What is AWS Direct Connect?

AWS Direct Connect links your internal network to an AWS Direct Connect location over a standard Ethernet fiber-optic cable. One end of the cable is connected to your router, the other to an AWS Direct Connect router. With this connection, you can create virtual interfaces directly to public AWS services (for example, to Amazon S3) or to Amazon VPC, bypassing internet service providers in your network path. An AWS Direct Connect location provides access to AWS in the Region with which it is associated. You can use a single connection in a public Region or AWS GovCloud (US) to access public AWS services in all other public Regions.

The following diagram shows how AWS Direct Connect interfaces with your network.

Contents

- AWS Direct Connect Components (p. 1)
- Network Requirements (p. 2)
- Accessing a Remote AWS Region (p. 2)
- Routing Policies and BGP Communities (p. 3)

AWS Direct Connect Components

The following are the key components that you use for AWS Direct Connect:

Connections

Create a connection in an AWS Direct Connect location to establish a network connection from your premises to an AWS Region. For more information, see AWS Direct Connect Connections (p. 15).
Virtual interfaces

Create a virtual interface to enable access to AWS services. A public virtual interface enables access to public services, such as Amazon S3. A private virtual interface enables access to your VPC. For more information, see AWS Direct Connect Virtual Interfaces (p. 27) and Prerequisites for Virtual Interfaces (p. 27).

Network Requirements

To use AWS Direct Connect in an AWS Direct Connect location, your network must meet one of the following conditions:

- Your network is colocated with an existing AWS Direct Connect location. For more information about available AWS Direct Connect locations, see AWS Direct Connect Product Details.
- You are working with an AWS Direct Connect partner who is a member of the AWS Partner Network (APN). For information, see APN Partners Supporting AWS Direct Connect.
- You are working with an independent service provider to connect to AWS Direct Connect.

In addition, your network must meet the following conditions:

- Your network must use single-mode fiber with a 1000BASE-LX (1310nm) transceiver for 1 gigabit Ethernet or a 10GBASE-LR (1310nm) transceiver for 10 gigabit Ethernet.
- Auto-negotiation for the port must be disabled. Port speed and full-duplex mode must be configured manually.
- 802.1Q VLAN encapsulation must be supported across the entire connection, including intermediate devices.
- Your device must support Border Gateway Protocol (BGP) and BGP MD5 authentication.
- (Optional) You can configure Bidirectional Forwarding Detection (BFD) on your network. Asynchronous BFD is automatically enabled for AWS Direct Connect virtual interfaces, but does not take effect until you configure it on your router.

AWS Direct Connect supports both the IPv4 and IPv6 communication protocols. IPv6 addresses provided by public AWS services are accessible through AWS Direct Connect public virtual interfaces.

AWS Direct Connect supports an Ethernet frame size of 1522 or 9023 bytes (14 bytes Ethernet header + 4 bytes VLAN tag + bytes for the IP datagram + 4 bytes FCS) at the link layer. You can set the MTU of your private virtual interfaces. For more information, see Setting Network MTU (p. 36).

Accessing a Remote AWS Region

AWS Direct Connect locations in public Regions or AWS GovCloud (US) can access public services in any other public Region (excluding China (Beijing and Ningxia)). In addition, AWS Direct Connect connections in public Regions or AWS GovCloud (US) can be configured to access a VPC in your account in any other public Region (excluding China (Beijing and Ningxia)). You can therefore use a single AWS Direct Connect connection to build multi-Region services. All networking traffic remains on the AWS global network backbone, regardless of whether you access public AWS services or a VPC in another Region.

Any data transfer out of a remote Region is billed at the remote Region data transfer rate. For more information about data transfer pricing, see the Pricing section on the AWS Direct Connect detail page.

For more information about the routing policies and supported BGP communities for an AWS Direct Connect connection, see Routing Policies and BGP Communities (p. 3).
Accessing Public Services in a Remote Region

To access public resources in a remote Region, you must set up a public virtual interface and establish a Border Gateway Protocol (BGP) session. For more information, see AWS Direct Connect Virtual Interfaces (p. 27).

After you have created a public virtual interface and established a BGP session to it, your router learns the routes of the other public AWS Regions. For more information about prefixes currently advertised by AWS, see AWS IP Address Ranges in the Amazon Web Services General Reference.

Accessing VPCs in a Remote Region

You can create a Direct Connect gateway in any public Region. Use it to connect your AWS Direct Connect connection over a private virtual interface to VPCs in your account that are located in different Regions. For more information, see Direct Connect Gateways (p. 46).

Alternatively, you can create a public virtual interface for your AWS Direct Connect connection and then establish a VPN connection to your VPC in the remote Region. For more information about configuring VPN connectivity to a VPC, see Scenarios for Using Amazon Virtual Private Cloud in the Amazon VPC User Guide.

Routing Policies and BGP Communities

AWS Direct Connect applies inbound and outbound routing policies for a public AWS Direct Connect connection. You can also use Border Gateway Protocol (BGP) community tags on advertised Amazon routes and apply BGP community tags on the routes you advertise to Amazon.

Routing Policies

If you’re using AWS Direct Connect to access public AWS services, you must specify the public IPv4 prefixes or IPv6 prefixes to advertise over BGP.

The following inbound routing policies apply:

- You must own the public prefixes and they must be registered as such in the appropriate regional internet registry.
- Traffic must be destined to Amazon public prefixes. Transitive routing between connections is not supported.
- AWS Direct Connect performs inbound packet filtering to validate that the source of the traffic originated from your advertised prefix.

The following outbound routing policies apply:

- AS_PATH is used to determine the routing path, and AWS Direct Connect is the preferred path for traffic sourced from Amazon. Only public ASNs are used internally for route selection.
- AWS Direct Connect advertises all local and remote AWS Region prefixes where available and includes on-net prefixes from other AWS non-Region points of presence (PoP) where available; for example, CloudFront and Route 53.
- AWS Direct Connect advertises prefixes with a minimum path length of 3.
- AWS Direct Connect advertises all public prefixes with the well-known NO_EXPORT BGP community.
- If you have multiple AWS Direct Connect connections, you can adjust the load-sharing of inbound traffic by advertising prefixes with similar path attributes.
The prefixes advertised by AWS Direct Connect must not be advertised beyond the network boundaries of your connection. For example, these prefixes must not be included in any public internet routing table.

**BGP Communities**

AWS Direct Connect supports a range of BGP community tags to help control the scope (Regional or global) and route preference of traffic.

**Scope BGP Communities**

You can apply BGP community tags on the public prefixes that you advertise to Amazon to indicate how far to propagate your prefixes in the Amazon network—for the local AWS Region only, all Regions within a continent, or all public Regions.

You can use the following BGP communities for your prefixes:

- **7224:9100**—Local AWS Region
- **7224:9200**—All AWS Regions for a continent (for example, North America–wide)
- **7224:9300**—Global (all public AWS Regions)

**Note**

If you do not apply any community tags, prefixes are advertised to all public AWS Regions (global) by default.

The communities 7224:1 – 7224:65535 are reserved by AWS Direct Connect.

In addition, the well-known NO_EXPORT BGP community is supported for both public and private virtual interfaces.

AWS Direct Connect also provides BGP community tags on advertised Amazon routes. If you're using AWS Direct Connect to access public AWS services, this enables you to create filters based on these community tags.

AWS Direct Connect applies the following BGP communities to its advertised routes:

- **7224:8100**—Routes that originate from the same AWS Region in which the AWS Direct Connect point of presence is associated.
- **7224:8200**—Routes that originate from the same continent with which the AWS Direct Connect point of presence is associated.
- No tag—Global (all public AWS Regions).

Communities that are not supported for an AWS Direct Connect public connection are removed.

**Local Preference BGP Communities**

You can use local preference BGP community tags to achieve load balancing and route preference for incoming traffic to your network. For each prefix that you advertise over a BGP session, you can apply a community tag to indicate the priority of the associated path for returning traffic. Local preference BGP community tags are supported for private virtual interfaces.

The following local preference BGP community tags are supported:

- **7224:7100**—Low preference
Local preference BGP community tags are mutually exclusive. To load balance traffic across multiple AWS Direct Connect connections, apply the same community tag across the prefixes for the connections. To support failover across multiple AWS Direct Connect connections, apply a community tag with a higher preference to the prefixes for the primary or active virtual interface.

Local preference BGP community tags are evaluated before any AS_PATH attribute, and are evaluated in order from lowest to highest preference (where highest preference is preferred).

- 7224:7200—Medium preference
- 7224:7300—High preference
AWS Direct Connect User Guide

Getting Started with AWS Direct Connect

AWS Direct Connect enables you to directly interface your on-premises network with a device at an AWS Direct Connect location.

AWS Direct Connect supports these port speeds over single-mode fiber: 1 Gbps: 1000BASE-LX (1310nm) and 10 Gbps: 10GBASE-LR (1310nm).

You can set up an AWS Direct Connect connection in one of the following ways.

<table>
<thead>
<tr>
<th>Model</th>
<th>Capacity</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dedicated connection</td>
<td>1Gbps, 10 Gbps</td>
<td>Connect directly to an AWS device from your router at an AWS Direct Connect location or work with an AWS Direct Connect Partner or a network provider to connect a router from your data center, office, or colocation environment to an AWS Direct Connect location. The network provider does not have to be an AWS Direct Connect Partner to connect you to a dedicated connection. AWS Direct Connect dedicated connections support these port speeds over single-mode fiber: 1 Gbps: 1000BASE-LX (1310nm) and 10 Gbps: 10GBASE-LR (1310nm).</td>
</tr>
<tr>
<td>Hosted connection</td>
<td>50Mbps, 100Mbps, 200Mbps, 300Mbps, 400Mbps, 500Mbps, 1Gbps, 2Gbps, 5Gbps, and 10Gbps</td>
<td>Work with a partner in the AWS Direct Connect Partner Program to connect a router from your data center, office, or colocation environment to an AWS Direct Connect location. Only certain partners provide higher capacity connections.</td>
</tr>
</tbody>
</table>

The following procedures demonstrate the common scenarios to get set up with an AWS Direct Connect connection. Alternatively, you can refer to the article How do I provision an AWS Direct Connect connection? in the Knowledge Center.

Contents
- Prerequisites (p. 7)
- Step 1: Sign Up for AWS (p. 7)
- Step 2: Request an AWS Direct Connect Dedicated Connection or Accept a Hosted Connection (p. 7)
Prerequisites

For connections to AWS Direct Connect with port speeds of 1 Gbps or higher, ensure that your network meets the following requirements:

• Your network must use single-mode fiber with a 1000BASE-LX (1310nm) transceiver for 1 gigabit Ethernet or a 10GBASE-LR (1310nm) transceiver for 10 gigabit Ethernet.
• Auto-negotiation for the port must be disabled. Port speed and full-duplex mode must be configured manually.
• 802.1Q VLAN encapsulation must be supported across the entire connection, including intermediate devices.
• Your device must support Border Gateway Protocol (BGP) and BGP MD5 authentication.
• (Optional) You can configure Bidirectional Forwarding Detection (BFD) on your network. Asynchronous BFD is automatically enabled for AWS Direct Connect virtual interfaces, but does not take effect until you configure it on your router.

Step 1: Sign Up for AWS

To use AWS Direct Connect, you need an AWS account if you don't already have one.

To sign up for an AWS account

1. Open https://aws.amazon.com/, and then choose Create an AWS Account.
   Note
   If you previously signed in to the AWS Management Console using AWS account root user credentials, choose Sign in to a different account. If you previously signed in to the console using IAM credentials, choose Sign-in using root account credentials. Then choose Create a new AWS account.
2. Follow the online instructions.
   Part of the sign-up procedure involves receiving a phone call and entering a verification code using the phone keypad.

Step 2: Request an AWS Direct Connect Dedicated Connection or Accept a Hosted Connection

For dedicated connections, you can submit a connection request using the AWS Direct Connect console. For hosted connections, work with an AWS Direct Connect Partner to request a hosted connection. Ensure that you have the following information:

• The port speed that you require. You cannot change the port speed after you create the connection request.
• The AWS Direct Connect location at which the connection is to be terminated.
You cannot use the AWS Direct Connect console to request a hosted connection. Instead, contact an AWS Direct Connect Partner, who can create a hosted connection for you, which you then accept. Skip the following procedure and go to Accept Your Hosted Connection (p. 8).

To create a new AWS Direct Connect connection

2. On the AWS Direct Connect screen, under Get started, choose Create a connection.
3. On the Create Connection pane, under Connection settings, do the following:
   a. For Name, enter a name for the connection.
   b. For Location, select the appropriate AWS Direct Connect location.
   c. If applicable, for Sub Location, choose the floor closest to you or your network provider. This option is only available if the location has meet-me rooms (MMRs) in multiple floors of the building.
   d. For Port Speed, choose the connection bandwidth.
4. Choose Create Connection.

It can take up to 72 hours for AWS to review your request and provision a port for your connection. During this time, you may receive an email with a request for more information about your use case or the specified location. The email is sent to the email address that you used when you signed up for AWS. You must respond within 7 days or the connection is deleted.

For more information, see AWS Direct Connect Connections (p. 15).

Accept Your Hosted Connection

You must accept the hosted connection in the AWS Direct Connect console before you can create a virtual interface.

To accept a hosted connection

2. In the navigation pane, choose Connections.
3. Select the hosted connection and choose View details.
4. Select the confirmation check box and choose Accept connection.
5. Go to Step 4 (p. 9) to continue setting up your AWS Direct Connect connection.

(Dedicated Connection) Step 3: Download the LOA-CFA

After you request a connection, AWS makes a Letter of Authorization and Connecting Facility Assignment (LOA-CFA) available to you to download, or emails you with a request for more information. The LOA-CFA is the authorization to connect to AWS, and is required by the colocation provider or your network provider to establish the cross-network connection (cross-connect).

To download the LOA-CFA

2. In the navigation pane, choose Connections.
Step 4: Create a Virtual Interface

To begin using your AWS Direct Connect connection, you must create a virtual interface. You can create a virtual interface to connect to your VPC. Or, you can create a public virtual interface to connect to public AWS services that aren't in a VPC. When you create a private virtual interface to a VPC, you need a private virtual interface for each VPC to which to connect. For example, you need three private virtual interfaces to connect to three VPCs.

