CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
CIP-004-6-R4-Part 4.1.3	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-004-6-R4-Part 4.1.3	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CIP-004-6-R4-Part 4.1.3	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.3. Access to designated storage locations, whether physical or electronic, for BES Cyber System Information.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
CIP-005-5-R1-Part 1.1	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.1: All applicable Cyber Assets connected to a network via a routable protocol shall reside within a defined ESP.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance

CIP-005-5-R1-Part 1.3	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.3: Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R1-Part 1.3	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.3: Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
CIP-005-5-R1-Part 1.3	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.3: Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
CIP-005-5-R1-Part 1.3	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.3: Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R1-Part 1.3	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.3: Require inbound and outbound access permissions, including the reason for granting access, and deny all other access by default.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
CIP-005-5-R1-Part 1.5	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.5: Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
CIP-005-5-R1-Part 1.5	Each Responsible Entity shall implement one or more documented processes that collectively include each of the applicable requirement parts in CIP-005-5 Table R1 – Electronic Security Perimeter. Part 1.5: Have one or more methods for detecting known or suspected malicious communications for both inbound and outbound communications.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R2-Part 2.2	Each Responsible Entity allowing Interactive Remote Access to BES Cyber Systems shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in CIP-005-5 Table R2 – Interactive Remote Access Management. Part 2.2: For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
CIP-005-5-R2-Part 2.2	Each Responsible Entity allowing Interactive Remote Access to BES Cyber Systems shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in CIP-005-5 Table R2 – Interactive Remote Access Management. Part 2.2: For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R2-Part 2.2	Each Responsible Entity allowing Interactive Remote Access to BES Cyber Systems shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in CIP-005-5 Table R2 – Interactive Remote Access Management. Part 2.2: For all Interactive Remote Access sessions, utilize encryption that terminates at an Intermediate System.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
CIP-005-5-R2-Part 2.3	Each Responsible Entity allowing Interactive Remote Access to BES Cyber Systems shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in CIP-005-5 Table R2 – Interactive Remote Access Management. Part 2.3: Require multi-factor authentication for all Interactive Remote Access sessions.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-005-5-R2-Part 2.3	Each Responsible Entity allowing Interactive Remote Access to BES Cyber Systems shall implement one or more documented processes that collectively include the applicable requirement parts, where technically feasible, in CIP-005-5 Table R2 – Interactive Remote Access Management. Part 2.3: Require multi-factor authentication for all Interactive Remote Access sessions.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
CIP-007-6-R1-Part 1.1	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R1 – Ports and Services. Part 1.1: Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R1-Part 1.1	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R1 – Ports and Services. Part 1.1: Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.</p>	<p><a href="#">emr-master-no-public-ip (p. 146)</a></p>	<p>Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.</p>
CIP-007-6-R1-Part 1.1	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R1 – Ports and Services. Part 1.1: Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.</p>	<p><a href="#">restricted-ssh (p. 159)</a></p>	<p>Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.</p>

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R1-Part 1.1	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R1 – Ports and Services. Part 1.1: Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.</p>	<p><a href="#">restricted-common-ports (p. 174)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.</p>
CIP-007-6-R1-Part 1.1	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R1 – Ports and Services. Part 1.1: Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.</p>	<p><a href="#">vpc-default-security-group-closed (p. 188)</a></p>	<p>Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.</p>

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R1-Part 1.1	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R1 – Ports and Services. Part 1.1: Where technically feasible, enable only logical network accessible ports that have been determined to be needed by the Responsible Entity, including port ranges or services where needed to handle dynamic ports. If a device has no provision for disabling or restricting logical ports on the device then those ports that are open are deemed needed.</p>	<p><a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.</p>
CIP-007-6-R2-Part 2.1	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R2 – Security Patch Management. Part 2.1: A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.</p>	<p><a href="#">guardduty-non-archived-findings (p. 152)</a></p>	<p>Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R2-Part 2.1	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R2 – Security Patch Management. Part 2.1: A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R2-Part 2.1	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R2 – Security Patch Management. Part 2.1: A patch management process for tracking, evaluating, and installing cyber security patches for applicable Cyber Assets. The tracking portion shall include the identification of a source or sources that the Responsible Entity tracks for the release of cyber security patches for applicable Cyber Assets that are updateable and for which a patching source exists.</p>	<p><a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a></p>	<p>Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.</p>
CIP-007-6-R3-Part 3.1-2	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R2 – Security Patch Management. Part 3.1: Deploy method(s) to deter, detect, or prevent malicious code. Part 3.2: Mitigate the threat of detected malicious code.</p>	<p><a href="#">guardduty-enabled-centralized (p. 152)</a></p>	<p>Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R3-Part 3.1-2	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R2 – Security Patch Management. Part 3.1: Deploy method(s) to deter, detect, or prevent malicious code. Part 3.2: Mitigate the threat of detected malicious code.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R4-Part 4.1	<p>Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.</p>	<p><a href="#">multi-region-cloudtrail-enabled (p. 163)</a></p>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
CIP-007-6-R4-Part 4.1	<p>Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.</p>	<p><a href="#">redshift-cluster-configuration-check (p. 170)</a></p>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
CIP-007-6-R4-Part 4.1	Log events at the BES Cyber System level (per BES Cyber System capability) or at the Cyber Asset level (per Cyber Asset capability) for identification of, and after-the-fact investigations of, Cyber Security Incidents that includes, as a minimum, each of the following types of events: 4.1.1. Detected successful login attempts; 4.1.2. Detected failed access attempts and failed login attempts; 4.1.3. Detected malicious code.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R4-Part 4.3	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R4 – Security Event Monitoring. Part 4.3: Where technically feasible, retain applicable event logs identified in Part 4.1 for at least the last 90 consecutive calendar days except under CIP Exceptional Circumstances.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-007-6-R5-Part 5.1	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-007-6 Table R5 – System Access Controls. Part 5.1: Have a method(s) to enforce authentication of interactive user access, where technically feasible.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
CIP-008-5-R1-Part 1.1	Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include Part 1.1: One or more processes to identify, classify, and respond to Cyber Security Incidents.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
CIP-008-5-R1-Part 1.1	Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include Part 1.1: One or more processes to identify, classify, and respond to Cyber Security Incidents.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-008-5-R1-Part 1.1	Each Responsible Entity shall document one or more Cyber Security Incident response plan(s) that collectively include Part 1.1: One or more processes to identify, classify, and respond to Cyber Security Incidents.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data backup processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data backup processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
CIP-009-6-R1-Part 1.3	Each Responsible Entity shall have one or more documented recovery plans that collectively include each of the applicable requirement parts in CIP-009-6 Table R1 – Recovery Plan Specifications. Part 1.3: One or more processes for the backup and storage of information required to recover BES Cyber System functionality.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-010-2-R1-Part 1.1	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-010-2 Table R1 – Configuration Change Management. Part 1.1: Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-010-2-R1-Part 1.1	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-010-2 Table R1 – Configuration Change Management. Part 1.1: Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-010-2-R1-Part 1.1	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-010-2 Table R1 – Configuration Change Management. Part 1.1: Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-010-2-R1-Part 1.1	Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-010-2 Table R1 – Configuration Change Management. Part 1.1: Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-010-2-R1-Part 1.1	<p>Each Responsible Entity shall implement one or more documented process(es) that collectively include each of the applicable requirement parts in CIP-010-2 Table R1 – Configuration Change Management. Part 1.1: Develop a baseline configuration, individually or by group, which shall include the following items: 1.1.1. Operating system(s) (including version) or firmware where no independent operating system exists; 1.1.2. Any commercially available or open-source application software (including version) intentionally installed; 1.1.3. Any custom software installed; 1.1.4. Any logical network accessible ports; and 1.1.5. Any security patches applied.</p>	<p><a href="#">ec2-volume-inuse-check (p. 137)</a></p>	<p>This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.</p>
CIP-011-2-R1-Part 1.2	<p>Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.</p>	<p><a href="#">acm-certificate-expiration-check (p. 108)</a></p>	<p>Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">s3-default-encryption-kms (p. 182)</a>	Ensure that encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
CIP-011-2-R1-Part 1.2	Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use. Part 1.2: Procedure(s) for protecting and securely handling BES Cyber System Information, including storage, transit, and use.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

## Template

The template is available on GitHub: [Operational Best Practices for NERC CIP](#).

## Operational Best Practices for NCSC Cloud Security Principles

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the UK National Cyber Security Centre (NCSC) Cloud Security Principles and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more UK NCSC Cloud Security Principles controls. A UK NCSC Cloud Security Principles control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This sample conformance pack template contains mappings to controls within the UK NCSC Cloud Security Principles ([National Cyber Security Centre | Cloud security guidance](#)), with such public sector information licensed under the Open Government Licence v3.0. The Open Government Licence should can be accessed here: [Open Government Licence for public sector information](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
1. Data in transit protection	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
1. Data in transit protection	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
1. Data in transit protection	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
1. Data in transit protection	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
1. Data in transit protection	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
1. Data in transit protection	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist,

Control ID	AWS Config Rule	Guidance
		enable encryption in transit to help protect that data.
1. Data in transit protection	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
1. Data in transit protection	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
2: Asset protection and resilience	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
2: Asset protection and resilience	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
2: Asset protection and resilience	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
2: Asset protection and resilience	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
2: Asset protection and resilience	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
2. Asset protection and resilience	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
2. Asset protection and resilience	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
2. Asset protection and resilience	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
2. Asset protection and resilience	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
2. Asset protection and resilience	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
2. Asset protection and resilience	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
2. Asset protection and resilience	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
2. Asset protection and resilience	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
2. Asset protection and resilience	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
2. Asset protection and resilience	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
2. Asset protection and resilience	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
2. Asset protection and resilience	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
2. Asset protection and resilience	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
2. Asset protection and resilience	<a href="#">s3-default-encryption-kms (p. 182)</a>	*DOCUMENTATION TEAM TO REVIEW*
2. Asset protection and resilience	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
2. Asset protection and resilience	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
2. Asset protection and resilience	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
2. Asset protection and resilience	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
5. Operational security	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
5. Operational security	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
5. Operational security	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
5. Operational security	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
5. Operational security	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
5. Operational security	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
5. Operational security	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
5. Operational security	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
5. Operational security	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
5. Operational security	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
5. Operational security	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
5. Operational security	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
5. Operational security	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
5. Operational security	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
5. Operational security	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	AWS Config Rule	Guidance
5. Operational security	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	<p>This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the <code>allowVersionUpgrade</code>. The default is true. It also lets you optionally set the <code>preferredMaintenanceWindow</code> (the default is <code>sat:16:00-sat:16:30</code>), and the <code>automatedSnapshotRetentionPeriod</code> (the default is 1). The actual values should reflect your organization's policies.</p>
5. Operational security	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	<p>Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>
5. Operational security	<a href="#">securityhub-enabled (p. 186)</a>	<p>AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.</p>

Control ID	AWS Config Rule	Guidance
5. Operational security	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
5. Operational security	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
5. Operational security	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
5. Operational security	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	AWS Config Rule	Guidance
7. Secure development	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
7. Secure development	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
9. Secure user management	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
9. Secure user management	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
9. Secure user management	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
9. Secure user management	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
9. Secure user management	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
9. Secure user management	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
9. Secure user management	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
10. Identity and authentication	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
10. Identity and authentication	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
10. Identity and authentication	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
10. Identity and authentication	<a href="#">iam-user-mfa-enabled (p. 158)</a>	<p>Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.</p>

Control ID	AWS Config Rule	Guidance
10. Identity and authentication	<a href="#">mfa-enabled-for-iam-console-access</a> (p. 163)	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
10. Identity and authentication	<a href="#">root-account-hardware-mfa-enabled</a> (p. 175)	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
10. Identity and authentication	<a href="#">root-account-mfa-enabled</a> (p. 175)	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
10. Identity and authentication	<a href="#">secretsmanager-rotation-enabled-check</a> (p. 183)	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	AWS Config Rule	Guidance
10. Identity and authentication	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
11. External interface protection	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
11. External interface protection	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
11. External interface protection	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
11. External interface protection	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	AWS Config Rule	Guidance
11. External interface protection	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
11. External interface protection	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
11. External interface protection	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
11. External interface protection	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
11. External interface protection	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
11. External interface protection	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
11. External interface protection	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
11. External interface protection	<a href="#">restricted-common-ports</a> (p. 174)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
11. External interface protection	<a href="#">sagemaker-notebook-no-direct-internet-access</a> (p. 183)	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
11. External interface protection	<a href="#">vpc-default-security-group-closed</a> (p. 188)	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
11. External interface protection	<a href="#">vpc-sg-open-only-to-authorized-ports</a> (p. 189)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
13. Audit information for users	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
13. Audit information for users	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
11. External interface protection	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
11. External interface protection	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
11. External interface protection	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
11. External interface protection	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
13. Audit information for users	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
13. Audit information for users	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

## Template

The template is available on GitHub: [Operational Best Practices for NCSC Cloud Security Principles](#).

# Operational Best Practices for NCSC Cyber Assessment Framework

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between UK National Cyber Security Centre (NCSC) Cyber Assessment Framework (CAF) controls and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more UK NCSC CAF controls. A UK NCSC CAF control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This sample conformance pack template contains mappings to controls within the UK NCSC CAF ([National Cyber Security Centre | NCSC CAF guidance](#)), with such public sector information licensed under the Open Government Licence v3.0. The Open Government Licence should can be accessed here: [Open Government Licence for public sector information](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
A3.a#_Asset_Management	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
A3.a#_Asset_Management	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
A3.a#_Asset_Management	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
A3.a#_Asset_Management	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
A3.a#_Asset_Management	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the

Control ID	AWS Config Rule	Guidance
		inventory and the management of your environment.
B2.a_Identity_Verification,Authentication_and_Authorisation	check (p. 153)	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
B2.a_Identity_Verification,Authentication_and_Authorisation	check (p. 154)	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
B2.a_Identity_Verification,Authentication_and_Authorisation	with-admin-access (p. 156)	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
B2.a_Identity_Verification,Authentication_and_Authorisation	ship-check (p. 157)	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
B2.a_Identity_Verification,Authentication,Authorization	<a href="#">Identify Unused Credentials-check (p. 159)</a>	<p>AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.</p>
B2.a_Identity_Verification,Authentication,Authorization	<a href="#">Require MFA for IAM Users (p. 158)</a>	<p>Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.</p>
B2.a_Identity_Verification,Authentication,Authorization	<a href="#">Require MFA for IAM Users with Console Access (p. 163)</a>	<p>Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.</p>
B2.a_Identity_Verification,Authentication,Authorization	<a href="#">Require MFA for the Root User (p. 175)</a>	<p>Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.</p>

Control ID	AWS Config Rule	Guidance
B2.a_Identity_Verification,Authentication_and_Authorisation	<a href="#">authentication and authorisation enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
B2.a_Identity_Verification,Authentication_and_Authorisation	<a href="#">check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
B2.b_Device_Management	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
B2.c_Privileged_User_Management	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.
B2.c_Privileged_User_Management	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
B2.c_Privileged_User_Management	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
B2.c_Privileged_User_Management	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
B2.c_Privileged_User_Management	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
B2.c_Privileged_User_Management	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
B2.c_Privileged_User_Management	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
B2.c_Privileged_User_Management	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	AWS Config Rule	Guidance
B2.c_Privileged_User_Management	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
B2.c_Privileged_User_Management	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
B2.c_Privileged_User_Management	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
B2.c_Privileged_User_Management	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
B2.d_Identity_and_Access_Management_IAM	<a href="#">iam-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
B2.d_Identity_and_Access_Management_IAM	<a href="#">iam-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
B2.d_Identity_and_Access_Management_IAM	<a href="#">iam-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
B2.d_Identity_and_Access_Management_IAM	<a href="#">iam-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
B2.d_Identity_and_Access_Management_(IAM)	iam-unused-credentials-check (p. 159)	<p>AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.</p>
B2.d_Identity_and_Access_Management_(IAM)	iam-dataevents-enabled (p. 118)	<p>The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.</p>
B2.d_Identity_and_Access_Management_(IAM)	iam-cluster-configuration-check (p. 170)	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.</p>
B2.d_Identity_and_Access_Management_(IAM)	iam-guardduty-enabled-centralized (p. 152)	<p>Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.</p>

Control ID	AWS Config Rule	Guidance
B2.d_Identity_and_Access_Management(IAM)	Non-archived-findings (p. 152)	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.
B2.d_Identity_and_Access_Management(IAM)	Cloud-watch-logs-enabled (p. 121)	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
B2.d_Identity_and_Access_Management(IAM)	Alarm-action-check (p. 119)	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.
B2.d_Identity_and_Access_Management(IAM)	Enabled (p. 186)	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
B3.a_Understanding_Data	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
B3.b_Data_in_Transit	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
B3.b_Data_in_Transit	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
B3.b_Data_in_Transit	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
B3.b_Data_in_Transit	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
B3.b_Data_in_Transit	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
B3.b_Data_in_Transit	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
B3.b_Data_in_Transit	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
B3.b_Data_in_Transit	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
B3.b_Data_in_Transit	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
B3.b_Data_in_Transit	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
B3.b_Data_in_Transit	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
B3.b_Data_in_Transit	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
B3.b_Data_in_Transit	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
B3.b_Data_in_Transit	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
B3.b_Data_in_Transit	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	AWS Config Rule	Guidance
B3.b_Data_in_Transit	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
B3.b_Data_in_Transit	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
B3.b_Data_in_Transit	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	AWS Config Rule	Guidance
B3.b_Data_in_Transit	<a href="#">rds-instance-public-access-check</a> (p. 166)	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
B3.b_Data_in_Transit	<a href="#">redshift-cluster-public-access-check</a> (p. 171)	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
B3.b_Data_in_Transit	<a href="#">restricted-common-ports</a> (p. 174)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
B3.b_Data_in_Transit	<a href="#">sagemaker-notebook-no-direct-internet-access</a> (p. 183)	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
B3.b_Data_in_Transit	<a href="#">vpc-default-security-group-closed</a> (p. 188)	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	AWS Config Rule	Guidance
B3.b_Data_in_Transit	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
B3.b_Data_in_Transit	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
B3.b_Data_in_Transit	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
B3.b_Data_in_Transit	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
B3.b_Data_in_Transit	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
B3.c_Stored_Data	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
B3.c_Stored_Data	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
B3.c_Stored_Data	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
B3.c_Stored_Data	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
B3.c_Stored_Data	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
B3.c_Stored_Data	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
B3.c_Stored_Data	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
B3.c_Stored_Data	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
B3.c_Stored_Data	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
B3.c_Stored_Data	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
B3.c_Stored_Data	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
B3.c_Stored_Data	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
B3.c_Stored_Data	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
B3.c_Stored_Data	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
B3.c_Stored_Data	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
B3.c_Stored_Data	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
B3.c_Stored_Data	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	AWS Config Rule	Guidance
B3.c_Stored_Data	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
B3.c_Stored_Data	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
B3.c_Stored_Data	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
B3.c_Stored_Data	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
B3.c_Stored_Data	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
B3.c_Stored_Data	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
B3.c_Stored_Data	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
B3.c_Stored_Data	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
B3.c_Stored_Data	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
B3.c_Stored_Data	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
B3.c_Stored_Data	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
B3.c_Stored_Data	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
B3.c_Stored_Data	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
B4.a_Secure_by_Design	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
B4.a_Secure_by_Design	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
B4.a_Secure_by_Design	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
B4.a_Secure_by_Design	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
B4.a_Secure_by_Design	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
B4.a_Secure_by_Design	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
B4.a_Secure_by_Design	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
B4.a_Secure_by_Design	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
B4.a_Secure_by_Design	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
B4.a_Secure_by_Design	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
B4.a_Secure_by_Design	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
B4.a_Secure_by_Design	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
B4.a_Secure_by_Design	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
B4.a_Secure_by_Design	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
B4.a_Secure_by_Design	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
B4.a_Secure_by_Design	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
B4.a_Secure_by_Design	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
B4.a_Secure_by_Design	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
B4.a_Secure_by_Design	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
B4.a_Secure_by_Design	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
B4.a_Secure_by_Design	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
B4.a_Secure_by_Design	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
B4.a_Secure_by_Design	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
B4.a_Secure_by_Design	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
B4.a_Secure_by_Design	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
B4.a_Secure_by_Design	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
B4.a_Secure_by_Design	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
B4.a_Secure_by_Design	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
B4.a_Secure_by_Design	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
B4.a_Secure_by_Design	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
B4.b_Secure_Configuration	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
B4.b_Secure_Configuration	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	AWS Config Rule	Guidance
B4.b_Secure_Configuration	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
B4.b_Secure_Configuration	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
B4.b_Secure_Configuration	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
B4.c#_Secure_Management	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
B4.c#_Secure_Management	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
B4.c#_Secure_Management	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
B4.d._Vulnerability_Management	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
B4.d._Vulnerability_Management	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
B4.d._Vulnerability_Management	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
B4.d._Vulnerability_Management	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	AWS Config Rule	Guidance
B4.d._Vulnerability_Management	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	<p>This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the <code>allowVersionUpgrade</code>. The default is <code>true</code>. It also lets you optionally set the <code>preferredMaintenanceWindow</code> (the default is <code>sat:16:00-sat:16:30</code>), and the <code>automatedSnapshotRetentionPeriod</code> (the default is <code>1</code>). The actual values should reflect your organization's policies.</p>
B4.d._Vulnerability_Management	<a href="#">securityhub-enabled (p. 186)</a>	<p>AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.</p>
B5.b_Design_for_Resilience	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	<p>Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.</p>

Control ID	AWS Config Rule	Guidance
B5.b_Design_for_Resilience	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
B5.b_Design_for_Resilience	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
B5.c_Backups	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	AWS Config Rule	Guidance
B5.c_Backups	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
B5.c_Backups	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
B5.c_Backups	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
B5.c_Backups	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	AWS Config Rule	Guidance
B5.c_Backups	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
B5.c_Backups	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
B5.c_Backups	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
B5.c_Backups	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	AWS Config Rule	Guidance
B5.c_Backups	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
C1.a_Monitoring_Coverage	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
C1.a_Monitoring_Coverage	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
C1.a_Monitoring_Coverage	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	AWS Config Rule	Guidance
C1.a_Monitoring_Coverage	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
C1.a_Monitoring_Coverage	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
C1.a_Monitoring_Coverage	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
C1.a_Monitoring_Coverage	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	AWS Config Rule	Guidance
C1.a_Monitoring_Coverage	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
C1.a_Monitoring_Coverage	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
C1.a_Monitoring_Coverage	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
C1.a_Monitoring_Coverage	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
C1.b_Securing_Logs	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
C1.b_Securing_Logs	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
C1.b_Securing_Logs	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
C1.b_Securing_Logs	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
C1.b_Securing_Logs	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
C1.b_Securing_Logs	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
C1.b_Securing_Logs	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
C1.b_Securing_Logs	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
C1.b_Securing_Logs	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
C1.b_Securing_Logs	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
C1.b_Securing_Logs	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
C1.c_Generating_Alerts	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
C1.c_Generating_Alerts	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	AWS Config Rule	Guidance
C1.c_Generating_Alerts	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
C1.c_Generating_Alerts	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
C1.c_Generating_Alerts	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
C1.c_Generating_Alerts	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
C1.c_Generating_Alerts	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
C1.c_Generating_Alerts	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	AWS Config Rule	Guidance
C1.c_Generating_Alerts	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
C1.c_Generating_Alerts	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
C1.c_Generating_Alerts	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
C1.c_Generating_Alerts	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
C1.c_Generating_Alerts	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
C1.c_Generating_Alerts	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
C1.d_Identifying_Security_Incidents	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
C1.d_Identifying_Security_Incident	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
C1.e _Monitoring_Tools_and_Skills	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
C1.e _Monitoring_Tools_and_Skills	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
C1.e _Monitoring_Tools_and_Skills	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
C2.a_System_Abnormalities_for_Attack_Detection-enabled-centralized (p. 152)		Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
C2.a_System_Abnormalities_for_Attack_Detection-enabled (p. 186)		AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

## Template

The template is available on GitHub: [Operational Best Practices for NCSC Cyber Assessment Framework](#).

## Operational Best Practices for Networking and Content Delivery Services

This pack contains AWS Config rules based on Networking and Content Delivery Services. For more information, see [Networking and Content Delivery on AWS](#). This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Networking and Content Delivery Services](#).

## Operational Best Practices for NIST 800-53 rev 4

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the NIST 800-53 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more NIST 800-53 controls. A NIST 800-53 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the NIST 800-53.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength.

Control ID	Control Description	AWS Config Rule	Guidance
			<p>This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(3)	The information system automatically disables inactive accounts after [Assignment: organization-defined time period].	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(12)(a)	The organization: a. Monitors information system accounts for [Assignment: organization-defined atypical use].	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC-2(12)(a)	The organization: a. Monitors information system accounts for [Assignment: organization-defined atypical use].	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(f)	The organization: f. Creates, enables, modifies, disables, and removes information system accounts in accordance with [Assignment: organization-defined procedures or conditions].	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(f)	<p>The organization: f. Creates, enables, modifies, disables, and removes information system accounts in accordance with [Assignment: organization-defined procedures or conditions].</p>	<p><a href="#">iam-password-policy (p. 154)</a></p>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(j)	The organization: j. Reviews accounts for compliance with account management requirements [Assignment: organization-defined frequency].	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-2(j)	The organization: j. Reviews accounts for compliance with account management requirements [Assignment: organization-defined frequency].	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-3	The information system enforces approved authorizations for information and system resources in accordance with applicable access control policies.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC-5c	The organization: c. Defines information system access authorizations to support separation of duties.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
AC-5c	The organization: c. Defines information system access authorizations to support separation of duties.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC-5c	The organization: c. Defines information system access authorizations to support separation of duties.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-5c	The organization: c. Defines information system access authorizations to support separation of duties.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC-6(10)	The information system prevents non-privileged users from executing privileged functions to include disabling, circumventing, or altering implemented security safeguards/countermeasures.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
AC-17(1)	The information system monitors and controls remote access methods.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC-17(1)	The information system monitors and controls remote access methods.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17(3)	The information system routes all remote accesses through [Assignment: organization-defined number] managed network access control points.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AU-2(a)(d)	The organization: a. Determines that the information system is capable of auditing the following events: [Assignment: organization-defined auditable events]; d. Determines that the following events are to be audited within the information system: [Assignment: organization-defined audited events (the subset of the auditable events defined in AU-2 a.) along with the frequency of (or situation requiring) auditing for each identified event].	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
AU-2(a)(d)	The organization: a. Determines that the information system is capable of auditing the following events: [Assignment: organization-defined auditable events]; d. Determines that the following events are to be audited within the information system: [Assignment: organization-defined audited events (the subset of the auditable events defined in AU-2 a.) along with the frequency of (or situation requiring) auditing for each identified event].	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
AU-7(1)	The information system provides the capability to process audit records for events of interest based on [Assignment: organization-defined audit fields within audit records].	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AU-7(1)	The information system provides the capability to process audit records for events of interest based on [Assignment: organization-defined audit fields within audit records].	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AU-9	The information system protects audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
AU-9	The information system protects audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
AU-9(2)	The information system backs up audit records [Assignment: organization-defined frequency] onto a physically different system or system component than the system or component being audited.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
AU-11	The organization retains audit records for [Assignment: organization-defined time period consistent with records retention policy] to provide support for after-the-fact investigations of security incidents and to meet regulatory and organizational information retention requirements.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
AU-12(a)(c)	The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
AU-12(a)(c)	The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AU-12(a)(c)	The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AU-12(a)(c)	The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
AU-12(a)(c)	The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AU-12(a)(c)	The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
AU-12(a)(c)	<p>The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.</p>	<p><a href="#">multi-region-cloudtrail-enabled (p. 163)</a></p>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
AU-12(a)(c)	<p>The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.</p>	<p><a href="#">s3-bucket-logging-enabled (p. 177)</a></p>	<p>Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AU-12(a)(c)	The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AU-12(a)(c)	The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Generates audit records for the events defined in AU-2 d. with the content defined in AU-3.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
AU-12(a)(c)	<p>The information system: a. Provides audit record generation capability for the auditable events defined in AU-2 a. at [Assignment: organization-defined information system components]; c. Control ID	Control Description	AWS Config Rule	Guidance
CA-7(a)(b)	The organization develops a continuous monitoring strategy and implements a continuous monitoring program that includes: a. Establishment of [Assignment: organization-defined metrics] to be monitored; b. Establishment of [Assignment: organization-defined frequencies] for monitoring and [Assignment: organization-defined frequencies] for assessments supporting such monitoring.	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
CM-2	The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM-2	The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM-2	The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
CM-2	The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
CM-2	The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
CM-2	The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
CM-2	The organization develops, documents, and maintains under configuration control, a current baseline configuration of the information system.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
CM-7(a)	The organization: a. Configures the information system to provide only essential capabilities.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	Control Description	AWS Config Rule	Guidance
CP-10	The organization provides for the recovery and reconstitution of the information system to a known state after a disruption, compromise, or failure.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
IA-2	The information system uniquely identifies and authenticates organizational users (or processes acting on behalf of organizational users).	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA-2(1)(11)	(1) The information system implements multifactor authentication for network access to privileged accounts. (11) The information system implements multifactor authentication for remote access to privileged and non-privileged accounts such that one of the factors is provided by a device separate from the system gaining access and the device meets [Assignment: organization-defined strength of mechanism requirements].	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
IA-2(1)(11)	(1) The information system implements multifactor authentication for network access to privileged accounts. Control ID	Control Description	AWS Config Rule	Guidance
SC-2	The information system separates user functionality (including user interface services) from information system management functionality.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
SC-2	The information system separates user functionality (including user interface services) from information system management functionality.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
SC-4	The information system prevents unauthorized and unintended information transfer via shared system resources.	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance

