliant' },
    { configRuleName: 'B', complianceType: 'non_compliant' }
  ]
}
```

R will be returned by this query:

```
SELECT configuration WHERE configuration.configRuleList.complianceType = 'non_compliant'
AND configuration.configRuleList.configRuleName = 'A'
```

The first condition `configuration.configRuleList.complianceType = 'non_compliant'` is applied to ALL elements in `R.configRuleList`, because R has a rule (rule B) with `complianceType = 'non_compliant'`, the condition is evaluated as true. The second condition `configuration.configRuleList.configRuleName` is applied to ALL elements in `R.configRuleList`, because R has a rule (rule A) with `configRuleName = 'A'`, the condition is evaluated as true. As both conditions are true, R will be returned.

- The `SELECT` all columns shorthand (that is `SELECT *`) selects only the top-level, scalar properties of a CI. The scalar properties returned are `accountId`, `awsRegion`, `arn`, `availabilityZone`, `configurationItemCaptureTime`, `resourceCreationTime`, `resourceId`, `resourceName`, `resourceType`, and `version`.
- Wildcard limitations:
  - Wildcards are supported only for property values and not for property keys (for example, `...WHERE someKey LIKE 'someValue%'` is supported but `...WHERE 'someKey%' LIKE 'someValue%'` is not supported).
  - Support for only suffix wildcards (for example, `...LIKE 'AWS::EC2::%'` is supported but `...LIKE '%::EC2::Instance'` is not supported).
  - Wildcard matches must be at least three characters long (for example, `...LIKE 'ab%'` is not allowed but `...LIKE 'abc%'` is allowed).
- Aggregation limitations:
  - Aggregate functions can accept only a single argument or property.
  - Aggregate functions cannot take other functions as arguments.
  - `GROUP BY` with an `ORDER BY` clause referencing aggregate functions may contain only a single property.
  - For all other aggregations `GROUP BY` clauses may contain up to three properties.
  - Pagination is supported for all aggregate queries except when `ORDER BY` clause has an aggregate function. For example, `GROUP BY X, ORDER BY Y` does not work if Y is an aggregate function.
  - No support for `HAVING` clauses in aggregations.

## Region Support

Advanced queries is supported in the following Regions:

Region name	Region	Endpoint	Protocol
Africa (Cape Town)*	af-south-1	config.af-south-1.amazonaws.com	HTTPS
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS

Region name	Region	Endpoint	Protocol
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Milan)*	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS

\*Saved queries is not available in Africa (Cape Town) and Europe (Milan) Regions.

\*Advanced queries for multi-account multi-regions is not available in Africa (Cape Town) and Europe (Milan) Regions.

## Query Using the SQL Query Editor (Console)

You can either use AWS sample queries or you can create your own query called as custom queries.

### Prerequisites

You must have permissions for `config:SelectResourceConfig` and `config:SelectAggregateResourceConfig` APIs. For more information, see [SelectResourceConfig API](#) and [SelectAggregateResourceConfig API](#).

You must have permissions for the `AWSConfigUserAccess` IAM managed policy. For more information, see [Granting Permissions for AWS Config Administration \(p. 3280\)](#).

If you are using `AWSServiceRoleForConfig` (service linked role) or `AWSConfigRole`, you will have permissions to save a query. If you are not using either of these roles, you must have permissions to `config:PutStoredQuery`, `config:GetStoredQuery`, `config:TagResource`, `config:UntagResource`, `config:ListTagsForResource` and `config:GetResources`.

### Use an AWS Sample Query

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Advanced queries** from the left navigation to query your resource configurations for a single account and Region or for multiple accounts and Regions.
3. On the **Advanced queries** page, choose an appropriate query from the list of queries. You can filter a query either by the name, description, creator or tags. To filter AWS queries, choose **Creator** and enter **AWS**. The query is displayed in the SQL query editor. If required, you can edit this query.

#### Important

An updated list of properties and their data types is available in [GitHub](#).

#### Note

To run a query on an aggregator, create an aggregator. For more information, see [Setting Up an Aggregator Using the Console \(p. 3266\)](#). If you already have an aggregator set up, in the query scope, choose the aggregator to run an advanced query on that aggregator. When you select an aggregator, consider adding the AWS account ID and AWS Region in the query statement to view that information in the results.

4. To save this query to a new query, choose **Save As**.
  - In the **Query Name** field, update the name of the query.
  - In the **Description** field, update the description of the query.
  - Enter up to 50 unique tags for this query.
  - Choose **Save**.
5. Choose **Run**. The query results are displayed in the table below the query editor.
6. Choose **Export as** to export the query results in CSV or JSON format.

#### Note

The query results are paginated. When you choose export, upto 500 results are exported. You can also use the APIs to retrieve all the results. The results are paginated and you can retrieve 100 results at a time.

## Create your custom query

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Advanced queries** from the left navigation to query your resource configurations for a single account and Region or for multiple accounts and Regions.
3. To create your custom query, choose **New query**.

### Important

An updated list of properties and their data types is available in [GitHub](#).

### Note

To view or edit a custom query, filter a query either by the name, description, creator or tags. To filter custom queries, choose **Creator** and enter **Custom**.

4. On the **Query editor** page, create your own query for this account and Region. You can also select an appropriate aggregator to create a query for multiple accounts and Regions.

### Note

To run a query on an aggregator, create an aggregator. For more information, see [Setting Up an Aggregator Using the Console \(p. 3266\)](#). If you already have an aggregator set up, in the query scope, choose the aggregator to run an advanced query on that aggregator. When you select an aggregator, consider adding the AWS account ID and AWS Region in the query statement to view that information in the results.

5. Edit if you wish you make changes to this query. Choose **Save Query** to save this query.
  - In the **Query Name** field, update the name of the query.
  - In the **Description** field, update the description of the query.
  - Enter up to 50 unique tags for this query.
  - Choose **Save**.
6. Choose **Run**. The query results are displayed in the table below the query editor.
7. Choose **Export as** to export the query results in CSV or JSON format.

### Note

The query results are paginated. When you choose export, upto 500 results are exported. You can also use the APIs to retrieve all the results. The results are paginated and you can retrieve 100 results at a time.

## Query Using the SQL Query Editor (AWS CLI)

To install the AWS Command Line Interface (AWS CLI) on your local computer, see [Installing the AWS CLI](#) in the *AWS CLI User Guide*.

### Query Resource Configuration Data

#### To query your resource configuration data using the query editor (AWS CLI) for a single account and Region

1. Open a command prompt or a terminal window.
2. Type the following command to query your resource configuration data.

```
aws configservice select-resource-config --expression "SELECT resourceId WHERE resourceType='AWS::EC2::Instance'"
```

Depending on your query, the output looks like the following.

```
{
  "QueryInfo": {
    "SelectFields": [
      {
        "Name": "resourceId"
      }
    ]
  },
  "Results": [
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"}
  ]
}
```

### To query your resource configuration data using the query editor (AWS CLI) for multiple accounts and Regions

1. Open a command prompt or a terminal window.
2. Type the following command to query your resource configuration data.

```
aws configservice select-aggregate-resource-config --expression "SELECT resourceId
WHERE resourceType='AWS::EC2::Instance'" --configuration-aggregator-name my-aggregator
```

Depending on your query, the output looks like the following.

```
{
  "QueryInfo": {
    "SelectFields": [
      {
        "Name": "resourceId"
      }
    ]
  },
  "Results": [
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"},
    {"resourceId": "ResourceId"}
  ]
}
```

#### Note

While using the `AWS::IAM::User` resource type in an advanced query, use `awsRegion = 'global'`.

### Save a Query

1. Open a command prompt or a terminal window.
2. Type the following command to save a query.

```
aws configservice put-stored-query --stored-query '{"QueryName\": \"cli-test\",
  \"Expression\": \"SELECT *\", \"Description\": \"cli test query\" }'
  --tags '[{ \"Key\": \"first-tag\", \"Value\": \"\" }, { \"Key\": \"second-tag
  \", \"Value\": \"non-empty-tag-value\" }]'
```

3. Depending on your query, the output looks like the following.

```
{
  \"QueryArn\": \"arn:aws:config:eu-central-1:Account ID:stored-query/cli-test/query-
  e65mijt4rmam5pab\"
}
```

**Note**

--tags is optional. When you pass the tags, the saved tags will not be returned by either list-stored-queries or get-stored-query. You must use list-tag-for-resources to retrieve the associated tags for a saved query. --description is optional while creating or updating a query.

## View all the Saved Queries

1. Type the following command to view the list of all saved queries.

```
aws configservice list-stored-queries
```

2. Depending on your query, the output looks like the following.

```
{
  \"StoredQueryMetadata\": [
    {
      \"QueryId\": \"query-e65mijt4rmam5pab\",
      \"QueryArn\": \"arn:aws:config:eu-central-1:Account ID:stored-query/cli-test/
      query-e65mijt4rmam5pab\",
      \"QueryName\": \"cli-test\"
    },
    {
      \"QueryId\": \"query-rltwlewlqfivadxq\",
      \"QueryArn\": \"arn:aws:config:eu-central-1:Account ID:stored-query/cli-
      test-2/query-rltwlewlqfivadxq\",
      \"QueryName\": \"cli-test-2\",
      \"Description\": \"cli test query\"
    }
  ]
}
```

## Get Details of a Saved Query

1. Type the following command to get details of a specific saved query.

```
aws configservice get-stored-query --query-name cli-test
```

2. Depending on your query, the output looks like the following.

```
{
  \"StoredQuery\": {
    \"QueryId\": \"query-e65mijt4rmam5pab\",
```

```
    "QueryArn": "arn:aws:config:eu-central-1:Account ID:stored-query/cli-test/  
query-e65mijt4rmam5pab",  
    "QueryName": "cli-test",  
    "Description": "cli test query",  
    "Expression": "SELECT *"  
  }  
}
```

## Delete a Saved Query

- Type the following command to delete your saved query.

```
aws configservice delete-stored-query --query-name cli-test
```

If successful, the command runs with no additional output.

## Example Queries

### Query to list all EC2 instances with AMI ID ami-12345

```
SELECT  
  resourceId,  
  resourceType,  
  configuration.instanceType,  
  configuration.placement.tenancy,  
  configuration.imageId,  
  availabilityZone  
WHERE  
  resourceType = 'AWS::EC2::Instance'  
  AND configuration.imageId = 'ami-12345'
```

### Results

```
{  
  "QueryInfo": {  
    "SelectFields": [  
      {  
        "Name": "resourceId"  
      },  
      {  
        "Name": "resourceType"  
      },  
      {  
        "Name": "configuration.instanceType"  
      },  
      {  
        "Name": "configuration.placement.tenancy"  
      },  
      {  
        "Name": "configuration.imageId"  
      },  
      {  
        "Name": "availabilityZone"  
      }  
    ]  
  },  
  "Results": [  

```

```

        {"resourceId":"resourceid","configuration":{"imageId":"ami-12345",
        \instanceType\":\"t2.micro\", \"placement\":{\"tenancy\":\"default\"}}, \"availabilityZone
        \": \"us-west-2c\", \"resourceType\":\"AWS::EC2::Instance\"},
        {"resourceId":"resourceid","configuration":{"imageId":"ami-12345",
        \instanceType\":\"t2.micro\", \"placement\":{\"tenancy\":\"default\"}}, \"availabilityZone
        \": \"us-west-2a\", \"resourceType\":\"AWS::EC2::Instance\"},
        {"resourceId":"resourceid","configuration":{"imageId":"ami-12345",
        \instanceType\":\"t2.micro\", \"placement\":{\"tenancy\":\"default\"}}, \"availabilityZone
        \": \"us-west-2c\", \"resourceType\":\"AWS::EC2::Instance\"},
        {"resourceId":"resourceid","configuration":{"imageId":"ami-12345\",
        \instanceType\":\"t1.micro\", \"placement\":{\"tenancy\":\"default\"}}, \"availabilityZone
        \": \"us-west-2a\", \"resourceType\":\"AWS::EC2::Instance\"},
        {"resourceId":"resourceid","configuration":{"imageId":"ami-12345\",
        \instanceType\":\"t2.micro\", \"placement\":{\"tenancy\":\"default\"}}, \"availabilityZone
        \": \"us-west-2c\", \"resourceType\":\"AWS::EC2::Instance\"},
        {"resourceId":"resourceid","configuration":{"imageId":"ami-12345\",
        \instanceType\":\"t2.micro\", \"placement\":{\"tenancy\":\"default\"}}, \"availabilityZone
        \": \"us-west-2c\", \"resourceType\":\"AWS::EC2::Instance\"},
        {"resourceId":"resourceid","configuration":{"imageId":"ami-12345\",
        \instanceType\":\"t2.micro\", \"placement\":{\"tenancy\":\"default\"}}, \"availabilityZone
        \": \"us-west-2c\", \"resourceType\":\"AWS::EC2::Instance\"}
    ]
}

```

### Query for count of resources grouped by their AWS Config rules compliance status

```

SELECT
    configuration.complianceType,
    COUNT(*)
WHERE
    resourceType = 'AWS::Config::ResourceCompliance'
GROUP BY
    configuration.complianceType

```

### Result

```

{
  "QueryInfo": {
    "SelectFields": [
      {
        "Name": "configuration.complianceType"
      },
      {
        "Name": "COUNT(*)"
      }
    ]
  },
  "Results": [
    {"COUNT(*)":163, "configuration":{"complianceType":"NON_COMPLIANT"}},
    {"COUNT(*)":2, "configuration":{"complianceType":"COMPLIANT"}}
  ]
}

```

### Query for the compliance status of AWS Conformance packs

```

SELECT
    resourceId,
    resourceName,
    resourceType,
    configuration.complianceType
WHERE
    resourceType = 'AWS::Config::ConformancePackCompliance'

```

Result

```
{
  "QueryInfo": {
    "SelectFields": [
      {
        "Name": "resourceId"
      },
      {
        "Name": "resourceName"
      },
      {
        "Name": "resourceType"
      },
      {
        "Name": "configuration.complianceType"
      }
    ]
  },
  "Results": [
    {"resourceId": "conformance-pack-conformance-pack-ID", "configuration": {"complianceType": "COMPLIANT"}, "resourceName": "MyConformancePack1", "resourceType": "AWS::Config::ConformancePackCompliance"},
    {"resourceId": "conformance-pack-conformance-pack-ID", "configuration": {"complianceType": "NON_COMPLIANT"}, "resourceName": "MyConformancePack2", "resourceType": "AWS::Config::ConformancePackCompliance"},
    {"resourceId": "conformance-pack-conformance-pack-ID", "configuration": {"complianceType": "NON_COMPLIANT"}, "resourceName": "MyConformancePack3", "resourceType": "AWS::Config::ConformancePackCompliance"}
  ]
}
```

Query to get counts of AWS resources grouped by account ID

```
aws configservice select-aggregate-resource-config --expression "SELECT COUNT(*), accountId group by accountId" --configuration-aggregator-name my-aggregator
```

Result

```
{
  "Results": [
    {"COUNT(*)": 2407, "accountId": "accountId"},
    {"COUNT(*)": 726, "accountId": "accountId"}
  ],
  "QueryInfo": {
    "SelectFields": [
      {
        "Name": "COUNT(*)"
      },
      {
        "Name": "accountId"
      }
    ]
  }
}
```

Query to list all EC2 volumes that are not in use

```
SELECT
  resourceId,
  accountId,
```

```
awsRegion,  
resourceType,  
configuration.volumeType,  
configuration.size,  
resourceCreationTime,  
tags,  
configuration.encrypted,  
configuration.availabilityZone,  
configuration.state.value  
WHERE  
  resourceType = 'AWS::EC2::Volume'  
AND  
  configuration.state.value <> 'in-use'
```

## Result

```
{  
  "Results": [  
    {"accountId": "accountId", "resourceId": "vol-0174de9c962f6581c", "awsRegion": "us-west-2", "configuration": {"volumeType": "gp2", "encrypted": false, "size": 100.0, "state": {"value": "available"}, "availabilityZone": "us-west-2a"}, "resourceCreationTime": "2020-02-21T07:39:43.771Z", "tags": [], "resourceType": "AWS::EC2::Volume"},

## Example Relationship Queries

Find EIPs related to an EC2 instance

```
SELECT
  resourceId
WHERE
  resourceType = 'AWS::EC2::EIP'
  AND relationships.resourceId = 'i-abcd1234'
```

Find EIPs related to an EC2 network interface

```
SELECT
  resourceId
WHERE
  resourceType = 'AWS::EC2::EIP'
  AND relationships.resourceId = 'eni-abcd1234'
```

Find EC2 instances and network interfaces related to a security group

```
SELECT
  resourceId
WHERE
  resourceType IN ('AWS::EC2::Instance', 'AWS::EC2::NetworkInterface')
  AND relationships.resourceId = 'sg-abcd1234'
```

OR

```
SELECT
  resourceId
WHERE
  resourceType = 'AWS::EC2::Instance'
  AND relationships.resourceId = 'sg-abcd1234'

SELECT
  resourceId
WHERE
  resourceType = 'AWS::EC2::NetworkInterface'
  AND relationships.resourceId = 'sg-abcd1234'
```

Find EC2 instances, network ACLs, network interfaces and route tables related to a subnet

```
SELECT
  resourceId
WHERE
  resourceType IN ('AWS::EC2::Instance', 'AWS::EC2::NetworkACL',
  'AWS::EC2::NetworkInterface', 'AWS::EC2::RouteTable')
  AND relationships.resourceId = 'subnet-abcd1234'
```

Find EC2 instances, internet gateways, network ACLs, network interfaces, route tables, subnets and security groups related to a VPC

```
SELECT
  resourceId
WHERE
  resourceType IN ('AWS::EC2::Instance', 'AWS::EC2::InternetGateway',
  'AWS::EC2::NetworkACL', 'AWS::EC2::NetworkInterface', 'AWS::EC2::RouteTable',
  'AWS::EC2::Subnet', 'AWS::EC2::SecurityGroup')
  AND relationships.resourceId = 'vpc-abcd1234'
```

Find EC2 route tables related to a VPN gateway

```
SELECT
  resourceId
WHERE
  resourceType = 'AWS::EC2::RouteTable'
  AND relationships.resourceId = 'vgw-abcd1234'
```

## Query Components

The SQL `SELECT` query components are as follows.

### Synopsis

```
SELECT property [, ...]
[ WHERE condition ]
[ GROUP BY property ]
[ ORDER BY property [ ASC | DESC ] [, property [ ASC | DESC ] ...] ]
```

### Parameters

#### [ WHERE condition ]

Filters results according to the `condition` you specify.

#### [ GROUP BY property ]

Aggregates the result set into groups of rows with matching values for the given property.

The `GROUP BY` clause is applicable to aggregations. AWS Config supports grouping by only one property.

#### [ ORDER BY property [ ASC | DESC ] [, property [ ASC | DESC ] ...] ]

Sorts a result set by one or more output properties.

When the clause contains multiple properties, the result set is sorted according to the first property, then according to the second property for rows that have matching values for the first property, and so on.

### Examples

```
SELECT resourceId WHERE resourceType='AWS::EC2::Instance'
```

```
SELECT configuration.complianceType, COUNT(*) WHERE resourceType =
  'AWS::Config::ResourceCompliance' GROUP BY configuration.complianceType
```

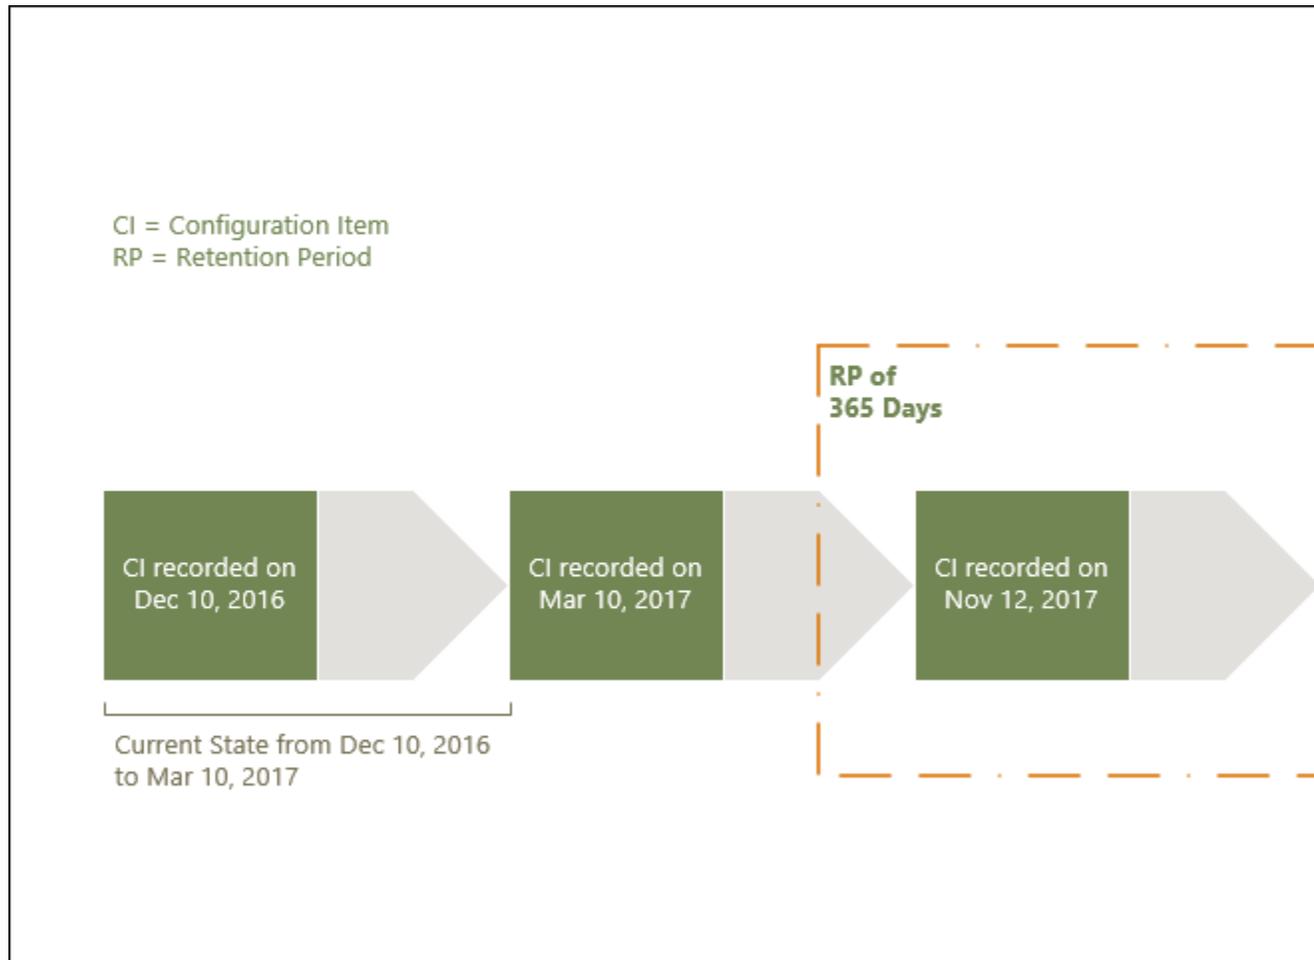

## Deleting AWS Config Data

AWS Config allows you to delete your data by specifying a retention period for your `ConfigurationItems`. When you specify a retention period, AWS Config retains your `ConfigurationItems` for that specified period. You can choose a period between a minimum of 30 days and a maximum of 7 years (2557 days). AWS Config deletes data older than your specified retention period. If you do not specify a retention period, AWS Config continues to store `ConfigurationItems` for the default period of 7 years (2557 days). When recording is switched on, the current state of the resource is when a `ConfigurationItem` is recorded and until the next change (a new `ConfigurationItem`) is recorded.

To understand the behavior of retention period, let's take a look at the timeline.

- When recording is switched on, the current state of a resource always exists and can't be deleted irrespective of the date the `ConfigurationItem` is recorded.
- When AWS Config records new `ConfigurationItems`, the previous `ConfigurationItems` are deleted depending on the specified retention period.

In the following timeline, AWS Config records `ConfigurationItems` at the following dates. For the purpose of this timeline, today is represented as May 24, 2018.

The following table explains which `ConfigurationItems` are displayed on the AWS Config timeline based on selected retention period.

Retention Period	Configuration Items displayed on timeline	Explanation
30 days	December 12, 2017	The current state of the resource started from December 12, 2017 when the <code>ConfigurationItem</code> was recorded and is valid until today (May 24, 2018). When recording is turned on, the current state always exists.
365 days	December 12, 2017; November 12, 2017, and March 10, 2017	<p>The retention period shows the current state December 12, 2017 and previous <code>ConfigurationItems</code> November 12, 2017 and March 10, 2017.</p> <p>The <code>ConfigurationItem</code> for March 10, 2017 is displayed on the timeline because that configuration state represented the current state 365 days ago.</p>

After you specify a retention period, AWS Config APIs no longer return `ConfigurationItems` that represent a state older than the specified retention period.

**Note**

- AWS Config cannot record your `ConfigurationItems` if recording is switched off.
- AWS Config cannot record your `ConfigurationItems` if your IAM role is broken.

## Setting Data Retention Period in AWS Management Console

In the AWS Management Console, if you do not select a data retention period, the default period is 7 years or 2557 days.

To set a custom data retention period for configuration items select the checkbox. You can select 1 year, 3 years, 5 years, or a custom period. For a custom period, enter the number of days between 30 and 2557 days.

## Resource types to record

Select the types of AWS resources for which you want AWS Config to record configuration changes. By default, AWS Config records configuration changes for all supported resources. You can also choose to record configuration changes for supported global resources.

- All resources**
- Record all resources supported in this region ⓘ
  - Include global resources (e.g., AWS IAM resources) ⓘ

**Specific types**

**Data retention period**

Default period is 7 years

- Set a custom retention period for configuration items recorded by AWS Config.

Custom

days

Select between a minimum period of 30 days and a maximum period of 7 years (2555 days).

## Notifications that AWS Config Sends to an Amazon SNS topic

You can configure AWS Config to stream configuration changes and notifications to an Amazon SNS topic. For example, when a resource is updated, you can get a notification sent to your email, so that you can view the changes. You can also be notified when AWS Config evaluates your custom or managed rules against your resources.

AWS Config sends notifications for the following events:

- Configuration item change for a resource.
- Configuration history for a resource was delivered for your account.
- Configuration snapshot for recorded resources was started and delivered for your account.
- Compliance state of your resources and whether they are compliant with your rules.
- Evaluation started for a rule against your resources.
- AWS Config failed to deliver the notification to your account.

- [Example Delivery Failed Notification \(p. 95\)](#)

## Example Configuration Item Change Notifications

AWS Config uses Amazon SNS to deliver notifications to subscription endpoints. These notifications provide the delivery status for configuration snapshots and configuration histories, and they provide each configuration item that AWS Config creates when the configurations of recorded AWS resources change. AWS Config also sends notifications that show whether your resources are compliant against your rules. If you choose to have notifications sent by email, you can use filters in your email client application based on the subject line and message body of the email.

The following is an example payload of an Amazon SNS notification that is generated when AWS Config detects that the Amazon Elastic Block Store volume `vol-ce676ccc` is attached to the instance with an ID of `i-344c463d`. The notification contains the configuration item change for the resource.

## Configuration Items for Resources with Relationships

If a resource is related to other resources, a change to that resource can result in multiple configuration items. The following example shows how AWS Config creates configuration items for resources with relationships.

1. You have an Amazon EC2 instance with an ID of `i-007d374c8912e3e90`, and the instance is associated with an Amazon EC2 security group, `sg-c8b141b4`.
2. You update your EC2 instance to change the security group to another security group, `sg-3f1fef43`.
3. Because the EC2 instance is related to another resource, AWS Config creates multiple configuration items like the following examples:

This notification contains the configuration item change for the EC2 instance when the security group is replaced.

}
```

## Example Compliance Change Notification

When AWS Config evaluates your resources against a custom or managed rule, AWS Config sends a notification that shows whether the resources are compliant against the rule.

The following is an example notification where the CloudTrail trail resource is compliant against the cloudtrail-enabled managed rule.

```
{  
  "Type": "Notification",  
  "MessageId": "11fd05dd-47e1-5523-bc01-55b988bb9478",  
  "TopicArn": "arn:aws:sns:us-east-2:123456789012:config-topic-ohio",

## Example Rules Evaluation Started Notification

AWS Config sends a notification when it starts to evaluate your custom or managed rule against your resources. The following is an example notification when AWS Config starts to evaluate the `iam-password-policy` managed rule.

```
{
  "Type": "Notification",
  "MessageId": "358c8e65-e27a-594e-82d0-de1fe77393d7",
  "TopicArn": "arn:aws:sns:us-east-2:123456789012:config-topic-ohio",
  "Subject": "[AWS Config:us-east-2] Config Rules Evaluation Started for Account
123456789012",
  "Message": {
    "awsAccountId": "123456789012",
    "awsRegion": "us-east-2",
    "configRuleNames": ["iam-password-policy"],
    "notificationCreationTime": "2016-10-13T21:55:21.339Z",
    "messageType": "ConfigRulesEvaluationStarted",
    "recordVersion": "1.0"
  },

## Example Oversized Configuration Item Change Notification

When AWS Config detects a configuration change for a resource, it sends a configuration item notification. If the notification exceeds the maximum size allowed by Amazon Simple Notification Service (Amazon SNS), the notification includes a brief summary of the configuration item. You can view the complete notification in the Amazon S3 bucket location specified in the `s3BucketLocation` field.

The following example notification shows a configuration item for an Amazon EC2 instance. The notification includes a summary of the changes and the location of the notification in the Amazon S3 bucket.

```
View the Timeline for this Resource in AWS Config Management Console:
  https://console.aws.amazon.com/config/home?region=us-west-2#/timeline/
AWS::EC2::Instance/resourceId_14b76876-7969-4097-ab8e-a31942b02e80?
time=2016-10-06T16:46:16.261Z
```

The full configuration item change notification for this resource exceeded the maximum size allowed by Amazon Simple Notification Service (SNS). A summary of the configuration item is provided here. You can view the complete notification in the specified Amazon S3 bucket location.

New State Record Summary:

```
-----
{
  "configurationItemSummary": {
    "changeType": "UPDATE",
    "configurationItemVersion": "1.2",
    "configurationItemCaptureTime": "2016-10-06T16:46:16.261Z",
    "configurationStateId": 0,
    "awsAccountId": "123456789012",

## Example Delivery Failed Notification

AWS Config sends a delivery failed notification if AWS Config can't deliver the configuration snapshot or an oversized configuration item change notification to your Amazon S3 bucket. Verify that you specified a valid Amazon S3 bucket.

View the Timeline for this Resource in AWS Config Management Console:  
[https://console.aws.amazon.com/config/home?region=us-west-2#/timeline/AWS::EC2::Instance/test\\_resourceId\\_014b953d-75e3-40ce-96b9-c7240b975457?time=2016-10-06T16:46:13.749Z](https://console.aws.amazon.com/config/home?region=us-west-2#/timeline/AWS::EC2::Instance/test_resourceId_014b953d-75e3-40ce-96b9-c7240b975457?time=2016-10-06T16:46:13.749Z)

The full configuration item change notification for this resource exceeded the maximum size allowed by Amazon Simple Notification Service (SNS). A summary of the configuration item is provided here. You can view the complete notification in the specified Amazon S3 bucket location.

New State Record Summary:

```
-----

}
```

# Evaluating Resources with AWS Config Rules

Use AWS Config to evaluate the configuration settings of your AWS resources. You do this by creating AWS Config rules, which represent your ideal configuration settings. AWS Config provides customizable, predefined rules called managed rules to help you get started. While AWS Config continuously tracks the configuration changes that occur among your resources, it checks whether these changes violate any of the conditions in your rules. If a resource violates a rule, AWS Config flags the resource and the rule as *noncompliant*.

For example, when an EC2 volume is created, AWS Config can evaluate the volume against a rule that requires volumes to be encrypted. If the volume is not encrypted, AWS Config flags the volume and the rule as noncompliant. AWS Config can also check all of your resources for account-wide requirements. For example, AWS Config can check whether the number of EC2 volumes in an account stays within a desired total, or whether an account uses AWS CloudTrail for logging.

Service-linked rules are a unique type of managed rule that support other AWS services to create AWS Config rules in your account. These rules are predefined to include all the permissions required to call other AWS services on your behalf. These rules are similar to standards that an AWS service recommends in your AWS account for compliance verification. For more information, see [Service-Linked AWS Config Rules \(p. 3297\)](#).

The AWS Config console shows the compliance status of your rules and resources. You can see how your AWS resources comply overall with your desired configurations, and learn which specific resources are noncompliant. You can also use the AWS CLI, the AWS Config API, and AWS SDKs to make requests to the AWS Config service for compliance information.

By using AWS Config to evaluate your resource configurations, you can assess how well your resource configurations comply with internal practices, industry guidelines, and regulations.

For regions that support AWS Config rules, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.

You can create up to 150 AWS Config rules per region in your account. For more information, see [AWS Config Limits](#) in the *Amazon Web Services General Reference*.

You can also create custom rules to evaluate additional resources that AWS Config doesn't yet record. For more information, see [Evaluating Additional Resource Types \(p. 198\)](#).

## Region Support

Currently, AWS Config Rules is supported in the following regions:

Region Name	Region	Endpoint	Protocol
Africa (Cape Town)	af-south-1	config.af-south-1.amazonaws.com	HTTPS
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (Osaka)	ap-northeast-3	config.ap-northeast-3.amazonaws.com	HTTPS
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Milan)	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS

## Viewing Configuration Compliance

You can use the AWS Config console, AWS CLI, or AWS Config API to view the compliance state of your rules and resources.

### To view compliance (console)

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
3. In the navigation pane, choose **Rules**. The console shows the **Rules** page, which lists your rules and the compliance status of each.
4. Choose a rule to view its **Rule details** page. This page shows the rule's configuration, its status, and any AWS resources that do not comply with it.
5. If the **Rule details** shows any noncompliant resources, choose the **Config timeline** icon () for a resource to see its configuration timeline page. The page shows the configuration settings that AWS Config captured when it detected that the resource was noncompliant. This information can help you determine why the resource fails to comply with the rule. For more information, see [Viewing Configuration Details](#) (p. 45).

You can also view the compliance of your resources by looking them up on the **Resource inventory** page. For more information, see [Looking Up Resources That Are Discovered by AWS Config](#) (p. 44).

### Example To view compliance (AWS CLI)

To view compliance, use any of the following CLI commands:

- To see the compliance state of each of your rules, use the `describe-compliance-by-config-rule` command, as shown in the following example:

```
$ aws configservice describe-compliance-by-config-rule
```

```
{
  "ComplianceByConfigRules": [
    {
      "Compliance": {
        "ComplianceContributorCount": {
          "CappedCount": 2,
          "CapExceeded": false
        },
        "ComplianceType": "NON_COMPLIANT"
      },
      "ConfigRuleName": "instances-in-vpc"
    },
    {
      "Compliance": {
        "ComplianceType": "COMPLIANT"
      },
      "ConfigRuleName": "restricted-common-ports"
    },
    ...
  ]
}
```

For each rule that has a compliance type of `NON_COMPLIANT`, AWS Config returns the number of noncompliant resources for the `CappedCount` parameter.