Before you begin, ensure that you have the following information:

- **Connection**: The AWS Direct Connect connection or link aggregation group (LAG) for which you are creating the virtual interface.
- **Virtual interface name**: A name for the virtual interface.
- **Virtual interface owner**: If you're creating the virtual interface for another account, you need the AWS account ID of the other account.
- **(Private virtual interface only) Connection to**: For connecting to a VPC in the same region, you need the virtual private gateway for your VPC. The ASN for the Amazon side of the BGP session is inherited from the virtual private gateway. When you create a virtual private gateway, you can specify your own private ASN. Otherwise, Amazon provides a default ASN. For more information, see Create a Virtual Private Gateway in the Amazon VPC User Guide. For connecting to a VPC through a Direct Connect gateway, you need the Direct Connect gateway. For more information, see Direct Connect Gateways.
- **VLAN**: A unique virtual local area network (VLAN) tag that’s not already in use on your connection. The value must be between 1 and 4094 and must comply with the Ethernet 802.1Q standard. This tag is required for any traffic traversing the AWS Direct Connect connection.
Step 4: Create a Virtual Interface

If you have a hosted connection, your AWS Direct Connect Partner provides this value. You can't modify the value after you have created the virtual interface.

- **Address family**: Whether the BGP peering session will be over IPv4 or IPv6.
- **Peer IP addresses**: A virtual interface can support a BGP peering session for IPv4, IPv6, or one of each (dual-stack). You cannot create multiple BGP sessions for the same IP addressing family on the same virtual interface. The IP address ranges are assigned to each end of the virtual interface for the BGP peering session.
  - **IPv4**:
    - (Public virtual interface only) You must specify unique public IPv4 addresses that you own.
    - (Private virtual interface only) Amazon can generate private IPv4 addresses for you. If you specify your own, ensure that you specify private CIDRs for your router interface and the AWS Direct Connect interface only (for example, do not specify other IP addresses from your local network).
  - **IPv6**: Amazon automatically allocates you a /125 IPv6 CIDR. You cannot specify your own peer IPv6 addresses.
- **BGP information**:
  - A public or private Border Gateway Protocol (BGP) Autonomous System Number (ASN) for your side of the BGP session. If you are using a public ASN, you must own it. If you are using a private ASN, it must be in the 64512 to 65535 range. Autonomous System (AS) prepending does not work if you use a private ASN for a public virtual interface.
  - An MD5 BGP authentication key. You can provide your own, or you can let Amazon generate one for you.
  - (Public virtual interface only) **Prefixes you want to advertise**: Public IPv4 routes or IPv6 routes to advertise over BGP. You must advertise at least one prefix using BGP, up to a maximum of 1,000 prefixes.
    - **IPv4**: The IPv4 CIDR must not overlap with another public IPv4 CIDR announced using AWS Direct Connect. If you do not own public IPv4 addresses, your network provider might be able to provide you with a public IPv4 CIDR. If not, contact AWS Support to request a public IPv4 CIDR (and provide a use case in your request).
    - **IPv6**: Specify a prefix length of /64 or shorter.
  - (Private virtual interface only) **Jumbo frames**: The maximum transmission unit (MTU) of packets over AWS Direct Connect. The default is 1500. Setting the MTU of a virtual interface to 9001 (jumbo frames) can cause an update to the underlying physical connection if it wasn't updated to support jumbo frames. Updating the connection disrupts network connectivity for all virtual interfaces associated with the connection for up to 30 seconds. To check whether a connection or virtual interface supports jumbo frames, select it in the AWS Direct Connect console and find **Jumbo Frame Capable** on the **Summary** tab.

AWS requests additional information from you if your public prefixes or ASNs belong to an ISP or network carrier. This can be a document using an official company letterhead or an email from the company's domain name verifying that the network prefix/ASN may be used by you.

When you create a public virtual interface, it can take up to 72 hours for AWS to review and approve your request.

To provision a public virtual interface to non-VPC services

2. In the navigation pane, choose **Virtual Interfaces**.
3. Choose **Create virtual interface**.
4. Under **Virtual interface type**, for **Type**, choose **Public**.
5. Under **Public Virtual Interface Settings**, do the following:
a. For **Virtual interface name**, enter a name for the virtual interface.
b. For **Connection**, choose the Direct Connect connection that you want to use for this interface.
c. For **VLAN**, enter the ID number for your virtual local area network (VLAN).
d. For **BGP ASN**, enter the Border Gateway Protocol (BGP) Autonomous System Number (ASN) of your gateway.

6. Under **Additional Settings**, do the following:
   a. To configure an IPv4 BGP or an IPv6 peer, do the following:
      
      [IPv4] To configure an IPv4 BGP peer, choose **IPv4** and do one of the following:
      
      - To specify these IP addresses yourself, for **Your router peer ip**, enter the destination IPv4 CIDR address to which Amazon should send traffic.
      - For **Amazon router peer ip**, enter the IPv4 CIDR address to use to send traffic to AWS.

   
   b. To advertise prefixes to Amazon, for **Prefixes you want to advertise**, enter the IPv4 CIDR destination addresses (separated by commas) to which traffic should be routed over the virtual interface.
   
   c. To change the maximum transmission unit (MTU) from 1500 (default) to 9001 (jumbo frames), select **Jumbo MTU (MTU size 9001)**.

7. To advertise prefixes to Amazon, under **Additional Settings**, for **Prefixes you want to advertise**, enter the IPv4 CIDR destination addresses (separated by commas) to which traffic should be routed over the virtual interface.

8. Choose **Create virtual interface**.

**To provision a private virtual interface to a VPC**

2. In the navigation pane, choose **Virtual Interfaces**.
3. Choose **Create virtual interface**.
4. Under **Virtual interface type**, for **Type**, choose **Private**.
5. Under **Private virtual interface settings**, do the following:
   a. For **Virtual interface name**, enter a name for the virtual interface.
   b. For **Connection**, choose the Direct Connect connection that you want to use for this interface.
   c. For **Gateway type**, choose **Virtual private gateway**.
   d. For **Virtual interface owner**, choose **Another AWS account**, and then enter the AWS account.
   e. For **Virtual private gateway**, choose the virtual private gateway to use for this interface.
   f. For **VLAN**, enter the ID number for your virtual local area network (VLAN).
   g. For **BGP ASN**, enter the Border Gateway Protocol (BGP) Autonomous System Number (ASN) of your gateway.

6. Under **Additional Settings**, do the following:
   a. To configure an IPv4 BGP or an IPv6 peer, do the following:
      
      [IPv4] To configure an IPv4 BGP peer, choose **IPv4** and do one of the following:
      
      - To specify these IP addresses yourself, for **Your router peer ip**, enter the destination IPv4 CIDR address to which Amazon should send traffic.
      - For **Amazon router peer ip**, enter the IPv4 CIDR address to use to send traffic to AWS.
Step 5: Download the Router Configuration

After you have created a virtual interface for your AWS Direct Connect connection, you can download the router configuration file. The file contains the necessary commands to configure your router for use with your private or public virtual interface.

To download a router configuration
2. In the navigation pane, choose Virtual Interfaces.
3. Select the connection and choose View Details.
4. Choose Download router configuration.
5. For Download router configuration, do the following:
   a. For Vendor, select the manufacturer of your router.
   b. For Platform, select the model of your router.
   c. For Software, select the software version for your router.
6. Choose Download, and then use the appropriate configuration for your router to ensure that you can connect to AWS Direct Connect.

For example configuration files, see Example Router Configuration Files.

After you configure your router, the status of the virtual interface goes to UP. If the virtual interface remains down and you cannot ping the AWS Direct Connect device's peer IP address, see Troubleshooting Layer 2 (Data Link) Issues (p. 75). If you can ping the peer IP address, see Troubleshooting Layer 3/4 (Network/Transport) Issues (p. 77). If the BGP peering session is established but you cannot route traffic, see Troubleshooting Routing Issues (p. 79).

Step 6: Verify Your Virtual Interface

After you have established virtual interfaces to the AWS Cloud or to Amazon VPC, you can verify your AWS Direct Connect connection using the following procedures.

To verify your virtual interface connection to the AWS Cloud
• Run traceroute and verify that the AWS Direct Connect identifier is in the network trace.

To verify your virtual interface connection to Amazon VPC
1. Using a pingable AMI, such as an Amazon Linux AMI, launch an EC2 instance into the VPC that is attached to your virtual private gateway. The Amazon Linux AMIs are available in the Quick Start tab when you use the instance launch wizard in the Amazon EC2 console. For more information,
see Launch an Instance in the Amazon EC2 User Guide for Linux Instances. Ensure that the security group that's associated with the instance includes a rule permitting inbound ICMP traffic (for the ping request).

2. After the instance is running, get its private IPv4 address (for example, 10.0.0.4). The Amazon EC2 console displays the address as part of the instance details.

3. Ping the private IPv4 address and get a response.

(Recommended) Configure Redundant Connections

To provide for failover, we recommend that you request and configure two dedicated connections to AWS, as shown in the following figure. These connections can terminate on one or two routers in your network.

There are different configuration choices available when you provision two dedicated connections:

- **Active/Active (BGP multipath).** This is the default configuration, where both connections are active. AWS Direct Connect supports multipathing to multiple virtual interfaces within the same location, and traffic is load-shared between interfaces based on flow. If one connection becomes unavailable, all traffic is routed through the other connection.

- **Active/Passive (failover).** One connection is handling traffic, and the other is on standby. If the active connection becomes unavailable, all traffic is routed through the passive connection. You need to prepend the AS path to the routes on one of your links for that to be the passive link.

How you configure the connections doesn't affect redundancy, but it does affect the policies that determine how your data is routed over both connections. We recommend that you configure both connections as active.

If you use a VPN connection for redundancy, ensure that you implement a health check and failover mechanism, and check your route table routing.

To achieve high availability, we strongly recommend that you configure connections to different AWS Direct Connect locations. For more information about high availability options, see Multiple Data Center HA Network Connectivity.
For more information about AWS Direct Connect resiliency, see AWS Direct Connect Resiliency Recommendations.
AWS Direct Connect Connections

AWS Direct Connect enables you to establish a dedicated network connection between your network and one of the AWS Direct Connect locations.

There are two types of connections:

- **Dedicated Connection**: A 1G or 10G physical Ethernet connection associated with a single customer. Customers can request a dedicated connection through the AWS Direct Connect console, the CLI, or the API.
- **Hosted Connection**: A 1G or 10G physical Ethernet connection that an AWS Direct Connect Partner provisions on behalf of a customer. Customers request a hosted connection by contacting a partner in the AWS Direct Connect Partner Program, who provisions the connection.

Dedicated Connections

To create an AWS Direct Connect dedicated connection, you need the following information:

**AWS Direct Connect location**

Work with a partner in the AWS Direct Connect Partner Program to help you establish network circuits between an AWS Direct Connect location and your data center, office, or colocation environment. They can also help provide colocation space within the same facility as the location. For more information, see APN Partners Supporting AWS Direct Connect.

**Port speed**

The possible values are 1Gbps and 10Gbps.

You cannot change the port speed after you create the connection request. To change the port speed, you must create and configure a new connection.

After you request the connection, AWS makes a Letter of Authorization and Connecting Facility Assignment (LOA-CFA) available to you to download, or emails you with a request for more information. If you receive a request for more information, you must respond within 7 days or the connection is deleted. The LOA-CFA is the authorization to connect to AWS, and is required by your network provider to order a cross connect for you. If you do not have equipment in the AWS Direct Connect location, you cannot order a cross connect for yourself there.

The following operations are available for dedicated connections:

- the section called “Creating a Connection” (p. 16)
- the section called “Viewing Connection Details” (p. 17)
- the section called “Updating a Connection” (p. 18)
- the section called “Deleting Connections” (p. 18)

You can add a dedicated connect to a link aggregation group (LAG) allowing you to treat multiple connections as a single one. For information, see Associating a Connection with a LAG (p. 43).

After you create a connection, create a virtual interface to connect to public and private AWS resources. For more information, see AWS Direct Connect Virtual Interfaces (p. 27).
Hosted Connections

To create an AWS Direct Connect connection, you need the following information:

AWS Direct Connect location

Work with an AWS Direct Connect Partner in the AWS Direct Connect Partner Program to help you establish network circuits between an AWS Direct Connect location and your data center, office, or colocation environment. They can also help provide colocation space within the same facility as the location. For more information, see APN Partners Supporting AWS Direct Connect.

Port speed

For hosted connections, the possible values are 50Mbps, 100Mbps, 200Mbps, 300Mbps, 400Mbps, 500Mbps, 1Gbps, 2Gbps, 5Gbps, and 10Gbps. Note that only those AWS Direct Connect partners who have met specific requirements may create a 1Gbps, 2Gbps, 5Gbps or 10Gbps hosted connection.

You cannot change the port speed after you create the connection request. To change the port speed, you must create and configure a new connection.

The following operations are available for hosted connections:

- the section called “Creating a Connection” (p. 16)
- the section called “Accepting a Hosted Connection” (p. 19)
- the section called “Viewing Connection Details” (p. 17)
- the section called “Updating a Connection” (p. 18)
- the section called “Deleting Connections” (p. 18)

After you accept a connection, create a virtual interface to connect to public and private AWS resources. For more information, see AWS Direct Connect Virtual Interfaces (p. 27).

Creating a Connection

You can create a standalone connection, or you can create a connection to associate with a LAG in your account. If you associate a connection with a LAG, it’s created with the same port speed and location that is specified in the LAG.

If you do not have equipment at an AWS Direct Connect location, first contact an AWS Direct Connect Partner at the AWS Direct Connect Partner Program. For more information, see APN Partners Supporting AWS Direct Connect.

To create a new AWS Direct Connect connection

2. In the navigation pane, choose Connections.
3. Choose Create connection.
4. On the Create connection pane, under Connection settings, do the following:
   a. For Name, enter a name for the connection.
   b. For Location, select the appropriate AWS Direct Connect location.
c. If applicable, for **Sub location**, choose the floor closest to you or your network provider. This option is available only if the location has meet-me rooms (MMRs) in multiple floors of the building.

d. For **Port speed**, choose the connection bandwidth.

5. Choose **Create connection**.

To create a connection using the command line or API

- `create-connection` (AWS CLI)
- `CreateConnection` (AWS Direct Connect API)

**Downloading the LOA-CFA**

After AWS has processed your connection request, you can download the LOA-CFA.

**To download the LOA-CFA**

2. In the navigation pane, choose **Connections**.
3. Select the connection and choose **View details**.
4. Choose **Download LOA-CFA**.

   **Note**
   If the link is not enabled, the LOA-CFA is not yet available for you to download. Check your email for a request for information. If it's still unavailable, or you haven't received an email after 72 hours, contact AWS Support.

5. Send the LOA-CFA to your network provider or colocation provider so that they can order a cross connect for you. The contact process can vary for each colocation provider. For more information, see Requesting Cross Connects at AWS Direct Connect Locations (p. 20).

The LOA-CFA expires after 90 days. If your connection is not up after 90 days, we send you an email alerting you that the LOA-CFA has expired. To refresh the LOA-CFA with a new issue date, download it again from the AWS Direct Connect console. If you do not take any action, we delete the connection.