Control ID	Control Description	AWS Config Rule	Guidance
SC-8(1)	The information system implements cryptographic mechanisms to [Selection (one or more): prevent unauthorized disclosure of information; detect changes to information] during transmission unless otherwise protected by [Assignment: organization-defined alternative physical safeguards].	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
SC-12	The organization establishes and manages cryptographic keys for required cryptography employed within the information system in accordance with [Assignment: organization-defined requirements for key generation, distribution, storage, access, and destruction].	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
SC-12	The organization establishes and manages cryptographic keys for required cryptography employed within the information system in accordance with [Assignment: organization-defined requirements for key generation, distribution, storage, access, and destruction].	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
SC-12	The organization establishes and manages cryptographic keys for required cryptography employed within the information system in accordance with [Assignment: organization-defined requirements for key generation, distribution, storage, access, and destruction].	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	The information system implements [Assignment: organization-defined cryptographic uses and type of cryptography required for each use] in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
SC-13	The information system implements FIPS-validated or NSA-approved cryptography in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
SC-23	The information system protects the authenticity of communications sessions.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-23	The information system protects the authenticity of communications sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-23	The information system protects the authenticity of communications sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
SC-28	The information system protects the [Selection (one or more): confidentiality; integrity] of [Assignment: organization-defined information at rest].	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-36	The organization distributes [Assignment: organization-defined processing and storage] across multiple physical locations.	<a href="#">rds-multi-az- support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
SC-36	The organization distributes [Assignment: organization-defined processing and storage] across multiple physical locations.	<a href="#">s3-bucket-replication- enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
SI-2(2)	The organization employs automated mechanisms [Assignment: organization-defined frequency] to determine the state of information system components with regard to flaw remediation.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
SI-2(2)	The organization employs automated mechanisms [Assignment: organization-defined frequency] to determine the state of information system components with regard to flaw remediation.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
SI-2(2)	The organization employs automated mechanisms [Assignment: organization-defined frequency] to determine the state of information system components with regard to flaw remediation.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(1)	The organization connects and configures individual intrusion detection tools into an information system-wide intrusion detection system.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(4)	The information system monitors inbound and outbound communications traffic [Assignment: organization-defined frequency] for unusual or unauthorized activities or conditions.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI-4(4)	The information system monitors inbound and outbound communications traffic [Assignment: organization-defined frequency] for unusual or unauthorized activities or conditions.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(4)	The information system monitors inbound and outbound communications traffic [Assignment: organization-defined frequency] for unusual or unauthorized activities or conditions.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SI-4(4)	The information system monitors inbound and outbound communications traffic [Assignment: organization-defined frequency] for unusual or unauthorized activities or conditions.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI-4(5)	The information system alerts [Assignment: organization-defined personnel or roles] when the following indications of compromise or potential compromise occur: [Assignment: organization-defined compromise indicators].	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(5)	The information system alerts [Assignment: organization-defined personnel or roles] when the following indications of compromise or potential compromise occur: [Assignment: organization- defined compromise indicators].	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SI-4(5)	The information system alerts [Assignment: organization-defined personnel or roles] when the following indications of compromise or potential compromise occur: [Assignment: organization- defined compromise indicators].	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(5)	The information system alerts [Assignment: organization-defined personnel or roles] when the following indications of compromise or potential compromise occur: [Assignment: organization-defined compromise indicators].	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI-4(16)	The organization correlates information from monitoring tools employed throughout the information system.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI-4(16)	The organization correlates information from monitoring tools employed throughout the information system.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(a)(b)(c)	The organization: a. Monitors the information system to detect: 1. Attacks and indicators of potential attacks in accordance with [Assignment: organization- defined monitoring objectives]; and 2. Unauthorized local, network, and remote connections; b. Identifies unauthorized use of the information system through [Assignment: organization- defined techniques and methods]; c. Deploys monitoring devices: i. strategically within the information system to collect organization- determined essential information; and (ii) at ad hoc locations within the system to track specific types of transactions of interest to the organization.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(a)(b)(c)	<p>The organization:</p> <p>a. Monitors the information system to detect: 1. Attacks and indicators of potential attacks in accordance with [Assignment: organization- defined monitoring objectives]; and 2. Unauthorized local, network, and remote connections; b. Identifies unauthorized use of the information system through [Assignment: organization- defined techniques and methods]; c. Deploys monitoring devices: i. strategically within the information system to collect organization- determined essential information; and (ii) at ad hoc locations within the system to track specific types of transactions of interest to the organization.</p>	<p><a href="#">guardduty-non-archived-findings (p. 152)</a></p>	<p>Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(a)(b)(c)	The organization: a. Monitors the information system to detect: 1. Attacks and indicators of potential attacks in accordance with [Assignment: organization- defined monitoring objectives]; and 2. Unauthorized local, network, and remote connections; b. Identifies unauthorized use of the information system through [Assignment: organization- defined techniques and methods]; c. Deploys monitoring devices: i. strategically within the information system to collect organization- determined essential information; and (ii) at ad hoc locations within the system to track specific types of transactions of interest to the organization.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(a)(b)(c)	<p>The organization:</p> <p>a. Monitors the information system to detect: 1. Identifies unauthorized use of the information system through [Assignment: organization- defined techniques and methods]; c. Deploys monitoring devices: i. strategically within the information system to collect organization- determined essential information; and (ii) at ad hoc locations within the system to track specific types of transactions of interest to the organization.</p>	<p><a href="#">cloudwatch-alarm-action-check (p. 119)</a></p>	<p>Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(a)(b)(c)	The organization: a. Monitors the information system to detect: 1. Attacks and indicators of potential attacks in accordance with [Assignment: organization- defined monitoring objectives]; and 2. Unauthorized local, network, and remote connections; b. Identifies unauthorized use of the information system through [Assignment: organization- defined techniques and methods]; c. Deploys monitoring devices: i. strategically within the information system to collect organization- determined essential information; and (ii) at ad hoc locations within the system to track specific types of transactions of interest to the organization.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(a)(b)(c)	<p>The organization:</p> <p>a. Monitors the information system to detect: 1. Attacks and indicators of potential attacks in accordance with [Assignment: organization- defined monitoring objectives]; and 2. Unauthorized local, network, and remote connections; b. Identifies unauthorized use of the information system through [Assignment: organization- defined techniques and methods]; c. Deploys monitoring devices: i. strategically within the information system to collect organization- determined essential information; and (ii) at ad hoc locations within the system to track specific types of transactions of interest to the organization.</p>	<p><a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a></p>	<p>Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.</p>
SI-7	<p>The organization employs integrity verification tools to detect unauthorized changes to [Assignment: organization-defined software, firmware, and information].</p>	<p><a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a></p>	<p>Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SI-7(1)	The information system performs an integrity check of [Assignment: organization-defined software, firmware, and information] [Selection (one or more): at startup; at [Assignment: organization-defined transitional states or security-relevant events]; [Assignment: organization- defined frequency]].	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
SI-7(1)	The information system performs an integrity check of [Assignment: organization-defined software, firmware, and information] [Selection (one or more): at startup; at [Assignment: organization-defined transitional states or security-relevant events]; [Assignment: organization- defined frequency]].	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
SI-7(1)	The information system performs an integrity check of [Assignment: organization-defined software, firmware, and information] [Selection (one or more): at startup; at [Assignment: organization-defined transitional states or security-relevant events]; [Assignment: organization- defined frequency]].	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

## Template

The template is available on GitHub: [Operational Best Practices for NIST 800-53 rev 4](#).

## Operational Best Practices for NIST 800 171

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the NIST 800-171 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more NIST 800-171 controls. A NIST 800-171 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the NIST 800-171.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
3.1.1	Limit system access to authorized users, processes acting on behalf of authorized users, and devices (including other systems).	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
3.1.12	Monitor and control remote access sessions.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.12	Monitor and control remote access sessions.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
3.1.12	Monitor and control remote access sessions.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
3.1.12	Monitor and control remote access sessions.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.12	Monitor and control remote access sessions.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
3.1.12	Monitor and control remote access sessions.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
3.1.12	Monitor and control remote access sessions.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.12	Monitor and control remote access sessions.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
3.1.12	Monitor and control remote access sessions.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.12	Monitor and control remote access sessions.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
3.1.12	Monitor and control remote access sessions.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
3.1.13	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.13	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
3.1.13	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1.13	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1.13	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1.14	Route remote access via managed access control points.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.14	Route remote access via managed access control points.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
3.1.14	Route remote access via managed access control points.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
3.1.14	Route remote access via managed access control points.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
3.1.14	Route remote access via managed access control points.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.14	Route remote access via managed access control points.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
3.1.14	Route remote access via managed access control points.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.14	Route remote access via managed access control points.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
3.1.14	Route remote access via managed access control points.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
3.1.14	Route remote access via managed access control points.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.14	Route remote access via managed access control points.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
3.1.14	Route remote access via managed access control points.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3.1.14	Route remote access via managed access control points.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.14	Route remote access via managed access control points.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
3.1.14	Route remote access via managed access control points.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.14	Route remote access via managed access control points.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
3.1.14	Route remote access via managed access control points.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
3.1.14	Route remote access via managed access control points.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.14	Route remote access via managed access control points.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
3.1.2	Limit system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
3.1.20	Verify and control/limit connections to and use of external systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.20	Verify and control/limit connections to and use of external systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
3.1.20	Verify and control/limit connections to and use of external systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.20	Verify and control/limit connections to and use of external systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
3.1.20	Verify and control/limit connections to and use of external systems.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.20	Verify and control/limit connections to and use of external systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
3.1.20	Verify and control/limit connections to and use of external systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
3.1.3	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.4	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
3.1.5	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.5	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
3.1.5	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.5	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

3.1.7	Prevent non-privileged users from executing privileged functions and audit the execution of such functions.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
3.11.2	Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting the system are identified.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.11.2	Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting the system are identified.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
3.11.3	Remediate vulnerabilities in accordance with assessments of risk.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
3.13.1	Monitor, control, and protect communications (i.e., information transmitted or received by organizational systems) at the external boundaries and key internal boundaries of organizational systems.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
3.13.10	Establish and manage cryptographic keys for cryptography employed in organizational systems.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.10	Establish and manage cryptographic keys for cryptography employed in organizational systems.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).

Control ID	Control Description	AWS Config Rule	Guidance
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.16	Protect the confidentiality of CUI at rest.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">api-gw-endpoint-type-check (p. 110)</a>	Enable this rule to control Amazon API Gateway types allowed in your environment (edge optimized, regional API endpoints and Private API endpoints) and to ensure network integrity. This rule requires you to set an endpoint configuration type value (default: Regional). The actual value should reflect your organization's infrastructure type and applied policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data backup processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.2	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
3.13.6	Deny network communications traffic by default and allow network communications traffic by exception (i.e., deny all, permit by exception).	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.6	Deny network communications traffic by default and allow network communications traffic by exception (i.e., deny all, permit by exception).	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
3.13.6	Deny network communications traffic by default and allow network communications traffic by exception (i.e., deny all, permit by exception).	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
3.13.8	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.8	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.13.8	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.13.8	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.13.8	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.13.8	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.14.1	Identify, report, and correct information and system flaws in a timely manner.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
3.14.1	Identify, report, and correct information and system flaws in a timely manner.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.2	Provide protection from malicious code at appropriate locations within organizational systems.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
3.14.2	Provide protection from malicious code at appropriate locations within organizational systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
3.14.3	Monitor system security alerts and advisories and take actions in response.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.3	Monitor system security alerts and advisories and take actions in response.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
3.14.3	Monitor system security alerts and advisories and take actions in response.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
3.14.4	Update malicious code protection mechanisms when new releases are available.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
3.14.6	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

3.3.2	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.4	Alert in the event of an audit process failure.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
3.3.4	Alert in the event of an audit process failure.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
3.3.5	Correlate audit review, analysis, and reporting processes for investigation and response to indications of inappropriate, suspicious, or unusual activity.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.5	Correlate audit review, analysis, and reporting processes for investigation and response to indications of inappropriate, suspicious, or unusual activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
3.3.8	Protect audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.8	Protect audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
3.3.8	Protect audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.3.8	Protect audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.3.8	Protect audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.8	Protect audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
3.3.8	Protect audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
3.3.8	Protect audit information and audit tools from unauthorized access, modification, and deletion.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.1	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
3.4.1	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
3.4.1	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.1	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
3.4.1	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-volume-in-use-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
3.4.1	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.4.6	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.7	Restrict, disable, and prevent the use of nonessential, functions, ports, protocols, or services.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
3.4.7	Restrict, disable, and prevent the use of nonessential, functions, ports, protocols, or services.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.7	Restrict, disable, and prevent the use of nonessential, functions, ports, protocols, or services.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
3.4.7	Restrict, disable, and prevent the use of nonessential, functions, ports, protocols, or services.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
3.4.9	Control and monitor user-installed software.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
3.4.9	Control and monitor user-installed software.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
3.5.10	Store and transmit only cryptographically-protected passwords.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
3.5.2	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational systems.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.2	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational systems.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
3.5.3	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
3.5.3	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.3	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
3.5.3	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.5	Prevent reuse of identifiers for a defined period.	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.6	Disable identifiers after a defined period of inactivity.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.5.6	Disable identifiers after a defined period of inactivity.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.5.7	Enforce a minimum password complexity and change of characters when new passwords are created.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.5.8	Prohibit password reuse for a specified number of generations.	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
3.6.1	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
3.6.1	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
3.6.1	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

## Template

The template is available on GitHub: [Operational Best Practices for NIST 800 171](#).

## Operational Best Practices for NIST CSF

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the NIST Cyber Security Framework (CSF) and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more NIST CSF controls. A NIST CSF control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable you to align to a subset of the NIST CSF.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-2	Software platforms and applications within the organization are inventoried	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
ID.AM-2	Software platforms and applications within the organization are inventoried	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration

Control ID	Control Description	AWS Config Rule	Guidance
			state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
ID.AM-3	Organizational communication and data flows are mapped	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
ID.AM-3	Organizational communication and data flows are mapped	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
ID.AM-3	Organizational communication and data flows are mapped	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-3	Organizational communication and data flows are mapped	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
ID.AM-3	Organizational communication and data flows are mapped	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
ID.AM-3	Organizational communication and data flows are mapped	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
ID.AM-3	Organizational communication and data flows are mapped	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
ID.AM-6	Cybersecurity roles and responsibilities for the entire workforce and third-party stakeholders (e.g., suppliers, customers, partners) are established	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The ELB health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
ID.BE-5	Resilience requirements to support delivery of critical services are established for all operating states (e.g. under duress/attack, during recovery, normal operations)	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
ID.RA-1	Asset vulnerabilities are identified and documented	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-1	Asset vulnerabilities are identified and documented	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
ID.RA-1	Asset vulnerabilities are identified and documented	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
ID.RA-2	Threat and vulnerability information is received from information sharing forums and sources	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-2	Threat and vulnerability information is received from information sharing forums and sources	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
ID.RA-3	Threats, both internal and external, are identified and documented	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
ID.RA-3	Threats, both internal and external, are identified and documented	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
PR.AC-1	Identities and credentials are issued, managed, verified, revoked, and audited for authorized devices, users and processes	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
PR.AC-3	Remote access is managed	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.AC-3	Remote access is managed	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
PR.AC-3	Remote access is managed	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
PR.AC-3	Remote access is managed	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
PR.AC-3	Remote access is managed	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
PR.AC-3	Remote access is managed	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
PR.AC-3	Remote access is managed	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
PR.AC-3	Remote access is managed	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.AC-3	Remote access is managed	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
PR.AC-3	Remote access is managed	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
PR.AC-3	Remote access is managed	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
PR.AC-3	Remote access is managed	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
PR.AC-3	Remote access is managed	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-3	Remote access is managed	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-3	Remote access is managed	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-3	Remote access is managed	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
PR.AC-3	Remote access is managed	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
PR.AC-4	Access permissions and authorizations are managed, incorporating the principles of least privilege and separation of duties	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
PR.AC-5	Network integrity is protected (e.g., network segregation, network segmentation)	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-6	Identities are proofed and bound to credentials and asserted in interactions	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
PR.AC-6	Identities are proofed and bound to credentials and asserted in interactions	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-6	Identities are proofed and bound to credentials and asserted in interactions	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
PR.AC-6	Identities are proofed and bound to credentials and asserted in interactions	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-6	Identities are proofed and bound to credentials and asserted in interactions	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
PR.AC-7	Users, devices, and other assets are authenticated (e.g., single-factor, multi-factor) commensurate with the risk of the transaction (e.g., individuals' security and privacy risks and other organizational risks)	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
PR.AC-7	Users, devices, and other assets are authenticated (e.g., single-factor, multi-factor) commensurate with the risk of the transaction (e.g., individuals' security and privacy risks and other organizational risks)	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
PR.AC-7	Users, devices, and other assets are authenticated (e.g., single-factor, multi-factor) commensurate with the risk of the transaction (e.g., individuals' security and privacy risks and other organizational risks)	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
PR.AC-7	Users, devices, and other assets are authenticated (e.g., single-factor, multi-factor) commensurate with the risk of the transaction (e.g., individuals' security and privacy risks and other organizational risks)	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
PR.DS-1	Data-at-rest is protected	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
PR.DS-1	Data-at-rest is protected	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
PR.DS-1	Data-at-rest is protected	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
PR.DS-1	Data-at-rest is protected	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
PR.DS-1	Data-at-rest is protected	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-1	Data-at-rest is protected	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
PR.DS-1	Data-at-rest is protected	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
PR.DS-2	Data-in-transit is protected	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-2	Data-in-transit is protected	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
PR.DS-2	Data-in-transit is protected	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
PR.DS-2	Data-in-transit is protected	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-3	Assets are formally managed throughout removal, transfers, and disposition	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
PR.DS-3	Assets are formally managed throughout removal, transfers, and disposition	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
PR.DS-3	Assets are formally managed throughout removal, transfers, and disposition	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-3	Assets are formally managed throughout removal, transfers, and disposition	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The ELB health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account.
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
PR.DS-4	Adequate capacity to ensure availability is maintained	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
PR.DS-5	Protections against data leaks are implemented	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Amazon S3 data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
PR.DS-5	Protections against data leaks are implemented	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
PR.DS-5	Protections against data leaks are implemented	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
PR.DS-5	Protections against data leaks are implemented	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
PR.DS-5	Protections against data leaks are implemented	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
PR.DS-5	Protections against data leaks are implemented	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
PR.DS-5	Protections against data leaks are implemented	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.DS-5	Protections against data leaks are implemented	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
PR.DS-5	Protections against data leaks are implemented	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
PR.DS-5	Protections against data leaks are implemented	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.DS-5	Protections against data leaks are implemented	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-5	Protections against data leaks are implemented	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
PR.DS-5	Protections against data leaks are implemented	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
PR.DS-5	Protections against data leaks are implemented	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
PR.DS-6	Integrity checking mechanisms are used to verify software, firmware, and information integrity	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (e.g. concept of least functionality)	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (e.g. concept of least functionality)	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (e.g. concept of least functionality)	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
PR.IP-1	A baseline configuration of information technology/industrial control systems is created and maintained incorporating security principles (e.g. concept of least functionality)	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-3	Configuration change control processes are in place	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
PR.IP-4	Backups of information are conducted, maintained, and tested periodically	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
PR.IP-4	Backups of information are conducted, maintained, and tested periodically	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-4	Backups of information are conducted, maintained, and tested periodically	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
PR.IP-4	Backups of information are conducted, maintained, and tested periodically	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.IP-4	Backups of information are conducted, maintained, and tested periodically	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
PR.IP-7	Protection processes are improved	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
PR.MA-2	Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
PR.MA-2	Remote maintenance of organizational assets is approved, logged, and performed in a manner that prevents unauthorized access	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-1	Audit/log records are determined, documented, implemented, and reviewed in accordance with policy	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
PR.PT-3	Access to systems and assets is controlled, incorporating the principle of least functionality	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
PR.PT-4	Communications and control networks are protected	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
PR.PT-4	Communications and control networks are protected	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
PR.PT-4	Communications and control networks are protected	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-4	Communications and control networks are protected	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
PR.PT-4	Communications and control networks are protected	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (e.g., failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The ELB health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
PR.PT-5	Mechanisms (e.g., failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
PR.PT-5	Mechanisms (e.g., failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (e.g., failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
PR.PT-5	Mechanisms (e.g., failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
PR.PT-5	Mechanisms (e.g., failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
PR.PT-5	Mechanisms (e.g., failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
PR.PT-5	Mechanisms (e.g., failsafe, load balancing, hot swap) are implemented to achieve resilience requirements in normal and adverse situations	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-1	A baseline of network operations and expected data flows for users and systems is established and managed	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
DE.AE-2	Detected events are analyzed to understand attack targets and methods	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-2	Detected events are analyzed to understand attack targets and methods	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Amazon S3 data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
DE.AE-3	Event data are collected and correlated from multiple sources and sensors	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
DE.AE-4	Impact of events is determined	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Amazon S3 data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
DE.AE-4	Impact of events is determined	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
DE.AE-4	Impact of events is determined	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
DE.AE-4	Impact of events is determined	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-4	Impact of events is determined	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
DE.AE-4	Impact of events is determined	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
DE.AE-5	Incident alert thresholds are established	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
DE.AE-5	Incident alert thresholds are established	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
DE.AE-5	Incident alert thresholds are established	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
DE.CM-1	The network is monitored to detect potential cybersecurity events	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
DE.CM-1	The network is monitored to detect potential cybersecurity events	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
DE.DP-5	Detection processes are continuously improved	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	Control Description	AWS Config Rule	Guidance
RS.AN-2	The impact of the incident is understood	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

## Template

The template is available on GitHub: [Operational Best Practices for NIST CSF](#).

## Operational Best Practices for NYDFS 23

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the New York State Department Of Financial Services (NYDFS) cybersecurity requirements for financial services companies (23 NYCRR 500) and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more US NYDFS controls. A US NYDFS 23 NYCRR 500 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable you to align to a subset of the US NYDFS 23 NYCRR 500 design principles.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
500.02(a)	(a) Cybersecurity Program. Each Covered Entity shall maintain a cybersecurity program designed to protect the confidentiality, integrity and availability of the Covered Entity's Information Systems.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	<p>(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.</p>	<p><a href="#">iam-password-policy</a> (p. 154)</p>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
500.02(b)(2)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (2) use defensive infrastructure and the implementation of policies and procedures to protect the Covered Entity's Information Systems, and the Nonpublic Information stored on those Information Systems, from unauthorized access, use or other malicious acts.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
500.02(b)(5)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (5) recover from Cybersecurity Events and restore normal operations and services.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
500.06(b)	(b) Each Covered Entity shall maintain records required by section 500.06(a)(1) of this Part for not fewer than five years and shall maintain records required by section 500.06(a)(2) of this Part for not fewer than three years.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
500.8(a)	(a) Each Covered Entity's cybersecurity program shall include written procedures, guidelines and standards designed to ensure the use of secure development practices for in-house developed applications utilized by the Covered Entity, and procedures for evaluating, assessing or testing the security of externally developed applications utilized by the Covered Entity within the context of the Covered Entity's technology environment.	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
500.8(a)	(a) Each Covered Entity's cybersecurity program shall include written procedures, guidelines and standards designed to ensure the use of secure development practices for in-house developed applications utilized by the Covered Entity, and procedures for evaluating, assessing or testing the security of externally developed applications utilized by the Covered Entity within the context of the Covered Entity's technology environment.	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
500.02(b)(3)	(b) The cybersecurity program shall be based on the Covered Entity's Risk Assessment and designed to perform the following core cybersecurity functions: (3) detect Cybersecurity Events.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.06(a)	(a) Each Covered Entity shall securely maintain systems that, to the extent applicable and based on its Risk Assessment: (1) are designed to reconstruct material financial transactions sufficient to support normal operations and obligations of the Covered Entity; and (2) include audit trails designed to detect and respond to Cybersecurity Events that have a reasonable likelihood of materially harming any material part of the normal operations of the Covered Entity.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	<p>As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.</p>	<p><a href="#">iam-password-policy (p. 154)</a></p>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
500.07	As part of its cybersecurity program, based on the Covered Entity's Risk Assessment each Covered Entity shall limit user access privileges to Information Systems that provide access to Nonpublic Information and shall periodically review such access privileges.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
500.12	<p>(a) Multi-Factor Authentication. Based on its Risk Assessment, each Covered Entity shall use effective controls, which may include Multi-Factor Authentication or Risk-Based Authentication, to protect against unauthorized access to Nonpublic Information or Information Systems.</p> <p>(b) Multi-Factor Authentication shall be utilized for any individual accessing the Covered Entity's internal networks from an external network, unless the Covered Entity's CISO has approved in writing the use of reasonably equivalent or more secure access controls.</p>	<a href="#">iam-user-mfa-enabled (p. 158)</a>	<p>Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.</p>
500.12	<p>(a) Multi-Factor Authentication. Based on its Risk Assessment, each Covered Entity shall use effective controls, which may include Multi-Factor Authentication or Risk-Based Authentication, to protect against unauthorized access to Nonpublic Information or Information Systems.</p> <p>(b) Multi-Factor Authentication shall be utilized for any individual accessing the Covered Entity's internal networks from an external network, unless the Covered Entity's CISO has approved in writing the use of reasonably equivalent or more secure access controls.</p>	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	<p>Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.</p>

Control ID	Control Description	AWS Config Rule	Guidance
500.12	<p>(a) Multi-Factor Authentication. Based on its Risk Assessment, each Covered Entity shall use effective controls, which may include Multi-Factor Authentication or Risk-Based Authentication, to protect against unauthorized access to Nonpublic Information or Information Systems.</p> <p>(b) Multi-Factor Authentication shall be utilized for any individual accessing the Covered Entity's internal networks from an external network, unless the Covered Entity's CISO has approved in writing the use of reasonably equivalent or more secure access controls.</p>	<a href="#">iam-root-access-key-check (p. 157)</a>	<p>Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.</p>
500.12	<p>(a) Multi-Factor Authentication. Based on its Risk Assessment, each Covered Entity shall use effective controls, which may include Multi-Factor Authentication or Risk-Based Authentication, to protect against unauthorized access to Nonpublic Information or Information Systems.</p> <p>(b) Multi-Factor Authentication shall be utilized for any individual accessing the Covered Entity's internal networks from an external network, unless the Covered Entity's CISO has approved in writing the use of reasonably equivalent or more secure access controls.</p>	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	<p>Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
500.12	<p>(a) Multi-Factor Authentication. Based on its Risk Assessment, each Covered Entity shall use effective controls, which may include Multi-Factor Authentication or Risk-Based Authentication, to protect against unauthorized access to Nonpublic Information or Information Systems.</p> <p>(b) Multi-Factor Authentication shall be utilized for any individual accessing the Covered Entity's internal networks from an external network, unless the Covered Entity's CISO has approved in writing the use of reasonably equivalent or more secure access controls.</p>	<a href="#">root-account-mfa-enabled (p. 175)</a>	<p>Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.</p>
500.14(a)	<p>(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.</p>	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	<p>API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.</p>
500.14(a)	<p>(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.</p>	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	<p>Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.</p>

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
500.14(a)	(a) implement risk-based policies, procedures and controls designed to monitor the activity of Authorized Users and detect unauthorized access or use of, or tampering with, Nonpublic Information by such Authorized Users.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
500.15(a)	(a) As part of its cybersecurity program, based on its Risk Assessment, each Covered Entity shall implement controls, including encryption, to protect Nonpublic Information held or transmitted by the Covered Entity both in transit over external networks and at rest.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

## Template

The template is available on GitHub: [Operational Best Practices for NYDFS 23](#).

## Operational Best Practices for PCI DSS 3.2.1

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Payment Card Data Security Standard (PCI DSS) 3.2.1 and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more PCI DSS controls. A PCI DSS control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the PCI DSS.

**AWS Region:** All supported AWS Regions except Asia Pacific (Hong Kong), Europe (Stockholm), and Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
1.2	Build firewall and router configurations that restrict connections between untrusted networks and any system components in the cardholder data environment.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC

Control ID	Control Description	AWS Config Rule	Guidance
			without the need for an internet gateway, NAT device, or VPN connection.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
1.2.1	Restrict inbound and outbound traffic to that which is necessary for the cardholder data environment, and specifically deny all other traffic.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
1.3	Prohibit direct public access between the Internet and any system component in the cardholder data environment.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
2.1	Always change vendor-supplied defaults and remove or disable unnecessary default accounts before installing a system on the network.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
2.2	Develop configuration standards for all system components.	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
2.2	Develop configuration standards for all system components.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
2.2.2	Enable only necessary services, protocols, daemons, etc., as required for the function of the system.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
2.4	Maintain an inventory of system components that are in scope for PCI DSS.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
2.4	Maintain an inventory of system components that are in scope for PCI DSS.	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">dynamodb-table-encryption-enabled (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (PCI DSS Default : TRUE), and <code>loggingEnabled</code> (PCI DSS Default: TRUE). The actual values should reflect your organization's policies.
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.4	Render PAN unreadable anywhere it is stored.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
3.6.4	Cryptographic key changes for keys that have reached the end of their cryptoperiod.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
3.6.4	Cryptographic key changes for keys that have reached the end of their cryptoperiod.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
4.1	Use strong cryptography and security protocols to safeguard sensitive cardholder data during transmission over open, public networks.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4.1	Use strong cryptography and security protocols to safeguard sensitive cardholder data during transmission over open, public networks.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
4.1	Use strong cryptography and security protocols to safeguard sensitive cardholder data during transmission over open, public networks.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
4.1	Use strong cryptography and security protocols to safeguard sensitive cardholder data during transmission over open, public networks.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
6.1	Establish a process to identify security vulnerabilities.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
6.2	Ensure that all system components and software are protected from known vulnerabilities.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
7.1	Limit access to system components and cardholder data to only those individuals whose job requires such access.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
7.1.2	Restrict access to privileged user IDs to least privileges necessary to perform job responsibilities.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
7.2	Establish an access control system(s) for systems components that restricts access based on a user's need to know, and is set to "deny all" unless specifically allowed.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
8.1.4	Remove/disable inactive user accounts within 90 days.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (PCI DSS Default: 90). The actual value should reflect your organization's policies.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
8.2.1	Using strong cryptography, render all authentication credentials (such as passwords/phrases) unreadable during transmission and storage on all system components.	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.1	Using strong cryptography, render all authentication credentials unreadable during transmission and storage on all system components.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.3	Passwords/passphrases must meet the following: • Require a minimum length of at least seven characters. • Contain both numeric and alphabetic characters.	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (PCI DSS Default: false), <code>RequireLowercaseCharacters</code> (PCI DSS Default: true), <code>RequireSymbols</code> (PCI DSS Default: false), <code>RequireNumbers</code> (PCI DSS Default: true), <code>MinimumPasswordLength</code> (PCI DSS Default: 7), <code>PasswordReusePrevention</code> (PCI DSS Default: 4), and <code>MaxPasswordAge</code> (PCI DSS Default: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.4	Change user passwords/passphrases at least once every 90 days.	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (PCI DSS Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.2.4	Change user passwords/passphrases at least once every 90 days.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (PCI DSS Default: false), <code>RequireLowercaseCharacters</code> (PCI DSS Default: true), <code>RequireSymbols</code> (PCI DSS Default: false), <code>RequireNumbers</code> (PCI DSS Default: true), <code>MinimumPasswordLength</code> (PCI DSS Default: 7), <code>PasswordReusePrevention</code> (PCI DSS Default: 4), and <code>MaxPasswordAge</code> (PCI DSS Default: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
8.2.4	Change user passwords/passphrases at least every 90 days.	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	<p>This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.</p>

Control ID	Control Description	AWS Config Rule	Guidance
8.2.5	Do not allow an individual to submit a new password/passphrase that is the same as any of the last four passwords/passphrases he or she has used.	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (PCI DSS Default: false), <code>RequireLowercaseCharacters</code> (PCI DSS Default: true), <code>RequireSymbols</code> (PCI DSS Default: false), <code>RequireNumbers</code> (PCI DSS Default: true), <code>MinimumPasswordLength</code> (PCI DSS Default: 7), <code>PasswordReusePrevention</code> (PCI DSS Default: 4), and <code>MaxPasswordAge</code> (PCI DSS Default: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.
8.3	Incorporate multi-factor authentication for all non-console access into the CDE for personnel with administrative access.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
8.3	Secure all individual non-console administrative access and all remote access to the CDE using multi-factor authentication.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
8.3	Secure all individual non-console administrative access and all remote access to the CDE using multi-factor authentication.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
8.3	Secure all individual non-console administrative access and all remote access to the CDE using multi-factor authentication..	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
10.1	Implement audit trails to link all access to system components to each individual user.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (PCI DSS Default : TRUE), and <code>loggingEnabled</code> (PCI DSS Default: TRUE). The actual values should reflect your organization's policies.
10.1	Implement audit trails to link all access to system components to each individual user.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
10.2	Implement automated audit trails for all system components.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
10.2	Implement automated audit trails for all system components.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
10.2	Implement automated audit trails for all system components.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (PCI DSS Default : TRUE), and <code>loggingEnabled</code> (PCI DSS Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
10.2.1	Implement automated audit trails for all system components to reconstruct the all individual user accesses to cardholder data.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
10.2.1	Implement automated audit trails for all system components to reconstruct the all individual user accesses to cardholder data.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. This rule requires that a value is set for <code>clusterDbEncrypted</code> (PCI DSS Default : TRUE), and <code>loggingEnabled</code> (PCI DSS Default: TRUE). The actual values should reflect your organization's policies.
10.3.3	Record within audit entries for all system components the date and time.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.3	Record within audit entries for all system components the date and time.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
10.3.4	Record within audit entries for all system components the success or failure indication.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
10.3.4	Record within audit entries for all system components the success or failure indication.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Amazon S3 data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.4	Record within audit entries for all system components the success or failure indication.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
10.3.4	Record within audit entries for all system components the success or failure indication.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (PCI DSS Default : TRUE), and loggingEnabled (PCI DSS Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.4	Record within audit entries for all system components the success or failure indication.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
10.3.4	Record within audit entries for all system components the success or failure indication.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
10.3.5	Record within audit entries for all system components the origination of event.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.5	Record within audit entries for all system components the origination of event.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Amazon S3 data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
10.3.5	Record within audit entries for all system components the origination of event.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
10.3.5	Record within audit entries for all system components the origination of event.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (PCI DSS Default : TRUE), and loggingEnabled (PCI DSS Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.5	Record within audit entries for all system components the origination of event.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. This rule requires that a value is set for clusterDbEncrypted (PCI DSS Default : TRUE), and loggingEnabled (PCI DSS Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
10.3.6	Record within audit entries for all system components the identity or name of affected data, system component, or resource.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
10.3.6	Record within audit entries for all system components the identity or name of affected data, system component, or resource.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
10.5.1	Limit viewing of audit trails to those with a job-related need.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
10.5.1	Limit viewing of audit trails to those with a job-related need.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.2	Protect audit trail files from unauthorized modifications.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
10.5.3	Promptly back up audit trail files to a centralized log server or media that is difficult to alter.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
10.5.5	Use file-integrity monitoring or change-detection software on logs to ensure that existing log data cannot be changed without generating alerts.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
10.6	Review logs and security events for all system components to identify anomalies or suspicious activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
11.4	Use intrusion-detection and/or intrusion-prevention techniques to detect and/or prevent intrusions into the network.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
12.5.2	Monitor and analyze security alerts and information, and distribute to appropriate personnel.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

## Template

The template is available on GitHub: [Operational Best Practices for PCI DSS 3.2.1](#).

