SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AM.4.226	Employ a capability to discover and identify systems with specific component attributes (e.g., firmware level, OS type) within your inventory.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
AM.4.226	Employ a capability to discover and identify systems with specific component attributes (e.g., firmware level, OS type) within your inventory.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
AM.4.226	Employ a capability to discover and identify systems with specific component attributes (e.g., firmware level, OS type) within your inventory.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
AU.4.053	Automate analysis of audit logs to identify and act on critical indicators (TTPs) and/or organizationally defined suspicious activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AU.4.053	Automate analysis of audit logs to identify and act on critical indicators (TTPs) and/or organizationally defined suspicious activity.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AU.4.053	Automate analysis of audit logs to identify and act on critical indicators (TTPs) and/or organizationally defined suspicious activity.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AU.4.053	Automate analysis of audit logs to identify and act on critical indicators (TTPs) and/or organizationally defined suspicious activity.	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	Control Description	AWS Config Rule	Guidance
AU.4.054	Review audit information for broad activity in addition to per-machine activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
RM.4.151	Perform scans for unauthorized ports available across perimeter network boundaries over the organization's Internet network boundaries and other organizationally defined boundaries.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

## Template

The template is available on GitHub: [Operational Best Practices for CMMC Level 4](#).

## Operational Best Practices for CMMC Level 5

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Cybersecurity Maturity Model Certification (CMMC) Level 5 and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more CMMC Level 5 controls. A CMMC Level 5 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the CMMC Level 5.

**AWS Region:** Due to tentative guidance provided by the DoD and the CMMC Accreditation Body with respect to FedRAMP reciprocity for CMMC Level 3 - 5, it is recommended that customers use AWS GovCloud (US) regions at this time for any workloads that require compliance with CMMC Level 3 - 5. As such, conformance pack templates for CMMC Levels 3 - 5 are not available within the conformance pack console to avoid confusion. Customers may independently install Config rules that map the tentative guidance for CMMC Level 3-5 (without a conformance pack template) via CloudFormation using the sample YAML file linked within this document.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational

Control ID	Control Description	AWS Config Rule	Guidance
			Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
AC.1.001	Limit information system access to authorized users, processes acting on behalf of authorized users, or devices (including other information systems).	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-password-policy</a> (p. 154)	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.002	Limit information system access to the types of transactions and functions that authorized users are permitted to execute.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC.1.003	Verify and control/limit connections to and use of external information systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
IA.1.076	Identify information system users, processes acting on behalf of users, or devices.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.1.077	Authenticate (or verify) the identities of those users, processes, or devices, as a prerequisite to allowing access to organizational information systems.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.1.175	Monitor, control, and protect organizational communications (i.e., information transmitted or received by organizational information systems) at the external boundaries and key internal boundaries of the information systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.1.176	Implement subnetworks for publicly accessible system components that are physically or logically separated from internal networks.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
SI.1.210	Identify, report, and correct information and information system flaws in a timely manner.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI.1.210	Identify, report, and correct information and information system flaws in a timely manner.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SI.1.211	Provide protection from malicious code at appropriate locations within organizational information systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC.2.007	Employ the principle of least privilege, including for specific security functions and privileged accounts.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance

Control ID	Control Description	AWS Config Rule	Guidance
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC.2.016	Control the flow of CUI in accordance with approved authorizations.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.041	Ensure that the actions of individual system users can be uniquely traced to those users so they can be held accountable for their actions.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. Control ID	Control Description	AWS Config Rule	Guidance
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AU.2.042	Create and retain system audit logs and records to the extent needed to enable the monitoring, analysis, investigation, and reporting of unlawful or unauthorized system activity.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">ec2-volume-in-use-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
CM.2.061	Establish and maintain baseline configurations and inventories of organizational systems (including hardware, software, firmware, and documentation) throughout the respective system development life cycles.	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
CM.2.062	Employ the principle of least functionality by configuring organizational systems to provide only essential capabilities.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
IA.2.081	Store and transmit only cryptographically-protected passwords.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.092	Establish an operational incident-handling capability for organizational systems that includes preparation, detection, analysis, containment, recovery, and user response activities.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
IR.2.093	Detect and report events.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
IR.2.093	Detect and report events.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
IR.2.093	Detect and report events.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
MA.2.113	Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
MA.2.113	Require multifactor authentication to establish nonlocal maintenance sessions via external network connections and terminate such connections when nonlocal maintenance is complete.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
RE.2.137	Regularly perform and test data backups.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
RE.2.137	Regularly perform and test data backups.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
RE.2.137	Regularly perform and test data backups.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
RE.2.137	Regularly perform and test data backups.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
RE.2.137	Regularly perform and test data backups.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
RM.2.142	Scan for vulnerabilities in organizational systems and applications periodically and when new vulnerabilities affecting those systems and applications are identified.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
SI.2.214	Monitor system security alerts and advisories and take action in response.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.216	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SI.2.216	Monitor organizational systems, including inbound and outbound communications traffic, to detect attacks and indicators of potential attacks.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.</p>
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">elb-logging-enabled (p. 144)</a>	<p>Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI.2.217	Identify unauthorized use of organizational systems.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC.3.017	Separate the duties of individuals to reduce the risk of malevolent activity without collusion.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.018	Prevent non-privileged users from executing privileged functions and capture the execution of such functions in audit logs.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
AC.3.014	Employ cryptographic mechanisms to protect the confidentiality of remote access sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AU.3.046	Alert in the event of an audit logging process failure.	<a href="#">cloud-trail-cloudwatch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
AU.3.049	Protect audit information and audit logging tools from unauthorized access, modification, and deletion.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
AU.3.051	Correlate audit record review, analysis, and reporting processes for investigation and response to indications of unlawful, unauthorized, suspicious, or unusual activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
CM.3.068	Restrict, disable, or prevent the use of nonessential programs, functions, ports, protocols, and services.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
IA.3.083	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
IA.3.083	Use multifactor authentication for local and network access to privileged accounts and for network access to non-privileged accounts.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.085	Prevent the reuse of identifiers for a defined period.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.086	Disable identifiers after a defined period of inactivity.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA.3.086	Disable identifiers after a defined period of inactivity.	<a href="#">iam-password-policy</a> (p. 154)	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
RE.3.139	Regularly perform complete, comprehensive, and resilient data backups as organizationally defined.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
CA.3.161	Monitor security controls on an ongoing basis to ensure the continued effectiveness of the controls.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
SC.3.180	Employ architectural designs, software development techniques, and systems engineering principles that promote effective information security within organizational systems.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
SC.3.182	Prevent unauthorized and unintended information transfer via shared system resources.	<a href="#">ec2-volume-in-use-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.185	Implement cryptographic mechanisms to prevent unauthorized disclosure of CUI during transmission unless otherwise protected by alternative physical safeguards.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.187	Establish and manage cryptographic keys for cryptography employed in organizational systems.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
SC.3.187	Establish and manage cryptographic keys for cryptography employed in organizational systems.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.190	Protect the authenticity of communications sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
SC.3.191	Protect the confidentiality of CUI at rest.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC.4.023	Control information flows between security domains on connected systems.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AM.4.226	Employ a capability to discover and identify systems with specific component attributes (e.g., firmware level, OS type) within your inventory.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
AM.4.226	Employ a capability to discover and identify systems with specific component attributes (e.g., firmware level, OS type) within your inventory.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
AM.4.226	Employ a capability to discover and identify systems with specific component attributes (e.g., firmware level, OS type) within your inventory.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
AU.4.053	Automate analysis of audit logs to identify and act on critical indicators (TTPs) and/or organizationally defined suspicious activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AU.4.053	Automate analysis of audit logs to identify and act on critical indicators (TTPs) and/or organizationally defined suspicious activity.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AU.4.053	Automate analysis of audit logs to identify and act on critical indicators (TTPs) and/or organizationally defined suspicious activity.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AU.4.053	Automate analysis of audit logs to identify and act on critical indicators (TTPs) and/or organizationally defined suspicious activity.	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	Control Description	AWS Config Rule	Guidance
AU.4.054	Review audit information for broad activity in addition to per-machine activity.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
RM.4.151	Perform scans for unauthorized ports available across perimeter network boundaries over the organization's Internet network boundaries and other organizationally defined boundaries.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
RM.4.151	Perform scans for unauthorized ports available across perimeter network boundaries over the organization's Internet network boundaries and other organizationally defined boundaries.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
RM.4.151	Perform scans for unauthorized ports available across perimeter network boundaries over the organization's Internet network boundaries and other organizationally defined boundaries.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
RM.4.151	Perform scans for unauthorized ports available across perimeter network boundaries over the organization's Internet network boundaries and other organizationally defined boundaries.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AU.5.055	Identify assets not reporting audit logs and assure appropriate organizationally defined systems are logging.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
CM.5.074	Verify the integrity and correctness of security critical or essential software as defined by the organization (e.g., roots of trust, formal verification, or cryptographic signatures).	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
CM.5.074	Verify the integrity and correctness of security critical or essential software as defined by the organization (e.g., roots of trust, formal verification, or cryptographic signatures).	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
CM.5.074	Verify the integrity and correctness of security critical or essential software as defined by the organization (e.g., roots of trust, formal verification, or cryptographic signatures).	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
CM.5.074	Verify the integrity and correctness of security critical or essential software as defined by the organization (e.g., roots of trust, formal verification, or cryptographic signatures).	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
IR.5.102	Use a combination of manual and automated, real-time responses to anomalous activities that match incident patterns.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
IR.5.102	Use a combination of manual and automated, real-time responses to anomalous activities that match incident patterns.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	Control Description	AWS Config Rule	Guidance
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
RE.5.140	Ensure information processing facilities meet organizationally defined information security continuity, redundancy, and availability requirements.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
SC.5.230	Enforce port and protocol compliance.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
SC.5.230	Enforce port and protocol compliance.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
SC.5.230	Enforce port and protocol compliance.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.5.230	Enforce port and protocol compliance.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SC.5.208	Employ organizationally defined and tailored boundary protections in addition to commercially available solutions.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
SC.5.208	Employ organizationally defined and tailored boundary protections in addition to commercially available solutions.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
SC.5.208	Employ organizationally defined and tailored boundary protections in addition to commercially available solutions.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC.5.208	Employ organizationally defined and tailored boundary protections in addition to commercially available solutions.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
SI.5.223	Monitor individuals and system components on an ongoing basis for anomalous or suspicious behavior.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

## Template

The template is available on GitHub: [Operational Best Practices for CMMC Level 5](#).

## Operational Best Practices for Compute Services

This pack contains AWS Config rules based on Compute Services. For more information, see [Compute for any workload](#). This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Compute Services](#).

## Operational Best Practices for Data Resiliency

This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Data Resiliency](#).

## Operational Best Practices for Databases Services

This pack contains AWS Config rules based on Databases Services. For more information, see [Databases on AWS](#). This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Databases Services](#).

## Operational Best Practices for Data Lakes and Analytics Services

This pack contains AWS Config rules for Data Lakes and Analytics Services. For more information, see [Data Lakes and Analytics on AWS](#). This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Data Lakes and Analytics Services](#).

## Operational Best Practices for EC2

This pack contains AWS Config rules based on EC2. This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for EC2](#).

## Operational Best Practices for Encryption and Key Management

This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Encryption and Key Management](#).

## Operational Best Practices for Esquema Nacional de Seguridad (ENS) Low

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between Spain Esquema Nacional de Seguridad (ENS) Low framework controls and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more Spain ENS Low controls. A Spain ENS control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This sample conformance pack template contains mappings to controls within the Spain ENS Low framework, as last updated on 2020/10/23.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
Article_16	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
Article_16	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
Article_16	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password

Control ID	AWS Config Rule	Guidance
		<p>policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
Article_16	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
Article_16	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Article_16	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Article_16	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
Article_16	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

AWS Config Developer Guide  
Operational Best Practices for Esquema  
Nacional de Seguridad (ENS) Low

Control ID	AWS Config Rule	Guidance
Article_16	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
Article_16	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
Article_20	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
Article_20	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
Article_20	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Article_21	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
Article_21	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
Article_21	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
Article_21	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
Article_21	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
Article_21	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	AWS Config Rule	Guidance
Article_21	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
Article_21	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
Article_21	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
Article_21	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
Article_21	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Article_21	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
Article_21	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
Article_21	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
Article_21	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Article_21	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
Article_21	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Article_22	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
Article_22	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Article_22	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

AWS Config Developer Guide

Control ID	AWS Config Rule	Guidance
Article_22	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Article_22	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Article_23	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Article_23	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
Article_23	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Article_23	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Article_23	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Article_23	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	AWS Config Rule	Guidance
Article_23	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
Article_23	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Article_23	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Article_24	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.
Article_24	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
Article_24	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	AWS Config Rule	Guidance
Article_25	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
Article_25	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
Article_25	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	AWS Config Rule	Guidance
Article_25	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
Article_25	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
Article_25	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
Article_25	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
Article_25	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
Article_25	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	AWS Config Rule	Guidance
Article_25	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
Article_25	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
Article_31	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Article_31	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Article_31	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
Article_31	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Article_31	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
Article_31	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.1	<a href="#">access-keys-rotated (p. 107)</a>	<p>The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.</p>
Appendix_II_4.2.1	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.1	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
Appendix_II_4.2.1	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.1	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Appendix_II_4.2.1	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_4.2.1	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
Appendix_II_4.2.1	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.1	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
Appendix_II_4.2.1	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
Appendix_II_4.2.1	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
Appendix_II_4.2.2	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.2	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
Appendix_II_4.2.2	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_4.2.2	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Appendix_II_4.2.2	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Appendix_II_4.2.5	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_4.2.5	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
Appendix_II_4.2.5	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Appendix_II_4.2.6	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
Appendix_II_4.2.6	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
Appendix_II_4.2.6	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Appendix_II_4.2.6	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
Appendix_II_4.2.6	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_4.2.6	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Appendix_II_4.2.6	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_4.2.6	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
Appendix_II_4.2.6	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
Appendix_II_4.2.6	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
Appendix_II_4.2.6	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.

AWS Config Developer Guide  
Operational Best Practices for Esquema  
Nacional de Seguridad (ENS) Low

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
Appendix_II_4.2.7	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
Appendix_II_4.2.7	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix_II_4.2.7	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
Appendix_II_4.2.7	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
Appendix_II_4.2.7	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
Appendix_II_4.2.7	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
Appendix_II_4.2.7	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

AWS Config Developer Guide  
Operational Best Practices for Esquema  
Nacional de Seguridad (ENS) Low

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Appendix_II_4.2.7	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
Appendix_II_4.2.7	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
Appendix_II_4.2.7	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
Appendix_II_4.2.7	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_4.2.7	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Appendix_II_4.2.7	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Appendix_II_4.2.7	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.1	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Appendix_II_4.3.1	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
Appendix_II_4.3.1	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
Appendix_II_4.3.1	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.2	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.3.2	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_4.3.4	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Appendix_II_4.3.4	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.4	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_4.3.4	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.3.6	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.3.6	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.8	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Appendix_II_4.3.8	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Appendix_II_4.3.8	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.8	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Appendix_II_4.3.11	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
Appendix_II_4.3.11	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
Appendix_II_4.3.11	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.11	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
Appendix_II_4.3.11	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
Appendix_II_4.3.11	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
Appendix_II_4.3.11	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
Appendix_II_4.3.11	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
Appendix_II_4.3.11	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
Appendix_II_4.3.11	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.11	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Appendix_II_4.3.11	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
Appendix_II_4.3.11	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
Appendix_II_4.3.11	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
Appendix_II_4.3.11	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.11	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
Appendix_II_4.3.11	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
Appendix_II_4.3.11	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.11	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
Appendix_II_4.3.11	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
Appendix_II_4.6.2	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.6.2	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.6.2	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Appendix_II_4.6.2	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Appendix_II_4.6.2	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Appendix_II_4.6.2	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.6.2	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
Appendix_II_4.6.2	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	<p>Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>
Appendix_II_4.6.2	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	<p>The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.</p>

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
Appendix_II_5.4.1	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.1	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.1	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
Appendix_II_5.4.1	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

AWS Config Developer Guide  
Operational Best Practices for Esquema  
Nacional de Seguridad (ENS) Low

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix_II_5.4.1	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
Appendix_II_5.4.1	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
Appendix_II_5.4.1	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
Appendix_II_5.4.1	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
Appendix_II_5.4.1	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.4.1	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Appendix_II_5.4.1	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
Appendix_II_5.4.1	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.4.1	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Appendix_II_5.4.1	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Appendix_II_5.4.1	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Appendix_II_5.4.3	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
Appendix_II_5.4.3	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.3	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix_II_5.4.3	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
Appendix_II_5.4.3	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.3	<a href="#">rds-snapshots-public-prohibited</a> (p. 168)	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">redshift-cluster-public-access-check</a> (p. 171)	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">restricted-common-ports</a> (p. 174)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Appendix_II_5.4.3	<a href="#">s3-account-level-public-access-blocks</a> (p. 175)	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.3	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.4.3	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.4.3	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Appendix_II_5.5.3	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
Appendix_II_5.5.3	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.5.3	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_5.5.3	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Appendix_II_5.5.3	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
Appendix_II_5.5.3	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
Appendix_II_5.5.3	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.5.3	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.5.3	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
Appendix_II_5.5.3	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.5.3	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.6.2	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
Appendix_II_5.6.2	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
Appendix_II_5.7.1	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non- repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Appendix_II_5.7.1	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Appendix_II_5.7.1	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.7.1	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Appendix_II_5.7.1	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_5.7.1	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
Appendix_II_5.7.4	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.7.4	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Appendix_II_5.7.7	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
Appendix_II_5.7.7	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
Appendix_II_5.7.7	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
Appendix_II_5.7.7	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.7.7	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
Appendix_II_5.8.2	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Appendix_II_5.8.2	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

## Template

The template is available on GitHub: [Operational Best Practices for Esquema Nacional de Seguridad \(ENS\) Low](#).