   **Note**
   Port-hour billing starts 90 days after you created the connection, or after the connection between your router and the AWS Direct Connect endpoint is established, whichever comes first. For more information, see AWS Direct Connect Pricing. If you no longer want the connection after you have reissued the LOA-CFA, you must delete the connection yourself. For more information, see Deleting Connections (p. 18).

To download the LOA-CFA using the command line or API

- `describe-loa` (AWS CLI)
- `DescribeLoa` (AWS Direct Connect API)

**Viewing Connection Details**

You can view the current status of your connection. You can also view your connection ID (for example, `dxcon-12n12kabc`) and verify that it matches the connection ID on the LOA-CFA that you received or downloaded.
To view details about a connection
2. In the left pane, choose Connections.
3. Select a connection and choose View details.

To describe a connection using the command line or API
- describe-connections (AWS CLI)
- DescribeConnections (AWS Direct Connect API)

**Updating a Connection**

You can update the connection name, add a tag to the connection, or remove a tag from the connection.

To update a connection
2. In the navigation pane, choose Connections.
3. Select the connection and choose Edit.
4. Modify the connection:
   - [Change the name] For Name, enter a new connection name.
   - [Add a tag] Choose Add tag and do the following:
     - For Key, enter the key name.
     - For Value, enter the key value.
   - [Remove a tag] Next to the tag, choose Remove tag.
5. Choose Edit connection.

To add a tag or remove a tag using the command line
- tag-resource (AWS CLI)
- untag-resource (AWS CLI)

**Deleting Connections**

You can delete a connection as long as there are no virtual interfaces attached to it. Deleting your connection stops all port hour charges for this connection. AWS Direct Connect data transfer charges are associated with virtual interfaces. Any cross connect or network circuit charges are independent of AWS Direct Connect and must be cancelled separately. For more information about how to delete a virtual interface, see Deleting Virtual Interfaces (p. 37).

If the connection is part of a link aggregation group (LAG), you cannot delete the connection if doing so causes the LAG to fall below its setting for the minimum number of operational connections.

To delete a connection
Accepting a Hosted Connection

If you are interested in purchasing a hosted connection, you must contact an AWS Direct Connect Partner in the AWS Direct Connect Partner Program. The partner provisions the connection for you. After the connection is configured, it appears in the Connections pane in the AWS Direct Connect console.

Before you can begin using a hosted connection, you must accept the connection.

2. In the navigation pane, choose Connections.
3. Select the hosted connection and choose View details.
4. Select the confirmation check box and choose Accept connection.

To accept a hosted connection using the command line or API

- confirm-connection (AWS CLI)
- ConfirmConnection (AWS Direct Connect API)
Requesting Cross Connects at AWS Direct Connect Locations

After you have downloaded your Letter of Authorization and Connecting Facility Assignment (LOA-CFA), you must complete your cross-network connection, also known as a cross connect. If you already have equipment located in an AWS Direct Connect location, contact the appropriate provider to complete the cross connect. For specific instructions for each provider, see the table below. Contact your provider for cross connect pricing. After the cross connect is established, you can create the virtual interfaces using the AWS Direct Connect console.

Some locations are set up as a campus. For more information, see AWS Direct Connect Locations.

If you do not already have equipment located in an AWS Direct Connect location, you can work with one of the partners in the AWS Partner Network (APN). They help you to connect to an AWS Direct Connect location. For more information, see APN Partners supporting AWS Direct Connect. You must share the LOA-CFA with your selected provider to facilitate your cross connect request.

An AWS Direct Connect connection can provide access to resources in other Regions. For more information, see Accessing a Remote AWS Region (p. 2).

**Note**
If the cross connect is not completed within 90 days, the authority granted by the LOA-CFA expires. To renew a LOA-CFA that has expired, you can download it again from the AWS Direct Connect console. For more information, see Downloading the LOA-CFA (p. 17).

AWS Direct Connect Virtual Interfaces

You must create a virtual interface to begin using your AWS Direct Connect connection. You can create a private virtual interface to connect to your VPC. Or, you can create a public virtual interface to connect to AWS services that aren't in a VPC, such as Amazon S3 and Glacier. You can configure multiple virtual interfaces on a single AWS Direct Connect connection. For private virtual interfaces, you need one private virtual interface for each VPC to connect to from the AWS Direct Connect connection, or you can use a AWS Direct Connect gateway. For more information, see Direct Connect Gateways.

To connect to other AWS services using IPv6 addresses, check the service documentation to verify that IPv6 addressing is supported.

We advertise appropriate Amazon prefixes to you so you can reach either your VPCs or other AWS services. You can access all AWS prefixes through this connection; for example, Amazon EC2, Amazon S3, and Amazon.com. You do not have access to non-Amazon prefixes. For a current list of prefixes advertised by AWS, see AWS IP Address Ranges in the Amazon Web Services General Reference.

Note
We recommend that you use a firewall filter (based on the source/destination address of packets) to control traffic to and from some prefixes. If you're using a prefix filter (route map), ensure that it accepts prefixes with an exact match or longer. Prefixes advertised from AWS Direct Connect may be aggregated and may differ from the prefixes defined in your prefix filter.

To use your AWS Direct Connect connection with another AWS account, you can create a hosted virtual interface for that account. The owner of the other account must accept the hosted virtual interface to begin using it. A hosted virtual interface works the same as a standard virtual interface and can connect to public resources or a VPC.

A connection of less than 1 Gbps supports only one virtual interface.

- Accepting a Hosted Virtual Interface (p. 39)

Prerequisites for Virtual Interfaces

Before you create a virtual interface, do the following:
To create a virtual interface, you need the following information:

- **Connection**: The AWS Direct Connect connection or link aggregation group (LAG) for which you are creating the virtual interface.
- **Virtual interface name**: A name for the virtual interface.
- **Virtual interface owner**: If you’re creating the virtual interface for another account, you need the AWS account ID of the other account.
- **Connection to**: For connecting to a VPC in the same region, you need the virtual private gateway for your VPC. The ASN for the Amazon side of the BGP session is inherited from the virtual private gateway. When you create a virtual private gateway, you can specify your own private ASN. Otherwise, Amazon provides a default ASN. For more information, see Create a Virtual Private Gateway in the Amazon VPC User Guide. For connecting to a VPC through a Direct Connect gateway, you need the Direct Connect gateway. For more information, see Direct Connect Gateways.
- **VLAN**: A unique virtual local area network (VLAN) tag that’s not already in use on your connection. The value must be between 1 and 4094 and must comply with the Ethernet 802.1Q standard. This tag is required for any traffic traversing the AWS Direct Connect connection.

If you have a hosted connection, your AWS Direct Connect Partner provides this value. You can’t modify the value after you have created the virtual interface.

- **Address family**: Whether the BGP peering session will be over IPv4 or IPv6.
- **Peer IP addresses**: A virtual interface can support a BGP peering session for IPv4, IPv6, or one of each (dual-stack). You cannot create multiple BGP sessions for the same IP addressing family on the same virtual interface. The IP address ranges are assigned to each end of the virtual interface for the BGP peering session.
  - **IPv4**:
    - (Public virtual interface only) You must specify unique public IPv4 addresses that you own.
    - (Private virtual interface only) Amazon can generate private IPv4 addresses for you. If you specify your own, ensure that you specify private CIDRs for your router interface and the AWS Direct Connect interface only (for example, do not specify other IP addresses from your local network).
  - **IPv6**: Amazon automatically allocates you a /125 IPv6 CIDR. You cannot specify your own peer IPv6 addresses.
- **BGP information**:
  - A public or private Border Gateway Protocol (BGP) Autonomous System Number (ASN) for your side of the BGP session. If you are using a public ASN, you must own it. If you are using a private ASN, it must be in the 64512 to 65535 range. Autonomous System (AS) prepending does not work if you use a private ASN for a public virtual interface.
  - An MD5 BGP authentication key. You can provide your own, or you can let Amazon generate one for you.
  - (Public virtual interface only) **Prefixes you want to advertise**: Public IPv4 routes or IPv6 routes to advertise over BGP. You must advertise at least one prefix using BGP, up to a maximum of 1,000 prefixes.
    - **IPv4**: The IPv4 CIDR must not overlap with another public IPv4 CIDR announced using AWS Direct Connect. If you do not own public IPv4 addresses, your network provider might be able to provide you with a public IPv4 CIDR. If not, contact AWS Support to request a public IPv4 CIDR (and provide a use case in your request).
    - **IPv6**: Specify a prefix length of /64 or shorter.
  - (Private virtual interface only) **Jumbo frames**: The maximum transmission unit (MTU) of packets over AWS Direct Connect. The default is 1500. Setting the MTU of a virtual interface to 9001 (jumbo
Creating a Virtual Interface

You can create a public virtual interface to connect to public resources (non-VPC services), or a private virtual interface to connect to your VPC.

Prerequisites

Before you begin, ensure that you have read the information in Prerequisites for Virtual Interfaces (p. 27).

Creating a Public Virtual Interface

When you create a public virtual interface, it can take up to 72 hours for AWS to review and approve your request.

To provision a public virtual interface

2. In the navigation pane, choose Virtual Interfaces.
3. Choose Create virtual interface.
4. Under Virtual interface type, for Type, choose Public.
5. Under Public virtual interface settings, do the following:
   a. For Virtual interface name, enter a name for the virtual interface.
   b. For Connection, choose the Direct Connect connection that you want to use for this interface.
   c. For VLAN, enter the ID number for your virtual local area network (VLAN).
   d. For BGP ASN, enter the Border Gateway Protocol (BGP) Autonomous System Number (ASN) of your gateway.
6. Under Additional settings, do the following:
   a. To configure an IPv4 BGP or an IPv6 peer, do the following:
      [IPv4] To configure an IPv4 BGP peer, choose IPv4 and do one of the following:
      • To specify these IP addresses yourself, for Your router peer ip, enter the destination IPv4 CIDR address to which Amazon should send traffic.
      • For Amazon router peer IP, enter the IPv4 CIDR address to use to send traffic to AWS.
   b. To provide your own BGP key, enter your BGP MD5 key. If you do not enter a value, then AWS generates a BGP key.
   c. To advertise prefixes to Amazon, for Prefixes you want to advertise, enter the IPv4 CIDR destination addresses (separated by commas) to which traffic should be routed over the virtual interface.
7. Choose Create virtual interface.
8. Download the router configuration for your device. For more information, see Downloading the Router Configuration File (p. 31).

To create a public virtual interface using the command line or API

- create-public-virtual-interface (AWS CLI)
- CreatePublicVirtualInterface (AWS Direct Connect API)

Creating a Private Virtual Interface

You can provision a private virtual interface to a virtual private gateway in the same Region as your AWS Direct Connect connection. For more information about provisioning a private virtual interface to a AWS Direct Connect gateway, see Direct Connect Gateways (p. 46).

If you use the VPC wizard to create a VPC, route propagation is automatically enabled for you. With route propagation, routes are automatically populated to the route tables in your VPC. If you choose, you can disable route propagation. For more information, see Enable Route Propagation in Your Route Table in the Amazon VPC User Guide.

To provision a private virtual interface to a VPC

2. In the navigation pane, choose Virtual Interfaces.
3. Choose Create virtual interface.
4. Under Virtual interface type, for Type, choose Private.
5. Under Private virtual interface settings, do the following:
   a. For Virtual interface name, enter a name for the virtual interface.
   b. For Connection, choose the Direct Connect connection that you want to use for this interface.
   c. For Gateway type, choose Virtual private gateway.
   d. For Virtual interface owner, choose Another AWS account, and then enter the AWS account.
   e. For Virtual private gateway, choose the virtual private gateway to use for this interface.
   f. For VLAN, enter the ID number for your virtual local area network (VLAN).
   g. For BGP ASN, enter the Border Gateway Protocol (BGP) Autonomous System Number (ASN) of your gateway.
6. Under Additional Settings, do the following:
   a. To configure an IPv4 BGP or an IPv6 peer, do the following:
      [IPv4] To configure an IPv4 BGP peer, choose IPv4 and do one of the following:
      - To specify these IP addresses yourself, for Your router peer ip, enter the destination IPv4 CIDR address to which Amazon should send traffic.
      - For Amazon router peer ip, enter the IPv4 CIDR address to use to send traffic to AWS.
   b. To advertise prefixes to Amazon, for Prefixes you want to advertise, enter the IPv4 CIDR destination addresses (separated by commas) to which traffic should be routed over the virtual interface.
   c. To change the maximum transmission unit (MTU) from 1500 (default) to 9001 (jumbo frames), select Jumbo MTU (MTU size 9001).
7. Choose Create virtual interface.
8. Download the router configuration for your device. For more information, see Downloading the Router Configuration File (p. 31).

To create a private virtual interface using the command line or API

- create-private-virtual-interface (AWS CLI)
- CreatePrivateVirtualInterface (AWS Direct Connect API)

Downloading the Router Configuration File

After you've created the virtual interface, you can download the router configuration file for your router.

2. In the navigation pane, choose Virtual Interfaces.
3. Select the virtual interface and choose View details.
4. Choose Download router configuration.
5. For Download router configuration, do the following:
   a. For Vendor, select the manufacturer of your router.
   b. For Platform, select the model of your router.
   c. For Software, select the software version for your router.
6. Choose Download, and then use the appropriate configuration for your router to ensure that you can connect to AWS Direct Connect.

Example Router Configuration Files

The following are example extracts of router configuration files.