# Operational Best Practices for Publicly Accessible Resources

This conformance pack helps identify resources that may be publicly accessible.

This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Asia Pacific (Hong Kong), Europe (Stockholm), and Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Publicly Accessible Resources](#).

## Operational Best Practices for RBI Cyber Security Framework for UCBs

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Reserve Bank of India (RBI) Cyber Security Framework for Urban Cooperative Banks (UCBs) and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more RBI Cyber Security Framework for UCBs controls. An RBI Cyber Security Framework for UCBs control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
Annex_I(1.1)	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Annex_I(1.3)	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
Annex_I(1.3)	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
Annex_I(1.3)	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
Annex_I(1.3)	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
Annex_I(1.3)	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
Annex_I(1.3)	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
Annex_I(1.3)	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
Annex_I(1.3)	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
Annex_I(1.3)	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Annex_I(1.3)	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
Annex_I(1.3)	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
Annex_I(1.3)	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
Annex_I(1.3)	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
Annex_I(1.3)	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
Annex_I(1.3)	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
Annex_I(1.3)	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
Annex_I(1.3)	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
Annex_I(1.3)	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
Annex_I(1.3)	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Annex_I(1.3)	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
Annex_I(1.3)	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
Annex_I(1.3)	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
Annex_I(1.3)	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
Annex_I(1.3)	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
Annex_I(1.3)	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
Annex_I(1.3)	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
Annex_I(1.3)	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Annex_I(1.3)	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Annex_I(1.3)	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Annex_I(1.3)	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Annex_I(1.3)	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Annex_I(5.1)	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
Annex_I(5.1)	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	AWS Config Rule	Guidance
Annex_I(5.1)	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Annex_I(6)	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
Annex_I(6)	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
Annex_I(6)	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (Config Default: 30), daysMediumSev (Config Default: 7), and daysHighSev (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	AWS Config Rule	Guidance
Annex_I(7.1)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Annex_I(7.1)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Annex_I(7.1)	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
Annex_I(7.1)	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
Annex_I(7.2)	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.
Annex_I(7.3)	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Annex_I(7.4)	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Annex_I(7.4)	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Annex_I(7.4)	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Annex_I(7.4)	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
Annex_I(7.4)	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
Annex_I(7.4)	<a href="#">rds-logging-enabled (p. 167)</a>	<p>To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.</p>
Annex_I(7.4)	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	<p>Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>

Control ID	AWS Config Rule	Guidance
Annex_I(7.4)	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
Annex_I(7.4)	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
Annex_I(7.4)	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
Annex_I(12)	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Annex_I(12)	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
Annex_I(12)	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Annex_I(12)	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
Annex_I(12)	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
Annex_I(12)	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	AWS Config Rule	Guidance
Annex_I(12)	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

## Template

The template is available on GitHub: [Operational Best Practices for RBI Cyber Security Framework for UCBs](#).

## Operational Best Practices for RBI MD-ITF

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Reserve Bank of India (RBI) Master Direction – Information Technology Framework and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more RBI Master Direction – Information Technology Framework controls. An RBI Master Direction – Information Technology Framework control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
3.1(a)	Identification and Classification of Information Assets.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type,

Control ID	Control Description	AWS Config Rule	Guidance
			software installations, application name, publisher and version, and other details about your environment.
3.1(c)	Role Based Access Control	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
3.1(c)	Role Based Access Control	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
3.1(c)	Role Based Access Control	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
3.1(c)	Role Based Access Control	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
3.1(c)	Role Based Access Control	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
3.1(c)	Role Based Access Control	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
3.1(c)	Role Based Access Control	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
3.1(c)	Role Based Access Control	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(c)	Role Based Access Control	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
3.1(c)	Role Based Access Control	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
3.1(g)	Incident Management	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(g)	Incident Management	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
3.1(g)	Incident Management	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
3.1(g)	Incident Management	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(g)	Incident Management	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
3.1(h)	Trails	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
3.1(h)	Trails	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
3.1(h)	Trails	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
3.1(h)	Trails	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
3.1(h)	Trails	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
3.1(h)	Trails	<a href="#">rds-logging-enabled (p. 167)</a>	<p>To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
3.1(h)	Trails	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(h)	Trails	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
3.1(h)	Trails	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(i)	Public Key Infrastructure	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
3.1_i	Public Key Infrastructure	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1(i)	Public Key Infrastructure	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1(i)	Public Key Infrastructure	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.1(i)	Public Key Infrastructure	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1(i)	Public Key Infrastructure	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1(i)	Public Key Infrastructure	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.3	Vulnerability Management	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.3	Vulnerability Management	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
3.3	Vulnerability Management	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
3.3	Vulnerability Management	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
3.5	Cyber Crisis Management Plan	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
3.5	Cyber Crisis Management Plan	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.5	Cyber Crisis Management Plan	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
3.5	Cyber Crisis Management Plan	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
3.5	Cyber Crisis Management Plan	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(g)	Fraud analysis- Suspicious transaction analysis, embezzlement, theft or suspected money-laundering, misappropriation of assets, manipulation of financial records etc. The regulatory requirement of reporting fraud to RBI should be system driven.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
4.4(h)	Capacity and performance analysis of IT security systems.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
4.4(i)	Incident reporting, their impact and steps taken for non-recurrence of such events in the future.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
4.4(i)	Incident reporting, their impact and steps taken for non-recurrence of such events in the future.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
6.3	NBFCs shall consider the need to put in place necessary backup sites for their critical business systems and Data centers.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
8.III	A Maker-checker concept to reduce the risk of error and misuse and to ensure reliability of data/information.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
8.IX	Arrangement for backup of data with periodic testing.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
8.IX	Arrangement for backup of data with periodic testing.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
8.IX	Arrangement for backup of data with periodic testing.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data backup processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
8.IX	Arrangement for backup of data with periodic testing.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data backup processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
8.IX	Arrangement for backup of data with periodic testing.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
8.IX	Arrangement for backup of data with periodic testing.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
8.IX	Arrangement for backup of data with periodic testing.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
8.1	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
8.I	Basic security aspects such as physical/ logical access controls and well defined password policy.	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
8.II	A well-defined user role.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
8.II	A well-defined user role.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
8.II	A well-defined user role.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
8.II	A well-defined user role.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.

Control ID	Control Description	AWS Config Rule	Guidance
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
8.1	IT Systems should be progressively scaled up as the size and complexity of NBFC's operations increases.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

## Template

The template is available on GitHub: [Operational Best Practices for RBI MD-ITF](#).

## Operational Best Practices for Security, Identity, and Compliance Services

This pack contains AWS Config rules based on Security, Identity, and Compliance Services. For more information, see [Security, Identity, and Compliance on AWS](#). This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Security, Identity, and Compliance Services](#).

## Operational Best Practices for Serverless

This pack contains AWS Config rules based on Serverless solutions. This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Serverless](#).

## Operational Best Practices for Storage Services

This pack contains AWS Config rules based on Storage Services. For more information, see [Cloud Storage on AWS](#). This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Storage Services](#).

## Example Templates with Remediation Action

### Operational Best Practices For Amazon DynamoDB with Remediation

The template is available on GitHub: [Operational Best Practices For Amazon DynamoDB with Remediation](#).

### Operational Best Practices For Amazon S3 with Remediation

The template is available on GitHub: [Operational Best Practices For Amazon S3 with Remediation](#).

## Custom Conformance Pack

The template is available on GitHub: [Custom Conformance Pack](#).

For more information about template structure, see [Template Anatomy](#) in the AWS CloudFormation User Guide.

## Viewing Compliance Data in the Conformance Packs Dashboard

The main page for **Conformance Packs** displays all of the conformance packs that you currently have in your AWS account. The page also contains the name, deployment status, and compliance status of each conformance pack.

### Navigating the Conformance Packs Main Page

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
  2. Navigate to the **Conformance packs** page. Review your conformance packs and their compliance states. You can then do the following:
    - To add and configure a new conformance pack, choose **Deploy conformance pack**.
    - To delete a conformance pack and its data, change the configuration settings, or view additional details, such as the delivery location or parameters, choose a conformance pack and choose **Actions**.
- Note**  
You cannot edit a deployed conformance pack. You can modify the other selections at any time by choosing the name of the conformance pack and **Edit** in the **Actions** dropdown.
- To view the history of compliance state changes and adjust remediation actions to meet compliance goals, choose a conformance pack and choose **Conformance pack timeline**.

### Learn more

[Conformance Pack Prerequisites](#)

[Conformance Pack Sample Templates](#)

[Deploying a Conformance Pack](#)

[AWS Service Limits](#)

## Deploying a Conformance Pack Using the AWS Config Console

On the **Conformance packs** page, you can deploy a conformance pack for an account in a Region. You can also edit and delete the deployed conformance pack.

## Deploy a Conformance Pack Using Sample Templates

You can deploy a conformance pack using AWS Config sample templates.

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Navigate to the **Conformance packs** page and choose **Deploy conformance pack**.
3. On the **Specify template** page, either choose a sample template or use an existing template.
  - If you choose **Use sample template**, select a **Sample template** from the drop-down list of sample templates.

For information about the contents of each template, see Conformance Pack Sample Templates.

- If you choose **Template is ready**, specify the template source. It is either an Amazon S3 URI or a template that you upload.

If your template is more than 50 KB, upload it to the S3 bucket and select that S3 bucket location.  
For example: `s3://bucketname/prefix`.

4. Choose **Next**.
5. On the **Specify conformance pack details** page, type the name for your conformance pack.

The conformance pack name must be a unique name with a maximum of 256 alphanumeric characters. The name can contain hyphens but cannot contain spaces.

6. Optional: Add a parameter.

Parameters are defined in your template and help you manage and organize your resources.

7. Choose **Next**.
8. On the **Review and deploy** page, review all of the information.

You can edit the template details and conformance pack details by choosing **Edit**.

9. Choose **Deploy conformance pack**.

AWS Config displays the conformance pack on the conformance pack page with the appropriate status.

If your conformance pack deployment fails, check your permissions, verify that you did the prerequisite steps, and try again. Or you can contact AWS Config support.

To deploy a **conformance pack using sample template with remediations**, see the [Prerequisites for Using a Conformance Pack With Remediation \(p. 219\)](#) and then use the preceding procedure.

To deploy a **conformance pack with one or more AWS Config rules**, see the [Prerequisites for Using a Conformance Pack With One or More AWS Config Rules \(p. 220\)](#).

## Edit a Conformance Pack

1. To edit a conformance pack, select the conformance pack from the table.
2. Choose **Actions** and then choose **Edit**.
3. On the **Edit conformance pack** page, you can edit the template details, sample template, conformance pack, and parameters section.

You cannot change the name of the conformance pack.

4. Choose **Save changes**.

The conformance pack is displayed with the AWS Config rules.

## Delete a Conformance Pack

1. To delete a conformance pack, select the conformance pack from the table.
2. Choose **Actions** and then choose **Delete**.
3. On the delete *conformance pack* dialog box, confirm if you would like to permanently delete this conformance pack.

You cannot revert this action. When you delete a conformance pack, you delete all of the AWS Config rules and remediation actions in that conformance pack.

4. Enter **Delete** and choose **Delete**.

On the **Conformance packs** page, you can see the deployment status as **Deleting** until the conformance pack is completely deleted.

## Deploying a Conformance Pack Using the AWS Command Line Interface

You can deploy, view, update, view compliance status, and delete an AWS Config conformance pack using the AWS Command Line Interface (AWS CLI).

To install the AWS CLI on your local machine see, [AWS Config Conforms Amazon S3 bucket](#).

If necessary, type `aws configure` to configure the AWS CLI to use an AWS Region where AWS Config conformance packs are available.

### Topics

- [Deploy a Conformance Pack \(p. 3254\)](#)
- [View a Conformance Pack \(p. 3255\)](#)
- [View Conformance Pack Status \(p. 3255\)](#)
- [View Conformance Pack Compliance Status \(p. 3256\)](#)

- [Delete a Conformance Pack \(p. 3257\)](#)

## Deploy a Conformance Pack

1. Open a command prompt or a terminal window.
2. Type the following command to deploy a conformance pack named **MyConformancePack1**.

```
aws configservice put-conformance-pack --conformance-pack-name="MyConformancePack1"
--template-s3-uri="s3://AmazonS3bucketname/template name.yaml" --delivery-s3-
bucket=AmazonS3bucketname
```

OR

You can also upload a YAML template from your local directory.

```
aws configservice put-conformance-pack --conformance-pack-name="MyConformancePack1" --  
template-body=template body --delivery-s3-bucket=AmazonS3bucketname
```

3. Press Enter to run the command.

You should see output similar to the following.

```
{  
  "conformancePackArn": "arn:aws:config:us-west-2:AccountID:conformance-pack/  
MyConformancePack1/conformance-pack-ID"  
}
```

## View a Conformance Pack

1. Type the following command.

```
aws configservice describe-conformance-packs
```

OR

```
aws configservice describe-conformance-packs --conformance-pack-  
name="MyConformancePack1"
```

2. You should see output similar to the following.

```
{  
  "conformancePackName": "MyConformancePack1",  
  "conformancePackId": "conformance-pack-ID",  
  "conformancePackArn": "arn:aws:config:us-west-2:AccountID:conformance-pack/  
MyConformancePack1/conformance-pack-ID",  
  "conformancePackInputParameters": [],  
  "lastUpdateRequestedTime": "Thu Jul 18 16:07:05 PDT 2019"  
}
```

## View Conformance Pack Status

1. Type the following command.

```
aws configservice describe-conformance-pack-status --conformance-pack-  
name="MyConformancePack1"
```

2. You should see output similar to the following .

```
{  
  "stackArn": "arn:aws:cloudformation:us-west-2:AccountID:stack/awsconfigconforms-  
MyConformancePack1-conformance-pack-ID/d4301fe0-a9b1-11e9-994d-025f28dd83ba",  
  "conformancePackName": "MyConformancePack1",  
  "conformancePackId": "conformance-pack-ID",  
  "lastUpdateCompletedTime": "Thu Jul 18 16:15:17 PDT 2019",  
  "conformancePackState": "CREATE_COMPLETE",  
  "conformancePackArn": "arn:aws:config:us-west-2:AccountID:conformance-pack/  
MyConformancePack1/conformance-pack-ID",  
  "lastUpdateRequestedTime": "Thu Jul 18 16:14:35 PDT 2019"
```

```
}
```

## View Conformance Pack Compliance Status

1. Type the following command.

```
aws configservice describe-conformance-pack-compliance --conformance-pack-name="MyConformancePack1"
```

2. You should see output similar to the following.

```
{
  "conformancePackName": "MyConformancePack1",
  "conformancePackRuleComplianceList": [
    {
      "configRuleName": "awsconfigconforms-RuleName1-conformance-pack-ID",
      "complianceType": "NON_COMPLIANT"
    },
    {
      "configRuleName": "awsconfigconforms-RuleName2-conformance-pack-ID",
      "complianceType": "COMPLIANT"
    }
  ]
}
```

## Get Compliance Details for a Specific Conformance Pack

1. Type the following command.

```
aws configservice get-conformance-pack-compliance-details --conformance-pack-name="MyConformancePack1"
```

2. You should see output similar to the following.

```
{
  "conformancePackRuleEvaluationResults": [
    {
      "evaluationResultIdentifier": {
        "orderingTimestamp": "Tue Jul 16 23:07:35 PDT 2019",
        "evaluationResultQualifier": {
          "resourceId": "resourceID",
          "configRuleName": "awsconfigconforms-RuleName1-conformance-pack-ID",
          "resourceType": "AWS:::Account"
        }
      },
      "configRuleInvokedTime": "Tue Jul 16 23:07:50 PDT 2019",
      "resultRecordedTime": "Tue Jul 16 23:07:51 PDT 2019",
      "complianceType": "NON_COMPLIANT"
    },
    {
      "evaluationResultIdentifier": {
        "orderingTimestamp": "Thu Jun 27 15:16:36 PDT 2019",
        "evaluationResultQualifier": {
          "resourceId": "resourceID",
```

```
        "configRuleName": "awsconfigconforms-RuleName2-conformance-pack-ID",
        "resourceType": "AWS::EC2::SecurityGroup"
    },
    "configRuleInvokedTime": "Thu Jul 11 23:08:06 PDT 2019",
    "resultRecordedTime": "Thu Jul 11 23:08:06 PDT 2019",
    "complianceType": "COMPLIANT"
},
"conformancePackName": "MyConformancePack1"
}
```

## Delete a Conformance Pack

- Type the following command.

```
aws configservice delete-conformance-pack --conformance-pack-name MyConformancePack1
```

If successful, the command runs with no additional output.

## Managing Conformance Packs (API)

Use the following AWS Config API actions to manage conformance packs:

- [DeleteConformancePack](#)
- [DescribeConformancePackCompliance](#)
- [DescribeConformancePacks](#)
- [DescribeConformancePackStatus](#)
- [GetConformancePackComplianceDetails](#)
- [GetConformancePackComplianceSummary](#)
- [PutConformancePack](#)

## Managing Conformance Packs Across all Accounts in Your Organization

Use AWS Config to manage conformance packs across all AWS accounts within an organization. You can do the following:

- Centrally deploy, update, and delete conformance packs across member accounts in an organization in AWS Organizations.
- Deploy a common set of AWS Config rules and remediation actions across all accounts and specify accounts where AWS Config rules and remediation actions should not be created.
- Use the APIs from the master account in AWS Organizations to enforce governance by ensuring that the underlying AWS Config rules and remediation actions are not modifiable by your organization's member accounts.

### Note

*For deployments across different regions*

The API call to deploy rules and conformance packs across accounts is region specific. At the organization level, you need to change the context of your API call to a different region if you want to deploy rules in other regions. For example, to deploy a rule in US East (N. Virginia), change the region to US East (N. Virginia) and then call `PutOrganizationConfigRule`.

*For accounts within an organization*

If a new account joins an organization, the rule is deployed to that account. When an account leaves an organization, the rule is removed.

Ensure AWS Config recording is on before you use the following APIs to manage conformance pack rules across all AWS accounts within an organization:

- [DeleteOrganizationConformancePack](#), deletes the specified organization conformance pack and all of the config rules and remediation actions from all member accounts in that organization.
- [DescribeOrganizationConformancePacks](#), returns a list of organization conformance packs.
- [DescribeOrganizationConformancePackStatuses](#), provides organization conformance pack deployment status for an organization.
- [GetOrganizationConformancePackDetailedStatus](#), returns detailed status for each member account within an organization for a given organization conformance pack.
- [PutOrganizationConformancePack](#), deploys conformance packs across member accounts in an AWS Organization.

## Viewing Compliance History Timeline for Conformance Packs

AWS Config supports storing compliance state changes to your conformance packs. This allows you to view the history of compliance state changes and adjust remediation actions to meet compliance goals. These compliance state changes are presented as a timeline. The timeline captures changes as `ConfigurationItems` over a period of time. You can also use this feature to find specific rules within a conformance pack that are non-compliant.

You can opt in or out to record all resource types in AWS Config. If you have opted to record all resource types, AWS Config automatically begins recording the conformance pack compliance history as evaluated by AWS Config Rules. By default, AWS Config records the configuration changes for all supported resources. You can also select only the specific conformance pack compliance history resource type: `AWS::Config::ConformancePackCompliance`. Recording for the `AWS::Config::ConformancePackCompliance` resource type is available at no additional charge. For more information, see [Selecting Which Resources AWS Config Records](#).

A conformance pack is compliant if all of the rules in a conformance packs are compliant. It is noncompliant if any of the rules are not compliant. The compliance status of a conformance pack is `INSUFFICIENT_DATA` only if all rules within a conformance pack cannot be evaluated due to insufficient data. If some of the rules in a conformance pack are compliant but the compliance status of other rules in that same conformance pack is `INSUFFICIENT_DATA`, the conformance pack shows compliant. Compliance for a conformance pack is not evaluated all at once. Some rules may take a longer time to evaluate than others. Compliance is evaluated for groups of rules at a time, continuing in stages until all the rules in a conformance pack have been evaluated.

### Topics

- [Viewing the Compliance Timeline \(p. 3259\)](#)
- [Querying Compliance History \(p. 3259\)](#)

## Viewing the Compliance Timeline

Access the compliance timeline by selecting a specific conformance pack from the **Conformance pack** main page.

1. Navigate to the **Conformance Pack** page.
2. On the **Conformance Pack** main page, choose a specific conformance pack and then choose **Conformance pack timeline**.

### Note

Alternatively, you can use the compliance timeline from the conformance pack's details page. Choose a conformance pack and choose **View details** in the **Actions** dropdown. From this page, choose **Conformance pack timeline**.

The timeline shows you the history of compliance state changes for a conformance pack. You can do the following:

1. Adjust remediation actions to meet compliance goals.
2. Expand a compliance change to view the line-by-line compliance status of each rule within a conformance pack.
3. From the expanded view, choose a specific rule to view its details page.

## Querying Compliance History

Query the compliance history using `get-resource-config-history` using the resource type `AWS::Config::ConformancePackCompliance`.

```
aws configservice get-resource-config-history --resource-type  
AWS::Config::ConformancePackCompliance --resource-id conformance-pack-ID
```

You should see output similar to the following:

```
{  
  "configurationItems": [  
    {  
      "version": "1.3",  
      "accountId": "Account ID",  
      "configurationItemCaptureTime": 1614641951.442,  
      "configurationItemStatus": "OK",  
      "configurationStateId": "1614641951442",  
      "configurationItemMD5Hash": "",  
      "arn": "arn:aws:config:us-east-1:Account ID:conformance-  
pack/MyConformancePack1/conformance-pack-ID",  
      "resourceType": "AWS::Config::ConformancePackCompliance",  
      "resourceId": "conformance-pack-ID",

  "resourceName": "MyConformancePack1",
  "awsRegion": "us-east-1",
  "tags": {},
  "relatedEvents": [],
  "relationships": [],
  "configuration": "{
    \"compliantRuleCount\": 1,
    \"configRuleList\": [
      {
        \"configRuleName\": \"RuleName1-conformance-pack-ID\",
        \"controls\": [],
        \"configRuleArn\": \"arn:aws:config:us-east-1:Account ID:config-rule/aws-service-rule/config-conforms.amazonaws.com/config-rule-nnnnnn\",
        \"complianceType\": \"INSUFFICIENT_DATA\"
      },
      {
        \"configRuleName\": \"RuleName2-conformance-pack-ID\",
        \"controls\": [],
        \"configRuleArn\": \"arn:aws:config:us-east-1:Account ID:config-rule/aws-service-rule/config-conforms.amazonaws.com/config-rule-mmmmmm\",
        \"complianceType\": \"COMPLIANT\"
      },
      {
        \"configRuleName\": \"RuleName3-conformance-pack-ID\",
        \"controls\": [],
        \"configRuleArn\": \"arn:aws:config:us-east-1:Account ID:config-rule/aws-service-rule/config-conforms.amazonaws.com/config-rule-pppppp\",
        \"complianceType\": \"INSUFFICIENT_DATA\"
      }
    ],
    \"totalRuleCount\": 3,
    \"nonCompliantRuleCount\": 0,
    \"complianceType\": \"COMPLIANT\"
  }"
}
]
```

For more information, see [Supported Resource Types \(AWS Config\)](#) and [GetResourceConfigHistory](#) in the API reference.

## Troubleshooting

If you get an error indicating that the conformance pack failed while creating, updating, or deleting it, you can check the status of your conformance pack.

```
aws configservice describe-conformance-pack-status --conformance-pack-name=ConformancePackName
```

You should see output similar to the following.

```
"ConformancePackStatusDetails": [
  {
    "ConformancePackName": "ConformancePackName",
    "ConformancePackId": "ConformancePackId",
    "ConformancePackArn": "ConformancePackArn",
    "ConformancePackState": "CREATE_FAILED",
    "StackArn": "CloudFormation stackArn",
    "ConformancePackStatusReason": "Failure Reason",
    "LastUpdateRequestedTime": 1573865201.619,
    "LastUpdateCompletedTime": 1573864244.653
  }
]
```

]

Check the **ConformancePackStatusReason** for information about the failure.

#### **When the stackArn is present in the response**

If the error message is not clear or if the failure is due to an internal error, go to the AWS CloudFormation console and do the following:

1. Search for the **stackArn** from the output.
2. Choose the **Events** tab of the AWS CloudFormation stack and check for failed events.

The status reason indicates why the conformance pack failed.

#### **When the stackArn is not present in the response**

If you receive a failure while you create a conformance pack but the **stackArn** is not present in the status response, the possible reason is that the stack creation failed and AWS CloudFormation rolled back and deleted the stack. Go to the AWS CloudFormation console and search for stacks that are in a **Deleted** state. The failed stack might be available there. The AWS CloudFormation stack contains the conformance pack name. If you find the failed stack, choose the **Events** tab of the AWS CloudFormation stack and check for failed events.

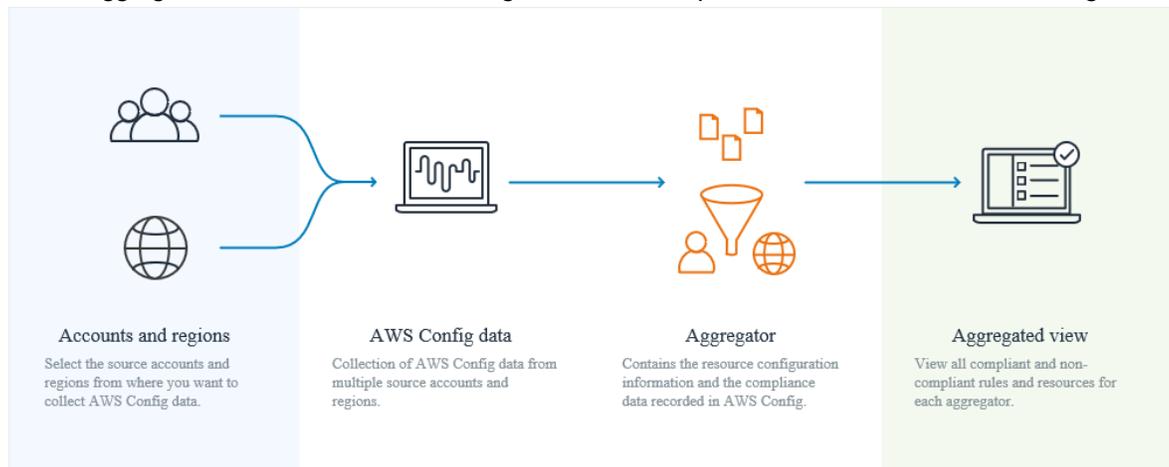

If none of these steps worked and if the failure reason is an internal service error, then try operation again or contact AWS Config support.

# Multi-Account Multi-Region Data Aggregation

An aggregator is an AWS Config resource type that collects AWS Config configuration and compliance data from the following:

- Multiple accounts and multiple regions.
- Single account and multiple regions.
- An organization in AWS Organizations and all the accounts in that organization which have AWS Config enabled.

Use an aggregator to view the resource configuration and compliance data recorded in AWS Config.

For more information about concepts, see [Multi-Account Multi-Region Data Aggregation \(p. 5\)](#) section in the Concepts topic.

To collect your AWS Config data from source accounts and regions, start with:

1. Adding an aggregator to aggregate AWS Config configuration and compliance data from multiple accounts and regions.
2. Authorizing aggregator accounts to collect AWS Config configuration and compliance data. Authorization is required when your source accounts are individual accounts. Authorization is not required if you are aggregating source accounts that are part of AWS Organizations.
3. Monitoring compliance data for rules and accounts in the aggregated view.