## Operational Best Practices for Esquema Nacional de Seguridad (ENS) Medium

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between Spain Esquema Nacional de Seguridad (ENS) Medium framework controls and AWS managed Config rules. Each Config rule applies to a specific AWS resource,

and relates to one or more Spain ENS Medium controls. A Spain ENS control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This sample conformance pack template contains mappings to controls within the Spain ENS Medium framework, as last updated on 2020/10/23.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
Article_16	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
Article_16	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
Article_16	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS

Control ID	AWS Config Rule	Guidance
		<p>Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
Article_16	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>
Article_16	<a href="#">iam-root-access-key-check (p. 157)</a>	<p>Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.</p>
Article_16	<a href="#">iam-user-group-membership-check (p. 157)</a>	<p>AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
Article_16	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
Article_16	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
Article_16	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
Article_16	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	AWS Config Rule	Guidance
Article_20	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
Article_20	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Article_20	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Article_21	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
Article_21	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
Article_21	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	AWS Config Rule	Guidance
Article_21	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
Article_21	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
Article_21	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
Article_21	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
Article_21	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
Article_21	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
Article_21	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	AWS Config Rule	Guidance
Article_21	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
Article_21	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
Article_21	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
Article_21	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
Article_21	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Article_21	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Article_21	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
Article_22	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
Article_22	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Article_22	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	AWS Config Rule	Guidance
Article_22	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
Article_22	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
Article_22	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Article_22	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Article_22	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Article_23	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Article_23	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
Article_23	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Article_23	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Article_23	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Article_23	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	AWS Config Rule	Guidance
Article_23	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
Article_23	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Article_23	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
Article_24	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Article_24	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Article_24	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Article_24	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
Article_24	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
Article_24	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
Article_24	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	AWS Config Rule	Guidance
Article_24	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Article_24	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.
Article_24	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
Article_24	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	AWS Config Rule	Guidance
Article_25	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
Article_25	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
Article_25	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	AWS Config Rule	Guidance
Article_25	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
Article_25	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
Article_25	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
Article_25	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
Article_25	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
Article_25	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	AWS Config Rule	Guidance
Article_25	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
Article_25	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
Article_31	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Article_31	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Article_31	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
Article_31	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Article_31	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
Article_31	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	AWS Config Rule	Guidance
Article_31	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
Article_33	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Article_33	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
Article_35	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
Article_35	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Article_37	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Article_37	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Article_37	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Article_37	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
Article_37	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Article_37	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
Article_37	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Article_37	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. Article_37	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
Article_37	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
Article_37	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.1	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
Appendix_II_4.2.1	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.1	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
Appendix_II_4.2.1	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.1	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Appendix_II_4.2.1	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_4.2.1	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
Appendix_II_4.2.1	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.1	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
Appendix_II_4.2.1	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
Appendix_II_4.2.1	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
Appendix_II_4.2.2	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Appendix_II_4.2.6	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
Appendix_II_4.2.6	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Appendix_II_4.2.6	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
Appendix_II_4.2.6	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_4.2.6	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Appendix_II_4.2.6	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_4.2.6	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.6	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
Appendix_II_4.2.6	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
Appendix_II_4.2.6	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
Appendix_II_4.2.6	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
Appendix_II_4.2.7	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
Appendix_II_4.2.7	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix_II_4.2.7	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
Appendix_II_4.2.7	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
Appendix_II_4.2.7	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
Appendix_II_4.2.7	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
Appendix_II_4.2.7	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_4.2.7	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Appendix_II_4.2.7	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
Appendix_II_4.2.7	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
Appendix_II_4.2.7	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
Appendix_II_4.2.7	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.2.7	<a href="#">s3-bucket-public-write-prohibited</a> (p. 180)	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_4.2.7	<a href="#">sagemaker-notebook-no-direct-internet-access</a> (p. 183)	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Appendix_II_4.2.7	<a href="#">vpc-default-security-group-closed</a> (p. 188)	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Appendix_II_4.2.7	<a href="#">vpc-sg-open-only-to-authorized-ports</a> (p. 189)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.1	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Appendix_II_4.3.1	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
Appendix_II_4.3.1	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
Appendix_II_4.3.1	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.2	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.3.2	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_4.3.3	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Appendix_II_4.3.3	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.3	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
Appendix_II_4.3.3	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
Appendix_II_4.3.4	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Appendix_II_4.3.4	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.4	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_4.3.4	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.3.6	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.3.6	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.7	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.3.7	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_4.3.7	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Appendix_II_4.3.7	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Appendix_II_4.3.7	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.7	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Appendix_II_4.3.7	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Appendix_II_4.3.7	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.7	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
Appendix_II_4.3.7	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Appendix_II_4.3.7	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.7	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
Appendix_II_4.3.7	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
Appendix_II_4.3.7	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
Appendix_II_4.3.7	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.8	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Appendix_II_4.3.8	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Appendix_II_4.3.8	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.8	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Appendix_II_4.3.9	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.3.9	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_4.3.9	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Appendix_II_4.3.9	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.9	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Appendix_II_4.3.9	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
Appendix_II_4.3.9	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Appendix_II_4.3.9	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.9	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
Appendix_II_4.3.9	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Appendix_II_4.3.9	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.9	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
Appendix_II_4.3.11	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
Appendix_II_4.3.11	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
Appendix_II_4.3.11	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.11	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
Appendix_II_4.3.11	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
Appendix_II_4.3.11	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
Appendix_II_4.3.11	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
Appendix_II_4.3.11	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
Appendix_II_4.3.11	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
Appendix_II_4.3.11	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.11	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Appendix_II_4.3.11	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
Appendix_II_4.3.11	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
Appendix_II_4.3.11	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
Appendix_II_4.3.11	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.11	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
Appendix_II_4.3.11	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
Appendix_II_4.3.11	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
Appendix_II_4.3.11	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.3.11	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
Appendix_II_4.3.11	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
Appendix_II_4.4.2	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
Appendix_II_4.4.2	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.4.2	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Appendix_II_4.6.1	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
Appendix_II_4.6.1	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix_II_4.6.1	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.6.1	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Appendix_II_4.6.1	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
Appendix_II_4.6.1	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Appendix_II_4.6.2	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.6.2	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_4.6.2	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Appendix_II_4.6.2	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
Appendix_II_4.6.2	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
Appendix_II_4.6.2	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
Appendix_II_4.6.2	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
Appendix_II_4.6.2	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	<p>Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>
Appendix_II_4.6.2	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	<p>The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.</p>

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
Appendix_II_5.4.1	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.1	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.1	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
Appendix_II_5.4.1	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix_II_5.4.1	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
Appendix_II_5.4.1	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
Appendix_II_5.4.1	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
Appendix_II_5.4.1	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
Appendix_II_5.4.1	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.4.1	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Appendix_II_5.4.1	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
Appendix_II_5.4.1	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.4.1	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.1	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Appendix_II_5.4.1	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Appendix_II_5.4.1	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Appendix_II_5.4.2	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.2	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix_II_5.4.2	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
Appendix_II_5.4.2	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.2	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
Appendix_II_5.4.2	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.4.2	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Appendix_II_5.4.2	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.3	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
Appendix_II_5.4.3	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.3	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
Appendix_II_5.4.3	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
Appendix_II_5.4.3	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.3	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
Appendix_II_5.4.3	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.4.3	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.3	<a href="#">restricted-common-ports</a> (p. 174)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
Appendix_II_5.4.3	<a href="#">s3-account-level-public-access-blocks</a> (p. 175)	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
Appendix_II_5.4.3	<a href="#">s3-bucket-public-read-prohibited</a> (p. 179)	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.4.3	<a href="#">s3-bucket-public-write-prohibited</a> (p. 180)	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.4.3	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Appendix_II_5.4.3	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
Appendix_II_5.4.3	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
Appendix_II_5.5.3	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
Appendix_II_5.5.3	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.5.3	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
Appendix_II_5.5.3	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
Appendix_II_5.5.3	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
Appendix_II_5.5.3	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
Appendix_II_5.5.3	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.5.3	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.5.3	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
Appendix_II_5.5.3	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.5.3	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.6.1	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
Appendix_II_5.6.1	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
Appendix_II_5.6.2	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
Appendix_II_5.6.2	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.6.2	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
Appendix_II_5.6.2	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
Appendix_II_5.7.1	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
Appendix_II_5.7.1	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.7.1	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
Appendix_II_5.7.1	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
Appendix_II_5.7.1	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
Appendix_II_5.7.1	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
Appendix_II_5.7.1	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.7.1	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
Appendix_II_5.7.1	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
Appendix_II_5.7.1	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
Appendix_II_5.7.1	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.7.1	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
Appendix_II_5.7.1	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
Appendix_II_5.7.1	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
Appendix_II_5.7.1	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.7.1	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
Appendix_II_5.7.1	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
Appendix_II_5.7.1	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
Appendix_II_5.7.1	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
Appendix_II_5.7.4	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.7.4	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Appendix_II_5.7.7	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
Appendix_II_5.7.7	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
Appendix_II_5.7.7	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
Appendix_II_5.7.7	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	AWS Config Rule	Guidance
Appendix_II_5.7.7	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
Appendix_II_5.8.2	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
Appendix_II_5.8.2	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

## Template

The template is available on GitHub: [Operational Best Practices for Esquema Nacional de Seguridad \(ENS\) Medium](#).

# Operational Best Practices for FDA Title 21 CFR Part 11

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Title 21 of the Code of Federal Regulations (CFR) Part 11 and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more FDA Title 21 CFR Part 11 controls. A FDA Title 21 CFR Part 11 control can be

related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable you to align to a subset of FDA Title 21 CFR Part 11 design principles.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
11.10(a)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a)	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
	Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.		
11.10(a)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">db-instance-backup-enabled (p. 126)</a></p>	<p>The backup feature of Amazon RDS creates backups of your databases and transaction logs. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.</p>
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a></p>	<p>When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a></p>	<p>Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.</p>
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">elb-deletion-protection-enabled (p. 144)</a></p>	<p>This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">rds-in-backup-plan (p. 167)</a></p>	<p>To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.</p>
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">rds-instance-deletion-protection-enabled (p. 166)</a></p>	<p>Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<a href="#">rds-multi-az-support (p. 168)</a>	<p>Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">s3-bucket-replication-enabled (p. 180)</a></p>	<p>Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.</p>
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">vpc-vpn-2-tunnels-up (p. 189)</a></p>	<p>Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a></p>	<p>An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.</p>
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a></p>	<p>Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a></p>	<p>Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.</p>
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">ec2-stopped-instance (p. 137)</a></p>	<p>Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(a)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (a) Validation of systems to ensure accuracy, reliability, consistent intended performance, and the ability to discern invalid or altered records.</p>	<p><a href="#">ec2-volume-inuse-check (p. 137)</a></p>	<p>This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.</p>
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">s3-bucket-public-read-prohibited (p. 179)</a></p>	<p>Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">cw-loggroup-retention-period-check (p. 125)</a></p>	<p>Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.</p>
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">s3-bucket-public-write-prohibited (p. 180)</a></p>	<p>Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a></p>	<p>To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.</p>
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">s3-bucket-ssl-requests-only (p. 181)</a></p>	<p>To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a></p>	<p>To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.</p>
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a></p>	<p>To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.</p>
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">redshift-cluster-public-access-check (p. 171)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">redshift-require-tls-ssl (p. 172)</a></p>	<p>Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.</p>
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">redshift-cluster-configuration-check (p. 170)</a></p>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">rds-snapshot-encrypted (p. 168)</a></p>	<p>Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.</p>
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">rds-snapshots-public-prohibited (p. 168)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">rds-storage-encrypted (p. 169)</a></p>	<p>To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.</p>
11.10(c)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (c) Protection of records to enable their accurate and ready retrieval throughout the records retention period.</p>	<p><a href="#">s3-bucket-versioning-enabled (p. 181)</a></p>	<p>Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">access-keys-rotated (p. 107)</a></p>	<p>The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">ec2-imdsv2-check (p. 132)</a></p>	<p>Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">emr-kerberos-enabled (p. 145)</a></p>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">iam-group-has-users-check (p. 153)</a></p>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (d) Limiting system access to authorized individuals.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">iam-password-policy</a> (p. 154)</p>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a></p>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">iam-root-access-key-check (p. 157)</a></p>	<p>Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">iam-user-group-membership-check (p. 157)</a></p>	<p>AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">iam-user-mfa-enabled (p. 158)</a></p>	<p>Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">iam-user-no-policies-check (p. 158)</a></p>	<p>This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">iam-user-unused-credentials-check (p. 159)</a></p>	<p>AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">mfa-enabled-for-iam-console-access (p. 163)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">root-account-hardware-mfa-enabled (p. 175)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<a href="#">root-account-mfa-enabled (p. 175)</a>	<p>Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	<p>Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code>. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">secretsmanager-rotation-enabled-check (p. 183)</a></p>	<p>This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a></p>	<p>This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">dms-replication-not-public (p. 127)</a></p>	<p>Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">ebs-snapshot-public-restorable-check (p. 131)</a></p>	<p>Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">ec2-instance-no-public-ip (p. 133)</a></p>	<p>Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">elasticsearch-in-vpc-only (p. 141)</a></p>	<p>Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">emr-master-no-public-ip (p. 146)</a></p>	<p>Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">restricted-ssh (p. 159)</a></p>	<p>Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">ec2-instances-in-vpc (p. 159)</a></p>	<p>Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">internet-gateway-authorized-vpc-only (p. 160)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">lambda-function-public-access-prohibited (p. 161)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">lambda-inside-vpc (p. 162)</a></p>	<p>Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">rds-instance-public-access-check (p. 166)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">restricted-common-ports (p. 174)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">s3-account-level-public-access-blocks (p. 175)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">vpc-default-security-group-closed (p. 188)</a></p>	<p>Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.</p>
11.10(d)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following:</p> <p>(d) Limiting system access to authorized individuals.</p>	<p><a href="#">rds-snapshots-public-prohibited (p. 168)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
11.10(e)	(e) Use of secure, computer-generated, time-stamped audit trails to independently record the date and time of operator entries and actions that create, modify, or delete electronic records. Record changes shall not obscure previously recorded information. Such audit trail documentation shall be retained for a period at least as long as that required for the subject electronic records and shall be available for agency review and copying.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.</p>	<p><a href="#">elasticsearch-encrypted-at-rest (p. 141)</a></p>	<p>Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.</p>	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	<p>Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.</p>	<a href="#">ec2-imsdv2-check (p. 132)</a>	<p>Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.</p>	<p><a href="#">iam-password-policy (p. 154)</a></p>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.</p>	<a href="#">iam-root-access-key-check (p. 157)</a>	<p>Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.</p>	<p><a href="#">secretsmanager-rotation-enabled-check (p. 183)</a></p>	<p>This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(g)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (g) Use of authority checks to ensure that only authorized individuals can use the system, electronically sign a record, access the operation or computer system input or output device, alter a record, or perform the operation at hand.</p>	<p><a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a></p>	<p>Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.</p>
11.10(h)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (h) Use of device (e.g., terminal) checks to determine, as appropriate, the validity of the source of data input or operational instruction.</p>	<p><a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a></p>	<p>An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(h)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (h) Use of device (e.g., terminal) checks to determine, as appropriate, the validity of the source of data input or operational instruction.</p>	<p><a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a></p>	<p>Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.</p>
11.10(h)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (h) Use of device (e.g., terminal) checks to determine, as appropriate, the validity of the source of data input or operational instruction.</p>	<p><a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a></p>	<p>Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(k)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (k) Use of appropriate controls over systems documentation including: (1) Adequate controls over the distribution of, access to, and use of documentation for system operation and maintenance. (2) Revision and change control procedures to maintain an audit trail that documents time-sequenced development and modification of systems documentation.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(k)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (k) Use of appropriate controls over systems documentation including: (1) Adequate controls over the distribution of, access to, and use of documentation for system operation and maintenance. (2) Revision and change control procedures to maintain an audit trail that documents time-sequenced development and modification of systems documentation.</p>	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	<p>Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(k)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (k) Use of appropriate controls over systems documentation including: (1) Adequate controls over the distribution of, access to, and use of documentation for system operation and maintenance. (2) Revision and change control procedures to maintain an audit trail that documents time-sequenced development and modification of systems documentation.</p>	<a href="#">emr-master-no-public-ip (p. 146)</a>	<p>Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.10(k)	Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (k) Use of appropriate controls over systems documentation including: (1) Adequate controls over the distribution of, access to, and use of documentation for system operation and maintenance. (2) Revision and change control procedures to maintain an audit trail that documents time-sequenced development and modification of systems documentation.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
11.10(k)	<p>Persons who use closed systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, when appropriate, the confidentiality of electronic records, and to ensure that the signer cannot readily repudiate the signed record as not genuine. Such procedures and controls shall include the following: (k) Use of appropriate controls over systems documentation including: (1) Adequate controls over the distribution of, access to, and use of documentation for system operation and maintenance. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	Control Description	AWS Config Rule	Guidance
11.30	Persons who use open systems to create, modify, maintain, or transmit electronic records shall employ procedures and controls designed to ensure the authenticity, integrity, and, as appropriate, the confidentiality of electronic records from the point of their creation to the point of their receipt. Such procedures and controls shall include those identified in 11.10, as appropriate, and additional measures such as document encryption and use of appropriate digital signature standards to ensure, as necessary under the circumstances, record authenticity, integrity, and confidentiality.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
11.200	<p>(a) Electronic signatures that are not based upon biometrics shall: (1) Employ at least two distinct identification components such as an identification code and password. (i) When an individual executes a series of signings during a single, continuous period of controlled system access, the first signing shall be executed using all electronic signature components; subsequent signings shall be executed using at least one electronic signature component that is only executable by, and designed to be used only by, the individual. (ii) When an individual executes one or more signings not performed during a single, continuous period of controlled system access, each signing shall be executed using all of the electronic signature components. (2) Be used only by their genuine owners; and (3) Be administered and executed to ensure that attempted use of an individual's electronic signature by anyone other than its genuine owner requires collaboration of two or more individuals.</p>	<p><a href="#">access-keys-rotated (p. 107)</a></p>	<p>The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.</p>

Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.</p>
11.300(d)	<p>Persons who use electronic signatures based upon use of identification codes in combination with passwords shall employ controls to ensure their security and integrity. Such controls shall include: (d) Use of transaction safeguards to prevent unauthorized use of passwords and/or identification codes, and to detect and report in an immediate and urgent manner any attempts at their unauthorized use to the system security unit, and, as appropriate, to organizational management.</p>	<p><a href="#">cloud-trail-cloud-watch-logs-enabled</a> (p. 121)</p>	<p>Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.300(d)	<p>Persons who use electronic signatures based upon use of identification codes in combination with passwords shall employ controls to ensure their security and integrity. Such controls shall include: (d) Use of transaction safeguards to prevent unauthorized use of passwords and/or identification codes, and to detect and report in an immediate and urgent manner any attempts at their unauthorized use to the system security unit, and, as appropriate, to organizational management.</p>	<p><a href="#">cloudtrail-enabled (p. 121)</a></p>	<p>AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.</p>
11.300(d)	<p>Persons who use electronic signatures based upon use of identification codes in combination with passwords shall employ controls to ensure their security and integrity. Such controls shall include: (d) Use of transaction safeguards to prevent unauthorized use of passwords and/or identification codes, and to detect and report in an immediate and urgent manner any attempts at their unauthorized use to the system security unit, and, as appropriate, to organizational management.</p>	<p><a href="#">securityhub-enabled (p. 186)</a></p>	<p>AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.</p>

Control ID	Control Description	AWS Config Rule	Guidance
11.300(d)	Persons who use electronic signatures based upon use of identification codes in combination with passwords shall employ controls to ensure their security and integrity. Such controls shall include: (d) Use of transaction safeguards to prevent unauthorized use of passwords and/or identification codes, and to detect and report in an immediate and urgent manner any attempts at their unauthorized use to the system security unit, and, as appropriate, to organizational management.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

## Template

The template is available on GitHub: [Operational Best Practices for FDA Title 21 CFR Part 11](#).