- To see the compliance state of each resource that AWS Config evaluates for a specific rule, use the [get-compliance-details-by-config-rule](#) command, as shown in the following example:

```
$ aws configservice get-compliance-details-by-config-rule --config-rule-
name ConfigRuleName{
  "EvaluationResults": [
    {
      "EvaluationResultIdentifier": {
        "OrderingTimestamp": 1443610576.349,
        "EvaluationResultQualifier": {
          "ResourceType": "AWS::EC2::Instance",
          "ResourceId": "i-nnnnnnnn",
          "ConfigRuleName": "ConfigRuleName"
        }
      },
      "ResultRecordedTime": 1443751424.969,
      "ConfigRuleInvokedTime": 1443751421.208,
      "ComplianceType": "COMPLIANT"
    },
    {
      "EvaluationResultIdentifier": {
        "OrderingTimestamp": 1443610576.349,
        "EvaluationResultQualifier": {
          "ResourceType": "AWS::EC2::Instance",
          "ResourceId": "i-nnnnnnnn",
          "ConfigRuleName": "ConfigRuleName"
        }
      },
      "ResultRecordedTime": 1443751425.083,
      "ConfigRuleInvokedTime": 1443751421.301,
      "ComplianceType": "NON_COMPLIANT"
    },
    ...
  ]
}
```

- To see the compliance state for each AWS resource of a specific type, use the [describe-compliance-by-resource](#) command, as shown in the following example:

```
$ aws configservice describe-compliance-by-resource --resource-type AWS::EC2::Instance
{
  "ComplianceByResources": [
    {

```

```
    "ResourceType": "AWS::EC2::Instance",
    "ResourceId": "i-nnnnnnnn",
    "Compliance": {
      "ComplianceContributorCount": {
        "CappedCount": 1,
        "CapExceeded": false
      },
      "ComplianceType": "NON_COMPLIANT"
    }
  },
  {
    "ResourceType": "AWS::EC2::Instance",
    "ResourceId": "i-nnnnnnnn",
    "Compliance": {
      "ComplianceType": "COMPLIANT"
    }
  },
  ...
```

- To see the compliance details of an individual AWS resource, use the `get-compliance-details-by-resource` command.

```
$ aws configservice get-compliance-details-by-resource --resource-type AWS::EC2::Instance
--resource-id i-nnnnnnnn
{
  "EvaluationResults": [
    {
      "EvaluationResultIdentifier": {
        "OrderingTimestamp": 1443610576.349,
        "EvaluationResultQualifier": {
          "ResourceType": "AWS::EC2::Instance",
          "ResourceId": "i-nnnnnnnn",
          "ConfigRuleName": "instances-in-vpc"
        }
      },
      "ResultRecordedTime": 1443751425.083,
      "ConfigRuleInvokedTime": 1443751421.301,
      "ComplianceType": "NON_COMPLIANT"
    }
  ]
}
```

### Example To view compliance (AWS Config API)

To view compliance, use any of the following API actions:

- To see the compliance state of each of your rules, use the [DescribeComplianceByConfigRule](#) action.
- To see the compliance state of each resource that AWS Config evaluates for a specific rule, use the [GetComplianceDetailsByConfigRule](#) action.
- To see the compliance state for each AWS resource of a specific type, use the [DescribeComplianceByResource](#) action.
- To see the compliance details of an individual AWS resource, use the [GetComplianceDetailsByResource](#) action. The details include which AWS Config rules evaluated the resource, when each rule last evaluated it, and whether the resource complies with each rule.

# Specifying Triggers for AWS Config Rules

When you add a rule to your account, you can specify when you want AWS Config to run the rule; this is called a *trigger*. AWS Config evaluates your resource configurations against the rule when the trigger occurs.

## Contents

- [Trigger types \(p. 101\)](#)
- [Example rules with triggers \(p. 101\)](#)
- [Rule evaluations when the configuration recorder is turned off \(p. 102\)](#)

## Trigger types

There are two types of triggers:

### Configuration changes

AWS Config runs evaluations for the rule when certain types of resources are created, changed, or deleted.

You choose which resources trigger the evaluation by defining the rule's *scope*. The scope can include the following:

- One or more resource types
- A combination of a resource type and a resource ID
- A combination of a tag key and value
- When any recorded resource is created, updated, or deleted

AWS Config runs the evaluation when it detects a change to a resource that matches the rule's scope. You can use the scope to constrain which resources trigger evaluations. Otherwise, evaluations are triggered when any recorded resource changes.

### Periodic

AWS Config runs evaluations for the rule at a frequency that you choose (for example, every 24 hours).

If you choose configuration changes and periodic, AWS Config invokes your Lambda function when it detects a configuration change and also at the frequency that you specify.

## Example rules with triggers

### Example rule with configuration change trigger

1. You add the AWS Config managed rule, `S3_BUCKET_LOGGING_ENABLED`, to your account to check whether your Amazon S3 buckets have logging enabled.
2. The trigger type for the rule is configuration changes. AWS Config runs the evaluations for the rule when an Amazon S3 bucket is created, changed, or deleted.
3. When a bucket is updated, the configuration change triggers the rule and AWS Config evaluates whether the bucket is compliant against the rule.

### Example rule with periodic trigger

1. You add the AWS Config managed rule, `IAM_PASSWORD_POLICY`, to your account. The rule checks whether the password policy for your IAM users comply with your account policy, such as requiring a minimum length or requiring specific characters.
2. The trigger type for the rule is periodic. AWS Config runs evaluation for the rule at a frequency that you specify, such as every 24 hours.
3. Every 24 hours, the rule is triggered and AWS Config evaluates whether the passwords for your IAM users are compliant against the rule.

### Example rule with configuration change and periodic triggers

1. You create a custom rule that evaluates whether CloudTrail trails in your account are turned on and logging for all regions.
2. You want AWS Config to run evaluations for the rule every time a trail is created, updated, or deleted. You also want AWS Config to run the rule every 12 hours.
3. For the trigger type, choose configuration changes and periodic.

## Rule evaluations when the configuration recorder is turned off

If you turn off the configuration recorder, AWS Config stops recording changes to your resource configurations. This affects your rule evaluations in the following ways:

- Rules with a periodic trigger continue to run evaluations at the specified frequency.
- Rules with a configuration change trigger do not run evaluations.
- Rules with both trigger types run evaluations only at the specified frequency. The rules do not run evaluations for configuration changes.
- If you run an on-demand evaluation for a rule with a configuration change trigger, the rule evaluates the last known state of the resource, which is the last recorded configuration item.

## AWS Config Managed Rules

AWS Config provides *AWS managed rules*, which are predefined, customizable rules that AWS Config uses to evaluate whether your AWS resources comply with common best practices. For example, you could use a managed rule to quickly start assessing whether your Amazon Elastic Block Store (Amazon EBS) volumes are encrypted or whether specific tags are applied to your resources. You can set up and activate these rules without writing the code to create an AWS Lambda function, which is required if you want to create custom rules. The AWS Config console guides you through the process of configuring and activating a managed rule. You can also use the AWS Command Line Interface or AWS Config API to pass the JSON code that defines your configuration of a managed rule.

You can customize the behavior of a managed rule to suit your needs. For example, you can define the rule's scope to constrain which resources trigger an evaluation for the rule, such as EC2 instances or volumes. You can customize the rule's parameters to define attributes that your resources must have to comply with the rule. For example, you can customize a parameter to specify that your security group should block incoming traffic to a specific port number.

After you activate a rule, AWS Config compares your resources to the conditions of the rule. After this initial evaluation, AWS Config continues to run evaluations each time one is triggered. The evaluation triggers are defined as part of the rule, and they can include the following types:

- **Configuration changes** – AWS Config triggers the evaluation when any resource that matches the rule's scope changes in configuration. The evaluation runs after AWS Config sends a configuration item change notification.
- **Periodic** – AWS Config runs evaluations for the rule at a frequency that you choose (for example, every 24 hours).

The AWS Config console shows which resources comply with the rule and which rules are being followed. For more information, see [Viewing Configuration Compliance \(p. 98\)](#).

## access-keys-rotated

Checks if the active access keys are rotated within the number of days specified in `maxAccessKeyAge`. The rule is `NON_COMPLIANT` if the access keys have not been rotated for more than `maxAccessKeyAge` number of days.

**Note**

Re-evaluating this rule within 4 hours of the first evaluation will have no effect on the results.

**Identifier:** ACCESS\_KEYS\_ROTATED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

maxAccessKeyAge, Type: int, Default: 90

Maximum number of days without rotation. Default 90.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## account-part-of-organizations

Checks if an AWS account is part of AWS Organizations. The rule is NON\_COMPLIANT if an AWS account is not part of AWS Organizations or AWS Organizations master account ID does not match rule parameter `MasterAccountId`.

**Identifier:** ACCOUNT\_PART\_OF\_ORGANIZATIONS

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing) Region

**Parameters:**

MasterAccountId (Optional), Type: String

The master account ID for an AWS account.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## acm-certificate-expiration-check

Checks if AWS Certificate Manager Certificates in your account are marked for expiration within the specified number of days. Certificates provided by ACM are automatically renewed. ACM does not automatically renew certificates that you import.

**Identifier:** ACM\_CERTIFICATE\_EXPIRATION\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), Europe (Milan) Region

**Parameters:**

daysToExpiration (Optional), Type: int, Default: 14

Specify the number of days before the rule flags the ACM Certificate as noncompliant.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## alb-http-drop-invalid-header-enabled

Checks if rule evaluates AWS Application Load Balancers (ALB) to ensure they are configured to drop http headers. The rule is NON\_COMPLIANT if the value of routing.http.drop\_invalid\_header\_fields.enabled is set to false.

**Identifier:** ALB\_HTTP\_DROP\_INVALID\_HEADER\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## alb-http-to-https-redirection-check

Checks whether HTTP to HTTPS redirection is configured on all HTTP listeners of Application Load Balancers. The rule is NON\_COMPLIANT if one or more HTTP listeners of Application Load Balancer do not have HTTP to HTTPS redirection configured.

**Identifier:** ALB\_HTTP\_TO\_HTTPS\_REDIRECTION\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## alb-waf-enabled

Checks if Web Application Firewall (WAF) is enabled on Application Load Balancers (ALBs). This rule is NON\_COMPLIANT if key: waf.enabled is set to false.

**Identifier:** ALB\_WAF\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

wafWebAclIds (Optional), Type: CSV

Comma separated list of web ACL ID (for WAF) or web ACL ARN (for WAFV2) checking for ALB association.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## api-gw-cache-enabled-and-encrypted

Checks that all methods in Amazon API Gateway stages have cache enabled and cache encrypted. The rule is NON\_COMPLIANT if any method in Amazon API Gateway stage is not configured to cache or the cache is not encrypted.

**Identifier:** API\_GW\_CACHE\_ENABLED\_AND\_ENCRYPTED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## api-gw-endpoint-type-check

Checks if Amazon API Gateway APIs are of the type specified in the rule parameter `endpointConfigurationType`. The rule returns NON\_COMPLIANT if the REST API does not match the endpoint type configured in the rule parameter.

**Identifier:** API\_GW\_ENDPOINT\_TYPE\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

endpointConfigurationTypes, Type: String

Comma-separated list of allowed endpointConfigurationTypes. Allowed values are REGIONAL, PRIVATE and EDGE.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### api-gw-execution-logging-enabled

Checks that all methods in Amazon API Gateway stage has logging enabled. The rule is NON\_COMPLIANT if logging is not enabled. The rule is NON\_COMPLIANT if `loggingLevel` is neither ERROR nor INFO.

**Identifier:** API\_GW\_EXECUTION\_LOGGING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

`loggingLevel` (Optional), Type: String, Default: ERROR,INFO

Comma-separated list of specific logging levels (for example, ERROR, INFO or ERROR,INFO).

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### api-gw-ssl-enabled

Checks if a REST API stage uses an Secure Sockets Layer (SSL) certificate. This rule is NON\_COMPLIANT if the REST API stage does not have an associated SSL certificate.

**Identifier:** API\_GW\_SSL\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

`CertificateIDs` (Optional), Type: CSV

Comma-separated list of client certificate IDs configured on a REST API stage.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### api-gw-xray-enabled

Checks if X-Ray tracing is enabled on Amazon API Gateway REST APIs. The rule will return COMPLIANT if X-Ray tracing is enabled, NON\_COMPLIANT otherwise.

**Identifier:** API\_GW\_XRAY\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## approved-amis-by-id

Checks if running instances are using specified AMIs. Specify a list of approved AMI IDs. Running instances with AMIs that are not on this list are NON\_COMPLIANT.

**Identifier:** APPROVED\_AMIS\_BY\_ID

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

amilds, Type: CSV

The AMI IDs (comma-separated list of up to 10).

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## approved-amis-by-tag

Checks if running instances are using specified AMIs. Specify a list of approved AMI IDs. Running instances with AMIs that are not on this list are NON\_COMPLIANT.

**Identifier:** APPROVED\_AMIS\_BY\_TAG

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

amisByTagKeyAndValue, Type: StringMap, Default: tag-key:tag-value,other-tag-key

The AMIs by tag (comma-separated list up to 10; for example,tag-key:tag-value; i.e. tag-key1 matches AMIs with tag-key1,tag-key2:value2 matches tag-key2 having value2).

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## aurora-mysql-backtracking-enabled

Checks if an Amazon Aurora MySQL cluster has backtracking enabled. This rule is NON\_COMPLIANT if the Aurora cluster uses MySQL and it does not have backtracking enabled.

**Identifier:** AURORA\_MYSQL\_BACKTRACKING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), Asia Pacific (Hong Kong), Europe (Milan), Europe (Stockholm), Middle East (Bahrain), Africa (Cape Town), South America (Sao Paulo) Region

**Parameters:**

BacktrackWindowInHours (Optional), Type: double

Amount of time in hours (up to 72) to backtrack your Aurora MySQL cluster.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## autoscaling-group-elb-healthcheck-required

Checks whether your Auto Scaling groups that are associated with a load balancer are using Elastic Load Balancing health checks.

**Identifier:** AUTOSCALING\_GROUP\_ELB\_HEALTHCHECK\_REQUIRED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## beanstalk-enhanced-health-reporting-enabled

Checks if an AWS Elastic Beanstalk environment is configured for enhanced health reporting. The rule is COMPLIANT if the environment is configured for enhanced health reporting. The rule is NON\_COMPLIANT if the environment is configured for basic health reporting.

**Identifier:** BEANSTALK\_ENHANCED\_HEALTH\_REPORTING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudformation-stack-drift-detection-check

Checks if the actual configuration of a Cloud Formation stack differs, or has drifted, from the expected configuration. A stack is considered to have drifted if one or more of its resources differ from their expected configuration. The rule and the stack are COMPLIANT when the stack drift status is IN\_SYNC. The rule and the stack are NON\_COMPLIANT when the stack drift status is DRIFTED.

**Identifier:** CLOUDFORMATION\_STACK\_DRIFT\_DETECTION\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Hong Kong), Asia Pacific (Osaka), Europe (Milan), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

cloudformationRoleArn, Type: String

The AWS CloudFormation role ARN with IAM policy permissions to detect drift for AWS CloudFormation Stacks

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudformation-stack-notification-check

Checks whether your CloudFormation stacks are sending event notifications to an SNS topic. Optionally checks whether specified SNS topics are used.

**Identifier:** CLOUDFORMATION\_STACK\_NOTIFICATION\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Hong Kong), Asia Pacific (Osaka), Europe (Milan), Europe (Paris), Europe (Stockholm), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

snsTopic1 (Optional), Type: String

SNS Topic ARN.

snsTopic2 (Optional), Type: String

SNS Topic ARN.

snsTopic3 (Optional), Type: String

SNS Topic ARN.

snsTopic4 (Optional), Type: String

SNS Topic ARN.

snsTopic5 (Optional), Type: String

SNS Topic ARN.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudfront-accesslogs-enabled

Checks if Amazon CloudFront distributions are configured to capture information from Amazon Simple Storage Service (Amazon S3) server access logs. This rule is NON\_COMPLIANT if a CloudFront distribution does not have logging configured.

**Identifier:** CLOUDFRONT\_ACCESSLOGS\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** Only available in US East (N. Virginia), Asia Pacific (Osaka) Region

**Parameters:**

S3BucketName (Optional), Type: String

The name of the Amazon S3 bucket for storing server access logs.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudfront-associated-with-waf

Checks if Amazon CloudFront distributions are associated with either WAF or WAFv2 web access control lists (ACLs). This rule is NON\_COMPLIANT if a CloudFront distribution is not associated with a web ACL.

**Identifier:** CLOUDFRONT\_ASSOCIATED\_WITH\_WAF

**Trigger type:** Configuration changes

**AWS Region:** Only available in US East (N. Virginia), Asia Pacific (Osaka) Region

**Parameters:**

wafWebAclIds (Optional), Type: CSV

Comma-separated list of web ACL IDs for WAF or web ACL Amazon Resource Names (ARNs) for WAFV2.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudfront-custom-ssl-certificate

Checks if the certificate associated with an Amazon CloudFront distribution is the default Secure Sockets Layer (SSL) certificate. This rule is NON\_COMPLIANT if a CloudFront distribution uses the default SSL certificate.

**Identifier:** CLOUDFRONT\_CUSTOM\_SSL\_CERTIFICATE

**Trigger type:** Configuration changes

**AWS Region:** Only available in US East (N. Virginia), Asia Pacific (Osaka) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudfront-default-root-object-configured

Checks if an Amazon CloudFront distribution is configured to return a specific object that is the default root object. The rule is NON\_COMPLIANT if Amazon CloudFront distribution does not have a default root object configured.

**Identifier:** CLOUDFRONT\_DEFAULT\_ROOT\_OBJECT\_CONFIGURED

**Trigger type:** Configuration changes

**AWS Region:** Only available in US East (N. Virginia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudfront-origin-access-identity-enabled

Checks if Amazon CloudFront distribution with S3 Origin type has Origin Access Identity (OAI) configured. The rule is NON\_COMPLIANT if the CloudFront distribution is backed by S3 and any of S3 Origin type is not OAI configured. The rule is NON\_COMPLIANT if the origin is not an S3 bucket; the rule does not return NOT\_APPLICABLE if the origin is not as S3 bucket.

**Identifier:** CLOUDFRONT\_ORIGIN\_ACCESS\_IDENTITY\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** Only available in US East (N. Virginia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudfront-origin-failover-enabled

Checks whether an origin group is configured for the distribution of at least 2 origins in the origin group for Amazon CloudFront. This rule is NON\_COMPLIANT if there are no origin groups for the distribution.

**Identifier:** CLOUDFRONT\_ORIGIN\_FAILOVER\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** Only available in US East (N. Virginia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudfront-sni-enabled

Checks if Amazon CloudFront distributions are using a custom SSL certificate and are configured to use SNI to serve HTTPS requests. This rule is NON\_COMPLIANT if a custom SSL certificate is associated but the SSL support method is a dedicated IP address.

**Identifier:** CLOUDFRONT\_SNI\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** Only available in US East (N. Virginia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudfront-viewer-policy-https

Checks whether your Amazon CloudFront distributions use HTTPS (directly or via a redirection). The rule is NON\_COMPLIANT if the value of ViewerProtocolPolicy is set to 'allow-all' for the defaultCacheBehavior or for the cacheBehaviors.

**Identifier:** CLOUDFRONT\_VIEWER\_POLICY\_HTTPS

**Trigger type:** Configuration changes

**AWS Region:** Only available in US East (N. Virginia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudtrail-s3-dataevents-enabled

Checks whether at least one AWS CloudTrail trail is logging Amazon S3 data events for all S3 buckets. The rule is NON\_COMPLIANT if trails log data events for S3 buckets is not configured.

**Identifier:** CLOUDTRAIL\_S3\_DATAEVENTS\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

S3BucketNames (Optional), Type: String

Comma-separated list of S3 bucket names for which data events logging should be enabled. Default behavior checks for all S3 buckets.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudtrail-security-trail-enabled

Checks that there is at least one AWS CloudTrail trail defined with security best practices. This rule is COMPLIANT if there is at least one trail that meets all of the following:

- records global service events
- is a multi-region trail
- has Log file validation enabled
- encrypted with a KMS key
- records events for reads and writes
- records management events
- does not exclude any management events

This rule is NON\_COMPLIANT if no trails meet all of the criteria mentioned above.

**Identifier:** CLOUDTRAIL\_SECURITY\_TRAIL\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudwatch-alarm-action-check

Checks whether CloudWatch alarms have at least one alarm action, one INSUFFICIENT\_DATA action, or one OK action enabled. Optionally, checks whether any of the actions matches one of the specified ARNs.

**Identifier:** CLOUDWATCH\_ALARM\_ACTION\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

alarmActionRequired, Type: String, Default: true

Alarms have at least one action.

insufficientDataActionRequired, Type: String, Default: true

Alarms have at least one action when the alarm transitions to the INSUFFICIENT\_DATA state from any other state.

okActionRequired, Type: String, Default: false

Alarms have at least one action when the alarm transitions to an OK state from any other state.

action1 (Optional), Type: String

The action to execute, specified as an ARN.

action2 (Optional), Type: String

The action to execute, specified as an ARN.

action3 (Optional), Type: String

The action to execute, specified as an ARN.

action4 (Optional), Type: String

The action to execute, specified as an ARN.

action5 (Optional), Type: String

The action to execute, specified as an ARN.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudwatch-alarm-resource-check

Checks whether the specified resource type has a CloudWatch alarm for the specified metric. For resource type, you can specify EBS volumes, EC2 instances, RDS clusters, or S3 buckets.

**Identifier:** CLOUDWATCH\_ALARM\_RESOURCE\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

resourceType, Type: String

AWS resource type. The value can be one of the following: `AWS::EC2::Volume`, `AWS::EC2::Instance`, `AWS::RDS::DBCluster`, or `AWS::S3::Bucket`.

metricName, Type: String

The name for the metric associated with the alarm (for example, 'CPUUtilization' for EC2 instances).

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloudwatch-alarm-settings-check

Checks whether CloudWatch alarms with the given metric name have the specified settings.

**Identifier:** CLOUDWATCH\_ALARM\_SETTINGS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

metricName, Type: String

The name for the metric associated with the alarm.

threshold (Optional), Type: int

The value against which the specified statistic is compared.

evaluationPeriods (Optional), Type: int

The number of periods over which data is compared to the specified threshold.

period (Optional), Type: int, Default: 300

The period, in seconds, during which the specified statistic is applied.

comparisonOperator (Optional), Type: String

The operation for comparing the specified statistic and threshold (for example, 'GreaterThanThreshold').

statistic (Optional), Type: String

The statistic for the metric associated with the alarm (for example, 'Average' or 'Sum').

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### cloudwatch-log-group-encrypted

Checks if a log group in Amazon CloudWatch Logs is encrypted with a AWS Key Management Service (KMS) managed Customer Master Keys (CMK). The rule is NON\_COMPLIANT if no AWS KMS CMK is configured on the log groups.

**Identifier:** CLOUDWATCH\_LOG\_GROUP\_ENCRYPTED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia) Region

**Parameters:**

KmsKeyId (Optional), Type: String

Amazon Resource Name (ARN) of AWS Key Management Service (KMS) key that is used to encrypt the CloudWatch Logs log group.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### cloud-trail-cloud-watch-logs-enabled

Checks whether AWS CloudTrail trails are configured to send logs to Amazon CloudWatch logs. The trail is non-compliant if the CloudWatchLogsLogGroupArn property of the trail is empty.

**Identifier:** CLOUD\_TRAIL\_CLOUD\_WATCH\_LOGS\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

expectedDeliveryWindowAge (Optional), Type: int

Maximum age in hours of the most recent delivery to CloudWatch logs that satisfies compliance.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### cloudtrail-enabled

Checks if AWS CloudTrail is enabled in your AWS account. Optionally, you can specify which S3 bucket, SNS topic, and AWS CloudTrail ARN to use.

**Identifier:** CLOUD\_TRAIL\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

s3BucketName (Optional), Type: String

Name of S3 bucket for CloudTrail to deliver log files to.

snsTopicArn (Optional), Type: String

SNS topic ARN for CloudTrail to use for notifications.

cloudWatchLogsLogGroupArn (Optional), Type: String

CloudWatch log group ARN for CloudTrail to send data to.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloud-trail-encryption-enabled

Checks whether AWS CloudTrail is configured to use the server side encryption (SSE) AWS Key Management Service (AWS KMS) customer master key (CMK) encryption. The rule is compliant if the KmsKeyId is defined.

**Identifier:** CLOUD\_TRAIL\_ENCRYPTION\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cloud-trail-log-file-validation-enabled

Checks whether AWS CloudTrail creates a signed digest file with logs. AWS recommends that the file validation must be enabled on all trails. The rule is noncompliant if the validation is not enabled.

**Identifier:** CLOUD\_TRAIL\_LOG\_FILE\_VALIDATION\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cmk-backing-key-rotation-enabled

Checks if key rotation is enabled for each key and matches to the key ID of the customer created customer master key (CMK). The rule is COMPLIANT, if the key rotation is enabled for specific key object. The rule is not applicable to CMKs that have imported key material.

**Note**

This rule only evaluates symmetric AWS KMS; keys and ignores asymmetric AWS KMS keys.

**Identifier:** CMK\_BACKING\_KEY\_ROTATION\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## codebuild-project-envvar-awscred-check

Checks whether the project contains environment variables AWS\_ACCESS\_KEY\_ID and AWS\_SECRET\_ACCESS\_KEY. The rule is NON\_COMPLIANT when the project environment variables contains plaintext credentials.

**Identifier:** CODEBUILD\_PROJECT\_ENVVAR\_AWSCRED\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## codebuild-project-source-repo-url-check

Checks whether the GitHub or Bitbucket source repository URL contains either personal access tokens or user name and password. The rule is complaint with the usage of OAuth to grant authorization for accessing GitHub or Bitbucket repositories.

**Identifier:** CODEBUILD\_PROJECT\_SOURCE\_REPO\_URL\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## codepipeline-deployment-count-check

Checks whether the first deployment stage of the AWS Codepipeline performs more than one deployment. Optionally checks if each of the subsequent remaining stages deploy to more than the specified number of deployments (`deploymentLimit`).

**Identifier:** CODEPIPELINE\_DEPLOYMENT\_COUNT\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Hong Kong), Asia Pacific (Osaka), Europe (Milan), Europe (Stockholm), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

`deploymentLimit` (Optional), Type: int

The maximum number of deployments each stage can perform.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## codepipeline-region-fanout-check

Checks if each stage in the AWS CodePipeline deploys to more than N times the number of the regions the AWS CodePipeline has deployed in all the previous combined stages, where N is the region fanout number. The first deployment stage can deploy to a maximum of one region and the second deployment stage can deploy to a maximum number specified in the `regionFanoutFactor`. If you do not provide a `regionFanoutFactor`, by default the value is three. For example: If 1st deployment stage deploys to one region and 2nd deployment stage deploys to three regions, 3rd deployment stage can deploy to 12 regions, that is, sum of previous stages multiplied by the region fanout (three) number. The rule is NON\_COMPLIANT if the deployment is in more than one region in 1st stage or three regions in 2nd stage or 12 regions in 3rd stage.

**Identifier:** CODEPIPELINE\_REGION\_FANOUT\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Hong Kong), Asia Pacific (Osaka), Europe (Milan), Europe (Stockholm), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

regionFanoutFactor (Optional), Type: int, Default: 3

The number of regions the AWS CodePipeline has deployed to in all previous stages is the acceptable number of regions any stage can deploy to.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## cw-loggroup-retention-period-check

Checks whether Amazon CloudWatch LogGroup retention period is set to specific number of days. The rule is NON\_COMPLIANT if the retention period is not set or is less than the configured retention period.

**Identifier:** CW\_LOGGROUP\_RETENTION\_PERIOD\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

LogGroupNames (Optional), Type: CSV

A comma-separated list of Log Group names to check the retention period.

MinRetentionTime (Optional), Type: int

Specify the retention time. Valid values are: 1, 3, 5, 7, 14, 30, 60, 90, 120, 150, 180, 365, 400, 545, 731, 1827, and 3653. The default retention period is 365 days.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## dax-encryption-enabled

Checks that Amazon DynamoDB Accelerator (DAX) clusters are encrypted. The rule is NON\_COMPLIANT if a DAX cluster is not encrypted

**Identifier:** DAX\_ENCRYPTION\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Hong Kong), Asia Pacific (Osaka), Asia Pacific (Seoul), Canada (Central), Europe (Milan), Europe (Stockholm), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## db-instance-backup-enabled

Checks if RDS DB instances have backups enabled. Optionally, the rule checks the backup retention period and the backup window.

**Identifier:** DB\_INSTANCE\_BACKUP\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

backupRetentionPeriod (Optional), Type: int

Retention period for backups.

preferredBackupWindow (Optional), Type: String

Time range in which backups are created.

checkReadReplicas (Optional), Type: boolean

Checks whether RDS DB instances have backups enabled for read replicas.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## desired-instance-tenancy

Checks instances for specified tenancy. Specify AMI IDs to check instances that are launched from those AMIs or specify host IDs to check whether instances are launched on those Dedicated Hosts. Separate multiple ID values with commas.

**Identifier:** DESIRED\_INSTANCE\_TENANCY

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

tenancy, Type: String

Desired tenancy of the instances. Valid values are DEDICATED, HOST and DEFAULT.

imageId (Optional), Type: CSV

The rule evaluates instances launched only from AMIs with the specified IDs. Separate multiple AMI IDs with commas.

hostId (Optional), Type: CSV

The IDs of the EC2 Dedicated Hosts on which the instances are meant to be launched. Separate multiple Host IDs with commas.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## desired-instance-type

Checks instances for specified tenancy. Specify AMI IDs to check instances that are launched from those AMIs or specify host IDs to check whether instances are launched on those Dedicated Hosts. Separate multiple ID values with commas.

For a list of supported Amazon EC2 instance types, see [Instance Types](#) in the *Amazon EC2 User Guide for Linux Instances*.

**Identifier:** DESIRED\_INSTANCE\_TYPE

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

instanceType, Type: CSV

Comma-separated list of EC2 instance types (for example, "t2.small, m4.large, i2.xlarge").

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## dms-replication-not-public

Checks whether AWS Database Migration Service replication instances are public. The rule is NON\_COMPLIANT if PubliclyAccessible field is True.

**Identifier:** DMS\_REPLICATION\_NOT\_PUBLIC

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## dynamodb-autoscaling-enabled

Checks if Auto Scaling or On-Demand is enabled on your DynamoDB tables and/or global secondary indexes. Optionally you can set the read and write capacity units for the table or global secondary index.

**Identifier:** DYNAMODB\_AUTOSCALING\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West) Region

**Parameters:**

minProvisionedReadCapacity (Optional), Type: int

The minimum number of units that should be provisioned with read capacity in the Auto Scaling group.

maxProvisionedReadCapacity (Optional), Type: int

The minimum number of units that should be provisioned with write capacity in the Auto Scaling group.

targetReadUtilization (Optional), Type: double

The maximum number of units that should be provisioned with read capacity in the Auto Scaling group.

minProvisionedWriteCapacity (Optional), Type: int

The maximum number of units that should be provisioned with write capacity in the Auto Scaling group.

maxProvisionedWriteCapacity (Optional), Type: int

The target utilization percentage for read capacity. Target utilization is expressed in terms of the ratio of consumed capacity to provisioned capacity.

targetWriteUtilization (Optional), Type: double

The target utilization percentage for write capacity. Target utilization is expressed in terms of the ratio of consumed capacity to provisioned capacity.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## dynamodb-in-backup-plan

Checks whether Amazon DynamoDB table is present in AWS Backup Plans. The rule is NON\_COMPLIANT if Amazon DynamoDB tables are not present in any AWS Backup plan.

**Identifier:** DYNAMODB\_IN\_BACKUP\_PLAN

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## dynamodb-pitr-enabled

Checks that point in time recovery (PITR) is enabled for Amazon DynamoDB tables. The rule is NON\_COMPLIANT if point in time recovery is not enabled for Amazon DynamoDB tables.

**Identifier:** DYNAMODB\_PITR\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## dynamodb-table-encrypted-kms

Checks if Amazon DynamoDB table is encrypted with AWS Key Management Service (KMS). The rule is NON\_COMPLIANT if Amazon DynamoDB table is not encrypted with AWS KMS. The rule is also NON\_COMPLIANT if the encrypted AWS KMS key is not present in `kmsKeyArns` input parameter.

**Identifier:** DYNAMODB\_TABLE\_ENCRYPTED\_KMS

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

`kmsKeyArns` (Optional), Type: CSV

Comma separated list of AWS KMS key ARNs allowed for encrypting Amazon DynamoDB Tables.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## dynamodb-table-encryption-enabled

Checks if the Amazon DynamoDB tables are encrypted and checks their status. The rule is COMPLIANT if the status is enabled or enabling.

**Identifier:** DYNAMODB\_TABLE\_ENCRYPTION\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Ningxia), Asia Pacific (Hong Kong), Asia Pacific (Osaka), Europe (Milan), Europe (Stockholm), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## dynamodb-throughput-limit-check

Checks if provisioned DynamoDB throughput is approaching the maximum limit for your account. By default, the rule checks if provisioned throughput exceeds a threshold of 80 percent of your account limits.

**Identifier:** DYNAMODB\_THROUGHPUT\_LIMIT\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

accountRCUThresholdPercentage (Optional), Type: int, Default: 80

Percentage of provisioned read capacity units for your account. When this value is reached, the rule is marked as NON\_COMPLIANT.

accountWCUThresholdPercentage (Optional), Type: int, Default: 80

Percentage of provisioned write capacity units for your account. When this value is reached, the rule is marked as NON\_COMPLIANT.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ebs-in-backup-plan

Check if Amazon Elastic Block Store (Amazon EBS) volumes are added in backup plans of AWS Backup. The rule is NON\_COMPLIANT if Amazon EBS volumes are not included in backup plans.

**Identifier:** EBS\_IN\_BACKUP\_PLAN

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ebs-optimized-instance

Checks whether EBS optimization is enabled for your EC2 instances that can be EBS-optimized.

**Identifier:** EBS\_OPTIMIZED\_INSTANCE

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ebs-snapshot-public-restorable-check

Checks whether Amazon Elastic Block Store (Amazon EBS) snapshots are not publicly restorable. The rule is NON\_COMPLIANT if one or more snapshots with RestorableByUserIds field are set to all, that is, Amazon EBS snapshots are public.

**Identifier:** EBS\_SNAPSHOT\_PUBLIC\_RESTORABLE\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-ebs-encryption-by-default

Check that Amazon Elastic Block Store (EBS) encryption is enabled by default. The rule is NON\_COMPLIANT if the encryption is not enabled.