## Region Support

Currently, multi-account multi-region data aggregation is supported in the following regions:

Region Name	Region	Endpoint	Protocol
Africa (Cape Town)	af-south-1	config.af-south-1.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
Middle East (Bahrain)	me-south-1	config.me-south-1.amazonaws.com	HTTPS
Asia Pacific (Hong Kong)	ap-east-1	config.ap-east-1.amazonaws.com	HTTPS
Asia Pacific (Mumbai)	ap-south-1	config.ap-south-1.amazonaws.com	HTTPS
Asia Pacific (Seoul)	ap-northeast-2	config.ap-northeast-2.amazonaws.com	HTTPS
Asia Pacific (Singapore)	ap-southeast-1	config.ap-southeast-1.amazonaws.com	HTTPS
Asia Pacific (Sydney)	ap-southeast-2	config.ap-southeast-2.amazonaws.com	HTTPS
Asia Pacific (Tokyo)	ap-northeast-1	config.ap-northeast-1.amazonaws.com	HTTPS
AWS GovCloud (US-East)	us-gov-east-1	config.us-gov-east-1.amazonaws.com	HTTPS
AWS GovCloud (US-West)	us-gov-west-1	config.us-gov-west-1.amazonaws.com	HTTPS
Canada (Central)	ca-central-1	config.ca-central-1.amazonaws.com	HTTPS
Europe (Stockholm)	eu-north-1	config.eu-north-1.amazonaws.com	HTTPS
Europe (Frankfurt)	eu-central-1	config.eu-central-1.amazonaws.com	HTTPS
Europe (Ireland)	eu-west-1	config.eu-west-1.amazonaws.com	HTTPS
Europe (London)	eu-west-2	config.eu-west-2.amazonaws.com	HTTPS
Europe (Milan)	eu-south-1	config.eu-south-1.amazonaws.com	HTTPS
Europe (Paris)	eu-west-3	config.eu-west-3.amazonaws.com	HTTPS
South America (São Paulo)	sa-east-1	config.sa-east-1.amazonaws.com	HTTPS
US East (N. Virginia)	us-east-1	config.us-east-1.amazonaws.com	HTTPS

Region Name	Region	Endpoint	Protocol
US East (Ohio)	us-east-2	config.us-east-2.amazonaws.com	HTTPS
US West (N. California)	us-west-1	config.us-west-1.amazonaws.com	HTTPS
US West (Oregon)	us-west-2	config.us-west-2.amazonaws.com	HTTPS

## Learn More

- [Troubleshooting for Multi-Account Multi-Region Data Aggregation \(p. 3277\)](#)

## Viewing Compliance Data in the Aggregator Dashboard

The dashboard on the **Aggregators** page displays the configuration data of AWS resources and provides an overview of your rules and conformance packs and their compliance states.

It provides the total resource count of AWS resources. The resource types and source accounts are ranked by the highest number of resources. It also provides a count of compliant and noncompliant rules and conformance packs. The noncompliant rules are ranked by highest number of noncompliant resources. The noncompliant conformance packs and source accounts are ranked by the highest number of noncompliant rules.

After setup, AWS Config starts aggregating data from the specified source accounts into an aggregator. It might take a few minutes for AWS Config to display the compliance status of rules on this page.

### Using the Aggregator Dashboard

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Navigate to the **Aggregators** page. Review your rules and their compliance states; conformance packs and their compliance states, and AWS resources and their configuration data. You can do the following:
  - Choose an aggregator from the dashboard and filter through your aggregators by AWS region, or account ID.

- View the top ten resource types, in the descending order according to the number of resources. Choose view all resources to go to the **Aggregated resources** page. On this page, you can view all the aggregated resources for an account.
- View the top five accounts by the number of resources, in the descending order according to the number of resources. Choose the number of resources for an account to go to the **Aggregated Resources** page. On this page, you can view all the aggregated resources for an account.
- View the top five noncompliant rules, in descending order according to the number of noncompliant resources. Choose a rule to go to the **Rule details** page.
- View the top five accounts by noncompliant rules, in descending order according to the number of noncompliant rules. Choose an account to go to the **Aggregated Rules** page. On this page, you can view all the aggregated rules for an account.
- View the top five accounts by noncompliant conformance packs, in descending order according to the number of noncompliant conformance packs. Choose an account to go to the **Aggregated Conformance Pack** page. On this page, you can view all the aggregated conformance packs for an account.

#### Note

Data displayed on the tiles is subject to delays.

The **Data collection from all source accounts and regions is incomplete** message is displayed in the aggregated view for the following reasons:

- AWS Config noncompliant rules and configuration data of AWS resources transfer is in progress.
- AWS Config can't find rules to match the filter. Select the appropriate account or region and try again.

The **Data collection from your organization is incomplete. You can view the below data only for 24 hours.** message is displayed in the aggregated view for the following reasons:

- AWS Config is unable to access your organization details due to invalid IAM role. If the IAM role is invalid for more than 24 hours, AWS Config deletes data for entire organization.
- AWS Config service access is disabled in your organization.

3. In the navigation pane, choose **Aggregators** and then choose one of the following options from the dropdown menu to go its aggregated page:

- **Conformance packs**

View all conformance packs that are created and linked to the different AWS accounts within your aggregator. The **Conformance Pack** page displays a table that lists the name, Region, account ID, and compliance status of each conformance pack. From this page, you can choose a conformance pack and **View details** for more information about its rules and resources and their compliance status.

- **Rules**

View all rules that are created and linked to the different AWS accounts within your aggregator. The **Rules** page displays a table that lists the name, compliance status, Region, and account of each rule. From this page, you can choose a rule and **View details** for information, such as its aggregator, Region, account ID, and resources in scope.

- **Resources**

View all resources that are recorded and linked to the different AWS accounts within your aggregator. From the **Resource** page, choose a resource and **View details** to view its details and the rules associated with it and the current resource configuration. You can also see information

about the resource, such as its aggregator, Region, account ID, resource name, resource type, and resource ID.

- **Authorizations**

View all accounts currently authorized or pending authorization. From the **Authorizations** page, choose **Add authorization** to provide access to another account. Choose **Delete authorization** to revoke access from an account ID.

- [Troubleshooting for Multi-Account Multi-Region Data Aggregation \(p. 3277\)](#)

# Setting Up an Aggregator Using the Console

On the **Aggregator** page, you can do the following:

- Create an aggregator by specifying the source account IDs or organization and regions from which you want to aggregate data.
- Edit and delete an aggregator.

### Topics

- [Add an Aggregator \(p. 3266\)](#)
- [Edit an Aggregator \(p. 3267\)](#)
- [Delete an Aggregator \(p. 3268\)](#)
- [Learn More \(p. 3266\)](#)

## Add an Aggregator

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Navigate to the **Aggregators** page and choose **Add aggregator**.
3. **Allow data replication**, gives permission to AWS Config to replicate data from the source accounts into an aggregator account.

Choose **Allow AWS Config to replicate data from source account(s) into an aggregator account**. **You must select this checkbox to continue to add an aggregator.**

4. For **Aggregator name**, type the name for your aggregator.

The aggregator name must be a unique name with a maximum of 64 alphanumeric characters. The name can contain hyphens and underscores.

5. For **Select source accounts**, either choose **Add individual account IDs** or **Add my organization** from which you want to aggregate data.

**Note**

Authorization is required when using **Add individual account IDs** to select source accounts.

- If you choose **Add individual account IDs**, you can add individual account IDs for an aggregator account.
  1. Choose **Add source accounts** to add account IDs.
  2. Choose **Add AWS account IDs** to manually add comma-separated AWS account IDs. If you want to aggregate data from the current account, type the account ID of the account.

OR

Choose **Upload a file** to upload a file (.txt or .csv) of comma-separated AWS account IDs.

3. Choose **Add source accounts** to confirm your selection.
- If you choose **Add my organization**, you can add all accounts in your organization to an aggregator account.

**Note**

Authorization is not required when using **Add my organization** to select source accounts. You must be signed in to the management account or a registered delegated administrator and all the features must be enabled in your organization. If the caller is a management account, AWS Config calls `EnableAwsServiceAccess` API to [enable integration](#) between AWS Config and AWS Organizations. If the caller is a registered delegated administrator, AWS Config calls `ListDelegatedAdministrators` API to verify whether the caller is a valid delegated administrator.

Ensure that the management account registers delegated administrator for AWS Config service principle name (config.amazonaws.com) before the delegated administrator creates an aggregator. To register a delegated administrator, see [Register a Delegated Administrator \(p. 3270\)](#).

1. Choose **Choose IAM role** to create an IAM role or choose an existing IAM role from your account.

You must assign an IAM role to allow AWS Config to call read-only APIs for your organization.

2. Choose **Create a role** and type the IAM role name to create IAM role.

OR

Choose **Choose a role from your account** to select an existing IAM role.

**Note**

In the IAM console, attach the `AWSConfigRoleForOrganizations` managed policy to your IAM role. Attaching this policy allows AWS Config to call AWS Organizations `DescribeOrganization`, `ListAWSServiceAccessForOrganization`, and `ListAccounts` APIs. By default `config.amazonaws.com` is automatically specified as a trusted entity.

3. Choose **Choose IAM role** to confirm your selection.
6. For **Regions**, choose the regions for which you want to aggregate data.
    - Select one region or multiple regions or all the AWS regions.
    - Select **Include future AWS regions** to aggregate data from all future AWS regions where multi-account multi-region data aggregation is enabled.
  7. Choose **Save**. AWS Config displays the aggregator.

## Edit an Aggregator

1. To make changes to the aggregator, choose the aggregator name.

2. Choose **Actions** and then choose **Edit**.
3. Use the sections on the **Edit aggregator** page to change the source accounts, IAM roles, or regions for the aggregator.

**Note**

You cannot change source type from individual account(s) to organization and vice versa.

4. Choose **Save**.

## Delete an Aggregator

1. To delete an aggregator, choose the aggregator name.
2. Choose **Actions** and then choose **Delete**.

A warning message is displayed. Deleting an aggregator results in the loss of all aggregated data. You cannot recover this data but data in the source account(s) is not impacted.

3. Choose **Delete** to confirm your selection.

## Learn More

# Setting Up an Aggregator Using the AWS Command Line Interface

You can create, view, update, and delete AWS Config aggregator data using the AWS Command Line Interface (AWS CLI). To use the AWS Management Console, see [Setting Up an Aggregator Using the Console \(p. 3266\)](#).

The AWS CLI is a unified tool to manage your AWS services. With just one tool to download and configure, you can control multiple AWS services from the command line and use scripts to automate them.

To install the AWS CLI on your local machine, see [Installing the AWS CLI](#) in the *AWS CLI User Guide*.

If necessary, type `aws configure` to configure the AWS CLI to use an AWS Region where AWS Config aggregators are available.

### Topics

- [Add an Aggregator Using Individual Accounts \(p. 3269\)](#)
- [Add an Aggregator Using AWS Organizations \(p. 3270\)](#)
- [Register a Delegated Administrator \(p. 3270\)](#)
- [View an Aggregator \(p. 3271\)](#)
- [Edit an Aggregator \(p. 3272\)](#)

- [Delete an Aggregator \(p. 3273\)](#)
- [Learn More \(p. 3266\)](#)

## Add an Aggregator Using Individual Accounts

1. Open a command prompt or a terminal window.
2. Type the following command to create an aggregator named **MyAggregator**.

```
aws configservice put-configuration-aggregator --configuration-aggregator-name
MyAggregator --account-aggregation-sources "[{\\"AccountIds\\": [\\"AccountID1\\",
\\"AccountID2\\",\\"AccountID3\\"],\\"AllAwsRegions\\": true}]"
```

For `account-aggregation-sources`, type one of the following.

- A comma-separated list of AWS account IDs for which you want to aggregate data. Wrap the account IDs in square brackets, and be sure to escape quotation marks (for example, `[{\\"AccountIds\\": [\\"AccountID1\\",\\"AccountID2\\",\\"AccountID3\\"],\\"AllAwsRegions\\": true}]`).
- You can also upload a JSON file of comma-separated AWS account IDs. Upload the file using the following syntax: `--account-aggregation-sources MyFilePath/MyFile.json`

The JSON file must be in the following format:

```
[
  {
    "AccountIds": [
      "AccountID1",
      "AccountID2",
      "AccountID3"
    ],
    "AllAwsRegions": true
  }
]
```

3. Press Enter to execute the command.

You should see output similar to the following:

```
{
  "ConfigurationAggregator": {
    "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-floqpus3",
    "CreationTime": 1517942461.442,
    "ConfigurationAggregatorName": "MyAggregator",
    "AccountAggregationSources": [
      {
        "AllAwsRegions": true,
        "AccountIds": [
          "AccountID1",
          "AccountID2",
          "AccountID3"
        ]
      }
    ],
    "LastUpdatedTime": 1517942461.442
  }
}
```

## Add an Aggregator Using AWS Organizations

Before you begin this procedure, you must be signed in to the management account or a registered delegated administrator and all the features must be enabled in your organization.

### Note

Ensure that the management account registers a delegated administrator for AWS Config service principle name (config.amazonaws.com) before the delegated administrator creates an aggregator. To register a delegated administrator, see [Register a Delegated Administrator \(p. 3270\)](#).

1. Open a command prompt or a terminal window.
2. Type the following command to create an aggregator named **MyAggregator**.

```
aws configservice put-configuration-aggregator --configuration-aggregator-name
MyAggregator --organization-aggregation-source "{\"RoleArn\": \"Complete-Arn\",
\"AllAwsRegions\": true}"
```

3. Press Enter to execute the command.

You should see output similar to the following:

```
{
  "ConfigurationAggregator": {
    "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-floqpus3",
    "CreationTime": 1517942461.442,
    "ConfigurationAggregatorName": "MyAggregator",
    "OrganizationAggregationSource": {
      "AllAwsRegions": true,
      "RoleArn": "arn:aws:config:Region:AccountID:config-aggregator/config-
aggregator-floqpus3"
    },
    "LastUpdatedTime": 1517942461.442
  }
}
```

## Register a Delegated Administrator

Delegated administrators are accounts within a given AWS Organization that are granted additional administrative privileges for a specified AWS service.

1. Login with management account credentials.
2. Open a command prompt or a terminal window.
3. Type the following command to enable service access:

```
aws organizations enable-aws-service-access --service-principal config.amazonaws.com
```

4. To verify if the enable service access is complete, type the following command and press Enter to execute the command.

```
aws organizations list-aws-service-access-for-organization
```

You should see output similar to the following:

```
{
```

```
"EnabledServicePrincipals": [  
  {  
    "ServicePrincipal": "config.amazonaws.com",  
    "DateEnabled": 1607020860.881  
  }  
]
```

5. Next, type the following command to register a member account as a delegated administrator for AWS Config.

```
aws organizations register-delegated-administrator --service-principal  
config.amazonaws.com --account-id MemberAccountID
```

6. To verify if the registration of delegated administrator is complete, type the following command and press Enter to execute the command.

```
aws organizations list-delegated-administrators --service-principal  
config.amazonaws.com
```

You should see output similar to the following:

```
{  
  "DelegatedAdministrators": [  
    {  
      "Id": "MemberAccountID",  
      "Arn": "arn:aws:organizations::MemeberAccountID:account/o-  
c7esubdi38/DelegatedAdministratorAccountID",  
      "Email": "name@amazon.com",  
      "Name": "name",  
      "Status": "ACTIVE",  
      "JoinedMethod": "INVITED",  
      "JoinedTimestamp": 1604867734.48,  
      "DelegationEnabledDate": 1607020986.801  
    }  
  ]  
}
```

## View an Aggregator

1. Type the following command:

```
aws configservice describe-configuration-aggregators
```

2. Depending on your source account you should see output similar to the following:

### For individuals accounts

```
{  
  "ConfigurationAggregators": [  
    {  
      "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-  
aggregator/config-aggregator-floppus3",  
      "CreationTime": 1517942461.442,  
      "ConfigurationAggregatorName": "MyAggregator",  
      "AccountAggregationSources": [  
        {  
          "AllAwsRegions": true,  

```

```
        "AccountIds": [
            "AccountID1",
            "AccountID2",
            "AccountID3"
        ]
    },
    "LastUpdatedTime": 1517942461.455
}
]
```

OR

#### For an organization

```
{
  "ConfigurationAggregator": {
    "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-floqpus3",
    "CreationTime": 1517942461.442,
    "ConfigurationAggregatorName": "MyAggregator",
    "OrganizationAggregationSource": {
      "AllAwsRegions": true,
      "RoleArn": "arn:aws:config:Region:AccountID:config-aggregator/config-
aggregator-floqpus3"
    },
    "LastUpdatedTime": 1517942461.442
  }
}
```

## Edit an Aggregator

1. You can use the `put-configuration-aggregator` command to update or edit a configuration aggregator.

Type the following command to add a new account ID to **MyAggregator**:

```
aws configservice put-configuration-aggregator --configuration-aggregator-name
MyAggregator --account-aggregation-sources "[{\"AccountIds\": [\"AccountID1\",
\"AccountID2\", \"AccountID3\"], \"AllAwsRegions\": true}]"
```

2. Depending on your source account you should see output similar to the following:

#### For individuals accounts

```
{
  "ConfigurationAggregator": {
    "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-xz2upuu6",
    "CreationTime": 1517952090.769,
    "ConfigurationAggregatorName": "MyAggregator",
    "AccountAggregationSources": [
      {
        "AllAwsRegions": true,
        "AccountIds": [
          "AccountID1",
          "AccountID2",
          "AccountID3",
          "AccountID4"
        ]
      }
    ]
  }
}
```

```
    ]
  },
  "LastUpdatedTime": 1517952566.445
}
}
```

OR

#### For an organization

```
{
  "ConfigurationAggregator": {
    "ConfigurationAggregatorArn": "arn:aws:config:Region:AccountID:config-
aggregator/config-aggregator-floppus3",
    "CreationTime": 1517942461.442,
    "ConfigurationAggregatorName": "MyAggregator",
    "OrganizationAggregationSource": {
      "AllAwsRegions": true,
      "RoleArn": "arn:aws:config:Region:AccountID:config-aggregator/config-
aggregator-floppus3"
    },
    "LastUpdatedTime": 1517942461.442
  }
}
```

## Delete an Aggregator

### To delete a configuration aggregator using the AWS CLI

- Type the following command:

```
aws configservice delete-configuration-aggregator --configuration-aggregator-name
MyAggregator
```

If successful, the command executes with no additional output.

## Learn More

- [Concepts \(p. 2\)](#)
- [Authorizing Aggregator Accounts to Collect AWS Config Configuration and Compliance Data Using the AWS Command Line Interface \(p. 3275\)](#)
- [Viewing Compliance Data in the Aggregator Dashboard \(p. 3264\)](#)
- [Troubleshooting for Multi-Account Multi-Region Data Aggregation \(p. 3277\)](#)

# Authorizing Aggregator Accounts to Collect AWS Config Configuration and Compliance Data Using the Console

AWS Config allows you to authorize aggregator accounts to collect AWS Config configuration and compliance data.

This flow is not required if you are aggregating source accounts that are part of AWS Organizations.

On the **Authorizations** page, you can do the following:

- Add Authorization to allow an aggregator account and region to collect AWS Config configuration and compliance data.
- Authorize a pending request from an aggregator account to collect AWS Config configuration and compliance data.
- Delete an authorization for an aggregator account.

## Topics

- [Add Authorization for Aggregator Accounts and Regions \(p. 3274\)](#)
- [Authorize a Pending Request for an Aggregator Account \(p. 3275\)](#)
- [Delete Authorization for an Existing Aggregator Account \(p. 3275\)](#)
- [Learn More \(p. 3266\)](#)

## Add Authorization for Aggregator Accounts and Regions

You can add authorization to grant permission to aggregator accounts and regions to collect AWS Config configuration and compliance data.

1. Sign in to the AWS Management Console and open the AWS Config console at <https://console.aws.amazon.com/config/>.
2. Navigate to the **Authorizations** page and choose **Add authorization**.
3. For **Aggregator account**, type the 12-digit account ID of an aggregator account.
4. For **Aggregator region**, choose the AWS regions where aggregator account is allowed to collect AWS Config configuration and compliance data.
5. Choose **Add authorization** to confirm your selection.

AWS Config displays an aggregator account, region, and authorization status.

### Note

You can also add authorization to aggregator accounts and regions programmatically using AWS CloudFormation sample template. For more information, see [AWS::Config::AggregationAuthorization](#) in the *AWS CloudFormation user guide*.

## Authorize a Pending Request for an Aggregator Account

If you have a pending authorization request from an existing aggregator account you will see the request status on the **Authorizations** page. You can authorize a pending request from this page.

1. For the aggregator account you want to authorize, choose **Authorize** in the Actions column.  
A confirmation message is displayed to confirm you grant permission to an aggregator account and region for collecting AWS Config data.
2. Choose **Authorize** to grant this permission for an aggregator account and region.  
The authorization status changes from **Requesting for authorization** to **Authorized**.

## Delete Authorization for an Existing Aggregator Account

1. For the aggregator account you want to delete authorization, choose **Delete** in the Actions column.  
A warning message is displayed. When you delete this authorization, AWS Config data is not shared with an aggregator account.  
**Note**  
After authorization for an aggregator is deleted the data will remain in the aggregator account for up to 24 hours before being deleted.
2. Choose **Delete** to confirm your selection.  
The aggregator account is deleted.

- [Troubleshooting for Multi-Account Multi-Region Data Aggregation \(p. 3277\)](#)

# Authorizing Aggregator Accounts to Collect AWS Config Configuration and Compliance Data Using the AWS Command Line Interface

You can authorize aggregator accounts to collect AWS Config data from source accounts and delete aggregator accounts using the AWS Command Line Interface (AWS CLI). To use the AWS Management Console, see [Authorizing Aggregator Accounts to Collect AWS Config Configuration and Compliance Data Using the Console \(p. 3274\)](#).

The AWS CLI is a unified tool to manage your AWS services. With just one tool to download and configure, you can control multiple AWS services from the command line and use scripts to automate them.

To install the AWS CLI on your local machine, see [Installing the AWS CLI](#) in the *AWS CLI User Guide*.

If necessary, type `aws configure` to configure the AWS CLI to use an AWS Region where AWS Config aggregators are available.

### Topics

- [Add Authorization for Aggregator Accounts and Regions \(p. 3276\)](#)
- [Delete an Authorization Account \(p. 3276\)](#)
- [Learn More \(p. 3266\)](#)

## Add Authorization for Aggregator Accounts and Regions

1. Open a command prompt or a terminal window.
2. Type the following command:

```
aws configservice put-aggregation-authorization --authorized-account-id AccountID --  
authorized-aws-region Region
```

3. Press Enter.

You should see output similar to the following:

```
{  
  "AggregationAuthorization": {  
    "AuthorizedAccountId": "AccountID",  
    "AggregationAuthorizationArn": "arn:aws:config:Region:AccountID:aggregation-  
authorization/AccountID/Region",  
    "CreationTime": 1518116709.993,  
    "AuthorizedAwsRegion": "Region"  
  }  
}
```

## Delete an Authorization Account

### To delete an authorized account using the AWS CLI

- Type the following command:

```
aws configservice delete-aggregation-authorization --authorized-account-id AccountID  
--authorized-aws-region Region
```

If successful, the command executes with no additional output.

## Learn More

- [Concepts \(p. 2\)](#)

- [Troubleshooting for Multi-Account Multi-Region Data Aggregation \(p. 3277\)](#)

# Troubleshooting for Multi-Account Multi-Region Data Aggregation

AWS Config might not aggregate data from source accounts for one of the following reasons:

If this happens	Do this
AWS Config is not enabled in the source account for accounts within an Organization.	Enable AWS Config in the source account and authorize the aggregator account to collect data.
Authorization is not granted to an aggregator account.	Sign in to the source account and grant authorization to the aggregator account to collect AWS Config data.
There might be a temporary issue that is preventing data aggregation.	Data aggregation is subject to delays. Wait for a few minutes.

AWS Config might not aggregate data from an organization for one of the following reasons:

If this happens	Do this
AWS Config is unable to access your organization details due to invalid IAM role.	Create an IAM role or select a valid IAM role from the IAM role list.  <b>Note</b> If the IAM role is invalid for more than 24 hours, AWS Config deletes data for entire organization.
AWS Config service access is disabled in your organization.	You can enable integration between AWS Config and AWS Organizations through the <code>EnableAWSServiceAccess</code> API. If you choose <b>Add my organization</b> in console, AWS Config automatically enables the integration between AWS Config and AWS Organizations.
AWS Config is unable to access your organization details because all features is not enabled in your organization.	<a href="#">Enable all features</a> in AWS Organizations console.
Organizational changes such as adding an account, removing an account, enabling service access, and disabling service access are not updated in Middle East (Bahrain) and Asia Pacific (Hong Kong) regions immediately.	Organizational changes are subject to 2 hour delay. Wait for 2 hours to see all organization changes.

# Security in AWS Config

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from data centers and network architectures that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The [shared responsibility model](#) describes this as security *of* the cloud and security *in* the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [AWS Compliance Programs](#). To learn about the compliance programs that apply to AWS Config, see [AWS Services in Scope by Compliance Program](#).
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company's requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using AWS Config. The following topics show you how to configure AWS Config to meet your security and compliance objectives.

## Topics

- [Data Protection in AWS Config \(p. 3278\)](#)
- [AWS Identity and Access Management \(p. 3279\)](#)
- [AWS managed policies for AWS Config \(p. 3299\)](#)
- [Logging and Monitoring in AWS Config \(p. 3307\)](#)
- [Using AWS Config with Interface Amazon VPC Endpoints \(p. 3318\)](#)
- [Incident Response in AWS Config \(p. 3319\)](#)
- [Compliance Validation for AWS Config \(p. 3319\)](#)

- [Infrastructure Security in AWS Config \(p. 3320\)](#)
- [Security Best Practices for AWS Config \(p. 3320\)](#)

## Data Protection in AWS Config

The AWS [shared responsibility model](#) applies to data protection in AWS Config. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the [Data Privacy FAQ](#). For information about data protection in Europe, see the [AWS Shared Responsibility Model and GDPR](#) blog post on the [AWS Security Blog](#).

For data protection purposes, we recommend that you protect AWS account credentials and set up individual user accounts with AWS Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We recommend TLS 1.2 or later.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see [Federal Information Processing Standard \(FIPS\) 140-2](#).

We strongly recommend that you never put sensitive identifying information, such as your customers' account numbers, into free-form fields such as a **Name** field. This includes when you work with AWS Config or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into AWS Config or other services might get picked up for inclusion in diagnostic logs. When you provide a URL to an external server, don't include credentials information in the URL to validate your request to that server.

## Encryption of Data at Rest

Data is encrypted at rest using transparent server-side encryption. This helps reduce the operational burden and complexity involved in protecting sensitive data. With encryption at rest, you can build security-sensitive applications that meet encryption compliance and regulatory requirements.

## Encryption of Data in Transit

Data gathered and accessed by AWS Config is exclusively over a Transport Layer Security (TLS) protected channel.

# AWS Identity and Access Management

AWS Config integrates with AWS Identity and Access Management (IAM), which allows you to create permission policies to attach to your IAM role, Amazon S3 buckets and Amazon Simple Notification Service (Amazon SNS) topics. You can use AWS Identity and Access Management to create AWS Config permission policies to attach to the IAM roles. A policy is a set of statements that grants AWS Config permissions.

### Important

We consider it a best practice not to use root account credentials to perform everyday work in AWS. Instead, we recommend that you create an IAM administrators group with appropriate permissions, create IAM users for the people in your organization who need to perform administrative tasks (including for yourself), and add those users to the administrative group. For more information, see [IAM Best Practices](#) in the *IAM User Guide* guide.

The first two topics control user permissions for AWS Config followed by topics that provide accurate configuration information about permissions needed for AWS Config. The topics provide examples of recommended IAM policies to use with the AWS Config console and the AWS Command Line Interface.

### Topics

- [Granting Permissions for AWS Config Administration \(p. 3280\)](#)
- [Granting Custom Permissions for AWS Config Users \(p. 3281\)](#)
- [Supported Resource-Level Permissions for AWS Config Rules APIs Actions \(p. 3287\)](#)
- [Permissions for the IAM Role Assigned to AWS Config \(p. 3289\)](#)

- [Permissions for the Amazon S3 Bucket \(p. 3292\)](#)
- [Permissions for the KMS Key \(p. 3294\)](#)
- [Permissions for the Amazon SNS Topic \(p. 3295\)](#)
- [Service-Linked AWS Config Rules \(p. 3297\)](#)

## Granting Permissions for AWS Config Administration

To allow users to administer AWS Config, you must grant explicit permissions to IAM users to perform the actions associated with AWS Config tasks. For most scenarios, you can do this using an AWS managed policy that contains predefined permissions.

### Note

The permissions you grant to users to perform AWS Config administration tasks are not the same as the permissions that AWS Config itself requires in order to deliver log files to Amazon S3 buckets or send notifications to Amazon SNS topics.

Users who set up and manage AWS Config must have full-access permissions. With full-access permissions, users can provide Amazon S3 and Amazon SNS endpoints that AWS Config delivers data to, create a role for AWS Config, and turn on and turn off recording.

Users who use AWS Config but don't need to set up AWS Config should have read-only permissions. With read-only permissions, users can look up the configurations of resources or search for resources by tags.

A typical approach is to create an IAM group that has the appropriate permissions and then add individual IAM users to that group. For example, you might create an IAM group for users who should have full access to AWS Config actions, and a separate group for users who should be able to view the configurations but not create or change a role.

### Contents

- [Creating an IAM Group and Users for AWS Config Access \(p. 3280\)](#)
- [Granting Full-Access Permission for AWS Config Access \(p. 3281\)](#)
- [Additional Resources \(p. 3281\)](#)

## Creating an IAM Group and Users for AWS Config Access

1. Open the IAM console at <https://console.aws.amazon.com/iam>.
2. From the dashboard, choose **Groups** in the navigation pane, and then choose **Create New Group**.
3. Type a name, and then choose **Next Step**.
4. On the **Attach Policy** page, find and choose **AWSConfigUserAccess**. This policy provides user access to use AWS Config, including searching by tags on resources, and reading all tags. This does not provide permission to configure AWS Config which requires administrative privileges.

### Note

You can also create a custom policy that grants permissions to individual actions. For more information, see [Granting Custom Permissions for AWS Config Users \(p. 3281\)](#).

5. Choose **Next Step**.
6. Review the information for the group you are about to create.

### Note

You can edit the group name, but you will need to choose the policy again.

7. Choose **Create Group**. The group that you created appears in the list of groups.
8. Choose the group name that you created, choose **Group Actions**, and then choose **Add Users to Group**.