## Operational Best Practices for FedRAMP(Low)

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Federal Risk and Authorization Management Program (FedRAMP) Low Baseline Controls and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more FedRAMP controls. A FedRAMP control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the

Control ID	Control Description	AWS Config Rule	Guidance
			<p>rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.</p>
AC-2	ACCOUNT MANAGEMENT	iam-password-policy (p. 154)	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
AC-2	ACCOUNT MANAGEMENT	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-2	ACCOUNT MANAGEMENT	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC-2	ACCOUNT MANAGEMENT	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AC-2	ACCOUNT MANAGEMENT	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AC-2	ACCOUNT MANAGEMENT	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
AC-2	ACCOUNT MANAGEMENT	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), and <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
AC-2	ACCOUNT MANAGEMENT	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
AC-2	ACCOUNT MANAGEMENT	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
AC-2	ACCOUNT MANAGEMENT	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
AC-2	ACCOUNT MANAGEMENT	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	Control Description	AWS Config Rule	Guidance
AC-2	ACCOUNT MANAGEMENT	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-2	ACCOUNT MANAGEMENT	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC-3	ACCESS ENFORCEMENT	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	ACCESS ENFORCEMENT	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
AC-3	ACCESS ENFORCEMENT	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC-3	ACCESS ENFORCEMENT	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC-3	ACCESS ENFORCEMENT	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	ACCESS ENFORCEMENT	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC-3	ACCESS ENFORCEMENT	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC-3	ACCESS ENFORCEMENT	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	ACCESS ENFORCEMENT	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC-3	ACCESS ENFORCEMENT	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
AC-17	REMOTE ACCESS	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17	REMOTE ACCESS	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17	REMOTE ACCESS	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AC-17	REMOTE ACCESS	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
AC-17	REMOTE ACCESS	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17	REMOTE ACCESS	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
AU-2	AUDIT EVENTS	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
AU-2	AUDIT EVENTS	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
AU-2	AUDIT EVENTS	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
AU-2	AUDIT EVENTS	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
AU-9	PROTECTION OF AUDIT INFORMATION	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
AU-9	PROTECTION OF AUDIT INFORMATION	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
AU-9	PROTECTION OF AUDIT INFORMATION	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
AU-11	AUDIT RECORD RETENTION	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. This rule allows you to optionally set the MinRetentionTime (FedRAMP Parameter: 90), as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
CA-7	CONTINUOUS MONITORING	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
CA-7	CONTINUOUS MONITORING	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	Control Description	AWS Config Rule	Guidance
CM-2	BASELINE CONFIGURATION	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
CM-2	BASELINE CONFIGURATION	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
CM-2	BASELINE CONFIGURATION	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.

Control ID	Control Description	AWS Config Rule	Guidance
CM-2	BASELINE CONFIGURATION	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
CM-2	BASELINE CONFIGURATION	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
CM-2	BASELINE CONFIGURATION	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
CM-8	INFORMATION SYSTEM COMPONENT INVENTORY	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
CP-9	INFORMATION SYSTEM BACKUP	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
CP-9	INFORMATION SYSTEM BACKUP	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
CP-9	INFORMATION SYSTEM BACKUP	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
CP-9	INFORMATION SYSTEM BACKUP	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
CP-9	INFORMATION SYSTEM BACKUP	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
CP-9	INFORMATION SYSTEM BACKUP	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
CP-9	INFORMATION SYSTEM BACKUP	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
CP-10	INFORMATION SYSTEM RECOVERY AND RECONSTITUTION	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
CP-10	INFORMATION SYSTEM RECOVERY AND RECONSTITUTION	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	Control Description	AWS Config Rule	Guidance
CP-10	INFORMATION SYSTEM RECOVERY AND RECONSTITUTION	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
CP-10	INFORMATION SYSTEM RECOVERY AND RECONSTITUTION	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
CP-10	INFORMATION SYSTEM RECOVERY AND RECONSTITUTION	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
IA-2	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS)	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
IA-2	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS)	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
IA-2	IDENTIFICATION AND AUTHENTICATION (ORGANIZATIONAL USERS)	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
IR-4	INCIDENT HANDLING	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (FedRAMP Parameter: 180), daysMediumSev (FedRAMP Parameter: 90), and daysHighSev (FedRAMP Parameter: 30) for non-archived findings, as required by your organization's policies.
SA-3	SYSTEM DEVELOPMENT LIFE CYCLE	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.

Control ID	Control Description	AWS Config Rule	Guidance
SC-5	DENIAL OF SERVICE PROTECTION	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
SC-5	DENIAL OF SERVICE PROTECTION	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
SC-7	BOUNDARY PROTECTION	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7	BOUNDARY PROTECTION	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-12	CRYPTOGRAPHIC KEY ESTABLISHMENT AND MANAGEMENT	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
SC-12	CRYPTOGRAPHIC KEY ESTABLISHMENT AND MANAGEMENT	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
SC-13	CRYPTOGRAPHIC PROTECTION	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

## Template

The template is available on GitHub: [Operational Best Practices for FedRAMP\(Low\)](#).

## Operational Best Practices for FedRAMP(Moderate)

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Federal Risk and Authorization Management Program (FedRAMP) and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more FedRAMP controls. A FedRAMP control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the FedRAMP controls.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (FedRAMP Parameter: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password

Control ID	Control Description	AWS Config Rule	Guidance
			Policy. The actual values should reflect your organization's policies.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC-2(1)	The organization employs automated mechanisms to support the management of information system accounts.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(3)	The information system automatically disables inactive accounts after 90 days for user accounts.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (FedRAMP Parameter: 90). The actual value should reflect your organization's policies.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
AC-2(4)	The information system automatically audits account creation, modification, enabling, disabling, and removal actions, and notifies [Assignment: organization-defined personnel or roles].	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(12)(a)	The organization: a. Monitors information system accounts for [Assignment: organization-defined atypical use].	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC-2(12)(a)	The organization: a. Monitors information system accounts for [Assignment: organization-defined atypical use].	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(f)	The organization: f. Creates, enables, modifies, disables, and removes information system accounts in accordance with [Assignment: organization-defined procedures or conditions].	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the maxCredentialUsageAge (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(f)	The organization: f. Creates, enables, modifies, disables, and removes information system accounts in accordance with [Assignment: organization-defined procedures or conditions].	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (FedRAMP Parameter: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(f)	The organization: f. Creates, enables, modifies, disables, and removes information system accounts in accordance with [Assignment: organization-defined procedures or conditions].	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC-2(g)	The organization: g. Monitors the use of information system accounts.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(g)	The organization: g. Monitors the use of information system accounts.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
AC-2(g)	The organization: g. Monitors the use of information system accounts.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
AC-2(g)	The organization: g. Monitors the use of information system accounts.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(g)	The organization: g. Monitors the use of information system accounts.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC-2(g)	The organization: g. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(j)	The organization: j. Reviews accounts for compliance with account management requirements [Assignment: organization-defined frequency].	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
AC-2(j)	The organization: j. Reviews accounts for compliance with account management requirements [Assignment: organization-defined frequency].	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC-2(j)	The organization: j. Reviews accounts for compliance with account management requirements [Assignment: organization-defined frequency].	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-2(j)	The organization: j. Reviews accounts for compliance with account management requirements [Assignment: organization-defined frequency].	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
AC-3	The information system enforces approved authorizations for logical access to information and system resources in accordance with applicable access control policies.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-3	The information system enforces approved authorizations for information access to information and system resources in accordance with applicable access control policies.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-4	The information system enforces approved authorizations for controlling the flow of information within the system and between interconnected systems based on [Assignment: organization-defined information flow control policies].	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC-5c	The organization: c. Defines information system access authorizations to support separation of duties.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
AC-5c	The organization: c. Defines information system access authorizations to support separation of duties.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
AC-5c	The organization: c. Defines information system access authorizations to support separation of duties.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
AC-5c	The organization: c. Defines information system access authorizations to support separation of duties.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
AC-6	The organization employs the principle of least privilege, allowing only authorized accesses for users (or processes acting on behalf of users) which are necessary to accomplish assigned tasks in accordance with organizational missions and business functions.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
AC-6(10)	The information system prevents non-privileged users from executing privileged functions to include disabling, circumventing, or altering implemented security safeguards/countermeasures.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
AC-17(1)	The information system monitors and controls remote access methods.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
AC-17(1)	The information system monitors and controls remote access methods.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17(2)	The information system implements cryptographic mechanisms to protect the confidentiality and integrity of remote access sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
AC-17(3)	The information system routes all remote accesses through [Assignment: organization-defined number] managed network access control points.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
AC-21(b)	The organization: b. Employs [Assignment: organization-defined automated mechanisms or manual processes] to assist users in making information sharing/ collaboration decisions.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
IA-5(4)	The organization employs automated tools to determine if password authenticators are sufficiently strong to satisfy [Assignment: organization-defined requirements].	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (FedRAMP Parameter: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IA-5(7)	The organization ensures that unencrypted static authenticators are not embedded in applications or access scripts or stored on function keys.	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
IR-4(1)	The organization employs automated mechanisms to support the incident handling process.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
IR-4(1)	The organization employs automated mechanisms to support the incident handling process.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (FedRAMP Parameter: 180), daysMediumSev (FedRAMP Parameter: 90), and daysHighSev (FedRAMP Parameter: 30) for non-archived findings, as required by your organization's policies.
IR-6(1)	The organization employs automated mechanisms to assist in the reporting of security incidents.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the daysLowSev (FedRAMP Parameter: 180), daysMediumSev (FedRAMP Parameter: 90), and daysHighSev (FedRAMP Parameter: 30) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
IR-7(1)	The organization employs automated mechanisms to increase the availability of incident response-related information and support.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (FedRAMP Parameter: 180), <code>daysMediumSev</code> (FedRAMP Parameter: 90), and <code>daysHighSev</code> (FedRAMP Parameter: 30) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
RA-5	<p>The organization: a. Scans for vulnerabilities in the information system and hosted applications [Assignment: organization-defined frequency and/or randomly in accordance with organization-defined process] and when new vulnerabilities potentially affecting the system/applications are identified and reported; b. Employs vulnerability scanning tools and techniques that facilitate interoperability among tools and automate parts of the vulnerability management process by using standards for: 1. Enumerating platforms, software flaws, and improper configurations; 2. Formatting checklists and test procedures; and 3. Measuring vulnerability impact; c. Analyzes vulnerability scan reports and results from security control assessments; d. Remediates legitimate vulnerabilities [Assignment: organization-defined response times], in accordance with an organizational assessment of risk; and e. Shares information obtained from the vulnerability scanning process and security control assessments with [Assignment: organization-defined personnel or roles] to help eliminate</p>	<p><a href="#">guardduty-enabled-centralized (p. 152)</a></p>	<p>Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. Track security flaws and flaw resolution within the system, component, or service and report findings to [Assignment: organization-defined personnel].	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SC-2	The information system separates user functionality (including user interface services) from information system management functionality.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
SC-2	The information system separates user functionality (including user interface services) from information system management functionality.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
SC-4	The information system prevents unauthorized and unintended information transfer via shared system resources.	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
SC-5	The information system protects against or limits the effects of the following types of denial of service attacks: [Assignment: organization-defined types of denial of service attacks or references to sources for such information] by employing [Assignment: organization-defined security safeguards].	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7	The information system: a. Monitors and controls communications at the external boundary of the system and at key internal boundaries within the system; b. Implements subnetworks for publicly accessible system components that are [Selection: physically; logically] separated from internal organizational networks; and c. Connects to external networks or information systems only through managed interfaces consisting of boundary protection devices arranged in accordance with an organizational security architecture.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance

SC-7	<p>The information system: a. Monitors and controls communications at the external boundary of the system and at key internal boundaries within the system; b. Implements subnetworks for publicly accessible system components that are [Selection: physically; logically] separated from internal organizational networks; and c. Connects to external networks or information systems only through managed interfaces consisting of boundary protection devices arranged in accordance with an organizational security architecture.</p>	<p><a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a></p>	<p>Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC-7(3)	The organization limits the number of external network connections to the information system.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
SC-8	The information system protects the confidentiality AND integrity of transmitted information.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-8	The information system protects the confidentiality AND integrity of transmitted information.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-8	The information system protects the confidentiality AND integrity of transmitted information.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-8	The information system protects the confidentiality AND integrity of transmitted information.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-8	The information system protects the confidentiality AND integrity of transmitted information.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-8	The information system protects the confidentiality AND integrity of transmitted information.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-8	The information system protects the confidentiality AND integrity of transmitted information.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
SC-8(1)	The information system implements cryptographic mechanisms to [Selection (one or more): prevent unauthorized disclosure of information; detect changes to information] during transmission unless otherwise protected by [Assignment: organization-defined alternative physical safeguards].	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-8(1)	The information system implements cryptographic mechanisms to [Selection (one or more): prevent unauthorized disclosure of information; detect changes to information] during transmission unless otherwise protected by [Assignment: organization-defined alternative physical safeguards].	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. SC-8(1)	The information system implements cryptographic mechanisms to [Selection (one or more): prevent unauthorized disclosure of information; detect changes to information] during transmission unless otherwise protected by [Assignment: organization-defined alternative physical safeguards].	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-8(1)	The information system implements cryptographic mechanisms to [Selection (one or more): prevent unauthorized disclosure of information; detect changes to information] during transmission unless otherwise protected by [Assignment: organization-defined alternative physical safeguards].	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-8(1)	The information system implements cryptographic mechanisms to [Selection (one or more): prevent unauthorized disclosure of information; detect changes to information] during transmission unless otherwise protected by [Assignment: organization-defined alternative physical safeguards].	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
SC-12	The organization establishes and manages cryptographic keys for required cryptography employed within the information system in accordance with [Assignment: organization-defined requirements for key generation, distribution, storage, access, and destruction].	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
SC-12	The organization establishes and manages cryptographic keys for required cryptography employed within the information system in accordance with [Assignment: organization-defined requirements for key generation, distribution, storage, access, and destruction].	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
SC-12	The organization establishes and manages cryptographic keys for required cryptography employed within the information system in accordance with [Assignment: organization-defined requirements for key generation, distribution, storage, access, and destruction].	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
SC-13	The information system implements FIPS-validated or NSA-approved cryptography in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards.	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
SC-23	The information system protects the authenticity of communications sessions.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-23	The information system protects the authenticity of communications sessions.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-23	The information system protects the authenticity of communications sessions.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
SC-28	The information system protects the confidentiality AND integrity of [Assignment: organization-defined information at rest].	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
SI-2(2)	The organization employs automated mechanisms at least monthly to determine the state of information system components with regard to flaw remediation.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
SI-2(2)	The organization employs automated mechanisms at least monthly to determine the state of information system components with regard to flaw remediation.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
SI-2(2)	The organization employs automated mechanisms at least monthly to determine the state of information system components with regard to flaw remediation.	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(1)	The organization connects and configures individual intrusion detection tools into an information system-wide intrusion detection system.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI-4(16)	The organization correlates information from monitoring tools employed throughout the information system.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI-4(16)	The organization correlates information from monitoring tools employed throughout the information system.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
SI-4(2)	The organization employs automated tools to support near real-time analysis of events.	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	Control Description	AWS Config Rule	Guidance
SI-4(4)	The information system monitors inbound and outbound communications traffic continuously for unusual or unauthorized activities or conditions.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
SI-4(4)	The information system monitors inbound and outbound communications traffic continuously for unusual or unauthorized activities or conditions.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.</p>

Control ID	Control Description	AWS Config Rule	Guidance
SI-7(1)	The information system performs an integrity check security relevant events at least monthly.	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
SI-7(1)	The information system performs an integrity check security relevant events at least monthly.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
SI-7(1)	The information system performs an integrity check security relevant events at least monthly.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

SI-12	The organization handles and retains information within the information system and information output from the system in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and operational requirements.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events. This rule allows you to optionally set the <code>MinRetentionTime</code> (FedRAMP Parameter: 90), as required by your organization's policies.

## Template

The template is available on GitHub: [Operational Best Practices for FedRAMP\(Moderate\)](#).

## Operational Best Practices for FFIEC

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Federal Financial Institutions Examination Council (FFIEC) Cyber Security Assessment Tool domains and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more FFIEC Cyber Security Assessment Tool controls. A FFIEC Cyber Security Assessment Tool control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the FFIEC Cyber Security Assessment Tool.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
D1.RM.RA.B.2	The risk assessment identifies Internet-based systems and high-risk transactions that warrant additional authentication controls.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D2.TI.Ti.B.1	The institution belongs or subscribes to a threat and vulnerability information-sharing source(s) that provides information on threats (e.g., FS-ISAC, US-CERT).	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
D2.TI.Ti.B.2	Threat information is used to monitor threats and vulnerabilities.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	Control Description	AWS Config Rule	Guidance
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	Control Description	AWS Config Rule	Guidance
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
D2.MA.Ma.B.1	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
D2.IS.Is.B.1	Information security threats are gathered and shared with applicable internal employees.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
D3.PC.Im.B.1	Network perimeter defense tools (e.g., border router and firewall) are used.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.1	Employee access is granted to systems and confidential data based on job responsibilities and the principles of least privilege.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.PC.Im.B.7	Access to make changes to systems configurations (including virtual machines and hypervisors) is controlled and monitored.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.PC.Im.B.7	Access to make changes to systems configurations (including virtual machines and hypervisors) is controlled and monitored.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.7	Access to make changes to systems configurations (including virtual machines and hypervisors) is controlled and monitored.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
D3.PC.Am.B.1	Employee access is granted to systems and confidential data based on job responsibilities and the principles of least privilege.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
D3.PC.Am.B.1	Employee access is granted to systems and confidential data based on job responsibilities and the principles of least privilege.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.3	Elevated privileges (e.g., administrator privileges) are limited and tightly controlled (e.g., assigned to individuals, not shared, and require stronger password controls)	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
D3.PC.Am.B.3	Elevated privileges (e.g., administrator privileges) are limited and tightly controlled (e.g., assigned to individuals, not shared, and require stronger password controls)	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	<p>To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.13	Confidential data is encrypted when transmitted across public or untrusted networks (e.g., Internet).	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
D3.PC.Im.B.5	Systems configurations (for servers, desktops, routers, etc.) follow industry standards and are enforced	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Se.B.1	Developers working for the institution follow secure program coding practices, as part of a system development life cycle (SDLC), that meet industry standards.	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
D3.PC.Se.B.1	Developers working for the institution follow secure program coding practices, as part of a system development life cycle (SDLC), that meet industry standards.	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
D3.DC.An.B.1	The institution is able to detect anomalous activities through monitoring across the environment.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.An.B.1	The institution is able to detect anomalous activities through monitoring across the environment.	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
D3.DC.An.B.1	The institution is able to detect anomalous activities through monitoring across the environment.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
D3.DC.Ev.B.1	A normal network activity baseline is established.	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	Control Description	AWS Config Rule	Guidance
D5.IR.PI.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	Control Description	AWS Config Rule	Guidance
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
D5.DR.De.B.1	Alert parameters are set for detecting information security incidents that prompt mitigating actions.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	Control Description	AWS Config Rule	Guidance
D2.TI.Ti.B.1	The institution belongs or subscribes to a threat and vulnerability information-sharing source(s) that provides information on threats (e.g., FS-ISAC, US-CERT).	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D2.TI.Ti.B.2	Threat information is used to monitor threats and vulnerabilities.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D2.TI.Ti.B.2	Threat information is used to monitor threats and vulnerabilities.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
D2.TI.Ti.B.3	Threat information is used to monitor threats and vulnerabilities.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
D2.TI.Ti.B.3	Threat information is used to monitor threats and vulnerabilities.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D2.MA.Ma.B.2	Computer event logs are used for investigations once an event has occurred.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
D2.MA.Ma.B.2	Computer event logs are used for investigations once an event has occurred.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
D2.MA.Ma.B.2	Computer event logs are used for investigations once an event has occurred.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
D2.MA.Ma.B.2	Computer event logs are used for investigations once an event has occurred.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
D2.MA.Ma.B.2	Computer event logs are used for investigations once an event has occurred.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
D2.MA.Ma.B.2	Computer event logs are used for investigations once an event has occurred.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
D2.MA.Ma.B.2	Computer event logs are used for investigations once an event has occurred.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
D2.MA.Ma.B.2	Computer event logs are used for investigations once an event has occurred.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
D2.MA.Ma.B.2	Audit log records and other security event logs are reviewed and retained in a secure manner.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
D2.IS.Is.B.1	Information security threats are gathered and shared with applicable internal employees.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D2.IS.Is.B.1	Information security threats are gathered and shared with applicable internal employees.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
D2.IS.Is.B.1	Information security threats are gathered and shared with applicable internal employees.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.IM.B.2	Systems that are accessed from the Internet or by external parties are protected by firewalls or other similar devices.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
D3.PC.IM.B.2	Systems that are accessed from the Internet or by external parties are protected by firewalls or other similar devices.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
D3.PC.IM.B.2	Systems that are accessed from the Internet or by external parties are protected by firewalls or other similar devices.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.IM.B.2	Systems that are accessed from the Internet or by external parties are protected by firewalls or other similar devices.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
D3.PC.IM.B.2	Systems that are accessed from the Internet or by external parties are protected by firewalls or other similar devices.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.IM.B.3	All ports are monitored.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
D3.PC.IM.B.3	All ports are monitored.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
D3.PC.IM.B.3	All ports are monitored.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
D3.PC.IM.B.3	All ports are monitored.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.IM.B.3	All ports are monitored.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
D3.PC.IM.B.3	All ports are monitored.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
D3.PC.Im.B.5	Systems configurations (for servers, desktops, routers, etc.) follow industry standards and are enforced	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Im.B.5	Systems configurations (for servers, desktops, routers, etc.) follow industry standards and are enforced	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
D3.PC.IM.B.6	Ports, functions, protocols and services are prohibited if no longer needed for business purposes.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
D3.PC.IM.B.6	Ports, functions, protocols and services are prohibited if no longer needed for business purposes.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	Control Description	AWS Config Rule	Guidance