**Cisco IOS**

```plaintext
interface GigabitEthernet0/1
no ip address

interface GigabitEthernet0/1.VLAN_NUMBER
description "Direct Connect to your Amazon VPC or AWS Cloud"
encapsulation dot1Q VLAN_NUMBER
ip address YOUR_PEER_IP

router bgp CUSTOMER_BGP_ASN

Viewing Virtual Interface Details

You can view the current status of your virtual interface. Details include:

- Connection state
Adding or Deleting a BGP Peer

In some locations, a virtual interface can support up to two IPv4 BGP peering sessions and up to two IPv6 BGP peering sessions. In other locations, a virtual interface can support a single IPv4 BGP peering session and a single IPv6 BGP peering session. For information about the Regions that support logical redundancy, see AWS Direct Connect Locations.

You cannot specify your own peer IPv6 addresses for an IPv6 BGP peering session. Amazon automatically allocates you a /125 IPv6 CIDR.

Multiprotocol BGP is not supported. IPv4 and IPv6 operate in dual-stack mode for the virtual interface.

Adding a BGP Peer

Use the following procedure to add a BGP peer.

To add a BGP peer

2. In the navigation pane, choose Virtual Interfaces.
3. Select the virtual interface and choose View details.
4. Choose Add peering.
5. (Private virtual interface) To add IPv4 BGP peers, do the following:
   - Choose IPv4.
   - To specify these IP addresses yourself, for Your router peer ip, enter the destination IPv4 CIDR address to which Amazon should send traffic. In the Amazon router peer ip field, enter the IPv4 CIDR address to use to send traffic to AWS.
6. (Public virtual interface) To add IPv4 BGP peers, do the following:
   - For **Your router peer ip**, enter the IPv4 CIDR destination address where traffic should be sent.
   - For **Amazon router peer IP**, enter the IPv4 CIDR address to use to send traffic to AWS.

7. (Private or public virtual interface) To add IPv6 BGP peers, choose **IPv6**. The peer IPv6 addresses are automatically assigned from Amazon's pool of IPv6 addresses; you cannot specify custom IPv6 addresses.

8. In the **BGP ASN** field, type the Border Gateway Protocol (BGP) Autonomous System Number (ASN) of your gateway, for example, a number between 1 and 65534. For a public virtual interface, the ASN must be private or already whitelisted for the virtual interface.

9. To provide your own BGP key, for **BGP Authentication Key**, enter your BGP MD5 key.

10. Choose **Add peering**.

**To create a BGP peer using the command line or API**

- `create-bgp-peer` (AWS CLI)
- `CreateBGPPeer` (AWS Direct Connect API)
Deleting a BGP Peer

If your virtual interface has both an IPv4 and IPv6 BGP peering session, you can delete one of the BGP peering sessions (but not both).

To delete a BGP peer
2. In the navigation pane, choose Virtual Interfaces.
3. Select the virtual interface and choose View details.
4. Under Peerings, select the peering that you want to delete and choose Delete.
5. In the Remove peering from virtual interface dialog box, choose Delete.

To delete a BGP peer using the command line or API
- delete-bgp-peer (AWS CLI)
- DeleteBGPPeer (AWS Direct Connect API)

Setting Network MTU

AWS Direct Connect supports an Ethernet frame size of 1522 or 9023 bytes (14 bytes Ethernet header + 4 bytes VLAN tag + bytes for the IP datagram + 4 bytes FCS) at the link layer.

The maximum transmission unit (MTU) of a network connection is the size, in bytes, of the largest permissible packet that can be passed over the connection. The MTU of a virtual private interface can be either 1500 or 9001 (jumbo frames). You can specify the MTU when you create the interface or update it after you create it. Setting the MTU of a virtual interface to 9001 (jumbo frames) can cause an update to the underlying physical connection if it wasn't updated to support jumbo frames. Updating the connection disrupts network connectivity for all virtual interfaces associated with the connection for up to 30 seconds. To check whether a connection or virtual interface supports jumbo frames, select it in the AWS Direct Connect console and find Jumbo Frame Capable on the Summary tab.

After you enable jumbo frames for your private virtual interface, you can only associate it with a connection or LAG that is jumbo frame capable. Jumbo frames are supported on virtual private interfaces attached to a virtual private gateway or a Direct Connect gateway. Jumbo frames apply only to propagated routes from AWS Direct Connect. If you add static routes to your virtual private gateway to the route table, traffic routed through the static route defaults to 1500 MTU. If you have two private virtual interfaces that advertise the same route but use different MTU values, 1500 MTU is used.

Important
If an EC2 instance doesn't support jumbo frames, it drops jumbo frames from AWS Direct Connect. All EC2 instance types support jumbo frames except for C1, CC1, T1, and M1. For more information, see Network Maximum Transmission Unit (MTU) for Your EC2 Instance in the Amazon EC2 User Guide for Linux Instances.

To set the MTU of a private virtual interface
2. In the navigation pane, choose Virtual Interfaces.
3. Select the virtual interface and choose Edit.
4. Under Jumbo MTU (MTU size 9001), select Enabled.
Adding or Removing Virtual Interface Tags

Tags provide a way to identify the virtual interface. Add or remove a tag.

To add or remove a virtual interface tag
2. In the navigation pane, choose Virtual Interfaces.
3. Select the virtual interface and choose Edit.
4. Add or remove a tag.
   - [Add a tag] Choose Add tag and do the following:
     - For Key, enter the key name.
     - For Value, enter the key value
   - [Remove a tag] Beside the tag, choose Remove tag.
5. Choose Edit virtual interface.

To add a tag or remove a tag using the command line
- tag-resource (AWS CLI)
- untag-resource (AWS CLI)

Deleting Virtual Interfaces

Delete one or more virtual interfaces. Before you can delete a connection, you must delete its virtual interface. Deleting a virtual interface stops AWS Direct Connect data transfer charges associated with the virtual interface.

To delete a virtual interface
2. In the left pane, choose Virtual Interfaces.
3. Select the virtual interfaces and choose Delete.
4. In the Delete confirmation dialog box, choose Delete.

To delete a virtual interface using the command line or API
- delete-virtual-interface (AWS CLI)
Creating a Hosted Virtual Interface

You can create a public or private hosted virtual interface. Before you begin, ensure that you have read the information in Prerequisites for Virtual Interfaces (p. 27).

Creating a Hosted Private Virtual Interface

To create a hosted private virtual interface

2. In the navigation pane, choose Virtual Interfaces.
3. Choose Create virtual interface.
4. Under Virtual interface type, for Type, choose Private.
5. Under Private virtual interface settings, do the following:
   a. For Virtual interface name, enter a name for the virtual interface.
   b. For Connection, choose the Direct Connect connection that you want to use for this interface.
   c. For Gateway type, choose Virtual private gateway.
   d. For Virtual interface owner, choose Another AWS account, and then enter the AWS account.
   e. For Virtual private gateway, choose the virtual private gateway to use for this interface.
   f. For VLAN, enter the ID number for your virtual local area network (VLAN).
   g. For BGP ASN, enter the Border Gateway Protocol (BGP) Autonomous System Number (ASN) of your gateway.
6. Under Additional Settings, do the following:
   a. To configure an IPv4 BGP or an IPv6 peer, do the following:
      [IPv4] To configure an IPv4 BGP peer, choose IPv4 and do one of the following:
      • To specify these IP addresses yourself, for Your router peer ip, enter the destination IPv4 CIDR address to which Amazon should send traffic.
      • For Amazon router peer ip, enter the IPv4 CIDR address to use to send traffic to AWS.
   b. To advertise prefixes to Amazon, for Prefixes you want to advertise, enter the IPv4 CIDR destination addresses (separated by commas) to which traffic should be routed over the virtual interface.
   c. To change the maximum transmission unit (MTU) from 1500 (default) to 9001 (jumbo frames), select Jumbo MTU (MTU size 9001).
7. Choose Create virtual interface.
8. After the hosted virtual interface is accepted by the owner of the other AWS account, you can download the router configuration file (p. 31).

To create a hosted private virtual interface using the command line or API

- allocate-private-virtual-interface (AWS CLI)
- AllocatePrivateVirtualInterface (AWS Direct Connect API)
Creating a Hosted Public Virtual Interface

To create a hosted public virtual interface

2. In the navigation pane, choose Virtual Interfaces.
3. Choose Create virtual interface.
4. Under Virtual interface type, for Type, choose Public.
5. Under Private virtual interface settings, for Virtual interface name, enter a name for the virtual interface.
6. Under Additional Settings, for Virtual interface owner, enter the ID of the AWS account to own this virtual interface.
7. For VLAN, enter the ID number for your virtual local area network (VLAN).
8. For BGP ASN, enter the Border Gateway Protocol (BGP) Autonomous System Number (ASN) of your AWS endpoint.
9. To configure an IPv4 BGP or an IPv6 peer, do the following:
   - [IPv4] To configure an IPv4 BGP peer, under Additional Settings, choose IPv4 and do one of the following:
     • To specify these IP addresses yourself, for Your router peer IP, enter the destination IPv4 CIDR address to which Amazon should send traffic. For Amazon router peer IP, enter the IPv4 CIDR address to use to send traffic to AWS.
10. To provide your own BGP key, under Additional Settings, enter your BGP MD5 key.
    If you do not enter a value, then AWS generates a BGP key.
11. To advertise prefixes to Amazon, under Additional Settings, for Prefixes you want to advertise, enter the IPv4 CIDR destination addresses (separated by commas) to which traffic should be routed over the virtual interface.
12. Choose Create virtual interface.
13. After the hosted virtual interface is accepted by the owner of the other AWS account, you can download the router configuration file (p. 31).

To create a hosted public virtual interface using the command line or API

- allocate-public-virtual-interface (AWS CLI)
- AllocatePublicVirtualInterface (AWS Direct Connect API)

Accepting a Hosted Virtual Interface

Before you can begin using a hosted virtual interface, you must accept the virtual interface. For a private virtual interface, you must also have an existing virtual private gateway or Direct Connect gateway.

To accept a hosted virtual interface

2. In the navigation pane, choose Virtual Interfaces.
3. Select the virtual interface and choose View details.
4. Choose **Accept**.

5. (Private virtual interface) In the **Accept virtual interface** dialog box, select a virtual private gateway or Direct Connect gateway, and choose **Accept**.

6. After you've accepted the hosted virtual interface, the owner of the AWS Direct Connect connection can download the router configuration file. The **Download router configuration** option is not available for the account that accepts the hosted virtual interface.

**To accept a hosted private virtual interface using the command line or API**

- `confirm-private-virtual-interface` (AWS CLI)
- `ConfirmPrivateVirtualInterface` (AWS Direct Connect API)

**To accept a hosted public virtual interface using the command line or API**

- `confirm-public-virtual-interface` (AWS CLI)
- `ConfirmPublicVirtualInterface` (AWS Direct Connect API)
Link Aggregation Groups

A link aggregation group (LAG) is a logical interface that uses the Link Aggregation Control Protocol (LACP) to aggregate multiple connections at a single AWS Direct Connect endpoint, allowing you to treat them as a single, managed connection.

You can create a LAG from existing connections, or you can provision new connections. After you've created the LAG, you can associate existing connections (whether standalone or part of another LAG) with the LAG.

The following rules apply:

- All connections in the LAG must use the same bandwidth.
- You can have a maximum of four connections in a LAG. Each connection in the LAG counts towards your overall connection limit for the Region.
- All connections in the LAG must terminate at the same AWS Direct Connect endpoint.

When you create a LAG, you can download the Letter of Authorization and Connecting Facility Assignment (LOA-CFA) for each new physical connection individually from the AWS Direct Connect console. For more information, see Downloading the LOA-CFA (p. 17).

All LAGs have an attribute that determines the minimum number of connections in the LAG that must be operational for the LAG itself to be operational. By default, new LAGs have this attribute set to 0. You can update your LAG to specify a different value—doing so means that your entire LAG becomes non-operational if the number of operational connections falls below this threshold. This attribute can be used to prevent over-utilization of the remaining connections.

All connections in a LAG operate in Active/Active mode.

**Note**

When you create a LAG or associate more connections with the LAG, we may not be able to guarantee enough available ports on a given AWS Direct Connect endpoint.

**Tasks**

- Creating a LAG (p. 41)
- Updating a LAG (p. 43)
- Associating a Connection with a LAG (p. 43)
- Disassociating a Connection From a LAG (p. 44)
- Deleting LAGs (p. 44)

Creating a LAG

You can create a LAG by provisioning new connections, or aggregating existing connections.

You cannot create a LAG with new connections if this results in you exceeding the overall connections limit for the Region.

To create a LAG from existing connections, the connections must be on the same AWS device (terminate at the same AWS Direct Connect endpoint). They must also use the same bandwidth. You cannot migrate a connection from an existing LAG if removing the connection causes the original LAG to fall below its setting for the minimum number of operational connections.
Important
For existing connections, connectivity to AWS is interrupted during the creation of the LAG.

To create a LAG with new connections
2. In the navigation pane, choose LAGs.
3. Choose Create LAG.
4. Under Lag creation type, choose Request new connections, and provide the following information:
   - LAG name: A name for the LAG.
   - Location: The location for the LAG.
   - Port speed: The port speed for the connections.
   - Number of new connections: The number of new connections to create.
5. Choose Create LAG.

To create a LAG from existing connections
2. In the navigation pane, choose LAGs.
3. Choose Create LAG.
4. Under Lag creation type, choose Use existing connections, and provide the following information:
   - LAG name: A name for the LAG.
   - Connection: The Direct Connect connection to use for the LAG.
   - Minimum links: The minimum number of connections that must be operational for the LAG itself to be operational. If you do not specify a value, we assign a default value of 0.
5. Choose Create LAG.

After you've created a LAG, you can view its details in the AWS Direct Connect console.

To view information about your LAG
2. In the navigation pane, choose LAGs.
3. Select the LAG and choose View details.
4. You can view information about the LAG, including its ID, the AWS Direct Connect endpoint on which the connections terminate.

After you've created a LAG, you can associate or disassociate connections from it. For more information, see Associating a Connection with a LAG (p. 43) and Disassociating a Connection From a LAG (p. 44).

To create a LAG using the command line or API
- create-lag (AWS CLI)
- CreateLag (AWS Direct Connect API)

To describe your LAGs using the command line or API
- describe-lags (AWS CLI)
Updating a LAG

You can update a LAG to change its name, or to change the value for the minimum number of operational connections, or to add a tag, or remove a tag.

Note
If you adjust the threshold value for the minimum number if operational connections, ensure that the new value does not cause the LAG to fall below the threshold and become non-operational.

To update a LAG
2. In the navigation pane, choose LAGs.
3. Select the LAG and choose Edit.
4. Modify the LAG
   - [Change the name] For LAG Name, enter a new LAG name.
   - [Adjust the minimum number of connections] For Minimum Links, enter minimum number of operational connections.
   - [Add a tag] Choose Add tag and do the following:
     - For Key, enter the key name.
     - For Value, enter the key value.
   - [Remove a tag] Beside the tag, choose Remove tag.
5. Choose Edit LAG.

To update a LAG using the command line or API
- update-lag (AWS CLI)
- UpdateLag (AWS Direct Connect API)

To add a tag or remove a tag using the command line
- tag-resource (AWS CLI)
- untag-resource (AWS CLI)

Associating a Connection with a LAG

You can associate an existing connection with a LAG. The connection can be standalone, or it can be part of another LAG. The connection must be on the same AWS device and must use the same bandwidth.
as the LAG. If the connection is already associated with another LAG, you cannot re-associate it if removing the connection causes the original LAG to fall below its threshold for the minimum number of operational connections.

Associating a connection to a LAG automatically re-associates its virtual interfaces to the LAG.

**Important**
Connectivity to AWS over the connection is interrupted during association.

**To associate a connection with a LAG**
2. In the navigation pane, choose **LAGs**.
3. Select the LAG and choose **View details**.
4. Under **Connections**, choose **Associate connection**.
5. For **Connection**, choose the Direct Connect connection to use for the LAG.
6. Choose **Associate Connection**.

**To associate a connection using the command line or API**

- [AssociateConnectionWithLag](https://docs.aws.amazon.com/directconnect/latest/dg/API_AssociateConnectionWithLag.html) (AWS Direct Connect API)

### Disassociating a Connection From a LAG

Convert a connection to standalone by disassociating it from a LAG. You can't disassociate a connection if it causes the LAG to fall below its threshold for the minimum number of operational connections.

Disassociating a connection from a LAG does not automatically disassociate any virtual interfaces.

**Important**
Your connection to AWS is broken off during disassociation.

**To disassociate a connection from a LAG**
2. In the left pane, choose **LAGs**.
3. Select the LAG and choose **View details**.
4. Under **Connections**, select the connection from the list of available connections and choose **Disassociate**.
5. In the confirmation dialog box choose **Disassociate**.

**To disassociate a connection using the command line or API**

- [DisassociateConnectionFromLag](https://docs.aws.amazon.com/directconnect/latest/dg/API_DisassociateConnectionFromLag.html) (AWS Direct Connect API)

### Deleting LAGs

If you no longer need LAGs, you can delete them. You cannot delete a LAG if it has virtual interfaces associated with it. You must first delete the virtual interfaces, or associate them with a different LAG or
connection. Deleting a LAG does not delete the connections in the LAG; you must delete the connections yourself. For more information, see Deleting Connections (p. 18).

To delete a LAG

2. In the navigation pane, choose LAGs.
3. Select the LAGs and choose Delete.
4. In the confirmation dialog box choose Delete.

To delete a LAG using the command line or API

- delete-lag (AWS CLI)
- DeleteLag (AWS Direct Connect API)
Direct Connect Gateways

You can use an AWS Direct Connect gateway to connect your AWS Direct Connect connection over a private virtual interface to one or more VPCs in your account that are located in the same or different Regions. You associate a Direct Connect gateway with the virtual private gateway for the VPC. Then, create a private virtual interface for your AWS Direct Connect connection to the Direct Connect gateway. You can attach multiple private virtual interfaces to your Direct Connect gateway.

A Direct Connect gateway is a globally available resource. You can create the Direct Connect gateway in any public Region and access it from all other public Regions.

In the following diagram, the Direct Connect gateway enables you to use your AWS Direct Connect connection in the US East (N. Virginia) Region to access VPCs in your account in both the US East (N. Virginia) and US West (N. California) Regions.

Complete the following steps for this configuration.

1. Create a Direct Connect gateway.
2. Associate each private virtual gateway with the Direct Connect gateway.
3. Create a private virtual interface between the Direct Connect gateway and the Direct Connect location.

The following rules apply:

- You cannot use a Direct Connect gateway to connect to a VPC in the China Regions.
- There are limits for creating and using Direct Connect gateways. For more information, see Limits (p. 73).
- The VPCs to which you connect through a Direct Connect gateway cannot have overlapping CIDR blocks. If you add an IPv4 CIDR block to a VPC that's associated with a Direct Connect gateway, ensure that the CIDR block does not overlap with an existing CIDR block for any other associated VPC. For more information, see Adding IPv4 CIDR Blocks to a VPC in the Amazon VPC User Guide.
- You cannot create a public virtual interface to a Direct Connect gateway.
- A Direct Connect gateway supports communication between attached private virtual interfaces and associated virtual private gateways only. The following traffic flows are not supported:
  - Direct communication between the VPCs that are associated with the Direct Connect gateway.
  - Direct communication between the virtual interfaces that are attached to the Direct Connect gateway.
  - Direct communication between a virtual interface attached to a Direct Connect gateway and a VPN connection on a virtual private gateway that's associated with the same Direct Connect gateway.
Creating a Direct Connect Gateway

- You cannot associate a virtual private gateway with more than one Direct Connect gateway and you cannot attach a private virtual interface to more than one Direct Connect gateway.
- A virtual private gateway that you associate with a Direct Connect gateway must be attached to a VPC.

To connect your AWS Direct Connect connection to a VPC in the same Region only, you can create a Direct Connect gateway. Or, you can create a private virtual interface and attach it to the virtual private gateway for the VPC. For more information, see Creating a Private Virtual Interface (p. 30) and VPN CloudHub.

To use your AWS Direct Connect connection with a VPC in another account, you can create a hosted private virtual interface for that account. When the owner of the other account accepts the hosted virtual interface, they can choose to attach it to either a virtual private gateway or a Direct Connect gateway in their account. For more information, see AWS Direct Connect Virtual Interfaces (p. 27).

Contents
- Creating a Direct Connect Gateway (p. 47)
- Associating and Disassociating Virtual Private Gateways (p. 47)
- Creating a Private Virtual Interface to the Direct Connect Gateway (p. 48)
- Adding or Removing Direct Connect Gateway Tags (p. 50)
- Deleting Direct Connect Gateways (p. 50)
- Associating a Virtual Private Gateway Across Accounts (p. 50)

Creating a Direct Connect Gateway

You can create a Direct Connect gateway in any supported public Region.

To create a Direct Connect gateway

2. In the navigation pane, choose Direct Connect gateways.
3. Choose Create Direct Connect gateway.
4. Specify the following information, and choose Create Direct Connect gateway.
   - Name: Enter a name to help you identify the Direct Connect gateway.
   - Amazon side ASN: Specify the ASN for the Amazon side of the BGP session. The ASN must be in the 64,512 to 65,534 range or 4,200,000,000 to 4,294,967,294 range.
   - Virtual private gateway: To associate a virtual private gateway, choose the virtual private gateway.

To create a Direct Connect gateway using the command line or API

- create-direct-connect-gateway (AWS CLI)
- CreateDirectConnectGateway (AWS Direct Connect API)

Associating and Disassociating Virtual Private Gateways

The virtual private gateway must be attached to the VPC to which you want to connect. For more information, see Create a Virtual Private Gateway in the Amazon VPC User Guide.
Note
If you are planning to use the virtual private gateway for a Direct Connect gateway and a
dynamic VPN connection, set the ASN on the virtual private gateway to the value you require
for the VPN connection. Otherwise, the ASN on the virtual private gateway can be set to any
permitted value. The Direct Connect gateway advertises all connected VPCs over the ASN
assigned to it.

To associate a virtual private gateway
2. In the navigation pane, choose Direct Connect gateways and select the Direct Connect gateway.
3. Choose View details.
4. Choose Gateways associations and choose Associate gateway.
5. For Gateways, choose the virtual private gateways to associate, and choose Associate gateway.
6. (Optional) To specify a list of prefixes to be allowed from the virtual private gateway, add the
prefixes to Allowed prefixes, separating them using commas.

You can view all of the virtual private gateways that are associated with the Direct Connect gateway by
choosing Gateway associations.

To disassociate a virtual private gateway
2. In the navigation pane, choose Direct Connect gateways and select the Direct Connect gateway.
3. Choose View details.
4. Choose Virtual gateways associations and select the virtual private gateway.
5. Choose Disassociate.

To associate a virtual private gateway using the command line or API
- create-direct-connect-gateway-association (AWS CLI)
- CreateDirectConnectGatewayAssociation (AWS Direct Connect API)

To view the virtual private gateways associated with a Direct Connect gateway using the
command line or API
- describe-direct-connect-gateway-associations (AWS CLI)
- DescribeDirectConnectGatewayAssociations (AWS Direct Connect API)

To disassociate a virtual private gateway using the command line or API
- delete-direct-connect-gateway-association (AWS CLI)
- DeleteDirectConnectGatewayAssociation (AWS Direct Connect API)
Creating a Private Virtual Interface to the Direct Connect Gateway

**Note**
If you're accepting a hosted private virtual interface, you can associate it with a Direct Connect gateway in your account. For more information, see Accepting a Hosted Virtual Interface (p. 39).

To provision a private virtual interface to a Direct Connect gateway

2. In the navigation pane, choose **Virtual Interfaces**.
3. Choose **Create virtual interface**.
4. Under **Virtual interface type**, for **Type**, choose **Private**.
5. Under **Virtual interface type**, choose **Private**.
6. Under **Private virtual interface settings**, do the following:
   a. For **Virtual interface name**, enter a name for the virtual interface.
   b. For **Connection**, choose the Direct Connect connection that you want to use for this interface.
   c. For **Virtual interface owner**, choose **My AWS account** if the virtual interface is for your AWS account.
   d. For **Gateway type**, choose **Direct Connect gateway**.
   e. For **Direct Connect gateway**, select the Direct Connect gateway.
   f. For **VLAN**, enter the ID number for your virtual local area network (VLAN).
   g. For **BGP ASN**, enter the Border Gateway Protocol (BGP) Autonomous System Number (ASN) of your gateway.
7. Under **Additional Settings**, do the following:
   a. To configure an IPv4 BGP or an IPv6 peer, do the following:
      [IPv4] To configure an IPv4 BGP peer, choose **IPv4** and do one of the following:
      - To specify these IP addresses yourself, for **Your router peer ip**, enter the destination IPv4 CIDR address to which Amazon should send traffic.
      - For **Amazon router peer ip**, enter the IPv4 CIDR address to use to send traffic to AWS.
   b. To advertise prefixes to Amazon, for **Prefixes you want to advertise**, enter the IPv4 CIDR destination addresses (separated by commas) to which traffic should be routed over the virtual interface.
   c. To change the maximum transmission unit (MTU) from 1500 (default) to 9001 (jumbo frames), select **Jumbo MTU (MTU size 9001)**.
8. Choose **Create virtual interface**.

After you've created the virtual interface, you can download the router configuration for your device. For more information, see Downloading the Router Configuration File (p. 31).

To create a private virtual interface using the command line or API

- `create-private-virtual-interface` (AWS CLI)
- `CreatePrivateVirtualInterface` (AWS Direct Connect API)

To view the virtual interfaces that are attached to a Direct Connect gateway using the command line or API

- `describe-direct-connect-gateway-attachments` (AWS CLI)
Adding or Removing Direct Connect Gateway Tags

Tags provide a way to identify the Direct Connect gateway. Add or remove a tag.

To add or remove a Direct Connect gateway tag
2. In the navigation pane, choose Direct Connect gateways.
3. Select the Direct Connect gateway and choose Edit.
4. Add or remove a tag.
   - [Add a tag] Choose Add tag and do the following:
     - For Key, enter the key name.
     - For Value, enter the key value
   - [Remove a tag] Next to the tag, choose Remove tag.
5. Choose Edit Direct Connect gateway.

To add a tag or remove a tag using the command line
- tag-resource (AWS CLI)
- untag-resource (AWS CLI)

Deleting Direct Connect Gateways

If you no longer require a Direct Connect gateway, you can delete it. You must first disassociate (p. 47) all associated virtual private gateways and delete (p. 37) the attached private virtual interface.

To delete a Direct Connect gateway
2. In the navigation pane, choose Direct Connect gateways.
3. Select the gateways and choose Delete.

To delete a Direct Connect gateway using the command line or API
- delete-direct-connect-gateway (AWS CLI)
- DeleteDirectConnectGateway (AWS Direct Connect API)

Associating a Virtual Private Gateway Across Accounts

You can associate a Direct Connect gateway with a virtual private gateway that's in a different AWS account. The owner of the virtual private gateway creates an association proposal and the owner of the Direct Connect gateway must accept the association proposal.
An association proposal can contain prefixes that will be allowed from the virtual private gateway. The owner of the Direct Connect gateway can optionally override any requested prefixes in the association proposal.

You can only associate a Direct Connect gateway and virtual private gateway when the account that owns the Direct Connect gateway and the account that owns the virtual private gateway have the same payer ID.

Consider this scenario of a Direct Connect gateway owner (Account Z) who owns the Direct Connect gateway. Account A and Account B want to use the Direct Connect gateway. Account A and Account B each send an association proposal to Account Z. Account Z accepts the association proposals and can optionally update the prefixes that are allowed from Account A's virtual private gateway or Account B's virtual private gateway. After Account Z accepts the proposals, Account A and Account B can route traffic from their virtual private gateway to the Direct Connect gateway. Account Z also owns the routing to the customers because Account Z owns the gateway.

**Allowed Prefixes**

When you associate a virtual private gateway with a Direct Connect gateway, you specify a list of Amazon VPC prefixes to advertise to the Direct Connect gateway. The prefix list acts as a filter that allows the same CIDRs, or smaller CIDRs to be advertised to the Direct Connect gateway. You must set the **Allowed prefixes** to a range that is the same or wider than the VPC CIDR because we provision entire VPC CIDR on the virtual private gateway.

Consider the case where the VPC CIDR is 10.0.0.0/16. You can set the **Allowed prefixes** to 10.0.0.0/16 (the VPC CIDR value), or 10.0.0.0/15 (a value that is wider than the VPC CIDR).

**Tasks**

- Creating an Association Proposal (p. 52)
- Accepting or Rejecting an Association Proposal (p. 52)
Creating an Association Proposal

If you own the virtual private gateway, you must create an association proposal. The virtual private gateway must be attached to a VPC in your AWS account. The owner of the Direct Connect gateway must share the ID of the Direct Connect gateway and the ID of its AWS account. After you create the proposal, the owner of the Direct Connect gateway must accept it in order for you to gain access to the on-premises network over AWS Direct Connect.

To create an association proposal

2. In the navigation pane, choose Virtual private gateways and select the virtual private gateway.
3. Choose View details.
4. Choose Direct Connect gateway associations and choose Associate Direct Connect gateway.
5. Under Association account type, for Account owner, choose Another account.
6. For Direct Connect gateway owner, enter the ID of the AWS account that owns the Direct Connect gateway.
7. Under Association settings, do the following:
   a. For Direct Connect gateway ID, enter the ID of the Direct Connect gateway.
   b. For Virtual interface owner, enter the ID of the AWS account that owns the virtual interface for the association.
   c. (Optional) To specify a list of prefixes to be allowed from the virtual private gateway, add the prefixes to Allowed prefixes, separating them using commas.
8. Choose Associate Direct Connect gateway.

To create an association proposal using the command line or API

• create-direct-connect-gateway-association-proposal (AWS CLI)
• CreateDirectConnectGatewayAssociationProposal (AWS Direct Connect API)

Accepting or Rejecting an Association Proposal

If you own the Direct Connect gateway, you must accept the association proposal in order to create the association. Otherwise, you can reject the association proposal.

To accept an association proposal

2. In the navigation pane, choose Direct Connect gateways.
3. Select the Direct Connect gateway with pending proposals and choose View details.
4. On the Pending proposals tab, select the proposal and choose Accept proposal.
5. (Optional) To specify a list of prefixes to be allowed from the virtual private gateway, add the prefixes to Allowed prefixes, separating them using commas.
6. Choose Accept proposal.
To reject an association proposal
2. In the navigation pane, choose Direct Connect gateways.
3. Select the Direct Connect gateway with pending proposals and choose View details.
4. On the Pending proposals tab, select the virtual private gateway and choose Reject proposal.
5. In the Reject proposal dialog box, enter Delete and choose Reject proposal.

To view association proposals using the command line or API
- describe-direct-connect-gateway-association-proposals (AWS CLI)
- DescribeDirectConnectGatewayAssociationProposals (AWS Direct Connect API)

To accept an association proposal using the command line or API
- accept-direct-connect-gateway-association-proposal (AWS CLI)
- AcceptDirectConnectGatewayAssociationProposal (AWS Direct Connect API)

To reject an association proposal using the command line or API
- delete-direct-connect-gateway-association-proposal (AWS CLI)
- DeleteDirectConnectGatewayAssociationProposal (AWS Direct Connect API)

Updating the Allowed Prefixes for an Association
You can update the prefixes that are allowed from the virtual private gateway over the Direct Connect gateway.

If you're the owner of the virtual private gateway, create a new association proposal (p. 52) for the same Direct Connect gateway and virtual private gateway, specifying the prefixes to allow.

If you're the owner of the Direct Connect gateway, update the allowed prefixes when you accept the association proposal (p. 52) or update the allowed prefixes for an existing association as follows.

To update the allowed prefixes for an existing association using the command line or API
- update-direct-connect-gateway-association (AWS CLI)
- UpdateDirectConnectGatewayAssociation (AWS Direct Connect API)

Deleting an Association Proposal
The owner of the virtual private gateway can delete the Direct Connect gateway association proposal if it is still pending acceptance. After an association proposal is accepted, you can't delete it, but you can disassociate the virtual private gateway from the Direct Connect gateway. For more information, see the section called "Associating and Disassociating Virtual Private Gateways" (p. 47).

To delete an association proposal
2. In the navigation pane, choose Virtual private gateways and select the virtual private gateway.
3. Choose View details.
4. Choose **Pending Direct Connect gateway associations**, select the association and choose **Delete association**.

5. In the **Delete association proposal** dialog box, enter Delete and choose **Delete**.

**To delete a pending association proposal using the command line or API**

- `delete-direct-connect-gateway-association-proposal` (AWS CLI)
- `DeleteDirectConnectGatewayAssociationProposal` (AWS Direct Connect API)
Control Access to AWS Direct Connect Using AWS Identity and Access Management

You can use features of AWS Identity and Access Management to specify which AWS Direct Connect actions a user under your AWS account can perform. For example, you could create an IAM policy that grants only certain users in your organization permission to use the DescribeConnections action to retrieve data about your AWS Direct Connect connections.

Permissions granted using IAM cover all AWS resources you use with AWS Direct Connect. You cannot use IAM to control access to specific AWS resources (also known as resource-level permissions). For example, you cannot grant a user access to data for only a specific virtual interface.

AWS Direct Connect Actions

In an IAM policy, you can specify any or all actions that AWS Direct Connect offers. The action name must include the lowercase prefix directconnect:. For example: directconnect:DescribeConnections, directconnect:CreateConnection, or directconnect:* (for all AWS Direct Connect actions). For a list of the actions, see the AWS Direct Connect API Reference.

AWS Direct Connect Resources

AWS Direct Connect does not support resource-level permissions; therefore, you cannot control access to specific AWS Direct Connect resources. You must use an asterisk (*) to specify the resource when writing a policy to control access to AWS Direct Connect actions.

AWS Direct Connect Keys

AWS Direct Connect implements the following policy keys:

- aws:CurrentTime (for date/time conditions)
- aws:EpochTime (the date in epoch or UNIX time, for use with date/time conditions)
- aws:SecureTransport (Boolean representing whether the request was sent using SSL)
- aws:SourceIp (the requester’s IP address, for use with IP address conditions)
- aws:UserAgent (information about the requester’s client application, for use with string conditions)

If you use aws:SourceIp, and the request comes from an Amazon EC2 instance, the instance’s public IP address is used to determine if access is allowed.

For services that use only SSL, such as Amazon Relational Database Service and Amazon Route 53, the aws:SecureTransport key has no meaning.
Example Policies for AWS Direct Connect

The following example policy grants read access to AWS Direct Connect.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "directconnect:Describe*",
        "ec2:DescribeVpnGateways"
      ],
      "Resource": "*
    }
  ]
}
```