9. On the **Add Users to Group** page, choose the existing IAM users, and then choose **Add Users**. If you don't already have IAM users, choose **Create New Users**, enter user names, and then choose **Create**.
10. If you created new users, choose **Users** in the navigation pane and complete the following for each user:
  - a. Choose the user.
  - b. If the user will use the console to manage AWS Config, in the **Security Credentials** tab, choose **Manage Password**, and then create a password for the user.
  - c. If the user will use the AWS CLI or API to manage AWS Config, and if you didn't already create access keys, in the **Security Credentials** tab, choose **Manage Access Keys** and then create access keys. Store the keys in a secure location.
  - d. Give each user his or her credentials (access keys or password).

## Granting Full-Access Permission for AWS Config Access

1. Sign in to the AWS Identity and Access Management (IAM) console at <https://console.aws.amazon.com/iam>.
2. In the navigation pane, choose **Policies**, and then choose **Create Policy**.
3. For **Create Your Own Policy**, choose **Select**.
4. Type a policy name and description. For example: `AWSConfigFullAccess`.
5. For **Policy Document**, type or paste the full-access policy into the editor. You can use the [Full access \(p. 3283\)](#).
6. Choose **Validate Policy** and ensure that no errors display in a red box at the top of the screen. Correct any errors that are reported.
7. Choose **Create Policy** to save your new policy.
8. In the list of policies, select the policy that you created. You can use the **Filter** menu and the **Search** box to find the policy.
9. Choose **Policy Actions**, and then choose **Attach**.
10. Select the users, groups, or roles, and then choose **Attach Policy**. You can use the **Filter** menu and the **Search** box to filter the list.
11. Choose **Apply Policy**.

### Note

Instead of creating a managed policy, you can also create an inline policy from the IAM console and attach it to an IAM user, group, or role. For more information, see [Working with Inline Policies](#) in the *IAM User Guide*.

## Additional Resources

To learn more about creating IAM users, groups, policies, and permissions, see [Creating an Admins Group Using the Console](#) and [Permissions and Policies](#) in the *IAM User Guide*.

## Granting Custom Permissions for AWS Config Users

AWS Config policies grant permissions to users who work with AWS Config. If you need to grant different permissions to users, you can attach a AWS Config policy to an IAM group or to a user. You can edit the policy to include or exclude specific permissions. You can also create your own custom policy. Policies are JSON documents that define the actions a user is allowed to perform and the resources that the user is allowed to perform those actions on.

### Contents

- [Read-only access \(p. 3282\)](#)
- [Full access \(p. 3283\)](#)
- [Controlling User Permissions for Actions on Multi-Account Multi-Region Data Aggregation \(p. 3284\)](#)
- [Additional Information \(p. 3281\)](#)

## Read-only access

The following example shows a AWS managed policy, `AWSConfigUserAccess` that grants read-only access to AWS Config.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "config:Get*",
        "config:Describe*",
        "config:Deliver*",
        "config:List*",
        "tag:GetResources",
        "tag:GetTagKeys",
        "cloudtrail:DescribeTrails",
        "cloudtrail:GetTrailStatus",
        "cloudtrail:LookupEvents"
      ],
      "Resource": "*"
    }
  ]
}
```

In the policy statements, the `Effect` element specifies whether the actions are allowed or denied. The `Action` element lists the specific actions that the user is allowed to perform. The `Resource` element lists the AWS resources the user is allowed to perform those actions on. For policies that control access to AWS Config actions, the `Resource` element is always set to `*`, a wildcard that means "all resources."

The values in the `Action` element correspond to the APIs that the services support. The actions are preceded by `config:` to indicate that they refer to AWS Config actions. You can use the `*` wildcard character in the `Action` element, such as in the following examples:

- `"Action": ["config:*ConfigurationRecorder"]`

This allows all AWS Config actions that end with `ConfigurationRecorder` (`StartConfigurationRecorder`, `StopConfigurationRecorder`).

- `"Action": ["config:*"]`

This allows all AWS Config actions, but not actions for other AWS services.

- `"Action": ["*"]`

This allows all AWS actions. This permission is suitable for a user who acts as an AWS administrator for your account.

The read-only policy doesn't grant user permission for the actions such as `StartConfigurationRecorder`, `StopConfigurationRecorder`, and `DeleteConfigurationRecorder`. Users with this policy are not allowed to start configuration recorder, stop configuration recorder, or delete configuration recorder. For the list of AWS Config actions, see the [AWS Config API Reference](#).

## Full access

The following example shows a policy that grants full access to AWS Config. It grants users the permission to perform all AWS Config actions. It also lets users manage files in Amazon S3 buckets and manage Amazon SNS topics in the account that the user is associated with.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "sns:AddPermission",
        "sns:CreateTopic",
        "sns>DeleteTopic",
        "sns:GetTopicAttributes",
        "sns:ListPlatformApplications",
        "sns:ListTopics",
        "sns:SetTopicAttributes"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "s3:CreateBucket",
        "s3:GetBucketAcl",
        "s3:GetBucketLocation",
        "s3:GetBucketNotification",
        "s3:GetBucketPolicy",
        "s3:GetBucketRequestPayment",
        "s3:GetBucketVersioning",
        "s3:ListAllMyBuckets",
        "s3:ListBucket",
        "s3:ListBucketMultipartUploads",
        "s3:ListBucketVersions",
        "s3:PutBucketPolicy"
      ],
      "Resource": "arn:aws:s3:::*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "iam:CreateRole",
        "iam:GetRole",
        "iam:GetRolePolicy",
        "iam:ListRolePolicies",
        "iam:ListRoles",
        "iam:PassRole",
        "iam:PutRolePolicy",
        "iam:AttachRolePolicy",
        "iam:CreatePolicy",
        "iam:CreatePolicyVersion",
        "iam>DeletePolicyVersion",
        "iam:CreateServiceLinkedRole"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "cloudtrail:DescribeTrails",
        "cloudtrail:GetTrailStatus",
        "cloudtrail:LookupEvents"
      ]
    }
  ]
}
```

```
    ],
    "Resource": "*"
  },
  {
    "Effect": "Allow",
    "Action": [
      "config:*",
      "tag:Get*"
    ],
    "Resource": "*"
  },
  {
    "Effect": "Allow",
    "Action": [
      "ssm:DescribeDocument",
      "ssm:GetDocument",
      "ssm:DescribeAutomationExecutions",
      "ssm:GetAutomationExecution",
      "ssm:ListDocuments",
      "ssm:StartAutomationExecution"
    ],
    "Resource": "*"
  }
]
}
```

**Note**

This policy grants broad permissions. Before granting full access, consider starting with a minimum set of permissions and granting additional permissions as necessary. Doing so is better practice than starting with permissions that are too lenient and then trying to tighten them later.

## Controlling User Permissions for Actions on Multi-Account Multi-Region Data Aggregation

You can use resource-level permissions to control a user's ability to perform specific actions on multi-account multi-region data aggregation. AWS Config multi-account multi-region data aggregation APIs support resource level permissions. With resource level permission can restrict to access/modify the resource data to specific users.

For example, you want to restrict access to resource data to specific users. You can create two aggregators `AccessibleAggregator` and `InAccessibleAggregator`. Then attach an IAM policy that allows access to the `AccessibleAggregator`.

In the first policy, you allow the aggregator actions such as `DescribeConfigurationAggregators` and `DeleteConfigurationAggregator` actions for the config ARN that you specify. In the following example, the config ARN is `arn:aws:config:ap-northeast-1:AccountID:config-aggregator/config-aggregator-mocpsqhs`.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "ConfigReadOnly",
      "Effect": "Allow",
      "Action": [
        "config:PutConfigurationAggregator",
        "config:DescribePendingAggregationRequests",
        "config>DeletePendingAggregationRequest",
```

```
        "config:GetAggregateConfigRuleComplianceSummary",
        "config:DescribeAggregateComplianceByConfigRules",
        "config:GetAggregateComplianceDetailsByConfigRule",
        "config:DescribeConfigurationAggregators",
        "config:DescribeConfigurationAggregatorSourcesStatus",
        "config>DeleteConfigurationAggregator"
    ],
    "Resource": "arn:aws:config:ap-northeast-1:AccountID:config-aggregator/config-
aggregator-mocpsqhs"
}
]
}
```

In the second policy, you deny the aggregator actions for the config ARN that you specify. In the following example, the config ARN is `arn:aws:config:ap-northeast-1:AccountID:config-aggregator/config-aggregator-pokxzldx`.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "ConfigReadOnly",
      "Effect": "Deny",
      "Action": [
        "config:PutConfigurationAggregator",
        "config:DescribePendingAggregationRequests",
        "config>DeletePendingAggregationRequest",
        "config:GetAggregateConfigRuleComplianceSummary",
        "config:DescribeAggregateComplianceByConfigRules",
        "config:GetAggregateComplianceDetailsByConfigRule",
        "config:DescribeConfigurationAggregators",
        "config:DescribeConfigurationAggregatorSourcesStatus",
        "config>DeleteConfigurationAggregator"
      ],
      "Resource": "arn:aws:config:ap-northeast-1:AccountID:config-aggregator/config-
aggregator-pokxzldx"
    }
  ]
}
```

If a user of the developer group tries to describe or delete configuration aggregators on the config that you specified in the second policy, that user gets an access denied exception.

The following AWS CLI examples show that the user creates two aggregators, `AccessibleAggregator` and `InAccessibleAggregator`.

```
aws configservice describe-configuration-aggregators
```

The command complete successfully:

```
{
  "ConfigurationAggregators": [
    {
      "ConfigurationAggregatorArn": "arn:aws:config:ap-northeast-1:AccountID:config-
aggregator/config-aggregator-mocpsqhs",
      "CreationTime": 1517942461.442,
      "ConfigurationAggregatorName": "AccessibleAggregator",
      "AccountAggregationSources": [
        {
          "AllAwsRegions": true,
```

```
        "AccountIDs": [
            "AccountID1",
            "AccountID2",
            "AccountID3"
        ]
    },
    ],
    "LastUpdatedTime": 1517942461.455
}
]
```

```
{
  "ConfigurationAggregators": [
    {
      "ConfigurationAggregatorArn": "arn:aws:config:ap-northeast-1:AccountID:config-
aggregator/config-aggregator-pokxzldx",
      "CreationTime": 1517942461.442,
      "ConfigurationAggregatorName": "InAccessibleAggregator",
      "AccountAggregationSources": [
        {
          "AllAwsRegions": true,
          "AccountIDs": [
            "AccountID1",
            "AccountID2",
            "AccountID3"
          ]
        }
      ],
      "LastUpdatedTime": 1517942461.455
    }
  ]
}
```

**Note**

For `account-aggregation-sources` enter a comma-separated list of AWS account IDs for which you want to aggregate data. Wrap the account IDs in square brackets, and be sure to escape quotation marks (for example, "[{\\"AccountIDs\\": [\\"AccountID1\\", \\"AccountID2\\", \\"AccountID3\\"], \\"AllAwsRegions\\": true}]").

The user then creates an IAM policy that denies access to `InAccessibleAggregator`.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "ConfigReadOnly",
      "Effect": "Deny",
      "Action": [
        "config:PutConfigurationAggregator",
        "config:DescribePendingAggregationRequests",
        "config>DeletePendingAggregationRequest",
        "config:GetAggregateConfigRuleComplianceSummary",
        "config:DescribeAggregateComplianceByConfigRules",
        "config:GetAggregateComplianceDetailsByConfigRule",
        "config:DescribeConfigurationAggregators",
        "config:DescribeConfigurationAggregatorSourcesStatus",
        "config>DeleteConfigurationAggregator"
      ],
      "Resource": "arn:aws:config:ap-northeast-1:AccountID:config-aggregator/config-
aggregator-pokxzldx"
    }
  ]
}
```

```
]
}
```

Next, the user confirms that IAM policy works for restricting access to specific aggregator and rules.

```
aws configservice get-aggregate-compliance-details-by-config-rule --configuration-
aggregator-name InAccessibleAggregator --config-rule-name rule name --account-id AccountID
--aws-region AwsRegion
```

The command returns an access denied exception:

```
An error occurred (AccessDeniedException) when calling the
GetAggregateComplianceDetailsByConfigRule operation: User: arn:aws:iam::AccountID:user/ is
not
authorized to perform: config:GetAggregateComplianceDetailsByConfigRule on resource:
arn:aws:config:AwsRegion-1:AccountID:config-aggregator/config-aggregator-pokxzldx
```

With resource-level permissions, you can grant or deny access to perform specific actions on multi-account multi-region data aggregation.

## Additional Information

To learn more about creating IAM users, groups, policies, and permissions, see [Creating Your First IAM User and Administrators Group](#) and [Access Management](#) in the *IAM User Guide*.

# Supported Resource-Level Permissions for AWS Config Rules APIs Actions

Resource-level permissions refers to the ability to specify which resources users are allowed to perform actions on. AWS Config supports resource-level permissions for certain AWS Config Rules API actions. This means that for certain AWS Config Rules actions, you can control when users are allowed to use those actions based on conditions that have to be fulfilled, or specific resources that users are allowed to use.

The following table describes the AWS Config Rules API actions that currently support resource-level permissions, as well as the supported resources (and their ARNs) for each action. When specifying an ARN, you can use the \* wildcard in your paths; for example, when you cannot or do not want to specify exact resource IDs.

### Important

If an AWS Config Rules API action is not listed in this table, then it does not support resource-level permissions. If an AWS Config Rules action does not support resource-level permissions, you can grant users permissions to use the action, but you have to specify a \* for the resource element of your policy statement.

API Action	Resources
DeleteConfigRule	Config Rule arn:aws:config: <i>region</i> : <i>accountID</i> :config-rule/config-rule- <i>ID</i>
DeleteEvaluationResults	Config Rule arn:aws:config: <i>region</i> : <i>accountID</i> :config-rule/config-rule- <i>ID</i>
DescribeComplianceByConfigRule	Config Rule

AWS Config Developer Guide  
Supported Resource-Level Permissions  
for AWS Config Rules APIs Actions

API Action	Resources
	arn:aws:config: <i>region</i> : <i>accountID</i> :config-rule/config-rule- <i>ID</i>
DescribeConfigRuleEvaluationStatus	Config Rule arn:aws:config: <i>region</i> : <i>accountID</i> :config-rule/config-rule- <i>ID</i>
DescribeConfigRules	Config Rule arn:aws:config: <i>region</i> : <i>accountID</i> :config-rule/config-rule- <i>ID</i>
GetComplianceDetailsByConfigRule	Config Rule arn:aws:config: <i>region</i> : <i>accountID</i> :config-rule/config-rule- <i>ID</i>
PutConfigRule	Config Rule arn:aws:config: <i>region</i> : <i>accountID</i> :config-rule/config-rule- <i>ID</i>
StartConfigRulesEvaluation	Config Rule arn:aws:config: <i>region</i> : <i>accountID</i> :config-rule/config-rule- <i>ID</i>
PutRemediationConfigurations	Remediation Configuration arn:aws:config: <i>region</i> : <i>accountID</i> :remediation-configuration/ <i>config rule name/remediation configuration id</i>
DescribeRemediationConfigurations	Remediation Configuration arn:aws:config: <i>region</i> : <i>accountID</i> :remediation-configuration/ <i>config rule name/remediation configuration id</i>
DeleteRemediationConfiguration	Remediation Configuration arn:aws:config: <i>region</i> : <i>accountID</i> :remediation-configuration/ <i>config rule name/remediation configuration id</i>
PutRemediationExceptions	Remediation Configuration arn:aws:config: <i>region</i> : <i>accountID</i> :remediation-configuration/ <i>config rule name/remediation configuration id</i>
DescribeRemediationExceptions	Remediation Configuration arn:aws:config: <i>region</i> : <i>accountID</i> :remediation-configuration/ <i>config rule name/remediation configuration id</i>
DeleteRemediationExceptions	Remediation Configuration arn:aws:config: <i>region</i> : <i>accountID</i> :remediation-configuration/ <i>config rule name/remediation configuration id</i>

For example, you want to allow read access and deny write access to specific rules to specific users.

In the first policy, you allow the AWS Config Rules read actions such as `DescribeConfigRules` and `DescribeConfigRuleEvaluationStatus` on the specified rules.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Allow",
      "Action": [
        "config:DescribeConfigRules",
        "config:StartConfigRulesEvaluation",
        "config:DescribeComplianceByConfigRule",
        "config:DescribeConfigRuleEvaluationStatus",
        "config:GetComplianceDetailsByConfigRule"
      ],
      "Resource": [
        "arn:aws:config:region:accountID:config-rule/config-rule-ID",
        "arn:aws:config:region:accountID:config-rule/config-rule-ID"
      ]
    }
  ]
}
```

In the second policy, you deny the AWS Config Rules write actions on the specific rule.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "VisualEditor0",
      "Effect": "Deny",
      "Action": [
        "config:PutConfigRule",
        "config>DeleteConfigRule",
        "config>DeleteEvaluationResults"
      ],
      "Resource": "arn:aws:config:region:accountID:config-rule/config-rule-ID"
    }
  ]
}
```

With resource-level permissions, you can allow read access and deny write access to perform specific actions on AWS Config Rules API actions.

## Permissions for the IAM Role Assigned to AWS Config

An AWS Identity and Access Management (IAM) role lets you define a set of permissions. AWS Config assumes the role that you assign to it to write to your S3 bucket, publish to your SNS topic, and to make `Describe` or `List` API requests to get configuration details for your AWS resources. For more information on IAM roles, see [IAM Roles](#) in the *IAM User Guide*.

When you use the AWS Config console to create or update an IAM role, AWS Config automatically attaches the required permissions for you. For more information, see [Setting Up AWS Config with the Console \(p. 25\)](#).

### Contents

- [Creating IAM Role Policies \(p. 3290\)](#)

- [Adding an IAM Trust Policy to your Role \(p. 3290\)](#)
- [IAM Role Policy for Amazon S3 Bucket \(p. 3290\)](#)
- [IAM Role Policy for KMS Key \(p. 3291\)](#)
- [IAM Role Policy for Amazon SNS Topic \(p. 3291\)](#)
- [IAM Role Policy for Getting Configuration Details \(p. 3291\)](#)
- [Managing Permissions for S3 Bucket Recording \(p. 3292\)](#)

## Creating IAM Role Policies

When you use the AWS Config console to create an IAM role, AWS Config automatically attaches the required permissions to the role for you.

If you are using the AWS CLI to set up AWS Config or you are updating an existing IAM role, you must manually update the policy to allow AWS Config to access your S3 bucket, publish to your SNS topic, and get configuration details about your resources.

### Adding an IAM Trust Policy to your Role

You can create an IAM trust policy that enables AWS Config to assume a role and use it to track your resources. For more information about trust policies, see [Assuming a Role](#) in the *IAM User Guide*.

The following is an example trust policy for AWS Config roles:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "",
      "Effect": "Allow",
      "Principal": {
        "Service": "config.amazonaws.com"
      },
      "Action": "sts:AssumeRole"
    }
  ]
}
```

### IAM Role Policy for Amazon S3 Bucket

The following example policy grants AWS Config permissions to access your Amazon S3 bucket:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "s3:PutObject",
        "s3:PutObjectAcl"
      ],
      "Resource": [
        "arn:aws:s3:::myBucketName/prefix/AWSLogs/myAccountID/*"
      ],
      "Condition": {
        "StringLike": {
          "s3:x-amz-acl": "bucket-owner-full-control"
        }
      }
    }
  ]
}
```

```
    }
  },
  {
    "Effect": "Allow",
    "Action": [
      "s3:GetBucketAcl"
    ],
    "Resource": "arn:aws:s3:::myBucketName"
  }
]
```

## IAM Role Policy for KMS Key

The following example policy grants AWS Config permissions to use KMS-based encryption on new objects for S3 bucket delivery:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "kms:Decrypt",
        "kms:GenerateDataKey"
      ],
      "Resource": "myKMSKeyARN"
    }
  ]
}
```

## IAM Role Policy for Amazon SNS Topic

The following example policy grants AWS Config permissions to access your SNS topic:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "sns:Publish",
      "Resource": "mySNSTopicARN"
    }
  ]
}
```

If your SNS topic is encrypted for additional setup instructions, see [Configuring AWS KMS Permissions](#) in the *Amazon Simple Notification Service Developer Guide*.

## IAM Role Policy for Getting Configuration Details

To record your AWS resource configurations, AWS Config requires IAM permissions to get the configuration details about your resources.

Use the AWS managed policy **AWS\_ConfigRole** and attach it to the IAM role that you assign to AWS Config. AWS updates this policy each time AWS Config adds support for an AWS resource type, which means AWS Config will continue to have the required permissions to get configuration details as long as the role has this managed policy attached.

If you create or update a role with the console, AWS Config attaches the **AWS\_ConfigRole** for you.

If you use the AWS CLI, use the `attach-role-policy` command and specify the Amazon Resource Name (ARN) for **AWS\_ConfigRole**:

```
$ aws iam attach-role-policy --role-name myConfigRole --policy-arn arn:aws:iam::aws:policy/service-role/AWS_ConfigRole
```

## Managing Permissions for S3 Bucket Recording

AWS Config records and delivers notifications when an S3 bucket is created, updated, or deleted.

It's recommended that you use either the `AWSServiceRoleForConfig` (see [Using Service-Linked Roles for AWS Config](#)) or a custom IAM role utilizing the `AWS_ConfigRole` managed policy. For more information on best practices for configuration recording, see [AWS Config Best Practices](#).

If you need to manage object-level permissions for your bucket recording, make sure in the S3 bucket policy to provide `config.amazonaws.com` (the AWS Config service principal name) access to all S3 related permissions from the `AWS_ConfigRole` managed policy. For more information, see [Permissions for the Amazon S3 Bucket](#).

## Permissions for the Amazon S3 Bucket

By default, all Amazon S3 buckets and objects are private. Only the resource owner which is the AWS account that created the bucket can access that bucket. The resource owner can, however, choose to grant access permissions to other resources and users. One way to do this is to write an access policy.

If AWS Config creates an Amazon S3 bucket for you automatically (for example, if you use AWS Config console to set up your delivery channel), these permissions are automatically added to Amazon S3 bucket. However, if you specify an existing Amazon S3 bucket, you must ensure that the S3 bucket has the correct permissions.

### Note

An object does not inherit the permissions from its bucket. For example, if you create a bucket and grant write access to a user, you can't access that user's objects unless the user explicitly grants you access.

### Contents

- [Required Permissions for the Amazon S3 Bucket When Using IAM Roles \(p. 3292\)](#)
- [Required Permissions for the Amazon S3 Bucket When Using Service-Linked Roles \(p. 3293\)](#)
- [Granting AWS Config access to the Amazon S3 Bucket \(p. 3293\)](#)

## Required Permissions for the Amazon S3 Bucket When Using IAM Roles

When AWS Config sends configuration information (history files and snapshots) to Amazon S3 bucket in your account, it assumes the IAM role that you assigned when you set up AWS Config. When AWS Config sends configuration information to an Amazon S3 bucket in another account, it first attempts to use the IAM role, but this attempt fails if the access policy for the bucket does not grant `WRITE` access to the IAM role. In this event, AWS Config sends the information again, this time as the AWS Config service principal. Before the delivery can succeed, the access policy must grant `WRITE` access to the `config.amazonaws.com` principal name. AWS Config is then the owner of the objects it delivers to the S3 bucket. You must attach an access policy, mentioned in step 6 below to the Amazon S3 bucket in another account to grant AWS Config access to the Amazon S3 bucket.

Before AWS Config can deliver logs to your Amazon S3 bucket AWS Config checks whether the bucket exists and in which AWS region the bucket is located. AWS Config attempts to call Amazon S3 [HeadBucket](#) API to check whether the bucket exists and to get the bucket region. If permissions are not provided to locate the bucket when the location check is performed, you see `AccessDenied` error in AWS CloudTrail logs. However, the log delivery to your Amazon S3 bucket succeeds if you do not provide bucket location permissions.

## Required Permissions for the Amazon S3 Bucket When Using Service-Linked Roles

If you set up AWS Config using a service-linked role, you need to attach an access policy, mentioned in step 6 below to the Amazon S3 bucket in your own account or another account to grant AWS Config access to the Amazon S3 bucket.

### Granting AWS Config access to the Amazon S3 Bucket

Follow these steps to add an access policy to the Amazon S3 bucket in your own account or another account. The access policy allows AWS Config to send configuration information to the Amazon S3 bucket.

1. Sign in to the AWS Management Console using the account that has the S3 bucket.
2. Open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.
3. Select the bucket that you want AWS Config to use to deliver configuration items, and then choose **Properties**.
4. Choose **Permissions**.
5. Choose **Edit Bucket Policy**.
6. Copy the following policy into the **Bucket Policy Editor** window:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AWSConfigBucketPermissionsCheck",
      "Effect": "Allow",
      "Principal": {
        "Service": [
          "config.amazonaws.com"
        ]
      },
      "Action": "s3:GetBucketAcl",
      "Resource": "arn:aws:s3:::targetBucketName"
    },
    {
      "Sid": "AWSConfigBucketExistenceCheck",
      "Effect": "Allow",
      "Principal": {
        "Service": [
          "config.amazonaws.com"
        ]
      },
      "Action": "s3:ListBucket",
      "Resource": "arn:aws:s3:::targetBucketName"
    },
    {
      "Sid": "AWSConfigBucketDelivery",
      "Effect": "Allow",
      "Principal": {
        "Service": [
```

```
        "config.amazonaws.com"
      ]
    },
    "Action": "s3:PutObject",
    "Resource": "arn:aws:s3:::targetBucketName/[optional] prefix/
AWSLogs/sourceAccountID-WithoutHyphens/Config/*",
    "Condition": {
      "StringEquals": {
        "s3:x-amz-acl": "bucket-owner-full-control"
      }
    }
  }
}
]
```

#### Note

AWS Config is owned by AWS and does not belong specifically to one of your AWS accounts or linked accounts within your AWS Organization. This means that the service won't work with organization ID or organization units based conditions.

#### Note

When granting permissions to your IAM role instead of AWS Config service principal name (SPN), ensure that your IAM role has `PutObjectACL` permission on cross-account bucket to avoid insufficient permission error. See sample IAM role policy at [IAM Role Policy for Amazon S3 Bucket](#) (p. 3290).

7. Substitute the following values in the bucket policy:
  - `targetBucketName` – The name of the Amazon S3 bucket to which AWS Config will deliver configuration items.
  - `[optional] prefix` – An optional addition to the Amazon S3 object key that helps create a folder-like organization in the bucket.
  - `sourceAccountID-WithoutHyphens` – The ID of the account for which AWS Config will deliver configuration items to the target bucket.
8. Choose **Save** and then **Close**.

## Permissions for the KMS Key

Create a policy for an Amazon S3 KMS Key that allows you to use KMS-based encryption on objects delivered by AWS Config for S3 bucket delivery.

#### Contents

- [Required Permissions for the KMS Key When Using IAM Roles \(S3 Bucket Delivery\)](#) (p. 3294)
- [Required Permissions for the KMS Key When Using Service-Linked Roles \(S3 Bucket Delivery\)](#) (p. 3295)

## Required Permissions for the KMS Key When Using IAM Roles (S3 Bucket Delivery)

If you set up AWS Config using an IAM role, you can attach the follow permission policy to the KMS Key:

```
{
  "Id": "Policy_ID",
  "Statement": [
```

```
{
  "Sid": "AWSConfigKMSPolicy",
  "Action": [
    "kms:Decrypt",
    "kms:GenerateDataKey"
  ],
  "Effect": "Allow",
  "Resource": "*myKMSKeyARN*",
  "Principal": {
    "AWS": [
      "account-id1",
      "account-id2",
      "account-id3"
    ]
  }
}
```

## Required Permissions for the KMS Key When Using Service-Linked Roles (S3 Bucket Delivery)

If you set up AWS Config using a service-linked role, you need to attach the following permission policy to the KMS Key.

```
{
  "Id": "Policy_ID",
  "Statement": [
    {
      "Sid": "AWSConfigKMSPolicy",
      "Effect": "Allow",
      "Principal": {
        "Service": "config.amazonaws.com"
      },
      "Action": [
        "kms:Decrypt",
        "kms:GenerateDataKey"
      ],
      "Resource": "myKMSKeyARN"
    }
  ]
}
```

## Permissions for the Amazon SNS Topic

Use the information in this topic only if you want to configure AWS Config to deliver Amazon SNS topics owned by your account or by a different account. AWS Config must have permissions to send notifications to an Amazon SNS topic.

### Note

AWS Config currently only supports same region and cross account access. SNS topics used for remediation AWS Systems Manager documents (SSM documents) or for the recorder delivery channel cannot be cross-region.

### Contents

- [Required Permissions for the Amazon SNS Topic When Using IAM Roles \(p. 3296\)](#)
- [Required Permissions for the Amazon SNS Topic When Using Service-Linked Roles \(p. 3296\)](#)

- [Troubleshooting for the Amazon SNS Topic \(p. 3297\)](#)

## Required Permissions for the Amazon SNS Topic When Using IAM Roles

You can attach a permission policy to the Amazon SNS topic owned by a different account. If you want to use an Amazon SNS topic from another account, make sure to attach the following policy to an existing Amazon SNS topic.

```
{
  "Id": "Policy1415489375392",
  "Statement": [
    {
      "Sid": "AWSConfigSNSPolicy20150201",
      "Action": [
        "SNS:Publish"
      ],
      "Effect": "Allow",
      "Resource": "arn:aws:sns:region:account-id:myTopic",
      "Principal": {
        "AWS": [
          "account-id1",
          "account-id2",
          "account-id3"
        ]
      }
    }
  ]
}
```

For the Resource key, *account-id* is the account number of the topic owner. For *account-id1*, *account-id2*, and *account-id3*, use the AWS accounts that will send data to an Amazon SNS topic. You must substitute appropriate values for *region* and *myTopic*.

## Required Permissions for the Amazon SNS Topic When Using Service-Linked Roles

If you set up AWS Config using a service-linked role, you need to attach a permission policy to the Amazon SNS topic. If you want to use an Amazon SNS topic from your own account, make sure to attach the following policy to an existing Amazon SNS topic.

```
{
  "Id": "Policy_ID",
  "Statement": [
    {
      "Sid": "AWSConfigSNSPolicy",
      "Effect": "Allow",
      "Principal": {
        "Service": "config.amazonaws.com"
      },
      "Action": "SNS:Publish",
      "Resource": "arn:aws:sns:region:account-id:myTopic"
    }
  ]
}
```

You must substitute appropriate values for *region*, *account-id*, and *myTopic*.

## Troubleshooting for the Amazon SNS Topic

AWS Config must have permissions to send notifications to an Amazon SNS topic. If an Amazon SNS topic cannot receive notifications, verify that the IAM role that AWS Config was assuming must have `sns:publish` permissions.

## Service-Linked AWS Config Rules

A service-linked AWS Config rule is a unique type of managed config rule that supports other AWS services to create AWS Config rules in your account. The service-linked AWS Config rules are predefined to include all the permissions required to call other AWS services on your behalf. These rules are similar to standards that an AWS service recommends in your AWS account for compliance verification.

