**AWS Directory Service API Reference**
Welcome to the AWS Directory Service API Reference

AWS Directory Service is a web service that makes it easy for you to setup and run directories in the AWS cloud, or connect your AWS resources with an existing on-premises Microsoft Active Directory. This guide provides detailed information about AWS Directory Service operations, data types, parameters, and errors. For information about AWS Directory Service features, see AWS Directory Service and the AWS Directory Service Administration Guide.

Note
AWS provides SDKs that consist of libraries and sample code for various programming languages and platforms (Java, Ruby, .Net, IOS, Android, etc.). The SDKs provide a convenient way to create programmatic access to AWS Directory Service and other AWS services. For more information about the AWS SDKs, including how to download and install them, see Tools for Amazon Web Services.
Actions

The following actions are supported:

- AcceptSharedDirectory (p. 4)
- AddIpRoutes (p. 6)
- AddTagsToResource (p. 10)
- CancelSchemaExtension (p. 13)
- ConnectDirectory (p. 16)
- CreateAlias (p. 20)
- CreateComputer (p. 23)
- CreateConditionalForwarder (p. 27)
- CreateDirectory (p. 30)
- CreateLogSubscription (p. 34)
- CreateMicrosoftAD (p. 36)
- CreateSnapshot (p. 40)
- CreateTrust (p. 43)
- DeleteConditionalForwarder (p. 47)
- DeleteDirectory (p. 50)
- DeleteLogSubscription (p. 53)
- DeleteSnapshot (p. 55)
- DeleteTrust (p. 58)
- DeregisterCertificate (p. 61)
- DeregisterEventTopic (p. 63)
- DescribeCertificate (p. 66)
- DescribeConditionalForwarders (p. 69)
- DescribeDirectories (p. 72)
- DescribeDomainControllers (p. 77)
- DescribeEventTopics (p. 80)
- DescribeLDAPSSettings (p. 83)
- DescribeSharedDirectories (p. 86)
- DescribeSnapshots (p. 89)
- DescribeTrusts (p. 93)
- DisableLDAPS (p. 97)
- DisableRadius (p. 99)
- DisableSso (p. 101)
- EnableLDAPS (p. 104)
- EnableRadius (p. 106)
- EnableSso (p. 109)
- GetDirectoryLimits (p. 112)
- GetSnapshotLimits (p. 114)
- ListCertificates (p. 117)
- ListIpRoutes (p. 120)
- ListLogSubscriptions (p. 123)
- ListSchemaExtensions (p. 126)
- ListTagsForResource (p. 129)
- RegisterCertificate (p. 132)
- RegisterEventTopic (p. 135)
- RejectSharedDirectory (p. 138)
- RemoveIpRoutes (p. 140)
- RemoveTagsFromResource (p. 143)
- ResetUserPassword (p. 146)
- RestoreFromSnapshot (p. 149)
- ShareDirectory (p. 152)
- StartSchemaExtension (p. 156)
- UnshareDirectory (p. 160)
- UpdateConditionalForwarder (p. 162)
- UpdateNumberOfDomainControllers (p. 165)
- UpdateRadius (p. 167)
- UpdateTrust (p. 170)
- VerifyTrust (p. 172)
AcceptSharedDirectory

Accepts a directory sharing request that was sent from the directory owner account.

Request Syntax

```
{
   "SharedDirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**SharedDirectoryId (p. 4)**

Identifier of the shared directory in the directory consumer account. This identifier is different for each directory owner account.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

Response Syntax

```
{
   "SharedDirectory": {
      "CreatedDateTime": number,
      "LastUpdatedDateTime": number,
      "OwnerAccountId": "string",
      "OwnerDirectoryId": "string",
      "SharedAccountId": "string",
      "SharedDirectoryId": "string",
      "ShareMethod": "string",
      "ShareNotes": "string",
      "ShareStatus": "string"
   }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**SharedDirectory (p. 4)**

The shared directory in the directory consumer account.

Type: SharedDirectory (p. 209) object
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryAlreadySharedException

The specified directory has already been shared with this AWS account.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

See Also

- AWS Command Line Interface
- AWS SDK for .NET
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
AddIpRoutes

If the DNS server for your on-premises domain uses a publicly addressable IP address, you must add a CIDR address block to correctly route traffic to and from your Microsoft AD on Amazon Web Services. AddIpRoutes adds this address block. You can also use AddIpRoutes to facilitate routing traffic that uses public IP ranges from your Microsoft AD on AWS to a peer VPC.

Before you call AddIpRoutes, ensure that all of the required permissions have been explicitly granted through a policy. For details about what permissions are required to run the AddIpRoutes operation, see AWS Directory Service API Permissions: Actions, Resources, and Conditions Reference.

Request Syntax

```
{
    "DirectoryId": "string",
    "IpRoutes": [
        {
            "CidrIp": "string",
            "Description": "string"
        }
    ],
    "UpdateSecurityGroupForDirectoryControllers": boolean
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 6)**

Identifier (ID) of the directory to which to add the address block.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**IpRoutes (p. 6)**

IP address blocks, using CIDR format, of the traffic to route. This is often the IP address block of the DNS server used for your on-premises domain.

Type: Array of IpRoute (p. 198) objects

Required: Yes

**UpdateSecurityGroupForDirectoryControllers (p. 6)**

If set to true, updates the inbound and outbound rules of the security group that has the description: "AWS created security group for directory ID directory controllers." Following are the new rules:

Inbound:

- Type: Custom UDP Rule, Protocol: UDP, Range: 88, Source: 0.0.0.0/0
- Type: Custom UDP Rule, Protocol: UDP, Range: 123, Source: 0.0.0.0/0
- Type: Custom UDP Rule, Protocol: UDP, Range: 138, Source: 0.0.0.0/0
• Type: Custom UDP Rule, Protocol: UDP, Range: 389, Source: 0.0.0.0/0
• Type: Custom UDP Rule, Protocol: UDP, Range: 464, Source: 0.0.0.0/0
• Type: Custom UDP Rule, Protocol: UDP, Range: 445, Source: 0.0.0.0/0
• Type: Custom TCP Rule, Protocol: TCP, Range: 88, Source: 0.0.0.0/0
• Type: Custom TCP Rule, Protocol: TCP, Range: 135, Source: 0.0.0.0/0
• Type: Custom TCP Rule, Protocol: TCP, Range: 445, Source: 0.0.0.0/0
• Type: Custom TCP Rule, Protocol: TCP, Range: 464, Source: 0.0.0.0/0
• Type: Custom TCP Rule, Protocol: TCP, Range: 636, Source: 0.0.0.0/0
• Type: Custom TCP Rule, Protocol: TCP, Range: 1024-65535, Source: 0.0.0.0/0
• Type: Custom TCP Rule, Protocol: TCP, Range: 3268-33269, Source: 0.0.0.0/0
• Type: DNS (UDP), Protocol: UDP, Range: 53, Source: 0.0.0.0/0
• Type: DNS (TCP), Protocol: TCP, Range: 53, Source: 0.0.0.0/0
• Type: LDAP, Protocol: TCP, Range: 389, Source: 0.0.0.0/0
• Type: All ICMP, Protocol: All, Range: N/A, Source: 0.0.0.0/0

Outbound:
• Type: All traffic, Protocol: All, Range: All, Destination: 0.0.0.0/0

These security rules impact an internal network interface that is not exposed publicly.

Type: Boolean
Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryUnavailableException

The specified directory is unavailable or could not be found.

HTTP Status Code: 400

EntityAlreadyExistsException

The specified entity already exists.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.
HTTP Status Code: 400
InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400
IpRouteLimitExceededException

The maximum allowed number of IP addresses was exceeded. The default limit is 100 IP address blocks.

HTTP Status Code: 400
 ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 98
X-Amz-Target: DirectoryService_20150416.AddIpRoutes
X-Amz-Date: 20161212T212029Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256

Credential=AKIAI7E3BYXS3example/20161212/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=477f3a2802dcc303f69499723eb2e29a455fe3db646df0dacfd7c005a3a9509

{
    "DirectoryName":"d-926example",
    "IpRoutes": [
        {
            "Description":"my IpRoute",
            "CidrIp":"12.12.12.12/32"
        }
    ]
}
```