The following example policy grants full access to AWS Direct Connect.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "directconnect:*",
        "ec2:DescribeVpnGateways"
      ],
      "Resource": "*
    }
  ]
}
```

For more information about writing IAM policies, see IAM Policies in the IAM User Guide.
# Using Tags with AWS Direct Connect

You can optionally assign tags to your AWS Direct Connect resources to categorize or manage them. A tag consists of a key and an optional value, both of which you define.

You can tag the following AWS Direct Connect resources.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Amazon Resource Name (ARN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Connections</td>
<td>arn:aws:directconnect:Region:account-id:dxcon/connection-id</td>
</tr>
<tr>
<td>Virtual interfaces</td>
<td>arn:aws:directconnect:Region:account-id:dxvif/virtual-interface-id</td>
</tr>
<tr>
<td>Link aggregation group (LAG)</td>
<td>arn:aws:directconnect:Region:account-id:dxlag/lag-id</td>
</tr>
</tbody>
</table>

For example, you have two AWS Direct Connect connections in a Region, each in different locations. Connection dxcon-11aa22bb is a connection serving production traffic, and is associated with virtual interface dxvif-33cc44dd. Connection dxcon-abcabcab is a redundant (backup) connection, and is associated with virtual interface dxvif-12312312. You might choose to tag your connections and virtual interfaces as follows, to help distinguish them:

<table>
<thead>
<tr>
<th>Resource ID</th>
<th>Tag key</th>
<th>Tag value</th>
</tr>
</thead>
<tbody>
<tr>
<td>dxcon-11aa22bb</td>
<td>Purpose</td>
<td>Production</td>
</tr>
<tr>
<td></td>
<td>Location</td>
<td>Amsterdam</td>
</tr>
<tr>
<td>dxvif-33cc44dd</td>
<td>Purpose</td>
<td>Production</td>
</tr>
<tr>
<td>dxcon-abcabcab</td>
<td>Purpose</td>
<td>Backup</td>
</tr>
<tr>
<td></td>
<td>Location</td>
<td>Frankfurt</td>
</tr>
<tr>
<td>dxvif-12312312</td>
<td>Purpose</td>
<td>Backup</td>
</tr>
</tbody>
</table>

# Tag Restrictions

The following rules and restrictions apply to tags:

- Maximum number of tags per resource: 50
- Maximum key length: 128 Unicode characters
- Maximum value length: 265 Unicode characters
- Tag keys and values are case-sensitive.
- The `aws:` prefix is reserved for AWS use — you can't create or delete tag keys or values with this prefix. Tags with this prefix do not count against your tags per resource limit.
- Allowed characters are letters, spaces, and numbers representable in UTF-8, plus the following special characters: + - = . _ : / @
Working with Tags

After you create any of the following resources, you can use the AWS Direct Connect console to add and remove tags.

- Connections: For more information, see the section called “Updating a Connection” (p. 18).
- Virtual Interfaces: For more information, see the section called “Adding or Removing Virtual Interface Tags” (p. 37).
- Link aggregation group For more information, see Updating a LAG (p. 43)

You can add, remove or describe tags using the AWS Direct Connect API, the AWS CLI, the AWS Tools for Windows PowerShell, or an AWS SDK only. When you use these tools to manage tags, you must specify the Amazon Resource Name (ARN) for the resource. For more information, see Amazon Resource Names (ARNs) and AWS Service Namespaces in the Amazon Web Services General Reference.

To add a tag using the AWS CLI

Use the tag-resource command:

```
aws directconnect tag-resource --resource-arn arn:aws:directconnect:Region:account-id:resource-type/resource-id --tags "key=key, value=value"
```

To describe your tags using the AWS CLI

Use the describe-tags command:

```
```

To delete a tag using the AWS CLI

Use the untag-resource command:

```
```
Using the AWS CLI

You can use the AWS CLI to create and work with AWS Direct Connect resources.

The following example uses the AWS CLI commands to create an AWS Direct Connect connection. You can also download the Letter of Authorization and Connecting Facility Assignment (LOA-CFA) or provision a private or public virtual interface.

Before you begin, ensure that you have installed and configured the AWS CLI. For more information, see the AWS Command Line Interface User Guide.

Contents
- Step 1: Create a Connection (p. 59)
- Step 2: Download the LOA-CFA (p. 60)
- Step 3: Create a Virtual Interface and get the Router Configuration (p. 60)

Step 1: Create a Connection

The first step is to submit a connection request. Ensure that you know the port speed that you require and the AWS Direct Connect location. For more information, see AWS Direct Connect Connections (p. 15).

To create a connection request

1. Describe the AWS Direct Connect locations for your current Region. In the output that's returned, take note of the location code for the location in which you want to establish the connection.

```bash
aws directconnect describe-locations
```

```json
{
    "locations": [
        {
            "locationName": "NAP do Brasil, Barueri, Sao Paulo",
            "locationCode": "TNDB"
        },
        {
            "locationName": "Tivit - Site Transamerica (Sao Paulo)",
            "locationCode": "TIVIT"
        }
    ]
}
```

2. Create the connection and specify a name, the port speed, and the location code. In the output that's returned, take note of the connection ID. You need the ID to get the LOA-CFA in the next step.

```bash
aws directconnect create-connection --location TIVIT --bandwidth 1Gbps --connection-name "Connection to AWS"
```

```json
{
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg31dyv6",
    "connectionState": "requested",
    "bandwidth": "1Gbps",
    "location": "TIVIT",
}
```
Step 2: Download the LOA-CFA

After you've requested a connection, you can get the LOA-CFA using the `describe-loa` command. The output is base64-encoded. You must extract the relevant LOA content, decode it, and create a PDF file.

**To get the LOA-CFA using Linux or macOS**

In this example, the final part of the command decodes the content using the `base64` utility, and sends the output to a PDF file.

```bash
aws directconnect describe-loa --connection-id dxcon-fg31dyv6 --output text --query loaContent|base64 --decode > myLoaCfa.pdf
```

**To get the LOA-CFA using Windows**

In this example, the output is extracted to a file called `myLoaCfa.base64`. The second command uses the `certutil` utility to decode the file and send the output to a PDF file.

```bash
aws directconnect describe-loa --connection-id dxcon-fg31dyv6 --output text --query loaContent > myLoaCfa.base64
certutil -decode myLoaCfa.base64 myLoaCfa.pdf
```

After you've downloaded the LOA-CFA, send it to your network provider or colocation provider.

Step 3: Create a Virtual Interface and get the Router Configuration

After you have placed an order for an AWS Direct Connect connection, you must create a virtual interface to begin using it. You can create a private virtual interface to connect to your VPC. Or, you can create a public virtual interface to connect to AWS services that aren't in a VPC. You can create a virtual interface that supports IPv4 or IPv6 traffic.

Before you begin, ensure that you've read the prerequisites in Prerequisites for Virtual Interfaces (p. 27).

When you create a virtual interface using the AWS CLI, the output includes generic router configuration information. To create a router configuration that's specific to your device, use the AWS Direct Connect console. For more information, see Downloading the Router Configuration File (p. 31).

**To create a private virtual interface**

1. Get the ID of the virtual private gateway (vgw-xxxxxxxx) that's attached to your VPC. You need the ID to create the virtual interface in the next step.

   ```bash
   aws ec2 describe-vpn-gateways
   ```
2. Create a private virtual interface. You must specify a name, a VLAN ID, and a BGP Autonomous System Number (ASN).

For IPv4 traffic, you need private IPv4 addresses for each end of the BGP peering session. You can specify your own IPv4 addresses, or you can let Amazon generate the addresses for you. In the following example, the IPv4 addresses are generated for you.

```bash
aws directconnect create-private-virtual-interface --
connection-id dxcon-fg31dyv6 --new-private-virtual-interface
virtualInterfaceName=PrivateVirtualInterface,vlan=101,asn=65000,virtualGatewayId=vgw-ebaa27db,addressFamily=ipv4
```

```xml
{
    "virtualInterfaceState": "pending",
    "asn": 65000,
    "vlan": 101,
    "customerAddress": "192.168.1.2/30",
    "ownerAccount": "123456789012",
    "connectionId": "dxcon-fg31dyv6",
    "addressFamily": "ipv4",
    "virtualGatewayId": "vgw-ebaa27db",
    "virtualInterfaceId": "dxvif-ffhhk74f",
    "authKey": "asdf34example",
    "routeFilterPrefixes": [],
    "location": "TIVIT",
    "bgpPeers": [
        {
            "bgpStatus": "down",
            "customerAddress": "192.168.1.2/30",
            "addressFamily": "ipv4",
            "authKey": "asdf34example",
            "bgpPeerState": "pending",
            "amazonAddress": "192.168.1.1/30",
            "asn": 65000
        }
    ],
    "customerRouterConfig": "<?xml version="1.0" encoding="UTF-8"?>
<logical_connection id="dxvif-ffhhk74f">
  <vlan>101</vlan>
  <customer_address>192.168.1.2/30</customer_address>
  <amazon_address>192.168.1.1/30</amazon_address>
  <bgp_auth_key>asdf34example</bgp_auth_key>
</logical_connection>"
}
```

"VpnGateways": [
    {
        "State": "available",
        "Tags": [
            {
                "Value": "DX_VGW",
                "Key": "Name"
            }
        ],
        "Type": "ipsec.1",
        "VpnGatewayId": "vgw-ebaa27db",
        "VpcAttachments": [
            {
                "State": "attached",
                "VpcId": "vpc-24f33d4d"
            }
        ]
    }
]
Step 3: Create a Virtual Interface and get the Router Configuration

To create a private virtual interface that supports IPv6 traffic, use the same command as above and specify `ipv6` for the `addressFamily` parameter. You cannot specify your own IPv6 addresses for the BGP peering session; Amazon allocates you IPv6 addresses.

3. To view the router configuration information in XML format, describe the virtual interface you created. Use the `--query` parameter to extract the `customerRouterConfig` information, and the `--output` parameter to organize the text into tab-delimited lines.

```bash
aws directconnect describe-virtual-interfaces --virtual-interface-id dxvif-ffhhk74f --query virtualInterfaces[*].customerRouterConfig --output text
```

```
<?xml version="1.0" encoding="UTF-8"?>
<logical_connection id="dxvif-ffhhk74f">
  <vlan>101</vlan>
  <customer_address>192.168.1.2/30</customer_address>
  <amazon_address>192.168.1.1/30</amazon_address>
  <bgp_asn>65000</bgp_asn>
  <bgp_auth_key>asdf34example</bgp_auth_key>
  <amazon_bgp_asn>7224</amazon_bgp_asn>
  <connection_type>private</connection_type>
</logical_connection>
```

To create a public virtual interface

1. To create a public virtual interface, you must specify a name, a VLAN ID, and a BGP Autonomous System Number (ASN).

   For IPv4 traffic, you must also specify public IPv4 addresses for each end of the BGP peering session, and public IPv4 routes that you will advertise over BGP. The following example creates a public virtual interface for IPv4 traffic.