**Identifier:** EC2\_EBS\_ENCRYPTION\_BY\_DEFAULT

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-imdsv2-check

Checks whether your Amazon Elastic Compute Cloud (Amazon EC2) instance metadata version is configured with Instance Metadata Service Version 2 (IMDSv2). The rule is NON\_COMPLIANT if the HttpTokens is set to optional.

**Identifier:** EC2\_IMDSV2\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-instance-detailed-monitoring-enabled

Checks if detailed monitoring is enabled for EC2 instances. The rule is NON\_COMPLIANT if detailed monitoring is not enabled.

**Identifier:** EC2\_INSTANCE\_DETAILED\_MONITORING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-instance-managed-by-systems-manager

Checks whether the Amazon EC2 instances in your account are managed by AWS Systems Manager.

**Note**

This rule does not consider changes in the `PingStatus` of an instance in Systems Manager, for example, `Status - Connection Lost`. The rule reports such instances as compliant.

**Identifier:** EC2\_INSTANCE\_MANAGED\_BY\_SSM

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-instance-no-public-ip

Checks whether Amazon Elastic Compute Cloud (Amazon EC2) instances have a public IP association. The rule is `NON_COMPLIANT` if the `publicIp` field is present in the Amazon EC2 instance configuration item. This rule applies only to IPv4.

**Identifier:** EC2\_INSTANCE\_NO\_PUBLIC\_IP

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-instance-profile-attached

Checks if an Amazon Elastic Compute Cloud (Amazon EC2) instance has an Identity and Access Management (IAM) profile attached to it. This rule is `NON_COMPLIANT` if no IAM profile is attached to the Amazon EC2 instance.

**Identifier:** EC2\_INSTANCE\_PROFILE\_ATTACHED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

`IamInstanceProfileArnList` (Optional), Type: CSV

Comma-separated list of IAM profile Amazon Resource Names (ARNs) that can be attached to Amazon EC2 instances.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-managedinstance-applications-blacklisted

Checks that none of the specified applications are installed on the instance. Optionally, specify the version. Newer versions will not be blacklisted. Optionally, specify the platform to apply the rule only to instances running that platform.

**Identifier:** EC2\_MANAGEDINSTANCE\_APPLICATIONS\_BLACKLISTED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

applicationNames, Type: CSV

Comma-separated list of application names. Optionally, specify versions appended with ':' (for example, 'Chrome:0.5.3, Firefox').

**Note**

The application names must be an exact match. For example, use **firefox** on Linux or **firefox-compatible** on Amazon Linux. In addition, AWS Config does not currently support wildcards for the *applicationNames* parameter (for example, **firefox\***).

platformType (Optional), Type: String

Platform type (for example, 'Linux' or 'Windows').

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-managedinstance-applications-required

Checks if all of the specified applications are installed on the instance. Optionally, specify the minimum acceptable version. You can also specify the platform to apply the rule only to instances running that platform.

**Note**

Ensure that SSM agent is running on the EC2 instance and configure SSM agents.

**Identifier:** EC2\_MANAGEDINSTANCE\_APPLICATIONS\_REQUIRED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

applicationNames, Type: CSV

Comma-separated list of application names. Optionally, specify versions appended with ':' (for example, 'Chrome:0.5.3, Firefox').

**Note**

The application names must be an exact match. For example, use **firefox** on Linux or **firefox-compat** on Amazon Linux. In addition, AWS Config does not currently support wildcards for the *applicationNames* parameter (for example, **firefox\***).

platformType (Optional), Type: String

Platform type (for example, 'Linux' or 'Windows').

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-managedinstance-association-compliance-status-check

Checks whether the compliance status of the AWS Systems Manager association compliance is COMPLIANT or NON\_COMPLIANT after the association execution on the instance. The rule is compliant if the field status is COMPLIANT.

**Identifier:** EC2\_MANAGEDINSTANCE\_ASSOCIATION\_COMPLIANCE\_STATUS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-managedinstance-inventory-blacklisted

Checks whether instances managed by Amazon EC2 Systems Manager are configured to collect blacklisted inventory types.

**Identifier:** EC2\_MANAGEDINSTANCE\_INVENTORY\_BLACKLISTED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

inventoryNames, Type: CSV

Comma separated list of Systems Manager inventory types (for example, 'AWS:Network, AWS:WindowsUpdate').

platformType (Optional), Type: String

Platform type (for example, 'Linux').

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-managedinstance-patch-compliance-status-check

Checks whether the compliance status of the AWS Systems Manager patch compliance is COMPLIANT or NON\_COMPLIANT after the patch installation on the instance. The rule is compliant if the field status is COMPLIANT.

**Identifier:** EC2\_MANAGEDINSTANCE\_PATCH\_COMPLIANCE\_STATUS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-managedinstance-platform-check

Checks whether EC2 managed instances have the desired configurations.

**Identifier:** EC2\_MANAGEDINSTANCE\_PLATFORM\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

platformType, Type: String

Platform type (for example, 'Linux').

platformVersion (Optional), Type: String

Platform version (for example, '2016.09').

agentVersion (Optional), Type: String

Agent version (for example, '2.0.433.0').

platformName (Optional), Type: String

The version of the platform (for example, '2016.09')

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-security-group-attached-to-eni

Checks that non-default security groups are attached to Amazon Elastic Compute Cloud (EC2) instances or an elastic network interfaces (ENIs). The rule returns NON\_COMPLIANT if the security group is not associated with an EC2 instance or an ENI.

**Identifier:** EC2\_SECURITY\_GROUP\_ATTACHED\_TO\_ENI

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-stopped-instance

Checks if there are instances stopped for more than the allowed number of days. The instance is NON\_COMPLIANT if the state of the ec2 instance has been stopped for longer than the allowed number of days.

**Identifier:** EC2\_STOPPED\_INSTANCE

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

AllowedDays (Optional), Type: int, Default: 30

The number of days an ec2 instance can be stopped before it is NON\_COMPLIANT. The default number of days is 30.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-volume-inuse-check

Checks if EBS volumes are attached to EC2 instances. Optionally checks if EBS volumes are marked for deletion when an instance is terminated.

**Identifier:** EC2\_VOLUME\_INUSE\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

deleteOnTermination (Optional), Type: boolean

EBS volumes are marked for deletion when an instance is terminated. Possible values: True or False (other input values are marked as non-compliant).

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ecs-task-definition-user-for-host-mode-check

Checks if an Amazon Elastic Container Service (Amazon ECS) task definition with host networking mode has 'privileged' or 'user' container definitions. The rule is NON\_COMPLIANT for task definitions with host network mode and container definitions of privileged=false or empty and user=root or empty.

**Identifier:** ECS\_TASK\_DEFINITION\_USER\_FOR\_HOST\_MODE\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## efs-encrypted-check

Checks if Amazon Elastic File System (Amazon EFS) is configured to encrypt the file data using AWS Key Management Service (AWS KMS). The rule is NON\_COMPLIANT if the encrypted key is set to false on `DescribeFileSystems` or if the `KmsKeyId` key on `DescribeFileSystems` does not match the `KmsKeyId` parameter.

**Identifier:** EFS\_ENCRYPTED\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

KmsKeyId (Optional), Type: String

Amazon Resource Name (ARN) of the KMS key that is used to encrypt the EFS file system.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## efs-in-backup-plan

Checks whether Amazon Elastic File System (Amazon EFS) file systems are added in the backup plans of AWS Backup. The rule is NON\_COMPLIANT if EFS file systems are not included in the backup plans.

**Identifier:** EFS\_IN\_BACKUP\_PLAN

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## eip-attached

Checks if all Elastic IP addresses that are allocated to an AWS account are attached to EC2 instances or in-use elastic network interfaces (ENIs).

**Note**

Results might take up to 6 hours to become available after an evaluation occurs.

**Identifier:** EIP\_ATTACHED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## eks-endpoint-no-public-access

Checks whether Amazon Elastic Kubernetes Service (Amazon EKS) endpoint is not publicly accessible. The rule is NON\_COMPLIANT if the endpoint is publicly accessible.

**Identifier:** EKS\_ENDPOINT\_NO\_PUBLIC\_ACCESS

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka), Europe (Milan), US West (N. California), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## eks-secrets-encrypted

Checks if Amazon Elastic Kubernetes Service clusters are configured to have Kubernetes secrets encrypted using AWS Key Management Service (KMS) keys.

- This rule is COMPLIANT if an EKS cluster has an encryptionConfig with secrets as one of the resources.
- This rule is also COMPLIANT if the key used to encrypt EKS secrets matches with the parameter.
- This rule is NON\_COMPLIANT if an EKS cluster does not have an encryptionConfig or if the encryptionConfig resources do not include secrets.
- This rule is also NON\_COMPLIANT if the key used to encrypt EKS secrets does not match with the parameter.

**Identifier:** EKS\_SECRETS\_ENCRYPTED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), US West (N. California), Africa (Cape Town) Region

**Parameters:**

kmsKeyArns (Optional), Type: CSV

Comma separated list of Amazon Resource Name (ARN) of the KMS key that should be used for encrypted secrets in an EKS cluster.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elasticache-redis-cluster-automatic-backup-check

Check if the Amazon ElastiCache Redis clusters have automatic backup turned on. The rule is NON\_COMPLIANT if the SnapshotRetentionLimit for Redis cluster is less than the SnapshotRetentionPeriod parameter. For example: If the parameter is 15 then the rule is non-compliant if the snapshotRetentionPeriod is between 0-15.

**Identifier:** ELASTICACHE\_REDIS\_CLUSTER\_AUTOMATIC\_BACKUP\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

snapshotRetentionPeriod (Optional), Type: int, Default: 15

Minimum snapshot retention period in days for Redis cluster. Default is 15 days.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elasticache-redis-cluster-auto-backup-check

The rule is NON\_COMPLIANT if SnapshotRetentionLimit for Redis cluster is 0, or less than the SnapshotRetentionPeriod parameter.

**Identifier:** ELASTICACHE\_REDIS\_CLUSTER\_AUTO\_BACKUP\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

snapshotRetentionPeriod (Optional), Type: int, Default: 15

Minimum snapshot retention period in days for Redis cluster. Default is 15 days.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elasticsearch-encrypted-at-rest

Checks if Amazon Elasticsearch Service (Amazon ES) domains have encryption at rest configuration enabled. The rule is NON\_COMPLIANT if the EncryptionAtRestOptions field is not enabled.

**Identifier:** ELASTICSEARCH\_ENCRYPTED\_AT\_REST

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Ningxia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elasticsearch-in-vpc-only

Checks if Amazon Elasticsearch Service (Amazon ES) domains are in Amazon Virtual Private Cloud (Amazon VPC). The rule is NON\_COMPLIANT if the Amazon ES domain endpoint is public.

**Identifier:** ELASTICSEARCH\_IN\_VPC\_ONLY

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elasticsearch-node-to-node-encryption-check

Check that Amazon ElasticSearch Service nodes are encrypted end to end. The rule is NON\_COMPLIANT if the node-to-node encryption is disabled on the domain.

**Identifier:** ELASTICSEARCH\_NODE\_TO\_NODE\_ENCRYPTION\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elastic-beanstalk-managed-updates-enabled

Checks if managed platform updates in an AWS Elastic Beanstalk environment is enabled. The rule is COMPLIANT if the value for `ManagedActionsEnabled` is set to true. The rule is NON\_COMPLIANT if the value for `ManagedActionsEnabled` is set to false, or if a parameter is provided and its value does not match the existing configurations.

**Identifier:** ELASTIC\_BEANSTALK\_MANAGED\_UPDATES\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

UpdateLevel (Optional), Type: String

UpdateLevel: (optional): A parameter for platform update, to check if updates level will be a 'minor' version update, or a 'patch'

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elb-acm-certificate-required

Checks if the Classic Load Balancers use SSL certificates provided by AWS Certificate Manager. To use this rule, use an SSL or HTTPS listener with your Classic Load Balancer. This rule is only applicable to Classic Load Balancers. This rule does not check Application Load Balancers and Network Load Balancers.

**Identifier:** ELB\_ACM\_CERTIFICATE\_REQUIRED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elb-cross-zone-load-balancing-enabled

Checks if cross-zone load balancing is enabled for the Classic Load Balancers (CLBs). This rule is NON\_COMPLIANT if cross-zone load balancing is not enabled for a CLB.

**Identifier:** ELB\_CROSS\_ZONE\_LOAD\_BALANCING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elb-custom-security-policy-ssl-check

Checks whether your Classic Load Balancer SSL listeners are using a custom policy. The rule is only applicable if there are SSL listeners for the Classic Load Balancer.

**Identifier:** ELB\_CUSTOM\_SECURITY\_POLICY\_SSL\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

sslProtocolsAndCiphers, Type: String

Comma-separated list of ciphers and protocols.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elb-deletion-protection-enabled

Checks if Elastic Load Balancing has deletion protection enabled. The rule is NON\_COMPLIANT if `deletion_protection.enabled` is false.

**Identifier:** ELB\_DELETION\_PROTECTION\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elb-logging-enabled

Checks if the Application Load Balancer and the Classic Load Balancer have logging enabled. The rule is NON\_COMPLIANT if the `access_logs.s3.enabled` is false or `access_logs.S3.bucket` is not equal to the `s3BucketName` that you provided.

**Identifier:** ELB\_LOGGING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

s3BucketNames (Optional), Type: CSV

Comma-separated list of Amazon S3 bucket names for Amazon ELB to deliver the log files.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elb-predefined-security-policy-ssl-check

Checks whether your Classic Load Balancer SSL listeners are using a predefined policy. The rule is only applicable if there are SSL listeners for the Classic Load Balancer.

**Identifier:** ELB\_PREDEFINED\_SECURITY\_POLICY\_SSL\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

predefinedPolicyName, Type: String

Name of the predefined policy.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## elb-tls-https-listeners-only

Checks if your Classic Load Balancer is configured with SSL or HTTPS listeners.

- If the Classic Load Balancer does not have a listener configured, then the rule returns NOT\_APPLICABLE.
- The rule is COMPLIANT if the Classic Load Balancer listeners are configured with SSL or HTTPS.
- The rule is NON\_COMPLIANT if a listener is not configured with SSL or HTTPS.

**Identifier:** ELB\_TLS\_HTTPS\_LISTENERS\_ONLY

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## emr-kerberos-enabled

Checks if Amazon EMR clusters have Kerberos enabled. The rule is NON\_COMPLIANT if a security configuration is not attached to the cluster or the security configuration does not satisfy the specified rule parameters.

**Identifier:** EMR\_KERBEROS\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

TicketLifetimeInHours (Optional), Type: int

Period for which Kerberos ticket issued by cluster's KDC is valid.

Realm (Optional), Type: String

Kereberos realm name of the other realm in the trust relationship.

Domain (Optional), Type: String

Domain name of the other realm in the trust relationship.

AdminServer (Optional), Type: String

Fully qualified domain of the admin server in the other realm of the trust relationship.

KdcServer (Optional), Type: String

Fully qualified domain of the KDC server in the other realm of the trust relationship.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## emr-master-no-public-ip

Checks if Amazon Elastic MapReduce (EMR) clusters' master nodes have public IPs. The rule is NON\_COMPLIANT if the master node has a public IP.

**Note**

This rule checks clusters that are in RUNNING or WAITING state.

**Identifier:** EMR\_MASTER\_NO\_PUBLIC\_IP

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## encrypted-volumes

Checks if the EBS volumes that are in an attached state are encrypted. If you specify the ID of a KMS key for encryption using the kmsId parameter, the rule checks if the EBS volumes in an attached state are encrypted with that KMS key.

**Identifier:** ENCRYPTED\_VOLUMES

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

kmsId (Optional), Type: String

ID or ARN of the KMS key that is used to encrypt the volume.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## fms-security-groups-audit-policy-check

Checks if the security groups associated inScope resources are compliant with the master security groups at each rule level based on allowSecurityGroup and denySecurityGroup flag.

**Note**

Only AWS Firewall Manager can create this rule.

**Identifier:** FMS\_SECURITY\_GROUP\_AUDIT\_POLICY\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka) Region

**Parameters:**

masterSecurityGroupIds, Type: String

Comma-separated list of master Groups Ids. Rule will check if security groups associated in scope resource compliant with the master security groups at rule level.

inScope, Type: String

If true, the config rule owner is in AWS FMS Security Group Audit policy scope.

resourceTags, Type: String

The resource tags (EC2 Instance, Elastic Network Interface or Security Group) that the rule should be associated with. (for example, { "tagKey1" : ["tagValue1"], "tagKey2" : ["tagValue2", "tagValue3"] }

excludeResourceTags, Type: boolean

If true, exclude resources that match resourceTags.

resourceTypes, Type: String

The resource type supported by this rule. Can be EC2 Instance, Elastic Network Interface or Security Group.

fmsRemediationEnabled, Type: boolean

If true, AWS Firewall Manager will update non-compliant resources according to FMS policy. AWS Config ignores this parameter when customer creates this rule.

allowSecurityGroup, Type: boolean

If true, the rule will check to ensure that all the in-scope security groups are within (outside, if false) the reference security group's inbound/outbound rules.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## fms-security-groups-content-check

Checks if AWS Firewall Manager created security groups content is the same as the master security groups. The rule is NON\_COMPLIANT if the content does not match.

### Note

Only AWS Firewall Manager can create this rule.

**Identifier:** FMS\_SECURITY\_GROUP\_CONTENT\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka) Region

### Parameters:

vpcls, Type: String

Comma-separated list of VPC ids in the account.

securityGroupsIds, Type: String

Comma-separated list of security groups IDs created by AWS Firewall Manager in every VPC in the account. Sorted by VPC ids.

fmsRemediationEnabled, Type: boolean

If true, AWS Firewall Manager will update non-compliant resources according to FMS policy. AWS Config ignores this parameter when customer creates this rule.

revertManualSecurityGroupChangesFlag, Type: boolean

If true, AWS Firewall Manager will check the security groups in the securityGroupsIds parameter. masterSecurityGroupsIds (Optional), Type: String

This parameter only applies to AWS Firewall Manager admin account. Comma-separated list of master security groups id in AWS Firewall manager admin account. Rule will check if the AWS Firewall manager created security groups in the account are same as the master security groups.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## fms-security-groups-resource-association-check

Checks if Amazon EC2 or an elastic network interface is associated with AWS Firewall Manager security groups. The rule is NON\_COMPLIANT if the resources are not associated with FMS security groups.

**Note**

Only AWS Firewall Manager can create this rule.

**Identifier:** FMS\_SECURITY\_GROUP\_RESOURCE\_ASSOCIATION\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka) Region

**Parameters:**

vpcIds, Type: String

Comma-separated list of VPC ids in the account.

securityGroupsIds, Type: String

Comma-separated list of security groups IDs created by AWS Firewall Manager in every VPC in the account. Sorted by VPC.

resourceTags, Type: String

The resource tags (EC2 Instance or Elastic Network Interface or ALB or ELB) that the rule should be associated with. (for example, { "tagKey1" : ["tagValue1"], "tagKey2" : ["tagValue2", "tagValue3"] }

excludeResourceTags, Type: boolean

If true, exclude resources that match resourceTags.

resourceTypes, Type: String

The resource type supported by this rule. Can be EC2 Instance or Elastic Network Interface or ALB or ELB.

fmsRemediationEnabled, Type: boolean

If true, AWS Firewall Manager will update non-compliant resources according to FMS policy. AWS Config ignores this parameter when customer creates this rule.

exclusiveResourceSecurityGroupManagementFlag, Type: boolean

Only allow AWS Firewall Manager created security groups associate with resource if this flag set to true.

applyToAllEC2InstanceENIs (Optional), Type: boolean

If true, AWS Firewall Manager will enforce the policy on all ENIs on EC2 Instance. Otherwise AWS Firewall Manager enforce the policy on default ENI on EC2 Instance.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## fms-shield-resource-policy-check

Checks whether an Application Load Balancer, Amazon CloudFront distributions, Elastic Load Balancer or Elastic IP has AWS Shield protection. It also checks if they have web ACL associated for Application Load Balancer and Amazon CloudFront distributions.

**Identifier:** FMS\_SHIELD\_RESOURCE\_POLICY\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka) Region

**Parameters:**

webACLId, Type: String

The WebACLId of the web ACL.

resourceTypes, Type: String

The resource scope which this config rule will be applied to.

resourceTags (Optional), Type: String

The resource tags that the rule should be associated with (for example, { "tagKey1" : ["tagValue1"], "tagKey2" : ["tagValue2", "tagValue3"] }).

excludeResourceTags (Optional), Type: boolean

If true, exclude the resources that match the resourceTags. If false, include all the resources that match the resourceTags.

fmsManagedToken (Optional), Type: String

A token generated by AWS Firewall Manager when creating the rule in your account. AWS Config ignores this parameter when you create this rule.

fmsRemediationEnabled (Optional), Type: boolean

If true, AWS Firewall Manager will update NON\_COMPLIANT resources according to FMS policy. AWS Config ignores this parameter when you create this rule.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## fms-webacl-resource-policy-check

Checks if the web ACL is associated with an Application Load Balancer, API Gateway stage, or Amazon CloudFront distributions. When AWS Firewall Manager creates this rule, the FMS policy owner specifies the webACLId in the FMS policy and can optionally enable remediation.

**Identifier:** FMS\_WEBACL\_RESOURCE\_POLICY\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka) Region

**Parameters:**

webACLId, Type: String

The WebACLId of the web ACL.

resourceTags (Optional), Type: String

The resource tags (ApplicationLoadBalancer, ApiGatewayStage and CloudFront distributions) that the rule should be associated with. (for example, { "tagKey1" : ["tagValue1"], "tagKey2" : ["tagValue2", "tagValue3"] })

excludeResourceTags (Optional), Type: boolean

If true, exclude resources that match resourceTags.

fmsManagedToken (Optional), Type: String

A token generated by AWS Firewall Manager when creating the rule in customer account. AWS Config ignores this parameter when customer creates this rule.

fmsRemediationEnabled (Optional), Type: boolean

If true, AWS Firewall Manager will update non-compliant resources according to FMS policy. AWS Config ignores this parameter when customer creates this rule.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## fms-webacl-rulegroup-association-check

Checks if the rule groups associate with the web ACL at the correct priority. The correct priority is decided by the rank of the rule groups in the ruleGroups parameter. When AWS Firewall Manager creates this rule, it assigns the highest priority 0 followed by 1, 2, and so on. The FMS policy owner specifies the ruleGroups rank in the FMS policy and can optionally enable remediation.

**Identifier:** FMS\_WEBACL\_RULEGROUP\_ASSOCIATION\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka) Region

### Parameters:

ruleGroups, Type: String

Comma-separated list of RuleGroupIds and WafOverrideAction pairs. (for example, ruleGroupId-1:NONE, ruleGroupId2:COUNT)

fmsManagedToken (Optional), Type: String

A token generated by AWS Firewall Manager when creating the rule in customer account. AWS Config ignores this parameter when customer creates this rule.

fmsRemediationEnabled (Optional), Type: boolean

If true, AWS Firewall Manager will update non-compliant resources according to FMS policy. AWS Config ignores this parameter when customer creates this rule.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## guardduty-enabled-centralized

Checks if Amazon GuardDuty is enabled in your AWS account and region. If you provide an AWS account for centralization, the rule evaluates the Amazon GuardDuty results in the centralized account. The rule is COMPLIANT when Amazon GuardDuty is enabled.

**Identifier:** GUARDDUTY\_ENABLED\_CENTRALIZED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

CentralMonitoringAccount (Optional), Type: String

Comma separated list of AWS Accounts (12-digit) where Amazon GuardDuty results are allowed to be centralized.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## guardduty-non-archived-findings

Checks whether Amazon GuardDuty has findings that are non archived. The rule is NON\_COMPLIANT if Amazon GuardDuty has non archived low/medium/high severity findings older than the specified number in the daysLowSev/daysMediumSev/daysHighSev parameter.

**Identifier:** GUARDDUTY\_NON\_ARCHIVED\_FINDINGS

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Middle East (Bahrain), Africa (Cape Town) Region

**Parameters:**

daysLowSev (Optional), Type: int, Default: 30

The number of days Amazon GuardDuty low severity findings are allowed to stay non archived. The default is 30 days.

daysMediumSev (Optional), Type: int, Default: 7

The number of days Amazon GuardDuty medium severity findings are allowed to stay non archived. The default is 7 days.

daysHighSev (Optional), Type: int, Default: 1

The number of days Amazon GuardDuty high severity findings are allowed to stay non archived. The default is 1 day.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-customer-policy-blocked-kms-actions

Checks that the managed AWS Identity and Access Management (IAM) policies that you create do not allow blocked actions on all AWS KMS keys. The rule is NON\_COMPLIANT if any blocked action is allowed on all AWS KMS keys by the managed IAM policy.

**Identifier:** IAM\_CUSTOMER\_POLICY\_BLOCKED\_KMS\_ACTIONS

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

blockedActionsPatterns, Type: CSV

Comma-separated list of blocked KMS action patterns, for example, kms:\*, kms:Decrypt, kms:ReEncrypt\*.

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-group-has-users-check

Checks whether IAM groups have at least one IAM user.

**Identifier:** IAM\_GROUP\_HAS\_USERS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-inline-policy-blocked-kms-actions

Checks that the inline policies attached to your IAM users, roles, and groups do not allow blocked actions on all AWS Key Management Service (KMS) keys. The rule is NON\_COMPLIANT if any blocked action is allowed on all KMS keys in an inline policy.

**Identifier:** IAM\_INLINE\_POLICY\_BLOCKED\_KMS\_ACTIONS

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

blockedActionsPatterns, Type: CSV

Comma-separated list of blocked KMS action patterns, for example, kms:\*, kms:Decrypt, kms:ReEncrypt\*.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-no-inline-policy-check

Checks that inline policy feature is not in use. The rule is NON\_COMPLIANT if an AWS Identity and Access Management (IAM) user, IAM role or IAM group has any inline policy.

**Identifier:** IAM\_NO\_INLINE\_POLICY\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-password-policy

Checks if the account password policy for IAM users meets the specified requirements indicated in the parameters. This rule is NON\_COMPLIANT if the account password policy does not meet the specified requirements.

### Important

The `true` and `false` values for the rule parameters are case-sensitive. If `true` is not provided in lowercase, it will be treated as `false`.

**Identifier:** IAM\_PASSWORD\_POLICY

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

RequireUppercaseCharacters (Optional), Type: boolean, Default: true

Require at least one uppercase character in password.

RequireLowercaseCharacters (Optional), Type: boolean, Default: true

Require at least one lowercase character in password.

RequireSymbols (Optional), Type: boolean, Default: true

Require at least one symbol in password.

RequireNumbers (Optional), Type: boolean, Default: true

Require at least one number in password.

MinimumPasswordLength (Optional), Type: int, Default: 14

Password minimum length.

PasswordReusePrevention (Optional), Type: int, Default: 24

Number of passwords before allowing reuse.

MaxPasswordAge (Optional), Type: int, Default: 90

Number of days before password expiration.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-policy-blacklisted-check

Checks if for each IAM resource, a policy ARN in the input parameter is attached to the IAM resource. The rule is NON\_COMPLIANT if the policy ARN is attached to the IAM resource. AWS Config marks the resource as COMPLIANT if the IAM resource is part of the `exceptionList` parameter irrespective of the presence of the policy ARN.

**Identifier:** IAM\_POLICY\_BLACKLISTED\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

`policyArns`, Type: CSV, Default: `arn:aws:iam::aws:policy/AdministratorAccess`

Comma-separated list of IAM policy arns which should not be attached to any IAM entity.

`exceptionList` (Optional), Type: CSV

Comma-separated list IAM users, groups, or roles that are exempt from this rule. For example, users: `[user1;user2]`, groups:`[group1;group2]`, roles:`[role1;role2;role3]`.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-policy-in-use

Checks whether the IAM policy ARN is attached to an IAM user, or a group with one or more IAM users, or an IAM role with one or more trusted entity.

**Identifier:** IAM\_POLICY\_IN\_USE

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

policyARN, Type: String

An IAM policy ARN to be checked.

policyUsageType (Optional), Type: String

Specify whether you expect the policy to be attached to an IAM user, group or role. Valid values are IAM\_USER, IAM\_GROUP, IAM\_ROLE, or ANY. Default value is ANY.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-policy-no-statements-with-admin-access

Checks the IAM policies that you create for Allow statements that grant permissions to all actions on all resources. The rule is NON\_COMPLIANT if any policy statement includes "Effect": "Allow" with "Action": "\*" over "Resource": "\*".

The following policy is NON\_COMPLIANT:

```
"Statement": [
{
  "Sid": "VisualEditor",
  "Effect": "Allow",
  "Action": "*",
  "Resource": "*"
}
```

The following policy is COMPLIANT:

```
"Statement": [
{
  "Sid": "VisualEditor",
  "Effect": "Allow",
  "Action": "service:*",
  "Resource": "*"
}
```

This rule checks only the IAM policies that you create. It does not check IAM Managed Policies. When you enable the rule, this rule checks all of the customer managed policies in your account, and all new policies that you create.

**Identifier:** IAM\_POLICY\_NO\_STATEMENTS\_WITH\_ADMIN\_ACCESS

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-role-managed-policy-check

Checks that the AWS Identity and Access Management (IAM) role is attached to all AWS managed policies specified in the list of managed policies. The rule is non-compliant if the IAM role is not attached to the AWS managed policy.

**Identifier:** IAM\_ROLE\_MANAGED\_POLICY\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

managedPolicyArns, Type: CSV

Comma-separated list of AWS managed policy ARNs.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-root-access-key-check

Checks whether the root user access key is available. The rule is compliant if the user access key does not exist.

**Identifier:** IAM\_ROOT\_ACCESS\_KEY\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-user-group-membership-check

Checks whether IAM users are members of at least one IAM group.

**Identifier:** IAM\_USER\_GROUP\_MEMBERSHIP\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

groupNames (Optional), Type: String

Comma-separated list of IAM groups in which IAM users must be members.

**Note**

This rule does not support group names with commas.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-user-mfa-enabled

Checks whether the AWS Identity and Access Management users have multi-factor authentication (MFA) enabled.

**Identifier:** IAM\_USER\_MFA\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-user-no-policies-check

Checks that none of your IAM users have policies attached. IAM users must inherit permissions from IAM groups or roles. The rule is NONCOMPLIANT if there is at least one IAM user with policies attached.

**Identifier:** IAM\_USER\_NO\_POLICIES\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## iam-user-unused-credentials-check

Checks if your AWS Identity and Access Management (IAM) users have passwords or active access keys that have not been used within the specified number of days you provided.

**Note**

Re-evaluating this rule within 4 hours of the first evaluation will have no effect on the results.

**Identifier:** IAM\_USER\_UNUSED\_CREDENTIALS\_CHECK

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

maxCredentialUsageAge, Type: int, Default: 90

Maximum number of days a credential cannot be used. The default value is 90 days.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## restricted-ssh

Checks if the incoming SSH traffic for the security groups is accessible. The rule is COMPLIANT when IP addresses of the incoming SSH traffic in the security groups are restricted (CIDR other than 0.0.0.0/0). This rule applies only to IPv4.

**Identifier:** INCOMING\_SSH\_DISABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## ec2-instances-in-vpc

Checks if your EC2 instances belong to a virtual private cloud (VPC). Optionally, you can specify the VPC ID to associate with your instances.

**Identifier:** INSTANCES\_IN\_VPC

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

vpcId (Optional), Type: String

VPC ID that contains these EC2 instances.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## internet-gateway-authorized-vpc-only

Checks that Internet gateways (IGWs) are only attached to an authorized Amazon Virtual Private Cloud (VPCs). The rule is NON\_COMPLIANT if IGWs are not attached to an authorized VPC.

**Identifier:** INTERNET\_GATEWAY\_AUTHORIZED\_VPC\_ONLY

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

AuthorizedVpcIds (Optional), Type: String

Comma-separated list of the authorized VPC IDs with attached IGWs. If parameter is not provided all attached IGWs will be NON\_COMPLIANT.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## kms-cmk-not-scheduled-for-deletion

Checks whether customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (KMS). The rule is NON\_COMPLIANT if CMKs are scheduled for deletion.

**Identifier:** KMS\_CMK\_NOT\_SCHEDULED\_FOR\_DELETION

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except Europe (Milan) Region

**Parameters:**

kmsKeyIds (Optional), Type: String

(Optional) Comma-separated list of specific customer managed key IDs not to be scheduled for deletion. If you do not specify any keys, the rule checks all the keys.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## lambda-concurrency-check

Checks whether the AWS Lambda function is configured with function-level concurrent execution limit. The rule is NON\_COMPLIANT if the Lambda function is not configured with function-level concurrent execution limit.

**Identifier:** LAMBDA\_CONCURRENCY\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Ningxia) Region

**Parameters:**

ConcurrencyLimitLow (Optional), Type: String

Minimum concurrency execution limit

ConcurrencyLimitHigh (Optional), Type: String

Maximum concurrency execution limit

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## lambda-dlq-check

Checks whether an AWS Lambda function is configured with a dead-letter queue. The rule is NON\_COMPLIANT if the Lambda function is not configured with a dead-letter queue.

**Identifier:** LAMBDA\_DLQ\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Ningxia) Region

**Parameters:**

dlqArns (Optional), Type: String

Comma-separated list of Amazon SQS and Amazon SNS ARNs that must be configured as the Lambda function dead-letter queue target.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## lambda-function-public-access-prohibited

Checks if the AWS Lambda function policy attached to the Lambda resource prohibits public access. If the Lambda function policy allows public access it is NON\_COMPLIANT.

**Identifier:** LAMBDA\_FUNCTION\_PUBLIC\_ACCESS\_PROHIBITED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Ningxia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## lambda-function-settings-check

Checks that the AWS Lambda function settings for runtime, role, timeout, and memory size match the expected values.

**Identifier:** LAMBDA\_FUNCTION\_SETTINGS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Ningxia) Region

**Parameters:**

runtime, Type: CSV

Comma-separated list of AWS Lambda runtime values  
role (Optional), Type: String

Name or ARN of the AWS Lambda execution role  
timeout (Optional), Type: int, Default: 3

AWS Lambda function timeout in seconds  
memorySize (Optional), Type: int, Default: 128

AWS Lambda function size in megabytes

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## lambda-inside-vpc

Checks whether an AWS Lambda function is allowed access to an Amazon Virtual Private Cloud. The rule is NON\_COMPLIANT if the Lambda function is not VPC enabled.

**Identifier:** LAMBDA\_INSIDE\_VPC

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Ningxia) Region

**Parameters:**

subnetIds (Optional), Type: String

Comma-separated list of Subnet IDs that Lambda functions can be associated with.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## mfa-enabled-for-iam-console-access

Checks whether AWS Multi-Factor Authentication (MFA) is enabled for all AWS Identity and Access Management (IAM) users that use a console password. The rule is compliant if MFA is enabled.