These service-linked AWS Config rules are owned by AWS service teams. The AWS service team creates these rules in your AWS account. You have read-only access to these rules. You cannot edit or delete these rules if you are subscribed to AWS service that these rules are linked to.

In the AWS Config console, the service-linked AWS Config rules are visible in the **Rules** page. The edit button is greyed in the console thereby restricting you to edit the rule. You can view details of the rule by choosing the rule. On the rule details page, you can view the name of the service that created the rule. The **Edit** and **Delete results** is greyed thereby restricting you to edit and delete results of the rule. To edit or delete the rule, contact the AWS service that created the rule.

While using the AWS Command Line Interface, the `PutConfigRule`, `DeleteConfigRule`, and `DeleteEvaluationResults` APIs return access denied with the following error message:

```
INSUFFICIENT_SLCR_PERMISSIONS = "An AWS service owns ServiceLinkedConfigRule.  
You do not have permissions to take action on this rule."
```

### Topics

- [Using Service-Linked Roles for AWS Config \(p. 3297\)](#)

## Using Service-Linked Roles for AWS Config

AWS Config uses AWS Identity and Access Management (IAM) [service-linked roles](#). A service-linked role is a unique type of IAM role that is linked directly to AWS Config. Service-linked roles are predefined by AWS Config and include all the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes setting up AWS Config easier because you don't have to manually add the necessary permissions. AWS Config defines the permissions of its service-linked roles, and unless defined otherwise, only AWS Config can assume its roles. The defined permissions include the trust policy and the permissions policy, and that permissions policy cannot be attached to any other IAM entity.

For information about other services that support service-linked roles, see [AWS Services That Work with IAM](#) and look for the services that have **Yes** in the **Service-Linked Role** column. Choose a **Yes** with a link to view the service-linked role documentation for that service.

## Service-Linked Role Permissions for AWS Config

AWS Config uses the service-linked role named **AWSServiceRoleForConfig** – AWS Config uses this service-linked role to call other AWS services on your behalf.

The **AWSServiceRoleForConfig** service-linked role trusts the `config.amazonaws.com` service to assume the role.

The permissions policy for the **AWSServiceRoleForConfig** role contains read-only and write-only permissions for AWS Config resources and read-only permissions for resources in other services that AWS Config supports. For more information, see [Supported Resource Types \(p. 9\)](#).

You must configure permissions to allow an IAM entity (such as a user, group, or role) to create, edit, or delete a service-linked role. For more information, see [Service-Linked Role Permissions](#) in the *IAM User Guide*.

To use a service-linked role with AWS Config, you must configure permissions on your Amazon S3 bucket and Amazon SNS topic. For more information, see [Required Permissions for the Amazon S3 Bucket When Using Service-Linked Roles \(p. 3293\)](#) and [Required Permissions for the Amazon SNS Topic When Using Service-Linked Roles \(p. 3296\)](#).

## Creating a Service-Linked Role for AWS Config

In the IAM CLI or the IAM API, create a service-linked role with the `config.amazonaws.com` service name. For more information, see [Creating a Service-Linked Role](#) in the *IAM User Guide*. If you delete this service-linked role, you can use this same process to create the role again.

## Editing a Service-Linked Role for AWS Config

AWS Config does not allow you to edit the **AWSServiceRoleForConfig** service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see [Editing a Service-Linked Role](#) in the *IAM User Guide*.

## Deleting a Service-Linked Role for AWS Config

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

### Note

If the AWS Config service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

### To delete AWS Config resources used by the **AWSServiceRoleForConfig**

Ensure that you do not have `ConfigurationRecorders` using the service-linked role. You can use the AWS Config console to stop the configuration recorder. To stop recording, under **Recording is on**, choose **Turn off**.

You can delete the `ConfigurationRecorder` using AWS Config API. To delete, use the `delete-configuration-recorder` command.

```
$ aws configservice delete-configuration-recorder --configuration-recorder-name default
```

### To manually delete the service-linked role using IAM

Use the IAM console, the IAM CLI, or the IAM API to delete the **AWSServiceRoleForConfig** service-linked role. For more information, see [Deleting a Service-Linked Role](#) in the *IAM User Guide*.

## AWS managed policies for AWS Config

To add permissions to users, groups, and roles, it is easier to use AWS managed policies than to write policies yourself. It takes time and expertise to [create IAM customer managed policies](#) that provide your team with only the permissions they need. To get started quickly, you can use our AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see [AWS managed policies](#) in the *IAM User Guide*.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) where the policy is attached. Services are most likely to update an AWS managed policy when a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

Additionally, AWS supports managed policies for job functions that span multiple services. For example, the **ReadOnlyAccess** AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see [AWS managed policies for job functions](#) in the *IAM User Guide*.

### AWS managed policy: AWSConfigServiceRolePolicy

AWS Config uses the service-linked role named **AWSServiceRoleForConfig** to call other AWS services on your behalf. When you use AWS Management Console to set up AWS Config, this SLR is automatically created by AWS Config if you select the option to use the AWS Config SLR instead of your own AWS Identity and Access Management (IAM) service role.

The **AWSServiceRoleForConfig** SLR contains the managed policy **AWSConfigServiceRolePolicy**. This managed policy contains read-only and write-only permissions for AWS Config resources and read-only permissions for resources in other services that AWS Config supports. For more information, see [Supported Resource Types \(p. 9\)](#) and [Using Service-Linked Roles for AWS Config \(p. 3297\)](#).

## AWS managed policy: AWS\_ConfigRole

If you want to create an IAM role for AWS Config, use the managed policy `AWS_ConfigRole` and attach it to your IAM role.

This IAM policy is updated each time AWS Config adds support for an AWS resource type. This means that AWS Config will continue to have the required permissions to record configuration data of supported resource types as long as the **AWS\_ConfigRole** role has this managed policy attached. For more information, see [Supported Resource Types \(p. 9\)](#) and [Permissions for the IAM Role Assigned to AWS Config \(p. 3289\)](#).

## AWS Config updates to AWS managed policies

View details about updates to AWS managed policies for AWS Config since this service began tracking these changes. For automatic alerts about changes to this page, subscribe to the RSS feed on the AWS Config [Document history](#) page.

Change	Description	Date
<a href="#">AWSConfigServiceRolePolicy (p. 327)</a> – Add ssm:ListDocuments permission and additional permissions for new resource types	This policy now grants permission to view information about AWS Systems Manager (formerly known as SSM) specified documents. This policy also now supports additional AWS resource types for AWS Backup, Amazon Elastic File	April 1, 2021

Change	Description	Date
	System, Amazon ElastiCache, Amazon Simple Storage Service, Amazon Elastic Compute Cloud, Amazon Kinesis, Amazon SageMaker, AWS Database Migration Service, and Amazon Route 53. These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types.	
<a href="#">AWS_ConfigRole (p. 3303)</a> – Add <code>ssm:ListDocuments</code> permission and additional permissions for new resource types	This policy now grants permission to view information about AWS Systems Manager (formerly known as SSM) specified documents. This policy also now supports additional AWS resource types for AWS Backup, Amazon Elastic File System, Amazon ElastiCache, Amazon Simple Storage Service, Amazon Elastic Compute Cloud, Amazon Kinesis, Amazon SageMaker, AWS Database Migration Service, and Amazon Route 53. These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types.	April 1, 2021
AWS Config started tracking changes	AWS Config started tracking changes for its AWS managed policies.	April 1, 2021

## Logging and Monitoring in AWS Config

AWS Config is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in AWS Config. Monitoring is an important part of maintaining the reliability, availability, and performance of AWS Config and your AWS solutions.

### Logging AWS Config API Calls with AWS CloudTrail

CloudTrail captures all API calls for AWS Config as events. The calls captured include calls from the AWS Config console and code calls to the AWS Config API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for AWS Config. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in **Event history**. Using the information collected by CloudTrail, you can determine the request that was made to AWS Config, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the [AWS CloudTrail User Guide](#).

### Topics

- [AWS Config Information in CloudTrail \(p. 3308\)](#)
- [Understanding AWS Config Log File Entries \(p. 3308\)](#)
- [Example Log Files \(p. 3308\)](#)

## AWS Config Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in AWS Config, that activity is recorded in a CloudTrail event along with other AWS service events in **Event history**. You can view, search, and download recent events in your AWS account. For more information, see [Viewing Events with CloudTrail Event History](#).

For an ongoing record of events in your AWS account, including events for AWS Config, create a trail. A *trail* enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- [Overview for Creating a Trail](#)
- [CloudTrail Supported Services and Integrations](#)
- [Configuring Amazon SNS Notifications for CloudTrail](#)
- [Receiving CloudTrail Log Files from Multiple Regions](#) and [Receiving CloudTrail Log Files from Multiple Accounts](#)

All AWS Config operations are logged by CloudTrail and are documented in the [AWS Config API Reference](#). For example, calls to the [DeliverConfigSnapshot](#), [DeleteDeliveryChannel](#), and [DescribeDeliveryChannels](#) operations generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the [CloudTrail userIdentity Element](#).

## Understanding AWS Config Log File Entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

## Example Log Files

For examples of the CloudTrail log entries, see the following topics.

### Contents

- [DeleteDeliveryChannel](#) (p. 3309)
- [DeliverConfigSnapshot](#) (p. 3309)
- [DescribeConfigurationRecorderStatus](#) (p. 3310)

  "eventType": "AwsApiCall",  
  "recipientAccountId": "222222222222"  
}
```

## Monitoring

You can use other AWS services to monitor AWS Config resources.

- You can use Amazon Simple Notification Service (SNS) to send you notifications every time a supported AWS resource is created, updated, or otherwise modified as a result of user API activity.
- You can use Amazon CloudWatch Events to detect and react to changes in the status of AWS Config events.

### Topics

- [Monitoring AWS Resource Changes with Amazon SQS \(p. 3314\)](#)
- [Monitoring AWS Config with Amazon CloudWatch Events \(p. 3316\)](#)

## Monitoring AWS Resource Changes with Amazon SQS

AWS Config uses Amazon Simple Notification Service (SNS) to send you notifications every time a supported AWS resource is created, updated, or otherwise modified as a result of user API activity. However, you might be interested in only certain resource configuration changes. For example, you might consider it critical to know when someone modifies the configuration of a security group, but not need to know every time there is a change to tags on your Amazon EC2 instances. Or, you might want to write a program that performs specific actions when specific resources are updated. For example, you

might want to start a certain workflow when a security group configuration is changed. If you want to programmatically consume the data from AWS Config in these or other ways, use an Amazon Simple Queue Service queue as the notification endpoint for Amazon SNS.

**Note**

Notifications can also come from Amazon SNS in the form of an email, a Short Message Service (SMS) message to SMS-enabled mobile phones and smartphones, a notification message to an application on a mobile device, or a notification message to one or more HTTP or HTTPS endpoints.

You can have a single SQS queue subscribe to multiple topics, whether you have one topic per region or one topic per account per region. You must subscribe the queue to your desired SNS topic. (You can subscribe multiple queues to one SNS topic.) For more information, see [Sending Amazon SNS Messages to Amazon SQS Queues](#).

## Permissions for Amazon SQS

To use Amazon SQS with AWS Config, you must configure a policy that grants permissions to your account to perform all actions that are allowed on an SQS queue. The following example policy grants the account number 111122223333 and account number 444455556666 permission to send messages pertaining to each configuration change to the queue named `arn:aws:sqs:us-east-2:444455556666:queue1`.

```
{
  "Version": "2012-10-17",
  "Id": "Queue1_Policy_UUID",
  "Statement":
  {
    "Sid": "Queue1_SendMessage",
    "Effect": "Allow",
    "Principal": {
      "AWS": ["111122223333", "444455556666"]
    },
    "Action": "sqs:SendMessage",
    "Resource": "arn:aws:sqs:us-east-2:444455556666:queue1"
  }
}
```

You must also create a policy that grants permissions for connections between an SNS topic and the SQS queue that subscribes to that topic. The following is an example policy that permits the SNS topic with the Amazon Resource Name (ARN) `arn:aws:sns:us-east-2:111122223333:test-topic` to perform any actions on the queue named `arn:aws:sqs:us-east-2:111122223333:test-topic-queue`.

**Note**

The account for the SNS topic and the SQS queue must be in the same region.

```
{
  "Version": "2012-10-17",
  "Id": "SNSstoSQS",
  "Statement":
  {
    "Sid": "rule1",
    "Effect": "Allow",
    "Principal": "*",
    "Action": "sqs:*",
    "Resource": "arn:aws:sqs:us-east-2:111122223333:test-topic-queue",
    "Condition": {
      "StringEquals": {
        "aws:SourceArn": "arn:aws:sns:us-east-2:111122223333:test-topic"
      }
    }
  }
}
```

```
}  
  }  
}
```

Each policy can include statements that cover only a single queue, not multiple queues. For information about other restrictions on Amazon SQS policies, see [Special Information for Amazon SQS Policies](#).

## Monitoring AWS Config with Amazon CloudWatch Events

### Note

Amazon EventBridge is the preferred way to manage your events. CloudWatch Events and EventBridge are the same underlying service and API, but EventBridge provides more features. Changes you make in either CloudWatch or EventBridge will appear in each console. For more information, see [Amazon EventBridge](#).

Amazon CloudWatch Events delivers a near real-time stream of system events that describe changes in AWS resources. Use Amazon CloudWatch Events to detect and react to changes in the status of AWS Config events.

You can create a rule that runs whenever there is a state transition, or when there is a transition to one or more states that are of interest. Then, based on rules you create, Amazon CloudWatch Events invokes one or more target actions when an event matches the values you specify in a rule. Depending on the type of event, you might want to send notifications, capture event information, take corrective action, initiate events, or take other actions.

Before you create event rules for AWS Config, however, you should do the following:

- Familiarize yourself with events, rules, and targets in CloudWatch Events. For more information, see [What Is Amazon CloudWatch Events?](#)
- For more information about how to get started with CloudWatch Events and set up rules, see [Getting Started with CloudWatch Events](#).
- Create the target or targets you will use in your event rules.

### Topics

- [Amazon CloudWatch Events format for AWS Config \(p. 3316\)](#)
- [Creating Amazon CloudWatch Events Rule for AWS Config \(p. 3317\)](#)

## Amazon CloudWatch Events format for AWS Config

The CloudWatch [event](#) for AWS Config has the following format:

```
{  
  "version": "0",  
  "id": "cd4d811e-ab12-322b-8255-872ce65b1bc8",  
  "detail-type": "event type",  
  "source": "aws.config",  
  "account": "111122223333",  
  "time": "2018-03-22T00:38:11Z",  
  "region": "us-east-1",  
  "resources": [resources],  
  "detail": {specific message type}  
}
```

## Creating Amazon CloudWatch Events Rule for AWS Config

Use the following steps to create a CloudWatch Events rule that triggers on an event emitted by AWS Config. Events are emitted on a best effort basis.

1. Open the CloudWatch console at <https://console.aws.amazon.com/cloudwatch/>.
2. In the navigation pane, choose **Events**.
3. Choose **Create rule**.
4. On the **Step 1: Create rule** page, for **Service Name**, choose **Config**.
5. For **Event Type**, choose the event type that triggers the rule:
  - Choose **All Events** to make a rule that applies to all AWS services. If you choose this option, you cannot choose specific message types, rule names, resource types, or resource IDs.
  - Choose **AWS API Call via CloudTrail** to base rules on API calls made to this service. For more information about creating this type of rule, see [Creating a CloudWatch Events Rule That Is Triggered on an AWS API Call Using AWS CloudTrail](#).
  - Choose **Config Configuration Item Change** to get notifications when a resource in your account changes.
  - Choose **Config Rules Compliance Change** to get notifications when a compliance check to your rules fails.
  - Choose **Config Rules Re-evaluation Status** to get reevaluation status notifications.
  - Choose **Config Configuration Snapshot Delivery Status** to get configuration snapshot delivery status notifications.
  - Choose **Config Configuration History Delivery Status** to get configuration history delivery status notifications.
6. Choose **Any message type** to receive notifications of any type. Choose **Specific message type(s)** to receive the following types of notifications:
  - If you choose **ConfigurationItemChangeNotification**, you receive messages when AWS Config successfully delivers the configuration snapshot to your Amazon S3 bucket.
  - If you choose **ComplianceChangeNotification**, you receive messages when the compliance type of a resource that AWS Config evaluates has changed.
  - If you choose **ConfigRulesEvaluationStarted**, you receive messages when AWS Config starts evaluating your rule against the specified resources.
  - If you choose **ConfigurationSnapshotDeliveryCompleted**, you receive messages when AWS Config successfully delivers the configuration snapshot to your Amazon S3 bucket.
  - If you choose **ConfigurationSnapshotDeliveryFailed**, you receive messages when AWS Config fails to deliver the configuration snapshot to your Amazon S3 bucket.
  - If you choose **ConfigurationSnapshotDeliveryStarted**, you receive messages when AWS Config starts delivering the configuration snapshot to your Amazon S3 bucket.
  - If you choose **ConfigurationHistoryDeliveryCompleted**, you receive messages when AWS Config successfully delivers the configuration history to your Amazon S3 bucket.
7. If you chose a specific event type from the **Event Type** drop-down list, choose **Any resource type** to make a rule that applies to all AWS Config supported resource types.

Or choose **Specific resource type(s)**, and then type the AWS Config supported resource type (for example, `AWS::EC2::Instance`).
8. If you chose a specific event type from the **Event Type** drop-down list, choose **Any resource ID** to include any AWS Config supported resource ID.

Or choose **Specific resource ID(s)**, and then type the AWS Config supported resource ID (for example, `i-04606de676e635647`).

9. If you chose a specific event type from the **Event Type** drop-down list, choose **Any rule name** to include any AWS Config supported rule.  
  
Or choose **Specific rule name(s)**, and then type the AWS Config supported rule (for example, **required-tags**).
- 10 Review your rule setup to make sure it meets your event-monitoring requirements.
- 11 In the **Targets** area, choose **Add target\***.
- 12 In the **Select target type** list, choose the type of target you have prepared to use with this rule, and then configure any additional options required by that type.
- 13 Choose **Configure details**.
- 14 On the **Configure rule details** page, type a name and description for the rule, and then choose the **State** box to enable the rule as soon as it is created.
- 15 Choose **Create rule** to confirm your selection.

## Using AWS Config with Interface Amazon VPC Endpoints

If you use Amazon Virtual Private Cloud (Amazon VPC) to host your AWS resources, you can establish a private connection between your VPC and AWS Config. You can use this connection to communicate with AWS Config from your VPC without going through the public internet.

Amazon VPC is an AWS service that you can use to launch AWS resources in a virtual network that you define. With a VPC, you have control over your network settings, such the IP address range, subnets, route tables, and network gateways. Interface VPC endpoints are powered by AWS PrivateLink, an AWS technology that enables private communication between AWS services using an elastic network interface with private IP addresses. To connect your VPC to AWS Config, you define an *interface VPC endpoint* for AWS Config. This type of endpoint enables you to connect your VPC to AWS services. The endpoint provides reliable, scalable connectivity to AWS Config without requiring an internet gateway, network address translation (NAT) instance, or VPN connection. For more information, see [What is Amazon VPC](#) in the *Amazon VPC User Guide*.

The following steps are for users of Amazon VPC. For more information, see [Getting Started](#) in the *Amazon VPC User Guide*.

### Availability

AWS Config currently supports VPC endpoints in the following Regions:

- US East (Ohio)
- US East (N. Virginia)
- US West (N. California)
- US West (Oregon)
- Asia Pacific (Mumbai)
- Asia Pacific (Seoul)
- Asia Pacific (Singapore)
- Asia Pacific (Sydney)
- Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt)
- Europe (Ireland)

- Europe (London)
- Europe (Paris)
- South America (São Paulo)

## Create a VPC Endpoint for AWS Config

To start using AWS Config with your VPC, create an interface VPC endpoint for AWS Config. You do not need to change the settings for AWS Config. AWS Config calls other AWS services using their public endpoints. For more information, see [Creating an Interface Endpoint](#) in the *Amazon VPC User Guide*.

## Incident Response in AWS Config

Incident response for AWS Config is an AWS responsibility. AWS has a formal, documented policy and program that governs incident response.

AWS operational issues with broad impact are posted on the AWS Service Health Dashboard. Operational issues are also posted to individual accounts via the Personal Health Dashboard.

## Compliance Validation for AWS Config

Third-party auditors assess the security and compliance of AWS Config as part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of AWS services in scope of specific compliance programs, see [AWS Services in Scope by Compliance Program](#). For general information, see [AWS Compliance Programs](#).

You can download third-party audit reports using AWS Artifact. For more information, see [Downloading Reports in AWS Artifact](#).

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- [Security and Compliance Quick Start Guides](#) – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- [Architecting for HIPAA Security and Compliance Whitepaper](#) – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.

**Note**

Not all services are compliant with HIPAA.

- [AWS Compliance Resources](#) – This collection of workbooks and guides might apply to your industry and location.

- [Evaluating Resources with Rules](#) in the *AWS Config Developer Guide* – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- [AWS Security Hub](#) – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.
- [AWS Audit Manager](#) – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.

## Resilience in AWS Config

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see [AWS Global Infrastructure](#).

## Infrastructure Security in AWS Config

As a managed service, AWS Config is protected by the AWS global network security procedures that are described in the [Amazon Web Services: Overview of Security Processes](#) whitepaper.

You use AWS published API calls to access AWS Config through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the [AWS Security Token Service](#) (AWS STS) to generate temporary security credentials to sign requests.

## Configuration and Vulnerability Analysis

For AWS Config, AWS handles basic security tasks such as guest operating system (OS) and database patching, firewall configuration, and disaster recovery.

## Security Best Practices for AWS Config

AWS Config provides a number of security features to consider as you develop and implement your own security policies. The following best practices are general guidelines and don't represent a complete security solution. Because these best practices might not be appropriate or sufficient for your environment, treat them as helpful considerations rather than prescriptions.

- Leverage tagging for AWS Config, which makes it easier to manage, search for, and filter resources.
- Confirm your [delivery channels](#) have been properly set, and once confirmed, verify that AWS Config is [recording properly](#).

For more information, see [AWS Config best practices](#) blog.

# AWS Config Resources

The following related resources can help you as you work with this service.

- [AWS Config](#) – The primary web page for information about AWS Config.
- [AWS Config Pricing](#)
- [Technical FAQ](#)
- [Partners](#) – Links to partner products that are fully integrated with AWS Config to help you visualize, monitor, and manage the data from your configuration stream, configuration snapshots, or configuration history.
- [Classes & Workshops](#) – Links to role-based and specialty courses as well as self-paced labs to help sharpen your AWS skills and gain practical experience.
- [AWS Developer Tools](#) – Links to developer tools, SDKs, IDE toolkits, and command line tools for developing and managing AWS applications.
- [AWS Whitepapers](#) – Links to a comprehensive list of technical AWS whitepapers, covering topics such as architecture, security, and economics and authored by AWS Solutions Architects or other technical experts.
- [AWS Support Center](#) – The hub for creating and managing your AWS Support cases. Also includes links to other helpful resources, such as forums, technical FAQs, service health status, and AWS Trusted Advisor.
- [AWS Support](#) – The primary webpage for information about AWS Support, a one-on-one, fast-response support channel to help you build and run applications in the cloud.
- [Contact Us](#) – A central contact point for inquiries concerning AWS billing, account, events, abuse, and other issues.
- [AWS Site Terms](#) – Detailed information about our copyright and trademark; your account, license, and site access; and other topics.

## AWS Software Development Kits for AWS Config

An AWS software development kit (SDK) makes it easier to build applications that access cost-effective, scalable, and reliable AWS infrastructure services. With AWS SDKs, you can get started in minutes with a single, downloadable package that includes the library, code samples, and reference documentation. The following table lists the available SDKs and third-party libraries you can use to access AWS Config programmatically.

Type of Access	Description
AWS SDKs	<p>AWS provides the following SDKs:</p> <ul style="list-style-type: none"><li>• <a href="#">AWS SDK for C++ Documentation</a></li><li>• <a href="#">AWS Mobile SDK for iOS Documentation</a></li><li>• <a href="#">AWS SDK for Go Documentation</a></li><li>• <a href="#">AWS SDK for Java Documentation</a></li><li>• <a href="#">AWS SDK for JavaScript Documentation</a></li><li>• <a href="#">AWS SDK for .NET Documentation</a></li><li>• <a href="#">AWS SDK for PHP Documentation</a></li></ul>

Type of Access	Description
	<ul style="list-style-type: none"><li>• <a href="#">AWS SDK for Python (Boto) Documentation</a></li><li>• <a href="#">AWS SDK for Ruby Documentation</a></li></ul>
Third-party libraries	<p>Developers in the AWS developer community also provide their own libraries, which you can find at the following AWS developer centers:</p> <ul style="list-style-type: none"><li>• <a href="#">AWS Java Developer Center</a></li><li>• <a href="#">AWS JavaScript Developer Center</a></li><li>• <a href="#">AWS PHP Developer Center</a></li><li>• <a href="#">AWS Python Developer Center</a></li><li>• <a href="#">AWS Ruby Developer Center</a></li><li>• <a href="#">AWS Windows and .NET Developer Center</a></li></ul>

# Frequently Asked Questions

## Changes to AWS Config Resource Relationships

### Topics

- [What is the exact impact for custom AWS Config rules that use configuration trigger for these resource types? \(p. 3323\)](#)
- [Should I expect a delay in reporting evaluation results for a managed rule with configuration changes? \(p. 3323\)](#)
- [What is the impact on historical data? Would it still display details about indirect relationships? \(p. 3323\)](#)
- [Is there a change in the output generated by GetResourceConfigHistory API? \(p. 3323\)](#)
- [Is there any change in the resource schema of a Configuration Item? \(p. 3323\)](#)
- [Are there other alternatives to retrieve indirect relationships? \(p. 3323\)](#)

## What is the new change in the AWS Config Resource Relationships?

To optimize costs associated with recording changes related to ephemeral workloads, AWS Config will release an update to relationships modeled within ConfigurationItems (CI) for seven Amazon EC2 resource types on **August 1, 2021**. Examples of ephemeral workloads include changes to Amazon Elastic Compute Cloud (Amazon EC2) spot instances, Amazon Elastic MapReduce jobs, and Amazon EC2 autoscaling. This update optimized CI models for Amazon EC2 instance, security group, network interface, subnet, VPC, VPN gateway, and customer gateway resource types to record direct relationships and deprecate indirect relationships.

## What is a direct and an in-direct relationship with respect to a resource?

A direct relationship is defined as a one-way relationship (A->B) between a resource (A) and another resource (B), and is typically derived from the Describe API response of resource (A). An indirect relationship, on the other hand, is a relationship that AWS Config infers (B->A), in order to create a bidirectional relationship. For example, **Amazon EC2 instance -> Security Group** is a direct relationship, since security groups are returned as part of the describe API response for an Amazon EC2 instance. But **Security Group -> Amazon EC2 instance** is an indirect relationship, since Amazon EC2 instances are not returned when describing an Amazon EC2 Security group.

## What is the benefit of this change to AWS Config subscribers?

By deprecating indirect relationships, there are fewer configuration items related to relationship changes. This helps in containing AWS Config costs especially in case of ephemeral workloads, where there is a high volume of configuration changes for Amazon EC2 resource types.

## Which resource relationships are being removed?

The following resource relationships are deprecated.

Resource Type	Indirect Relationship With Resource Type		
AWS::EC2::CustomerGateway	AWS::VPN::Connection		
AWS::EC2::Instance	AWS::EC2::EIP, AWS::EC2::RouteTable		
AWS::EC2::NetworkInterface	AWS::EC2::EIP, AWS::EC2::RouteTable		
AWS::EC2::SecurityGroup	AWS::EC2::Instance, AWS::EC2::NetworkInterface		
AWS::EC2::Subnet	AWS::EC2::Instance, AWS::EC2::NetworkACL, AWS::EC2::NetworkInterface, AWS::EC2::RouteTable		
AWS::EC2::VPC	AWS::EC2::Instance, AWS::EC2::InternetGateway, AWS::EC2::NetworkACL, AWS::EC2::NetworkInterface, AWS::EC2::RouteTable, AWS::EC2::Subnet, AWS::EC2::VPNGateway, AWS::EC2::SecurityGroup		
AWS::EC2::VPNGateway	AWS::EC2::RouteTable, AWS::EC2::VPNConnection		

## How are the AWS Config managed rules affected?

AWS Config managed rules that trigger on one of the resources listed above, are updated by the AWS Config team. If you have not defined tags for these rules, no action is needed on your part. If tags are defined, you might need to make updates to the tags of your managed rules.

## What is the exact impact for custom AWS Config rules that use configuration trigger for these resource types?

If you use a custom rule that is not triggered by the resources listed in the above table, then no further action is required on your part. If you have a rule that triggers on one of the resources from the above table, examine the rule to determine if the Compliant status requires information from another resource whose relationship is listed in table. The change to the resource relationship will result in fewer changes being triggered since indirect relationships (listed in above table) will no longer be tracked. Add the related resources as an additional configuration trigger or use advanced queries if the information is essential to the implementation logic of your rule.

## Should I expect a delay in reporting evaluation results for a managed rule with configuration changes?

Any managed rule affected by this change will be updated. You should not experience any delay in reporting evaluation results for a managed rule with configuration changes.

## What is the impact on historical data? Would it still display details about indirect relationships?

Indirect relationships will be available in historical `ConfigurationItems` recorded before they are deprecated, but will not be available in `ConfigurationItems` recorded after deprecation.

## Is there a change in the output generated by `GetResourceConfigHistory` API?

The models used in the `GetResourceConfigHistory` API are not changed and there is no change to the data returned for `ConfigurationItems` recorded prior to deprecation. `ConfigurationItems` recorded after deprecation no longer include the indirect relationships in the **Relationships** field.

## Is there any change in the resource schema of a Configuration Item?

There is no change to the schema of the data in the **configuration** field in the Configuration Item. The only change is that the **relationships** field in the Configuration Item will no longer include the specified indirect relationships.

## Are there other alternatives to retrieve indirect relationships?

With the launch of Advanced queries, you can run Structured Query Language (SQL) queries. For example, if you want to retrieve the list of EC2 instances related to a security group, use the following query:

AWS Config Developer Guide  
Are there other alternatives to  
retrieve indirect relationships?

---