Example Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: cfc1cbc8-c0b0-11e6-aa44-41d91ee57463
Content-Type: application/x-amz-json-1.1
Content-Length: 2
Date: Mon, 12 Dec 2016 21:20:31 GMT

{
}
```
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface
- AWS SDK for .NET
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
AddTagsToResource

Adds or overwrites one or more tags for the specified directory. Each directory can have a maximum of 50 tags. Each tag consists of a key and optional value. Tag keys must be unique to each resource.

Request Syntax

```json
{
  "ResourceId": "string",
  "Tags": [
    {
      "Key": "string",
      "Value": "string"
    }
  ]
}
```

Request Parameters

The request accepts the following data in JSON format.

ResourceId (p. 10)

Identifier (ID) for the directory to which to add the tag.

Type: String

Pattern: ^[d]-[0-9a-f]{10}$

Required: Yes

Tags (p. 10)

The tags to be assigned to the directory.

Type: Array of Tag (p. 215) objects

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.
HTTP Status Code: 400
InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400
ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500
TagLimitExceededException

The maximum allowed number of tags was exceeded.

HTTP Status Code: 400

Examples

The following examples are formatted for legibility.

Example Request

```plaintext
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 87
X-Amz-Target: DirectoryService_20150416.AddTagsToResource
X-Amz-Date: 20161212T222805Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
    Credential=AKIAI7E3BYXS3example/20161212/us-west-2/ds/aws4_request,
    SignedHeaders=content-type;host;x-amz-date;x-amz-target,
    Signature=2756d8b256b5e6b3d74879557e4f421d21111510a78c6c3650a7a93809d533c4

{
    "ResourceId":"d-926example",
    "Tags":[
        {
            "Key":"environment",
            "Value":"production"
        }
    ]
}
```

Example Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: 419ff1d5-c0ba-11e6-9ed0-172b3469d361
Content-Type: application/x-amz-json-1.1
Content-Length: 2
Date: Mon, 12 Dec 2016 22:28:07 GMT

{
}
```
See Also

- AWS Command Line Interface
- AWS SDK for .NET
- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for JavaScript
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3
CancelSchemaExtension

Cancels an in-progress schema extension to a Microsoft AD directory. Once a schema extension has started replicating to all domain controllers, the task can no longer be canceled. A schema extension can be canceled during any of the following states; Initializing, CreatingSnapshot, and UpdatingSchema.

Request Syntax

```json
{
    "DirectoryId": "string",
    "SchemaExtensionId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 13)**

The identifier of the directory whose schema extension will be canceled.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**SchemaExtensionId (p. 13)**

The identifier of the schema extension that will be canceled.

Type: String

Pattern: ^e-[0-9a-f]{10}$

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400
ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```http
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 68
X-Amz-Date: 20161212T231630Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161212/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=14da7b7426d03c907c02a3e29f96158b8c1cd2be2e0f323a86b338a1614648f1

{  
  "DirectoryId": "d-926example",
  "SchemaExtensionId": "e-926731d2a0"
}
```

Example Response

```http
HTTP/1.1 200 OK
x-amzn-RequestId: 04eada50-c0c1-11e6-887b-29887bf36843
Content-Type: application/x-amz-json-1.1
Content-Length: 2
Date: Mon, 12 Dec 2016 23:16:32 GMT

{}
```

ConnectDirectory

Creates an AD Connector to connect to an on-premises directory.

Before you call ConnectDirectory, ensure that all of the required permissions have been explicitly granted through a policy. For details about what permissions are required to run the ConnectDirectory operation, see AWS Directory Service API Permissions: Actions, Resources, and Conditions Reference.

Request Syntax

```json
{
    "ConnectSettings": {
        "CustomerDnsIps": [ "string" ],
        "CustomerUserName": "string",
        "SubnetIds": [ "string" ],
        "VpcId": "string"
    },
    "Description": "string",
    "Name": "string",
    "Password": "string",
    "ShortName": "string",
    "Size": "string",
    "Tags": [
        {
            "Key": "string",
            "Value": "string"
        }
    ]
}
```

Request Parameters

The request accepts the following data in JSON format.

ConnectSettings (p. 16)

A DirectoryConnectSettings (p. 182) object that contains additional information for the operation.

Type: DirectoryConnectSettings (p. 182) object

Required: Yes

Description (p. 16)

A description for the directory.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: ^([a-zA-Z0-9_])\[\a-zA-Z0-9_@#%*+=:?./!\s-]*$

Required: No

Name (p. 16)

The fully qualified name of the on-premises directory, such as corp.example.com.

Type: String
Password (p. 16)

The password for the on-premises user account.

Type: String

Required: Yes

ShortName (p. 16)

The NetBIOS name of the on-premises directory, such as CORP.

Type: String

Pattern: \^[^\/:*"<>|.*]+[^\/:*"<>|]*\$

Required: No

Size (p. 16)

The size of the directory.

Type: String

Valid Values: Small | Large

Required: Yes

Tags (p. 16)

The tags to be assigned to AD Connector.

Type: Array of Tag (p. 215) objects

Required: No

Response Syntax

```json
{
    "DirectoryId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

DirectoryId (p. 17)

The identifier of the new directory.

Type: String

Pattern: ^d-[0-9a-f]{10}$
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**DirectoryLimitExceededException**

The maximum number of directories in the region has been reached. You can use the GetDirectoryLimits (p. 112) operation to determine your directory limits in the region.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

**Example Request**

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 295
X-Amz-Date: 20161212T233740Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256

Credential=AKIAI7E3BYX3example/20161212/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=60ddfa4a90d91327ef8cb510563d6f031eb1b092d5b1034fab7b157733bf86b

{
    "Name":"corp.example.com",
    "ConnectSettings":{
        "CustomerUserName":"Administrator",
        "VpcId":"vpc-45025421",
        "SubnetIds":[
            "subnet-ba0146de",
            "subnet-bef46bc8"
        ],
        "CustomerDnsIps":[
            "172.30.21.228"
        ]
    },
    "Description":"Connector to corp",
```

"ShortName": "corp",
"Password": "StrongPassword",
"Size": "Small"
}

Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: fa22d0f1-c0c3-11e6-9ed0-172b3469d361
Content-Type: application/x-amz-json-1.1
Content-Length: 30
Date: Mon, 12 Dec 2016 23:37:43 GMT

{
  "DirectoryId": "d-926example"
}

CreateAlias

Creates an alias for a directory and assigns the alias to the directory. The alias is used to construct the access URL for the directory, such as http://<alias>.awsapps.com.

**Important**
After an alias has been created, it cannot be deleted or reused, so this operation should only be used when absolutely necessary.