**Identifier:** MFA\_ENABLED\_FOR\_IAM\_CONSOLE\_ACCESS

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## multi-region-cloudtrail-enabled

Checks that there is at least one multi-region AWS CloudTrail. The rule is non-compliant if the trails do not match input parameters

**Identifier:** MULTI\_REGION\_CLOUD\_TRAIL\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

s3BucketName (Optional), Type: String

Name of Amazon S3 bucket for AWS CloudTrail to deliver log files to.

snsTopicArn (Optional), Type: String

Amazon SNS topic ARN for AWS CloudTrail to use for notifications.

cloudWatchLogsLogGroupArn (Optional), Type: String

Amazon CloudWatch log group ARN for AWS CloudTrail to send data to.

includeManagementEvents (Optional), Type: boolean

Event selector to include management events for the AWS CloudTrail.

readWriteType (Optional), Type: String

Type of events to record. Valid values are ReadOnly, WriteOnly and ALL.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### no-unrestricted-route-to-igw

Checks if there are public routes in the route table to an Internet Gateway (IGW). The rule is NON\_COMPLIANT if a route to an IGW has a destination CIDR block of '0.0.0.0/0' or ':::/0' or if a destination CIDR block does not match the rule parameter.

**Identifier:** NO\_UNRESTRICTED\_ROUTE\_TO\_IGW

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

routeTableIds (Optional), Type: CSV

Comma-separated list of route table IDs that can have routes to an Internet Gateway with a destination CIDR block of '0.0.0.0/0' or ':::/0'.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### rds-automatic-minor-version-upgrade-enabled

Checks if Amazon Relational Database Service (RDS) database instances are configured for automatic minor version upgrades. The rule is NON\_COMPLIANT if the value of 'autoMinorVersionUpgrade' is false.

**Identifier:** RDS\_AUTOMATIC\_MINOR\_VERSION\_UPGRADE\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### rds-cluster-deletion-protection-enabled

Checks if an Amazon Relational Database Service (Amazon RDS) cluster has deletion protection enabled. This rule is NON\_COMPLIANT if an RDS cluster does not have deletion protection enabled.

**Identifier:** RDS\_CLUSTER\_DELETION\_PROTECTION\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), Middle East (Bahrain), South America (Sao Paulo) Region

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-cluster-iam-authentication-enabled

Checks if an Amazon RDS Cluster has IAM authentication enabled. The rule is NON\_COMPLIANT if RDS Cluster doesn't have IAM authentication enabled.

**Identifier:** RDS\_CLUSTER\_IAM\_AUTHENTICATION\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-enhanced-monitoring-enabled

Checks whether enhanced monitoring is enabled for Amazon Relational Database Service (Amazon RDS) instances.

**Identifier:** RDS\_ENHANCED\_MONITORING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

monitoringInterval (Optional), Type: int

An integer value in seconds between points when enhanced monitoring metrics are collected for the database instance. The valid values are 1, 5, 10, 15, 30, and 60.

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-instance-deletion-protection-enabled

Checks if an Amazon Relational Database Service (Amazon RDS) instance has deletion protection enabled. This rule is NON\_COMPLIANT if an Amazon RDS instance does not have deletion protection enabled i.e `deletionProtection` is set to false.

### Warning

Some RDS DB instances within a Cluster (Aurora/DocumentDB) will show as non-compliant.

**Identifier:** RDS\_INSTANCE\_DELETION\_PROTECTION\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

### Parameters:

`databaseEngines` (Optional), Type: CSV

Comma-separated list of RDS database engines to include in the evaluation of the rule. For example, 'mysql, postgres, mariadb'.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-instance-iam-authentication-enabled

Checks if an Amazon Relational Database Service (Amazon RDS) instance has AWS Identity and Access Management (IAM) authentication enabled. This rule is NON\_COMPLIANT if an Amazon RDS instance does not have AWS IAM authentication enabled i.e `configuration.iAMDatabaseAuthenticationEnabled` is set to false.

**Identifier:** RDS\_INSTANCE\_IAM\_AUTHENTICATION\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), Asia Pacific (Hong Kong), Asia Pacific (Osaka), Africa (Cape Town) Region

### Parameters:

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-instance-public-access-check

Check whether the Amazon Relational Database Service instances are not publicly accessible. The rule is NON\_COMPLIANT if the `publiclyAccessible` field is true in the instance configuration item.

**Identifier:** RDS\_INSTANCE\_PUBLIC\_ACCESS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-in-backup-plan

Checks whether Amazon RDS database is present in back plans of AWS Backup. The rule is NON\_COMPLIANT if Amazon RDS databases are not included in any AWS Backup plan.

**Identifier:** RDS\_IN\_BACKUP\_PLAN

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-logging-enabled

Checks if log types exported to Amazon CloudWatch for an Amazon Relational Database Service (Amazon RDS) instance are enabled. The rule is NON\_COMPLIANT if any such log types are not enabled.

**Identifier:** RDS\_LOGGING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Ningxia), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

additionalLogs (Optional), Type: StringMap

Comma-separated list of engine names and log type names. For example, "additionalLogs": "oracle: general, slowquery ; aurora: alert, slowquery"

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-multi-az-support

Checks whether high availability is enabled for your RDS DB instances.

In a Multi-AZ deployment, Amazon RDS automatically provisions and maintains a synchronous standby replica in a different Availability Zone. For more information, see [High Availability \(Multi-AZ\)](#) in the *Amazon RDS User Guide*.

**Note**

This rule does not evaluate Amazon Aurora DB and Amazon DocumentDB instances.

**Identifier:** RDS\_MULTI\_AZ\_SUPPORT

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates](#) (p. 192).

## rds-snapshots-public-prohibited

Checks if Amazon Relational Database Service (Amazon RDS) snapshots are public. The rule is NON\_COMPLIANT if any existing and new Amazon RDS snapshots are public.

**Note**

It can take up to 12 hours for compliance results to be captured.

**Identifier:** RDS\_SNAPSHOTS\_PUBLIC\_PROHIBITED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates](#) (p. 192).

## rds-snapshot-encrypted

Checks whether Amazon Relational Database Service (Amazon RDS) DB snapshots are encrypted. The rule is NON\_COMPLIANT, if the Amazon RDS DB snapshots are not encrypted.

**Identifier:** RDS\_SNAPSHOT\_ENCRYPTED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Europe (Milan) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## rds-storage-encrypted

Checks whether storage encryption is enabled for your RDS DB instances.

**Identifier:** RDS\_STORAGE\_ENCRYPTED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

kmsKeyId (Optional), Type: String

KMS key ID or ARN used to encrypt the storage.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## redshift-backup-enabled

Checks that Amazon Redshift automated snapshots are enabled for clusters. The rule is NON\_COMPLIANT if the value for `automatedSnapshotRetentionPeriod` is greater than `MaxRetentionPeriod` or less than `MinRetentionPeriod` or the value is 0.

**Identifier:** REDSHIFT\_BACKUP\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Ningxia), Asia Pacific (Osaka), Asia Pacific (Sydney), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

MinRetentionPeriod (Optional), Type: int

Minimum value for the retention period. Minimum value is 1.

MaxRetentionPeriod (Optional), Type: int

Maximum value for the retention period. Maximum value is 35.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## redshift-cluster-configuration-check

Checks whether Amazon Redshift clusters have the specified settings.

**Identifier:** REDSHIFT\_CLUSTER\_CONFIGURATION\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Middle East (Bahrain) Region

**Parameters:**

clusterDbEncrypted, Type: boolean, Default: true

Database encryption is enabled.

loggingEnabled, Type: boolean, Default: true

Audit logging is enabled.

nodeTypes (Optional), Type: CSV, Default: dc1.large

Specify node type.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## redshift-cluster-kms-enabled

Checks if Amazon Redshift clusters are using a specified AWS Key Management Service (AWS KMS) key for encryption. The rule is COMPLIANT if encryption is enabled and the cluster is encrypted with the key provided in the kmsKeyArn parameter. The rule is NON\_COMPLIANT if the cluster is not encrypted or encrypted with another key.

**Identifier:** REDSHIFT\_CLUSTER\_KMS\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

kmsKeyArns (Optional), Type: CSV

Comma-separated list of AWS KMS key Amazon Resource Names (ARNs) used in Amazon Redshift clusters for encryption.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## redshift-cluster-maintenancesettings-check

Checks whether Amazon Redshift clusters have the specified maintenance settings.

**Identifier:** REDSHIFT\_CLUSTER\_MAINTENANCESETTINGS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Middle East (Bahrain) Region

**Parameters:**

allowVersionUpgrade, Type: boolean, Default: true

Allow version upgrade is enabled.

preferredMaintenanceWindow (Optional), Type: String

Scheduled maintenance window for clusters (for example, Mon:09:30-Mon:10:00).

automatedSnapshotRetentionPeriod (Optional), Type: int, Default: 1

Number of days to retain automated snapshots.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## redshift-cluster-public-access-check

Checks if Amazon Redshift clusters are not publicly accessible. The rule is NON\_COMPLIANT if the `publiclyAccessible` field is true in the cluster configuration item.

**Identifier:** REDSHIFT\_CLUSTER\_PUBLIC\_ACCESS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## redshift-enhanced-vpc-routing-enabled

Checks if Amazon Redshift cluster has 'enhancedVpcRouting' enabled. The rule is NON\_COMPLIANT if 'enhancedVpcRouting' is not enabled or if the configuration.enhancedVpcRouting field is 'false'.

**Identifier:** REDSHIFT\_ENHANCED\_VPC\_ROUTING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## redshift-require-tls-ssl

Checks whether Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. The rule is NON\_COMPLIANT if any Amazon Redshift cluster has parameter require\_SSL not set to true.

**Identifier:** REDSHIFT\_REQUIRE\_TLS\_SSL

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Europe (Milan) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## required-tags

Checks if your resources have the tags that you specify. For example, you can check whether your Amazon EC2 instances have the `CostCenter` tag. Separate multiple values with commas.

**Important**

The supported resource types for this rule are as follows:

- ACM::Certificate
- AutoScaling::AutoScalingGroup
- CloudFormation::Stack
- CodeBuild::Project
- DynamoDB::Table
- EC2::CustomerGateway
- EC2::Instance
- EC2::InternetGateway
- EC2::NetworkAcl
- EC2::NetworkInterface
- EC2::RouteTable
- EC2::SecurityGroup
- EC2::Subnet

- EC2::Volume
- EC2::VPC
- EC2::VPNConnection
- EC2::VPNGateway
- ElasticLoadBalancing::LoadBalancer
- ElasticLoadBalancingV2::LoadBalancer
- RDS::DBInstance
- RDS::DBSecurityGroup
- RDS::DBSnapshot
- RDS::DBSubnetGroup
- RDS::EventSubscription
- Redshift::Cluster
- Redshift::ClusterParameterGroup
- Redshift::ClusterSecurityGroup
- Redshift::ClusterSnapshot
- Redshift::ClusterSubnetGroup
- S3::Bucket

**Identifier:** REQUIRED\_TAGS

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

tag1Key, Type: String, Default: CostCenter

Key of the required tag.

tag1Value (Optional), Type: CSV

Optional value of the required tag. Separate multiple values with commas.

tag2Key (Optional), Type: String

Key of a second required tag.

tag2Value (Optional), Type: CSV

Optional value of the second required tag. Separate multiple values with commas.

tag3Key (Optional), Type: String

Key of a third required tag.

tag3Value (Optional), Type: CSV

Optional value of the third required tag. Separate multiple values with commas.

tag4Key (Optional), Type: String

Key of a fourth required tag.

tag4Value (Optional), Type: CSV

Optional value of the fourth required tag. Separate multiple values with commas.

tag5Key (Optional), Type: String

Key of a fifth required tag.

tag5Value (Optional), Type: CSV

Optional value of the fifth required tag. Separate multiple values with commas.

tag6Key (Optional), Type: String

Key of a sixth required tag.

tag6Value (Optional), Type: CSV

Optional value of the sixth required tag. Separate multiple values with commas.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## restricted-common-ports

Checks if the security groups in use do not allow unrestricted incoming TCP traffic to the specified ports. The rule is COMPLIANT when the IP addresses for inbound TCP connections are restricted to the specified ports. This rule applies only to IPv4.

**Identifier:** RESTRICTED\_INCOMING\_TRAFFIC

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

blockedPort1 (Optional), Type: int, Default: 20

Blocked TCP port number.

blockedPort2 (Optional), Type: int, Default: 21

Blocked TCP port number.

blockedPort3 (Optional), Type: int, Default: 3389

Blocked TCP port number.

blockedPort4 (Optional), Type: int, Default: 3306

Blocked TCP port number.

blockedPort5 (Optional), Type: int, Default: 4333

Blocked TCP port number.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## root-account-hardware-mfa-enabled

Checks whether your AWS account is enabled to use multi-factor authentication (MFA) hardware device to sign in with root credentials.

**Identifier:** ROOT\_ACCOUNT\_HARDWARE\_MFA\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West) Region

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## root-account-mfa-enabled

Checks if your AWS account is enabled to use multi-factor authentication (MFA) hardware device to sign in with root credentials. The rule is NON\_COMPLIANT if any virtual MFA devices are permitted for signing in with root credentials.

**Identifier:** ROOT\_ACCOUNT\_MFA\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West) Region

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-account-level-public-access-blocks

Checks if the required public access block settings are configured from account level. The rule is only NON\_COMPLIANT when the fields set below do not match the corresponding fields in the configuration item.

**Note**

If you are using this rule, ensure that S3 Block Public Access is enabled. The rule is change-triggered, so it will not be invoked unless S3 Block Public Access is enabled. If S3 Block Public Access is not enabled the rule returns INSUFFICIENT\_DATA. This means that you still might have some public buckets. For more information about setting up S3 Block Public Access, see [Blocking public access to your Amazon S3 storage](#).

**Identifier:** S3\_ACCOUNT\_LEVEL\_PUBLIC\_ACCESS\_BLOCKS

**Trigger type:** Configuration changes (current status not checked, only evaluated when changes generate new events)

**Note**

This rule is only triggered by configuration changes for the specific region where the S3 endpoint is located. In all other regions, the rule is checked periodically. If a change was made in another region, there could be a delay before the rule returns NON\_COMPLIANT.

**AWS Region:** All supported AWS regions except Europe (Milan), Middle East (Bahrain) Region

**Parameters:**

IgnorePublicAcls (Optional), Type: String, Default: True

IgnorePublicAcls is enforced or not, default True

BlockPublicPolicy (Optional), Type: String, Default: True

BlockPublicPolicy is enforced or not, default True

BlockPublicAcls (Optional), Type: String, Default: True

BlockPublicAcls is enforced or not, default True

RestrictPublicBuckets (Optional), Type: String, Default: True

RestrictPublicBuckets is enforced or not, default True

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-bucket-blacklisted-actions-prohibited

Checks if the Amazon Simple Storage Service bucket policy does not allow blacklisted bucket-level and object-level actions on resources in the bucket for principals from other AWS accounts. For example, the rule checks that the Amazon S3 bucket policy does not allow another AWS account to perform any s3:GetBucket\* actions and s3:DeleteObject on any object in the bucket. The rule is NON\_COMPLIANT if any blacklisted actions are allowed by the Amazon S3 bucket policy.

**Identifier:** S3\_BUCKET\_BLACKLISTED\_ACTIONS\_PROHIBITED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

blacklistedActionPattern, Type: CSV

Comma-separated list of blacklisted action patterns, for example, s3:GetBucket\* and s3:DeleteObject.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-bucket-default-lock-enabled

Checks whether Amazon S3 bucket has lock enabled, by default. The rule is NON\_COMPLIANT if the lock is not enabled.

**Identifier:** S3\_BUCKET\_DEFAULT\_LOCK\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

mode (Optional), Type: String

mode: (optional): A mode parameter with valid values of GOVERNANCE or COMPLIANCE.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-bucket-level-public-access-prohibited

Checks if Amazon Simple Storage Service (Amazon S3) buckets are publicly accessible. This rule is NON\_COMPLIANT if an Amazon S3 bucket is not listed in the `excludedPublicBuckets` parameter and bucket level settings are public.

**Identifier:** S3\_BUCKET\_LEVEL\_PUBLIC\_ACCESS\_PROHIBITED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

`excludedPublicBuckets` (Optional), Type: CSV

Comma-separated list of known allowed public Amazon S3 bucket names.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-bucket-logging-enabled

Checks whether logging is enabled for your S3 buckets.

**Identifier:** S3\_BUCKET\_LOGGING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

targetBucket (Optional), Type: String

Target S3 bucket for storing server access logs.

targetPrefix (Optional), Type: String

Prefix of the S3 bucket for storing server access logs.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-bucket-policy-grantee-check

Checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or VPCs that you provide. The rule is COMPLIANT if a bucket policy is not present.

For example, if the input parameter to the rule is the list of two principals: 111122223333 and 444455556666 and the bucket policy specifies that only 111122223333 can access the bucket, then the rule is COMPLIANT. With the same input parameters: If the bucket policy specifies that 111122223333 and 444455556666 can access the bucket, it is also compliant. However, if the bucket policy specifies that 999900009999 can access the bucket, the rule is NON-COMPLIANT.

### Note

If a bucket policy contains more than one statement, each statement in the bucket policy is evaluated against this rule.

**Identifier:** S3\_BUCKET\_POLICY\_GRANTEE\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

### Parameters:

awsPrincipals (Optional), Type: CSV

Comma-separated list of principals such as IAM User ARNs, IAM Role ARNs and AWS accounts, for example 'arn:aws:iam::111122223333:user/Alice, arn:aws:iam::444455556666:role/Bob, 123456789012'.

servicePrincipals (Optional), Type: CSV

Comma-separated list of service principals, for example 'cloudtrail.amazonaws.com, lambda.amazonaws.com'.

federatedUsers (Optional), Type: CSV

Comma-separated list of identity providers for web identity federation such as Amazon Cognito and SAML identity providers. For example 'cognito-identity.amazonaws.com, arn:aws:iam::111122223333:saml-provider/my-provider'.

ipAddresses (Optional), Type: CSV

Comma-separated list of CIDR formatted IP addresses, for example '10.0.0.1, 192.168.1.0/24, 2001:db8::/32'.

vpcls (Optional), Type: CSV

Comma-separated list of Amazon Virtual Private Clouds (Amazon VPC) IDs, for example 'vpc-1234abc0, vpc-ab1234c0'.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### s3-bucket-policy-not-more-permissive

Checks if your Amazon Simple Storage Service bucket policies do not allow other inter-account permissions than the control Amazon S3 bucket policy that you provide.

**Note**

If you provide an invalid parameter value, you will see the following error: Value for controlPolicy parameter must be an Amazon S3 bucket policy.

**Identifier:** S3\_BUCKET\_POLICY\_NOT\_MORE\_PERMISSIVE

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

controlPolicy, Type: String

Amazon S3 bucket policy that defines an upper bound on the permissions of your S3 buckets. The policy can be a maximum of 1024 characters long.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### s3-bucket-public-read-prohibited

Checks if your Amazon S3 buckets do not allow public read access. The rule checks the Block Public Access settings, the bucket policy, and the bucket access control list (ACL).

The rule is compliant when both of the following are true:

- The Block Public Access setting restricts public policies or the bucket policy does not allow public read access.
- The Block Public Access setting restricts public ACLs or the bucket ACL does not allow public read access.

The rule is noncompliant when:

- If the Block Public Access setting does not restrict public policies, AWS Config evaluates whether the policy allows public read access. If the policy allows public read access, the rule is noncompliant.
- If the Block Public Access setting does not restrict public bucket ACLs, AWS Config evaluates whether the bucket ACL allows public read access. If the bucket ACL allows public read access, the rule is noncompliant.

**Identifier:** S3\_BUCKET\_PUBLIC\_READ\_PROHIBITED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### s3-bucket-public-write-prohibited

Checks if your Amazon S3 buckets do not allow public write access. The rule checks the Block Public Access settings, the bucket policy, and the bucket access control list (ACL).

The rule is compliant when both of the following are true:

- The Block Public Access setting restricts public policies or the bucket policy does not allow public write access.
- The Block Public Access setting restricts public ACLs or the bucket ACL does not allow public write access.

The rule is noncompliant when:

- If the Block Public Access setting does not restrict public policies, AWS Config evaluates whether the policy allows public write access. If the policy allows public write access, the rule is noncompliant.
- If the Block Public Access setting does not restrict public bucket ACLs, AWS Config evaluates whether the bucket ACL allows public write access. If the bucket ACL allows public write access, the rule is noncompliant.

**Identifier:** S3\_BUCKET\_PUBLIC\_WRITE\_PROHIBITED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### s3-bucket-replication-enabled

Checks whether the Amazon S3 buckets have cross-region replication enabled.

**Identifier:** S3\_BUCKET\_REPLICATION\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-bucket-server-side-encryption-enabled

Checks that your Amazon S3 bucket either has Amazon S3 default encryption enabled or that the S3 bucket policy explicitly denies `put-object` requests without server side encryption that uses AES-256 or AWS Key Management Service.

**Identifier:** S3\_BUCKET\_SERVER\_SIDE\_ENCRYPTION\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-bucket-ssl-requests-only

Checks if S3 buckets have policies that require requests to use Secure Socket Layer (SSL). The rule is COMPLIANT if buckets explicitly deny access to HTTP requests. The rule is NON\_COMPLIANT if bucket policies allow HTTP requests.

**Identifier:** S3\_BUCKET\_SSL\_REQUESTS\_ONLY

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-bucket-versioning-enabled

Checks if versioning is enabled for your S3 buckets. Optionally, the rule checks if MFA delete is enabled for your S3 buckets.

**Identifier:** S3\_BUCKET\_VERSIONING\_ENABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

isMfaDeleteEnabled (Optional), Type: String

MFA delete is enabled for your S3 buckets.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## s3-default-encryption-kms

Checks whether the Amazon S3 buckets are encrypted with AWS Key Management Service(AWS KMS). The rule is NON\_COMPLIANT if the Amazon S3 bucket is not encrypted with AWS KMS key.

**Identifier:** S3\_DEFAULT\_ENCRYPTION\_KMS

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

kmsKeyArns (Optional), Type: CSV

Comma separated list of AWS KMS key ARNs allowed for encrypting Amazon S3 Buckets.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## sagemaker-endpoint-configuration-kms-key-configured

Checks whether AWS Key Management Service (KMS) key is configured for an Amazon SageMaker endpoint configuration. The rule is NON\_COMPLIANT if 'KmsKeyId' is not specified for the Amazon SageMaker endpoint configuration.

**Identifier:** SAGEMAKER\_ENDPOINT\_CONFIGURATION\_KMS\_KEY\_CONFIGURED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

kmsKeyArns (Optional), Type: String

Comma-separated list of specific AWS KMS key ARNs allowed for an Amazon SageMaker endpoint configuration.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## sagemaker-notebook-instance-kms-key-configured

Check whether an AWS Key Management Service (KMS) key is configured for an Amazon SageMaker notebook instance. The rule is NON\_COMPLIANT if 'KmsKeyId' is not specified for the Amazon SageMaker notebook instance.

**Identifier:** SAGEMAKER\_NOTEBOOK\_INSTANCE\_KMS\_KEY\_CONFIGURED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

kmsKeyArns (Optional), Type: String

Comma-separated list of AWS KMS key ARNs allowed for an Amazon SageMaker notebook instance.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## sagemaker-notebook-no-direct-internet-access

Checks whether direct internet access is disabled for an Amazon SageMaker notebook instance. The rule is NON\_COMPLIANT if Amazon SageMaker notebook instances are internet-enabled.

**Identifier:** SAGEMAKER\_NOTEBOOK\_NO\_DIRECT\_INTERNET\_ACCESS

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## secretsmanager-rotation-enabled-check

Checks if AWS Secrets Manager secret has rotation enabled. The rule also checks an optional `maximumAllowedRotationFrequency` parameter. If the parameter is specified, the rotation frequency of the secret is compared with the maximum allowed frequency. The rule is NON\_COMPLIANT if the

secret is not scheduled for rotation. The rule is also NON\_COMPLIANT if the rotation frequency is higher than the number specified in the maximumAllowedRotationFrequency parameter.

**Note**

Re-evaluating this rule within 4 hours of the first evaluation will have no effect on the results.

**Identifier:** SECRESMANAGER\_ROTATION\_ENABLED\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka) Region

**Parameters:**

maximumAllowedRotationFrequency (Optional), Type: int

Maximum allowed rotation frequency of the secret in days.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## secretsmanager-scheduled-rotation-success-check

Checks whether AWS Secrets Manager secret rotation has rotated successfully as per the rotation schedule. The rule returns NON\_COMPLIANT if RotationOccurringAsScheduled is false.

**Note**

The rule returns NOT\_APPLICABLE for secrets without rotation.

**Identifier:** SECRESMANAGER\_SCHEDULED\_ROTATION\_SUCCESS\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except Asia Pacific (Osaka) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## secretsmanager-secret-periodic-rotation

Checks if AWS Secrets Manager secrets have been rotated in the past specified number of days. The rule is NON\_COMPLIANT if a secret has not been rotated for more than 'maxDaysSinceRotation' number of days. The default value is 90 days.

**Identifier:** SECRESMANAGER\_SECRET\_PERIODIC\_ROTATION

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

maxDaysSinceRotation (Optional), Type: int

Maximum number of days in which a secret can remain unchanged. The default value is 90 days.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## secretsmanager-secret-unused

Checks if AWS Secrets Manager secrets have been accessed within a specified number of days. The rule is NON\_COMPLIANT if a secret has not been accessed in 'unusedForDays' number of days. The default value is 90 days.

**Identifier:** SECRETSMANAGER\_SECRET\_UNUSED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

unusedForDays (Optional), Type: int

The number of days in which a secret can remain unused. The default value is 90 days.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## secretsmanager-using-cmk

Checks if all secrets in AWS Secrets Manager are encrypted using an AWS Key Management Service (AWS KMS) customer master key (CMK). This rule is COMPLIANT if a secret is encrypted using an AWS KMS CMK. This rule is NON\_COMPLIANT if a secret is encrypted using the default AWS KMS key.

**Identifier:** SECRETSMANAGER\_USING\_CMK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

kmsKeyArns (Optional), Type: CSV

Comma-separated list of KMS key Amazon Resource Names (ARNs) to check if the keys are used in the encryption.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## securityhub-enabled

Checks that AWS Security Hub is enabled for an AWS Account. The rule is NON\_COMPLIANT if AWS Security Hub is not enabled.

**Identifier:** SECURITYHUB\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## service-vpc-endpoint-enabled

Checks whether Service Endpoint for the service provided in rule parameter is created for each Amazon VPC. The rule returns NON\_COMPLIANT if an Amazon VPC doesn't have a VPC endpoint created for the service.

**Identifier:** SERVICE\_VPC\_ENDPOINT\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

serviceName, Type: String

The short name or suffix for the service. Note: To get a list of available service names or valid suffix list, use DescribeVpcEndpointServices.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## shield-advanced-enabled-autorenew

Checks if AWS Shield Advanced is enabled in your AWS account and this subscription is set to automatically renew.

**Note**

The API endpoint of AWS Shield Advanced is only available in US East (N. Virginia) Region. This rule should only be scheduled to run in the US East (N. Virginia) Region.

**Identifier:** SHIELD\_ADVANCED\_ENABLED\_AUTORENEW

**Trigger type:** Periodic

**AWS Region:** Only available in US East (N. Virginia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## shield-drt-access

Checks if the DDoS response team (DRT) can access your AWS account. The rule is NON\_COMPLIANT if AWS Shield Advanced is enabled but the role for DRT access is not configured.

**Identifier:** SHIELD\_DRT\_ACCESS

**Trigger type:** Periodic

**AWS Region:** Only available in US East (N. Virginia) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## sns-encrypted-kms

Checks if Amazon SNS topic is encrypted with AWS Key Management Service (AWS KMS). The rule is NON\_COMPLIANT if the Amazon SNS topic is not encrypted with AWS KMS. The rule is also NON\_COMPLIANT when encrypted KMS key is not present in `kmsKeyIds` input parameter.

**Identifier:** SNS\_ENCRYPTED\_KMS

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

`kmsKeyIds` (Optional), Type: CSV

Comma separated list of AWS KMS key ARNs allowed for encrypting Amazon SNS Topic.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## subnet-auto-assign-public-ip-disabled

Checks if Amazon Virtual Private Cloud (Amazon VPC) subnets are assigned a public IP address. The rule is COMPLIANT if Amazon VPC does not have subnets that are assigned a public IP address. The rule is NON\_COMPLIANT if Amazon VPC has subnets that are assigned a public IP address.

**Identifier:** SUBNET\_AUTO\_ASSIGN\_PUBLIC\_IP\_DISABLED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## vpc-default-security-group-closed

Checks that the default security group of any Amazon Virtual Private Cloud (VPC) does not allow inbound or outbound traffic. The rule returns NOT\_APPLICABLE if the security group is not default. The rule is NON\_COMPLIANT if the default security group has one or more inbound or outbound traffic.

**Identifier:** VPC\_DEFAULT\_SECURITY\_GROUP\_CLOSED

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

### AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## vpc-flow-logs-enabled

Checks whether Amazon Virtual Private Cloud flow logs are found and enabled for Amazon VPC.

**Identifier:** VPC\_FLOW\_LOGS\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions

**Parameters:**

trafficType (Optional), Type: String

TrafficType of flow logs

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### vpc-network-acl-unused-check

Checks if there are unused network access control lists (network ACLs). The rule is COMPLIANT if each network ACL is associated with a subnet. The rule is NON\_COMPLIANT if a network ACL is not associated with a subnet.

**Identifier:** VPC\_NETWORK\_ACL\_UNUSED\_CHECK

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### vpc-sg-open-only-to-authorized-ports

Checks whether any security groups with inbound 0.0.0.0/0 have TCP or UDP ports accessible. The rule is NON\_COMPLIANT when a security group with inbound 0.0.0.0/0 has a port accessible which is not specified in the rule parameters.

**Identifier:** VPC\_SG\_OPEN\_ONLY\_TO\_AUTHORIZED\_PORTS

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions

**Parameters:**

authorizedTcpPorts (Optional), Type: String

Comma-separated list of TCP ports authorized to be open to 0.0.0.0/0. Ranges are defined by dash, for example, "443,1020-1025".

authorizedUdpPorts (Optional), Type: String

Comma-separated list of UDP ports authorized to be open to 0.0.0.0/0. Ranges are defined by dash, for example, "500,1020-1025".

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

### vpc-vpn-2-tunnels-up

Checks that both VPN tunnels provided by AWS Site-to-Site VPN are in UP status. The rule returns NON\_COMPLIANT if one or both tunnels are in DOWN status.

**Identifier:** VPC\_VPN\_2\_TUNNELS\_UP

**Trigger type:** Configuration changes

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), Middle East (Bahrain) Region

**Parameters:**

None

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## wafv2-logging-enabled

Checks whether logging is enabled on AWS Web Application Firewall (WAFV2) regional and global web access control list (ACLs). The rule is NON\_COMPLIANT if the logging is enabled but the logging destination does not match the value of the parameter.

**Identifier:** WAFV2\_LOGGING\_ENABLED

**Trigger type:** Periodic

**AWS Region:** All supported AWS regions except China (Beijing), China (Ningxia), AWS GovCloud (US-East), AWS GovCloud (US-West), Asia Pacific (Osaka), Europe (Milan), Africa (Cape Town) Region

**Parameters:**

KinesisFirehoseDeliveryStreamArns (Optional), Type: CSV

Comma separated list of Kinesis Firehose delivery stream ARNs

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

## waf-classic-logging-enabled

Checks if logging is enabled on AWS Web Application Firewall (WAF) classic global web ACLs. This rule is NON\_COMPLIANT for a global web ACL, if it does not have logging enabled.

**Identifier:** WAF\_CLASSIC\_LOGGING\_ENABLED

**Trigger type:** Periodic

**AWS Region:** Only available in US East (N. Virginia) Region

**Parameters:**

KinesisFirehoseDeliveryStreamArns (Optional), Type: CSV

Comma separated list of Amazon Kinesis stream ARN for AWS WAF logs.

## AWS CloudFormation template

To create AWS Config managed rules with AWS CloudFormation templates, see [Creating AWS Config Managed Rules With AWS CloudFormation Templates \(p. 192\)](#).

# Working with AWS Config Managed Rules

You can set up and activate AWS managed rules from the AWS Management Console, AWS CLI, or AWS Config API.

## Setting Up and Activating an AWS Managed Rule (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
3. In the left navigation, choose **Rules**.
4. On the **Rules** page, choose **Add rule**.
5. On the **Rules** page, you can do the following:
  - Type in the search field to filter results by rule name, description, and label. For example, type **EC2** to return rules that evaluate EC2 resource types or type **periodic** to return rules that are triggered periodically.
  - Choose the arrow icon to see the next page of rules. Recently added rules are marked as **New**.
6. Choose a rule that you want to create.
7. On the **Configure rule** page, configure the rule by completing the following steps:
  - a. For **Name**, type a unique name for the rule.
  - b. If the trigger types for your rule include **Configuration changes**, specify one of the following options for **Scope of changes** with which AWS Config invokes your Lambda function:
    - **Resources** – When a resource that matches the specified resource type, or the type plus identifier, is created, changed, or deleted.
    - **Tags** – When a resource with the specified tag is created, changed, or deleted.
    - **All changes** – When a resource recorded by AWS Config is created, changed, or deleted.
  - c. If the trigger types for your rule include **Periodic**, specify the **Frequency** with which AWS Config invokes your Lambda function.
  - d. If your rule includes parameters in the **Rule parameters** section, you can customize the values for the provided keys. A parameter is an attribute that your resources must have before they are considered COMPLIANT with the rule.
8. Choose **Save**. Your new rule displays on the **Rules** page.

**Compliance** will display **Evaluating...** until AWS Config has evaluation results for your rule. A summary of the results appears after several minutes. You can update the results with the refresh button.

If the rule or function is not working as expected, you might see one of the following for **Compliance**:

- **No results reported** - AWS Config evaluated your resources against the rule. The rule did not apply to the AWS resources in its scope, the specified resources were deleted, or the evaluation results were deleted. To get evaluation results, update the rule, change its scope, or choose **Re-evaluate**.

This message may also appear if the rule didn't report evaluation results.

- **No resources in scope** - AWS Config cannot evaluate your recorded AWS resources against this rule because none of your resources are within the rule's scope. To get evaluation results, edit the rule and change its scope, or add resources for AWS Config to record by using the **Settings** page.
- **Evaluations failed** - For information that can help you determine the problem, choose the rule name to open its details page and see the error message.

## Activating an AWS Managed Rule (AWS CLI)

Use the `put-config-rule` command.

## Activating an AWS Managed Rule (API)

Use the `PutConfigRule` action.

# Creating AWS Config Managed Rules With AWS CloudFormation Templates

For supported AWS Config managed rules, you can use the AWS CloudFormation templates to create the rule for your account or update an existing AWS CloudFormation stack. A stack is a collection of related resources that you provision and update as a single unit. When you launch a stack with a template, the AWS Config managed rule is created for you. The templates create only the rule, and don't create additional AWS resources.