D3.PC.Im.B.7	Access to make changes to systems configurations (including virtual machines and hypervisors) is controlled and monitored.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.1	Employee access is granted to systems and confidential data based on job responsibilities and the principles of least privilege.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.PC.Am.B.1	Employee access is granted to systems and confidential data based on job responsibilities and the principles of least privilege.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
D3.PC.Am.B.1	Employee access is granted to systems and confidential data based on job responsibilities and the principles of least privilege.	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.2	Employee access to systems and confidential data provides for separation of duties.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.PC.Am.B.2	Employee access to systems and confidential data provides for separation of duties.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.PC.Am.B.3	Elevated privileges (e.g., administrator privileges) are limited and tightly controlled (e.g., assigned to individuals, not shared, and require stronger password controls).	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.3	Elevated privileges (e.g., administrator privileges) are limited and tightly controlled (e.g., assigned to individuals, not shared, and require stronger password controls)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
D3.PC.Am.B.3	Elevated privileges (e.g., administrator privileges) are limited and tightly controlled (e.g., assigned to individuals, not shared, and require stronger password controls)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.PC.Am.B.6	Identification and authentication are required and managed for access to systems, applications, and hardware.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.7	Access controls include password complexity and limits to password attempts and reuse.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.8	All default passwords and unnecessary default accounts are changed before system implementation.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
D3.PC.Am.B.10	Production and non-production environments are segregated to prevent unauthorized access or changes to information assets. (*N/A if no production environment exists at the institution or the institution's third party.)	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.10	Production and non-production environments are segregated to prevent unauthorized access or changes to information assets. (*N/A if no production environment exists at the institution or the institution's third party.)	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
D3.PC.Am.B.10	Production and non-production environments are segregated to prevent unauthorized access or changes to information assets. (*N/A if no production environment exists at the institution or the institution's third party.)	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.10	Production and non-production environments are segregated to prevent unauthorized access or changes to information assets. (*N/A if no production environment exists at the institution or the institution's third party.)	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
D3.PC.Am.B.12	All passwords are encrypted in storage and in transit.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.13	Confidential data is encrypted when transmitted across public or untrusted networks (e.g., Internet).	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.13	Confidential data is encrypted when transmitted across public or untrusted networks (e.g., Internet).	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.13	Confidential data is encrypted when transmitted across public or untrusted networks (e.g., Internet).	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.13	Confidential data is encrypted when transmitted across public or untrusted networks (e.g., Internet).	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.13	Confidential data is encrypted when transmitted across public or untrusted networks (e.g., Internet).	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.15	Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.15	Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
D3.PC.Am.B.15	Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.15	Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
D3.PC.Am.B.15	Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.15	Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.15	Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.15	Remote access to critical systems by employees, contractors, and third parties uses encrypted connections and multifactor authentication.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
D3.PC.Am.B.16	Administrative, physical, or technical controls are in place to prevent users without administrative responsibilities from installing unauthorized software.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.PC.Am.B.16	Administrative, physical, or technical controls are in place to prevent users without administrative responsibilities from installing unauthorized software.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
D3.PC.Am.B.16	Administrative, physical, or technical controls are in place to prevent users without administrative responsibilities from installing unauthorized software.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
D3.DC.Th.B.1	Independent testing (including penetration testing and vulnerability scanning) is conducted according to the risk assessment for external-facing systems and the internal network.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D3.DC.Th.B.1	Independent testing (including penetration testing and vulnerability scanning) is conducted according to the risk assessment for external-facing systems and the internal network.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.Th.B.1	Independent testing (including penetration testing and vulnerability scanning) is conducted according to the risk assessment for external-facing systems and the internal network.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
D3.DC.An.B.1	The institution is able to detect anomalous activities through monitoring across the environment.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
D3.DC.An.B.1	The institution is able to detect anomalous activities through monitoring across the environment.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.An.B.2	Customer transactions generating anomalous activity alerts are monitored and reviewed.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D3.DC.An.B.2	Customer transactions generating anomalous activity alerts are monitored and reviewed.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.An.B.2	Customer transactions generating anomalous activity alerts are monitored and reviewed.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
D3.DC.An.B.3	Logs of physical and/or logical access are reviewed following events.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.An.B.4	Access to critical systems by third parties is monitored for unauthorized or unusual activity	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. D3.DC.Ev.B.2	Mechanisms (e.g., antivirus alerts, log event alerts) are in place to alert management to potential attacks.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D3.DC.Ev.B.3	Processes are in place to monitor for the presence of unauthorized users, devices, connections, and software.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
D3.DC.Ev.B.3	Processes are in place to monitor for the presence of unauthorized users, devices, connections, and software.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D3.DC.Ev.B.3	Processes are in place to monitor for the presence of unauthorized users, devices, connections, and software.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
D3.DC.Ev.B.3	Processes are in place to monitor for the presence of unauthorized users, devices, connections, and software.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
D3.CC.PM.B.1	A patch management program is implemented and ensures that software and firmware patches are applied in a timely manner.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
D3.CC.PM.B.3	Patch management reports are reviewed and reflect missing security patches.	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
D4.C.Co.B.2	The institution ensures that third-party connections are authorized.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	Control Description	AWS Config Rule	Guidance
D4.C.Co.B.2	The institution ensures that third-party connections are authorized.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
D4.C.Co.B.2	The institution ensures that third-party connections are authorized.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
D4.C.Co.B.2	The institution ensures that third-party connections are authorized.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	Control Description	AWS Config Rule	Guidance
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
D5.IR.Pl.B.6	The institution plans to use business continuity, disaster recovery, and data backup programs to recover operations following an incident.	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
D5.DR.De.B.1	Alert parameters are set for detecting information security incidents that prompt mitigating actions.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
D5.DR.De.B.1	Alert parameters are set for detecting information security incidents that prompt mitigating actions.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
D5.DR.De.B.2	System performance reports contain information that can be used as a risk indicator to detect information security incidents	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
D5.DR.De.B.3	Tools and processes are in place to detect, alert, and trigger the incident response program.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
D5.ER.Es.B.4	Incidents are classified, logged and tracked.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

## Template

The template is available on GitHub: [Operational Best Practices for FFIEC](#).

## Operational Best Practices for HIPAA Security

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed

to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Health Insurance Portability and Accountability Act (HIPAA) and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more HIPAA controls. A HIPAA control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable a customer to align to a subset of the HIPAA.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures to sufficiently reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon

Control ID	Control Description	AWS Config Rule	Guidance
	vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.		Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
164.308(a)(1)(ii)(B)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
164.308(a)(1)(ii)(B)	Implement security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with 164.306(a): Ensure the confidentiality, integrity, and availability of all electronic protected health information the covered entity or business associate creates, receives, maintains, or transmits.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
164.308(a)(1)(ii)(D)	Implement procedures to regularly review records of information system activity, such as audit logs, access reports, and security incident tracking reports.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
164.308(a)(3)(i)	Implement policies and procedures to ensure that all members of its workforce have appropriate access to electronic protected health information, as provided under paragraph (a)(4) of this section, and to prevent those workforce members who do not have access under paragraph (a) (4) of this section from obtaining access to electronic protected health information.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
164.308(a)(3)(ii)(a)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(A)	Implement procedures for the authorization and/or supervision of workforce members who work with electronic protected health information or in locations where it might be accessed.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
164.308(a)(3)(ii)(B)	Implement procedures to determine that the access of a workforce member to electronic protected health information is appropriate.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
164.308(a)(3)(ii)(B)	Implement procedures to determine that the access of a workforce member to electronic protected health information is appropriate.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(B)	Implement procedures to determine that the access of a workforce member to electronic protected health information is appropriate.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
164.308(a)(3)(ii)(B)	Implement procedures to determine that the access of a workforce member to electronic protected health information is appropriate.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.308(a)(3)(ii)(B)	Implement procedures to determine that the access of a workforce member to electronic protected health information is appropriate.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(B)	Implement procedures to determine that the access of a workforce member to electronic protected health information is appropriate.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
164.308(a)(3)(ii)(B)	Implement procedures to determine that the access of a workforce member to electronic protected health information is appropriate.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(3)(ii)(C)	Implement procedures for terminating access to electronic protected health information when the employment of, or other arrangement with, a workforce member ends or as required by determinations made as specified in paragraph (a)(3)(ii)(b).	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
164.308(a)(4)(i)	Implement policies and procedures for authorizing access to electronic protected health information that are consistent with the applicable requirements of subpart E of this part.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(4)(i)	Implement policies and procedures for authorizing access to electronic protected health information that are consistent with the applicable requirements of subpart E of this part.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.308(a)(4)(i)	Implement policies and procedures for authorizing access to electronic protected health information that are consistent with the applicable requirements of subpart E of this part.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.308(a)(4)(i)	Implement policies and procedures for authorizing access to electronic protected health information that are consistent with the applicable requirements of subpart E of this part.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(4)(ii)(B)	Implement policies and procedures for granting access to electronic protected health information, As one illustrative example, through access to a workstation, transaction, program, process, or other mechanism.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
164.308(a)(4)(ii)(B)	Implement policies and procedures for granting access to electronic protected health information, As one illustrative example, through access to a workstation, transaction, program, process, or other mechanism.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.308(a)(4)(ii)(B)	Implement policies and procedures for granting access to electronic protected health information, As one illustrative example, through access to a workstation, transaction, program, process, or other mechanism.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(4)(ii)(B)	Implement policies and procedures for granting access to electronic protected health information, As one illustrative example, through access to a workstation, transaction, program, process, or other mechanism.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
164.308(a)(4)(ii)(B)	Implement policies and procedures for granting access to electronic protected health information, As one illustrative example, through access to a workstation, transaction, program, process, or other mechanism.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">iam-password-policy</a> (p. 154)	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
164.308(a)(4)(ii)(C)	Implement policies and procedures that, based upon the covered entity's or the business associate's access authorization policies, establish, document, review, and modify a user's right of access to a workstation, transaction, program, or process.	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(6)(i)	Implement policies and procedures to address security incidents.	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
164.308(a)(6)(i)	Implement policies and procedures to address security incidents.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
164.308(a)(6)(i)	Implement policies and procedures to address security incidents.	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(6)(i)	Implement policies and procedures to address security incidents.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
164.308(a)(6)(ii)	Identify and respond to suspected or known security incidents; mitigate, to the extent practicable, harmful effects of security incidents that are known to the covered entity or business associate; and document security incidents and their outcomes.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(7)(i)	Establish (and implement as needed) policies and procedures for responding to an emergency or other occurrence (for example, fire, vandalism, system failure, and natural disaster) that damages systems that contain electronic protected health information.	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
164.308(a)(7)(i)	Establish (and implement as needed) policies and procedures for responding to an emergency or other occurrence (for example, fire, vandalism, system failure, and natural disaster) that damages systems that contain electronic protected health information.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(7)(i)	Establish (and implement as needed) policies and procedures for responding to an emergency or other occurrence (for example, fire, vandalism, system failure, and natural disaster) that damages systems that contain electronic protected health information.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
164.308(a)(7)(i)	Establish (and implement as needed) policies and procedures for responding to an emergency or other occurrence (for example, fire, vandalism, system failure, and natural disaster) that damages systems that contain electronic protected health information.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(7)(i)	Establish (and implement as needed) policies and procedures for responding to an emergency or other occurrence (for example, fire, vandalism, system failure, and natural disaster) that damages systems that contain electronic protected health information.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
164.308(a)(7)(ii)(A)	Establish and implement procedures to create and maintain retrievable exact copies of electronic protected health information.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
164.308(a)(7)(ii)(A)	Establish and implement procedures to create and maintain retrievable exact copies of electronic protected health information.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	Control Description	AWS Config Rule	Guidance
164.308(a)(7)(ii)(A)	Establish and implement procedures to create and maintain retrievable exact copies of electronic protected health information.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
164.308(a)(7)(ii)(A)	Establish and implement procedures to create and maintain retrievable exact copies of electronic protected health information.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
164.308(a)(7)(ii)(A)	Establish and implement procedures to create and maintain retrievable exact copies of electronic protected health information.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
164.312(a)(1)	Implement technical policies and procedures for electronic information systems that maintain electronic protected health information to allow access only to those persons or software programs that have been granted access rights as specified in 164.308(a)(4).	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(2)(i)	Assign a unique name and/or number for identifying and tracking user identity.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
164.312(a)(2)(ii)	Establish (and implement as needed) procedures for obtaining necessary electronic protected health information during an emergency.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
164.312(a)(2)(ii)	Establish (and implement as needed) procedures for obtaining necessary electronic protected health information during an emergency.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(2)(ii)	Establish (and implement as needed) procedures for obtaining necessary electronic protected health information during an emergency.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
164.312(a)(2)(ii)	Establish (and implement as needed) procedures for obtaining necessary electronic protected health information during an emergency.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
164.312(a)(2)(ii)	Establish (and implement as needed) procedures for obtaining necessary electronic protected health information during an emergency.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(a)(2)(iv)	Implement a mechanism to encrypt and decrypt electronic protected health information.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(b)	Implement hardware, software, and/or procedural mechanisms that record and examine activity in information systems that contain or use electronic protected health information.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
164.312(c)(1)	Implement policies and procedures to protect electronic protected health information from improper alteration or destruction.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
164.312(c)(1)	Implement policies and procedures to protect electronic protected health information from improper alteration or destruction.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(c)(1)	Implement policies and procedures to protect electronic protected health information from improper alteration or destruction.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
164.312(c)(2)	Implement electronic mechanisms to corroborate that electronic protected health information has not been altered or destroyed in an unauthorized manner.	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
164.312(c)(2)	Implement electronic mechanisms to corroborate that electronic protected health information has not been altered or destroyed in an unauthorized manner.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(c)(2)	Implement electronic mechanisms to corroborate that electronic protected health information has not been altered or destroyed in an unauthorized manner.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(d)	Implement procedures to verify that a person or entity seeking access to electronic protected health information is the one claimed.	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
164.312(d)	Implement procedures to verify that a person or entity seeking access to electronic protected health information is the one claimed.	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
164.312(d)	Implement procedures to verify that a person or entity seeking access to electronic protected health information is the one claimed.	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
164.312(d)	Implement procedures to verify that a person or entity seeking access to electronic protected health information is the one claimed.	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(d)	Implement procedures to verify that a person or entity seeking access to electronic protected health information is the one claimed.	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(1)	Implement technical security measures to guard against unauthorized access to electronic protected health information that is being transmitted over an electronic communications network.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
164.312(e)(2)(i)	Implement security measures to ensure that electronically transmitted electronic protected health information is not improperly modified without detection until disposed of.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
164.312(e)(2)(ii)	Implement a mechanism to encrypt electronic protected health information whenever deemed appropriate.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

## Template

The template is available on GitHub: [Operational Best Practices for HIPAA Security](#).

## Operational Best Practices for K-ISMS

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between Korea – Information Security Management System (ISMS) and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to

one or more Korea – ISMS controls. A Korea – ISMS control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
1.2.1	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
1.2.1	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
1.2.1	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
1.2.1	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule

Control ID	AWS Config Rule	Guidance
		helps monitor unused EIPs in your environment.
2.1.3	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
2.1.3	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
2.1.3	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.
2.1.3	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.

Control ID	AWS Config Rule	Guidance
2.3.3	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
2.3.3	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
2.5.1	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
2.5.1	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
2.5.1	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
2.5.1	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
2.5.1	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
2.5.1	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
2.5.1	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
2.5.1	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
2.5.1	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
2.5.1	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
2.5.1	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
2.5.1	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	AWS Config Rule	Guidance
2.5.1	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
2.5.1	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
2.5.1	<a href="#">iam-customer-policy-blocked-kms-actions (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing blocked actions on all AWS Key Management Service keys. Having more privileges than needed to complete a task may violate the principle of least privilege and separation of duties. This rule allows you to set the <code>blockedActionsPatterns</code> parameter. (AWS Foundational Security Best Practices value: <code>kms:Decrypt, kms:ReEncryptFrom</code> ). The actual values should reflect your organization's policie

Control ID	AWS Config Rule	Guidance
2.5.1	<a href="#">iam-inline-policy-blocked-kms-actions (p. 153)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to allow blocked actions on all AWS Key Management Service keys. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning, rolling back, and delegating permissions management. This rule allows you to set the <code>blockedActionsPatterns</code> parameter. (AWS Foundational Security Best Practices value: <code>kms:Decrypt, kms:ReEncryptFrom</code> ). The actual values should reflect your organization's policies.
2.5.3	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
2.5.3	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
2.5.3	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
2.5.3	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
2.5.4	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.
2.5.5	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
2.5.5	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
2.5.5	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
2.5.5	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
2.5.5	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
2.6	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.

Control ID	AWS Config Rule	Guidance
2.6	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
2.6	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
2.6	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
2.6	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
2.6	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
2.6	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
2.6	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
2.6	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
2.6	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
2.6	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
2.6	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
2.6	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
2.6	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
2.6	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
2.6	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
2.6	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
2.6	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
2.6	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
2.6	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
2.6	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
2.6	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
2.6	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
2.6	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
2.6	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
2.6	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
2.6.4	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	AWS Config Rule	Guidance
2.6.4	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
2.6.6	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
2.6.6	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
2.6.6	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	AWS Config Rule	Guidance
2.6.6	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
2.6.6	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
2.6.6	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
2.6.6	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
2.6.6	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
2.6.6	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
2.6.6	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
2.6.6	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
2.7	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
2.7	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
2.7	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
2.7	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
2.7	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
2.7	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
2.7	<a href="#">dynamodb-table-encrypted-kms (p. 129)</a>	Ensure that encryption is enabled for your Amazon DynamoDB tables. Because sensitive data can exist at rest in these tables, enable encryption at rest to help protect that data. By default, DynamoDB tables are encrypted with an AWS owned customer master key (CMK).
2.7	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
2.7	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
2.7	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.

Control ID	AWS Config Rule	Guidance
2.7	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
2.7	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
2.7	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
2.7	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
2.7	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
2.7	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
2.7	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
2.7	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
2.7	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
2.7	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
2.7	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
2.7	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
2.7	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
2.7.2	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
2.7.2	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
2.8.5	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.

Control ID	AWS Config Rule	Guidance
2.8.5	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
2.8.6	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
2.8.6	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
2.9.1	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.