**Request Syntax**

```json
{
  "Alias": "string",
  "DirectoryId": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**Alias (p. 20)**

The requested alias.

The alias must be unique amongst all aliases in AWS. This operation throws an EntityAlreadyExistsException error if the alias already exists.

Type: String

Pattern: `^(?!d-)(((\da-zA-Z)+)([-]*)(\da-zA-Z))*`

Required: Yes

**DirectoryId (p. 20)**

The identifier of the directory for which to create the alias.

Type: String

Pattern: `^d-[0-9a-f]{10}$`

Required: Yes

**Response Syntax**

```json
{
  "Alias": "string",
  "DirectoryId": "string"
}
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

**Alias (p. 20)**

The alias for the directory.

Type: String

**DirectoryId (p. 20)**

The identifier of the directory.

Type: String

Pattern: `^d-[0-9a-f]{10}$`

---

**Errors**

For information about the errors that are common to all actions, see [Common Errors (p. 222)](#).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityAlreadyExistsException**

The specified entity already exists.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

---

**Examples**

The following examples are formatted for legibility.

**Example Request**

```
POST / HTTP/1.1
```
Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: 49abfbf6-be39-11e6-9458-41d91ee57463
Content-Type: application/x-amz-json-1.1
Content-Length: 49
Date: Fri, 09 Dec 2016 17:59:57 GMT

{
  "Alias": "myaccess",
  "DirectoryId": "d-926example"
}

CreateComputer

Creates a computer account in the specified directory, and joins the computer to the directory.

Request Syntax

```json
{
   "ComputerAttributes": [
      {
         "Name": "string",
         "Value": "string"
      }
   ],
   "ComputerName": "string",
   "DirectoryId": "string",
   "OrganizationalUnitDistinguishedName": "string",
   "Password": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**ComputerAttributes (p. 23)**

An array of Attribute (p. 176) objects that contain any LDAP attributes to apply to the computer account.

Type: Array of Attribute (p. 176) objects

Required: No

**ComputerName (p. 23)**

The name of the computer account.

Type: String

Required: Yes

**DirectoryId (p. 23)**

The identifier of the directory in which to create the computer account.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**OrganizationalUnitDistinguishedName (p. 23)**

The fully-qualified distinguished name of the organizational unit to place the computer account in.

Type: String

Required: No
Password (p. 23)

A one-time password that is used to join the computer to the directory. You should generate a random, strong password to use for this parameter.

Type: String

Length Constraints: Minimum length of 8. Maximum length of 64.

Pattern: $u0020-u00FF+$

Required: Yes

Response Syntax

```
{
   "Computer": {
      "ComputerAttributes": [
         {
            "Name": "string",
            "Value": "string"
         },
         {
            "ComputerId": "string",
            "ComputerName": "string"
         }
      ]
   }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

Computer (p. 24)

A Computer (p. 180) object that represents the computer account.

Type: Computer (p. 180) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

AuthenticationFailedException

An authentication error occurred.

HTTP Status Code: 400

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryUnavailableException

The specified directory is unavailable or could not be found.
HTTP Status Code: 400
**EntityAlreadyExistsException**

The specified entity already exists.

HTTP Status Code: 400
**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400
**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400
**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500
**UnsupportedOperationException**

The operation is not supported.

HTTP Status Code: 400

**Examples**

The following examples are formatted for legibility.

**Example Request**

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 245
X-Amz-Target: DirectoryService_20150416.CreateComputer

CreateConditionalForwarder

Creates a conditional forwarder associated with your AWS directory. Conditional forwarders are required in order to set up a trust relationship with another domain. The conditional forwarder points to the trusted domain.

Request Syntax

```json
{
   "DirectoryId": "string",
   "DnsIpAddrs": [ "string" ],
   "RemoteDomainName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 27)**

The directory ID of the AWS directory for which you are creating the conditional forwarder.

Type: String

Pattern: `^d-[0-9a-f]{10}$`

Required: Yes

**DnsIpAddrs (p. 27)**

The IP addresses of the remote DNS server associated with RemoteDomainName.

Type: Array of strings

Pattern: `^((?:25[0-5]|2[0-4]\d|1\d{2}|[0-9]{1,2})\.(?:25[0-5]|2[0-4]\d|1\d{2}|[0-9]{1,2})\.(?:25[0-5]|2[0-4]\d|1\d{2}|[0-9]{1,2})\.(?:25[0-5]|2[0-4]\d|1\d{2}|[0-9]{1,2}))\.(?:25[0-5]|2[0-4]\d|1\d{2}|[0-9]{1,2})\.(?:25[0-5]|2[0-4]\d|1\d{2}|[0-9]{1,2})\.(?:25[0-5]|2[0-4]\d|1\d{2}|[0-9]{1,2})$`

Required: Yes

**RemoteDomainName (p. 27)**

The fully qualified domain name (FQDN) of the remote domain with which you will set up a trust relationship.

Type: String

Pattern: `^[a-zA-Z0-9]+[\.-]+[a-zA-Z0-9]+\.[\.-]+$`

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).
**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**DirectoryUnavailableException**

The specified directory is unavailable or could not be found.

HTTP Status Code: 400

**EntityAlreadyExistsException**

The specified entity already exists.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**UnsupportedOperationException**

The operation is not supported.

HTTP Status Code: 400

---

**Examples**

The following examples are formatted for legibility.

**Example Request**

```plaintext
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 105
X-Amz-Target: DirectoryService_20150416.CreateConditionalForwarder
X-Amz-Date: 20161213T215543Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256

Credential=AKIAI7E3BYXS3example/20161213/us-west-2/ds/aws4_request,

CreateDirectory

Creates a Simple AD directory. For more information, see Simple Active Directory in the AWS Directory Service Admin Guide.

Before you call CreateDirectory, ensure that all of the required permissions have been explicitly granted through a policy. For details about what permissions are required to run the CreateDirectory operation, see AWS Directory Service API Permissions: Actions, Resources, and Conditions Reference.

Request Syntax

```json
{
    "Description": "string",
    "Name": "string",
    "Password": "string",
    "ShortName": "string",
    "Size": "string",
    "Tags": [
        {
            "Key": "string",
            "Value": "string"
        }
    ],
    "VpcSettings": {
        "SubnetIds": [ "string" ],
        "VpcId": "string"
    }
}
```

Request Parameters

The request accepts the following data in JSON format.

Description (p. 30)

A description for the directory.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: ^([a-zA-Z0-9-]+)[\\a-zA-Z0-9-@#%*+=:?./!\s-]*$

Required: No

Name (p. 30)

The fully qualified name for the directory, such as corp.example.com.

Type: String

Pattern: ^([a-zA-Z0-9-]+)[\\a-zA-Z0-9-@#%*+=?:/.\s-]*$

Required: Yes

Password (p. 30)

The password for the directory administrator. The directory creation process creates a directory administrator account with the user name Administrator and this password.
If you need to change the password for the administrator account, you can use the `ResetUserPassword` (p. 146) API call.

The regex pattern for this string is made up of the following conditions:

- Length (?=^.{8,64}$) – Must be between 8 and 64 characters

AND any 3 of the following password complexity rules required by Active Directory:

- Numbers and upper case and lowercase (?=.*\d)(?=.*[A-Z])(?=.*[a-z])
- Numbers and special characters and lower case (?=.*\d)(?=.*[^A-Za-z0-9\s])(?=.*[a-z])
- Special characters and upper case and lower case (?=.*[^A-Za-z0-9\s])(?=.*[A-Z])(?=.*[a-z])
- Numbers and upper case and special characters (?=.*\d)(?=.*[A-Z])(?=.*[^A-Za-z0-9\s])

For additional information about how Active Directory passwords are enforced, see Password must meet complexity requirements on the Microsoft website.