### Note

When AWS Config managed rules are updated, the templates are updated for the latest changes. To save a specific version of a template for a rule, download the template, and upload it to your S3 bucket.

For more information about working with AWS CloudFormation templates, see [Getting Started with AWS CloudFormation](#) in the *AWS CloudFormation User Guide*.

### To launch an AWS CloudFormation stack for an AWS Config managed rule

1. Go to the [CloudFormation console](#) and create a new stack.
2. For **Specify template**:
  - If you downloaded the template, choose **Upload a template file**, and then **Choose file** to upload the template.
  - You can also choose **Amazon S3 URL**, and enter the template URL `s3.amazonaws.com/aws-configservice-us-east-1/cloudformation-templates-for-managed-rules/THE_RULE_IDENTIFIER.template`.

### Note

The rule identifier should be written in ALL\_CAPS\_WITH\_UNDERSCORES. For example, `CLOUDWATCH_LOG_GROUP_ENCRYPTED` instead of `cloudwatch-log-group-encrypted`.

3. Choose **Next**.
4. For **Specify stack details**, type a stack name and enter parameter values for the AWS Config rule. For example, if you are using the `DESIRED_INSTANCE_TYPE` managed rule template, you can specify the instance type such as "m4.large".
5. Choose **Next**.

6. For **Options**, you can create tags or configure other advanced options. These are not required.
7. Choose **Next**.
8. For **Review**, verify that the template, parameters, and other options are correct.
9. Choose **Create**. The stack is created in a few minutes. You can view the created rule in the [AWS Config console](#).

You can use the templates to create a single stack for AWS Config managed rules or update an existing stack in your account. If you delete a stack, the managed rules created from that stack are also deleted. For more information, see [Working with Stacks](#) in the *AWS CloudFormation User Guide*.

## AWS Config Custom Rules

You can develop custom rules and add them to AWS Config. You associate each custom rule with an AWS Lambda function, which contains the logic that evaluates whether your AWS resources comply with the rule.

You associate this function with your rule, and the rule invokes the function either in response to configuration changes or periodically. The function then evaluates whether your resources comply with your rule, and sends its evaluation results to AWS Config.

The exercise in [Getting Started with Custom Rules for AWS Config \(p. 193\)](#) guides you through creating a custom rule for the first time. It includes an example function that you can add to AWS Lambda with no modification.

To learn how AWS Lambda functions work and how to develop them, see the [AWS Lambda Developer Guide](#).

### Topics

- [Getting Started with Custom Rules for AWS Config \(p. 193\)](#)
- [Developing a Custom Rule for AWS Config \(p. 195\)](#)
- [Example AWS Lambda Functions and Events for AWS Config Rules \(p. 199\)](#)

## Getting Started with Custom Rules for AWS Config

This procedure guides you through the process of creating a custom rule that evaluates whether each of your EC2 instances is the t2.micro type. AWS Config will run event-based evaluations for this rule, meaning it will check your instance configurations each time AWS Config detects a configuration change in an instance. AWS Config will flag t2.micro instances as compliant and all other instances as noncompliant. The compliance status will appear in the AWS Config console.

To have the best outcome with this procedure, you should have one or more EC2 instances in your AWS account. Your instances should include a combination of at least one t2.micro instance and other types.

To create this rule, first, you will create an AWS Lambda function by customizing a blueprint in the AWS Lambda console. Then, you will create a custom rule in AWS Config, and you will associate the rule with the function.

### Topics

- [Creating an AWS Lambda Function for a Custom Config Rule \(p. 194\)](#)
- [Creating a Custom Rule \(p. 194\)](#)

## Creating an AWS Lambda Function for a Custom Config Rule

1. Sign in to the AWS Management Console and open the AWS Lambda console at <https://console.aws.amazon.com/lambda/>.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
3. In the AWS Lambda console, choose **Create a Lambda function**.
4. On the **Select blueprint** page, for **filter**, type **config-rule-change-triggered**. Select the blueprint in the filter results.
5. On the **Configure triggers** page, choose **Next**.
6. On the **Configure function** page, complete the following steps:
  - a. For **Name**, type **InstanceTypeCheck**.
  - b. For **Runtime**, keep **Node.js**.
  - c. For **Code entry type**, keep **Edit code inline**. The Node.js code for your function is provided in the code editor. For this procedure, you do not need to change the code.
  - d. For **Handler**, keep **index.handler**.
  - e. For **Role**, choose **Create new role from template(s)**.
  - f. For **Role name**, type a name.
  - g. For **Policy templates**, choose **AWS Config Rules permission**.
  - h. On the **Configure function** page, choose **Next**.
  - i. On the **Review page**, verify the details about your function, and choose **Create function**. The AWS Lambda console displays your function.
7. To verify that your function is set up correctly, test it with the following steps:
  - a. Choose **Actions**, and then choose **Configure test event**.
  - b. In the **Input test event** window, for **Sample event template**, choose **AWS Config Change Triggered Rule**.
  - c. Choose **Save and test**. AWS Lambda tests your function with the example event. If your function is working as expected, an error message similar to the following appears under **Execution result**:

```
{
  "errorMessage": "Result Token provided is invalid",
  "errorType": "InvalidResultTokenException",
  . . .
}
```

The `InvalidResultTokenException` is expected because your function runs successfully only when it receives a *result token* from AWS Config. The result token identifies the AWS Config rule and the event that caused the evaluation, and the result token associates an evaluation with a rule. This exception indicates that your function has the permission it needs to send results to AWS Config. Otherwise, the following error message appears: `not authorized to perform: config:PutEvaluations`. If this error occurs, update the role that you assigned to your function to allow the `config:PutEvaluations` action, and test your function again.

## Creating a Custom Rule

1. Open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. In the AWS Management Console menu, verify that the region selector is set to the same region in which you created the AWS Lambda function for your custom rule.

3. On the **Rules** page, choose **Add rule**.
4. On the **Add rule** page, choose **Add custom rule**.
5. On the **Configure rule** page, complete the following steps:
  - a. For **Name**, type **InstanceTypesAreT2micro**.
  - b. For **Description**, type **Evaluates whether EC2 instances are the t2.micro type**.
  - c. For **AWS Lambda function ARN**, specify the ARN that AWS Lambda assigned to your function.

**Note**

The ARN that you specify in this step must not include the `$LATEST` qualifier. You can specify an ARN without a version qualifier or with any qualifier besides `$LATEST`. AWS Lambda supports function versioning, and each version is assigned an ARN with a qualifier. AWS Lambda uses the `$LATEST` qualifier for the latest version.

- d. For **Trigger type**, choose **Configuration changes**.
  - e. For **Scope of changes**, choose **Resources**.
  - f. For **Resources**, choose **Instance**.
  - g. In the **Rule parameters** section, you must specify the rule parameter that your AWS Lambda function evaluates and the desired value. The function for this procedure evaluates the `desiredInstanceType` parameter.
- For **Key**, type **desiredInstanceType**. For **Value**, type **t2.micro**.
6. Choose **Save**. Your new rule displays on the **Rules** page.

**Compliance** will display **Evaluating...** until AWS Config receives evaluation results from your AWS Lambda function. If the rule and the function are working as expected, a summary of the results appears after several minutes. For example, a result of **2 noncompliant resource(s)** indicates that 2 of your instances are not `t2.micro` instances, and a result of **Compliant** indicates that all instances are `t2.micro`. You can update the results with the refresh button.

If the rule or function is not working as expected, you might see one of the following for **Compliance**:

- **No results reported** - AWS Config evaluated your resources against the rule. The rule did not apply to the AWS resources in its scope, the specified resources were deleted, or the evaluation results were deleted. To get evaluation results, update the rule, change its scope, or choose **Re-evaluate**.

Verify that the scope includes **Instance** for **Resources**, and try again.

- **No resources in scope** - AWS Config cannot evaluate your recorded AWS resources against this rule because none of your resources are within the rule's scope. To get evaluation results, edit the rule and change its scope, or add resources for AWS Config to record by using the **Settings** page.

Verify that AWS Config is recording EC2 instances.

- **Evaluations failed** - For information that can help you determine the problem, choose the rule name to open its details page and see the error message.

If your rule works correctly and AWS Config provides evaluation results, you can learn which conditions affect the compliance status of your rule. You can learn which resources, if any, are noncompliant, and why. For more information, see [Viewing Configuration Compliance \(p. 98\)](#).

## Developing a Custom Rule for AWS Config

Complete the following procedure to create a custom rule. To create a custom rule, you first create an AWS Lambda function, which contains the evaluation logic for the rule. Then you associate the function with a custom rule that you create in AWS Config.

## Contents

- [Creating an AWS Lambda Function for a Custom Config Rule \(p. 196\)](#)
- [Creating a Custom Rule in AWS Config \(p. 197\)](#)
- [Evaluating Additional Resource Types \(p. 198\)](#)

## Creating an AWS Lambda Function for a Custom Config Rule

A *Lambda function* is custom code that you upload to AWS Lambda, and it is invoked by events that are published to it by an event source. If the Lambda function is associated with a Config rule, AWS Config invokes it when the rule's trigger occurs. The Lambda function then evaluates the configuration information that is sent by AWS Config, and it returns the evaluation results. For more information about Lambda functions, see [Function and Event Sources](#) in the *AWS Lambda Developer Guide*.

You can use a programming language that is supported by AWS Lambda to create a Lambda function for a custom rule. To make this task easier, you can customize an AWS Lambda blueprint or reuse a sample function from the AWS Config Rules GitHub repository.

### AWS Lambda blueprints

The AWS Lambda console provides sample functions, or *blueprints*, which you can customize by adding your own evaluation logic. When you create a function, you can choose one of the following blueprints:

- **config-rule-change-triggered** – Triggered when your AWS resource configurations change.
- **config-rule-periodic** – Triggered at a frequency that you choose (for example, every 24 hours).

### AWS Config Rules GitHub repository

A public repository of sample functions for custom rules is available on GitHub, a web-based code hosting and sharing service. The sample functions are developed and contributed by the AWS community. If you want to use a sample, you can copy its code into a new AWS Lambda function. To view the repository, see <https://github.com/aws-labs/aws-config-rules/>.

### To create the function for your custom rule

1. Sign in to the AWS Management Console and open the AWS Lambda console at <https://console.aws.amazon.com/lambda/>.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
3. Choose **Create a Lambda function**.
4. On the **Select blueprint** page, you can choose one of the blueprint functions for AWS Config rules as a starting point, or you can proceed without a blueprint by choosing **Skip**.
5. On the **Configure triggers** page, choose **Next**.
6. On the **Configure function** page, type a name and description.
7. For **Runtime**, choose the programming language in which your function is written.
8. For **Code entry type**, choose your preferred entry type. If you are using a blueprint, keep **Edit code inline**.
9. Provide your code using the method required by the code entry type that you selected. If you are using a blueprint, the function code is provided in the code editor, and you can customize it to include your own evaluation logic. Your code can evaluate the event data that AWS Config provides when it invokes your function:

- For functions based on the **config-rule-change-triggered** blueprint, or for functions triggered by configuration changes, the event data is the configuration item or an oversized configuration item object for the AWS resource that changed.
  - For functions based on the **config-rule-periodic** blueprint, or for functions triggered at a frequency that you choose, the event data is a JSON object that includes information about when the evaluation was triggered.
  - For both types of functions, AWS Config passes rule parameters in JSON format. You can define which rule parameters are passed when you create the custom rule in AWS Config.
  - For example events that AWS Config publishes when it invokes your function, see [Example Events for AWS Config Rules \(p. 204\)](#).
10. For **Handler**, specify the handler for your function. If you are using a blueprint, keep the default value.
  11. For **Role**, choose **Create new role from template(s)**.
  12. For **Role name**, type a name.
  13. For **Policy templates**, choose **AWS Config Rules permission**.
  14. On the **Configure function** page, choose **Next**.
  15. On the **Review page**, verify the details about your function, and choose **Create function**.

## Creating a Custom Rule in AWS Config

Use AWS Config to create a custom rule and associate the rule with a Lambda function.

### To create a custom rule

1. Open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. In the AWS Management Console menu, verify that the region selector is set to the same region in which you created the AWS Lambda function for your custom rule.
3. On the **Rules** page, choose **Add rule**.
4. On the **Add rule** page, choose **Add custom rule**.
5. On the **Configure rule** page, type a name and description.
6. For **AWS Lambda function ARN**, specify the ARN that AWS Lambda assigned to your function.

#### Note

The ARN that you specify in this step must not include the `$LATEST` qualifier. You can specify an ARN without a version qualifier or with any qualifier besides `$LATEST`. AWS Lambda supports function versioning, and each version is assigned an ARN with a qualifier. AWS Lambda uses the `$LATEST` qualifier for the latest version.

7. For **Trigger type**, choose one or both of the following:
  - **Configuration changes** – AWS Config invokes your Lambda function when it detects a configuration change.
  - **Periodic** – AWS Config invokes your Lambda function at the frequency that you choose (for example, every 24 hours).
8. If the trigger types for your rule include **Configuration changes**, specify one of the following options for **Scope of changes** with which AWS Config invokes your Lambda function:
  - **Resources** – When a resource that matches the specified resource type, or the type plus identifier, is created, changed, or deleted.
  - **Tags** – When a resource with the specified tag is created, changed, or deleted.
  - **All changes** – When a resource recorded by AWS Config is created, changed, or deleted.

9. If the trigger types for your rule include **Periodic**, specify the **Frequency** with which AWS Config invokes your Lambda function.
10. In the **Rule parameters** section, specify any rule parameters that your AWS Lambda function evaluates and the desired value.
11. Choose **Save**. Your new rule displays on the **Rules** page.

**Compliance** will display **Evaluating...** until AWS Config receives evaluation results from your AWS Lambda function. If the rule and the function are working as expected, a summary of results appears after several minutes. You can update the results with the refresh button.

If the rule or function is not working as expected, you might see one of the following for **Compliance**:

- **No results reported** - AWS Config evaluated your resources against the rule. The rule did not apply to the AWS resources in its scope, the specified resources were deleted, or the evaluation results were deleted. To get evaluation results, update the rule, change its scope, or choose **Re-evaluate**.

This message may also appear if the rule didn't report evaluation results.

- **No resources in scope** - AWS Config cannot evaluate your recorded AWS resources against this rule because none of your resources are within the rule's scope. You can choose which resources AWS Config records on the **Settings** page.
- **Evaluations failed** - For information that can help you determine the problem, choose the rule name to open its details page and see the error message.

#### Note

When you create a custom rule with the AWS Config console, the appropriate permissions are automatically created for you. If you create a custom rule with the AWS CLI, you need to give AWS Config permission to invoke your Lambda function, using the `aws lambda add-permission` command. For more information, see [Using Resource-Based Policies for AWS Lambda \(Lambda Function Policies\)](#) in the *AWS Lambda Developer Guide*.

## Evaluating Additional Resource Types

You can create custom rules to run evaluations for resource types not yet recorded by AWS Config. This is useful if you want to evaluate compliance for additional resource types that AWS Config doesn't currently record. For a list of additional resource types that you can evaluate with custom rules, see [AWS Resource Types Reference](#).

#### Note

The list in the AWS CloudFormation User Guide may contain recently added resource types that are not yet available for creating custom rules in AWS Config. AWS Config adds resource types support at regular intervals.

#### Example

1. You want to evaluate Amazon S3 Glacier vaults in your account. Amazon S3 Glacier vault resources are currently not recorded by AWS Config.
2. You create an AWS Lambda function that evaluates whether your Amazon S3 Glacier vaults comply with your account requirements.
3. You create a custom rule named **evaluate-glacier-vaults** and then assign your AWS Lambda function to the rule.
4. AWS Config invokes your Lambda function and then evaluates the Amazon S3 Glacier vaults against your rule.
5. AWS Config returns the evaluations and you can view the compliance results for your rule.

### Note

You can view the configuration details in the AWS Config timeline and look up resources in the AWS Config console for resources that AWS Config supports. If you configured AWS Config to record all resource types, newly supported resources will automatically be recorded. For more information, see [Supported Resource Types \(p. 9\)](#).

## Example AWS Lambda Functions and Events for AWS Config Rules

Each custom Config rule is associated with an AWS Lambda *function*, which is custom code that contains the evaluation logic for the rule. When the trigger for a Config rule occurs (for example, when AWS Config detects a configuration change), AWS Config invokes the rule's Lambda function by publishing an *event*, which is a JSON object that provides the configuration data that the function evaluates.

For more information about functions and events in AWS Lambda, see [Function and Event Sources](#) in the *AWS Lambda Developer Guide*.

### Topics

- [Example AWS Lambda Functions for AWS Config Rules \(Node.js\) \(p. 199\)](#)
- [Example Events for AWS Config Rules \(p. 204\)](#)

## Example AWS Lambda Functions for AWS Config Rules (Node.js)

AWS Lambda executes functions in response to events that are published by AWS services. The function for a custom Config rule receives an event that is published by AWS Config, and the function then uses data that it receives from the event and that it retrieves from the AWS Config API to evaluate the compliance of the rule. The operations in a function for a Config rule differ depending on whether it performs an evaluation that is triggered by configuration changes or triggered periodically.

For information about common patterns within AWS Lambda functions, see [Programming Model](#) in the *AWS Lambda Developer Guide*.

### Contents

- [Example Function for Evaluations Triggered by Configuration Changes \(p. 199\)](#)
- [Example Function for Periodic Evaluations \(p. 202\)](#)

## Example Function for Evaluations Triggered by Configuration Changes

AWS Config will invoke a function like the following example when it detects a configuration change for a resource that is within a custom rule's scope.

If you use the AWS Config console to create a rule that is associated with a function like this example, choose **Configuration changes** as the trigger type. If you use the AWS Config API or AWS CLI to create the rule, set the `MessageType` attribute to `ConfigurationItemChangeNotification` and `OversizedConfigurationItemChangeNotification`. These settings enable your rule to be triggered whenever AWS Config generates a configuration item or an oversized configuration item as a result of a resource change.

This example evaluates your resources and checks whether the instances match the resource type, `AWS::EC2::Instance`. The rule is triggered when AWS Config generates a configuration item or an oversized configuration item notification.

```
'use strict';
```

```
const aws = require('aws-sdk');

const config = new aws.ConfigService();

// Helper function used to validate input
function checkDefined(reference, referenceName) {
  if (!reference) {
    throw new Error(`Error: ${referenceName} is not defined`);
  }
  return reference;
}

// Check whether the message type is OversizedConfigurationItemChangeNotification,
function isOverSizedChangeNotification(messageType) {
  checkDefined(messageType, 'messageType');
  return messageType === 'OversizedConfigurationItemChangeNotification';
}

// Get the configurationItem for the resource using the getResourceConfigHistory API.
function getConfiguration(resourceType, resourceId, configurationCaptureTime, callback) {
  config.getResourceConfigHistory({ resourceType, resourceId, laterTime: new
  Date(configurationCaptureTime), limit: 1 }, (err, data) => {
    if (err) {
      callback(err, null);
    }
    const configurationItem = data.configurationItems[0];
    callback(null, configurationItem);
  });
}

// Convert the oversized configuration item from the API model to the original invocation
model.
function convertApiConfiguration(apiConfiguration) {
  apiConfiguration.awsAccountId = apiConfiguration.accountId;
  apiConfiguration.ARN = apiConfiguration.arn;
  apiConfiguration.configurationStateMd5Hash = apiConfiguration.configurationItemMD5Hash;
  apiConfiguration.configurationItemVersion = apiConfiguration.version;
  apiConfiguration.configuration = JSON.parse(apiConfiguration.configuration);
  if ({}.hasOwnProperty.call(apiConfiguration, 'relationships')) {
    for (let i = 0; i < apiConfiguration.relationships.length; i++) {
      apiConfiguration.relationships[i].name =
      apiConfiguration.relationships[i].relationshipName;
    }
  }
  return apiConfiguration;
}

// Based on the message type, get the configuration item either from the configurationItem
object in the invoking event or with the getResourceConfigHistory API in the
getConfiguration function.
function getConfigurationItem(invokingEvent, callback) {
  checkDefined(invokingEvent, 'invokingEvent');
  if (isOverSizedChangeNotification(invokingEvent.messageType)) {
    const configurationItemSummary =
    checkDefined(invokingEvent.configurationItemSummary, 'configurationItemSummary');
    getConfiguration(configurationItemSummary.resourceType,
    configurationItemSummary.resourceId,
    configurationItemSummary.configurationItemCaptureTime, (err, apiConfigurationItem) => {
      if (err) {
        callback(err);
      }
      const configurationItem = convertApiConfiguration(apiConfigurationItem);
      callback(null, configurationItem);
    });
  }
}
```

```
    } else {
      checkDefined(invokingEvent.configurationItem, 'configurationItem');
      callback(null, invokingEvent.configurationItem);
    }
  }

  // Check whether the resource has been deleted. If the resource was deleted, then the
  // evaluation returns not applicable.
  function isApplicable(configurationItem, event) {
    checkDefined(configurationItem, 'configurationItem');
    checkDefined(event, 'event');
    const status = configurationItem.configurationItemStatus;
    const eventLeftScope = event.eventLeftScope;
    return (status === 'OK' || status === 'ResourceDiscovered') && eventLeftScope ===
    false;
  }

  // In this example, the resource is compliant if it is an instance and its type matches the
  // type specified as the desired type.
  // If the resource is not an instance, then this resource is not applicable.
  function evaluateChangeNotificationCompliance(configurationItem, ruleParameters) {
    checkDefined(configurationItem, 'configurationItem');
    checkDefined(configurationItem.configuration, 'configurationItem.configuration');
    checkDefined(ruleParameters, 'ruleParameters');

    if (configurationItem.resourceType !== 'AWS::EC2::Instance') {
      return 'NOT_APPLICABLE';
    } else if (ruleParameters.desiredInstanceType ===
    configurationItem.configuration.instanceType) {
      return 'COMPLIANT';
    }
    return 'NON_COMPLIANT';
  }

  // Receives the event and context from AWS Lambda.
  exports.handler = (event, context, callback) => {
    checkDefined(event, 'event');
    const invokingEvent = JSON.parse(event.invokingEvent);
    const ruleParameters = JSON.parse(event.ruleParameters);
    getConfigurationItem(invokingEvent, (err, configurationItem) => {
      if (err) {
        callback(err);
      }
      let compliance = 'NOT_APPLICABLE';
      const putEvaluationsRequest = {};
      if (isApplicable(configurationItem, event)) {
        // Invoke the compliance checking function.
        compliance = evaluateChangeNotificationCompliance(configurationItem,
        ruleParameters);
      }
      // Initializes the request that contains the evaluation results.
      putEvaluationsRequest.Evaluations = [
        {
          ComplianceResourceType: configurationItem.resourceType,
          ComplianceResourceId: configurationItem.resourceId,
          ComplianceType: compliance,
          OrderingTimestamp: configurationItem.configurationItemCaptureTime,
        },
      ];
      putEvaluationsRequest.ResultToken = event.resultToken;

      // Sends the evaluation results to AWS Config.
      config.putEvaluations(putEvaluationsRequest, (error, data) => {
        if (error) {
          callback(error, null);
        } else if (data.FailedEvaluations.length > 0) {

```

```
        // Ends the function if evaluation results are not successfully reported to
AWS Config.
        callback(JSON.stringify(data), null);
    } else {
        callback(null, data);
    }
    });
});
};
```

## Function Operations

The function performs the following operations at runtime:

1. The function runs when AWS Lambda passes the event object to the handler function. AWS Lambda also passes a context object, which contains information and methods that the function can use while it runs. In this example, the function accepts the optional `callback` parameter, which it uses to return information to the caller.
2. The function checks whether the `messageType` for the event is a configuration item or an oversized configuration item, and then returns the configuration item.
3. The handler calls the `isApplicable` function to determine whether the resource was deleted.
4. The handler calls the `evaluateChangeNotificationCompliance` function and passes the `configurationItem` and `ruleParameters` objects that AWS Config published in the event.

The function first evaluates whether the resource is an EC2 instance. If the resource is not an EC2 instance, the function returns a compliance value of `NOT_APPLICABLE`.

The function then evaluates whether the `instanceType` attribute in the configuration item is equal to the `desiredInstanceType` parameter value. If the values are equal, the function returns `COMPLIANT`. If the values are not equal, the function returns `NON_COMPLIANT`.

5. The handler prepares to send the evaluation results to AWS Config by initializing the `putEvaluationsRequest` object. This object includes the `Evaluations` parameter, which identifies the compliance result, the resource type, and the ID of the resource that was evaluated. The `putEvaluationsRequest` object also includes the result token from the event, which identifies the rule and the event for AWS Config.
6. The handler sends the evaluation results to AWS Config by passing the object to the `putEvaluations` method of the `config` client.

## Example Function for Periodic Evaluations

AWS Config will invoke a function like the following example for periodic evaluations. Periodic evaluations occur at the frequency that you specify when you define the rule in AWS Config.

If you use the AWS Config console to create a rule that is associated with a function like this example, choose **Periodic** as the trigger type. If you use the AWS Config API or AWS CLI to create the rule, set the `MessageType` attribute to `ScheduledNotification`.

This example checks whether the total number of a specified resource exceeds a specified maximum.

```
var aws = require('aws-sdk'), // Loads the AWS SDK for JavaScript.
    config = new aws.ConfigService(), // Constructs a service object to use the
    aws.ConfigService class.
    COMPLIANCE_STATES = {
        COMPLIANT : 'COMPLIANT',
        NON_COMPLIANT : 'NON_COMPLIANT',
        NOT_APPLICABLE : 'NOT_APPLICABLE'
    };
```

```

// Receives the event and context from AWS Lambda.
exports.handler = function(event, context, callback) {
    // Parses the invokingEvent and ruleParameters values, which contain JSON objects
    // passed as strings.
    var invokingEvent = JSON.parse(event.invokingEvent),
        ruleParameters = JSON.parse(event.ruleParameters),
        noOfResources = 0;

    if (isScheduledNotification(invokingEvent)) {
        countResourceTypes(ruleParameters.applicableResourceType, "", noOfResources,
function(err, count) {
    if (err === null) {
        var putEvaluationsRequest;
        // Initializes the request that contains the evaluation results.
        putEvaluationsRequest = {
            Evaluations : [ {
                // Applies the evaluation result to the AWS account published in
the event.
                ComplianceResourceType : 'AWS:::Account',
                ComplianceResourceId : event.accountId,
                ComplianceType : evaluateCompliance(ruleParameters.maxCount,
count),
                OrderingTimestamp : new Date()
            } ],
            ResultToken : event.resultToken
        };
        // Sends the evaluation results to AWS Config.
        config.putEvaluations(putEvaluationsRequest, function(err, data) {
            if (err) {
                callback(err, null);
            } else {
                if (data.FailedEvaluations.length > 0) {
                    // Ends the function execution if evaluation results are not
successfully reported
                    callback(JSON.stringify(data));
                }
                callback(null, data);
            }
        });
    } else {
        callback(err, null);
    }
});
    } else {
        console.log("Invoked for a notification other than Scheduled Notification...
Ignoring.");
    }
};

// Checks whether the invoking event is ScheduledNotification.
function isScheduledNotification(invokingEvent) {
    return (invokingEvent.messageType === 'ScheduledNotification');
}

// Checks whether the compliance conditions for the rule are violated.
function evaluateCompliance(maxCount, actualCount) {
    if (actualCount > maxCount) {
        return COMPLIANCE_STATES.NON_COMPLIANT;
    } else {
        return COMPLIANCE_STATES.COMPLIANT;
    }
}

// Counts the applicable resources that belong to the AWS account.
function countResourceTypes(applicableResourceType, nextToken, count, callback) {

```

```

{"OK", "resourceId": "i-00000000", "ARN": "arn:aws:ec2:us-east-2:123456789012:instance/i-00000000", "awsRegion": "us-east-2", "availabilityZone": "us-east-2a",

}

```

## Example Event for Evaluations Triggered by Oversized Configuration Changes

Some resource changes generate oversized configuration items. The following example event shows that the rule was triggered by an oversized configuration change for an EC2 instance.

```

{
  "invokingEvent": {"configurationItemSummary": {"changeType": "UPDATE",
"configurationItemVersion": "1.2", "configurationItemCaptureTime":
"2016-10-06T16:46:16.261Z", "configurationStateId": 0, "awsAccountId": "123456789012",
"configurationItemStatus": "OK", "resourceType": "AWS::EC2::Instance",
"resourceId": "i-00000000", "resourceName": null, "ARN": "arn:aws:ec2:us-
west-2:123456789012:instance/i-00000000", "awsRegion": "us-west-2", "availabilityZone":

  "configRuleId": "config-rule-0123456",
  "accountId": "123456789012",
  "version": "1.0"
}

```

## Example Event for Evaluations Triggered by Periodic Frequency

AWS Config publishes an event when it evaluates your resources at a frequency that you specify (such as every 24 hours). The following example event shows that the rule was triggered by a periodic frequency.

```

{
  "invokingEvent": {"awsAccountId": "123456789012", "notificationCreationTime":
"2016-07-13T21:50:00.373Z", "messageType": "ScheduledNotification", "recordVersion":
"1.0"},
  "ruleParameters": {"myParameterKey": "myParameterValue"},
  "resultToken": "myResultToken",
  "eventLeftScope": false,
  "executionRoleArn": "arn:aws:iam::123456789012:role/config-role",
  "configRuleArn": "arn:aws:config:us-east-2:123456789012:config-rule/config-
rule-0123456",
  "configRuleName": "periodic-config-rule",
  "configRuleId": "config-rule-6543210",
}

```

```
"accountId": "123456789012",  
"version": "1.0"  
}
```

## Event Attributes

The JSON object for an AWS Config event contains the following attributes:

### `invokingEvent`

The event that triggers the evaluation for a rule. If the event is published in response to a resource configuration change, the value for this attribute is a string that contains a JSON `configurationItem` or a `configurationItemSummary` (for oversized configuration items). The configuration item represents the state of the resource at the moment that AWS Config detected the change. For an example of a configuration item, see the output produced by the `get-resource-config-history` AWS CLI command in [Viewing Configuration History \(p. 45\)](#).

If the event is published for a periodic evaluation, the value is a string that contains a JSON object. The object includes information about the evaluation that was triggered.

For each type of event, a function must parse the string with a JSON parser to be able to evaluate its contents, as shown in the following Node.js example:

```
var invokingEvent = JSON.parse(event.invokingEvent);
```

### `ruleParameters`

Key/value pairs that the function processes as part of its evaluation logic. You define parameters when you use the AWS Config console to create a custom rule. You can also define parameters with the `InputParameters` attribute in the `PutConfigRule` AWS Config API request or the `put-config-rule` AWS CLI command.

The JSON code for the parameters is contained within a string, so a function must parse the string with a JSON parser to be able to evaluate its contents, as shown in the following Node.js example:

```
var ruleParameters = JSON.parse(event.ruleParameters);
```

### `resultToken`

A token that the function must pass to AWS Config with the `PutEvaluations` call.

### `eventLeftScope`

A Boolean value that indicates whether the AWS resource to be evaluated has been removed from the rule's scope. If the value is `true`, the function indicates that the evaluation can be ignored by passing `NOT_APPLICABLE` as the value for the `ComplianceType` attribute in the `PutEvaluations` call.

### `executionRoleArn`

The ARN of the IAM role that is assigned to AWS Config.

### `configRuleArn`

The ARN that AWS Config assigned to the rule.

### `configRuleName`

The name that you assigned to the rule that caused AWS Config to publish the event and invoke the function.

`configRuleId`

The ID that AWS Config assigned to the rule.

`accountId`

The ID of the AWS account that owns the rule.

`version`

A version number assigned by AWS. The version will increment if AWS adds attributes to AWS Config events. If a function requires an attribute that is only in events that match or exceed a specific version, then that function can check the value of this attribute.

The current version for AWS Config events is 1.0.

## Managing your AWS Config Rules

You can use the AWS Config console, AWS CLI, and AWS Config API to view, add, and delete your rules.

### Contents

- [Add, View, Update and Delete Rules \(Console\) \(p. 207\)](#)
- [View, Update, and Delete Rules \(AWS CLI\) \(p. 208\)](#)
- [View, Update, and Delete Rules \(API\) \(p. 210\)](#)

## Add, View, Update and Delete Rules (Console)

On the **Rules** page, you can view the rules for the region in your account. You can also see the evaluation status for each rule.

### To view your rules

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. In the AWS Management Console, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
3. Choose **Rules**. The **Rules** page shows all the rule that are currently in your AWS account. It lists the name, associated remediation action, and compliance status of each rule.
  - Choose **Add rule** to get started with creating a rule.
  - Choose a rule to see its settings, or choose a rule and **View details**.
  - See the compliance status of the rule when it evaluates your resources.
  - Choose a rule and **Edit rule** to change the configuration settings of the rule and set a remediation action for a noncompliant rule.

### To update a rule

1. Choose a rule and **Edit rule** for the rule that you want to update.
2. Modify the settings on the **Config rule** page to change your rule as needed.
3. Choose **Save**.

### To delete a rule

1. Choose a rule and **Edit rule** for the rule that you want to delete.
2. On the **Configure rule** page, choose **Delete rule**.
3. When prompted, choose **Delete**.

### To add a rule

If you choose **Add rule**, you can see the available AWS managed rules on the **Add rule** page. You can also create your own custom rule.

1. If you want to create your own rule, choose **Add custom rule** and follow the procedure in [Developing a Custom Rule for AWS Config \(p. 195\)](#).
2. To add a managed rule, choose a rule on the page and follow the procedure in [Working with AWS Config Managed Rules \(p. 191\)](#).

On the **Add rule** page, you can do the following:

- Choose **Add custom rule** to create your own rule.
- Type in the search field to filter results by rule name, description, or label. For example, type **EC2** to return rules that evaluate EC2 resource types or type **periodic** to return rules with periodic triggers. Type "new" to search for newly added rules. For more information about trigger types, see [Specifying Triggers for AWS Config Rules \(p. 101\)](#).
- Reorder the results alphabetically by choosing the arrow by the **Name** label.
- Choose the arrow icon to see the next page of rules.
- See recently added rules that are marked as **New**.
- See labels to identify the resource type that the rule evaluates and if the rule has a periodic trigger.

## View, Update, and Delete Rules (AWS CLI)

### To view your rules

- Use the `describe-config-rules` command:

```
$ aws configservice describe-config-rules
```

AWS Config returns the details for all of your rules.

### To update a rule

1. Use the `put-config-rule` command with the `--generate-cli-skeleton` parameter to create a local JSON file that has the parameters for your rule:

```
$ aws configservice put-config-rule --generate-cli-skeleton > putConfigRule.json
```

2. Open the JSON file in a text editor and remove any parameters that don't need updating, with the following exceptions:
  - Include at least one of the following parameters to identify the rule:  
ConfigRuleName, ConfigRuleArn, or ConfigRuleId.
  - If you are updating a custom rule, you must include the `Source` object and its parameters.