```bash
aws directconnect create-public-virtual-interface --connection-id dxcon-fg31dyv6 --new-public-virtual-interface virtualInterfaceName=PublicVirtualInterface,vlan=2000,asn=65000,amazonAddress=203.0.113.1/30,customerAddress=203.0.113.2/30,routeFilterPrefixes=[{cidr=203.0.113.0/30}]
```

```json
{
  "virtualInterfaceState": "verifying",
  "asn": 65000,
  "vlan": 2000,
  "customerAddress": "203.0.113.2/30",
  "ownerAccount": "123456789012",
  "connectionId": "dxcon-fg31dyv6",
  "addressFamily": "ipv4",
  "virtualGatewayId": "",
  "virtualInterfaceId": "dxvif-fgh0hcrk",
  "authKey": "asdf34example",
  "routeFilterPrefixes": [
    {
      "cidr": "203.0.113.0/30"
    },
    {
      "cidr": "203.0.113.4/30"
    }
  ],
}
```
Step 3: Create a Virtual Interface and get the Router Configuration

To create a public virtual interface that supports IPv6 traffic, you can specify IPv6 routes that you will advertise over BGP. You cannot specify IPv6 addresses for the peering session; Amazon allocates IPv6 addresses to you. The following example creates a public virtual interface for IPv6 traffic.

```bash
aws directconnect create-public-virtual-interface --
connection-id dxcon-fg31dyv6 --new-public-virtual-interface
virtualInterfaceName=PublicVirtualInterface,vlan=2000,asn=65000,addressFamily=ipv6,routeFilterPrefixes=
{cidr=2001:db8:64ce:ba00::/64},
{cidr=2001:db8:64ce:ba01::/64}
```

2. To view the router configuration information in XML format, describe the virtual interface you created. Use the `--query` parameter to extract the `customerRouterConfig` information, and the `--output` parameter to organize the text into tab-delimited lines.

```bash
aws directconnect describe-virtual-interaces --virtual-interface-id dxvif-fgh0hcrk --
query virtualInterfaces[*].customerRouterConfig --output text
```

```xml
<?xml version="1.0" encoding="UTF-8"?>
<logical_connection id="dxvif-fgh0hcrk">
  <vlan>2000</vlan>
  <customer_address>203.0.113.2/30</customer_address>
  <amazon_address>203.0.113.1/30</amazon_address>
  <bgp_asn>65000</bgp_asn>
  <bgp_auth_key>asdf34example</bgp_auth_key>
  <amazon_bgp_asn>7224</amazon_bgp_asn>
  <connection_type>public</connection_type>
</logical_connection>
```
AWS Direct Connect User Guide

AWS Direct Connect Information in CloudTrail

Logging AWS Direct Connect API Calls Using AWS CloudTrail

AWS Direct Connect is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in AWS Direct Connect. CloudTrail captures all API calls for AWS Direct Connect as events. The calls captured include calls from the AWS Direct Connect console and code calls to the AWS Direct Connect API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for AWS Direct Connect. If you don’t configure a trail, you can still view the most recent events in the CloudTrail console in Event history. Using the information collected by CloudTrail, you can determine the request that was made to AWS Direct Connect, the IP address from which the request was made, who made the request, when it was made, and additional details.

For more information, see the AWS CloudTrail User Guide.

AWS Direct Connect Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in AWS Direct Connect, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for AWS Direct Connect, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs.

For more information, see the following:

• Overview for Creating a Trail
• CloudTrail Supported Services and Integrations
• Configuring Amazon SNS Notifications for CloudTrail
• Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

All AWS Direct Connect actions are logged by CloudTrail and are documented in the AWS Direct Connect API Reference. For example, calls to the CreateConnection and CreatePrivateVirtualInterface actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

• Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
• Whether the request was made with temporary security credentials for a role or federated user.
• Whether the request was made by another AWS service.

For more information, see the CloudTrail `userIdentity` Element.

Understanding AWS Direct Connect Log File Entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following are example CloudTrail log records for AWS Direct Connect.

**Example Example: CreateConnection**

```
{
  "Records": [
    {
      "eventVersion": "1.0",
      "userIdentity": {
        "type": "IAMUser",
        "principalId": "EX_PRINCIPAL_ID",
        "arn": "arn:aws:iam::123456789012:user/Alice",
        "accountId": "123456789012",
        "accessKeyId": "EXAMPLE_KEY_ID",
        "userName": "Alice",
        "sessionContext": {
          "attributes": {
            "mfaAuthenticated": "false",
            "creationDate": "2014-04-04T12:03:05Z"
          }
        }
      },
      "eventTime": "2014-04-04T17:28:16Z",
      "eventSource": "directconnect.amazonaws.com",
      "eventName": "CreateConnection",
      "awsRegion": "us-west-2",
      "sourceIPAddress": "127.0.0.1",
      "userAgent": "Coral/Jakarta",
      "requestParameters": {
        "location": "EqSE2",
        "connectionName": "MyExampleConnection",
        "bandwidth": "1Gbps"
      },
      "responseElements": {
        "location": "EqSE2",
        "region": "us-west-2",
        "connectionState": "requested",
        "bandwidth": "1Gbps",
        "ownerAccount": "123456789012",
        "connectionId": "dxcon-fhajolyy",
        "connectionName": "MyExampleConnection"
      }
    },
    ...
  ]
}```
Example Example: CreatePrivateVirtualInterface

```json
{
    "Records": [
        {
            "eventVersion": "1.0",
            "userIdentity": {
                "type": "IAMUser",
                "principalId": "EX_PRINCIPAL_ID",
                "arn": "arn:aws:iam::123456789012:user/Alice",
                "accountId": "123456789012",
                "accessKeyId": "EXAMPLE_KEY_ID",
                "userName": "Alice",
                "sessionContext": {
                    "attributes": {
                        "mfaAuthenticated": "false",
                        "creationDate": "2014-04-04T12:05Z"
                    }
                }
            },
            "eventTime": "2014-04-04T17:39:55Z",
            "eventSource": "directconnect.amazonaws.com",
            "eventName": "CreatePrivateVirtualInterface",
            "awsRegion": "us-west-2",
            "sourceIPAddress": "127.0.0.1",
            "userAgent": "Coral/Jakarta",
            "requestParameters": {
                "connectionId": "dxcon-fhajolyy",
                "newPrivateVirtualInterface": {
                    "virtualInterfaceName": "MyVirtualInterface",
                    "customerAddress": "[PROTECTED]",
                    "authKey": "[PROTECTED]",
                    "asn": -1,
                    "virtualGatewayId": "vgw-bb09d4a5",
                    "amazonAddress": "[PROTECTED]",
                    "vlan": 123
                }
            },
            "responseElements": {
                "virtualInterfaceId": "dxvif-fgg6lw",
                "authKey": "[PROTECTED]",
                "virtualGatewayId": "vgw-bb09d4a5",
                "customerRouterConfig": "[PROTECTED]",
                "virtualInterfaceType": "private",
                "asn": -1,
                "routeFilterPrefixes": [],
                "virtualInterfaceName": "MyVirtualInterface",
                "virtualInterfaceState": "pending",
                "customerAddress": "[PROTECTED]",
                "vlan": 123,
                "ownerAccount": "123456789012",
                "amazonAddress": "[PROTECTED]",
                "connectionId": "dxcon-fhajolyy",
                "location": "EqSE2"
            }
        }
    ]
}
```

      },
      "responseElements": null
    }
  ]
}```
Monitoring AWS Direct Connect

Monitoring is an important part of maintaining the reliability, availability, and performance of your AWS Direct Connect resources. You should collect monitoring data from all of the parts of your AWS solution so that you can more easily debug a multi-point failure if one occurs. Before you start monitoring AWS Direct Connect; however, you should create a monitoring plan that includes answers to the following questions:

- What are your monitoring goals?
- What resources should be monitored?
- How often should you monitor these resources?
- What monitoring tools can you use?
- Who performs the monitoring tasks?
- Who should be notified when something goes wrong?

The next step is to establish a baseline for normal AWS Direct Connect performance in your environment, by measuring performance at various times and under different load conditions. As you monitor AWS Direct Connect, store historical monitoring data. That way, you can compare it with current performance data, identify normal performance patterns and performance anomalies, and devise methods to address issues.

To establish a baseline, you should monitor the usage, state, and health of your physical AWS Direct Connect connections.

Contents
- Monitoring Tools (p. 68)
- Monitoring with Amazon CloudWatch (p. 69)

Monitoring Tools

AWS provides various tools that you can use to monitor an AWS Direct Connect connection. You can configure some of these tools to do the monitoring for you, while some of the tools require manual intervention. We recommend that you automate monitoring tasks as much as possible.

Automated Monitoring Tools

You can use the following automated monitoring tools to watch AWS Direct Connect and report when something is wrong:

- **Amazon CloudWatch Alarms** – Watch a single metric over a time period that you specify. Perform one or more actions based on the value of the metric relative to a given threshold over a number of time periods. The action is a notification sent to an Amazon SNS topic. CloudWatch alarms do not invoke actions simply because they are in a particular state; the state must have changed and been maintained for a specified number of periods. For more information, see Monitoring with Amazon CloudWatch (p. 69).

- **AWS CloudTrail Log Monitoring** – Share log files between accounts and monitor CloudTrail log files in real time by sending them to CloudWatch Logs. You can also write log processing applications in Java and validate that your log files have not changed after delivery by CloudTrail. For more information, see Logging AWS Direct Connect API Calls Using AWS CloudTrail (p. 64) and Working with CloudTrail Log Files in the AWS CloudTrail User Guide.
Manual Monitoring Tools

Another important part of monitoring an AWS Direct Connect connection involves manually monitoring those items that the CloudWatch alarms don’t cover. The AWS Direct Connect and CloudWatch console dashboards provide an at-a-glance view of the state of your AWS environment.

- The AWS Direct Connect console shows:
  - Connection status (see the State column)
  - Virtual interface status (see the State column)
- The CloudWatch home page shows:
  - Current alarms and status
  - Graphs of alarms and resources
  - Service health status

In addition, you can use CloudWatch to do the following:
- Create customized dashboards to monitor the services you care about.
- Graph metric data to troubleshoot issues and discover trends.
- Search and browse all your AWS resource metrics.
- Create and edit alarms to be notified of problems.

Monitoring with Amazon CloudWatch

You can monitor physical AWS Direct Connect connections using CloudWatch, which collects and processes raw data from AWS Direct Connect into readable, near real-time metrics. By default, CloudWatch provides AWS Direct Connect metric data in 5-minute intervals. You can optionally view data in 1-minute intervals.

For more information, see the Amazon CloudWatch User Guide.

**Note**
If your connection is a hosted connection from an AWS Direct Connect partner, you cannot view CloudWatch metrics for the hosted connection.

- Creating CloudWatch Alarms to Monitor AWS Direct Connect Connections (p. 71)

AWS Direct Connect Metrics and Dimensions

The following metrics are available from AWS Direct Connect. Metrics are currently available for AWS Direct Connect physical connections only.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionState</td>
<td>The state of the connection. 0 indicates DOWN and 1 indicates UP.</td>
</tr>
<tr>
<td></td>
<td>Units: Boolean</td>
</tr>
<tr>
<td>Metric</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ConnectionBpsEgress</td>
<td>The bitrate for outbound data from the AWS side of the connection. The number reported is the aggregate over the specified time period (5 minutes by default, 1 minute minimum). Units: Bits per second</td>
</tr>
<tr>
<td>ConnectionBpsIngress</td>
<td>The bitrate for inbound data to the AWS side of the connection. The number reported is the aggregate over the specified time period (5 minutes by default, 1 minute minimum). Units: Bits per second</td>
</tr>
<tr>
<td>ConnectionPpsEgress</td>
<td>The packet rate for outbound data from the AWS side of the connection. The number reported is the aggregate over the specified time period (5 minutes by default, 1 minute minimum). Units: Packets per second</td>
</tr>
<tr>
<td>ConnectionPpsIngress</td>
<td>The packet rate for inbound data to the AWS side of the connection. The number reported is the aggregate over the specified time period (5 minutes by default, 1 minute minimum). Units: Packets per second</td>
</tr>
<tr>
<td>ConnectionCRCErrorCount</td>
<td>The number of times cyclic redundancy check (CRC) errors are observed for the data received at the connection. Units: Integer</td>
</tr>
<tr>
<td>ConnectionLightLevelTx</td>
<td>Indicates the health of the fiber connection for egress (outbound) traffic from the AWS side of the connection. This metric is available for connections with 10-Gbps port speeds only. Units: dBm</td>
</tr>
<tr>
<td>ConnectionLightLevelRx</td>
<td>Indicates the health of the fiber connection for ingress (inbound) traffic to the AWS side of the connection. This metric is available for connections with 10-Gbps port speeds only. Units: dBm</td>
</tr>
</tbody>
</table>
You can filter the AWS Direct Connect data using the following dimensions.

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConnectionId</td>
<td>This dimension filters the data by the AWS Direct Connect connection.</td>
</tr>
</tbody>
</table>

**Viewing AWS Direct Connect CloudWatch Metrics**

AWS Direct Connect sends the following metrics about your AWS Direct Connect connections at 30-second intervals to Amazon CloudWatch. Amazon CloudWatch then aggregates these data points to 1-minute or 5-minute intervals. You can use the following procedures to view the metrics for AWS Direct Connect connections.

**To view metrics using the CloudWatch console**

Metrics are grouped first by the service namespace, and then by the various dimension combinations within each namespace.

2. In the navigation pane, choose Metrics.
3. For All metrics, choose the DX metric namespace.
4. Choose Connection Metrics, and select the metric dimension to view the metrics (for example, for the AWS Direct Connect connection).
5. (Optional) To return data for the selected metric in 1-minute intervals, choose Graphed metrics, and select 1 Minute from the Period list.

**To view metrics using the AWS Direct Connect console**

2. In the navigation pane, choose Connections.
3. Select your connection. The Monitoring tab displays the metrics for your connection.

**To view metrics using the AWS CLI**

At a command prompt, use the following command:

```
aws cloudwatch list-metrics --namespace "AWS/DX"
```

**Creating CloudWatch Alarms to Monitor AWS Direct Connect Connections**

You can create a CloudWatch alarm that sends an Amazon SNS message when the alarm changes state. An alarm watches a single metric over a time period that you specify. It sends a notification to an Amazon SNS topic based on the value of the metric relative to a given threshold over a number of time periods.

For example, you can create an alarm that monitors the state of an AWS Direct Connect connection. It sends a notification when the connection state is DOWN for five consecutive 1-minute periods.
To create an alarm for the connection state

2. In the navigation pane, choose Alarms.
3. Choose Create Alarm.
4. Choose the DX Metrics category.
5. Select the AWS Direct Connect connection and choose the ConnectionState metric. Choose Next.
6. Configure the alarm as follows, and then choose Create Alarm:
   - For Alarm Threshold, type a name and description for your alarm. For Whenever, choose < and type 1. Type 5 for the consecutive periods.
   - For Actions, select an existing notification list or choose New list to create a new one.
   - For Alarm Preview, select a period of 1 minute.