Type: String

Pattern: (?=^.{8,64}$)((?=.*\d)(?=.*[A-Z])(?=.*[a-z])|(?=.*\d)(?=.*[^A-Za-z0-9\s])(?=.*[a-z])|(?=.*[^A-Za-z0-9\s])(?=.*[A-Z])(?=.*[a-z])|(?=.*\d)(?=.*[A-Z])(?=.*[^A-Za-z0-9\s]))^.*

Required: Yes

**ShortName (p. 30)**

The NetBIOS name of the directory, such as CORP.

Type: String

Pattern: ^[^\/:*?"<>|]+[^\/:*?"<>|]*$

Required: No

**Size (p. 30)**

The size of the directory.

Type: String

Valid Values: Small | Large

Required: Yes

**Tags (p. 30)**

The tags to be assigned to the Simple AD directory.

Type: Array of Tag (p. 215) objects

Required: No

**VpcSettings (p. 30)**

A `DirectoryVpcSettings` (p. 192) object that contains additional information for the operation.

Type: `DirectoryVpcSettings` (p. 192) object

Required: No

**Response Syntax**

```json
{
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

DirectoryId (p. 31)

The identifier of the directory that was created.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryLimitExceededException

The maximum number of directories in the region has been reached. You can use the GetDirectoryLimits (p. 112) operation to determine your directory limits in the region.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 245
X-Amz-Date: 20161213T222613Z
{
    "Description":"Regional directory for example.com",
    "VpcSettings":{
        "SubnetIds":[
            "subnet-ba0146de",
            "subnet-bef46bc8"
        ],
        "VpcId":"vpc-45025421"
    },
    "Name":"seattle.example.com",
    "ShortName":"seattle",
    "Password":"Str0ngP@ssw0rd",
    "Size":"Small"
}

Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: 298112b6-c183-11e6-9b49-eff49203d13b
Content-Type: application/x-amz-json-1.1
Content-Length: 30
Date: Tue, 13 Dec 2016 22:26:17 GMT

{
    "DirectoryId":"d-926example"
}

CreateLogSubscription

Creates a subscription to forward real-time Directory Service domain controller security logs to the specified Amazon CloudWatch log group in your AWS account.

Request Syntax

```json
{
    "DirectoryId": "string",
    "LogGroupName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

DirectoryId (p. 34)

Identifier of the directory to which you want to subscribe and receive real-time logs to your specified CloudWatch log group.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

LogGroupName (p. 34)

The name of the CloudWatch log group where the real-time domain controller logs are forwarded.

Type: String

Pattern: [-._/#A-Za-z0-9]+

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityAlreadyExistsException

The specified entity already exists.
HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InsufficientPermissionsException**

The account does not have sufficient permission to perform the operation.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**UnsupportedOperationException**

The operation is not supported.

HTTP Status Code: 400

---

CreateMicrosoftAD

Creates a Microsoft AD directory in the AWS Cloud. For more information, see AWS Managed Microsoft AD in the AWS Directory Service Admin Guide.

Before you call CreateMicrosoftAD, ensure that all of the required permissions have been explicitly granted through a policy. For details about what permissions are required to run the CreateMicrosoftAD operation, see AWS Directory Service API Permissions: Actions, Resources, and Conditions Reference.

Request Syntax

```json
{
   "Description": "string",
   "Edition": "string",
   "Name": "string",
   "Password": "string",
   "ShortName": "string",
   "Tags": [
      {
         "Key": "string",
         "Value": "string"
      }
   ],
   "VpcSettings": {
      "SubnetIds": [ "string" ],
      "VpcId": "string"
   }
}
```

Request Parameters

The request accepts the following data in JSON format.

**Description (p. 36)**

A description for the directory. This label will appear on the AWS console Directory Details page after the directory is created.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: `^[a-zA-Z0-9-_]+\[a-zA-Z0-9-_@#%*+=?/:./\s-]*$`

Required: No

**Edition (p. 36)**

AWS Managed Microsoft AD is available in two editions: Standard and Enterprise. Enterprise is the default.

Type: String

Valid Values: Enterprise | Standard

Required: No

**Name (p. 36)**

The fully qualified domain name for the AWS Managed Microsoft AD directory, such as corp.example.com. This name will resolve inside your VPC only. It does not need to be publicly resolvable.
Password (p. 36)

The password for the default administrative user named Admin.

If you need to change the password for the administrator account, you can use the ResetUserPassword (p. 146) API call.

Type: String

Pattern: ^([a-zA-Z0-9]+[\.-])+([a-zA-Z0-9]+$

Required: Yes

ShortName (p. 36)

The NetBIOS name for your domain, such as CORP. If you don't specify a NetBIOS name, it will default to the first part of your directory DNS. For example, CORP for the directory DNS corp.example.com.

Type: String

Pattern: ^[^\/:*?"<>|]+[^\/:*?"<>|]*$

Required: No

Tags (p. 36)

The tags to be assigned to the AWS Managed Microsoft AD directory.

Type: Array of Tag (p. 215) objects

Required: No

VpcSettings (p. 36)

Contains VPC information for the CreateDirectory (p. 30) or CreateMicrosoftAD (p. 36) operation.

Type: DirectoryVpcSettings (p. 192) object

Required: Yes

Response Syntax

```
{
  "DirectoryId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
**DirectoryId (p. 37)**

The identifier of the directory that was created.

Type: String

Pattern: ^d-[0-9a-f]{10}$

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**DirectoryLimitExceededException**

The maximum number of directories in the region has been reached. You can use the GetDirectoryLimits (p. 112) operation to determine your directory limits in the region.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**UnsupportedOperationException**

The operation is not supported.

HTTP Status Code: 400

**Examples**

The following examples are formatted for legibility.

**Example Request**

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 207
X-Amz-Target: DirectoryService_20150416.CreateMicrosoftAD
X-Amz-Date: 20161213T231510Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161213/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
```

38
Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: 00019586-c18a-11e6-870b-c3330207df37
Content-Type: application/x-amz-json-1.1
Content-Length: 30
Date: Tue, 13 Dec 2016 23:15:12 GMT

{
   "DirectoryId":"d-926example"
}

CreateSnapshot

Creates a snapshot of a Simple AD or Microsoft AD directory in the AWS cloud.

**Note**
You cannot take snapshots of AD Connector directories.

**Request Syntax**

```
{
    "DirectoryId": "string",
    "Name": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**DirectoryId (p. 40)**

The identifier of the directory of which to take a snapshot.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**Name (p. 40)**

The descriptive name to apply to the snapshot.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: ^([a-zA-Z0-9_])\[\a-zA-Z0-9_@#%*+=?:./!\s-]*$

Required: No

**Response Syntax**

```
{
    "SnapshotId": "string"
}
```

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**SnapshotId (p. 40)**

The identifier of the snapshot that was created.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

SnapshotLimitExceededException

The maximum number of manual snapshots for the directory has been reached. You can use the GetSnapshotLimits (p. 114) operation to determine the snapshot limits for a directory.

HTTP Status Code: 400

Examples

The following examples are formatted for legibility.

Example Request

```plaintext
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 58
X-Amz-Target: DirectoryService_20150416.CreateSnapshot
X-Amz-Date: 20161213T233356Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256

Credential=AKIAI7E3BYXS3example/20161213/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=8789d87320d00e26fec4d745a34b3c5d898e4e89bf96b5f9c744ca612bed3d6d