3. Fill in the values for the parameters that remain. To reference the details of your rule, use the **describe-config-rules** command.

For example, the following JSON code updates the resource types that are in the scope of a custom rule:

```
{
  "ConfigRule": {
    "ConfigRuleName": "ConfigRuleName",
    "Scope": {
      "ComplianceResourceTypes": [
        "AWS::EC2::Instance",
        "AWS::EC2::Volume",
        "AWS::EC2::VPC"
      ]
    },
    "Source": {
      "Owner": "CUSTOM_LAMBDA",
      "SourceIdentifier": "arn:aws:lambda:us-east-2:123456789012:function:ConfigRuleName",
      "SourceDetails": [
        {
          "EventSource": "aws.config",
          "MessageType": "ConfigurationItemChangeNotification"
        }
      ]
    }
  }
}
```

4. Use the **put-config-rule** command with the `--cli-input-json` parameter to pass your JSON configuration to AWS Config:

```
$ aws configservice put-config-rule --cli-input-json file://putConfigRule.json
```

5. To verify that you successfully updated your rule, use the **describe-config-rules** command to view the rule's configuration:

```
$ aws configservice describe-config-rules --config-rule-name ConfigRuleName
{
  "ConfigRules": [
    {
      "ConfigRuleState": "ACTIVE",
      "ConfigRuleName": "ConfigRuleName",
      "ConfigRuleArn": "arn:aws:config:us-east-2:123456789012:config-rule/config-rule-nnnnnn",
      "Source": {
        "Owner": "CUSTOM_LAMBDA",
        "SourceIdentifier": "arn:aws:lambda:us-east-2:123456789012:function:ConfigRuleName",
        "SourceDetails": [
          {
            "EventSource": "aws.config",
            "MessageType": "ConfigurationItemChangeNotification"
          }
        ]
      },
      "Scope": {
        "ComplianceResourceTypes": [
          "AWS::EC2::Instance",
          "AWS::EC2::Volume",
          "AWS::EC2::VPC"
        ]
      }
    }
  ]
}
```

```
    },  
    "ConfigRuleId": "config-rule-nnnnnn"  
  }  
]  
}
```

### To delete a rule

- Use the `delete-config-rule` command as shown in the following example:

```
$ aws configservice delete-config-rule --config-rule-name ConfigRuleName
```

## View, Update, and Delete Rules (API)

### To view your rules

Use the [DescribeConfigRules](#) action.

### To update or add a rule

Use the [PutConfigRule](#) action.

### To delete a rule

Use the [DeleteConfigRule](#) action.

#### Note

If a rule is creating invalid evaluation results, you might want to delete these results before you fix the rule and run a new evaluation. For more information, see [Deleting Evaluation Results](#) (p. 211).

## Evaluating Your Resources

When you create custom rules or use managed rules, AWS Config evaluates your resources against those rules. You can run on-demand evaluations for resources against your rules. For example, this is helpful when you create a custom rule and want to verify that AWS Config is correctly evaluating your resources or to identify if there is an issue with the evaluation logic of your AWS Lambda function.

### Example

1. You create a custom rule that evaluates whether your IAM users have active access keys.
2. AWS Config evaluates the resources against your custom rule.
3. An IAM user who doesn't have an active access key exists in your account. Your rule doesn't correctly flag this resource as noncompliant.
4. You fix the rule and start the evaluation again.
5. Because you fixed your rule, the rule correctly evaluates your resources, and flags the IAM user resource as noncompliant.

## Evaluating your Resources (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.

2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
3. In the navigation pane, choose **Rules**. The **Rules** page shows your rules and the compliance status for each.
4. Choose a rule from the list.
5. In the **Re-evaluate rule** section, choose **Re-evaluate**.
6. AWS Config starts evaluating the resources against your rule.

#### Note

You can re-evaluate a rule once per minute. You must wait for AWS Config to complete the evaluation for your rule before you start another evaluation. You can't run an evaluation if at the same time the rule is being updated or if the rule is being deleted.

## Evaluating your Resources (CLI)

- Use the **start-config-rules-evaluation** command.

```
$ aws configservice start-config-rules-evaluation --config-rule-names ConfigRuleName
```

AWS Config starts evaluating the recorded resource configurations against your rule.

You can also specify multiple rules in your request.

```
aws configservice start-config-rules-evaluation --config-rule-  
names ConfigRuleName1 ConfigRuleName2 ConfigRuleName3
```

## Evaluating your Resources (API)

Use the [StartConfigRulesEvaluation](#) action.

## Deleting Evaluation Results

After AWS Config evaluates your rule, you can see the evaluation results on the **Rules** page or the **Rules details** page for the rule. If the evaluation results are incorrect or if you want to evaluate again, you can delete the current evaluation results for the rule. For example, if your rule was incorrectly evaluating your resources or you recently deleted resources from your account, you can delete the evaluation results and then run a new evaluation.

## Deleting Evaluating Results (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. In the AWS Management Console menu, verify that the region selector is set to a region that supports AWS Config rules. For the list of supported regions, see [AWS Config Regions and Endpoints](#) in the *Amazon Web Services General Reference*.
3. In the navigation pane, choose **Rules**. The **Rules** page shows your rules and the compliance status.
4. Choose a rule from the list.

5. In the **Delete evaluation results** section, choose **Delete results**. AWS Config deletes the evaluation results for this rule.
6. When prompted, choose **Delete**. Deleted evaluations can't be retrieved.
7. After the evaluation results are deleted, you can manually start a new evaluation.

## Deleting Evaluating Results (CLI)

- Use the `delete-evaluation-results` command:

```
$ aws configservice delete-evaluation-results --config-rule-name ConfigRuleName
```

AWS Config deletes the evaluation results for the rule.

## Deleting Evaluating Results (API)

Use the `DeleteEvaluationResults` action.

# Enabling AWS Config Rules Across all Accounts in Your Organization

AWS Config allows you to manage AWS Config rules across all AWS accounts within an organization. You can:

- Centrally create, update, and delete AWS Config rules across all accounts in your organization.
- Deploy a common set of AWS Config rules across all accounts and specify accounts where AWS Config rules should not be created.
- Use the APIs from the master account in AWS Organizations to enforce governance by ensuring that the underlying AWS Config rules are not modifiable by your organization's member accounts.

### Note

*For deployments accross different regions*

The API call to deploy rules and conformance packs across accounts is region specific. At the organization level, you need to change the context of your API call to a different region if you want to deploy rules in other regions. For example, to deploy a rule in US East (N. Virginia), change the region to US East (N. Virginia) and then call `PutOrganizationConfigRule`.

*For accounts within an organization*

If a new account joins an organization, the rule is deployed to that account. When an account leaves an organization, the rule is removed.

Ensure AWS Config recording is on before you use the following APIs to manage AWS Config rules across all AWS accounts within an organization:

- `PutOrganizationConfigRule`, adds or updates organization config rule for your entire organization evaluating whether your AWS resources comply with your desired configurations.
- `PutOrganizationConformancePack`, deploys conformance packs across member accounts in an AWS Organization.
- `DescribeOrganizationConfigRules`, returns a list of organization config rules.
- `GetOrganizationConfigRuleDetailedStatus`, returns detailed status for each member account within an organization for a given organization config rule.

- [DescribeOrganizationConfigRuleStatuses](#), provides organization config rule deployment status for an organization.
- [DeleteOrganizationConfigRule](#), deletes the specified organization config rule and all of its evaluation results from all member accounts in that organization.

## Remediating Noncompliant AWS Resources by AWS Config Rules

AWS Config allows you to remediate noncompliant resources that are evaluated by AWS Config Rules. AWS Config applies remediation using [AWS Systems Manager Automation documents](#). These documents define the actions to be performed on noncompliant AWS resources evaluated by AWS Config Rules. You can associate SSM documents by using the AWS Management Console or by using APIs.

AWS Config provides a set of managed automation documents with remediation actions. You can also create and associate custom automation documents with AWS Config rules.

To apply remediation on noncompliant resources, you can either choose the remediation action you want to associate from a prepopulated list or create your own custom remediation actions using SSM documents. AWS Config provides a recommended list of remediation action in the AWS Management Console.

In the AWS Management Console, you can either choose to **manually** or **automatically** remediate noncompliant resources by associating remediation actions with AWS Config rules. With all remediation actions, you can either choose manual or automatic remediation.

### Topics

- [Prerequisite](#) (p. 213)
- [Setting Up Manual Remediation \(Console\)](#) (p. 213)
- [Setting Up Auto Remediation \(Console\)](#) (p. 214)
- [Setting Up and Applying a Remediation Action Remediation Using Rules and Resources \(Console\)](#) (p. 214)
- [Delete Remediation Action \(Console\)](#) (p. 216)
- [Managing Remediation \(API\)](#) (p. 217)

## Prerequisite

Before you begin to apply remediation on noncompliant resources, you must select a rule and set up remediation (manual or auto) for the rule.

## Setting Up Manual Remediation (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Rules** on the left and then on the **Rules** page, choose **Add Rule** to add new rules to the rule list.

For existing rules, select the noncompliant rule from the rule list and choose the **Actions** dropdown list.

3. From the **Actions** dropdown list, choose **Manage remediation**. Select "Manual remediation" and then choose the appropriate remediation action from the recommended list.

Depending on the selected remediation action, you see specific parameters or no parameters.

4. (Optional): If you want to pass the resource ID of noncompliant resources to the remediation action, choose **Resource ID parameter**. If selected, at runtime that parameter is substituted with the ID of the resource to be remediated.

Each parameter has either a static value or a dynamic value. If you do not choose a specific resource ID parameter from the drop-down list, you can enter values for each key. If you choose a resource ID parameter from the drop-down list, you can enter values for all the other keys except the selected resource ID parameter.

5. Choose **Save**. The **Rules** page is displayed.

## Setting Up Auto Remediation (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Rules** on the left and then on the **Rules** page, choose **Add Rule** to add new rules to the rule list.

For existing rules, select the noncompliant rule from the rule list and choose the **Actions** dropdown list.

3. From the **Actions** dropdown list, choose **Manage remediation**. Select "Automatic remediation" and then choose the appropriate remediation action from the recommended list.

Depending on the selected remediation action, you see specific parameters or no parameters.

4. Choose **Auto remediation** to automatically remediate noncompliant resources.

If a resource is still non-compliant after auto remediation, you can set the rule to try auto remediation again. Enter the desired retries and seconds.

### Note

There are costs associated with running a remediation script multiple times.

5. (Optional): If you want to pass the resource ID of noncompliant resources to the remediation action, choose **Resource ID parameter**. If selected, at runtime that parameter is substituted with the ID of the resource to be remediated.

Each parameter has either a static value or a dynamic value. If you do not choose a specific resource ID parameter from the drop-down list, you can enter values for each key. If you choose a resource ID parameter from the drop-down list, you can enter values for all the other keys except the selected resource ID parameter.

6. Choose **Save**. The **Rules** page is displayed.

## Setting Up and Applying a Remediation Action Remediation Using Rules and Resources (Console)

You can also set up remediation from the Rules and the Resources pages. The following procedures provide more details about each workflow.

### Using Rules

You can apply a remediation action to a noncompliant rule from **Rules** on the left.

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.

2. Choose **Rules** on the left and then on the **Rules** page, choose **Add Rule** to add new rules to the rule list.

For existing rules, select the noncompliant rule from the rule list and choose **Edit**.

3. Choose **Manage remediation** and on the **Manage remediation: *name of the rule*** page, select the appropriate remediation action from the recommended list. The remediation actions are related to AWS Systems Manager automation documents.

Depending on the selected remediation action, you will see either specific parameters or no parameters.

4. If you want to pass the resource ID of noncompliant resources to the remediation action, choose **Resource ID parameter**. If selected, at runtime that parameter is substituted with the ID of the resource to be remediated.

Each parameter has either a static value or a dynamic value. If you do not choose a specific resource ID parameter from the drop-down list, you can enter values for each key. If you choose a resource ID parameter from the drop-down list, you can enter values for all the other keys except the selected resource ID parameter.

5. Choose **Save**.
6. In the **Choose resources in scope** section, choose all the noncompliant resources. The resources in scope include those resources where this rule is applied and their compliance status.

For more information about a resource, choose **Resource actions** and either choose **View details**, **Configuration timeline**, or **Compliance timeline**.

7. Choose **Remediate**.

If the resources are remediated, the resource compliance status is compliant. To view the compliant resources, select **Compliant** from the compliance status list.

If the resources are not remediated, the action status column displays **Action execution failed (details)**. Choose **(details)** to view the main action steps invoked during the execution of the remediation action and the status of each action step.

#### Note

For troubleshooting failed remediation actions, you can run the AWS Command Line Interface (AWS CLI) command `describe-remediation-execution-status` to get detailed view of a Remediation Execution for a set of resources. The details include state, timestamps for remediation execution steps, and any error messages for the failed steps.

## Using Resources

You can also apply a remediation action to a noncompliant rule from **Resources** on the left.

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Resources** on the left and then on the **Resource inventory** page, **Resources** is selected by default.
3. Select one or more resources from the resource type and choose **Look up**.
4. Choose the name of the appropriate noncompliant resource from the resource table.
5. On the **Resource details: *name of the resource*** page, choose one or more noncompliant rules from the rules in scope.
6. Choose **Rule actions** and select **Manage remediation**.
7. On the **Manage remediation: *name of the rule*** page, select the appropriate remediation action.

Depending on the selected remediation action, you will see either specific parameters or no parameters.

8. If you want to pass the resource ID of noncompliant resources to the remediation action, choose **Resource ID parameter**. If selected, at runtime that parameter is substituted with the ID of the resource to be remediated.

Each parameter has either a static value or a dynamic value. If you do not choose a specific resource ID parameter from the drop-down list, you can enter values for each key. If you choose a resource ID parameter from the drop-down list, you can enter values for all the other keys except the selected resource ID parameter.

9. Choose **Save**.
10. In the **Choose resources in scope** section, choose all the noncompliant resources. The resources in scope include those resources where this rule is applied and their compliance status.

For more information about a resource, choose **Resource actions** and either choose **View details**, **Configuration timeline**, or **Compliance timeline**.

11. Choose **Remediate**.

If the resources are remediated, the resource compliance status is **compliant**. To view the compliant resources, select **Compliant** from the compliance status list.

If the resources are not remediated, the action status column displays **Action execution failed (details)**. Choose **(details)** to view the main action steps invoked during the execution of the remediation action and the status of each action step.

**Note**

For troubleshooting failed remediation actions, you can run the AWS Command Line Interface (AWS CLI) command `describe-remediation-execution-status` to get detailed view of a Remediation Execution for a set of resources. The details include state, timestamps for remediation execution steps, and any error messages for the failed steps.

## Delete Remediation Action (Console)

To delete a rule first you must delete remediation action associated with that rule.

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Rules** on the left and then on the **Rules** page, select the rule from the rule list and choose **Edit**.
3. On the rule page, choose **Edit** again.
4. On the **Edit *name of the rule*** page, in the **Choose remediation action** section, choose **Delete remediation action** and confirm your delete action.

**Note**

If remediation is in progress, the remediation action is not deleted. If you choose **Delete remediation action**, you cannot retrieve the remediation action. When you delete a remediation action, AWS Config does not delete a rule.

If the remediation action is deleted, the **Resource ID parameter** is empty and displays N/A. On the **Rules** page, the remediation action column displays **Not set** for the corresponding rule.

## Managing Remediation (API)

### Manual Remediation

Use the following AWS Config API actions to manage remediation:

- [DeleteRemediationConfiguration](#)
- [DescribeRemediationConfigurations](#)
- [DescribeRemediationExecutionStatus](#)
- [PutRemediationConfigurations](#)
- [StartRemediationExecution](#)

### Auto Remediation

Use the following AWS Config API actions to manage auto remediation:

- [PutRemediationExceptions](#)
- [DescribeRemediationExceptions](#)
- [DeleteRemediationExceptions](#)

## Tagging Your AWS Config Resources

A tag is a label that you assign to an AWS resource. Each tag consists of a *key* and an optional *value*, both of which you define. Tags make it easier to manage, search for, and filter resources.

Tags enable you to categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type—you can quickly identify a specific resource based on the tags you've assigned to it. You can assign one or more tags to your AWS resources. Each tag has an associated value.

We recommend that you devise a set of tag keys that meets your needs for each resource type. Using a consistent set of tag keys makes it easier for you to manage your AWS resources. You can search and filter the resources based on the tags you add.

Tags are interpreted strictly as a string of characters and are not automatically assigned to your resources. You can edit tag keys and values, and you can remove tags from a resource at any time. You can set the value of a tag to an empty string, but you can't set the value of a tag to null. If you add a tag that has the same key as an existing tag on that resource, the new value overwrites the old value. If you delete a resource, any tags for the resource are also deleted.

You can work with tags using the AWS Command Line Interface (AWS CLI) and the AWS Config API reference.

### Restrictions Related to Tagging

The following basic restrictions apply to tags.

Restriction	Description
Maximum number of tags per resource	50

Restriction	Description
Maximum key length	128 Unicode characters in UTF-8
Maximum value length	256 Unicode characters in UTF-8
Prefix restriction	Do not use the <code>aws :</code> prefix in your tag names or values because it is reserved for AWS use. You can't edit or delete tag names or values with this prefix. Tags with this prefix do not count against your tags per resource limit.
Character restrictions	Tags may only contain Unicode letters, digits, whitespace, or these symbols: <code>_ . : / = + - @</code>

## Managing Tags with AWS Config API Actions

Tag based access controls are available for three resources `ConfigurationAggregator`, `AggregationAuthorization`, and `ConfigRule`. Use the following to add, update, list, and delete the tags for your resources.

- [ListTagsForResource](#)
- [TagResource](#)
- [UntagResource](#)

# Conformance Packs

A conformance pack is a collection of AWS Config rules and remediation actions that can be easily deployed as a single entity in an account and a Region or across an organization in AWS Organizations.

Conformance packs are created by authoring a YAML template that contains the list of AWS Config managed or custom rules and remediation actions. You can deploy the template by using the AWS Config console or the AWS CLI. To quickly get started and to evaluate your AWS environment, use one of the sample conformance pack templates.

## Note

Conformance packs are only available in the redesigned AWS Config console.

## Topics

- [Prerequisites \(p. 219\)](#)
- [Region Support \(p. 220\)](#)
- [AWS Config Process Checks Within a Conformance Pack \(p. 222\)](#)
- [Conformance Pack Sample Templates \(p. 225\)](#)
- [Viewing Compliance Data in the Conformance Packs Dashboard \(p. 3252\)](#)
- [Deploying a Conformance Pack Using the AWS Config Console \(p. 3252\)](#)
- [Deploying a Conformance Pack Using the AWS Command Line Interface \(p. 3254\)](#)
- [Managing Conformance Packs \(API\) \(p. 3257\)](#)
- [Managing Conformance Packs Across all Accounts in Your Organization \(p. 3257\)](#)
- [Viewing Compliance History Timeline for Conformance Packs \(p. 3258\)](#)
- [Troubleshooting \(p. 3260\)](#)

## Prerequisites

Before you deploy your conformance pack, turn on AWS Config recording.

## Start AWS Config Recording

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Choose **Settings** in the navigation pane.
3. To start recording, under **Recording is off**, choose **Turn on**. When prompted, choose **Continue**.

## Prerequisites for Using a Conformance Pack With Remediation

Before deploying conformance packs using sample templates with remediation, you must create appropriate resources such as automation assume role and other AWS resources based on your remediation target.

If you have an existing automation role that you are using for remediation using SSM documents, you can directly provide the ARN of that role. If you have any resources you can provide those in the template.

AWS Config does not support AWS CloudFormation intrinsic functions for the automation execution role. You must provide the exact ARN of the role as a string.

For more information about how to pass the exact ARN, see [Conformance Pack Sample Templates \(p. 225\)](#). While using example templates, update your Account ID and master Account ID for organization.

## Prerequisites for Using a Conformance Pack With One or More AWS Config Rules

Before deploying a conformance pack with one or more custom AWS Config rules, create appropriate resources such as AWS Lambda function and the corresponding execution role.

If you have an existing custom AWS Config rule, you can directly provide the ARN of AWS Lambda function to create another instance of that custom rule as part of the pack.

If you do not have an existing custom AWS Config rule, you can create a AWS Lambda function and use the ARN of the Lambda function. For more information, see [AWS Config Custom Rules \(p. 193\)](#).

If your AWS Lambda function is present in a different AWS account, you can create AWS Config rules with appropriate cross-account AWS Lambda function authorization. For more information, see [How to Centrally Manage AWS Config Rules across Multiple AWS Accounts](#) blog post.

## Prerequisites for Organization Conformance Packs

Specify an automation execution role ARN for that remediation in the template if the input template has an autoremediation configuration. Ensure a role with the specified name exists in all the accounts (master and member) of an organization. You must create this role in all accounts before calling `PutOrganizationConformancePack`. You can create this role manually or using the AWS CloudFormation stack-sets to create this role in every account.

If your template uses AWS CloudFormation intrinsic function `Fn::ImportValue` to import a particular variable, then that variable must be defined as an `Export Value` in all the member accounts of that organization.

For custom AWS Config rule, see [How to Centrally Manage AWS Config Rules across Multiple AWS Accounts](#) blog to setup proper permissions.

## Region Support

Conformance packs are supported in the following Regions.

Region name	Region	Endpoint	Protocol
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS

Region name	Region	Endpoint	Protocol
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS

Deploying conformance packs across member accounts in an AWS Organization is supported in the following Regions.

Region name	Region	Endpoint	Protocol
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS

Region name	Region	Endpoint	Protocol
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS

## AWS Config Process Checks Within a Conformance Pack

Process checks is a type of AWS Config rule that allows you to track your external and internal tasks that require verification as part of the conformance packs. These checks can be added to an existing conformance pack or a new conformance pack. You can track all compliance that includes AWS configurations and manual checks in a single location.

With process checks, you can list the compliance of requirements and actions at a single location. These process checks help increase the coverage of compliance regimes-based conformance packs. You can further expand the conformance pack by adding new process checks that track processes and actions needing manual verification and tracking. This enables conformance pack to become the template that provides details about AWS configurations and manual processes for a compliance regime.

You can track and manage the compliance of processes not associated with resource configuration changes within a conformance packs as process checks. For example, you can add a process check to track the PCI-DSS compliance requirement to store media backup at an offsite location. You will manually evaluate the compliance of this according to PCI-DSS guidelines, or according to your organization's guidance.

**Region availability:** Process checks with the conformance packs are available in all AWS Regions where AWS Config conformance packs are available. For more information, see [Region Support \(p. 220\)](#).

### Topics

- [Sample Conformance Pack Template for Creating Process Checks \(p. 223\)](#)
- [Include Process Checks Within a Conformance Pack \(p. 223\)](#)
- [Change Compliance Status of a Process Check \(p. 224\)](#)
- [View and Edit the Process Check \(Console\) \(p. 225\)](#)

## Sample Conformance Pack Template for Creating Process Checks

```
#####  
#  
# Conformance Pack template for process check  
#  
#####  
Resources:  
  AWSConfigProcessCheck:  
    Properties:  
      ConfigRuleName: RuleName  
      Description: Description of Rule  
      Source:  
        Owner: AWS  
        SourceIdentifier: AWS_CONFIG_PROCESS_CHECK  
      Type: AWS::Config::ConfigRule
```

See two sample templates, the [Operational Best Practices for CIS AWS Foundations Benchmark v1.3 Level 1 \(p. 687\)](#) template and the [Operational Best Practices for CIS AWS Foundations Benchmark v1.3 Level 2 \(p. 701\)](#) template.

## Include Process Checks Within a Conformance Pack

1. Add a process check in the conformance pack template. Refer to the previous sample template.

```
Resources:  
  ConfigEnabledAllRegions:  
    Properties:  
      ConfigRuleName: Config-Enabled-All-Regions  
      Description: Ensure AWS Config is enabled in all Regions.  
      Source:  
        Owner: AWS  
        SourceIdentifier: AWS_CONFIG_PROCESS_CHECK
```

```
Type: AWS::Config::ConfigRule
```

2. Enter the name for the process check.
3. Enter the description for the process check.
4. Deploy the conformance pack from the AWS Management Console. For more information, see [Deploying a Conformance Pack Using the AWS Config Console \(p. 3252\)](#).

**Note**

You can also deploy the conformance packs using the Command Line Interface (AWS CLI). For more information, see [Deploying a Conformance Pack Using the AWS Command Line Interface \(p. 3254\)](#).

## Change Compliance Status of a Process Check

### Change Compliance Status of a Process Check (Console)

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Navigate to the AWS Config Rules page.
3. Choose the name of the process check that you specified in the template along with the identifier in the conformance pack.

**Note**

All the process checks from the same conformance pack have the same suffix.

4. On the Rule details page, you cannot edit the rule but you can edit the compliance of the rule. In the Manual compliance section, choose **Edit compliance**.
5. Choose the appropriate compliance from the dropdown list.
6. (Optional) Enter a description for the compliance status.
7. Choose **Save**.

After changing the compliance status, return to your conformance pack to view the process check and its description.

### Change Compliance Status of a Process Check (CLI)

You can update the compliance of process checks within a conformance pack using the AWS Command Line Interface (AWS CLI).

To install the AWS CLI on your local machine, see [Installing the AWS CLI](#) in the *AWS CLI User Guide*.

If necessary, type `aws configure` to configure the AWS CLI to use an AWS Region where AWS Config conformance packs are available.

1. Open a command prompt or a terminal window.
2. Type the following command to update the compliance of a process check where `ComplianceResourceId` is your `Account ID`, and include the name of your rule.

```
aws configservice put-external-evaluation --config-rule-  
name process-check-rule-name --external-evaluation  
ComplianceResourceType=AWS:::Account,ComplianceResourceId=Account  
ID,ComplianceType=NON_COMPLIANT,OrderingTimestamp=2020-12-17T00:10:00.000Z
```

3. Press Enter to run the command.

## Change Compliance Status of a Process Check (API)

After the deployment is complete, to update the evaluations and compliance of the process checks, use the `PutExternalEvaluation` API. For more information, see [PutExternalEvaluation](#).

## View and Edit the Process Check (Console)

You can view process checks only after a compliance state has been added to process checks. Choose the specific conformance pack to view all the process checks within that conformance pack. Here you can see a list of process checks that are in compliant and non-compliant status.

Because this is a service linked rule, you cannot edit the process check through the Rule details page.

### Note

However, you can update the compliance of the process check by choosing **Edit Compliance** and selecting the appropriate value from Compliant, Non-Compliant or Not-Applicable.

You can edit or delete a process check from the conformance pack where you added the process checks.

## Conformance Pack Sample Templates

Here are the conformance pack YAML templates that you see in AWS Config console. Within each conformance pack template, you can use one or more AWS Config rules and remediation actions. The AWS Config rules listed within the conformance pack can be AWS Config managed rules and/or AWS Config custom rules. You can download all the conformance pack templates from [GitHub](#).

### Important

Conformance packs provide a general-purpose compliance framework to help you create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. AWS conformance pack sample templates intend to help you create your own conformance packs with different or additional rules, input parameters and remediation actions that suit your environment. The sample templates, including those related to compliance standards and industry benchmarks, are not designed to ensure your compliance with a specific governance standard. They can neither replace your internal efforts nor guarantee that you will pass a compliance assessment.

## AWS Control Tower Detective Guardrails Conformance Pack

The template is available on GitHub: [AWS Control Tower Detective Guardrails Conformance Pack](#).

### Operational Best Practices for ABS CCIG 2.0 Material Workloads

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the ABS Cloud Computing Implementation Guide 2.0 - Material Workloads and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ABS Cloud Computing Implementation Guide controls. An ABS Cloud Computing Implementation Guide control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**AWS Region:** All supported AWS Regions except Asia Pacific (Hong Kong), Europe (Stockholm), and Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
section4a-govern-the-cloud-2-standard-workloads	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best

Control ID	AWS Config Rule	Guidance
		practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
section4a-govern-the-cloud-2-standard-workloads	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4a-govern-the-cloud-2-material-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
section4a-govern-the-cloud-2-material-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
section4a-govern-the-cloud-3-material-workloads	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
section4a-govern-the-cloud-3-material-workloads	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
section4a-govern-the-cloud-3-standard-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
section4a-govern-the-cloud-3-standard-workloads	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	AWS Config Rule	Guidance
section4a-govern-the-cloud-3-standard-workloads	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
section4a-govern-the-cloud-3-standard-workloads	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
section4a-govern-the-cloud-4-standard-workloads	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
section4b-design-and-secure-the-cloud-1-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-1-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-1-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">ec2-managedinstance-association-compliance-status-check</a> (p. 135)	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">ec2-managedinstance-patch-compliance-status-check</a> (p. 136)	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">redshift-cluster-maintenancesettings-check</a> (p. 171)	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the <code>allowVersionUpgrade</code> . The default is true. It also lets you optionally set the <code>preferredMaintenanceWindow</code> (the default is <code>sat:16:00-sat:16:30</code> ), and the <code>automatedSnapshotRetentionPeriod</code> (the default is 1). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">autoscaling-group-elb-healthcheck-required</a> (p. 113)	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">dynamodb-autoscaling-enabled</a> (p. 128)	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">ec2-instance-detailed-monitoring-enabled</a> (p. 132)	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">elb-cross-zone-load-balancing-enabled</a> (p. 143)	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
section4b-design-and-secure-the-cloud-3-material-workloads	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-3-material-workloads	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
section4b-design-and-secure-the-cloud-3-material-workloads	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
section4b-design-and-secure-the-cloud-3-material-workloads	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">rds-instance-iam-authentication-enabled (p. 166)</a>	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">rds-instance-public-access-check</a> (p. 166)	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">redshift-cluster-public-access-check</a> (p. 171)	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">restricted-common-ports</a> (p. 174)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">sagemaker-notebook-no-direct-internet-access</a> (p. 183)	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">vpc-default-security-group-closed</a> (p. 188)	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
section4b-design-and-secure-the-cloud-4-material-workloads	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-5-material-workloads	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-5-material-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-5-material-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
section4b-design-and-secure-the-cloud-5-material-workloads	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
section4b-design-and-secure-the-cloud-5-material-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">sagemaker-endpoint-configuration-kms-key-configured</a> (p. 182)	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">sagemaker-notebook-instance-kms-key-configured</a> (p. 183)	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">sns-encrypted-kms</a> (p. 187)	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-material-workloads	<a href="#">acm-certificate-expiration-check</a> (p. 108)	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-6-material-workloads	<a href="#">elb-acm-certificate-required</a> (p. 143)	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-material-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-6-material-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-6-material-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-6-material-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-material-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-6-material-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-8-material-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-material-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
section4b-design-and-secure-the-cloud-8-material-workloads	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
section4b-design-and-secure-the-cloud-8-material-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-8-material-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-user-unused-credentials-check</a> (p. 159)	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">mfa-enabled-for-iam-console-access</a> (p. 163)	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">rds-instance-iam-authentication-enabled</a> (p. 166)	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4b-design-and-secure-the-cloud-9-material-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-9-material-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. The actual value should reflect the alarm actions for your environment.
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-11-material-workloads	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
section4b-design-and-secure-the-cloud-14-material-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4b-design-and-secure-the-cloud-14-material-workloads	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
section4b-design-and-secure-the-cloud-14-material-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-material-workloads	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
section4b-design-and-secure-the-cloud-14-material-workloads	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
section4b-design-and-secure-the-cloud-14-material-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
section4b-design-and-secure-the-cloud-14-material-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
section4c-run-the-cloud-1-standard-workloads	<a href="#">codepipeline-deployment-count-check (p. 124)</a>	Enable this rule to help monitor unauthorized AWS CodePipeline deployments by checking for the approved deployment limit each stage can perform.
section4c-run-the-cloud-1-standard-workloads	<a href="#">codepipeline-region-fanout-check (p. 124)</a>	Enable this rule to manage and monitor development systems by enforcing deployment stage rules via region fanout factor for AWS CodePipeline.
section4c-run-the-cloud-2-standard-workloads	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
section4c-run-the-cloud-2-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
section4c-run-the-cloud-2-standard-workloads	<a href="#">rds-instance-iam-authentication-enabled (p. 166)</a>	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.
section4c-run-the-cloud-2-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-2-material-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
section4c-run-the-cloud-2-material-workloads	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
section4c-run-the-cloud-3-standard-workloads	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
section4c-run-the-cloud-3-standard-workloads	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
section4c-run-the-cloud-3-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
section4c-run-the-cloud-3-standard-workloads	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
section4c-run-the-cloud-3-standard-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
section4c-run-the-cloud-3-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4c-run-the-cloud-3-standard-workloads	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
section4c-run-the-cloud-4-material-workloads	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
section4c-run-the-cloud-4-material-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
section4c-run-the-cloud-4-material-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-5-standard-workloads	<a href="#">autoscaling-group-elb-healthcheck-required</a> (p. 113)	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
section4c-run-the-cloud-5-standard-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled</a> (p. 121)	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4c-run-the-cloud-5-standard-workloads	<a href="#">dynamodb-autoscaling-enabled</a> (p. 128)	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
section4c-run-the-cloud-5-standard-workloads	<a href="#">ec2-instance-detailed-monitoring-enabled</a> (p. 132)	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-5-standard-workloads	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
section4c-run-the-cloud-6-standard-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
section4c-run-the-cloud-6-material-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-6-material-workloads	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
section4c-run-the-cloud-6-material-workloads	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
section4c-run-the-cloud-6-material-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
section4c-run-the-cloud-6-material-workloads	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

## Template

The template is available on GitHub: [Operational Best Practices for ABS CCIIG 2.0 Material Workloads](#).