Control ID	AWS Config Rule	Guidance
2.9.1	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
2.9.1	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
2.9.1	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
2.9.2	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
2.9.2	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
2.9.2	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
2.9.2	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
2.9.2	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
2.9.2	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
2.9.2	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
2.9.3	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

Control ID	AWS Config Rule	Guidance
2.9.3	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
2.9.3	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
2.9.3	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
2.9.3	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
2.9.3	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
2.9.3	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
2.9.3	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
2.9.3	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.

Control ID	AWS Config Rule	Guidance
2.9.3	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
2.9.3	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
2.9.3	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
2.9.3	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
2.9.3	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
2.9.3	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
2.9.3	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	AWS Config Rule	Guidance
2.9.3	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
2.9.4	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
2.9.4	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
2.9.4	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
2.9.4	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
2.9.4	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
2.9.4	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
2.9.4	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
2.9.4	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	AWS Config Rule	Guidance
2.9.4	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
2.9.4	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
2.9.4	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	AWS Config Rule	Guidance
2.10.3	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
2.10.3	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
2.10.3	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
2.10.3	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	AWS Config Rule	Guidance
2.10.3	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
2.10.3	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
2.10.3	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
2.10.5	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
2.10.5	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
2.10.5	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
2.10.5	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
2.10.5	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
2.10.5	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
2.10.5	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
2.10.8	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
2.10.8	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
2.10.8	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	AWS Config Rule	Guidance
2.11.2	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
2.11.3	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
2.11.3	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
2.11.3	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
2.11.3	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
2.11.3	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
2.11.3	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
2.11.3	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
2.12	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
2.12	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
2.12	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
2.12	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.

Control ID	AWS Config Rule	Guidance
2.12	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
2.12	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
2.12	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
2.12	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	AWS Config Rule	Guidance
2.12	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
2.12	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
2.12	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
2.12	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
2.12	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
2.12	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
2.12	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
2.12	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	AWS Config Rule	Guidance
2.12	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

## Template

The template is available on GitHub: [Operational Best Practices for K-ISMS](#).

## Operational Best Practices for Load Balancing

This pack contains AWS Config rules based on load balancing within AWS. This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Load Balancing](#).

## Operational Best Practices for Logging

This pack contains AWS Config rules based on logging within AWS. This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Logging](#).

## Operational Best Practices for Management and Governance Services

This pack contains AWS Config rules based on Management and Governance Services. For more information, see [Management and Governance on AWS](#). This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional

managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Management and Governance Services](#).

## Operational Best Practices for MAS Notice 655

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Monetary Authority of Singapore (MAS) Notice 655 – Cyber Hygiene and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more MAS Notice 655 – Cyber Hygiene controls. A MAS Notice 655 – Cyber Hygiene control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
4.1	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
4.1	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
4.1	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions

Control ID	AWS Config Rule	Guidance
		<p>and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.</p>
4.1	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>

Control ID	AWS Config Rule	Guidance
4.1	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
4.1	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
4.1	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
4.1	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
4.1	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
4.1	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
4.1	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
4.1	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
4.1	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
4.1	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
4.1	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.

Control ID	AWS Config Rule	Guidance
4.1	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
4.1	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
4.1	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
4.2	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
4.2	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
4.2	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
4.2	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the <code>allowVersionUpgrade</code> . The default is true. It also lets you optionally set the <code>preferredMaintenanceWindow</code> (the default is <code>sat:16:00-sat:16:30</code> ), and the <code>automatedSnapshotRetentionPeriod</code> (the default is 1). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
4.2	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. With its new session-based controls, changes to instance metadata can be restricted. Additionally, updating to IMDSV2 can provide additional protection against misconfigured-open website application firewalls, reverse proxies, layer-3 firewalls and network address translation, as well as unpatched SSRF vulnerabilities.
4.3	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
4.4	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
4.4	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.

Control ID	AWS Config Rule	Guidance
4.4	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
4.4	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
4.4	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
4.4	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
4.4	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
4.4	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
4.4	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
4.4	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
4.4	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
4.4	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
4.4	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
4.4	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
4.4	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
4.4	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
4.4	<a href="#">redshift-cluster-public-access-check</a> (p. 171)	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
4.4	<a href="#">restricted-common-ports</a> (p. 174)	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
4.4	<a href="#">s3-account-level-public-access-blocks</a> (p. 175)	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
4.4	<a href="#">sagemaker-notebook-no-direct-internet-access</a> (p. 183)	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
4.4	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
4.4	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
4.5	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
4.5	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.

Control ID	AWS Config Rule	Guidance
4.5	<a href="#">ec2-managedinstance-association-compliance-status-check</a> (p. 135)	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
4.6	<a href="#">iam-password-policy</a> (p. 154)	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
4.6	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
4.6	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
4.6	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
4.6	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
4.6	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
4.5	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

## Template

The template is available on GitHub: [Operational Best Practices for MAS Notice 655](#).

## Operational Best Practices for MAS TRMG June 2013

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the Monetary Authority of Singapore (MAS) Technology Risk Management Guidelines (TRMG) June 2013 and AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more Title 21 CFR Part 11 controls. A MAS TRMG June 2013 control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This Conformance Pack was validated by AWS Security Assurance Services LLC (AWS SAS), which is a team of Payment Card Industry Qualified Security Assessors (QSAs), HITRUST Certified Common Security Framework Practitioners (CCSFPs), and compliance professionals certified to provide guidance and assessments for various industry frameworks. AWS SAS professionals designed this Conformance Pack to enable you to align to a subset of MAS TRMG June 2013 design principles.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to

Control ID	AWS Config Rule	Guidance
		control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
4.1.1	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
4.1.1	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
4.1.1	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets has rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active and reduce the business impact if the secret is compromised.
4.1.1	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or VPCs that you provide.

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">access-keys-rotated (p. 107)</a>	The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.
4.1.1	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon EC2 instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.
4.1.1	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
4.1.1	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
4.1.1	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
4.1.1	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
4.1.1	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
4.1.1	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
4.1.1	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
4.1.1	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
4.1.1	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
4.1.1	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
4.1.1	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
4.1.1	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
4.1.1	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
4.1.1	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
4.1.1	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
4.1.1	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
4.1.1	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
4.1.1	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
4.1.1	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
4.1.1	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
4.1.1	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
4.1.1	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
4.1.1	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
4.1.1	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
4.1.1	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
4.1.1	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
4.1.1	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
4.1.1	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
4.1.1	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
4.1.1	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
4.2.1	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
4.2.1	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
4.2.1	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
4.2.1	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
4.2.3	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	AWS Config Rule	Guidance
4.2.3	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
4.2.3	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
4.4.3	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
4.5.1	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
4.5.1	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
6.2.5	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
6.2.5	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	AWS Config Rule	Guidance
6.2.5	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
6.2.5	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
6.2.5	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
6.2.5	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
6.4.3	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
6.4.3	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
6.4.3	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
6.4.3	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
6.4.3	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
6.4.3	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
6.4.3	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
6.4.3	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
6.4.3	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
6.4.3	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
6.4.3	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
6.4.3	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
6.4.3	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
6.4.3	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
6.4.3	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
6.4.3	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
6.4.3	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
6.4.3	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
6.4.3	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
6.4.3	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
6.4.3	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
6.4.3	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
6.4.3	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
6.4.3	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
6.4.3	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
6.4.3	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
6.4.3	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
6.4.3	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
6.4.3	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
6.4.3	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
6.4.3	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
6.4.3	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
6.4.3	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
6.4.3	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
6.4.3	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
6.4.3	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
6.4.3	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
6.4.3	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
6.4.3	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
6.4.3	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
6.4.3	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.</p>
6.4.3	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	<p>Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.</p>
6.4.3	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	<p>Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.</p>
7.1.6	<a href="#">db-instance-backup-enabled (p. 126)</a>	<p>The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.</p>

Control ID	AWS Config Rule	Guidance
7.1.6	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
7.1.6	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
7.1.6	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
7.1.6	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	AWS Config Rule	Guidance
7.1.6	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
7.1.6	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
7.1.6	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
7.1.6	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
7.1.7	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
7.1.7	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
7.1.7	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
7.1.7	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
7.1.7	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
7.1.7	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>
7.1.7	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	<p>Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.</p>
7.1.7	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	<p>To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.</p>

Control ID	AWS Config Rule	Guidance
7.1.7	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
7.1.7	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
7.1.7	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	AWS Config Rule	Guidance
7.2.2	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
7.2.2	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
7.2.2	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
7.2.2	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
7.2.2	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
7.2.4	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
7.2.4	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
7.2.4	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
7.2.4	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
7.2.4	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
7.2.4	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
7.2.4	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
7.5.1	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
7.5.1	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
7.5.1	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	AWS Config Rule	Guidance
7.5.1	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
7.5.1	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
7.5.1	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
7.5.1	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.

Control ID	AWS Config Rule	Guidance
7.5.1	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
7.5.2	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
7.5.2	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
7.5.2	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
7.5.2	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
7.5.2	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
7.5.2	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	AWS Config Rule	Guidance
8.1.1	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
8.1.1	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
8.1.1	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
8.1.1	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	AWS Config Rule	Guidance
8.1.1	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
8.1.1	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
8.1.1	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
8.1.1	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
8.1.1	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
8.1.1	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
8.1.1	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
8.1.1	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
8.1.1	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
8.1.1	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
8.1.1	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
8.1.1	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
8.1.1	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
8.1.1	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
8.1.1	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
8.1.1	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
8.1.1	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
8.1.1	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
8.1.1	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
8.1.2	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	AWS Config Rule	Guidance
8.1.2	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
8.1.2	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. 8.4.1	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
9.0.1	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
9.1.6	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
9.1.6	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
9.1.6	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
9.1.6	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
9.1.6	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
9.1.6	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
9.1.6	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
9.1.6	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
9.1.6	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
9.1.6	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
9.1.6	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
9.1.6	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
9.1.6	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">access-keys-rotated (p. 107)</a>	<p>The credentials are audited for authorized devices, users, and processes by ensuring IAM access keys are rotated as per organizational policy. Changing the access keys on a regular schedule is a security best practice. It shortens the period an access key is active and reduces the business impact if the keys are compromised. This rule requires an access key rotation value (Config Default: 90). The actual value should reflect your organization's policies.</p>
9.1.6	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
9.1.6	<a href="#">iam-group-has-users-check (p. 153)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.</p>

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
9.1.6	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	<p>AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.</p>

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
9.1.6	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
9.1.6	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
9.1.6	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
9.1.6	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
9.1.6	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
9.1.6	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
9.1.6	<a href="#">secretsmanager-rotation-enabled-check (p. 183)</a>	This rule ensures AWS Secrets Manager secrets have rotation enabled. Rotating secrets on a regular schedule can shorten the period a secret is active, and potentially reduce the business impact if the secret is compromised.
9.1.6	<a href="#">secretsmanager-scheduled-rotation-success-check (p. 184)</a>	This rule ensures that AWS Secrets Manager secrets have rotated successfully according to the rotation schedule. Rotating secrets on a regular schedule can shorten the period that a secret is active, and potentially reduce the business impact if it is compromised.
9.1.6	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
9.1.6	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
9.1.6	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
9.1.6	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
9.1.6	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
9.1.6	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
9.1.6	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
9.1.6	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
9.1.6	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
9.1.6	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
9.1.6	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
9.1.6	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
9.1.6	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
9.1.6	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
9.1.6	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
9.2.1	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
9.2.1	<a href="#">ec2-security-group-attached-to-eni (p. 137)</a>	This rule ensures the security groups are attached to an Amazon Elastic Compute Cloud (Amazon EC2) instance or to an ENI. This rule helps monitoring unused security groups in the inventory and the management of your environment.
9.2.1	<a href="#">eip-attached (p. 139)</a>	This rule ensures Elastic IPs allocated to a Amazon Virtual Private Cloud (Amazon VPC) are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances or in-use Elastic Network Interfaces. This rule helps monitor unused EIPs in your environment.
9.2.1	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
9.2.2	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
9.2.2	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
9.2.2	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the allowVersionUpgrade. The default is true. It also lets you optionally set the preferredMaintenanceWindow (the default is sat:16:00-sat:16:30), and the automatedSnapshotRetentionPeriod (the default is 1). The actual values should reflect your organization's policies.
9.3.1	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
9.3.1	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
9.3.1	<a href="#">account-part-of-organizations (p. 108)</a>	Centralized management of AWS accounts within AWS Organizations helps to ensure that accounts are compliant. The lack of centralized account governance may lead to inconsistent account configurations, which may expose resources and sensitive data.

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">emr-kerberos-enabled (p. 145)</a>	<p>The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.</p>
9.3.1	<a href="#">ec2-imdsv2-check (p. 132)</a>	<p>Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.</p>

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.
9.3.1	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">redshift-cluster-maintenancesettings-check (p. 171)</a>	<p>This rule ensures that Amazon Redshift clusters have the preferred settings for your organization. Specifically, that they have preferred maintenance windows and automated snapshot retention periods for the database. This rule requires you to set the <code>allowVersionUpgrade</code>. The default is <code>true</code>. It also lets you optionally set the <code>preferredMaintenanceWindow</code> (the default is <code>sat:16:00-sat:16:30</code>), and the <code>automatedSnapshotRetentionPeriod</code> (the default is <code>1</code>). The actual values should reflect your organization's policies.</p>
9.3.1	<a href="#">vpc-default-security-group-closed (p. 188)</a>	<p>Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.</p>
9.3.1	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	<p>Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.</p>
9.3.1	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	<p>Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.</p>

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
9.3.1	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
9.3.1	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
9.3.1	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
9.3.1	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
9.3.1	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
9.3.1	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
9.3.1	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
9.3.1	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
9.3.1	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
9.3.1	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
9.3.1	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
9.3.1	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	AWS Config Rule	Guidance
9.3.1	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
9.3.2	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for alarmActionRequired (Config Default: True), insufficientDataActionRequired (Config Default: True), okActionRequired (Config Default: False). The actual value should reflect the alarm actions for your environment.
9.3.2	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
9.3.2	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
9.3.4	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
9.3.4	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
9.3.4	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	AWS Config Rule	Guidance
9.3.4	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
9.3.4	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
9.3.4	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
9.5.1	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
9.5.1	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
9.6.1	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
9.6.1	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
9.6.1	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
9.6.1	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
9.6.2	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
9.6.2	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
9.6.2	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	AWS Config Rule	Guidance
9.6.2	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
9.6.3	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
9.6.3	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
9.6.3	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.

Control ID	AWS Config Rule	Guidance
9.6.3	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
9.6.3	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
9.6.4	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	AWS Config Rule	Guidance
9.6.4	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
9.6.4	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
9.6.4	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
9.6.6	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
9.6.6	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.

Control ID	AWS Config Rule	Guidance
9.6.6	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
9.6.6	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
9.6.6	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
9.6.6	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
9.6.6	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.

Control ID	AWS Config Rule	Guidance
9.6.6	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
11.0.1(b)	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
11.0.1(b)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.0.1(b)	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
11.0.1(b)	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
11.0.1(b)	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
11.0.1(b)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
11.0.1(c)	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
11.0.1(c)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.0.1(c)	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.0.1(c)	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
11.0.1(c)	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.

Control ID	AWS Config Rule	Guidance
11.0.1(c)	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
11.0.1(c)	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
11.0.1(c)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
11.1.2	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
11.1.2	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
11.1.2	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
11.1.2	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
11.1.2	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.

Control ID	AWS Config Rule	Guidance
11.1.2	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
11.1.2	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.1.2	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.1.2	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
11.1.2	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
11.1.2	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling <code>s3_bucket_policy_grantee_check</code> . This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
11.1.2	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. 11.1.2	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
11.1.3	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
11.1.3	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
11.1.3	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
11.1.3	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
11.1.3	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	AWS Config Rule	Guidance
11.1.3	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
11.1.5	<a href="#">iam-password-policy (p. 154)</a>	The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set RequireUppercaseCharacters (AWS Foundational Security Best Practices value: true), RequireLowercaseCharacters (AWS Foundational Security Best Practices value: true), RequireSymbols (AWS Foundational Security Best Practices value: true), RequireNumbers (AWS Foundational Security Best Practices value: true), MinimumPasswordLength (AWS Foundational Security Best Practices value: 14), PasswordReusePrevention (AWS Foundational Security Best Practices value: 24), and MaxPasswordAge (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.
11.1.6	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	AWS Config Rule	Guidance
11.1.6	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.1.6	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
11.1.6	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.1.6	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.

Control ID	AWS Config Rule	Guidance
11.2.3(a)	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.
11.2.3(a)	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
11.2.3(a)	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
11.2.3(a)	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
11.2.3(b)	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
11.2.3(b)	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
11.2.3(b)	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
11.2.3(b)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
11.2.3(c)	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
11.2.3(c)	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
11.2.3(c)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.2.3(c)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
11.2.3(c)	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.2.3(c)	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
11.2.3(d)	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
11.2.3(d)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
11.2.3(d)	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.2.3(d)	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
11.2.3(d)	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
11.2.3(d)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	AWS Config Rule	Guidance
11.2.3(e)	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
11.2.3(e)	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
11.2.3(e)	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
11.2.3(e)	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
11.2.3(e)	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
11.2.3(e)	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
11.2.3(e)	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
11.2.3(e)	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	AWS Config Rule	Guidance
11.2.3(e)	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
11.2.3(e)	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
11.2.3(f)	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
11.2.3(f)	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
11.2.3(f)	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
11.2.3(f)	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
11.2.3(f)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.2.3(f)	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.

Control ID	AWS Config Rule	Guidance
11.2.3(h)	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
11.2.3(j)	<a href="#">iam-no-inline-policy-check (p. 154)</a>	Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.
11.2.3(j)	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
11.2.3(j)	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
11.2.3(j)	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
11.2.3(j)	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
11.2.3(j)	<a href="#">s3-bucket-policy-grantee-check (p. 178)</a>	Manage access to the AWS Cloud by enabling s3_bucket_policy_grantee_check. This rule checks that the access granted by the Amazon S3 bucket is restricted by any of the AWS principals, federated users, service principals, IP addresses, or Amazon Virtual Private Cloud (Amazon VPC) IDs that you provide.
12.1.1	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
12.1.1	<a href="#">cloudtrail-security-trail-enabled (p. 118)</a>	This rule helps ensure the use of AWS recommended security best practices for AWS CloudTrail, by checking for the enablement of multiple settings. These include the use of log encryption, log validation, and enabling AWS CloudTrail in multiple regions.
12.1.1	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
12.1.1	<a href="#">ec2-instance-managed-by-systems-manager (p. 132)</a>	An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">ec2-stopped-instance (p. 137)</a>	Enable this rule to help with the baseline configuration of Amazon Elastic Compute Cloud (Amazon EC2) instances by checking whether Amazon EC2 instances have been stopped for more than the allowed number of days, according to your organization's standards.
12.1.1	<a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a>	Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.
12.1.1	<a href="#">ec2-managedinstance-patch-compliance-status-check (p. 136)</a>	Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.
12.1.1	<a href="#">ec2-volume-inuse-check (p. 137)</a>	This rule ensures that Amazon Elastic Block Store volumes that are attached to Amazon Elastic Compute Cloud (Amazon EC2) instances are marked for deletion when an instance is terminated. If an Amazon EBS volume isn't deleted when the instance that it's attached to is terminated, it may violate the concept of least functionality.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
12.1.1	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
12.1.1	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
12.1.1	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
12.1.1	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
12.1.1	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
12.1.1	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
12.1.1	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
12.1.1	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
12.1.1	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
12.1.1	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
12.1.1	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
12.1.1	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
12.1.1	<a href="#">cloud-trail-log-file-validation-enabled (p. 122)</a>	Utilize AWS CloudTrail log file validation to check the integrity of CloudTrail logs. Log file validation helps determine if a log file was modified or deleted or unchanged after CloudTrail delivered it. This feature is built using industry standard algorithms: SHA-256 for hashing and SHA-256 with RSA for digital signing. This makes it computationally infeasible to modify, delete or forge CloudTrail log files without detection.
12.1.1	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
12.1.1	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.
12.1.1	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
12.1.1	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
12.1.1	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
12.1.1	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
12.1.1	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
12.1.1	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
12.1.1	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
12.1.1	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
12.1.1	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
12.1.1	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.1	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
12.1.1	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
12.1.1	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
12.1.1	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
12.1.1	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
12.1.1	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.1	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.1	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.1	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
12.1.1	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
12.1.1	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
12.1.1	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
12.1.1	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
12.1.1	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
12.1.1	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
12.1.1	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
12.1.1	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
12.1.1	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
12.1.1	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
12.1.1	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
12.1.1	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
12.1.1	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
12.1.1	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials AWS_ACCESS_KEY_ID and AWS_SECRET_ACCESS_KEY do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.