{
    "DirectoryId":"d-926example",
    "Name":"ad.example.com"
}
```
Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: 9e6db78c-18e-1f09-03078e3561b
Content-Type: application/x-amz-json-1.1
Content-Length: 29
Date: Tue, 13 Dec 2016 23:33:58 GMT

{
  "SnapshotId":"s-9267f8d3f0"
}

CreateTrust

AWS Directory Service for Microsoft Active Directory allows you to configure trust relationships. For example, you can establish a trust between your AWS Managed Microsoft AD directory, and your existing on-premises Microsoft Active Directory. This would allow you to provide users and groups access to resources in either domain, with a single set of credentials.

This action initiates the creation of the AWS side of a trust relationship between an AWS Managed Microsoft AD directory and an external domain. You can create either a forest trust or an external trust.

Request Syntax

```
{
   "ConditionalForwarderIpAddrs": [ "string" ],
   "DirectoryId": "string",
   "RemoteDomainName": "string",
   "SelectiveAuth": "string",
   "TrustDirection": "string",
   "TrustPassword": "string",
   "TrustType": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**ConditionalForwarderIpAddrs (p. 43)**

The IP addresses of the remote DNS server associated with RemoteDomainName.

Type: Array of strings

Pattern: ^(?:(?:25[0-5]|2[0-4][0-9]|1\d\d|[1-9]\d|\d)\.(?:25[0-5]|2[0-4]\d|2\d\d|1\d|\d)\.(?:25[0-5]|2[0-4]\d|2\d\d|1\d|\d)\.(?:25[0-5]|2[0-4]\d|2\d\d|1\d|\d)\)$

Required: No

**DirectoryId (p. 43)**

The Directory ID of the AWS Managed Microsoft AD directory for which to establish the trust relationship.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**RemoteDomainName (p. 43)**

The Fully Qualified Domain Name (FQDN) of the external domain for which to create the trust relationship.

Type: String

Pattern: ^([a-zA-Z0-9-]+[\s.-])+([a-zA-Z0-9]+[\s.-])+$

Required: Yes
SelectiveAuth (p. 43)

Optional parameter to enable selective authentication for the trust.
Type: String
Valid Values: Enabled | Disabled
Required: No

TrustDirection (p. 43)

The direction of the trust relationship.
Type: String
Valid Values: One-Way: Outgoing | One-Way: Incoming | Two-Way
Required: Yes

TrustPassword (p. 43)

The trust password. The must be the same password that was used when creating the trust relationship on the external domain.
Type: String
Pattern: (.|\s)*\S(.|\s)*
Required: Yes

TrustType (p. 43)

The trust relationship type. Forest is the default.
Type: String
Valid Values: Forest | External
Required: No

Response Syntax

```
{
   "TrustId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.
The following data is returned in JSON format by the service.

TrustId (p. 44)

A unique identifier for the trust relationship that was created.
Type: String
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityAlreadyExistsException

The specified entity already exists.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 222
X-Amz-Target: DirectoryService_20150416.CreateTrust
X-Amz-Date: 20161213T235223Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161213/us-west-2/ds/aws4_request,

DeleteConditionalForwarder

Deletes a conditional forwarder that has been set up for your AWS directory.

Request Syntax

```
{
    "DirectoryId": "string",
    "RemoteDomainName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 47)**

The directory ID for which you are deleting the conditional forwarder.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**RemoteDomainName (p. 47)**

The fully qualified domain name (FQDN) of the remote domain with which you are deleting the conditional forwarder.

Type: String

Pattern: ^([a-zA-Z0-9-0-9]+[\.-]+[ -][a-zA-Z0-9-0-9]+[.]?)+$  

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**DirectoryUnavailableException**

The specified directory is unavailable or could not be found.

HTTP Status Code: 400
EntityDoesNotExistException
   The specified entity could not be found.
   HTTP Status Code: 400

InvalidParameterException
   One or more parameters are not valid.
   HTTP Status Code: 400

ServiceException
   An exception has occurred in AWS Directory Service.
   HTTP Status Code: 500

UnsupportedOperationException
   The operation is not supported.
   HTTP Status Code: 400

Examples
The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 76
X-Amz-Target: DirectoryService_20150416.DeleteConditionalForwarder
X-Amz-Date: 20161214T001055Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256

Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,

DeleteDirectory

Deletes an AWS Directory Service directory.

Before you call DeleteDirectory, ensure that all of the required permissions have been explicitly granted through a policy. For details about what permissions are required to run the DeleteDirectory operation, see AWS Directory Service API Permissions: Actions, Resources, and Conditions Reference.

Request Syntax

```
{
    "DirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

DirectoryId (p. 50)

The identifier of the directory to delete.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

Response Syntax

```
{
    "DirectoryId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

DirectoryId (p. 50)

The directory identifier.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).
Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 31
X-Amz-Date: 20161214T002424Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
               SignedHeaders=content-type;host;x-amz-date;x-amz-target,

DeleteLogSubscription

Deletes the specified log subscription.

Request Syntax

```json
{
  "DirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 53)**

Identifier of the directory whose log subscription you want to delete.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**UnsupportedOperationException**

The operation is not supported.

HTTP Status Code: 400

DeleteSnapshot

Deletes a directory snapshot.

Request Syntax

```json
{
   "SnapshotId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**SnapshotId (p. 55)**

The identifier of the directory snapshot to be deleted.

Type: String

Pattern: ^s-[0-9a-f]{10}$

Required: Yes

Response Syntax

```json
{
   "SnapshotId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**SnapshotId (p. 55)**

The identifier of the directory snapshot that was deleted.

Type: String

Pattern: ^s-[0-9a-f]{10}$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400
EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 30
X-Amz-Target: DirectoryService_20150416.DeleteSnapshot
X-Amz-Date: 20161214T012131Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256

DeleteTrust

Deletes an existing trust relationship between your AWS Managed Microsoft AD directory and an external domain.

Request Syntax

```
{
    "DeleteAssociatedConditionalForwarder": boolean,
    "TrustId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DeleteAssociatedConditionalForwarder (p. 58)**

Delete a conditional forwarder as part of a DeleteTrustRequest.

Type: Boolean

Required: No

**TrustId (p. 58)**

The Trust ID of the trust relationship to be deleted.

Type: String

Pattern: `t-[0-9a-f]{10}$`

Required: Yes

Response Syntax

```
{
    "TrustId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**TrustId (p. 58)**

The Trust ID of the trust relationship that was deleted.

Type: String

Pattern: `t-[0-9a-f]{10}$`
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 73
X-Amz-Target: DirectoryService_20150416.DeleteTrust
X-Amz-Date: 20161214T013332Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,

DeregisterCertificate

Deletes from the system the certificate that was registered for a secured LDAP connection.

Request Syntax

```json
{
   "CertificateId": "string",
   "DirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**CertificateId (p. 61)**

- The identifier of the certificate.
- Type: String
- Pattern: ^c-[0-9a-f]{10}$
- Required: Yes

**DirectoryId (p. 61)**

- The identifier of the directory.
- Type: String
- Pattern: ^d-[0-9a-f]{10}$
- Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**CertificateDoesNotExistException**

- The certificate is not present in the system for describe or deregister activities.
- HTTP Status Code: 400

**CertificateInUseException**

- The certificate is being used for the LDAP security connection and cannot be removed without disabling LDAP security.
- HTTP Status Code: 400
ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryDoesNotExistException

The specified directory does not exist in the system.