## Operational Best Practices for ABS CCIG 2.0 Standard Workloads

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the ABS Cloud Computing Implementation Guide 2.0 - Standard Workloads and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ABS Cloud Computing Implementation Guide controls. An ABS Cloud Computing Implementation Guide control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**AWS Region:** All supported AWS Regions except Asia Pacific (Hong Kong), Europe (Stockholm), and Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
section4a-govern-the-cloud-2-standard-workloads	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	AWS Config Rule	Guidance
section4a-govern-the-cloud-2-standard-workloads	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
section4a-govern-the-cloud-2-standard-workloads	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	AWS Config Rule	Guidance
section4a-govern-the-cloud-2-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4a-govern-the-cloud-3-standard-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
section4a-govern-the-cloud-3-standard-workloads	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
section4a-govern-the-cloud-3-standard-workloads	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	AWS Config Rule	Guidance
section4a-govern-the-cloud-3-standard-workloads	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
section4a-govern-the-cloud-4-standard-workloads	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
section4b-design-and-secure-the-cloud-1-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-1-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-1-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
section4b-design-and-secure-the-cloud-2-standard-workloads	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-3-standard-workloads	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">rds-instance-iam-authentication-enabled (p. 166)</a>	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">vpc-default-security-group-closed</a> (p. 188)	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">vpc-sg-open-only-to-authorized-ports</a> (p. 189)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
section4b-design-and-secure-the-cloud-4-standard-workloads	<a href="#">vpc-vpn-2-tunnels-up</a> (p. 189)	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">acm-certificate-expiration-check</a> (p. 108)	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
section4b-design-and-secure-the-cloud-5-standard-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-6-standard-workloads	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">iam-user-unused-credentials-check</a> (p. 159)	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">mfa-enabled-for-iam-console-access</a> (p. 163)	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">rds-instance-iam-authentication-enabled</a> (p. 166)	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-8-standard-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">rds-instance-iam-authentication-enabled (p. 166)</a>	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-9-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
section4b-design-and-secure-the-cloud-10-standard-workloads	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-12-standard-workloads	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-14-standard-workloads	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
section4b-design-and-secure-the-cloud-15-standard-workloads	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
section4c-run-the-cloud-1-standard-workloads	<a href="#">codepipeline-deployment-count-check (p. 124)</a>	Enable this rule to help monitor unauthorized AWS CodePipeline deployments by checking for the approved deployment limit each stage can perform.
section4c-run-the-cloud-1-standard-workloads	<a href="#">codepipeline-region-fanout-check (p. 124)</a>	Enable this rule to manage and monitor development systems by enforcing deployment stage rules via region fanout factor for AWS CodePipeline.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-2-standard-workloads	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
section4c-run-the-cloud-2-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
section4c-run-the-cloud-2-standard-workloads	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-2-standard-workloads	<a href="#">rds-instance-iam-authentication-enabled (p. 166)</a>	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.
section4c-run-the-cloud-2-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4c-run-the-cloud-3-standard-workloads	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
section4c-run-the-cloud-3-standard-workloads	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
section4c-run-the-cloud-3-standard-workloads	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
section4c-run-the-cloud-3-standard-workloads	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
section4c-run-the-cloud-3-standard-workloads	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
section4c-run-the-cloud-3-standard-workloads	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
section4c-run-the-cloud-3-standard-workloads	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-3-standard-workloads	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
section4c-run-the-cloud-5-standard-workloads	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
section4c-run-the-cloud-5-standard-workloads	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
section4c-run-the-cloud-5-standard-workloads	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
section4c-run-the-cloud-5-standard-workloads	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	AWS Config Rule	Guidance
section4c-run-the-cloud-5-standard-workloads	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
section4c-run-the-cloud-6-standard-workloads	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

## Template

The template is available on GitHub: [Operational Best Practices for ABS CCIG 2.0 Standard Workloads](#).

## Operational Best Practices for ACSC Essential 8

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Australian Cyber Security Centre (ACSC) Essential Eight Maturity Model and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ACSC Essential Eight controls. An ACSC Essential Eight control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings. Some of the mappings to config rules are for the higher order section (eg. Mitigation Strategies to Limit the Extent of Cyber Security Incidents) as opposed to the more prescriptive sections.

This sample conformance pack template contains mappings to controls within the ACSC Essential 8, which was created by the Commonwealth of Australia and can be found at [ACSC | Essential Eight](#). Licensing of the framework under Creative Commons Attribution 4.0 International Public License and copyright information for the framework (including a disclaimer of warranties) can be found at [ACSC | Copyright](#).

**AWS Region:** All supported AWS Regions except Asia Pacific (Hong Kong), Middle East (Bahrain), and South America (São Paulo)

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_prevent	<a href="#">malware_delivery_and_execution_public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
Mitigation_strategies_to_prevent	<a href="#">malware_delivery_and_execution_public_ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Mitigation_strategies_to_prevent	<a href="#">malware_delivery_and_execution_only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
Mitigation_strategies_to_prevent	<a href="#">malware_delivery_and_execution_ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
Mitigation_strategies_to_prevent	<a href="#">malware_delivery_and_execution_ec2 (p. 150)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC,

Control ID	AWS Config Rule	Guidance
		<p>without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.</p>
Mitigation_strategies_to_prevent_malware_delivery_and_execution_prohibited (p. 161)	malware_delivery_and_execution_prohibited (p. 161)	<p>Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.</p>
Mitigation_strategies_to_prevent_malware_delivery_and_execution_check (p. 166)	malware_delivery_and_execution_check (p. 166)	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.</p>
Mitigation_strategies_to_prevent_malware_delivery_and_execution_check (p. 171)	malware_delivery_and_execution_check (p. 171)	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.</p>
Mitigation_strategies_to_prevent_malware_delivery_and_execution_ports (p. 174)	malware_delivery_and_execution_ports (p. 174)	<p>Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.</p>

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_prevent_malware_delivery_and_execution	<a href="#">malware-delivery-and-execution-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Mitigation_strategies_to_prevent_malware_delivery_and_execution	<a href="#">malware-delivery-and-execution-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Mitigation_strategies_to_prevent_malware_delivery_and_execution	<a href="#">malware-delivery-and-execution-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Application_control	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	AWS Config Rule	Guidance
Application_control	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Application_control	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
Patch_applications	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	AWS Config Rule	Guidance
Patch_applications	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Patch_applications	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
Patch_applications	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Daily_backups	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
Daily_backups	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Daily_backups	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Daily_backups	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
Daily_backups	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
Daily_backups	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Daily_backups	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
Daily_backups	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	<a href="#">extent_of_cyber_security_incidents_check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	<a href="#">extent_of_cyber_security_incidents_check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	<a href="#">extent_of_cyber_security_incidents_check (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	<a href="#">extent_of_cyber_security_incidents_check (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	<a href="#">extent_of_cyber_security_incidents_check (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	<a href="#">extent_of_cyber_security_incidents_check (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cyber-security_incidents	<a href="#">CloudTrail encryption enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
Mitigation_strategies_to_limit_the_extent_of_data-breach_incidents	<a href="#">CloudTrail log file integrity enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
Mitigation_strategies_to_limit_the_extent_of_cyber-security_incidents	<a href="#">CloudTrail S3 bucket logging enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Mitigation_strategies_to_limit_the_extent_of_cyber-security_incidents	<a href="#">CloudTrail S3 bucket logging encryption enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
Mitigation_strategies_to_limit_the_extent_of_data-breach_incidents	<a href="#">CloudWatch Log Groups encryption enabled (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
Mitigation_strategies_to_limit_the_extent_of_cyber-security_incidents	<a href="#">DynamoDB encryption kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extents_of_cybersecurity_default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent_of_efs_encryption (p. 136)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extents_of_cybersecurity_in_rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extents_of_cybersecurity_encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent_of_elb_encryption_required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent_of_elb_logging (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">detect_https_listeners_only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">encrypt_ebs_volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">centralize_guardduty_events (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">iam_password_policy_requirements (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. To help protect credentials, this rule allows you to optionally require passwords to expire every 12 months and establish a password reuse value of 100. This policy has been configured to match requirements specified in the ACSC ISM.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">restrict_ssh (p. 158)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	internet-gateways-in-vpc-only (p. 160)	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	cloud-trail-enabled (p. 163)	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	rds-log-fileset (p. 167)	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
Mitigation_strategies_to_limit_the_extent_of_cyber_security_incidents	rds-snapshots-encrypted (p. 168)	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent of cybersecurity incidents (p. 166)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent of cybersecurity incidents check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent of cybersecurity incidents (p. 170)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">Extent of cyber security incidents blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cyber-security_incidents	<a href="#">Extent of object lock enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_logging_security_incidents	<a href="#">Extent of logging enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Mitigation_strategies_to_limit_the_extent_of_cyber-security_incidents	<a href="#">Extent of cyber security prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Mitigation_strategies_to_limit_the_extent_of_cyber-security_incidents	<a href="#">Extent of cyber security encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cyber-security_incidents	<a href="#">Extent of cyber security only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">enable-encryption-at-rest-kms (p. 182)</a>	To help protect data at rest, ensure that encryption is enabled for your S3 buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. For more information about the encryption process and administration, use the AWS Key Management Service (AWS KMS) customer-managed CMKs.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">enable-encryption-at-rest-sagemaker-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">enable-encryption-at-rest-sagemaker-notebook-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">enable-security-hub (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent of cybersecurity incidents</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent of cybersecurity incidents</a> closed (p. 188)	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent of cybersecurity incidents</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
Mitigation_strategies_to_limit_the_extent_of_cybersecurity_incidents	<a href="#">extent of cybersecurity incidents</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	AWS Config Rule	Guidance
Restrict_administrative_privileges	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
Restrict_administrative_privileges	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Restrict_administrative_privileges	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Restrict_administrative_privileges	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
Restrict_administrative_privileges	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.
Restrict_administrative_privileges	<a href="#">rds-instance-iam-authentication-enabled (p. 166)</a>	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.
Patch_operating_systems	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
Multi-factor_authentication	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
Multi-factor_authentication	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
Multi-factor_authentication	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
Multi-factor_authentication	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
Multi-factor_authentication	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
Mitigation_strategies_to_recover_data_and_system_availability	<a href="#">api-gateway-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability-enabled (p. 121)	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_file_availability-enabled (p. 122)	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability-enabled (p. 118)	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability-enabled (p. 118)	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability_encrypted (p. 121)	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability_log_check (p. 125)	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability_enabled (p. 128)	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability_backup (p. 129)	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability_public_check (p. 131)	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability_cross_zone_load_balancing_enabled (p. 143)	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_recover_data_and_system_availability	elasticloadbalancing:delete_protection_enabled (p. 144)	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
Mitigation_strategies_to_recover_data_and_system_availability	elasticloadbalancing:logging_enabled (p. 144)	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Mitigation_strategies_to_recover_data_and_system_availability	cloudtrail:trail_multi_region_enabled (p. 163)	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
Mitigation_strategies_to_recover_data_and_system_availability	rds:deletion_protection_enabled (p. 164)	Ensure Amazon RDS instances have deletion protection enabled. Use deletion protection to prevent your RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_recover_data_in_a_system_availability	data-backup-enabled (p. 166)	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Mitigation_strategies_to_recover_data_in_a_system_availability	data-backup-enabled (p. 166) deletion-protection-enabled (p. 166)	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
Mitigation_strategies_to_recover_data_in_a_system_availability	data-logging-enabled (p. 167)	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability	<p>Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.</p>
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability_prohibited (p. 168)	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.</p>
Mitigation_strategies_to_recover_data_and_system_availability	data_and_system_availability_check (p. 170)	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.</p>

Control ID	AWS Config Rule	Guidance
Mitigation_strategies_to_recover_data_and_system_availability	<a href="#">Amazon S3 bucket system availability enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
Mitigation_strategies_to_recover_data_and_system_availability	<a href="#">Amazon S3 server access logging enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Mitigation_strategies_to_recover_data_and_system_availability	<a href="#">Amazon VPC flow logs enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
Mitigation_strategies_to_recover_data_and_system_availability	<a href="#">AWS WAF logging enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

## Template

The template is available on GitHub: [Operational Best Practices for ACSC Essential 8](#).

## Operational Best Practices for ACSC ISM

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Australian Cyber Security Centre (ACSC) Information Security Manual (ISM) 2020-06 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more ISM controls. An ISM control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of ISM.

This sample conformance pack template contains mappings to controls within the ISM framework, which was created by the Commonwealth of Australia and can be found at [Australian Government Information Security Manual](#). Licensing of the framework under Creative Commons Attribution 4.0 International Public License and copyright information for the framework (including a disclaimer of warranties) can be found at [ACSC | Copyright](#).

**AWS Region:** All supported AWS Regions except Asia Pacific (Hong Kong), Middle East (Bahrain), and South America (São Paulo)

Control ID	AWS Config Rule	Guidance
298	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
380	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
459	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for

Control ID	AWS Config Rule	Guidance
		your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
459	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
459	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
459	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
459	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
459	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
459	<a href="#">s3-default-encryption-kms (p. 182)</a>	To help protect data at rest, ensure that encryption is enabled for your S3 buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. For more information about the encryption process and administration, use the AWS Key Management Service (AWS KMS) customer-managed CMKs.

Control ID	AWS Config Rule	Guidance
586	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
586	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
634	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
859	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
974	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	AWS Config Rule	Guidance
974	<a href="#">mfa-enabled-for-iam-console-access</a> (p. 163)	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
1139	<a href="#">elb-custom-security-policy-ssl-check</a> (p. 143)	To help protect data in transit, ensure that your Classic ElasticLoadBalancer SSL listeners are using a custom security policy. These policies can provide various high-strength cryptographic algorithms to help ensure encrypted network communications between systems. This rule requires that you set a custom security policy for your SSL listeners. The default security policy is: Protocol-TLSv1.2,ECDHE-ECDSA-AES128-GCM-SHA256. The actual value should reflect your organization's policies.
1173	<a href="#">root-account-hardware-mfa-enabled</a> (p. 175)	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
1173	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
1228	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
1240	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
0261	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
0261	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
0261	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
1271	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
1277	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
1387	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
1387	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
1402	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. To help protect credentials, this rule allows you to optionally require passwords to expire every 12 months and establish a password reuse value of 100.
1404	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.
1405	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
1405	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
1405	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
1405	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
1405	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
1410	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
1425	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
1425	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
1425	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
1425	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
1490	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
1490	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
1511	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
1511	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
1511	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
1511	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
1511	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
1511	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
1512	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
1512	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
1528	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
1528	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
1528	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
1528	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
1528	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
1528	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
1528	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
1528	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
1528	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
1528	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
1528	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
1536	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
1537	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
1552	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
1552	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
1552	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
1552	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
P10	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
P3	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	AWS Config Rule	Guidance
P5	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
P7	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
P7	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
P8	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	AWS Config Rule	Guidance
1405	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
1528	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
1579	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
1425	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
1580	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	AWS Config Rule	Guidance
P10	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
P11	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
1528	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
1528	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
P1	<a href="#">rds-cluster-deletion-protection-enabled (p. 164)</a>	Ensure Amazon RDS instances have deletion protection enabled. Use deletion protection to prevent your RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
P1	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
1277	<a href="#">rds-instance-iam-authentication-enabled (p. 166)</a>	Ensure an AWS Identity and Access Management (IAM) authentication is enabled on RDS instances to control access to systems and assets. This enforces network traffic to and from the database to be encrypted using Secure Sockets Layer (SSL). Because authentication is managed externally, you are not required to store user credentials in the database.
1511	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
1580	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
1425	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
298	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	<p>This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the <code>allowVersionUpgrade</code>. The default is <code>true</code>. It also lets you optionally set the <code>preferredMaintenanceWindow</code> (the default is <code>sat:16:00-sat:16:30</code>), and the <code>automatedSnapshotRetentionPeriod</code> (the default is <code>1</code>). The actual values should reflect your organization's policies.</p>
1388	<a href="#">restricted-common-ports (p. 174)</a>	<p>Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set <code>blockedPort1</code> - <code>blockedPort5</code> parameters (Config Defaults: <code>20,21,3389,3306,4333</code>). The actual values should reflect your organization's policies.</p>
1513	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	<p>Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.</p>

Control ID	AWS Config Rule	Guidance
1511	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
1388	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

## Template

The template is available on GitHub: [Operational Best Practices for ACSC ISM](#).

## Operational Best Practices for AI and ML

This pack contains AWS Config rules based on AI and ML. This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for AI and ML](#).

## Operational Best Practices for Amazon DynamoDB

The template is available on GitHub: [Operational Best Practices for Amazon DynamoDB](#).

## Operational Best Practices for Amazon S3

The template is available on GitHub: [Operational Best Practices for Amazon S3](#).

## Operational Best Practices for APRA CPG 234

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Australian Prudential Regulation Authority (APRA) CPG 234 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more APRA CPG 234 controls. An APRA CPG 234 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings..

This sample conformance pack template contains mappings to controls within APRA CPG 234 2019, which was created by the Commonwealth of Australia and can be found at [Prudential Practice Guide: CPG 234 Information Security](#). Licensing of the framework under Creative Commons Australia Attribution 3.0 Licence and copyright information for the framework (including a disclaimer of warranties) can be found at [APRA | Copyright](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
36a	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
36a	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
36a	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon

Control ID	AWS Config Rule	Guidance
		Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
36b	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
36b	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
36b	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	AWS Config Rule	Guidance
36b	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
36c	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
36c	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
36c	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
36c	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
36c	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
36c	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
36c	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	AWS Config Rule	Guidance
36d	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
36d	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
36d	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
36d	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
36d	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
36d	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
36d	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
36d	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
36d	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
36d	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
36d	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
36d	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
36d	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
36d	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
36d	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
36d	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
36d	<a href="#">access-keys-rotated (p. 107)</a>	<p>The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.</p>
36d	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
36d	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	AWS Config Rule	Guidance
36d	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
36d	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
36d	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
36d	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
36d	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
36d	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
36d	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
36d	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
36d	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
36d	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
36d	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
36d	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
36d	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
36e	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
36e	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.

Control ID	AWS Config Rule	Guidance
36e	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
36e	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
36e	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
36e	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
36e	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
36e	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
36e	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
36e	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
36e	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
36e	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
36e	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
36e	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
36e	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
36e	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
36e	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
36e	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
36f	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
36f	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
36f	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
36f	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
36f	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
36f	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. 36f	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
36f	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
36f	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
36f	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
36f	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
36f	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
36f	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
36g	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
36g	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
36g	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	AWS Config Rule	Guidance
36h	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
36h	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
36h	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	AWS Config Rule	Guidance
36h	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
36h	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
36h	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
36i	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	AWS Config Rule	Guidance
36i	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
36i	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
36i	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	AWS Config Rule	Guidance
36i	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
36i	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
36i	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
36i	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	AWS Config Rule	Guidance
36i	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
36j	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
36j	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
36j	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
36j	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
36j	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
36l	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	AWS Config Rule	Guidance
36l	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
36l	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
36l	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
36l	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
36l	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
36l	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
36l	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
36l	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	AWS Config Rule	Guidance
36l	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
36l	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
36l	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
36l	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	AWS Config Rule	Guidance
36l	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
36l	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
39(a)(b)(d)	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
39(a)(b)(d)	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	AWS Config Rule	Guidance
39(a)(b)(d)	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
44a	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
44a	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
44a	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
44b	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
44b	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
44b	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
44b	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
44c	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	AWS Config Rule	Guidance
44c	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
45	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
45	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
45	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
45	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
45	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
45	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.
45	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
45	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
45	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
45	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	AWS Config Rule	Guidance
45	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
45	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
45	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
45	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
45	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
45	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
45	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
45	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
45	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
45	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
45	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
45	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
45	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
45	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
45	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
45	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
45	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
45	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
45	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
45	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
45	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
45	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
45	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
47c	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
47c	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>
47c	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
47c	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
47c	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
47c	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
47c	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
52c	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
52c	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
52c	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
52c	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
52c	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
52c	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
52c	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
52c	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
52c	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
52c	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
52c	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
52c	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
52c	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
52c	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
52c	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
52c	<a href="#">s3-default-encryption-kms (p. 182)</a>	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
52d	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	AWS Config Rule	Guidance
52d	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
52d	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
52d	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
52d	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
52d	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
52d	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
52d	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
52d	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
52d	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
52d	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
52d	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
52d	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
52d	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
52d	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
52d	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
52d	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
52e	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
52e	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
53	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
53	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
53	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
53	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
53	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
53	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
53	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
53	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
53	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
53	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
53	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
53	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
53	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
53	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
53	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
53	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
53	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
54	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
54	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
54	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
54	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
54	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
54	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	AWS Config Rule	Guidance
54	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
54	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
54	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
54	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
54	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
54	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
54	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
54	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
54	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
54	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
54	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
54	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
54	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
54	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
54	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
54	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
55	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
67	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
67	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
67	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
67	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
67	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
67	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
67	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	<p>Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>
67	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	<p>The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.</p>

Control ID	AWS Config Rule	Guidance
67	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
67	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
67	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
67	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
67	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
67	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
67	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	AWS Config Rule	Guidance
67	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
68	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
68	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
73	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
73	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AttachmentA_1(b)(h)	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
AttachmentA_1(b)(h)	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
AttachmentA_1(b)(h)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AttachmentA_1(b)(h)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AttachmentA_1(b)(h)	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AttachmentA_1(b)(h)	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
AttachmentA_1(b)(h)	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AttachmentA_1(b)(h)	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
AttachmentA_1(b)(h)	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AttachmentA_1(c)	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
AttachmentA_1(c)	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
AttachmentA_1(e)	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AttachmentA_1(e)	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
AttachmentA_1(e)	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	AWS Config Rule	Guidance
AttachmentA_1(e)	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
AttachmentA_1(e)	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AttachmentA_1(e)	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AttachmentA_1(e)	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AttachmentA_1(e)	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
AttachmentA_1(e)	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>
AttachmentA_1(e)	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	<p>The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.</p>

Control ID	AWS Config Rule	Guidance
AttachmentA_1(e)	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AttachmentA_1(e)	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
AttachmentC_4	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
AttachmentC_4	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
AttachmentC_4	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	AWS Config Rule	Guidance
AttachmentC_4	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
AttachmentC_4	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
AttachmentC_4	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AttachmentC_4	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AttachmentC_4	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AttachmentC_4	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
AttachmentC_4	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
AttachmentC_4	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
AttachmentC_4	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AttachmentC_4	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
AttachmentC_4	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
AttachmentC_4	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
AttachmentC_4	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AttachmentC_5	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
AttachmentC_5	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AttachmentC_5	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AttachmentC_5	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
AttachmentC_5	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
AttachmentC_6	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	<p>Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.</p>

Control ID	AWS Config Rule	Guidance
AttachmentC_6	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AttachmentC_6	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AttachmentC_7(c)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AttachmentC_7(h)	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
AttachmentC_7(h)	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
AttachmentC_7(h)	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AttachmentC_7(h)	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AttachmentC_7(h)	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.
AttachmentC_7(h)	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
AttachmentC_7(h)	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
AttachmentC_7(h)	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AttachmentC_7(h)	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	AWS Config Rule	Guidance
AttachmentC_7(h)	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AttachmentC_7(h)	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AttachmentC_7(h)	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AttachmentC_7(h)	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	AWS Config Rule	Guidance
AttachmentC_7(i)	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
AttachmentC_7(j)	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AttachmentC_7(j)	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
AttachmentC_7(j)	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
AttachmentC_7(j)	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AttachmentC_8	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
AttachmentC_8	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AttachmentC_8	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AttachmentC_8	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
AttachmentC_8	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
AttachmentC_8	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AttachmentC_8	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	AWS Config Rule	Guidance
AttachmentC_8	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AttachmentC_8	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AttachmentC_8	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
AttachmentD_1	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.

Control ID	AWS Config Rule	Guidance
AttachmentD_1	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
AttachmentE_1(a)(b)(d)	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
AttachmentE_1(a)(b)(d)	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
AttachmentE_1(a)(b)(d)	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
AttachmentE_1(a)(b)(d)	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	AWS Config Rule	Guidance
AttachmentE_1(a)(b)(d)	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
AttachmentE_1(a)(b)(d)	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
AttachmentE_1(a)(b)(d)	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
AttachmentE_1(a)(b)(d)	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
AttachmentE_1(a)(b)(d)	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
AttachmentE_1(a)(b)(d)	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
AttachmentE_1(a)(b)(d)	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
AttachmentE_1(a)(b)(d)	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
AttachmentE_1(a)(b)(d)	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
AttachmentE_1(a)(b)(d)	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
AttachmentE_4	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
AttachmentE_4	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
AttachmentE_5(d)	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

## Template

The template is available on GitHub: [Operational Best Practices for APRA CPG 234](#).

## Operational Best Practices for Asset Management

This pack contains AWS Config rules based on asset management within AWS. This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Asset Management](#).

## Operational Best Practices for AWS Identity And Access Management

The template is available on GitHub: [Operational Best Practices for AWS Identity And Access Management](#).

## Operational Best Practices for AWS Well-Architected Framework Reliability Pillar

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between Amazon Web Services' Well-Architected Framework Reliability Pillar and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more of the pillar's design principles. A Well-Architected Framework category can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the Well-Architected Framework Reliability Pillar design principles.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
REL-1	How do you manage service quotas and constraints? For cloud-based workload architectures, there are service quotas (which are also referred to as service limits). These quotas exist to prevent accidentally provisioning more resources than you need and to limit request rates on API operations so as to protect services from abuse. There are also resource constraints, for example, the rate that you can push bits down a fiber-optic cable, or the amount of storage on a physical disk.	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect

Control ID	Control Description	AWS Config Rule	Guidance
			your organization's policies.
REL-1	How do you manage service quotas and constraints? For cloud-based workload architectures, there are service quotas (which are also referred to as service limits). These quotas exist to prevent accidentally provisioning more resources than you need and to limit request rates on API operations so as to protect services from abuse. There are also resource constraints, for example, the rate that you can push bits down a fiber-optic cable, or the amount of storage on a physical disk.	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
REL-2	How do you plan your network topology? Workloads often exist in multiple environments. These include multiple cloud environments (both publicly accessible and private) and possibly your existing data center infrastructure. Plans must include network considerations such as intra- and inter-system connectivity, public IP address management, private IP address management, and domain name resolution.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
REL-7	<p>How do you design your workload to adapt to changes in demand? A scalable workload provides elasticity to add or remove resources automatically so that they closely match the current demand at any given point in time.</p>	<p><a href="#">dynamodb-autoscaling-enabled (p. 128)</a></p>	<p>Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.</p>
REL-8	<p>How do you implement change? Controlled changes are necessary to deploy new functionality, and to ensure that the workloads and the operating environment are running known software and can be patched or replaced in a predictable manner. If these changes are uncontrolled, then it makes it difficult to predict the effect of these changes, or to address issues that arise because of them.</p>	<p><a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a></p>	<p>This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the <code>allowVersionUpgrade</code>. The default is true. It also lets you optionally set the <code>preferredMaintenanceWindow</code> (the default is <code>sat:16:00-sat:16:30</code>), and the <code>automatedSnapshotRetentionPeriod</code> (the default is 1). The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
REL-9	How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO).	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
REL-9	How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO).	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
REL-9	How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO).	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
REL-9	How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO).	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data backup processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
REL-9	How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO).	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data backup processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
REL-9	How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO).	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
REL-9	How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO).	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
REL-10	How do you use fault isolation to protect your workload? Fault isolated boundaries limit the effect of a failure within a workload to a limited number of components. Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
REL-9	How do you back up data? Back up data, applications, and configuration to meet your requirements for recovery time objectives (RTO) and recovery point objectives (RPO).	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
REL-10	How do you use fault isolation to protect your workload? Fault isolated boundaries limit the effect of a failure within a workload to a limited number of components. Components outside of the boundary are unaffected by the failure. Using multiple fault isolated boundaries, you can limit the impact on your workload.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SEC-2	<p>How do you manage authentication for people and machines? Authentication is required to verify the identity of someone (a person) or something (a machine). This includes administrators of your AWS accounts as well as other operators of your workload, and end users. Machine access is when one component authenticates with another, for example, an application calling an API. This includes both machines internal to your organization and external parties who need access. Understanding the type (person/machine) and relationship to your organization (internal/external) will determine how authentication (username/password, plus MFA, key/secret key, API key) will occur and where identity should be stored (root user, IAM, API Gateway, Amazon Cognito, IdP-federated).</p>	<a href="#">access-keys-rotated (p. 107)</a>	<p>The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance

Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.</p>
SEC-3	<p>How do you manage authorization for people and machines? Authorization is the rights or permissions that you grant to people or machines to access your workload. Permissions control what someone or something has access to, including your AWS accounts, administration, internal components, APIs, end users, and more.</p>	<p><a href="#">elb-deletion-protection-enabled (p. 144)</a></p>	<p>This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SEC-3	<p>How do you manage authorization for people and machines? Authorization is the rights or permissions that you grant to people or machines to access your workload. Permissions control what someone or something has access to, including your AWS accounts, administration, internal components, APIs, end users, and more.</p>	<p><a href="#">emr-kerberos-enabled (p. 145)</a></p>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
SEC-3	<p>How do you manage authorization for people and machines? Authorization is the rights or permissions that you grant to people or machines to access your workload. Permissions control what someone or something has access to, including your AWS accounts, administration, internal components, APIs, end users, and more.</p>	<p><a href="#">iam-group-has-users-check (p. 153)</a></p>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SEC-3	How do you manage authorization for people and machines? Authorization is the rights or permissions that you grant to people or machines to access your workload. Permissions control what someone or something has access to, including your AWS accounts, administration, internal components, APIs, end users, and more.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
SEC-3	How do you manage authorization for people and machines? Authorization is the rights or permissions that you grant to people or machines to access your workload. Permissions control what someone or something has access to, including your AWS accounts, administration, internal components, APIs, end users, and more.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
SEC-3	How do you manage authorization for people and machines? Authorization is the rights or permissions that you grant to people or machines to access your workload. Permissions control what someone or something has access to, including your AWS accounts, administration, internal components, APIs, end users, and more.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-3	How do you manage authorization for people and machines? Authorization is the rights or permissions that you grant to people or machines to access your workload. Permissions control what someone or something has access to, including your AWS accounts, administration, internal components, APIs, end users, and more.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-4	How do you detect and investigate security events? Capture and analyze events from logs and metrics to gain visibility. Take action on security events and potential threats to help secure your workload.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether it's the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether it's the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
SEC-5	How do you protect your network resources? Any workload that has some form of network connectivity, whether itâ€™s the internet or a private network, requires multiple layers of defense to help protect from external and internal network-based threats.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SEC-6	How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances, containers, AWS Lambda functions, database services, IoT devices, and more.	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-6	How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances, containers, AWS Lambda functions, database services, IoT devices, and more.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
SEC-6	How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances, containers, AWS Lambda functions, database services, IoT devices, and more.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
SEC-6	How do you protect your compute resources? Compute resources in your workload require multiple layers of defense to help protect from external and internal threats. Compute resources include EC2 instances, containers, AWS Lambda functions, database services, IoT devices, and more.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-7	How do you classify your data? Classification provides a way to categorize data, based on criticality and sensitivity in order to help you determine appropriate protection and retention controls.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
SEC-7	How do you classify your data? Classification provides a way to categorize data, based on criticality and sensitivity in order to help you determine appropriate protection and retention controls.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

AWS Config Developer Guide  
Operational Best Practices for AWS Well-  
Architected Framework Security Pillar

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	<p>How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.</p>	<p><a href="#">redshift-cluster-configuration-check (p. 170)</a></p>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.</p>
SEC-8	<p>How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.</p>	<p><a href="#">redshift-cluster-public-access-check (p. 171)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">s3-default-encryption-kms (p. 182)</a>	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
SEC-8	How do you protect your data at rest? Protect your data at rest by implementing multiple controls, to reduce the risk of unauthorized access or mishandling.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-9	How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
SEC-9	How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
SEC-9	How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SEC-9	How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SEC-9	How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
SEC-9	How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SEC-9	How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
SEC-9	How do you protect your data in transit? Protect your data in transit by implementing multiple controls to reduce the risk of unauthorized access or loss.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

## Template

The template is available on GitHub: [Operational Best Practices for AWS Well-Architected Security Pillar](#).

## Operational Best Practices for BCP and DR

This pack contains AWS Config rules based on BCP and DR within AWS. This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any

Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for BCP and DR](#).