For more examples of creating alarms, see Creating Amazon CloudWatch Alarms in the Amazon CloudWatch User Guide.
AWS Direct Connect Limits

The following table lists the limits related to AWS Direct Connect. Unless indicated otherwise, you can request an increase for any of these limits using the AWS Direct Connect Limits form.

<table>
<thead>
<tr>
<th>Component</th>
<th>Limit</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Virtual interfaces per AWS Direct Connect connection</td>
<td>50</td>
<td>This limit cannot be increased</td>
</tr>
<tr>
<td>Active AWS Direct Connect connections per Region per account</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>Routes per Border Gateway Protocol (BGP) session on a private virtual interface</td>
<td>100</td>
<td>This limit cannot be increased</td>
</tr>
<tr>
<td>Routes per Border Gateway Protocol (BGP) session on a public virtual interface</td>
<td>1,000</td>
<td>This limit cannot be increased</td>
</tr>
<tr>
<td>Connections per link aggregation group (LAG)</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>Link aggregation groups (LAGs) per Region</td>
<td>10</td>
<td></td>
</tr>
<tr>
<td>AWS Direct Connect gateways per account</td>
<td>200</td>
<td></td>
</tr>
<tr>
<td>Virtual private gateways per AWS Direct Connect gateway</td>
<td>10</td>
<td>This limit cannot be increased</td>
</tr>
<tr>
<td>Virtual interfaces per AWS Direct Connect gateway</td>
<td>30</td>
<td></td>
</tr>
</tbody>
</table>

AWS Direct Connect supports these port speeds over single-mode fiber: 1 Gbps: 1000BASE-LX (1310nm) and 10 Gbps: 10GBASE-LR (1310nm).
Troubleshooting AWS Direct Connect

The following topics can help you troubleshoot issues with your AWS Direct Connect connection.

Topics
- Troubleshooting Layer 1 (Physical) Issues (p. 74)
- Troubleshooting Layer 2 (Data Link) Issues (p. 75)
- Troubleshooting Layer 3/4 (Network/Transport) Issues (p. 77)
- Troubleshooting Routing Issues (p. 79)

Troubleshooting Layer 1 (Physical) Issues

If you or your network provider are having difficulty establishing physical connectivity to an AWS Direct Connect device, use the following steps to troubleshoot the issue.

1. Verify with the colocation provider that the cross connect is complete. Ask them or your network provider to provide you with a cross connect completion notice and compare the ports with those listed on your LOA-CFA.
2. Verify that your router or your provider’s router is powered on and that the ports are activated.
3. Ensure that the routers are using the correct optical transceiver, auto-negotiation is disabled, and port speed and full-duplex mode are manually configured. For more information, see Network Requirements.
4. Verify that the router is receiving an acceptable optical signal over the cross connect.
5. Try flipping (also known as rolling) the Tx/Rx fiber strands.
6. Check the Amazon CloudWatch metrics for AWS Direct Connect. You can verify the AWS Direct Connect device’s Tx/Rx optical readings (10-Gbps port speeds only), physical error count, and operational status. For more information, see Monitoring with Amazon CloudWatch.
7. Contact the colocation provider and request a written report for the Tx/Rx optical signal across the cross connect.
8. If the above steps do not resolve physical connectivity issues, contact AWS Support and provide the cross connect completion notice and optical signal report from the colocation provider.

The following flow chart contains the steps to diagnose issues with the physical connection.
Troubleshooting Layer 2 (Data Link) Issues

If your AWS Direct Connect physical connection is up but your virtual interface is down, use the following steps to troubleshoot the issue.

1. If you cannot ping the Amazon peer IP address, verify that your peer IP address is configured correctly and in the correct VLAN. Ensure that the IP address is configured in the VLAN subinterface and not the physical interface (for example, GigabitEthernet0/0.123 instead of GigabitEthernet0/0).
2. Verify if the router has a MAC address entry from the AWS endpoint in your address resolution protocol (ARP) table.

3. Ensure that any intermediate devices between endpoints have VLAN trunking enabled for your 802.1Q VLAN tag. ARP cannot be established on the AWS side until AWS receives tagged traffic.

4. Clear your or your provider's ARP table cache.

5. If the above steps do not establish ARP or you still cannot ping the Amazon peer IP, contact AWS Support.

The following flow chart contains the steps to diagnose issues with the data link.
If the BGP session is still not established after verifying these steps, see Troubleshooting Layer 3/4 (Network/Transport) Issues (p. 77). If the BGP session is established but you are experiencing routing issues, see Troubleshooting Routing Issues (p. 79).

Troubleshooting Layer 3/4 (Network/Transport) Issues

Consider a situation where your AWS Direct Connect physical connection is up and you can ping the Amazon peer IP address. If your virtual interface is down and the BGP peering session cannot be established, use the following steps to troubleshoot the issue:

1. Ensure that your BGP local Autonomous System Number (ASN) and Amazon's ASN are configured correctly.
2. Ensure that the peer IPs for both sides of the BGP peering session are configured correctly.
3. Ensure that your MD5 authentication key is configured and exactly matches the key in the downloaded router configuration file. Check that there are no extra spaces or characters.
4. Verify that you or your provider are not advertising more than 100 prefixes for private virtual interfaces or 1,000 prefixes for public virtual interfaces. These are hard limits and cannot be exceeded.
5. Ensure that there are no firewall or ACL rules that are blocking TCP port 179 or any high-numbered ephemeral TCP ports. These ports are necessary for BGP to establish a TCP connection between the peers.
6. Check your BGP logs for any errors or warning messages.
7. If the above steps do not establish the BGP peering session, contact AWS Support.

The following flow chart contains the steps to diagnose issues with the BGP peering session.
Virtual interface is down and cannot establish BGP session

Are BGP ASNs correct? No → Update ASN configuration

Yes → Are peer IPs correct? No → Update IP address configuration

Yes → Is MD5 authentication key correct? No → Check that key exactly matches the router config file

Yes → Are you below the prefix limit? No → Do not advertise more than 100 prefixes for private or 1,000 for public

Yes → Do firewall/ACL rules allow BGP traffic? No → Enable TCP traffic on port 179 and high number of ephemeral ports

Yes → Check BGP logs

Still not working → Contact AWS Support
If the BGP peering session is established but you are experiencing routing issues, see Troubleshooting Routing Issues (p. 79).

Troubleshooting Routing Issues

Consider a situation where your virtual interface is up and you've established a BGP peering session. If you cannot route traffic over the virtual interface, use the following steps to troubleshoot the issue:

1. Ensure that you are advertising a route for your on-premises network prefix over the BGP session. For a private virtual interface, this can be a private or public network prefix. For a public virtual interface, this must be your publicly routable network prefix.

2. For a private virtual interface, ensure that your VPC security groups and network ACLs allow inbound and outbound traffic for your on-premises network prefix. For more information, see Security Groups and Network ACLs in the Amazon VPC User Guide.

3. For a private virtual interface, ensure that your VPC route tables have prefixes pointing to the virtual private gateway to which your private virtual interface is connected. For example, if you prefer to have all your traffic routed towards your on-premises network by default, you can add the default route (0.0.0.0/0 or ::/0) with the virtual private gateway as the target in your VPC route tables.

   - Alternatively, enable route propagation to automatically update routes in your route tables based on your dynamic BGP route advertisement. You can have up to 100 propagated routes per route table. This limit cannot be increased. For more information, see Enabling and Disabling Route Propagation in the Amazon VPC User Guide.

4. If the above steps do not resolve your routing issues, contact AWS Support.

The following flow chart contains the steps to diagnose routing issues.
# Document History

The following table describes the releases for AWS Direct Connect.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jumbo frames support</td>
<td>You can send jumbo frames (9001 MTU) over AWS Direct Connect. For more information, see Setting Network MTU (p. 36).</td>
<td>2018-10-11</td>
</tr>
<tr>
<td>Local preference BGP communities</td>
<td>You can use local preference BGP community tags to achieve load balancing and route preference for incoming traffic to your network. For more information, see Local Preference BGP Communities (p. 4).</td>
<td>2018-02-06</td>
</tr>
<tr>
<td>AWS Direct Connect gateway</td>
<td>You can use a Direct Connect gateway to connect your AWS Direct Connect connection to VPCs in remote Regions. For more information, see Direct Connect Gateways (p. 46).</td>
<td>2017-11-01</td>
</tr>
<tr>
<td>Amazon CloudWatch metrics</td>
<td>You can view CloudWatch metrics for your AWS Direct Connect connections. For more information, see Monitoring with Amazon CloudWatch (p. 69).</td>
<td>2017-06-29</td>
</tr>
<tr>
<td>Link aggregation groups</td>
<td>You can create a link aggregation group (LAG) to aggregate multiple AWS Direct Connect connections. For more information, see Link Aggregation Groups (p. 41).</td>
<td>2017-02-13</td>
</tr>
<tr>
<td>IPv6 support</td>
<td>Your virtual interface can now support an IPv6 BGP peering session. For more information, see Adding or Deleting a BGP Peer (p. 34).</td>
<td>2016-12-01</td>
</tr>
<tr>
<td>Tagging support</td>
<td>You can now tag your AWS Direct Connect resources. For more information, see Using Tags with AWS Direct Connect (p. 57).</td>
<td>2016-11-04</td>
</tr>
<tr>
<td>Self-service LOA-CFA</td>
<td>You can now download your Letter of Authorization and Connecting Facility Assignment (LOA-CFA) using the AWS Direct Connect console or API.</td>
<td>2016-06-22</td>
</tr>
<tr>
<td>New location in Silicon Valley</td>
<td>Updated topic to include the addition of the new Silicon Valley location in the US West (N. California) Region.</td>
<td>2016-06-03</td>
</tr>
<tr>
<td>New location in Amsterdam</td>
<td>Updated topic to include the addition of the new Amsterdam location in the EU (Frankfurt) Region.</td>
<td>2016-05-19</td>
</tr>
<tr>
<td>New locations in Portland, Oregon, and Singapore</td>
<td>Updated topic to include the addition of the new Portland, Oregon, and Singapore locations in the US West (Oregon) and Asia Pacific (Singapore) Regions.</td>
<td>2016-04-27</td>
</tr>
<tr>
<td>New location in Sao Paulo, Brasil</td>
<td>Updated topic to include the addition of the new Sao Paulo location in the South America (São Paulo) Region.</td>
<td>2015-12-09</td>
</tr>
<tr>
<td>New locations in Dallas, London, Silicon Valley, and Mumbai</td>
<td>Updated topics to include the addition of the new locations in Dallas (US East (N. Virginia) Region), London (EU (Ireland) Region), Silicon Valley (AWS GovCloud (US-West) Region), and Mumbai (Asia Pacific (Singapore) Region).</td>
<td>2015-11-27</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
<td>Date</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>New location in the China (Beijing) Region</td>
<td>Updated topics to include the addition of the new Beijing location in the China (Beijing) Region.</td>
<td>2015-04-14</td>
</tr>
<tr>
<td>New Las Vegas location in the US West (Oregon) Region</td>
<td>Updated topics to include the addition of the new AWS Direct Connect Las Vegas location in the US West (Oregon) Region.</td>
<td>2014-11-10</td>
</tr>
<tr>
<td>New EU (Frankfurt) Region</td>
<td>Updated topics to include the addition of the new AWS Direct Connect locations serving the EU (Frankfurt) Region.</td>
<td>2014-10-23</td>
</tr>
<tr>
<td>New locations in the Asia Pacific (Sydney) Region</td>
<td>Updated topics to include the addition of the new AWS Direct Connect locations serving the Asia Pacific (Sydney) Region.</td>
<td>2014-07-14</td>
</tr>
<tr>
<td>Support for AWS CloudTrail</td>
<td>Added a new topic to explain how you can use CloudTrail to log activity in AWS Direct Connect. For more information, see Logging AWS Direct Connect API Calls Using AWS CloudTrail (p. 64).</td>
<td>2014-04-04</td>
</tr>
<tr>
<td>Support for accessing remote AWS Regions</td>
<td>Added a new topic to explain how you can access public resources in a remote Region. For more information, see Accessing a Remote AWS Region (p. 2).</td>
<td>2013-12-19</td>
</tr>
<tr>
<td>Support for hosted connections</td>
<td>Updated topics to include support for hosted connections.</td>
<td>2013-10-22</td>
</tr>
<tr>
<td>New location in the EU (Ireland) Region</td>
<td>Updated topics to include the addition of the new AWS Direct Connect location serving the EU (Ireland) Region.</td>
<td>2013-06-24</td>
</tr>
<tr>
<td>New Seattle location in the US West (Oregon) Region</td>
<td>Updated topics to include the addition of the new AWS Direct Connect location in Seattle serving the US West (Oregon) Region.</td>
<td>2013-05-08</td>
</tr>
<tr>
<td>Support for using IAM with AWS Direct Connect</td>
<td>Added a topic about using AWS Identity and Access Management with AWS Direct Connect. For more information, see Control Access to AWS Direct Connect Using AWS Identity and Access Management (p. 55).</td>
<td>2012-12-21</td>
</tr>
<tr>
<td>New Asia Pacific (Sydney) Region</td>
<td>Updated topics to include the addition of the new AWS Direct Connect location serving the Asia Pacific (Sydney) Region.</td>
<td>2012-12-14</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
<td>Date</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
<td>------------</td>
</tr>
<tr>
<td>New AWS Direct Connect console, and the US East (N. Virginia) and South America (Sao Paulo) Regions</td>
<td>Replaced the AWS Direct Connect Getting Started Guide with the AWS Direct Connect User Guide. Added new topics to cover the new AWS Direct Connect console, added a billing topic, added router configuration information, and updated topics to include the addition of two new AWS Direct Connect locations serving the US East (N. Virginia) and South America (Sao Paulo) Regions.</td>
<td>2012-08-13</td>
</tr>
<tr>
<td>Support for the EU (Ireland), Asia Pacific (Singapore), and Asia Pacific (Tokyo) Regions</td>
<td>Added a new troubleshooting section and updated topics to include the addition of four new AWS Direct Connect locations serving the US West (Northern California), EU (Ireland), Asia Pacific (Singapore), and Asia Pacific (Tokyo) Regions.</td>
<td>2012-01-10</td>
</tr>
<tr>
<td>Support for the US West (Northern California) Region</td>
<td>Updated topics to include the addition of the US West (Northern California) Region.</td>
<td>2011-09-08</td>
</tr>
<tr>
<td>Public release</td>
<td>The first release of AWS Direct Connect.</td>
<td>2011-08-03</td>
</tr>
</tbody>
</table>