HTTP Status Code: 400

DirectoryUnavailableException

The specified directory is unavailable or could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

DeregisterEventTopic

Removes the specified directory as a publisher to the specified SNS topic.

Request Syntax

```json
{
    "DirectoryId": "string",
    "TopicName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

DirectoryId (p. 63)

The Directory ID to remove as a publisher. This directory will no longer send messages to the specified SNS topic.

Type: String

Pattern: \^d-[0-9a-f]{10}\$

Required: Yes

TopicName (p. 63)

The name of the SNS topic from which to remove the directory as a publisher.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [a-zA-Z0-9-._]+

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400
InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 52
X-Amz-Target: DirectoryService_20150416.DeregisterEventTopic
X-Amz-Date: 20161214T014408Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXSexample/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=e3b8ad858165a3dd7d4f35b0adfd17bee88d71aed26b0f49e6db792ed8b10f8b1

{
  "DirectoryId": "d-926example",
  "TopicName": "snstopicexample"
}
```

Example Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: a68a1e79-c19b-11e6-870b-c3330207df37
Content-Type: application/x-amz-json-1.1
Content-Length: 29
Date: Wed, 14 Dec 2016 01:44:10 GMT

{
}
```

DescribeCertificate

Displays information about the certificate registered for a secured LDAP connection.

Request Syntax

```
{
    "CertificateId": "string",
    "DirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

CertificateId (p. 66)

  The identifier of the certificate.

  Type: String

  Pattern: ^c-[0-9a-f]{10}$

  Required: Yes

DirectoryId (p. 66)

  The identifier of the directory.

  Type: String

  Pattern: ^d-[0-9a-f]{10}$

  Required: Yes

Response Syntax

```
{
    "Certificate": {
        "CertificateId": "string",
        "CommonName": "string",
        "ExpiryDateTime": number,
        "RegisteredDateTime": number,
        "State": "string",
        "StateReason": "string"
    }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
Certificate (p. 66)

Information about the certificate, including registered date time, certificate state, the reason for the state, expiration date time, and certificate common name.

Type: Certificate (p. 177) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

CertificateDoesNotExistException

The certificate is not present in the system for describe or deregister activities.

HTTP Status Code: 400

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryDoesNotExistException

The specified directory does not exist in the system.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

DescribeConditionalForwarders

Obtains information about the conditional forwarders for this account.

If no input parameters are provided for RemoteDomainNames, this request describes all conditional forwarders for the specified directory ID.

Request Syntax

```json
{
    "DirectoryId": "string",
    "RemoteDomainNames": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 69)**

The directory ID for which to get the list of associated conditional forwarders.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**RemoteDomainNames (p. 69)**

The fully qualified domain names (FQDN) of the remote domains for which to get the list of associated conditional forwarders. If this member is null, all conditional forwarders are returned.

Type: Array of strings

Pattern: ^([a-zA-Z0-9]+[\.-])+([a-zA-Z0-9])+$

Required: No

Response Syntax

```json
{
    "ConditionalForwarders": [
        {
            "DnsIpAddrs": [ "string" ],
            "RemoteDomainName": "string",
            "ReplicationScope": "string"
        }
    ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.
ConditionalForwarders (p. 69)

The list of conditional forwarders that have been created.

Type: Array of ConditionalForwarder (p. 181) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryUnavailableException

The specified directory is unavailable or could not be found.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 79
X-Amz-Target: DirectoryService_20150416.DescribeConditionalForwarders
X-Amz-Date: 20161214T020215Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
```
Credentials=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=d8f7ff4237b393b4734bbf5d96713dff3deff651b4ab348f64bd776606147f9d

{
  "DirectoryId": "d-926example",
  "RemoteDomainNames": ["sales.example.com"]
}

Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: 56d08425-c1a1-11e6-a132-e5016ac609f4
Content-Type: application/x-amz-json-1.1
Content-Length: 28
Date: Wed, 14 Dec 2016 02:02:18 GMT

{
  "ConditionalForwarders":[]
}

DescribeDirectories

Obtains information about the directories that belong to this account.

You can retrieve information about specific directories by passing the directory identifiers in the DirectoryIds parameter. Otherwise, all directories that belong to the current account are returned.

This operation supports pagination with the use of the NextToken request and response parameters. If more results are available, the DescribeDirectoriesResult.NextToken member contains a token that you pass in the next call to DescribeDirectories (p. 72) to retrieve the next set of items.

You can also specify a maximum number of return results with the Limit parameter.

Request Syntax

```
{
   "DirectoryIds": [ "string" ],
   "Limit": number,
   "NextToken": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

DirectoryIds (p. 72)

A list of identifiers of the directories for which to obtain the information. If this member is null, all directories that belong to the current account are returned.

An empty list results in an InvalidParameterException being thrown.

Type: Array of strings

Pattern: ^d-[0-9a-f]{10}$

Required: No

Limit (p. 72)

The maximum number of items to return. If this value is zero, the maximum number of items is specified by the limitations of the operation.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

NextToken (p. 72)

The DescribeDirectoriesResult.NextToken value from a previous call to DescribeDirectories (p. 72). Pass null if this is the first call.

Type: String

Required: No
Response Syntax

{
   "DirectoryDescriptions": [
      {
         "AccessUrl": "string",
         "Alias": "string",
         "ConnectSettings": {

            "RadiusServers": [ "string" ],
            "RadiusTimeout": number,
            "SharedSecret": "string",
            "UseSameUsername": boolean
         },
         "RadiusStatus": "string",
         "ShareMethod": "string",
         "ShareNotes": "string",
         "ShareStatus": "string",
         "ShortName": "string",
         "Size": "string",
         "SsoEnabled": boolean,
         "Stage": "string",
         "StageLastUpdatedDateTime": number,
         "StageReason": "string",
      }
   ]
}
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

DirectoryDescriptions (p. 73)

The list of DirectoryDescription (p. 186) objects that were retrieved.

It is possible that this list contains less than the number of items specified in the Limit member of the request. This occurs if there are less than the requested number of items left to retrieve, or if the limitations of the operation have been exceeded.

Type: Array of DirectoryDescription (p. 186) objects

NextToken (p. 73)

If not null, more results are available. Pass this value for the NextToken parameter in a subsequent call to DescribeDirectories (p. 72) to retrieve the next set of items.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidNextTokenException

The NextToken value is not valid.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400
ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

DescribeDomainControllers

Provides information about any domain controllers in your directory.

Request Syntax

```json
{
  "DirectoryId": "string",
  "DomainControllerIds": [ "string" ],
  "Limit": number,
  "NextToken": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 77)**

Identifier of the directory for which to retrieve the domain controller information.

- Type: String
- Pattern: ^d-[0-9a-f]{10}$
- Required: Yes

**DomainControllerIds (p. 77)**

A list of identifiers for the domain controllers whose information will be provided.

- Type: Array of strings
- Pattern: ^dc-[0-9a-f]{10}$
- Required: No

**Limit (p. 77)**

The maximum number of items to return.

- Type: Integer
- Valid Range: Minimum value of 0.
- Required: No

**NextToken (p. 77)**

The DescribeDomainControllers.NextToken value from a previous call to DescribeDomainControllers (p. 77). Pass null if this is the first call.