Control ID	AWS Config Rule	Guidance
12.1.1	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.
12.1.1	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
12.1.4	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.
12.1.4	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
12.1.4	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
12.1.4	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">iam-password-policy (p. 154)</a>	<p>The identities and the credentials are issued, managed, and verified based on an organizational IAM password policy. They meet or exceed requirements as stated by NIST SP 800-63 and the Centers for Internet Security (CIS) AWS Foundations Benchmark for password strength. This rule allows you to optionally set <code>RequireUppercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireLowercaseCharacters</code> (AWS Foundational Security Best Practices value: true), <code>RequireSymbols</code> (AWS Foundational Security Best Practices value: true), <code>RequireNumbers</code> (AWS Foundational Security Best Practices value: true), <code>MinimumPasswordLength</code> (AWS Foundational Security Best Practices value: 14), <code>PasswordReusePrevention</code> (AWS Foundational Security Best Practices value: 24), and <code>MaxPasswordAge</code> (AWS Foundational Security Best Practices value: 90) for your IAM Password Policy. The actual values should reflect your organization's policies.</p>
12.1.4	<a href="#">iam-no-inline-policy-check (p. 154)</a>	<p>Ensure an AWS Identity and Access Management (IAM) user, IAM role or IAM group does not have an inline policy to control access to systems and assets. AWS recommends to use managed policies instead of inline policies. The managed policies allow reusability, versioning and rolling back, and delegating permissions management.</p>

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
12.1.4	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
12.1.4	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
12.1.4	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
12.1.4	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.
12.1.4	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
12.1.4	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
12.1.4	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
12.1.4	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
12.1.4	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the Amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
12.1.4	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
12.1.4	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
12.1.4	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
12.1.4	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
12.1.4	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the <code>ignorePublicAcls</code> (Config Default: True), <code>blockPublicPolicy</code> (Config Default: True), <code>blockPublicAcls</code> (Config Default: True), and <code>restrictPublicBuckets</code> parameters (Config Default: True). The actual values should reflect your organization's policies.
12.1.4	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
12.1.4	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
12.1.4	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
12.1.4	<a href="#">ec2-imdsv2-check (p. 132)</a>	Ensure the Instance Metadata Service Version 2 (IMDSv2) method is enabled to help protect access and control of Amazon Elastic Compute Cloud (Amazon EC2) instance metadata. The IMDSv2 method uses session-based controls. With IMDSv2, controls can be implemented to restrict changes to instance metadata.
12.1.4	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.4	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
12.1.4	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.4	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.4	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.4	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
12.1.4	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	AWS Config Rule	Guidance
12.1.4	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
12.1.5	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
12.1.5	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
12.1.5	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.

Control ID	AWS Config Rule	Guidance
12.1.5	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
12.1.5	<a href="#">lambda-dlq-check (p. 161)</a>	Enable this rule to help notify the appropriate personnel through Amazon Simple Queue Service (Amazon SQS) or Amazon Simple Notification Service (Amazon SNS) when a function has failed.
12.1.5	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
12.1.5	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.

Control ID	AWS Config Rule	Guidance
12.1.5	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.
12.1.6	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
12.1.6	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	AWS Config Rule	Guidance
12.1.6	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
12.1.6	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.
12.1.6	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.

Control ID	AWS Config Rule	Guidance
12.1.6	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
12.1.6	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.
12.2.4	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
12.2.4	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
12.2.4	<a href="#">api-gw-cache-enabled-and-encrypted (p. 110)</a>	To help protect data at rest, ensure encryption is enabled for your API Gateway stage's cache. Because sensitive data can be captured for the API method, enable encryption at rest to help protect that data.

Control ID	AWS Config Rule	Guidance
12.2.4	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
12.2.4	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
12.2.4	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).
12.2.4	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
12.2.4	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
12.2.4	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
12.2.4	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.

Control ID	AWS Config Rule	Guidance
12.2.4	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.
12.2.4	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
12.2.4	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
12.2.4	<a href="#">s3-bucket-server-side-encryption-enabled (p. 181)</a>	To help protect data at rest, ensure encryption is enabled for your Amazon Simple Storage Service (Amazon S3) buckets. Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.
12.2.4	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
12.2.4	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
12.2.4	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
12.2.4	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.
12.2.4	<a href="#">ec2-efs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
12.2.4	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
12.2.4	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
12.2.4	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
12.2.4	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.
A.1.2	<a href="#">codebuild-project-envvar-awscred-check (p. 123)</a>	Ensure authentication credentials <code>AWS_ACCESS_KEY_ID</code> and <code>AWS_SECRET_ACCESS_KEY</code> do not exist within AWS Codebuild project environments. Do not store these variables in clear text. Storing these variables in clear text leads to unintended data exposure and unauthorized access.
A.1.2	<a href="#">codebuild-project-source-repo-url-check (p. 123)</a>	Ensure the GitHub or Bitbucket source repository URL does not contain personal access tokens, user name and password within AWS Codebuild project environments. Use OAuth instead of personal access tokens or a user name and password to grant authorization for accessing GitHub or Bitbucket repositories.

Control ID	AWS Config Rule	Guidance
B.2.4	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
B.2.4	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
B.2.4	<a href="#">rds-enhanced-monitoring-enabled (p. 165)</a>	Enable Amazon Relational Database Service (Amazon RDS) to help monitor Amazon RDS availability. This provides detailed visibility into the health of your Amazon RDS database instances. When the Amazon RDS storage is using more than one underlying physical device, Enhanced Monitoring collects the data for each device. Also, when the Amazon RDS database instance is running in a Multi-AZ deployment, the data for each device on the secondary host is collected, and the secondary host metrics.

Control ID	AWS Config Rule	Guidance
B.2.4	<a href="#">ec2-instance-detailed-monitoring-enabled (p. 132)</a>	Enable this rule to help improve Amazon Elastic Compute Cloud (Amazon EC2) instance monitoring on the Amazon EC2 console, which displays monitoring graphs with a 1-minute period for the instance.
B.2.4	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
B.2.4	<a href="#">cloudwatch-alarm-action-check (p. 119)</a>	Amazon CloudWatch alarms alert when a metric breaches the threshold for a specified number of evaluation periods. The alarm performs one or more actions based on the value of the metric or expression relative to a threshold over a number of time periods. This rule requires a value for <code>alarmActionRequired</code> (Config Default: True), <code>insufficientDataActionRequired</code> (Config Default: True), <code>okActionRequired</code> (Config Default: False). The actual value should reflect the alarm actions for your environment.
B.3.1	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	AWS Config Rule	Guidance
B.3.1	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
B.3.1	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
C.3.1	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.

Control ID	AWS Config Rule	Guidance
C.3.1	<a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a>	To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.
C.3.1	<a href="#">cmk-backing-key-rotation-enabled (p. 123)</a>	Enable key rotation to ensure that keys are rotated once they have reached the end of their crypto period.
D.2.2	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
D.2.2	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
D.2.3	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	AWS Config Rule	Guidance
D.2.3	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.
D.2.3	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
D.2.3	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.

Control ID	AWS Config Rule	Guidance
D.2.3	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
D.2.3	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.
D.2.3	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
E.2.5	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	AWS Config Rule	Guidance
E.2.5	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
E.2.5	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.
E.2.5	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
E.2.5	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
E.2.5	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
E.2.5	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

## Template

The template is available on GitHub: [Operational Best Practices for MAS TRMG June 2013](#).

## Operational Best Practices for Monitoring

This pack contains AWS Config rules based on monitoring within AWS. This Conformance Pack has been designed for compatibility with the majority of AWS regions and to not require setting of any Parameters. Additional managed rules that require parameters to be set for your environment and/or for your specific region can be found at: [List of AWS Config Managed Rules](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

See Parameters section for names and descriptions of required parameters.

The template is available on GitHub: [Operational Best Practices for Monitoring](#).

## Operational Best Practices for NBC TRMG

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the National Bank of Cambodia's (NBC) Technology Risk Management (TRM) Guidelines framework and AWS managed Config rules. Each Config rule applies to a specific AWS resource, and relates to one or more NBC TRM Guideline. An NBC TRM Guideline can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

This sample conformance pack template contains mappings to controls within the National Bank of Cambodia's (NBC) Technology Risk Management (TRM) Guidelines framework, which can be accessed here: [National Bank of Cambodia: Technology Risk Management Guidelines](#).

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1(d)	d) Among the important controls that need to be considered are: - A systematic process of applying and authorising the creation of user IDs and the access control matrix - Conducting a risk assessment and granting access rights based on the same. - Implementation of role-based access control designed to ensure effective segregation of duties - Changing	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.

Control ID	Control Description	AWS Config Rule	Guidance
	<p>default user names and/or passwords of systems and prohibiting sharing of user IDs and passwords of generic accounts - Modification of access rights whenever there is a change in role or responsibility and removal of access rights on cessation of employment/contract</p> <ul style="list-style-type: none"><li>- Processes to notify in a timely manner the information security function regarding user additions, deletions and role changes -</li><li>Periodic reconciliation of user IDs in a system and actual users required to have access and deletion of any unnecessary IDs, if any</li><li>- Auditing, logging and monitoring of access to IT assets by all users and</li><li>- Considering deactivating user IDs of users of critical applications who are on prolonged leave</li></ul>		

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1(d)	<p>d) Among the important controls that need to be considered are:</p> <ul style="list-style-type: none"><li>- A systematic process of applying and authorising the creation of user IDs and the access control matrix</li><li>- Conducting a risk assessment and granting access rights based on the same.</li><li>- Implementation of role-based access control designed to ensure effective segregation of duties</li><li>- Changing default user names and/or passwords of systems and prohibiting sharing of user IDs and passwords of generic accounts</li><li>- Modification of access rights whenever there is a change in role or responsibility and removal of access rights on cessation of employment/contract</li><li>- Processes to notify in a timely manner the information security function regarding user additions, deletions and role changes</li><li>- Periodic reconciliation of user IDs in a system and actual users required to have access and deletion of any unnecessary IDs, if any</li><li>- Auditing, logging and monitoring of access to IT assets by all users and</li><li>- Considering deactivating user IDs of users of critical applications who are on prolonged leave</li></ul>	<p><a href="#">api-gw-execution-logging-enabled (p. 111)</a></p>	<p>API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.1(d)	<p>d) Among the important controls that need to be considered are:</p> <ul style="list-style-type: none"> <li>- A systematic process of applying and authorising the creation of user IDs and the access control matrix</li> <li>- Conducting a risk assessment and granting access rights based on the same.</li> <li>- Implementation of role-based access control designed to ensure effective segregation of duties</li> <li>- Changing default user names and/or passwords of systems and prohibiting sharing of user IDs and passwords of generic accounts</li> <li>- Modification of access rights whenever there is a change in role or responsibility and removal of access rights on cessation of employment/contract</li> <li>- Processes to notify in a timely manner the information security function regarding user additions, deletions and role changes</li> <li>- Periodic reconciliation of user IDs in a system and actual users required to have access and deletion of any unnecessary IDs, if any</li> <li>- Auditing, logging and monitoring of access to IT assets by all users and</li> <li>- Considering de-activating user IDs of users of critical applications who are on prolonged leave</li> </ul>	<p><a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a></p>	<p>Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.</p>

Control ID	Control Description	AWS Config Rule	Guidance

Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.</p>
3.1.2(e)	<p>e) Network services can range from simple unmanaged bandwidth to sophisticated services such as VPN, Voice over IP, VSAT, etc. Security features of network services should be: - Technology applied for security of network services, such as authentication, encryption and network connection controls - Technical parameters required for secured connection with the network services in accordance with the security and network connection rules and - Procedures for the network service usage to restrict access to network services or applications, where necessary</p>	<p><a href="#">elb-tls-https-listeners-only (p. 145)</a></p>	<p>Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(e)	e) Use encryption to protect communication channels between the remote access device and the institution to restrict the risks related to network spoofing.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
3.1.3(e)	e) Use encryption to protect communication channels between the remote access device and the institution to restrict the risks related to network spoofing.	<a href="#">alb-http-to-https-redirect-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1.3(e)	e) Use encryption to protect communication channels between the remote access device and the institution to restrict the risks related to network spoofing.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
3.1.3(e)	e) Use encryption to protect communication channels between the remote access device and the institution to restrict the risks related to network spoofing.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(e)	e) Use encryption to protect communication channels between the remote access device and the institution to restrict the risks related to network spoofing.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1.3(e)	e) Use encryption to protect communication channels between the remote access device and the institution to restrict the risks related to network spoofing.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1.3(e)	e) Use encryption to protect communication channels between the remote access device and the institution to restrict the risks related to network spoofing.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.1.3(e)	e) Use encryption to protect communication channels between the remote access device and the institution to restrict the risks related to network spoofing.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs, network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs, network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs, network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs, network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs, network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs, network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs', network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs, network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
3.1.3(f)	f) While using TCP/IP Internet-based remote access, organisations need to establish a virtual private network over the Internet to securely communicate data packets over this public infrastructure. Further, VLANs, network segments to restrict remote access to authorised network areas and applications within the institution.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if <code>MULTI_REGION_CLOUD_TRAIL_ENABLED</code> is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(g)	g) Maintain logs for remote access communications. Logs should include the date, time, user, user location, duration, and purpose for all remote access including all activities carried out through remote access	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for <code>clusterDbEncrypted</code> (Config Default : TRUE), and <code>loggingEnabled</code> (Config Default: TRUE). The actual values should reflect your organization's policies.
3.1.3(i)	i) Enforce two-factor authentication process for remote access (e.g., PIN based token card with a one-time random password generator, or token based PKI)	<a href="#">iam-user-mfa-enabled (p. 158)</a>	Enable this rule to restrict access to resources in the AWS Cloud. This rule ensures multi-factor authentication (MFA) is enabled for all IAM users. MFA adds an extra layer of protection on top of a user name and password. Reduce the incidents of compromised accounts by requiring MFA for IAM users.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.3(i)	i)Enforce two-factor authentication process for remote access (e.g., PIN based token card with a one-time random password generator, or token based PKI)	<a href="#">mfa-enabled-for-iam-console-access (p. 163)</a>	Manage access to resources in the AWS Cloud by ensuring that MFA is enabled for all AWS Identity and Access Management (IAM) users that have a console password. MFA adds an extra layer of protection on top of a user name and password. By requiring MFA for IAM users, you can reduce incidents of compromised accounts and keep sensitive data from being accessed by unauthorized users.
3.1.3(i)	i)Enforce two-factor authentication process for remote access (e.g., PIN based token card with a one-time random password generator, or token based PKI)	<a href="#">root-account-hardware-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring hardware MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.
3.1.3(i)	i)Enforce two-factor authentication process for remote access (e.g., PIN based token card with a one-time random password generator, or token based PKI)	<a href="#">root-account-mfa-enabled (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring MFA is enabled for the root user. The root user is the most privileged user in an AWS account. The MFA adds an extra layer of protection for a user name and password. By requiring MFA for the root user, you can reduce the incidents of compromised AWS accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.4(c)(e)	<p>c) The patch management process should include aspects like: - Determining methods of obtaining and validating patches for ensuring that the patch is from an authorised source - Identifying vulnerabilities that are applicable to applications and systems used by the organisation - Assessing the business impact of implementing patches (or not implementing a particular patch) - Ensuring patches are tested - Describing methods for deploying patches, e.g. automatically - Reporting on the status of patch deployment across the organisation and - Including methods for dealing with the failed deployment of a patch (e.g., redeployment of the patch). e) BFI should deploy automated patch management tools and software update tools for all systems for which such tools are available and safe</p>	<p><a href="#">ec2-instance-managed-by-systems-manager</a> (p. 132)</p>	<p>An inventory of the software platforms and applications within the organization is possible by managing Amazon Elastic Compute Cloud (Amazon EC2) instances with AWS Systems Manager. Use AWS Systems Manager to provide detailed system configurations, operating system patch levels, services name and type, software installations, application name, publisher and version, and other details about your environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.4(c)(e)	<p>c) The patch management process should include aspects like: - Determining methods of obtaining and validating patches for ensuring that the patch is from an authorised source - Identifying vulnerabilities that are applicable to applications and systems used by the organisation - Assessing the business impact of implementing patches (or not implementing a particular patch) - Ensuring patches are tested - Describing methods for deploying patches, e.g. automatically - Reporting on the status of patch deployment across the organisation and - Including methods for dealing with the failed deployment of a patch (e.g., redeployment of the patch). e) BFI should deploy automated patch management tools and software update tools for all systems for which such tools are available and safe</p>	<p><a href="#">ec2-managedinstance-association-compliance-status-check (p. 135)</a></p>	<p>Use AWS Systems Manager Associations to help with inventory of software platforms and applications within an organization. AWS Systems Manager assigns a configuration state to your managed instances and allows you to set baselines of operating system patch levels, software installations, application configurations, and other details about your environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.4(c)(e)	<p>c) The patch management process should include aspects like: - Determining methods of obtaining and validating patches for ensuring that the patch is from an authorised source - Identifying vulnerabilities that are applicable to applications and systems used by the organisation - Assessing the business impact of implementing patches (or not implementing a particular patch) - Ensuring patches are tested - Describing methods for deploying patches, e.g. automatically - Reporting on the status of patch deployment across the organisation and - Including methods for dealing with the failed deployment of a patch (e.g., redeployment of the patch). e) BFI should deploy automated patch management tools and software update tools for all systems for which such tools are available and safe</p>	<p><a href="#">ec2-managedinstance-patch-compliance-status-check</a> (p. 136)</p>	<p>Enable this rule to help with identification and documentation of Amazon Elastic Compute Cloud (Amazon EC2) vulnerabilities. The rule checks if Amazon EC2 instance patch compliance in AWS Systems Manager as required by your organization's policies and procedures.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.5(d)(e)	<p>d) Appropriate key management requires secure processes for generating, storing, archiving, retrieving, distributing, retiring and destroying cryptographic keys e) All cryptographic keys should be protected against modification and loss. In addition, secret and private keys need protection against unauthorised use as well as disclosure. Equipment used to generate, store and archive keys should be physically protected</p>	<p><a href="#">kms-cmk-not-scheduled-for-deletion (p. 160)</a></p>	<p>To help protect data at rest, ensure necessary customer master keys (CMKs) are not scheduled for deletion in AWS Key Management Service (AWS KMS). Because key deletion is necessary at times, this rule can assist in checking for all keys scheduled for deletion, in case a key was scheduled unintentionally.</p>
3.1.5(d)(e)	<p>d) Appropriate key management requires secure processes for generating, storing, archiving, retrieving, distributing, retiring and destroying cryptographic keys e) All cryptographic keys should be protected against modification and loss. 3.1.5(f)	<p>f) A key management system should be based on an agreed set of standards, procedures and secure methods for:</p> <ul style="list-style-type: none"><li>- generating keys for different cryptographic systems and different applications</li><li>- issuing and obtaining public key certificates</li><li>- distributing keys to intended entities, including how keys should be activated when received</li><li>- storing keys, including how authorised users obtain access to keys</li><li>- changing or updating keys including rules on when keys should be changed and how this will be done</li><li>- dealing with compromised keys</li><li>- revoking keys including how keys should be withdrawn or deactivated, e.g. when keys have been compromised or when a user leaves an organisation (in which case keys should also be archived)</li><li>- recovering keys that are lost or corrupted</li><li>- backing up or archiving keys</li><li>- destroying keys, and</li><li>- logging and auditing of key management related activities.</li></ul>	<p><a href="#">acm-certificate-expiration-check (p. 108)</a></p>	<p>Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.5(f)	<p>f) A key management system should be based on an agreed set of standards, procedures and secure methods for:</p> <ul style="list-style-type: none"><li>- generating keys for different cryptographic systems and different applications</li><li>- issuing and obtaining public key certificates</li><li>- distributing keys to intended entities, including how keys should be activated when received</li><li>- storing keys, including how authorised users obtain access to keys</li><li>- changing or updating keys including rules on when keys should be changed and how this will be done</li><li>- dealing with compromised keys</li><li>- revoking keys including how keys should be withdrawn or deactivated, e.g. when keys have been compromised or when a user leaves an organisation (in which case keys should also be archived)</li><li>- recovering keys that are lost or corrupted</li><li>- backing up or archiving keys</li><li>- destroying keys, and</li><li>- logging and auditing of key management related activities.</li></ul>	<a href="#">elb-acm-certificate-required (p. 143)</a>	<p>Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.5(f)	<p>f) A key management system should be based on an agreed set of standards, procedures and secure methods for:</p> <ul style="list-style-type: none"><li>- generating keys for different cryptographic systems and different applications</li><li>- issuing and obtaining public key certificates</li><li>- distributing keys to intended entities, including how keys should be activated when received</li><li>- storing keys, including how authorised users obtain access to keys</li><li>- changing or updating keys including rules on when keys should be changed and how this will be done</li><li>- dealing with compromised keys</li><li>- revoking keys including how keys should be withdrawn or deactivated, e.g. when keys have been compromised or when a user leaves an organisation (in which case keys should also be archived)</li><li>- recovering keys that are lost or corrupted</li><li>- backing up or archiving keys</li><li>- destroying keys, and</li><li>- logging and auditing of key management related activities.</li></ul>	<p><a href="#">cloudtrail-enabled (p. 121)</a></p>	<p>AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.5(f)	<p>f) A key management system should be based on an agreed set of standards, procedures and secure methods for:</p> <ul style="list-style-type: none"> <li>- generating keys for different cryptographic systems and different applications</li> <li>- issuing and obtaining public key certificates</li> <li>- distributing keys to intended entities, including how keys should be activated when received</li> <li>- storing keys, including how authorised users obtain access to keys</li> <li>- changing or updating keys including rules on when keys should be changed and how this will be done</li> <li>- dealing with compromised keys</li> <li>- revoking keys including how keys should be withdrawn or deactivated, e.g. when keys have been compromised or when a user leaves an organisation (in which case keys should also be archived)</li> <li>- recovering keys that are lost or corrupted</li> <li>- backing up or archiving keys</li> <li>- destroying keys, and</li> <li>- logging and auditing of key management related activities.</li> </ul>	<p><a href="#">multi-region-cloudtrail-enabled (p. 163)</a></p>	<p>AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.6(a)	a) The BFI should deploy a combination of automated tools and manual techniques to perform a comprehensive VA on a periodic basis. For web-based external facing systems, the scope of VA should include common web vulnerabilities such as SQL injection and cross-site scripting.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
3.1.6(a)	a) The BFI should deploy a combination of automated tools and manual techniques to perform a comprehensive VA on a periodic basis. For web-based external facing systems, the scope of VA should include common web vulnerabilities such as SQL injection and cross-site scripting.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
3.1.6(f)	f) The security function should provide status updates regarding the number of unmitigated, critical vulnerabilities, for each department/division, and plan for mitigating to senior management on a periodic basis	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">cloud-trail-encryption-enabled (p. 122)</a>	Because sensitive data may exist and to help protect data at rest, ensure encryption is enabled for your AWS CloudTrail trails.
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">cloudwatch-log-group-encrypted (p. 121)</a>	To help protect sensitive data at rest, ensure encryption is enabled for your Amazon CloudWatch Log Groups.
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">efs-encrypted-check (p. 138)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic File System (EFS).