```
SELECT
  resourceId,
  resourceType
WHERE
  resourceType = 'AWS::EC2::Instance'
AND
  relationships.resourceId = 'sg-234213'
```

Sample relationships queries are available here: [Example Queries](#)

# Document History

The following table describes the important changes to the documentation for AWS Config. For notification about updates to this documentation, you can subscribe to an RSS feed.

- **API version:** 2014-11-12
- **Latest documentation update:** April 15, 2021

update-history-change	update-history-description	update-history-date
<a href="#">AWS Config updates managed rules (p. 3327)</a>	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">aurora-mysql-backtracking-enabled</a></li> <li>• <a href="#">ec2-instance-profile-attached</a></li> <li>• <a href="#">ecs-task-definition-user-for-host-mode-check</a></li> <li>• <a href="#">no-unrestricted-route-to-igw</a></li> <li>• <a href="#">rds-automatic-minor-version-upgrade-enabled</a></li> <li>• <a href="#">redshift-enhanced-vpc-routing-enabled</a></li> </ul>	April 15, 2021
<a href="#">Security IAM update (p. 3327)</a>	<p>The <code>AWSConfigServiceRolePolicy</code> policy and <code>AWS_ConfigRole</code> policy now grant permission to view information about AWS Systems Manager (formerly known as SSM) specified documents. These policies also now support additional AWS resource types for AWS Backup, Amazon Elastic File System, Amazon ElastiCache, Amazon Simple Storage Service, Amazon Elastic Compute Cloud, Amazon Kinesis, Amazon SageMaker, AWS Database Migration Service, and Amazon Route 53. These permission changes allow AWS Config to invoke the read-only APIs required to support these resource types. For more information, see <a href="#">AWS managed policies for AWS Config</a>.</p>	April 14, 2021
<a href="#">Conformance Pack Compliance as Configuration Items (CIs) (p. 3327)</a>	<p>With this release, AWS Config supports conformance pack compliance as configuration</p>	March 30, 2021

items. This enables you to view a timeline of changes to the compliance state of your conformance packs, aggregate conformance packs compliance across multiple accounts and regions, and use advanced queries to check the compliance of your conformance packs.

The following API's are updated:

- [DescribeAggregateComplianceByConformancePacks](#)
- [GetAggregateConformancePackComplianceSummary](#)

The following pages in the developer guide are updated:

- [Viewing Compliance Data in the Conformance Packs Dashboard](#)
- [Viewing Compliance History Timeline for Conformance Packs](#)
- [Viewing Compliance Data in the Aggregator Dashboard](#)
- [Querying the Current Configuration State of AWS Resources](#)
- [Supported Resource Types](#)

#### Pagination update (p. 3327)

With this release, AWS Config advanced queries feature now supports pagination for queries that contain aggregate functions, such as COUNT and SUM. You can now use advanced queries to get complete results for your aggregate queries through pagination, which were previously limited to 500 rows. For more information, see [Querying the Current Configuration State of AWS Resources](#)

March 26, 2021

#### Region support (p. 3327)

With this release, AWS Config and AWS Config Rules is now supported in Asia Pacific (Osaka) Region.

March 4, 2021

<a href="#">AWS Config supports new resources types (p. 3327)</a>	With this release, you can use AWS Config to record configuration changes to Amazon Elastic Container Registry, Amazon Elastic Container Service, and Amazon Elastic Kubernetes Service resource types. For more information, see <a href="#">Supported Resource Types</a> .	February 25, 2021
<a href="#">KMS encryption support (p. 3327)</a>	<p>With this release, AWS Config allows you to use KMS-based encryption on objects delivered by AWS Config for S3 bucket delivery.</p> <p>The following API's are updated:</p> <ul style="list-style-type: none"><li>• <a href="#">DeliveryChannel</a></li><li>• <a href="#">PutDeliveryChannel</a></li></ul> <p>The following pages in the developer guide are updated:</p> <ul style="list-style-type: none"><li>• <a href="#">Permissions for the KMS Key</a></li><li>• <a href="#">Permissions for the IAM Role Assigned to AWS Config</a></li></ul>	February 16, 2021
<a href="#">AWS Config updates managed rules (p. 3327)</a>	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"><li>• <a href="#">secretsmanager-secret-periodic-rotation</a></li><li>• <a href="#">secretsmanager-secret-unused</a></li><li>• <a href="#">secretsmanager-using-cmk</a></li></ul>	February 16, 2021
<a href="#">Saved Query Region support (p. 3327)</a>	With this release, saved query is now supported in AWS GovCloud (US-East) and AWS GovCloud (US-West) Regions.	February 15, 2021
<a href="#">Multi-account multi-region data aggregation Region support (p. 3327)</a>	With this release, multi-account multi-region data aggregation is now supported in Africa (Cape Town) and Europe (Milan) Regions. For more information, see <a href="#">Multi-Account Multi-Region Data Aggregation</a> .	February 15, 2021

<a href="#">Advanced queries Region support (p. 3327)</a>	<p>With this release, advanced queries is now supported in Africa (Cape Town) and Europe (Milan) Regions. For more information, see <a href="#">Querying the Current Configuration State of AWS Resources</a>.</p>	<p>February 15, 2021</p>
<a href="#">AWS Config documentation history notification available through RSS feed (p. 3327)</a>	<p>You can now receive notification about updates to the AWS Config documentation by subscribing to an RSS feed.</p>	<p>January 1, 2021</p>

## Earlier Updates

The following table describes the documentation release history of AWS Config prior to Dec 31, 2020.

Change	Description	Release Date
<p>Saved Query support</p>	<p>With this release, AWS Config allows you to save your queries. After you save the query, you can search it, copy it to the query editor, edit it, or delete it. For more information about how to save a query, see the <a href="#">Query Using the SQL Query Editor (Console) (p. 70)</a> and <a href="#">Query Using the SQL Query Editor (AWS CLI) (p. 71)</a>.</p> <p>For more information about APIs, see the <i>AWS Config API Reference</i>:</p> <ul style="list-style-type: none"> <li>• <a href="#">PutStoredQuery</a></li> <li>• <a href="#">GetStoredQuery</a></li> <li>• <a href="#">ListStoredQueries</a></li> <li>• <a href="#">DeleteStoredQuery</a></li> </ul> <p>Also see <a href="#">Service Limits (p. 23)</a>.</p>	<p>December 21, 2020</p>
<p>Process checks support</p>	<p>With this release, AWS Config supports process checks that is a type of AWS Config rule that allows you to track your external and internal tasks that require verification as part of the conformance packs. With process checks, you can list the compliance of requirements and actions at a single location.</p> <p>For more information about process checks, see the <a href="#">AWS Config Process Checks Within a Conformance Pack (p. 222)</a> topic and the <a href="#">PutExternalEvaluation</a> API.</p>	<p>December 17, 2020</p>

Change	Description	Release Date
<p>AWS Config updates managed rules</p>	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">api-gw-ssl-enabled</a> (p. 111)</li> <li>• <a href="#">api-gw-xray-enabled</a> (p. 111)</li> <li>• <a href="#">beanstalk-enhanced-health-reporting-enabled</a> (p. 113)</li> <li>• <a href="#">cloudfront-accesslogs-enabled</a> (p. 115)</li> <li>• <a href="#">cloudfront-associated-with-waf</a> (p. 115)</li> <li>• <a href="#">cloudfront-custom-ssl-certificate</a> (p. 116)</li> <li>• <a href="#">elastic-beanstalk-managed-updates-enabled</a> (p. 142)</li> <li>• <a href="#">rds-cluster-iam-authentication-enabled</a> (p. 165)</li> <li>• <a href="#">redshift-cluster-kms-enabled</a> (p. 170)</li> <li>• <a href="#">s3-bucket-level-public-access-prohibited</a> (p. 177)</li> <li>• <a href="#">subnet-auto-assign-public-ip-disabled</a> (p. 188)</li> <li>• <a href="#">vpc-network-acl-unused-check</a> (p. 189)</li> </ul>	<p>December 17, 2020</p>
<p>AWS Config supports AWS Network Firewall</p>	<p>With this release, you can use AWS Config to record configuration changes to your AWS Network Firewall FirewallPolicy, RuleGroup, and Firewall resource types. For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	<p>December 4, 2020</p>
<p>Documentation update</p>	<p>AWS Config added support for organization-wide resource data aggregation in a delegated administrator account. You can now use a delegated administrator account to aggregate resource configuration and compliance data from all member accounts of an organization in AWS Organizations.</p> <p>For more information, see <a href="#">PutConfigurationAggregator</a>, <a href="#">Setting Up an Aggregator Using the Console</a> (p. 3266) and <a href="#">Register a Delegated Administrator</a> (p. 3270).</p>	<p>December 4, 2020</p>

Documentation update	<p>The following conformance pack topics are updated.</p> <ul style="list-style-type: none"> <li>• <a href="#">Prerequisites</a> (p. 219)</li> <li>• <a href="#">Deploying a Conformance Pack Using the AWS Config Console</a> (p. 3252)</li> <li>• <a href="#">Managing Conformance Packs Across all Accounts in Your Organization</a> (p. 3257)</li> </ul>	September 28, 2020

Change	Description	Release Date
AWS Config updates managed rules	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">iam-customer-policy-blocked-kms-actions</a> (p. 153)</li> <li>• <a href="#">iam-inline-policy-blocked-kms-actions</a> (p. 153)</li> </ul>	September 17, 2020
AWS Config supports AWS WAFv2	<p>With this release, you can use AWS Config to record configuration changes to your AWS WAFv2 WebACL, IPSet, RegexPatternSet, RuleGroup, and ManagedRuleSet resource types. For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	September 1, 2020
Documentation update	<p>A note has been added to <a href="#">Granting Custom Permissions for AWS Config Users</a> (p. 3281) about creating custom permissions that grant full access.</p> <p>The documentation has been updated for the following rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">s3-bucket-server-side-encryption-enabled</a> (p. 181)</li> <li>• <a href="#">ec2-instance-detailed-monitoring-enabled</a> (p. 132)</li> <li>• <a href="#">ec2-managedinstance-platform-check</a> (p. 136)</li> </ul>	August 24, 2020
Documentation update	<p><a href="#">Operational Best Practices for PCI DSS 3.2.1</a> (p. 3122) and <a href="#">Operational Best Practices for NIST CSF</a> (p. 2954) templates are updated.</p>	August 14, 2020
Documentation update	<p>Example relationship queries are added. For more information, see <a href="#">Example Relationship Queries</a> (p. 78).</p>	July 30, 2020
Documentation update	<p>The following API's are updated:</p> <ul style="list-style-type: none"> <li>• <a href="#">ConfigurationAggregator</a></li> <li>• <a href="#">RemediationConfiguration</a></li> <li>• <a href="#">DescribeOrganizationConfigRules</a></li> <li>• <a href="#">GetOrganizationConfigRuleDetailedStatus</a></li> <li>• <a href="#">DescribeOrganizationConfigRuleStatuses</a></li> <li>• <a href="#">DescribeOrganizationConformancePacks</a></li> <li>• <a href="#">DescribeOrganizationConformancePackStatuses</a></li> <li>• <a href="#">GetOrganizationConformancePackDetailedStatus</a></li> </ul>	July 23, 2020

Change	Description	Release Date
AWS Config supports AWS Systems Manager resource type	With this release, you can use AWS Config to record configuration changes to the AWS Systems Manager file data resource type. For more information, see <a href="#">Supported Resource Types (p. 9)</a> .	July 9, 2020
Documentation update	<a href="#">Operational Best Practices for AWS Identity And Access Management (p. 513)</a> and <a href="#">Operational Best Practices for PCI DSS 3.2.1 (p. 3122)</a> templates are updated.	July 9, 2020

Change	Description	Release Date
<p>AWS Config updates managed rules</p>	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">account-part-of-organizations</a> (p. 108)</li> <li>• <a href="#">alb-http-drop-invalid-header-enabled</a> (p. 109)</li> <li>• <a href="#">alb-waf-enabled</a> (p. 109)</li> <li>• <a href="#">cloudfront-default-root-object-configured</a> (p. 116)</li> <li>• <a href="#">cloudfront-origin-access-identity-enabled</a> (p. 116)</li> <li>• <a href="#">cloudfront-origin-failover-enabled</a> (p. 117)</li> <li>• <a href="#">cloudfront-sni-enabled</a> (p. 117)</li> <li>• <a href="#">cloudtrail-security-trail-enabled</a> (p. 118)</li> <li>• <a href="#">cw-loggroup-retention-period-check</a> (p. 125)</li> <li>• <a href="#">dax-encryption-enabled</a> (p. 125)</li> <li>• <a href="#">dynamodb-in-backup-plan</a> (p. 128)</li> <li>• <a href="#">ebs-in-backup-plan</a> (p. 130)</li> <li>• <a href="#">ec2-imdsv2-check</a> (p. 132)</li> <li>• <a href="#">efs-in-backup-plan</a> (p. 139)</li> <li>• <a href="#">eks-endpoint-no-public-access</a> (p. 139)</li> <li>• <a href="#">eks-secrets-encrypted</a> (p. 140)</li> <li>• <a href="#">elasticsearch-node-to-node-encryption-check</a> (p. 142)</li> <li>• <a href="#">elb-cross-zone-load-balancing-enabled</a> (p. 143)</li> <li>• <a href="#">elb-tls-https-listeners-only</a> (p. 145)</li> <li>• <a href="#">iam-no-inline-policy-check</a> (p. 154)</li> <li>• <a href="#">rds-cluster-deletion-protection-enabled</a> (p. 164)</li> <li>• <a href="#">rds-in-backup-plan</a> (p. 167)</li> <li>• <a href="#">rds-instance-deletion-protection-enabled</a> (p. 166)</li> <li>• <a href="#">rds-instance-iam-authentication-enabled</a> (p. 166)</li> <li>• <a href="#">rds-logging-enabled</a> (p. 167)</li> <li>• <a href="#">redshift-backup-enabled</a> (p. 169)</li> <li>• <a href="#">waf-classic-logging-enabled</a> (p. 190)</li> <li>• <a href="#">wafv2-logging-enabled</a> (p. 190)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	<p>July 9, 2020</p>

Change	Description	Release Date
Multi-account multi-region data aggregation Region support	With this release, multi-account multi-region data aggregation is now supported in Asia Pacific (Hong Kong) and Middle East (Bahrain) Regions. For more information, see <a href="#">Multi-Account Multi-Region Data Aggregation (p. 3262)</a> and <a href="#">Troubleshooting for Multi-Account Multi-Region Data Aggregation (p. 3277)</a> .	July 1, 2020
Advanced queries Region support	With this release, advanced queries is now supported in Asia Pacific (Hong Kong) and Middle East (Bahrain) Regions. For more information, see <a href="#">Querying the Current Configuration State of AWS Resources (p. 66)</a> .	July 1, 2020
Documentation update	The documentation has been updated for the following rules: <ul style="list-style-type: none"> <li>• <a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a></li> <li>• <a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a></li> <li>• <a href="#">required-tags (p. 172)</a></li> <li>• <a href="#">restricted-common-ports (p. 174)</a></li> <li>• <a href="#">rds-snapshots-public-prohibited (p. 168)</a></li> <li>• <a href="#">s3-bucket-policy-grantee-check (p. 178)</a></li> </ul>	June 30, 2020
Documentation update	The documentation has been updated with information about security for AWS Config. See <a href="#">Security in AWS Config (p. 3278)</a> .	June 24, 2020
Documentation update	AWS Control Tower Detective Guardrails Conformance Pack template is updated. For more information, see <a href="#">AWS Control Tower Detective Guardrails Conformance Pack (p. 227)</a> .	June 4, 2020
AWS Config supports a new conformance pack	With this release, AWS Config supports Operational Best Practices for NIST CSF conformance pack. For more information, see <a href="#">Operational Best Practices for NIST CSF (p. 2954)</a> .	May 29, 2020

Change	Description	Release Date
AWS Config updates managed rules	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">dynamodb-pitr-enabled</a> (p. 129)</li> <li>• <a href="#">dynamodb-table-encrypted-kms</a> (p. 129)</li> <li>• <a href="#">ec2-ebs-encryption-by-default</a> (p. 131)</li> <li>• <a href="#">rds-snapshot-encrypted</a> (p. 168)</li> <li>• <a href="#">redshift-require-tls-ssl</a> (p. 172)</li> <li>• <a href="#">s3-bucket-default-lock-enabled</a> (p. 177)</li> <li>• <a href="#">s3-default-encryption-kms</a> (p. 182)</li> <li>• <a href="#">securityhub-enabled</a> (p. 186)</li> <li>• <a href="#">sns-encrypted-kms</a> (p. 187)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	May 28, 2020
Delegated administrator support	<p>With this release, you can deploy AWS Config rules and conformance packs from any delegated member account in your organization, in addition to the management account.</p> <p>For more information about APIs, see the <i>AWS Config API Reference</i>:</p> <ul style="list-style-type: none"> <li>• <a href="#">PutOrganizationConfigRule</a></li> <li>• <a href="#">PutOrganizationConformancePack</a></li> <li>• <a href="#">DescribeOrganizationConfigRules</a></li> <li>• <a href="#">GetOrganizationConfigRuleDetailedStatus</a></li> <li>• <a href="#">DescribeOrganizationConfigRuleStatuses</a></li> <li>• <a href="#">DeleteOrganizationConfigRule</a></li> <li>• <a href="#">DeleteOrganizationConformancePack</a></li> <li>• <a href="#">DescribeOrganizationConformancePacks</a></li> <li>• <a href="#">DescribeOrganizationConformancePackStatuses</a></li> <li>• <a href="#">GetOrganizationConformancePackDetailedStatus</a></li> </ul> <p>For more information, see <a href="#">Service Limits</a> (p. 23).</p>	May 27, 2020
AWS Config rules Region support	<p>With this release, few AWS Config rules are supported in Africa (Cape Town) and Europe (Milan) regions. For a detailed list of rules and the regions they are supported in, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	April 28, 2020

Change	Description	Release Date
AWS Config supports new conformance packs	<p>With this release, AWS Config supports two conformance packs.</p> <ul style="list-style-type: none"> <li>• AWS Control Tower Detective Guardrails Conformance Pack</li> <li>• Operational Best Practices for CIS</li> </ul> <p>For more information, see <a href="#">Conformance Pack Sample Templates (p. 225)</a>.</p>	April 22, 2020
AWS Config supports AWS Secrets Manager	<p>With this release, you can use AWS Config to record configuration changes to your Secrets Manager secret. For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	April 20, 2020
AWS Config updates managed rules	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">secretsmanager-rotation-enabled-check (p. 183)</a></li> <li>• <a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a></li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p>	April 16, 2020
Conformance pack Region support	<p>With this release, conformance packs are now supported in Asia Pacific (Hong Kong) and Middle East (Bahrain). For more information, see <a href="#">Conformance Packs (p. 219)</a>.</p>	April 8, 2020
Documentation update	<p>AWS Config limits are available in this developer guide. For more information, see <a href="#">Service Limits (p. 23)</a>.</p>	April 8, 2020
Documentation update	<p>Third-party resources that are managed (i.e. created/updated/deleted) through AWS CloudFormation registry are automatically tracked in AWS Config as configuration items. For more information, see <a href="#">Record Configurations for Third-Party Resources (p. 38)</a>.</p>	March 30, 2020
Documentation update	<p>The AWS Config Managed Rules are updated to include AWS Region information. For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p>	March 27, 2020

Change	Description	Release Date
AWS Config supports Amazon SNS resource type	With this release, you can use AWS Config to record configuration changes to your Amazon SNS topic. For more information, see <a href="#">Supported Resource Types (p. 9)</a> .	March 6, 2020
Multi-account multi-region data aggregation Region support	With this release, multi-account multi-region data aggregation is now supported in Europe (Stockholm) Region. For more information, see <a href="#">Multi-Account Multi-Region Data Aggregation (p. 3262)</a> .	March 5, 2020
Advanced queries Region support	With this release, advanced queries is now supported in Europe (Stockholm) Region. For more information, see <a href="#">Querying the Current Configuration State of AWS Resources (p. 66)</a> .	March 5, 2020
AWS Config allows you to run advanced queries with configuration aggregators	<p>With this release, AWS Config adds support to run advanced queries based on resource configuration properties with configuration aggregators, enabling you to run the same queries across multiple accounts and Regions. For more information, see <a href="#">Querying the Current Configuration State of AWS Resources (p. 66)</a>.</p> <p>With this release, AWS Config adds <code>SelectAggregateResourceConfig</code> API. For more information, see <a href="#">SelectAggregateResourceConfig</a> in the <i>AWS Config API Reference</i>:</p>	February 28, 2020
AWS Config supports Amazon SQS resource type	<p>With this release, you can use AWS Config to record configuration changes to your Amazon SQS queue.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	February 13, 2020

Change	Description	Release Date
<p>AWS CloudFormation support for Conformance packs</p>	<p>With this release, AWS CloudFormation support for the following resources was added:  <code>AWS::Config::ConformancePack</code>  and  <code>OrganizationConformancePack</code>.</p> <ul style="list-style-type: none"> <li>• <a href="#">AWS::Config::ConformancePack</a></li> </ul> <p>Use the <code>AWS::Config::ConformancePack</code> resource to create a Conformance Pack that is a collection of AWS Config rules that can be easily deployed in an account and a Region and across AWS Organization.</p> <ul style="list-style-type: none"> <li>• <a href="#">AWS::Config::OrganizationConformancePack</a></li> </ul> <p>Use the <code>AWS::Config::OrganizationConformancePack</code> resource to create an Organization Conformance Pack that has information about conformance packs that AWS Config creates in the member accounts.</p>	<p>February 13, 2020</p>
<p>AWS Config updates managed rules</p>	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">api-gw-execution-logging-enabled</a> (p. 111)</li> <li>• <a href="#">ec2-stopped-instance</a> (p. 137)</li> <li>• <a href="#">elasticache-redis-cluster-automatic-backup-check</a> (p. 140)</li> <li>• <a href="#">emr-master-no-public-ip</a> (p. 146)</li> <li>• <a href="#">guardduty-non-archived-findings</a> (p. 152)</li> <li>• <a href="#">rds-enhanced-monitoring-enabled</a> (p. 165)</li> <li>• <a href="#">s3-account-level-public-access-blocks</a> (p. 175)</li> <li>• <a href="#">sagemaker-endpoint-configuration-kms-key-configured</a> (p. 182)</li> <li>• <a href="#">service-vpc-endpoint-enabled</a> (p. 186)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	<p>December 20, 2019</p>

Change	Description	Release Date
Record configurations for custom resource types	<p>With this release, AWS Config introduces support to record configurations for custom resource types. You can publish the configuration data of third-party resources into AWS Config and view and monitor the resource inventory and configuration history using AWS Config console and APIs. For more information, see <a href="#">Record Configurations for Third-Party Resources (p. 38)</a>.</p> <p>For more information about APIs, see the <i>AWS Config API Reference</i>:</p> <ul style="list-style-type: none"> <li>• <a href="#">DeleteResourceConfig</a></li> <li>• <a href="#">PutResourceConfig</a></li> </ul>	November 20, 2019
Conformance packs	<p>With this release, AWS Config introduces conformance packs. Conformance packs enable you to package a collection of AWS Config rules and remediation actions that can then be deployed together as a single entity across an entire AWS Organization. For more information, see <a href="#">Conformance Packs (p. 219)</a>.</p> <p>For more information about APIs, see the <i>AWS Config API Reference</i>:</p> <ul style="list-style-type: none"> <li>• <a href="#">DeleteOrganizationConformancePack</a></li> <li>• <a href="#">DeleteOrganizationConformancePack</a></li> <li>• <a href="#">DescribeConformancePacks</a></li> <li>• <a href="#">DescribeConformancePacks</a></li> <li>• <a href="#">DescribeConformancePackStatus</a></li> <li>• <a href="#">DescribeOrganizationConformancePacks</a></li> <li>• <a href="#">DescribeOrganizationConformancePackStatuses</a></li> <li>• <a href="#">GetConformancePackComplianceDetails</a></li> <li>• <a href="#">GetConformancePackComplianceSummary</a></li> <li>• <a href="#">GetOrganizationConformancePackDetailedStatus</a>,</li> <li>• <a href="#">PutConformancePack</a></li> <li>• <a href="#">PutOrganizationConformancePack</a></li> </ul>	November 19, 2019
AWS Config supports Amazon Elasticsearch Service and AWS Key Management Service resource types	<p>With this release, you can use AWS Config to record configuration changes to your Amazon Elasticsearch Service domain and AWS Key Management Service key.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	November 11, 2019

Change	Description	Release Date
<p>AWS Config updates managed rules</p>	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">dms-replication-not-public</a> (p. 127)</li> <li>• <a href="#">emr-kerberos-enabled</a> (p. 145)</li> <li>• <a href="#">fms-security-groups-audit-policy-check</a> (p. 147)</li> <li>• <a href="#">fms-security-groups-content-check</a> (p. 148)</li> <li>• <a href="#">fms-security-groups-resource-association-check</a> (p. 148)</li> <li>• <a href="#">internet-gateway-authorized-vpc-only</a> (p. 160)</li> <li>• <a href="#">kms-cmk-not-scheduled-for-deletion</a> (p. 160)</li> <li>• <a href="#">sagemaker-notebook-no-direct-internet-access</a> (p. 183)</li> <li>• <a href="#">sagemaker-notebook-instance-kms-key-configured</a> (p. 183)</li> <li>• <a href="#">shield-drt-access</a> (p. 187)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	<p>October 10, 2019</p>
<p>AWS Config supports Amazon RDS resource type</p>	<p>With this release, you can use AWS Config to record configuration changes to your Amazon Relational Database Service (Amazon RDS) DBCluster and DBClusterSnapshot.</p> <p>For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	<p>September 17, 2019</p>
<p>AWS Config supports Amazon QLDB resource type</p>	<p>With this release, you can use AWS Config to record configuration changes to Amazon Quantum Ledger Database (QLDB) ledger resource type.</p> <p>For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	<p>September 10, 2019</p>

Change	Description	Release Date
<p>AWS Config allows you to apply auto remediation on noncompliant resources as evaluated by AWS Config Rules</p>	<p>With this release, AWS Config introduces support to apply auto remediation using AWS Systems Manager automation documents on noncompliant resources as evaluated by AWS Config Rules. For more information, see <a href="#">Remediating Noncompliant AWS Resources by AWS Config Rules</a> (p. 213).</p> <p>With this release, AWS Config adds the following new APIs. For more information, see the <i>AWS Config API Reference</i> :</p> <ul style="list-style-type: none"> <li>• <a href="#">PutRemediationExceptions</a></li> <li>• <a href="#">DescribeRemediationExceptions</a></li> <li>• <a href="#">DeleteRemediationExceptions</a></li> </ul>	<p>September 5, 2019</p>
<p>AWS Config updates managed rules</p>	<p>With this release, AWS Config supports the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">alb-http-to-https-redirect-check</a> (p. 109)</li> <li>• <a href="#">api-gw-cache-enabled-and-encrypted</a> (p. 110)</li> <li>• <a href="#">api-gw-endpoint-type-check</a> (p. 110)</li> <li>• <a href="#">cloudtrail-s3-dataevents-enabled</a> (p. 118)</li> <li>• <a href="#">cloudwatch-log-group-encrypted</a> (p. 121)</li> <li>• <a href="#">ebs-snapshot-public-restorable-check</a> (p. 131)</li> <li>• <a href="#">elb-deletion-protection-enabled</a> (p. 144)</li> <li>• <a href="#">lambda-concurrency-check</a> (p. 161)</li> <li>• <a href="#">lambda-dlq-check</a> (p. 161)</li> <li>• <a href="#">lambda-inside-vpc</a> (p. 162)</li> <li>• <a href="#">shield-advanced-enabled-autorenew</a> (p. 186)</li> <li>• <a href="#">vpc-vpn-2-tunnels-up</a> (p. 189)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	<p>August 22, 2019</p>

Change	Description	Release Date
<p>AWS Config updates managed rules</p>	<p>With this release, AWS Config updates the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">cloudfront-viewer-policy-https</a> (p. 117)</li> <li>• <a href="#">ec2-instance-no-public-ip</a> (p. 133)</li> <li>• <a href="#">ec2-security-group-attached-to-eni</a> (p. 137)</li> <li>• <a href="#">efs-encrypted-check</a> (p. 138)</li> <li>• <a href="#">elasticsearch-encrypted-at-rest</a> (p. 141)</li> <li>• <a href="#">elasticsearch-in-vpc-only</a> (p. 141)</li> <li>• <a href="#">redshift-cluster-public-access-check</a> (p. 171)</li> <li>• <a href="#">vpc-sg-open-only-to-authorized-ports</a> (p. 189)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	<p>July 31, 2019</p>
<p>AWS Config supports Amazon EC2 resource types</p>	<p>With this release, you can use AWS Config to record configuration changes to the following Amazon EC2 resources; VPCEndpoint, VPCEndpointService, and VPCPeeringConnection.</p> <p>For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	<p>July 12, 2019</p>
<p>AWS Config allows you to manage AWS Config rules across all AWS accounts within an organization</p>	<p>With this release, AWS Config introduces support for managing AWS Config rules across all AWS accounts within an organization. You can centrally create, update, and delete AWS Config rules across all accounts in your organization. For more information, see <a href="#">Enabling AWS Config Rules Across all Accounts in Your Organization</a> (p. 212).</p> <p>For more information about APIs, see the <i>AWS Config API Reference</i>:</p> <ul style="list-style-type: none"> <li>• <a href="#">PutOrganizationConfigRule</a></li> <li>• <a href="#">DescribeOrganizationConfigRules</a></li> <li>• <a href="#">GetOrganizationConfigRuleDetailedStatus</a></li> <li>• <a href="#">DescribeOrganizationConfigRuleStatuses</a></li> <li>• <a href="#">DeleteOrganizationConfigRule</a></li> </ul>	<p>July 9, 2019</p>

Change	Description	Release Date
AWS Config supports Amazon S3 and Amazon EC2 resource types	<p>With this release, you can use AWS Config to record configuration changes to the Amazon S3 AccountPublicAccessBlock resource and the following Amazon EC2 resources; NatGateway, EgressOnlyInternetGateway, and FlowLog.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	May 17, 2019
AWS Config updates managed rules	<p>With this release, AWS Config updates the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">s3-bucket-public-read-prohibited (p. 179)</a></li> <li>• <a href="#">s3-bucket-public-write-prohibited (p. 180)</a></li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p>	May 7, 2019
AWS Config allows you to delete a remediation action using AWS Console.	<p>With this release, AWS Config introduces support to delete a remediation action using AWS Management Console. For more information, see <a href="#">Remediating Noncompliant AWS Resources by AWS Config Rules (p. 213)</a>.</p>	April 24, 2019
AWS Config supports new managed rules	<p>This release supports a new managed rule: <a href="#">fms-shield-resource-policy-check (p. 149)</a>.</p> <p>For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p>	April 7, 2019
AWS Config supports Amazon API Gateway resource type	<p>With this release, you can use AWS Config to record configuration changes to the following Amazon API Gateway resources; Api (WebSocket API), RestApi (REST API), Stage (WebSocket API stage), and Stage (REST API stage).</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	March 20, 2019

Change	Description	Release Date
<p>AWS Config allows you to run advanced queries</p>	<p>With this release, AWS Config adds support to run advanced queries based on resource configuration properties. For more information, see <a href="#">Querying the Current Configuration State of AWS Resources</a> (p. 66).</p> <p>With this release, AWS Config adds <code>SelectResourceConfig</code> API. For more information, see <a href="#">SelectResourceConfig</a> in the <i>AWS Config API Reference</i>:</p>	<p>March 19, 2019</p>
<p>AWS Config allows you to assign tags your AWS Config resources</p>	<p>With this release, AWS Config introduces support for tag based access control for three AWS Config resources—<code>ConfigRule</code>, <code>ConfigurationAggregator</code>, and <code>AggregationAuthorization</code>. For more information, see <a href="#">Tagging Your AWS Config Resources</a> (p. 217).</p> <p>With this release, you can add, remove or list tags from your AWS Config resources using the following APIs. For more information, see the <i>AWS Config API Reference</i>:</p> <ul style="list-style-type: none"> <li>• <a href="#">ListTagsForResource</a></li> <li>• <a href="#">TagResource</a></li> <li>• <a href="#">UntagResource</a></li> </ul>	<p>March 14, 2019</p>