- Type: String
- Required: No

Response Syntax

```json
{
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**DomainControllers (p. 77)**

List of the DomainController (p. 194) objects that were retrieved.

Type: Array of DomainController (p. 194) objects

**NextToken (p. 77)**

If not null, more results are available. Pass this value for the NextToken parameter in a subsequent call to DescribeDomainControllers (p. 77) retrieve the next set of items.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidNextTokenException**

The NextToken value is not valid.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400
ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

See Also

- AWS SDK for Ruby V3
DescribeEventTopics

Obtains information about which SNS topics receive status messages from the specified directory.

If no input parameters are provided, such as DirectoryId or TopicName, this request describes all of the associations in the account.

Request Syntax

```json
{
   "DirectoryId": "string",
   "TopicNames": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 80)**

The Directory ID for which to get the list of associated SNS topics. If this member is null, associations for all Directory IDs are returned.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

**TopicNames (p. 80)**

A list of SNS topic names for which to obtain the information. If this member is null, all associations for the specified Directory ID are returned.

An empty list results in an InvalidParameterException being thrown.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [a-zA-Z0-9-_.]+

Required: No

Response Syntax

```json
{
   "EventTopics": [
   {
      "CreatedDateTime": number,
      "DirectoryId": "string",
      "Status": "string",
      "TopicArn": "string",
      "TopicName": "string"
   }
   ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

EventTopics (p. 80)

A list of SNS topic names that receive status messages from the specified Directory ID.

Type: Array of EventTopic (p. 196) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```plaintext

DescribeLDAPSSettings

Describes the status of LDAP security for the specified directory.

Request Syntax

```json
{
  "DirectoryId": "string",
  "Limit": number,
  "NextToken": "string",
  "Type": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 83)**

The identifier of the directory.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**Limit (p. 83)**

Specifies the number of items that should be displayed on one page.

Type: Integer

Required: No

**NextToken (p. 83)**

The type of next token used for pagination.

Type: String

Required: No

**Type (p. 83)**

The type of LDAP security to enable. Currently only the value Client is supported.

Type: String

Valid Values: Client

Required: No

Response Syntax

```json
{
}
```
"LDAPSSettingsInfo": [
    {
      "LastUpdatedDateTime": number,
      "LDAPSStatus": "string",
      "LDAPSStatusReason": "string"
    }
  ],

"NextToken": "string"

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

LDAPSSettingsInfo (p. 83)

Information about LDAP security for the specified directory, including status of enablement, state last updated date time, and the reason for the state.

Type: Array of LDAPSSettingInfo (p. 201) objects

NextToken (p. 83)

The next token used to retrieve the LDAPS settings if the number of setting types exceeds page limit and there is another page.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryDoesNotExistException

The specified directory does not exist in the system.

HTTP Status Code: 400

InvalidNextTokenException

The NextToken value is not valid.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

 ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500
UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

DescribeSharedDirectories

Returns the shared directories in your account.

Request Syntax

```
{
    "Limit": number,
    "NextToken": "string",
    "OwnerDirectoryId": "string",
    "SharedDirectoryIds": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

Limit (p. 86)

The number of shared directories to return in the response object.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

NextToken (p. 86)

The DescribeSharedDirectoriesResult.NextToken value from a previous call to DescribeSharedDirectories (p. 86). Pass null if this is the first call.

Type: String

Required: No

OwnerDirectoryId (p. 86)

Returns the identifier of the directory in the directory owner account.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

SharedDirectoryIds (p. 86)

A list of identifiers of all shared directories in your account.

Type: Array of strings

Pattern: ^d-[0-9a-f]{10}$

Required: No

Response Syntax

```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextToken (p. 86)**

If not null, token that indicates that more results are available. Pass this value for the `NextToken` parameter in a subsequent call to DescribeSharedDirectories (p. 86) to retrieve the next set of items.

Type: String

**SharedDirectories (p. 86)**

A list of all shared directories in your account.

Type: Array of SharedDirectory (p. 209) objects

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidNextTokenException**

The `NextToken` value is not valid.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400
**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**UnsupportedOperationException**

The operation is not supported.

HTTP Status Code: 400

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface

DescribeSnapshots

Obtains information about the directory snapshots that belong to this account.

This operation supports pagination with the use of the NextToken request and response parameters. If more results are available, the DescribeSnapshots.NextToken member contains a token that you pass in the next call to DescribeSnapshots (p. 89) to retrieve the next set of items.

You can also specify a maximum number of return results with the Limit parameter.

Request Syntax

```json
{
  "DirectoryId": "string",
  "Limit": number,
  "NextToken": "string",
  "SnapshotIds": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 89)**

The identifier of the directory for which to retrieve snapshot information.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

**Limit (p. 89)**

The maximum number of objects to return.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**NextToken (p. 89)**

The DescribeSnapshotsResult.NextToken value from a previous call to DescribeSnapshots (p. 89). Pass null if this is the first call.

Type: String

Required: No

**SnapshotIds (p. 89)**

A list of identifiers of the snapshots to obtain the information for. If this member is null or empty, all snapshots are returned using the Limit and NextToken members.

Type: Array of strings
Response Syntax

```
{
    "NextToken": "string",
    "Snapshots": [
        {
            "DirectoryId": "string",
            "Name": "string",
            "SnapshotId": "string",
            "StartTime": number,
            "Status": "string",
            "Type": "string"
        }
    ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextToken (p. 90)**

If not null, more results are available. Pass this value in the `NextToken` member of a subsequent call to DescribeSnapshots (p. 89).

Type: String

**Snapshots (p. 90)**

The list of `Snapshot (p. 212)` objects that were retrieved.

It is possible that this list contains less than the number of items specified in the `Limit` member of the request. This occurs if there are less than the requested number of items left to retrieve, or if the limitations of the operation have been exceeded.

Type: Array of `Snapshot (p. 212)` objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400
InvalidNextTokenException

The NextToken value is not valid.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 76
X-Amz-Target: DirectoryService_20150416.DescribeSnapshots
X-Amz-Date: 20161214T164618Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=602552c456c471537cbfaec3b7712674bdc20574c076dace469f3848fa8ab7a

{
  "DirectoryId": "d-926example",
  "Limit": 0,
  "SnapshotIds": ["s-9267f6da4e"]
}
```

Example Response

```
HTTP/1.1 200 OK
x-amzn-RequestId: d7b33e7e-c21c-11e6-91f4-6dbff6648f8a
Content-Type: application/x-amz-json-1.1
Content-Length: 138
Date: Wed, 14 Dec 2016 16:46:21 GMT

{
  "Snapshots": [  
    {
      "DirectoryId": "d-926example",
      "SnapshotId": "s-9267f6da4e",
      "StartTime": 1.481289211615E9,
      "Status": "Completed",
      "Type": "Auto"
    }
  ]
}
```
See Also

DescribeTrusts

Obtains information about the trust relationships for this account.

If no input parameters are provided, such as DirectoryId or TrustIds, this request describes all the trust relationships belonging to the account.

Request Syntax

```
{
  "DirectoryId": "string",
  "Limit": number,
  "NextToken": "string",
  "TrustIds": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

DirectoryId (p. 93)

The Directory ID of the AWS directory that is a part of the requested trust relationship.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

Limit (p. 93)

The maximum number of objects to return.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

NextToken (p. 93)

The DescribeTrustsResult.NextToken value from a previous call to DescribeTrusts (p. 93). Pass null if this is the first call.

Type: String

Required: No

TrustIds (p. 93)

A list of identifiers of the trust relationships for which to obtain the information. If this member is null, all trust relationships that belong to the current account are returned.

An empty list results in an InvalidParameterException being thrown.