Control ID	Control Description	AWS Config Rule	Guidance
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">elasticsearch-encrypted-at-rest (p. 141)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elasticsearch Service (Amazon ES) domains.
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">encrypted-volumes (p. 146)</a>	Because sensitive data can exist and to help protect data at rest, ensure encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes.
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">rds-storage-encrypted (p. 169)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) instances. Because sensitive data can exist at rest in Amazon RDS instances, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.10(b)	<p>b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Because sensitive data can exist at rest in Amazon S3 buckets, enable encryption to help protect that data.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">sagemaker-endpoint-configuration-kms-key-configured (p. 182)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker endpoint. Because sensitive data can exist at rest in SageMaker endpoint, enable encryption at rest to help protect that data.
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">sagemaker-notebook-instance-kms-key-configured (p. 183)</a>	To help protect data at rest, ensure encryption with AWS Key Management Service (AWS KMS) is enabled for your SageMaker notebook. Because sensitive data can exist at rest in SageMaker notebook, enable encryption at rest to help protect that data.
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">sns-encrypted-kms (p. 187)</a>	To help protect data at rest, ensure that your Amazon Simple Notification Service (Amazon SNS) topics require encryption using AWS Key Management Service (AWS KMS). Because sensitive data can exist at rest in published messages, enable encryption at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">ec2-ebs-encryption-by-default (p. 131)</a>	To help protect data at rest, ensure that encryption is enabled for your Amazon Elastic Block Store (Amazon EBS) volumes. Because sensitive data can exist at rest in these volumes, enable encryption at rest to help protect that data.
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">rds-snapshot-encrypted (p. 168)</a>	Ensure that encryption is enabled for your Amazon Relational Database Service (Amazon RDS) snapshots. Because sensitive data can exist at rest, enable encryption at rest to help protect that data.
3.1.10(b)	b) Sensitive information such as system documentation, application source code, and production transaction data should have more extensive controls to guard against alteration (e.g., integrity checkers, cryptographic hashes). Furthermore, policies should minimise the distribution of sensitive information, including printouts that contain the information.	<a href="#">s3-default-encryption-kms (p. 182)</a>	To help protect data at rest, ensure that encryption is enabled for your S3 buckets. Because sensitive data can exist at rest in an Amazon S3 bucket, enable encryption at rest to help protect that data. For more information about the encryption process and administration, use the AWS Key Management Service (AWS KMS) customer-managed CMKs.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data back-up processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1(h)	h) To minimise risks associated with changes, BFIs should perform backups of affected systems or applications prior to the change. BFIs should establish a rollback plan to revert to a former version of the system or application if a problem is encountered during or after the deployment.	<a href="#">rds-in-backup-plan (p. 167)</a>	To help with data back-up processes, ensure your Amazon Relational Database Service (Amazon RDS) instances are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">api-gw-execution-logging-enabled (p. 111)</a>	API Gateway logging displays detailed views of users who accessed the API and the way they accessed the API. This insight enables visibility of user activities.
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">cloud-trail-cloud-watch-logs-enabled (p. 121)</a>	Use Amazon CloudWatch to centrally collect and manage log event activity. Inclusion of AWS CloudTrail data provides details of API call activity within your AWS account.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">cloudtrail-enabled (p. 121)</a>	AWS CloudTrail can help in non-repudiation by recording AWS Management Console actions and API calls. You can identify the users and AWS accounts that called an AWS service, the source IP address where the calls generated, and the timings of the calls. Details of captured data are seen within AWS CloudTrail Record Contents.
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">cloudtrail-s3-dataevents-enabled (p. 118)</a>	The collection of Simple Storage Service (Amazon S3) data events helps in detecting any anomalous activity. The details include AWS account information that accessed an Amazon S3 bucket, IP address, and time of event.
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">elb-logging-enabled (p. 144)</a>	Elastic Load Balancing activity is a central point of communication within an environment. Ensure ELB logging is enabled. The collected data provides detailed information about requests sent to the ELB. Each log contains information such as the time the request was received, the client's IP address, latencies, request paths, and server responses.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">multi-region-cloudtrail-enabled (p. 163)</a>	AWS CloudTrail records AWS Management Console actions and API calls. You can identify which users and accounts called AWS, the source IP address from where the calls were made, and when the calls occurred. CloudTrail will deliver log files from all AWS Regions to your S3 bucket if MULTI_REGION_CLOUD_TRAIL_ENABLED is enabled. Additionally, when AWS launches a new Region, CloudTrail will create the same trail in the new Region. As a result, you will receive log files containing API activity for the new Region without taking any action.
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">s3-bucket-logging-enabled (p. 177)</a>	Amazon Simple Storage Service (Amazon S3) server access logging provides a method to monitor the network for potential cybersecurity events. The events are monitored by capturing detailed records for the requests that are made to an Amazon S3 bucket. Each access log record provides details about a single access request. The details include the requester, bucket name, request time, request action, response status, and an error code, if relevant.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">vpc-flow-logs-enabled (p. 188)</a>	The VPC flow logs provide detailed records for information about the IP traffic going to and from network interfaces in your Amazon Virtual Private Cloud (Amazon VPC). By default, the flow log record includes values for the different components of the IP flow, including the source, destination, and protocol.
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">cw-loggroup-retention-period-check (p. 125)</a>	Ensure a minimum duration of event log data is retained for your log groups to help with troubleshooting and forensics investigations. The lack of available past event log data makes it difficult to reconstruct and identify potentially malicious events.
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">rds-logging-enabled (p. 167)</a>	To help with logging and monitoring within your environment, ensure Amazon Relational Database Service (Amazon RDS) logging is enabled. With Amazon RDS logging, you can capture events such as connections, disconnections, queries, or tables queried.

Control ID	Control Description	AWS Config Rule	Guidance
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.
3.2.1(k)	k) Audit and security logs are useful information which facilitates investigations and trouble shooting. The BFI should ensure that the logging facility is enabled to record activities that are performed during the migration process.	<a href="#">redshift-cluster-configuration-check (p. 170)</a>	To protect data at rest, ensure that encryption is enabled for your Amazon Redshift clusters. You must also ensure that required configurations are deployed on Amazon Redshift clusters. The audit logging should be enabled to provide information about connections and user activities in the database. This rule requires that a value is set for clusterDbEncrypted (Config Default : TRUE), and loggingEnabled (Config Default: TRUE). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.2(a)	<p>a) The key aspects that are required to be considered include:</p> <ul style="list-style-type: none"> <li>- Completeness—ensuring that the total number of records from the source database is transferred to the new database (assuming the number of fields is the same).</li> <li>- Availability of data backup—ensuring that data is backed up before migration for future reference or any emergency that might arise out of the data migration process.</li> <li>- Integrity of data—ensuring that the data is not altered manually or electronically during the migration process. If such a need exists, having a documented plan to validate pre and post values for the changed data set should exist.</li> <li>- Consistency of data—the field/record called for from the new application should be consistent with that of the original application and</li> <li>- Continuity—the new application should be able to continue with newer records (or appendage) and help in ensuring seamless business continuity</li> </ul>	<p><a href="#">db-instance-backup-enabled (p. 126)</a></p>	<p>The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.2.2(a)	<p>a) The key aspects that are required to be considered include:</p> <ul style="list-style-type: none"><li>- Completeness—ensuring that the total number of records from the source database is transferred to the new database (assuming the number of fields is the same).</li><li>- Availability of data backup—ensuring that data is backed up before migration for future reference or any emergency that might arise out of the data migration process.</li><li>- Integrity of data—ensuring that the data is not altered manually or electronically during the migration process. If such a need exists, having a documented plan to validate pre and post values for the changed data set should exist.</li><li>- Consistency of data—the field/record called for from the new application should be consistent with that of the original application and</li><li>- Continuity—the new application should be able to continue with newer records (or appendage) and help in ensuring seamless business continuity</li></ul>	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	<p>Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.2.2(a)	<p>a) The key aspects that are required to be considered include:</p> <ul style="list-style-type: none"> <li>- Completeness—ensuring that the total number of records from the source database is transferred to the new database (assuming the number of fields is the same).</li> <li>- Availability of data backup—ensuring that data is backed up before migration for future reference or any emergency that might arise out of the data migration process.</li> <li>- Integrity of data—ensuring that the data is not altered manually or electronically during the migration process. Control ID	Control Description	AWS Config Rule	Guidance
3.2.2(a)	a) Develop and implement processes for preventing, detecting, analysing and responding to information security incidents.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.
3.2.2(a)	a) Develop and implement processes for preventing, detecting, analysing and responding to information security incidents.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">dynamodb-autoscaling-enabled (p. 128)</a>	Amazon DynamoDB auto scaling uses the AWS Application Auto Scaling service to adjust provisioned throughput capacity that automatically responds to actual traffic patterns. This enables a table or a global secondary index to increase its provisioned read/write capacity to handle sudden increases in traffic, without throttling.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">ebs-optimized-instance (p. 131)</a>	An optimized instance in Amazon Elastic Block Store (Amazon EBS) provides additional, dedicated capacity for Amazon EBS I/O operations. This optimization provides the most efficient performance for your EBS volumes by minimizing contention between Amazon EBS I/O operations and other traffic from your instance.
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">elb-deletion-protection-enabled (p. 144)</a>	This rule ensures that Elastic Load Balancing has deletion protection enabled. Use this feature to prevent your load balancer from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">rds-multi-az-support (p. 168)</a>	Multi-AZ support in Amazon Relational Database Service (Amazon RDS) provides enhanced availability and durability for database instances. When you provision a Multi-AZ database instance, Amazon RDS automatically creates a primary database instance, and synchronously replicates the data to a standby instance in a different Availability Zone. Each Availability Zone runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure, Amazon RDS performs an automatic failover to the standby so that you can resume database operations as soon as the failover is complete.
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">s3-bucket-default-lock-enabled (p. 177)</a>	Ensure that your Amazon Simple Storage Service (Amazon S3) bucket has lock enabled, by default. Because sensitive data can exist at rest in S3 buckets, enforce object locks at rest to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">vpc-vpn-2-tunnels-up (p. 189)</a>	Redundant Site-to-Site VPN tunnels can be implemented to achieve resilience requirements. It uses two tunnels to help ensure connectivity in case one of the Site-to-Site VPN connections becomes unavailable. To protect against a loss of connectivity, in case your customer gateway becomes unavailable, you can set up a second Site-to-Site VPN connection to your Amazon Virtual Private Cloud (Amazon VPC) and virtual private gateway by using a second customer gateway.
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">elb-cross-zone-load-balancing-enabled (p. 143)</a>	Enable cross-zone load balancing for your Elastic Load Balancers (ELBs) to help maintain adequate capacity and availability. The cross-zone load balancing reduces the need to maintain equivalent numbers of instances in each enabled availability zone. It also improves your application's ability to handle the loss of one or more instances.
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">rds-instance-deletion-protection-enabled (p. 166)</a>	Ensure Amazon Relational Database Service (Amazon RDS) instances have deletion protection enabled. Use deletion protection to prevent your Amazon RDS instances from being accidentally or maliciously deleted, which can lead to loss of availability for your applications.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">autoscaling-group-elb-healthcheck-required (p. 113)</a>	The Elastic Load Balancer (ELB) health checks for Amazon Elastic Compute Cloud (Amazon EC2) Auto Scaling groups support maintenance of adequate capacity and availability. The load balancer periodically sends pings, attempts connections, or sends requests to test Amazon EC2 instances health in an auto-scaling group. If an instance is not reporting back, traffic is sent to a new Amazon EC2 instance.
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">dynamodb-throughput-limit-check (p. 130)</a>	Enable this rule to ensure that provisioned throughput capacity is checked on your Amazon DynamoDB tables. This is the amount of read/write activity that each table can support. DynamoDB uses this information to reserve sufficient system resources to meet your throughput requirements. This rule generates an alert when the throughput approaches the maximum limit for a customer's account. This rule allows you to optionally set <code>accountRCUThresholdPercentage</code> (Config Default: 80) and <code>accountWCUThresholdPercentage</code> (Config Default: 80) parameters. The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1(a)	a) Consider important factors associated with maintaining high system availability, adequate capacity, reliable performance, fast response time, scalability as part of the system design.	<a href="#">lambda-concurrency-check (p. 161)</a>	This rule ensures that a Lambda function's concurrency high and low limits are established. This can assist in baselining the number of requests that your function is serving at any given time.
3.3.1(f)	f) Install appropriate mechanisms to backup data to meet the RTO- Recovery Time Objective and RPO- Recovery Point Objective requirements as identified through the risk assessment process.	<a href="#">dynamodb-in-backup-plan (p. 128)</a>	To help with data back-up processes, ensure your Amazon DynamoDB tables are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
3.3.1(f)	f) Install appropriate mechanisms to backup data to meet the RTO- Recovery Time Objective and RPO- Recovery Point Objective requirements as identified through the risk assessment process.	<a href="#">elasticache-redis-cluster-automatic-backup-check (p. 140)</a>	When automatic backups are enabled, Amazon ElastiCache creates a backup of the cluster on a daily basis. The backup can be retained for a number of days as specified by your organization. Automatic backups can help guard against data loss. If a failure occurs, you can create a new cluster, which restores your data from the most recent backup.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1(f)	f) Install appropriate mechanisms to backup data to meet the RTO- Recovery Time Objective and RPO- Recovery Point Objective requirements as identified through the risk assessment process.	<a href="#">s3-bucket-replication-enabled (p. 180)</a>	Amazon Simple Storage Service (Amazon S3) Cross-Region Replication (CRR) supports maintaining adequate capacity and availability. CRR enables automatic, asynchronous copying of objects across Amazon S3 buckets to help ensure that data availability is maintained.
3.3.1(f)	f) Install appropriate mechanisms to backup data to meet the RTO- Recovery Time Objective and RPO- Recovery Point Objective requirements as identified through the risk assessment process.	<a href="#">s3-bucket-versioning-enabled (p. 181)</a>	Amazon Simple Storage Service (Amazon S3) bucket versioning helps keep multiple variants of an object in the same Amazon S3 bucket. Use versioning to preserve, retrieve, and restore every version of every object stored in your Amazon S3 bucket. Versioning helps you to easily recover from unintended user actions and application failures.
3.3.1(f)	f) Install appropriate mechanisms to backup data to meet the RTO- Recovery Time Objective and RPO- Recovery Point Objective requirements as identified through the risk assessment process.	<a href="#">ebs-in-backup-plan (p. 130)</a>	To help with data back-up processes, ensure your Amazon Elastic Block Store (Amazon EBS) volumes are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.