## Operational Best Practices for BNM RMiT

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Bank Negara Malaysia (BNM) Risk Management in Technology (RMiT) and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more BNM RMiT controls. A BNM RMiT control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable you to align to a subset of Title 21 CFR Part 11 design principles.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.27	A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators.	<a href="#">cloudwatch-alarm-resource-check (p. 120)</a>	Enable this rule to check whether the specified resource type has an Amazon CloudWatch alarm for the specified metric. For resource type, you can specify EBS volumes, EC2 instances, RDS clusters, or S3 buckets. Use CloudWatch alarms for communicating event detection information to appropriate personnel. This rule requires you to set resourceType (for example, AWS::EC2::Instance) and metricName (for example, CPUUtilization) parameters.
10.27	A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
10.27	A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
10.27	A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators.	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	Control Description	AWS Config Rule	Guidance
10.27	A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators.	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
10.27	A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators.	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
10.27	A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators.	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
10.27	A financial institution must establish real-time monitoring mechanisms to track capacity utilisation and performance of key processes and services. These monitoring mechanisms shall be capable of providing timely and actionable alerts to administrators.	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
10.34	A financial institution must ensure the network services for its critical systems are reliable and have no SPOF in order to protect the critical systems against potential network faults and cyber threats.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
10.34	A financial institution must ensure the network services for its critical systems are reliable and have no SPOF in order to protect the critical systems against potential network faults and cyber threats.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
10.35	A financial institution must establish real-time network bandwidth monitoring processes and corresponding network service resilience metrics to flag any over utilisation of bandwidth and system disruptions due to bandwidth congestion and network faults. This includes traffic analysis to detect trends and anomalies.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
10.35	A financial institution must establish real-time network bandwidth monitoring processes and corresponding network service resilience metrics to flag any over utilisation of bandwidth and system disruptions due to bandwidth congestion and network faults. This includes traffic analysis to detect trends and anomalies.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
10.35	A financial institution must establish real-time network bandwidth monitoring processes and corresponding network service resilience metrics to flag any over utilisation of bandwidth and system disruptions due to bandwidth congestion and network faults. This includes traffic analysis to detect trends and anomalies.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
10.36	A financial institution must ensure network services supporting critical systems are designed and implemented to ensure the confidentiality, integrity and availability of data.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.36	A financial institution must ensure network services supporting critical systems are designed and implemented to ensure the confidentiality, integrity and availability of data.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
10.36	A financial institution must ensure network services supporting critical systems are designed and implemented to ensure the confidentiality, integrity and availability of data.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
10.36	A financial institution must ensure network services supporting critical systems are designed and implemented to ensure the confidentiality, integrity and availability of data.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
10.36	A financial institution must ensure network services supporting critical systems are designed and implemented to ensure the confidentiality, integrity and availability of data.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
10.36	A financial institution must ensure network services supporting critical systems are designed and implemented to ensure the confidentiality, integrity and availability of data.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
10.38	A financial institution must ensure sufficient and relevant network device logs are retained for investigations and forensic purposes for at least three years.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">iam-password-policy (p. 154)</a></p>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. To help protect credentials, this rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">iam-user-group-membership-check (p. 157)</a></p>	<p>AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">iam-user-mfa-enabled (p. 158)</a></p>	<p>Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. 10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">iam-no-inline-policy-check (p. 154)</a></p>	<p>Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">dms-replication-not-public (p. 127)</a></p>	<p>Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">elasticsearch-in-vpc-only (p. 141)</a></p>	<p>Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">emr-master-no-public-ip (p. 146)</a></p>	<p>Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">ec2-instances-in-vpc (p. 159)</a></p>	<p>Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">internet-gateway-authorized-vpc-only (p. 160)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">redshift-cluster-public-access-check (p. 171)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">s3-account-level-public-access-blocks (p. 175)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">encrypted-volumes (p. 146)</a></p>	<p>Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a></p>	<p>To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">rds-storage-encrypted (p. 169)</a></p>	<p>To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">redshift-cluster-configuration-check (p. 170)</a></p>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a></p>	<p>To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a></p>	<p>To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a></p>	<p>To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.</p>
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">sns-encrypted-kms (p. 187)</a></p>	<p>To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">s3-default-encryption-kms (p. 182)</a>	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
10.53	A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.53	<p>A financial institution must implement appropriate safeguards on customer and counterparty information and proprietary data when using cloud services to protect against unauthorised disclosure and access. This shall include retaining ownership, control and management of all data pertaining to customer and counterparty information, proprietary data and services hosted on the cloud, including the relevant cryptographic keys management.</p>	<p><a href="#">elb-tls-https-listeners-only (p. 145)</a></p>	<p>Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.</p>
10.54	<p>A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems.</p>	<p><a href="#">iam-user-unused-credentials-check (p. 159)</a></p>	<p>AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.54	<p>A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems</p>	<p><a href="#">emr-kerberos-enabled (p. 145)</a></p>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
10.54	<p>A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems</p>	<p><a href="#">iam-group-has-users-check (p. 153)</a></p>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.54	<p>A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems</p>	<p><a href="#">iam-password-policy (p. 154)</a></p>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. To help protect credentials, this rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.54	A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
10.54	A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
10.54	A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
10.54	A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
10.54	A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
10.54	A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
10.54	A financial institution must implement an appropriate access controls policy for the identification, authentication and authorisation of users (internal and external users such as third party service providers). This must address both logical and physical technology access controls which are commensurate with the level of risk of unauthorised access to its technology systems	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
10.61	A financial institution must ensure— (a) access controls to enterprise-wide systems are effectively managed and monitored; and (b) user activities in critical systems are logged for audit and investigations. Activity logs must be maintained for at least three years and regularly reviewed in a timely manner.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
10.62	In fulfilling the requirement under paragraph 10.61, large financial institutions are required to— (a) deploy an identity access management system to effectively manage and monitor user access to enterprise-wide systems; and (b) deploy automated audit tools to flag any anomalies.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
10.62	In fulfilling the requirement under paragraph 10.61, large financial institutions are required to— (a) deploy an identity access management system to effectively manage and monitor user access to enterprise-wide systems; and (b) deploy automated audit tools to flag any anomalies.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
10.62	<p>In fulfilling the requirement under paragraph 10.61, large financial institutions are required to— (a) deploy an identity access management system to effectively manage and monitor user access to enterprise-wide systems; and (b) deploy automated audit tools to flag any anomalies.</p>	<p><a href="#">securityhub-enabled (p. 186)</a></p>	<p>AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.</p>
10.63	<p>A financial institution must ensure that critical systems are not running on outdated systems with known security vulnerabilities or end-of-life (EOL) technology systems. In this regard, a financial institution must clearly assign responsibilities to identified functions:</p> <ul style="list-style-type: none"> <li>(a) to continuously monitor and implement latest patch releases in a timely manner;</li> <li>and (b) identify critical technology systems that are approaching EOL for further remedial action.</li> </ul>	<p><a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a></p>	<p>An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
10.63	A financial institution must ensure that critical systems are not running on outdated systems with known security vulnerabilities or end-of-life (EOL) technology systems. In this regard, a financial institution must clearly assign responsibilities to identified functions: (a) to continuously monitor and implement latest patch releases in a timely manner; and (b) identify critical technology systems that are approaching EOL for further remedial action.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
10.63	A financial institution must ensure that critical systems are not running on outdated systems with known security vulnerabilities or end-of-life (EOL) technology systems. In this regard, a financial institution must clearly assign responsibilities to identified functions: (a) to continuously monitor and implement latest patch releases in a timely manner; and (b) identify critical technology systems that are approaching EOL for further remedial action.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(a)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (a) confidentiality and integrity of customer and counterparty information and transactions	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
10.66(b)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered via channels and devices with minimum disruption to services	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
10.66(b)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered via channels and devices with minimum disruption to services	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(b)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered via channels and devices with minimum disruption to services	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
10.66(b)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered via channels and devices with minimum disruption to services	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(b)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered via channels and devices with minimum disruption to services	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
10.66(b)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (b) reliability of services delivered via channels and devices with minimum disruption to services	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(d)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (d) sufficient audit trail and monitoring of anomalous transactions	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
10.66(e)	A financial institution must implement robust technology security controls in providing digital services which assure the following: (e) ability to identify and revert to the recovery point prior to incident or service disruption	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
11.7	A financial institution must deploy effective tools to support the continuous and proactive monitoring and timely detection of anomalous activities in its technology infrastructure. The scope of monitoring must cover all critical systems including the supporting infrastructure.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
11.7	<p>A financial institution must deploy effective tools to support the continuous and proactive monitoring and timely detection of anomalous activities in its technology infrastructure. The scope of monitoring must cover all critical systems including the supporting infrastructure.</p>	<p><a href="#">securityhub-enabled (p. 186)</a></p>	<p>AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.</p>
11.7(c)(f)	<p>The SOC must be able to perform the following functions: (c) vulnerability management; (f) provision of situational awareness to detect adversaries and threats including threat intelligence analysis and operations, and monitoring indicators of compromise (IOC). This includes advanced behavioural analysis to detect signature-less and file-less malware and to identify anomalies that may pose security threats including at endpoints and network layers.</p>	<p><a href="#">guardduty-enabled-centralized (p. 152)</a></p>	<p>Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.7(c)(f)	<p>The SOC must be able to perform the following functions:</p> <ul style="list-style-type: none"> <li>(c) vulnerability management;</li> <li>(f) provision of situational awareness to detect adversaries and threats including threat intelligence analysis and operations, and monitoring indicators of compromise (IOC).</li> </ul> <p>This includes advanced behavioural analysis to detect signature-less and file-less malware and to identify anomalies that may pose security threats including at endpoints and network layers.</p>	<p><a href="#">guardduty-non-archived-findings (p. 152)</a></p>	<p>Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.</p>
11.7(c)(f)	<p>The SOC must be able to perform the following functions:</p> <ul style="list-style-type: none"> <li>(c) vulnerability management;</li> <li>(f) provision of situational awareness to detect adversaries and threats including threat intelligence analysis and operations, and monitoring indicators of compromise (IOC).</li> </ul> <p>This includes advanced behavioural analysis to detect signature-less and file-less malware and to identify anomalies that may pose security threats including at endpoints and network layers.</p>	<p><a href="#">securityhub-enabled (p. 186)</a></p>	<p>AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix 5.1	Conduct periodic review on the configuration and rules settings for all security devices. Use automated tools to review and monitor changes to configuration and rules settings. - Appendix 5. Control Measures on Cybersecurity	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
Appendix 5.1	Conduct periodic review on the configuration and rules settings for all security devices. Use automated tools to review and monitor changes to configuration and rules settings. - Appendix 5. Control Measures on Cybersecurity	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix 5.5(b)	Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix 5.5(b)	Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
Appendix 5.5(b)	Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix 5.5(b)	Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix 5.5(b)	Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix 5.5(b)	Ensure security controls for server-to-server external network connections include the following: (b) use of secure tunnels such as Transport Layer Security (TLS) and Virtual Private Network (VPN) IPSec	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
Appendix 5.5(c)	Ensure security controls for server-to-server external network connections include the following: (c) deploying staging servers with adequate perimeter defences and protection such as firewall, IPS and antivirus.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix 5.5(c)	Ensure security controls for server-to-server external network connections include the following: (c) deploying staging servers with adequate perimeter defences and protection such as firewall, IPS and antivirus.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix 5.5(c)	Ensure security controls for server-to-server external network connections include the following: (c) deploying staging servers with adequate perimeter defences and protection such as firewall, IPS and antivirus.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
Appendix 5.5(c)	Ensure security controls for server-to-server external network connections include the following: (c) deploying staging servers with adequate perimeter defences and protection such as firewall, IPS and antivirus.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Appendix 5.5(c)	Ensure security controls for server-to-server external network connections include the following: (c) deploying staging servers with adequate perimeter defences and protection such as firewall, IPS and antivirus.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
Appendix 5.6	Ensure security controls for remote access to server include the following: (a) restrict access to only hardened and locked down end-point devices; (b) use secure tunnels such as TLS and VPN IPsec; (c) deploy 'gateway' server with adequate perimeter defences and protection such as firewall, IPS and antivirus; and (d) close relevant ports immediately upon expiry of remote access.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix 5.6	Ensure security controls for remote access to server include the following: (a) restrict access to only hardened and locked down end-point devices; (b) use secure tunnels such as TLS and VPN IPsec; (c) deploy 'gateway' server with adequate perimeter defences and protection such as firewall, IPS and antivirus; and (d) close relevant ports immediately upon expiry of remote access.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
Appendix 5.6	Ensure security controls for remote access to server include the following: (a) restrict access to only hardened and locked down end-point devices; (b) use secure tunnels such as TLS and VPN IPsec; (c) deploy 'gateway' server with adequate perimeter defences and protection such as firewall, IPS and antivirus; and (d) close relevant ports immediately upon expiry of remote access.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Appendix 5.6	Ensure security controls for remote access to server include the following: (a) restrict access to only hardened and locked down end-point devices; (b) use secure tunnels such as TLS and VPN IPsec; (c) deploy 'gateway' server with adequate perimeter defences and protection such as firewall, IPS and antivirus; and (d) close relevant ports immediately upon expiry of remote access.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. ## Template

The template is available on GitHub: [Operational Best Practices for BNM RMIT](#).

# Operational Best Practices for CIS AWS Foundations Benchmark v1.3 Level 1

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Center for Internet Security (CIS) Amazon Web Services Foundation v1.3 Level 1 and AWS managed Config rules/AWS Config Process Checks. Each Config rule applies to a specific AWS resource, and relates to one or more CIS Amazon Web Services Foundation v1.3 Level 1 controls. A CIS Amazon Web Services Foundation v1.3 Level 1 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

For more information about process checks, see [AWS Config Process Checks Within a Conformance Pack \(p. 222\)](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
1.1	account-contact-details-configured (Process Check)	Ensure the contact email and telephone number for AWS accounts are current and map to more than one individual in your organization. Within the My Account section of the console ensure correct information is specified in the Contact Information section. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
1.2	account-security-contact-configured (Process Check)	Ensure the contact email and telephone number for the your organizations security team are current. Within the My Account section of the AWS Management Console ensure the correct information is specified in the Security section. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
1.3	account-security-questions-configured (Process Check)	Ensure the security questions that can be used to authenticate individuals calling AWS customer service for support are configured. Within the My Account section of the AWS Management Console ensure three security challenge questions are configured.

Control ID	AWS Config Rule	Guidance
		<p>For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a></p>
1.4	<a href="#">iam-root-access-key-check (p. 157)</a>	<p>Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.</p>
1.5	<a href="#">root-account-mfa-enabled (p. 175)</a>	<p>Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.</p>
1.7	<a href="#">root-account-regular-use (Process Check)</a>	<p>Ensure the use of the root account is avoided for everyday tasks. Within IAM, run a credential report to examine when the root user was last used. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a></p>

Control ID	AWS Config Rule	Guidance
1.8	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	AWS Config Rule	Guidance
1.9	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
1.10	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	<p>Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.</p>

Control ID	AWS Config Rule	Guidance
1.11	iam-user-console-and-api-access-at-creation (Process Check)	Ensure access keys are not setup during the initial user setup for all IAM users that have a console password. For all IAM users with console access, compare the user 'Creation time` to the Access Key `Created` date. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
1.12	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.
1.13	iam-user-single-access-key (Process Check)	Ensure there is only one active access key available for any single IAM user. For all IAM users check that there is only one active key used within the Security Credentials tab for each user within IAM. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
1.14	<a href="#">access-keys-rotated (p. 107)</a>	<p>The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.</p>
1.15	<a href="#">iam-user-no-policies-check (p. 158)</a>	<p>This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.</p>
1.15	<a href="#">iam-no-inline-policy-check (p. 154)</a>	<p>Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.</p>
1.15	<a href="#">iam-user-group-membership-check (p. 157)</a>	<p>AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
1.16	<a href="#">iam-policy-no-statements-with-admin-access</a> (p. 156)	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
1.17	iam-support-role-created (Process Check)	Ensure a support role has been created to manage incidents with AWS Support. Check that the AWSSupportAccess policy is attached to an IAM role. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
1.19	iam-expired-certificates (Process Check)	Ensure that all the expired SSL/TLS certificates stored in IAM are removed. From the command line with the installed AWS CLI run the 'aws iam list-server-certificates' command and determine if there are any expired server certificates. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
1.20	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
1.21	<code>iam-access-analyzer-enabled</code> (Process Check)	Ensure that IAM Access Analyzer is enabled. Within the IAM section of the console, select Access Analyzer and ensure that the STATUS is set to Active. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
2.1.1	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
2.2.1	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
2.2.1	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
3.1	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
3.3	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.3	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
3.3	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
3.3	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
3.4	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
3.5	<code>config-enabled-all-regions</code> (Process Check)	Ensure AWS Config is enabled in all AWS Regions. Within the AWS Config section of the console, for each Region enabled ensure the AWS Config recorder is configured correctly. Ensure recording of global AWS resources is enabled at least in one Region. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
3.6	<a href="#">s3-bucket-logging-enabled</a> (p. 177)	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
4.1	alarm-unauthorized-api-calls (Process Check)	Ensure a log metric filter and an alarm exists for unauthorized API calls. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.2	alarm-sign-in-without-mfa (Process Check)	Ensure a log metric filter and an alarm exists for AWS Management Console sign-in without Multi-Factor Authentication (MFA). For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.3	alarm-root-account-use (Process Check)	Ensure a log metric filter and an alarm exists for usage of the root account. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
4.4	alarm-iam-policy-change (Process Check)	Ensure a log metric filter and an alarm exists for IAM policy changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.5	alarm-cloudtrail-config-change (Process Check)	Ensure a log metric filter and an alarm exists for AWS CloudTrail configuration changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.8	alarm-s3-bucket-policy-change (Process Check)	Ensure a log metric filter and an alarm exists for Amazon S3 bucket policy changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.12	alarm-vpc-network-gateway-change (Process Check)	Ensure a log metric filter and an alarm exists for changes to network gateways. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
4.13	alarm-vpc-route-table-change (Process Check)	Ensure a log metric filter and an alarm exists for route table changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.14	alarm-vpc-change (Process Check)	Ensure a log metric filter and an alarm exists for Amazon Virtual Private Cloud (VPC) changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.15	alarm-organizations-change (Process Check)	Ensure a log metric filter and an alarm exists for AWS Organizations changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
5.1	vpc-networkacl-open-admin-ports (Process Check)	Ensure no network ACLs allow public ingress to the remote server administration ports. Within the VPC section of the console, ensure there are network ACLs with a source of '0.0.0.0/0' with allowing ports or port ranges including remote server admin ports. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
5.2	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

## Template

The template is available on GitHub: [Operational Best Practices for CIS AWS Foundations Benchmark v1.3 Level 1](#).

# Operational Best Practices for CIS AWS Foundations Benchmark v1.3 Level 2

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Center for Internet Security (CIS) Amazon Web Services Foundation v1.3 Level 2 and AWS managed Config rules/AWS Config Process Checks. Each Config rule applies to a specific AWS resource, and relates to one or more CIS Amazon Web Services Foundation v1.3 Level 2 controls. A CIS Amazon Web Services Foundation v1.3 Level 2 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

For more information about process checks, see [AWS Config Process Checks Within a Conformance Pack \(p. 222\)](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
1.1	account-contact-details-configured (Process Check)	Ensure the contact email and telephone number for AWS accounts are current and map to more than one individual in your organization. Within the My Account section of

Control ID	AWS Config Rule	Guidance
		<p>the console ensure correct information is specified in the Contact Information section. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a></p>
1.2	account-security-contact-configured (Process Check)	<p>Ensure the contact email and telephone number for the your organizations security team are current. Within the My Account section of the AWS Management Console ensure the correct information is specified in the Security section. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a></p>
1.3	account-security-questions-configured (Process Check)	<p>Ensure the security questions that can be used to authenticate individuals calling AWS customer service for support are configured. Within the My Account section of the AWS Management Console ensure three security challenge questions are configured. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a></p>

Control ID	AWS Config Rule	Guidance
1.4	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
1.5	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
1.6	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
1.7	root-account-regular-use (Process Check)	Ensure the use of the root account is avoided for everyday tasks. Within IAM, run a credential report to examine when the root user was last used. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
1.8	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	AWS Config Rule	Guidance
1.9	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the AWS Foundational Security Best Practices standard for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
1.10	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	<p>Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.</p>

Control ID	AWS Config Rule	Guidance
1.11	iam-user-console-and-api-access-at-creation (Process Check)	Ensure access keys are not setup during the initial user setup for all IAM users that have a console password. For all IAM users with console access, compare the user 'Creation time` to the Access Key `Created` date. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
1.12	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.
1.13	iam-user-single-access-key (Process Check)	Ensure there is only one active access key available for any single IAM user. For all IAM users check that there is only one active key used within the Security Credentials tab for each user within IAM. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
1.14	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
1.15	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
1.15	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
1.15	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
1.16	<a href="#">iam-policy-no-statements-with-admin-access</a> (p. 156)	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
1.17	iam-support-role-created (Process Check)	Ensure a support role has been created to manage incidents with AWS Support. Check that the AWSSupportAccess policy is attached to an IAM role. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
1.18	ec2-instance-role-assigned (Process Check)	For instances that are known to perform AWS actions, ensure that they belong to an instance role that has the necessary permissions. Within the EC2 section of the AWS Management Console select the instance and check that the IAM role field is populated. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
1.19	iam-expired-certificates (Process Check)	<p>Ensure that all the expired SSL/TLS certificates stored in IAM are removed. From the command line with the installed AWS CLI run the 'aws iam list-server-certificates' command and determine if there are any expired server certificates. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a></p>
1.20	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.</p>
1.21	iam-access-analyzer-enabled (Process Check)	<p>Ensure that IAM Access Analyzer is enabled. Within the IAM section of the console, select Access Analyzer and ensure that the STATUS is set to Active. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a></p>

Control ID	AWS Config Rule	Guidance
1.22	iam-central-user-management (Process Check)	Ensure IAM users are managed centrally via the identity federation or AWS Organizations for multi-account environments. Within the IAM section of the AWS Management Console, confirm that no IAM users representing individuals are present. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
2.1.1	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
2.1.2	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
2.2.1	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
2.2.1	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	AWS Config Rule	Guidance
3.1	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
3.2	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	<p>Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.</p>
3.3	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	<p>Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.</p>
3.3	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	<p>Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.</p>

Control ID	AWS Config Rule	Guidance
3.3	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
3.3	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
3.4	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
3.5	<code>config-enabled-all-regions</code> (Process Check)	Ensure AWS Config is enabled in all AWS Regions. Within the AWS Config section of the console, for each Region enabled ensure the AWS Config recorder is configured correctly. Ensure recording of global AWS resources is enabled at least in one Region. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
3.6	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
3.7	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
3.8	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
3.9	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
3.10	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
3.11	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
4.1	alarm-unauthorized-api-calls (Process Check)	Ensure a log metric filter and an alarm exists for unauthorized API calls. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.2	alarm-sign-in-without-mfa (Process Check)	Ensure a log metric filter and an alarm exists for AWS Management Console sign-in without Multi-Factor Authentication (MFA). For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.3	alarm-root-account-use (Process Check)	Ensure a log metric filter and an alarm exists for usage of the root account. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.4	alarm-iam-policy-change (Process Check)	Ensure a log metric filter and an alarm exists for IAM policy changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
4.5	alarm-cloudtrail-config-change (Process Check)	Ensure a log metric filter and an alarm exists for AWS CloudTrail configuration changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.6	alarm-console-auth-failures (Process Check)	Ensure a log metric filter and an alarm exists for AWS Management Console authentication failures. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.7	alarm-kms-disable-or-delete-cmk (Process Check)	Ensure a log metric filter and an alarm exists for disabling or scheduled deletion of customer created CMKs. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.8	alarm-s3-bucket-policy-change (Process Check)	Ensure a log metric filter and an alarm exists for Amazon S3 bucket policy changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
4.9	alarm-aws-config-change (Process Check)	Ensure a log metric filter and an alarm exists for AWS Config configuration changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.10	alarm-vpc-security-group-change (Process Check)	Ensure a log metric filter and an alarm exists for security group changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.11	alarm-vpc-nacl-change (Process Check)	Ensure a log metric filter and an alarm exists for changes to Network Access Control Lists (NACL). For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.12	alarm-vpc-network-gateway-change (Process Check)	Ensure a log metric filter and an alarm exists for changes to network gateways. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
4.13	alarm-vpc-route-table-change (Process Check)	Ensure a log metric filter and an alarm exists for route table changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.14	alarm-vpc-change (Process Check)	Ensure a log metric filter and an alarm exists for Amazon Virtual Private Cloud (VPC) changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
4.15	alarm-organizations-change (Process Check)	Ensure a log metric filter and an alarm exists for AWS Organizations changes. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>
5.1	vpc-networkacl-open-admin-ports (Process Check)	Ensure no network ACLs allow public ingress to the remote server administration ports. Within the VPC section of the console, ensure there are network ACLs with a source of '0.0.0.0/0' with allowing ports or port ranges including remote server admin ports. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

Control ID	AWS Config Rule	Guidance
5.2	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
5.3	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
5.4	<a href="#">vpc-networkacl-open-admin-ports (Process Check)</a>	Ensure the routing tables for Amazon VPC peering are "least access". Within the VPC section of the console, examine the route table entries to ensure that the least number of subnets or hosts are required to accomplish the purpose for peering are routable. For further details on the auditing of this control please refer to the CIS Amazon Web Services Foundations Benchmark version 1.3.0 document available at <a href="https://www.cisecurity.org/benchmark/amazon_web_services/">https://www.cisecurity.org/benchmark/amazon_web_services/</a>

## Template

The template is available on GitHub: [Operational Best Practices for CIS AWS Foundations Benchmark v1.3 Level 2](#).

## Operational Best Practices for CIS Top 20

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Center for Internet Security (CIS) Top 20 Critical Security Controls and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more CIS Top 20 controls. A CIS Top 20 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the CIS Top 20.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
CIS.2	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CIS.2	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
CIS.2	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	AWS Config Rule	Guidance
CIS.2	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
CIS.2	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
CIS.2	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
CIS.3	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
CIS.3	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
CIS.3	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CIS.4	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
CIS.4	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
CIS.4	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
CIS.4	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
CIS.4	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
CIS.4	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
CIS.5	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
CIS.5	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CIS.5	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	AWS Config Rule	Guidance
CIS.5	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
CIS.5	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the <code>allowVersionUpgrade</code> . The default is true. It also lets you optionally set the <code>preferredMaintenanceWindow</code> (the default is sat:16:00-sat:16:30), and the <code>automatedSnapshotRetentionPeriod</code> (the default is 1). The actual values should reflect your organization's policies.
CIS.6	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
CIS.6	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
CIS.6	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
CIS.6	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
CIS.6	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
CIS.6	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	AWS Config Rule	Guidance
CIS.6	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
CIS.6	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
CIS.6	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	AWS Config Rule	Guidance
CIS.6	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
CIS.6	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.</p>
CIS.6	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	<p>Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>

Control ID	AWS Config Rule	Guidance
CIS.6	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CIS.6	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
CIS.8	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
CIS.9	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
CIS.9	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
CIS.9	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
CIS.9	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
CIS.9	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
CIS.9	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	AWS Config Rule	Guidance
CIS.9	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
CIS.9	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
CIS.9	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
CIS.9	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
CIS.9	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
CIS.9	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
CIS.9	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
CIS.9	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
CIS.9	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
CIS.9	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CIS.9	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
CIS.9	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
CIS.9	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
CIS.9	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
CIS.10	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
CIS.10	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	AWS Config Rule	Guidance
CIS.10	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
CIS.10	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
CIS.10	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
CIS.11	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	AWS Config Rule	Guidance
CIS.11	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
CIS.11	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
CIS.11	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
CIS.11	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
CIS.12	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
CIS.12	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
CIS.12	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
CIS.12	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
CIS.12	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
CIS.12	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
CIS.12	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
CIS.12	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
CIS.12	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
CIS.12	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
CIS.12	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
CIS.12	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
CIS.12	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
CIS.12	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
CIS.12	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
CIS.12	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
CIS.12	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
CIS.12	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CIS.12	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
CIS.12	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CIS.12	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	AWS Config Rule	Guidance
CIS.12	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
CIS.13	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
CIS.13	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
CIS.13	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
CIS.13	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
CIS.13	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	AWS Config Rule	Guidance
CIS.13	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
CIS.13	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
CIS.13	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
CIS.13	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
CIS.13	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
CIS.13	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
CIS.13	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
CIS.13	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
CIS.13	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
CIS.13	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
CIS.13	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
CIS.13	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
CIS.13	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
CIS.13	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
CIS.13	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
CIS.13	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
CIS.13	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
CIS.14	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
CIS.14	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
CIS.14	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
CIS.14	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
CIS.14	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	AWS Config Rule	Guidance
CIS.14	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
CIS.14	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
CIS.14	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
CIS.14	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
CIS.14	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
CIS.14	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
CIS.14	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	AWS Config Rule	Guidance
CIS.14	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
CIS.14	<a href="#">encrypted-volumes (p. 146)</a>	<p>Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.</p>
CIS.14	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	<p>To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.</p>
CIS.14	<a href="#">rds-instance-public-access-check (p. 166)</a>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.</p>

Control ID	AWS Config Rule	Guidance
CIS.14	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
CIS.14	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
CIS.14	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
CIS.14	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
CIS.14	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
CIS.14	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
CIS.14	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
CIS.14	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
CIS.14	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
CIS.14	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CIS.14	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
CIS.14	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
CIS.14	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
CIS.14	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
CIS.14	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
CIS.16	<a href="#">access-keys-rotated (p. 107)</a>	<p>The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.</p>
CIS.16	<a href="#">cloudtrail-enabled (p. 121)</a>	<p>AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.</p>
CIS.16	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	<p>Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.</p>

Control ID	AWS Config Rule	Guidance
CIS.16	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
CIS.16	<a href="#">guardduty-enabled-centralized (p. 152)</a>	<p>Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.</p>
CIS.16	<a href="#">guardduty-non-archived-findings (p. 152)</a>	<p>Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.</p>

Control ID	AWS Config Rule	Guidance
CIS.16	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
CIS.16	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
CIS.16	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
CIS.16	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
CIS.16	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
CIS.16	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
CIS.16	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
CIS.16	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
CIS.16	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
CIS.16	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
CIS.16	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
CIS.16	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
CIS.16	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CIS.18	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.

Control ID	AWS Config Rule	Guidance
CIS.18	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
CIS.19	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
CIS.19	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
CIS.19	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
CIS.2	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

## Template

The template is available on GitHub: [Operational Best Practices for CIS Top 20](#).

## Operational Best Practices for CMMC Level 1

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Cybersecurity Maturity Model Certification (CMMC) Level 1 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more CMMC Level 1 controls. A CMMC Level 1 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the CMMC Level 1.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-imsdv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
SC.1.176	Implement subnetworks for publicly accessible system components that are physically or logically separated from internal networks.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
SI.1.210	Identify, report, and correct information and information system flaws in a timely manner.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI.1.210	Identify, report, and correct information and information system flaws in a timely manner.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI.1.210	Identify, report, and correct information and information system flaws in a timely manner.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SI.1.211	Provide protection from malicious code at appropriate locations within organizational information systems.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance

## Template

The template is available on GitHub: [Operational Best Practices for CMMC Level 1](#).

## Operational Best Practices for CMMC Level 2

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Cybersecurity Maturity Model Certification (CMMC) Level 2 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more CMMC Level 2 controls. A CMMC Level 2 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the CMMC Level 2.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users,	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you

Control ID	Control Description	AWS Config Rule	Guidance
	processes acting on behalf of authorized users, or devices (including other information systems).		incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-imsdv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

SI.1.211	Provide protection from malicious code at appropriate locations within organizational information systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.008	Use non-privileged accounts or roles when accessing nonsecurity functions.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. As a result, you will receive log files containing API activity for the new Region without taking any action.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-volume-in-use-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
CM.2.063	Control and monitor user-installed software.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.063	Control and monitor user-installed software.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.093	Detect and report events.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
IR.2.093	Detect and report events.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.093	Detect and report events.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
IR.2.093	Detect and report events.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
MA.2.113	Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
MA.2.113	Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
RE.2.137	Regularly perform and test data backups.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
RE.2.137	Regularly perform and test data backups.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
RE.2.137	Regularly perform and test data backups.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
RE.2.137	Regularly perform and test data backups.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
RE.2.137	Regularly perform and test data backups.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
RE.2.137	Regularly perform and test data backups.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
RE.2.137	Regularly perform and test data backups.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
RE.2.137	Regularly perform and test data backups.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
RE.2.137	Regularly perform and test data backups.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
RM.2.142	Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting those systems and applications are identified.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.216	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI.2.216	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SI.2.216	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.216	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

## Template

The template is available on GitHub: [Operational Best Practices for CMMC Level 2](#).

## Operational Best Practices for CMMC Level 3

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Cybersecurity Maturity Model Certification (CMMC) Level 3 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more CMMC Level 3 controls. A CMMC Level 3 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the CMMC Level 3.

**AWS Region:** Due to tentative guidance provided by the DoD and the CMMC Accreditation Body with respect to FedRAMP reciprocity for CMMC Level 3 - 5, it is recommended that customers use AWS GovCloud (US) regions at this time for any workloads that require compliance with CMMC Level 3 - 5. As such, conformance pack templates for CMMC Levels 3 - 5 are not available within the conformance pack console to avoid confusion. Customers may independently install Config rules that map the tentative guidance for CMMC Level 3-5 (without a conformance pack template) via CloudFormation using the sample YAML file linked within this document.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best

Control ID	Control Description	AWS Config Rule	Guidance
			<p>Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-imsdv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance

Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.176	Implement subnetworks for publicly accessible system components that are physically or logically separated from internal networks.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
SI.1.210	Identify, report, and correct information and information system flaws in a timely manner.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI.1.210	Identify, report, and correct information and information system flaws in a timely manner.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SI.1.211	Provide protection from malicious code at appropriate locations within organizational information systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ec2-imsdv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-volume-in-use-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Control ID	Control Description	AWS Config Rule	Guidance
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
IR.2.093	Detect and report events.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.093	Detect and report events.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
IR.2.093	Detect and report events.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
MA.2.113	Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
MA.2.113	Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
RE.2.137	Regularly perform and test data backups.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
RE.2.137	Regularly perform and test data backups.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
RE.2.137	Regularly perform and test data backups.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
RE.2.137	Regularly perform and test data backups.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
RE.2.137	Regularly perform and test data backups.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
RM.2.142	Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting those systems and applications are identified.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.216	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SI.2.216	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.</p>
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">elb-logging-enabled (p. 144)</a>	<p>Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">cloud-trail-cloudwatch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
AU.3.051	Correlate audit record review, analysis, and reporting processes for investigation and response to indications of unlawful, unauthorized, suspicious, or unusual activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
IA.3.083	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
IA.3.083	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.085	Prevent the reuse of identifiers for a defined period.	<a href="#">iam-password-policy</a> (p. 154)	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.086	Disable identifiers after a defined period of inactivity.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.086	Disable identifiers after a defined period of inactivity.	<a href="#">iam-password-policy</a> (p. 154)	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
CA.3.161	Monitor security controls on an ongoing basis to ensure the continued effectiveness of the controls.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
SC.3.182	Prevent unauthorized and unintended information transfer via shared system resources.	<a href="#">ec2-volume-in-use-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.187	Establish and manage cryptographic keys for cryptography employed in organizational systems.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
SC.3.187	Establish and manage cryptographic keys for cryptography employed in organizational systems.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

## Template

The template is available on GitHub: [Operational Best Practices for CMMC Level 3](#).

## Operational Best Practices for CMMC Level 4

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Cybersecurity Maturity Model Certification (CMMC) Level 4 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more CMMC Level 4 controls. A CMMC Level 4 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the CMMC Level 4.

**AWS Region:** Due to tentative guidance provided by the DoD and the CMMC Accreditation Body with respect to FedRAMP reciprocity for CMMC Level 3 - 5, it is recommended that customers use AWS GovCloud (US) regions at this time for any workloads that require compliance with CMMC Level 3 - 5. As such, conformance pack templates for CMMC Levels 3 - 5 are not available within the conformance pack console to avoid confusion. Customers may independently install Config rules that map the tentative guidance for CMMC Level 3-5 (without a conformance pack template) via CloudFormation using the sample YAML file linked within this document.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational

Control ID	Control Description	AWS Config Rule	Guidance
			Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-password-policy</a> (p. 154)	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.008	Use non-privileged accounts or roles when accessing nonsecurity functions.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
AC.2.008	Use non-privileged accounts or roles when accessing nonsecurity functions.	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.008	Use non-privileged accounts or roles when accessing nonsecurity functions.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.2.008	Use non-privileged accounts or roles when accessing nonsecurity functions.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.2.008	Use non-privileged accounts or roles when accessing nonsecurity functions.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.008	Use non-privileged accounts or roles when accessing nonsecurity functions.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.2.008	Use non-privileged accounts or roles when accessing nonsecurity functions.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.013	Monitor and control remote access sessions.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AC.2.013	Monitor and control remote access sessions.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC.2.013	Monitor and control remote access sessions.	<a href="#">cloud-trail-cloudwatch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-volume-in-use-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
CM.2.063	Control and monitor user-installed software.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.063	Control and monitor user-installed software.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
CM.2.064	Establish and enforce security configuration settings for information technology products employed in organizational systems.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.065	Track, review, approve, or disapprove, and log changes to organizational systems.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
IR.2.093	Detect and report events.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
MA.2.113	Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
MA.2.113	Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
RE.2.137	Regularly perform and test data backups.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
RE.2.137	Regularly perform and test data backups.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
RE.2.137	Regularly perform and test data backups.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
RE.2.137	Regularly perform and test data backups.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
RE.2.137	Regularly perform and test data backups.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
RM.2.142	Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting those systems and applications are identified.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">cloud-trail-cloudwatch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
AU.3.051	Correlate audit record review, analysis, and reporting processes for investigation and response to indications of unlawful, unauthorized, suspicious, or unusual activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
IA.3.083	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
IA.3.083	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.085	Prevent the reuse of identifiers for a defined period.	<a href="#">iam-password-policy</a> (p. 154)	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.086	Disable identifiers after a defined period of inactivity.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.086	Disable identifiers after a defined period of inactivity.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
CA.3.161	Monitor security controls on an ongoing basis to ensure the continued effectiveness of the controls.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
SC.3.182	Prevent unauthorized and unintended information transfer via shared system resources.	<a href="#">ec2-volume-in-use-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.187	Establish and manage cryptographic keys for cryptography employed in organizational systems.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
SC.3.187	Establish and manage cryptographic keys for cryptography employed in organizational systems.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