<p>AWS Config allows you to apply remediation on noncompliant resources as evaluated by AWS Config Rules</p>	<p>With this release, AWS Config introduces support to apply remediation using AWS Systems Manager automation documents on noncompliant resources as evaluated by AWS Config Rules. For more information, see <a href="#">Remediating Noncompliant AWS Resources by AWS Config Rules</a> (p. 213).</p> <p>With this release, AWS Config adds the following new APIs. For more information, see the <i>AWS Config API Reference</i> :</p> <ul style="list-style-type: none"> <li>• <a href="#">DeleteRemediationConfiguration</a></li> <li>• <a href="#">DescribeRemediationConfigurations</a></li> <li>• <a href="#">DescribeRemediationExecutionStatus</a></li> <li>• <a href="#">PutRemediationConfigurations</a></li> <li>• <a href="#">StartRemediationExecution</a></li> </ul>	<p>March 12, 2019</p>

Change	Description	Release Date
<p>AWS Config supports AWS Config Rules in China (Ningxia) Region</p>	<p>This release only supports 54 AWS Config Rules in the China (Ningxia) Region. For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p> <p>However, AWS Config does not currently support the following rules in the China (Ningxia) Region:</p> <ul style="list-style-type: none"> <li>• acm-certificate-expiration-check</li> <li>• cmk-backing-key-rotation-enabled</li> <li>• cloudformation-stack-drift-detection-check</li> <li>• cloudformation-stack-notification-check</li> <li>• cloud-trail-encryption-enabled</li> <li>• cloud-trail-log-file-validation-enabled</li> <li>• codebuild-project-envvar-awscred-check</li> <li>• codebuild-project-source-repo-url-check</li> <li>• codepipeline-deployment-count-check</li> <li>• codepipeline-region-fanout-check</li> <li>• dynamodb-table-encryption-enabled</li> <li>• elb-acm-certificate-required</li> <li>• encrypted-volumes</li> <li>• fms-webacl-resource-policy-check</li> <li>• fms-webacl-rulegroup-association-check</li> <li>• guardduty-enabled-centralized</li> <li>• lambda-function-public-access-prohibited</li> <li>• lambda-function-settings-check</li> <li>• rds-storage-encrypted</li> <li>• root-account-mfa-hardware-mfa-enabled</li> <li>• root-account-mfa-enabled</li> <li>• s3-bucket-blacklisted-actions-prohibited</li> <li>• s3-bucket-policy-grantee-check</li> <li>• s3-bucket-policy-not-more-permissive</li> <li>• s3-bucket-public-read-prohibited</li> <li>• s3-bucket-public-write-prohibited</li> <li>• s3-bucket-server-side-encryption-enabled</li> </ul>	<p>March 12, 2019</p>

Change	Description	Release Date
	<ul style="list-style-type: none"> <li>• <a href="#">s3-bucket-ssl-requests-only</a></li> </ul>	
AWS Config supports new managed rules	<p>This release supports the following new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">iam-user-mfa-enabled</a> (p. 158)</li> <li>• <a href="#">s3-bucket-policy-grantee-check</a> (p. 178)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	January 21, 2019
AWS Config supports AWS Service Catalog resource type	<p>With this release, you can use AWS Config to record configuration changes to the following AWS Service Catalog resources; CloudFormation product, provisioned product, and portfolio. For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	January 11, 2019
Service-linked AWS Config rules support	<p>With this release, AWS Config adds a new managed config rule that supports other AWS services to create AWS Config Rules in your account. For more information, see <a href="#">Service-Linked AWS Config Rules</a> (p. 3297).</p>	November 20, 2018
AWS Config allows you to aggregate configuration data of AWS resources	<p>With this release, AWS Config introduces support for aggregating the configuration data of AWS resources. For more information, see <a href="#">Viewing Compliance Data in the Aggregator Dashboard</a> (p. 3264).</p> <p>With this release, AWS Config adds the following new APIs. For more information, see the <i>AWS Config API Reference</i> :</p> <ul style="list-style-type: none"> <li>• <a href="#">BatchGetAggregateResourceConfig</a></li> <li>• <a href="#">GetAggregateDiscoveredResourceCounts</a></li> <li>• <a href="#">GetAggregateResourceConfig</a></li> <li>• <a href="#">ListAggregateDiscoveredResources</a></li> </ul>	November 19, 2018

Change	Description	Release Date
<p>AWS Config supports new managed rules</p>	<p>This release supports the following new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">cloudformation-stack-drift-detection-check</a> (p. 114)</li> <li>• <a href="#">codepipeline-deployment-count-check</a> (p. 124)</li> <li>• <a href="#">codepipeline-region-fanout-check</a> (p. 124)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	<p>November 19, 2018</p>
<p>AWS Config supports new managed rules</p>	<p>This release supports the following new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">access-keys-rotated</a> (p. 107)</li> <li>• <a href="#">cloud-trail-cloud-watch-logs-enabled</a> (p. 121)</li> <li>• <a href="#">cloud-trail-encryption-enabled</a> (p. 122)</li> <li>• <a href="#">cloud-trail-log-file-validation-enabled</a> (p. 122)</li> <li>• <a href="#">cmk-backing-key-rotation-enabled</a> (p. 123)</li> <li>• <a href="#">iam-policy-no-statements-with-admin-access</a> (p. 156)</li> <li>• <a href="#">iam-role-managed-policy-check</a> (p. 157)</li> <li>• <a href="#">iam-root-access-key-check</a> (p. 157)</li> <li>• <a href="#">iam-user-unused-credentials-check</a> (p. 159)</li> <li>• <a href="#">mfa-enabled-for-iam-console-access</a> (p. 163)</li> <li>• <a href="#">multi-region-cloudtrail-enabled</a> (p. 163)</li> <li>• <a href="#">root-account-hardware-mfa-enabled</a> (p. 175)</li> <li>• <a href="#">vpc-flow-logs-enabled</a> (p. 188)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	<p>November 12, 2018</p>

Change	Description	Release Date
AWS Config supports new managed rules	<p>This release supports the following new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">dynamodb-table-encryption-enabled</a> (p. 129)</li> <li>• <a href="#">elb-logging-enabled</a> (p. 144)</li> <li>• <a href="#">rds-instance-public-access-check</a> (p. 166)</li> <li>• <a href="#">vpc-default-security-group-closed</a> (p. 188)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	October 24, 2018
Compliance history support	<p>With this release, AWS Config now supports storing compliance history of resources as evaluated by AWS Config Rules. For more information, see <a href="#">Viewing Compliance History Timeline for Resources</a> (p. 49).</p>	October 18, 2018
Multi-account multi-region Data Aggregation Region support	<p>With this release, multi-account multi-region Data Aggregation is now supported in six new Regions. For more information, see <a href="#">Multi-Account Multi-Region Data Aggregation</a> (p. 3262).</p>	October 4, 2018
AWS Config supports resource-level permissions for AWS Config Rules APIs actions	<p>With this release, AWS Config supports resource-level permissions for certain AWS Config Rules API actions. For more information about the supported APIs, see <a href="#">Supported Resource-Level Permissions for AWS Config Rules APIs Actions</a> (p. 3287).</p>	October 1, 2018
AWS Config supports CodePipeline resource type	<p>With this release, you can use AWS Config to record configuration changes to the AWS CodePipeline resource type. For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	September 12, 2018

Change	Description	Release Date
AWS Config supports new managed rules	<p>This release supports the following new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">ec2-instance-managed-by-systems-manager</a> (p. 132)</li> <li>• <a href="#">ec2-managedinstance-association-compliance-status-check</a> (p. 135)</li> <li>• <a href="#">ec2-managedinstance-patch-compliance-status-check</a> (p. 136)</li> <li>• <a href="#">guardduty-enabled-centralized</a> (p. 152)</li> <li>• <a href="#">rds-snapshots-public-prohibited</a> (p. 168)</li> <li>• <a href="#">s3-bucket-blacklisted-actions-prohibited</a> (p. 176)</li> <li>• <a href="#">s3-bucket-policy-not-more-permissive</a> (p. 179)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	September 5, 2018
AWS Config supports AWS Systems Manager resource type	<p>With this release, you can use AWS Config to record configuration changes to the AWS Systems Manager patch compliance and association compliance resource types. For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	August 9, 2018
AWS Config allows you to delete your AWS Config data using AWS Management Console	<p>With this release, AWS Config introduces support for retention period using AWS Management Console. In the AWS Management Console, you can select a custom data retention period for your <code>ConfigurationItems</code>. For more information, see <a href="#">Deleting AWS Config Data</a> (p. 80).</p>	August 7, 2018
AWS Config supports AWS Shield resource type	<p>With this release, you can use AWS Config to record configuration changes to the AWS Shield Protection resource type. For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	August 7, 2018
AWS Config supports AWS PrivateLink	<p>With this release, AWS Config supports AWS PrivateLink, enabling you to route data between your Amazon Virtual Private Cloud (VPC) and AWS Config entirely within the AWS network. For more information, see <a href="#">Using AWS Config with Interface Amazon VPC Endpoints</a> (p. 3318).</p>	July 31, 2018

Change	Description	Release Date
AWS Config allows you to delete your AWS Config data	<p>With this release, AWS Config introduces support for retention period. AWS Config allows you to delete your data by specifying a retention period for your <code>ConfigurationItems</code>. For more information, see <a href="#">Deleting AWS Config Data (p. 80)</a>.</p> <p>With this release, AWS Config adds the following new APIs. For more information, see the <i>AWS Config API Reference</i> :</p> <ul style="list-style-type: none"> <li>• <a href="#">PutRetentionConfiguration</a></li> <li>• <a href="#">DescribeRetentionConfigurations</a></li> <li>• <a href="#">DeleteRetentionConfiguration</a></li> </ul>	May 25, 2018
AWS Config supports new managed rules	<p>This release supports the following two new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">lambda-function-settings-check (p. 162)</a></li> <li>• <a href="#">s3-bucket-replication-enabled (p. 180)</a></li> <li>• <a href="#">iam-policy-blacklisted-check (p. 155)</a></li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p>	May 10, 2018
AWS Config supports AWS X-Ray resource type	<p>With this release, you can use AWS Config to record configuration changes to the AWS X-Ray <code>EncryptionConfig</code> resource type. For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	May 1, 2018
AWS Config supports AWS Lambda resource type and one new managed rule	<p>With this release, you can use AWS Config to record configuration changes to the AWS Lambda function resource type. For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p> <p>This release also supports the <a href="#">lambda-function-public-access-prohibited (p. 161)</a> managed rule. For more information, see <a href="#">AWS Config Managed Rules (p. 102)</a>.</p>	April 25, 2018

Change	Description	Release Date
AWS Config supports AWS Elastic Beanstalk resource type	<p>With this release, you can use AWS Config to record configuration changes to the AWS Elastic Beanstalk Application, Application Version, and Environment resources.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	April 24, 2018
AWS Config supports new managed rules	<p>This release supports the following two new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">fms-webacl-resource-policy-check (p. 150)</a></li> <li>• <a href="#">fms-webacl-rulegroup-association-check (p. 151)</a></li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p>	April 4, 2018
Multi-account multi-region data aggregation	<p>With this release, AWS Config introduces multi-account multi-region data aggregation. This feature allows you to aggregate AWS Config data from multiple accounts or an organization and multiple regions into an aggregator account. For more information, see <a href="#">Multi-Account Multi-Region Data Aggregation (p. 3262)</a>.</p> <p>With this release, AWS Config adds the following new APIs. For more information, see the <i>AWS Config API Reference</i> :</p> <ul style="list-style-type: none"> <li>• <a href="#">PutConfigurationAggregator</a></li> <li>• <a href="#">DescribePendingAggregationRequests</a></li> <li>• <a href="#">DeletePendingAggregationRequest</a></li> <li>• <a href="#">PutAggregationAuthorization</a></li> <li>• <a href="#">DescribeAggregationAuthorizations</a></li> <li>• <a href="#">GetAggregateConfigRuleComplianceSummary</a></li> <li>• <a href="#">DescribeAggregateComplianceByConfigRules</a></li> <li>• <a href="#">GetAggregateComplianceDetailsByConfigRule</a></li> <li>• <a href="#">DescribeConfigurationAggregators</a></li> <li>• <a href="#">DescribeConfigurationAggregatorSourcesStatus</a></li> <li>• <a href="#">DeleteAggregationAuthorization</a></li> <li>• <a href="#">DeleteConfigurationAggregator</a></li> </ul>	April 4, 2018

Change	Description	Release Date
Monitoring AWS Config with Amazon CloudWatch Events	<p>With this release, use Amazon CloudWatch Events to detect and react to changes in the status of AWS Config events.</p> <p>For more information, see <a href="#">Monitoring AWS Config with Amazon CloudWatch Events</a> (p. 3316).</p>	March 29, 2018
New API operation	<p>With this release, AWS Config adds support for <a href="#">BatchGetResourceConfig</a> API, allowing you to batch-retrieve the current state of one or more of your resources.</p>	March 20, 2018
AWS Config supports AWS WAF RuleGroup resource type	<p>With this release, you can use AWS Config to record configuration changes to the AWS WAF RuleGroup and AWS WAF RuleGroup Regional resources.</p> <p>For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	February 15, 2018
AWS Config supports new managed rules	<p>This release supports the following new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">elb-acm-certificate-required</a> (p. 143)</li> <li>• <a href="#">elb-custom-security-policy-ssl-check</a> (p. 143)</li> <li>• <a href="#">elb-predefined-security-policy-ssl-check</a> (p. 145)</li> <li>• <a href="#">codebuild-project-envvar-awscred-check</a> (p. 123)</li> <li>• <a href="#">codebuild-project-source-repo-url-check</a> (p. 123)</li> <li>• <a href="#">iam-group-has-users-check</a> (p. 153)</li> <li>• <a href="#">s3-bucket-server-side-encryption-enabled</a> (p. 181)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	January 25, 2018
AWS Config supports Elastic Load Balancing resource type	<p>With this release, you can use AWS Config to record configuration changes to your Elastic Load Balancing classic load balancers.</p> <p>For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	November 17, 2017

Change	Description	Release Date
<p>AWS Config supports the Amazon CloudFront and AWS WAF resource type</p>	<p>With this release, you can use AWS Config to record configuration changes to your CloudFront distribution and streaming distribution.</p> <p>With this release, you can use AWS Config to record configuration changes to the following AWS WAF and AWS WAF Regional resources; rate based rule, rule, and Web ACL.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	<p>November 15, 2017</p>
<p>AWS Config supports the AWS CodeBuild resource type</p>	<p>With this release, you can use AWS Config to record configuration changes to your AWS CodeBuild projects.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	<p>October 20, 2017</p>
<p>AWS Config supports Auto Scaling resources and one new managed rule</p>	<p>With this release, you can use AWS Config to record configuration changes to the following Auto Scaling resources; groups, launch configuration, scheduled action, and scaling policy.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p> <p>This release also supports the following managed rule:</p> <ul style="list-style-type: none"> <li>• <a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a></li> </ul> <p>For more information, see <a href="#">AWS Config Managed Rules (p. 102)</a>.</p>	<p>September 18, 2017</p>
<p>AWS Config supports the AWS CodeBuild resource type</p>	<p>With this release, you can use AWS Config to record configuration changes to your AWS CodeBuild projects.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	<p>October 20, 2017</p>

Change	Description	Release Date
<p>AWS Config supports Auto Scaling resources and one new managed rule</p>	<p>With this release, you can use AWS Config to record configuration changes to the following Auto Scaling resources; groups, launch configuration, scheduled action, and scaling policy.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p> <p>This release also supports the following managed rule:</p> <ul style="list-style-type: none"> <li>• <a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a></li> </ul> <p>For more information, see <a href="#">AWS Config Managed Rules (p. 102)</a>.</p>	<p>September 18, 2017</p>
<p>AWS Config supports the DynamoDB table resource type and one new managed rule</p>	<p>With this release, you can use AWS Config to record configuration changes to your DynamoDB tables.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p> <p>This release supports the following managed rule:</p> <ul style="list-style-type: none"> <li>• <a href="#">dynamodb-autoscaling-enabled (p. 128)</a></li> </ul> <p>For more information, see <a href="#">AWS Config Managed Rules (p. 102)</a>.</p>	<p>September 8, 2017</p>
<p>AWS Config supports two new managed rules for Amazon S3</p>	<p>This release supports two new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">s3-bucket-public-read-prohibited (p. 179)</a></li> <li>• <a href="#">s3-bucket-public-write-prohibited (p. 180)</a></li> </ul> <p>For more information, see <a href="#">AWS Config Managed Rules (p. 102)</a>.</p>	<p>August 14, 2017</p>

Change	Description	Release Date
New page in the AWS Config console	<p>You can use the <b>Dashboard</b> in the AWS Config console to see the following:</p> <ul style="list-style-type: none"> <li>• Total number of resources</li> <li>• Total number of rules</li> <li>• Number of noncompliant resources</li> <li>• Number of noncompliant rules</li> </ul> <p>For more information, see <a href="#">Viewing the AWS Config Dashboard (p. 33)</a>.</p>	July 17, 2017
New API operation	<p>You can use the <a href="#">GetDiscoveredResourceCounts</a> operation to return the number of resource types, the number of each resource type, and the total number of resources that AWS Config is recording in a Region for your AWS account.</p>	July 17, 2017
AWS Config supports the AWS CloudFormation stack resource type and one new managed rule	<p>With this release, you can use AWS Config to record configuration changes to your AWS CloudFormation stacks.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p> <p>This release supports the following managed rule:</p> <ul style="list-style-type: none"> <li>• <a href="#">cloudformation-stack-notification-check (p. 114)</a></li> </ul> <p>For more information, see <a href="#">AWS Config Managed Rules (p. 102)</a>.</p>	July 6, 2017
New and updated content	<p>This release adds support for AWS Config Rules in the Canada (Central) Region and South America (São Paulo) Region.</p> <p>For all regions that support AWS Config and Config Rules, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	July 5, 2017
New and updated content	<p>AWS Config Rules is available in the AWS GovCloud (US) Region. For more information, see the <a href="#">AWS GovCloud (US) User Guide</a>.</p> <p>For regions that support AWS Config, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	June 8, 2017

Change	Description	Release Date
<p>AWS Config supports the Amazon CloudWatch alarm resource type and three new managed rules</p>	<p>With this release, you can use AWS Config to record configuration changes to your Amazon CloudWatch alarms.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p> <p>This release supports three new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">cloudwatch-alarm-action-check (p. 119)</a></li> <li>• <a href="#">cloudwatch-alarm-resource-check (p. 120)</a></li> <li>• <a href="#">cloudwatch-alarm-settings-check (p. 120)</a></li> </ul> <p>For more information, see <a href="#">AWS Config Managed Rules (p. 102)</a>.</p>	<p>June 1, 2017</p>
<p>New and updated content</p>	<p>This release supports specifying the application version number for the following managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">ec2-managedinstance-applications-blacklisted (p. 134)</a></li> <li>• <a href="#">ec2-managedinstance-applications-required (p. 134)</a></li> </ul> <p>For more information, see <a href="#">AWS Config Managed Rules (p. 102)</a>.</p>	<p>June 1, 2017</p>
<p>New and updated content</p>	<p>This release adds support for AWS Config Rules in the Asia Pacific (Mumbai) Region. For more information, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	<p>April 27, 2017</p>
<p>New and updated content</p>	<p>This release supports an updated console experience for adding AWS Config managed rules to your account for the first time.</p> <p>When you set up AWS Config Rules for the first time or in a new Region, you can search for AWS managed rules by name, description, or label. You can choose <b>Select all</b> to select all rules or choose <b>Clear all</b> to clear all rules.</p> <p>For more information, see <a href="#">Setting Up AWS Config Rules with the Console (p. 33)</a>.</p>	<p>April 5, 2017</p>

Change	Description	Release Date
AWS Config supports new managed rules	<p>This release supports the following new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">acm-certificate-expiration-check</a> (p. 108)</li> <li>• <a href="#">ec2-instance-detailed-monitoring-enabled</a> (p. 132)</li> <li>• <a href="#">ec2-managedinstance-inventory-blacklisted</a> (p. 135)</li> <li>• <a href="#">ec2-volume-inuse-check</a> (p. 137)</li> <li>• <a href="#">iam-user-group-membership-check</a> (p. 157)</li> <li>• <a href="#">iam-user-no-policies-check</a> (p. 158)</li> <li>• <a href="#">s3-bucket-ssl-requests-only</a> (p. 181)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	February 21, 2017
New and updated content	<p>This release adds support for AWS Config Rules in the Europe (London) Region. For more information, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	February 21, 2017
New and updated content	<p>This release adds AWS CloudFormation templates for AWS Config managed rules. You can use the templates to create managed rules for your account. For more information, see <a href="#">Creating AWS Config Managed Rules With AWS CloudFormation Templates</a> (p. 192).</p>	February 16, 2017
New and updated content	<p>This release adds support for a new test mode for the <code>PutEvaluations</code> API. Set the <code>TestMode</code> parameter to true in your custom rule to verify whether your AWS Lambda function will deliver evaluation results to AWS Config. No updates occur to your existing evaluations, and evaluation results are not sent to AWS Config.</p> <p>For more information, see <a href="#">PutEvaluations</a> in the <i>AWS Config API Reference</i>.</p>	February 16, 2017
New and updated content	<p>This release adds support for AWS Config Rules in the Asia Pacific (Seoul), and US West (N. California) Regions. For more information, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	December 21, 2016

Change	Description	Release Date
New and updated content	This release adds support for AWS Config in the Europe (London) Region. For more information, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i> .	December 13, 2016
New and updated content	This release adds support for AWS Config in the Canada (Central) Region. For more information, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i> .	December 8, 2016
AWS Config supports Amazon Redshift resource types and two new managed rules	<p>With this release, you can use AWS Config to record configuration changes to your Amazon Redshift clusters, cluster parameter groups, cluster security groups, cluster snapshots, cluster subnet groups, and event subscriptions.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p> <p>This release supports two new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">redshift-cluster-configuration-check (p. 170)</a></li> <li>• <a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a></li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p>	December 7, 2016
New and updated content	<p>This release adds support for a new managed rule:</p> <ul style="list-style-type: none"> <li>• <a href="#">dynamodb-throughput-limit-check (p. 130)</a></li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules (p. 103)</a>.</p>	December 7, 2016
New and updated content	This release adds support for creating up to 50 rules per Region in an account. For more information, see <a href="#">AWS Config Limits</a> in the <i>AWS General Reference</i> .	December 7, 2016

Change	Description	Release Date
<p>AWS Config supports the managed instance inventory resource type for Amazon EC2 Systems Manager and three new managed rules</p>	<p>With this release, you can use AWS Config to record software configuration changes on your managed instances with support for managed instance inventory.</p> <p>For more information, see <a href="#">Recording Software Configuration for Managed Instances</a> (p. 65).</p> <p>This release supports three new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">ec2-managedinstance-inventory-blacklisted</a> (p. 135)</li> <li>• <a href="#">ec2-managedinstance-applications-required</a> (p. 134)</li> <li>• <a href="#">ec2-managedinstance-platform-check</a> (p. 136)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	<p>December 1, 2016</p>
<p>AWS Config supports the Amazon S3 bucket resource and two new managed rules</p>	<p>With this release, you can use AWS Config to record configuration changes to your Amazon S3 buckets. For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p> <p>This release supports two new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">s3-bucket-logging-enabled</a> (p. 177)</li> <li>• <a href="#">s3-bucket-versioning-enabled</a> (p. 181)</li> </ul> <p>For more information, see <a href="#">AWS Config Managed Rules</a> (p. 102).</p>	<p>October 18, 2016</p>
<p>New and updated content</p>	<p>This release adds support for AWS Config and AWS Config Rules in the US East (Ohio) Region. For more information, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	<p>October 17, 2016</p>

Change	Description	Release Date
New and updated managed rules	<p>This update adds support for eight new managed rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">approved-amis-by-id</a> (p. 112)</li> <li>• <a href="#">approved-amis-by-tag</a> (p. 112)</li> <li>• <a href="#">db-instance-backup-enabled</a> (p. 126)</li> <li>• <a href="#">desired-instance-type</a> (p. 127)</li> <li>• <a href="#">ebs-optimized-instance</a> (p. 131)</li> <li>• <a href="#">iam-password-policy</a> (p. 154)</li> <li>• <a href="#">rds-multi-az-support</a> (p. 168)</li> <li>• <a href="#">rds-storage-encrypted</a> (p. 169)</li> </ul> <p>You can specify multiple parameter values for the following rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">desired-instance-tenancy</a> (p. 126)</li> <li>• <a href="#">required-tags</a> (p. 172)</li> </ul> <p>For more information, see <a href="#">List of AWS Config Managed Rules</a> (p. 103).</p>	October 4, 2016
New and updated content for the AWS Config console	<p>This update adds support for viewing AWS CloudTrail API activity in the AWS Config timeline. If CloudTrail is logging for your account, you can view create, update, and delete API events for configuration changes to your resources. For more information, see <a href="#">Viewing Configuration Details</a> (p. 45).</p>	September 06, 2016
AWS Config supports Elastic Load Balancing resource type	<p>With this release, you can use AWS Config to record configuration changes to your Elastic Load Balancing application load balancers. For more information, see <a href="#">Supported Resource Types</a> (p. 9).</p>	August 31, 2016
New and updated content	<p>This release adds support for AWS Config Rules in the Asia Pacific (Singapore), and Asia Pacific (Sydney) Regions. For more information, see <a href="#">AWS Regions and Endpoints</a> in the <i>AWS General Reference</i>.</p>	August 18, 2016

Change	Description	Release Date
New and updated content for AWS Config Rules	<p>This update adds support for creating a rule that can be triggered by both configuration changes and at a periodic frequency that you choose. For more information, see <a href="#">Specifying Triggers for AWS Config Rules (p. 101)</a>.</p> <p>This update also adds support for manually evaluating your resources against your rule and deleting evaluation results. For more information, see <a href="#">Evaluating Your Resources (p. 210)</a>.</p> <p>This update also adds support for evaluating additional resource types using custom rules. For more information, see <a href="#">Evaluating Additional Resource Types (p. 198)</a>.</p>	July 25, 2016
AWS Config supports Amazon RDS and AWS Certificate Manager (ACM) resource types	<p>With this release, you can use AWS Config to record configuration changes to your Amazon Relational Database Service (Amazon RDS) DB instances, DB security groups, DB snapshots, DB subnet groups, and event subscriptions. You can also use AWS Config to record configuration changes to certificates provided by ACM.</p> <p>For more information, see <a href="#">Supported Resource Types (p. 9)</a>.</p>	July 21, 2016
Updated information about managing the configuration recorder	<p>This update adds steps for renaming and deleting the configuration recorder to <a href="#">Managing the Configuration Recorder (p. 60)</a>.</p>	July 07, 2016
Simplified role creation and updated policies	<p>With this update, creating an IAM role for AWS Config is simplified. This enhancement is available in regions that support Config rules. To support this enhancement, the steps in <a href="#">Setting Up AWS Config with the Console (p. 25)</a> are updated, the example policy in <a href="#">Permissions for the Amazon S3 Bucket (p. 3292)</a> is updated, and the example policy in <a href="#">Granting Custom Permissions for AWS Config Users (p. 3281)</a> is updated.</p>	March 31, 2016

Change	Description	Release Date
Example functions and events for Config rules	This update provides updated example functions in <a href="#">Example AWS Lambda Functions for AWS Config Rules (Node.js)</a> (p. 199), and this update adds example events in <a href="#">Example Events for AWS Config Rules</a> (p. 204).	March 29, 2016
AWS Config Rules GitHub repository	This update adds information about the <a href="#">AWS Config Rules GitHub repository</a> to <a href="#">Evaluating Resources with AWS Config Rules</a> (p. 96). This repository provides sample functions for custom rules that are developed and contributed by AWS Config users.	March 1, 2016
AWS Config Rules	This release introduces AWS Config Rules. With rules, you can use AWS Config to evaluate whether your AWS resources comply with your desired configurations. For more information, see <a href="#">Evaluating Resources with AWS Config Rules</a> (p. 96).	December 18, 2015
AWS Config supports IAM resource types	With this release, you can use AWS Config to record configuration changes to your IAM users, groups, roles, and customer managed policies. For more information, see <a href="#">Supported Resource Types</a> (p. 9).	December 10, 2015
AWS Config supports EC2 Dedicated host	With this release, you can use AWS Config to record configuration changes to your EC2 Dedicated hosts. For more information, see <a href="#">Supported Resource Types</a> (p. 9).	November 23, 2015
Updated permissions information	This update adds information about the following AWS managed policies for AWS Config: <ul style="list-style-type: none"> <li>• <a href="#">AWS_ConfigRole</a> – Grants AWS Config permission to get configuration details about your resources. For more information, see <a href="#">IAM Role Policy for Getting Configuration Details</a> (p. 3291).</li> <li>• <a href="#">AWSConfigUserAccess</a> – Grants read-only access to an AWS Config user. For more information, see <a href="#">Granting Custom Permissions for AWS Config Users</a> (p. 3281).</li> </ul>	October 19, 2015

Change	Description	Release Date
AWS Config Rules preview	This release introduces the AWS Config Rules preview. With rules, you can use AWS Config to evaluate whether your AWS resources comply with your desired configurations. For more information, see <a href="#">Evaluating Resources with AWS Config Rules (p. 96)</a> .	October 7, 2015
New and updated content	This release adds the ability to look up resources that AWS Config has discovered. For more information, see <a href="#">Looking Up Resources That Are Discovered by AWS Config (p. 44)</a> .	August 27, 2015
New and updated content	This release adds the ability to select which resource types AWS Config records. For more information, see <a href="#">Selecting Which Resources AWS Config Records (p. 62)</a> .	June 23, 2015
New and updated content	This release adds support for the following regions: Asia Pacific (Tokyo), Asia Pacific (Singapore), Europe (Frankfurt), South America (São Paulo), and US West (N. California). For more information, see <a href="#">AWS Regions and Endpoints</a> .	April 6, 2015
New guide	This release introduces AWS Config.	November 12, 2014