Control ID	Control Description	AWS Config Rule	Guidance
3.3.1(f)	f) Install appropriate mechanisms to backup data to meet the RTO- Recovery Time Objective and RPO- Recovery Point Objective requirements as identified through the risk assessment process.	<a href="#">efs-in-backup-plan (p. 139)</a>	To help with data backup processes, ensure your Amazon Elastic File System (Amazon EFS) file systems are a part of an AWS Backup plan. AWS Backup is a fully managed backup service with a policy-based backup solution. This solution simplifies your backup management and enables you to meet your business and regulatory backup compliance requirements.
3.3.1(f)	f) Install appropriate mechanisms to backup data to meet the RTO- Recovery Time Objective and RPO- Recovery Point Objective requirements as identified through the risk assessment process.	<a href="#">dynamodb-pitr-enabled (p. 129)</a>	Enable this rule to check that information has been backed up. It also maintains the backups by ensuring that point-in-time recovery is enabled in Amazon DynamoDB. The recovery maintains continuous backups of your table for the last 35 days.
3.3.1(f)	f) Install appropriate mechanisms to backup data to meet the RTO- Recovery Time Objective and RPO- Recovery Point Objective requirements as identified through the risk assessment process.	<a href="#">db-instance-backup-enabled (p. 126)</a>	The backup feature of Amazon RDS creates backups of your databases and transaction logs. Amazon RDS automatically creates a storage volume snapshot of your DB instance, backing up the entire DB instance. The system allows you to set specific retention periods to meet your resilience requirements.

3.6.1(a)(h)	<p>a) BFIs need to ensure suitable security measures for their web applications and take reasonable mitigating measures against various web security risks. h) BFIs need to ensure suitable security measures for their web applications and take reasonable mitigating measures against various web security risks</p>	<p><a href="#">alb-waf-enabled (p. 109)</a></p>	<p>Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1(b)	b) BFIs need to evaluate security requirements associated with their internet banking systems and other relevant systems and adopt an encryption solution considering the degree of confidentiality and integrity required.	<a href="#">acm-certificate-expiration-check (p. 108)</a>	Ensure network integrity is protected by ensuring X509 certificates are issued by AWS ACM. These certificates must be valid and unexpired. This rule requires a value for daysToExpiration (AWS Foundational Security Best Practices value: 90). The actual value should reflect your organization's policies.
3.6.1(b)	b) BFIs need to evaluate security requirements associated with their internet banking systems and other relevant systems and adopt an encryption solution considering the degree of confidentiality and integrity required.	<a href="#">alb-http-to-https-redirection-check (p. 109)</a>	To help protect data in transit, ensure that your Application Load Balancer automatically redirects unencrypted HTTP requests to HTTPS. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.6.1(b)	b) BFIs need to evaluate security requirements associated with their internet banking systems and other relevant systems and adopt an encryption solution considering the degree of confidentiality and integrity required.	<a href="#">elb-acm-certificate-required (p. 143)</a>	Because sensitive data can exist and to help protect data at transit, ensure encryption is enabled for your Elastic Load Balancing. Use AWS Certificate Manager to manage, provision and deploy public and private SSL/TLS certificates with AWS services and internal resources.
3.6.1(b)	b) BFIs need to evaluate security requirements associated with their internet banking systems and other relevant systems and adopt an encryption solution considering the degree of confidentiality and integrity required.	<a href="#">redshift-require-tls-ssl (p. 172)</a>	Ensure that your Amazon Redshift clusters require TLS/SSL encryption to connect to SQL clients. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1(b)	b) BFIs need to evaluate security requirements associated with their internet banking systems and other relevant systems and adopt an encryption solution considering the degree of confidentiality and integrity required.	<a href="#">s3-bucket-ssl-requests-only (p. 181)</a>	To help protect data in transit, ensure that your Amazon Simple Storage Service (Amazon S3) buckets require requests to use Secure Socket Layer (SSL). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.6.1(b)	b) BFIs need to evaluate security requirements associated with their internet banking systems and other relevant systems and adopt an encryption solution considering the degree of confidentiality and integrity required.	<a href="#">alb-http-drop-invalid-header-enabled (p. 109)</a>	Ensure that your Elastic Load Balancers (ELB) are configured to drop http headers. Because sensitive data can exist, enable encryption in transit to help protect that data.
3.6.1(b)	b) BFIs need to evaluate security requirements associated with their internet banking systems and other relevant systems and adopt an encryption solution considering the degree of confidentiality and integrity required.	<a href="#">elasticsearch-node-to-node-encryption-check (p. 142)</a>	Ensure node-to-node encryption for Amazon Elasticsearch Service is enabled. Node-to-node encryption enables TLS 1.2 encryption for all communications within the Amazon Virtual Private Cloud (Amazon VPC). Because sensitive data can exist, enable encryption in transit to help protect that data.
3.6.1(b)	b) BFIs need to evaluate security requirements associated with their internet banking systems and other relevant systems and adopt an encryption solution considering the degree of confidentiality and integrity required.	<a href="#">elb-tls-https-listeners-only (p. 145)</a>	Ensure that your Elastic Load Balancers (ELBs) are configured with SSL or HTTPS listeners. Because sensitive data can exist, enable encryption in transit to help protect that data.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1(d)	d) BFIs providing internet banking should be responsive to unusual network traffic conditions/system performance and sudden surge in system resource utilisation which could be an indication of a DDoS attack. Consequently, the success of any pre-emptive and reactive actions depends on the deployment of appropriate tools to effectively detect, monitor and analyse anomalies in networks and systems.	<a href="#">alb-waf-enabled (p. 109)</a>	Ensure AWS WAF is enabled on Elastic Load Balancers (ELB) to help protect web applications. A WAF helps to protect your web applications or APIs against common web exploits. These web exploits may affect availability, compromise security, or consume excessive resources within your environment.
3.6.1(d)	d) BFIs providing internet banking should be responsive to unusual network traffic conditions/system performance and sudden surge in system resource utilisation which could be an indication of a DDoS attack. Consequently, the success of any pre-emptive and reactive actions depends on the deployment of appropriate tools to effectively detect, monitor and analyse anomalies in networks and systems.	<a href="#">guardduty-enabled-centralized (p. 152)</a>	Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1(d)	d) BFIs providing internet banking should be responsive to unusual network traffic conditions/system performance and sudden surge in system resource utilisation which could be an indication of a DDoS attack. Consequently, the success of any pre-emptive and reactive actions depends on the deployment of appropriate tools to effectively detect, monitor and analyse anomalies in networks and systems.	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.
3.6.1(d)	d) BFIs providing internet banking should be responsive to unusual network traffic conditions/system performance and sudden surge in system resource utilisation which could be an indication of a DDoS attack. Consequently, the success of any pre-emptive and reactive actions depends on the deployment of appropriate tools to effectively detect, monitor and analyse anomalies in networks and systems.	<a href="#">wafv2-logging-enabled (p. 190)</a>	To help with logging and monitoring within your environment, enable AWS WAF (V2) logging on regional and global web ACLs. AWS WAF logging provides detailed information about the traffic that is analyzed by your web ACL. The logs record the time that AWS WAF received the request from your AWS resource, information about the request, and an action for the rule that each request matched.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.1(e)	e) BFIs need to regularly assess information security vulnerabilities and evaluate the effectiveness of the existing IT security risk management framework, making any necessary adjustments to ensure emerging vulnerabilities are addressed in a timely manner. This assessment should also be conducted as part of any material change.	<a href="#">guardduty-non-archived-findings (p. 152)</a>	Amazon GuardDuty helps you understand the impact of an incident by classifying findings by severity: low, medium, and high. You can use these classifications for determining remediation strategies and priorities. This rule allows you to optionally set the <code>daysLowSev</code> (Config Default: 30), <code>daysMediumSev</code> (Config Default: 7), and <code>daysHighSev</code> (Config Default: 1) for non-archived findings, as required by your organization's policies.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">emr-master-no-public-ip (p. 146)</a>	Manage access to the AWS Cloud by ensuring Amazon EMR cluster master nodes cannot be publicly accessed. Amazon EMR cluster master nodes can contain sensitive information and access control is required for such accounts.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">restricted-ssh (p. 159)</a>	Amazon Elastic Compute Cloud (Amazon EC2) Security Groups can help manage network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Not allowing ingress (or remote) traffic from 0.0.0.0/0 to port 22 on your resources help you restricting remote access.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">ec2-instances-in-vpc (p. 159)</a>	Deploy Amazon Elastic Compute Cloud (Amazon EC2) instances within an Amazon Virtual Private Cloud (Amazon VPC) to enable secure communication between an instance and other services within the amazon VPC, without requiring an internet gateway, NAT device, or VPN connection. All traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. Assign Amazon EC2 instances to an Amazon VPC to properly manage access.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">internet-gateway-authorized-vpc-only (p. 160)</a>	Manage access to resources in the AWS Cloud by ensuring that internet gateways are only attached to authorized Amazon Virtual Private Cloud (Amazon VPC). Internet gateways allow bi-directional internet access to and from the Amazon VPC that can potentially lead to unauthorized access to Amazon VPC resources.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">lambda-inside-vpc (p. 162)</a>	Deploy AWS Lambda functions within an Amazon Virtual Private Cloud (Amazon VPC) for a secure communication between a function and other services within the Amazon VPC. With this configuration, there is no requirement for an internet gateway, NAT device, or VPN connection. All the traffic remains securely within the AWS Cloud. Because of their logical isolation, domains that reside within an Amazon VPC have an extra layer of security when compared to domains that use public endpoints. To properly manage access, AWS Lambda functions should be assigned to a VPC.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">rds-snapshots-public-prohibited (p. 168)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information and principles and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">redshift-cluster-public-access-check (p. 171)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Redshift clusters are not public. Amazon Redshift clusters can contain sensitive information and principles and access control is required for such accounts.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">restricted-common-ports (p. 174)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) security groups. Not restricting access to ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. This rule allows you to optionally set blockedPort1 - blockedPort5 parameters (Config Defaults: 20,21,3389,3306,4333). The actual values should reflect your organization's policies.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">s3-account-level-public-access-blocks (p. 175)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Simple Storage Service (Amazon S3) buckets cannot be publicly accessed. This rule helps keeping sensitive data safe from unauthorized remote users by preventing public access. This rule allows you to optionally set the ignorePublicAcls (Config Default: True), blockPublicPolicy (Config Default: True), blockPublicAcls (Config Default: True), and restrictPublicBuckets parameters (Config Default: True). The actual values should reflect your organization's policies.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">s3-bucket-public-read-prohibited (p. 179)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">s3-bucket-public-write-prohibited (p. 180)</a>	Manage access to resources in the AWS Cloud by only allowing authorized users, processes, and devices access to Amazon Simple Storage Service (Amazon S3) buckets. The management of access should be consistent with the classification of the data.

Control ID	Control Description	AWS Config Rule	Guidance
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">sagemaker-notebook-no-direct-internet-access (p. 183)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon SageMaker notebooks do not allow direct internet access. By preventing direct internet access, you can keep sensitive data from being accessed by unauthorized users.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">vpc-default-security-group-closed (p. 188)</a>	Amazon Elastic Compute Cloud (Amazon EC2) security groups can help in the management of network access by providing stateful filtering of ingress and egress network traffic to AWS resources. Restricting all the traffic on the default security group helps in restricting remote access to your AWS resources.
3.6.4(a)(b)	a) Restrict internet access and segregate critical systems from General IT environment. b) Reduce attack surface and vulnerabilities.	<a href="#">vpc-sg-open-only-to-authorized-ports (p. 189)</a>	Manage access to resources in the AWS Cloud by ensuring common ports are restricted on Amazon Elastic Compute Cloud (Amazon EC2) Security Groups. Not restricting access on ports to trusted sources can lead to attacks against the availability, integrity and confidentiality of systems. By restricting access to resources within a security group from the internet (0.0.0.0/0) remote access can be controlled to internal systems.

## Template

The template is available on GitHub: [Operational Best Practices for NBC TRMG](#).

## Operational Best Practices for NERC CIP

Conformance packs provide a general-purpose compliance framework designed to enable you to create security, operational or cost-optimization governance checks using managed or custom AWS Config rules and AWS Config remediation actions. Conformance Packs, as sample templates, are not designed to fully ensure compliance with a specific governance or compliance standard. You are responsible for making your own assessment of whether your use of the Services meets applicable legal and regulatory requirements.

The following provides a sample mapping between the North American Electric Reliability Corporation Critical Infrastructure Protection Standards (NERC CIP) AWS managed Config rules. Each AWS Config rule applies to a specific AWS resource, and relates to one or more NERC CIP controls. A NERC CIP control can be related to multiple Config rules. Refer to the table below for more detail and guidance related to these mappings.

**AWS Region:** All supported AWS Regions except Middle East (Bahrain)

Control ID	Control Description	AWS Config Rule	Guidance
CIP-003-7-R2-Part 4	Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include: 4.1 Identification, classification, and response to Cyber Security Incidents; 4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E-ISAC), unless prohibited by law; 4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals; 4.4 Incident handling for Cyber Security Incidents; 4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by:	<a href="#">securityhub-enabled (p. 186)</a>	AWS Security Hub helps to monitor unauthorized personnel, connections, devices, and software. AWS Security Hub aggregates, organizes, and prioritizes the security alerts, or findings, from multiple AWS services. Some such services are Amazon Security Hub, Amazon Inspector, Amazon Macie, AWS Identity and Access Management (IAM) Access Analyzer, and AWS Firewall Manager, and AWS Partner solutions.

Control ID	Control Description	AWS Config Rule	Guidance
	(1) responding to an actual Reportable Cyber Security		
CIP-003-7-R2-Part 4	<p>Cyber Security Incident Response: Each Responsible Entity shall have one or more Cyber Security Incident response plan(s), either by asset or group of assets, which shall include:</p> <p>4.1 Identification, classification, and response to Cyber Security Incidents;</p> <p>4.2 Determination of whether an identified Cyber Security Incident is a Reportable Cyber Security Incident and subsequent notification to the Electricity Information Sharing and Analysis Center (E-ISAC), unless prohibited by law;</p> <p>4.3 Identification of the roles and responsibilities for Cyber Security Incident response by groups or individuals;</p> <p>4.4 Incident handling for Cyber Security Incidents;</p> <p>4.5 Testing the Cyber Security Incident response plan(s) at least once every 36 calendar months by:</p> <p>(1) responding to an actual Reportable Cyber Security</p>	<p><a href="#">guardduty-enabled-centralized (p. 152)</a></p>	<p>Amazon GuardDuty can help to monitor and detect potential cybersecurity events by using threat intelligence feeds. These include lists of malicious IPs and machine learning to identify unexpected, unauthorized, and malicious activity within your AWS Cloud environment.</p>

Control ID	Control Description	AWS Config Rule	Guidance
CIP-003-8-Attachment 1-Section 3.1	Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to: 3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are: ii. using a routable protocol when entering or leaving the asset containing the low impact BES Cyber System(s).	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.
CIP-003-8-Attachment 1-Section 3.1	Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to: 3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are: ii. using a routable protocol when entering or leaving the asset containing the low impact BES Cyber System(s).	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-003-8-Attachment 1-Section 3.1	Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to: 3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are: ii. using a routable protocol when entering or leaving the asset containing the low impact BES Cyber System(s).	<a href="#">ec2-instance-no-public-ip (p. 133)</a>	Manage access to the AWS Cloud by ensuring Amazon Elastic Compute Cloud (Amazon EC2) instances cannot be publicly accessed. Amazon EC2 instances can contain sensitive information and access control is required for such accounts.
CIP-003-8-Attachment 1-Section 3.1	Electronic Access Controls: For each asset containing low impact BES Cyber System(s) identified pursuant to CIP-002, the Responsible Entity shall implement electronic access controls to: 3.1 Permit only necessary inbound and outbound electronic access as determined by the Responsible Entity for any communications that are: ii. using a routable protocol when entering or leaving the asset containing the low impact BES Cyber System(s).	<a href="#">elasticsearch-in-vpc-only (p. 141)</a>	Manage access to the AWS Cloud by ensuring Amazon Elasticsearch Service (Amazon ES) Domains are within an Amazon Virtual Private Cloud (Amazon VPC). An Amazon ES domain within an Amazon VPC enables secure communication between Amazon ES and other services within the Amazon VPC without the need for an internet gateway, NAT device, or VPN connection.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">emr-kerberos-enabled (p. 145)</a>	The access permissions and authorizations can be managed and incorporated with the principles of least privilege and separation of duties, by enabling Kerberos for Amazon EMR clusters. In Kerberos, the services and the users that need to authenticate are known as principals. The principals exist within a Kerberos realm. Within the realm, a Kerberos server is known as the key distribution center (KDC). It provides a means for the principals to authenticate. The KDC authenticates by issuing tickets for authentication. The KDC maintains a database of the principals within its realm, their passwords, and other administrative information about each principal.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">iam-group-has-users-check (p. 153)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, by ensuring that IAM groups have at least one IAM user. Placing IAM users in groups based on their associated permissions or job function is one way to incorporate least privilege.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">iam-policy-no-statements-with-admin-access (p. 156)</a>	AWS Identity and Access Management (IAM) can help you incorporate the principles of least privilege and separation of duties with access permissions and authorizations, restricting policies from containing "Effect": "Allow" with "Action": "*" over "Resource": "*". Allowing users to have more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">iam-root-access-key-check (p. 157)</a>	Access to systems and assets can be controlled by checking that the root user does not have access keys attached to their AWS Identity and Access Management (IAM) role. Ensure that the root access keys are deleted. Instead, create and use role-based AWS accounts to help to incorporate the principle of least functionality.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">iam-user-group-membership-check (p. 157)</a>	AWS Identity and Access Management (IAM) can help you restrict access permissions and authorizations, by ensuring IAM users are members of at least one group. Allowing users more privileges than needed to complete a task may violate the principle of least privilege and separation of duties.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">iam-user-no-policies-check (p. 158)</a>	This rule ensures AWS Identity and Access Management (IAM) policies are attached only to groups or roles to control access to systems and assets. Assigning privileges at the group or the role level helps to reduce opportunity for an identity to receive or retain excessive privileges.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">iam-user-unused-credentials-check (p. 159)</a>	AWS Identity and Access Management (IAM) can help you with access permissions and authorizations by checking for IAM passwords and access keys that are not used for a specified time period. If these unused credentials are identified, you should disable and/or remove the credentials, as this may violate the principle of least privilege. This rule requires you to set a value to the <code>maxCredentialUsageAge</code> (Config Default: 90). The actual value should reflect your organization's policies.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">dms-replication-not-public (p. 127)</a>	Manage access to the AWS Cloud by ensuring DMS replication instances cannot be publicly accessed. DMS replication instances can contain sensitive information and access control is required for such accounts.

Control ID	Control Description	AWS Config Rule	Guidance
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">ebs-snapshot-public-restorable-check (p. 131)</a>	Manage access to the AWS Cloud by ensuring EBS snapshots are not publicly restorable. EBS volume snapshots can contain sensitive information and access control is required for such accounts.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">lambda-function-public-access-prohibited (p. 161)</a>	Manage access to resources in the AWS Cloud by ensuring AWS Lambda functions cannot be publicly accessed. Public access can potentially lead to degradation of availability of resources.
CIP-004-6-R4-Part 4.1.1	Each Responsible Entity shall implement one or more documented access management program(s) that collectively include each of the applicable requirement parts in CIP-004-6 Table R4 – Access Management Program. 4.1.1. Electronic access.	<a href="#">rds-instance-public-access-check (p. 166)</a>	Manage access to resources in the AWS Cloud by ensuring that Amazon Relational Database Service (Amazon RDS) instances are not public. Amazon RDS database instances can contain sensitive information, and principles and access control is required for such accounts.