Type: Array of strings

Pattern: ^t-[0-9a-f]{10}$

Required: No
Response Syntax

```
{
   "NextToken": "string",
   "Trusts": [
      {
         "CreatedDateTime": number,
         "DirectoryId": "string",
         "LastUpdatedDateTime": number,
         "RemoteDomainName": "string",
         "SelectiveAuth": "string",
         "StateLastUpdatedDateTime": number,
         "TrustDirection": "string",
         "TrustId": "string",
         "TrustState": "string",
         "TrustStateReason": "string",
         "TrustType": "string"
      }
   ]
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**NextToken (p. 94)**

If not null, more results are available. Pass this value for the `NextToken` parameter in a subsequent call to DescribeTrusts (p. 93) to retrieve the next set of items.

Type: String

**Trusts (p. 94)**

The list of Trust objects that were retrieved.

It is possible that this list contains less than the number of items specified in the `Limit` member of the request. This occurs if there are less than the requested number of items left to retrieve, or if the limitations of the operation have been exceeded.

Type: Array of Trust (p. 216) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400
InvalidNextTokenException

The NextToken value is not valid.
HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.
HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.
HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.
HTTP Status Code: 400

Examples

The following examples are formatted for legibility.

Example Request

```plaintext
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity

DisableLDAPS

Deactivates LDAP secure calls for the specified directory.

Request Syntax

```json
{
  "DirectoryId": "string",
  "Type": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 97)**

The identifier of the directory.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**Type (p. 97)**

The type of LDAP security to enable. Currently only the value Client is supported.

Type: String

Valid Values: Client

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

- **ClientException**
  
  A client exception has occurred.

  HTTP Status Code: 400

- **DirectoryDoesNotExistException**
  
  The specified directory does not exist in the system.

  HTTP Status Code: 400

- **DirectoryUnavailableException**
  
  The specified directory is unavailable or could not be found.
HTTP Status Code: 400
InvalidLDAPSStatusException
The LDAP activities could not be performed because they are limited by the LDAPS status.

HTTP Status Code: 400
InvalidParameterException
One or more parameters are not valid.

HTTP Status Code: 400
ServiceException
An exception has occurred in AWS Directory Service.

HTTP Status Code: 500
UnsupportedOperationException
The operation is not supported.

HTTP Status Code: 400

**DisableRadius**

Disables multi-factor authentication (MFA) with the Remote Authentication Dial In User Service (RADIUS) server for an AD Connector or Microsoft AD directory.

**Request Syntax**

```
{
  "DirectoryId": "string"
}
```

**Request Parameters**

The request accepts the following data in JSON format.

**DirectoryId (p. 99)**

The identifier of the directory for which to disable MFA.

Type: String

Pattern: ^d-\[0-9a-f\]{10}$

Required: Yes

**Response Elements**

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

**Errors**

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**Examples**

The following examples are formatted for legibility.
Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 31
X-Amz-Target: DirectoryService_20150416.DisableRadius
X-Amz-Date: 20161214T215510Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,

DisableSso

Disables single-sign on for a directory.

Request Syntax

```
{
    "DirectoryId": "string",
    "Password": "string",
    "UserName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

DirectoryId (p. 101)

The identifier of the directory for which to disable single-sign on.

- Type: String
- Pattern: ^d-[0-9a-f]{10}$
- Required: Yes

Password (p. 101)

The password of an alternate account to use to disable single-sign on. This is only used for AD Connector directories. For more information, see the UserName parameter.

- Type: String
- Required: No

UserName (p. 101)

The username of an alternate account to use to disable single-sign on. This is only used for AD Connector directories. This account must have privileges to remove a service principal name.

If the AD Connector service account does not have privileges to remove a service principal name, you can specify an alternate account with the UserName and Password parameters. These credentials are only used to disable single sign-on and are not stored by the service. The AD Connector service account is not changed.

- Type: String
- Length Constraints: Minimum length of 1.
- Pattern: [a-zA-Z0-9._-]+
- Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

AuthenticationFailedException

An authentication error occurred.

HTTP Status Code: 400

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InsufficientPermissionsException

The account does not have sufficient permission to perform the operation.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```plaintext
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 80
X-Amz-Target: DirectoryService_20150416.DisableSso
X-Amz-Date: 20161214T221722Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=b68ee7e88af7fc741471e9098dbc1636979ae461f0b9cd2f187124abf762455

{
  "UserName": "Admin",
  "DirectoryId": "d-926example",
  "Password": "Str0ngP@ssw0rd"
}
```

Example Response

EnableLDAPS

Activates the switch for the specific directory to always use LDAP secure calls.

Request Syntax

```
{
   "DirectoryId": "string",
   "Type": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 104)**

  The identifier of the directory.

  Type: String

  Pattern: ^d-[0-9a-f]{10}$

  Required: Yes

**Type (p. 104)**

  The type of LDAP security to enable. Currently only the value Client is supported.

  Type: String

  Valid Values: Client

  Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

  A client exception has occurred.

  HTTP Status Code: 400

**DirectoryDoesNotExistException**

  The specified directory does not exist in the system.

  HTTP Status Code: 400

**DirectoryUnavailableException**

  The specified directory is unavailable or could not be found.
HTTP Status Code: 400
InvalidLDAPSStatusException
The LDAP activities could not be performed because they are limited by the LDAPS status.

HTTP Status Code: 400
InvalidParameterException
One or more parameters are not valid.

HTTP Status Code: 400
NoAvailableCertificateException
The LDAP activities could not be performed because at least one valid certificate must be registered with the system.

HTTP Status Code: 400
ServiceException
An exception has occurred in AWS Directory Service.

HTTP Status Code: 500
UnsupportedOperationException
The operation is not supported.

EnableRadius

Enables multi-factor authentication (MFA) with the Remote Authentication Dial In User Service (RADIUS) server for an AD Connector or Microsoft AD directory.

Request Syntax

```
{
  "DirectoryId": "string",
  "RadiusSettings": {
    "AuthenticationProtocol": "string",
    "DisplayLabel": "string",
    "RadiusPort": number,
    "RadiusRetries": number,
    "RadiusServers": ["string"],
    "RadiusTimeout": number,
    "SharedSecret": "string",
    "UseSameUsername": boolean
  }
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 106)**

The identifier of the directory for which to enable MFA.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**RadiusSettings (p. 106)**

A RadiusSettings (p. 205) object that contains information about the RADIUS server.

Type: RadiusSettings (p. 205) object

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400
EntityAlreadyExistsException

The specified entity already exists.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 259
X-Amz-Target: DirectoryService_20150416.EnableRadius
X-Amz-Date: 20161214T214103Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
               SignedHeaders=content-type;host;x-amz-date;x-amz-target,
               Signature=4ba918cf440a45fddd5fcd1bd65207f94e760cebbd7de404d0096c6b1e652d4e

{
    "DirectoryId":"d-926example",
    "RadiusSettings":{
        "DisplayLabel":"MyRadius",
        "UseSameUsername":true,
        "RadiusTimeout":1,
        "AuthenticationProtocol":"PAP",
        "RadiusPort":1200,

EnableSso

Enables single sign-on for a directory. Single sign-on allows users in your directory to access certain AWS services from a computer joined to the directory without having to enter their credentials separately.

Request Syntax

```json
{
  "DirectoryId": "string",
  "Password": "string",
  "UserName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 109)**

The identifier of the directory for which to enable single-sign on.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**Password (p. 109)**

The password of an alternate account to use to enable single-sign on. This is only used for AD Connector directories. For more information, see the UserName parameter.

Type: String

Required: No

**UserName (p. 109)**

The username of an alternate account to use to enable single-sign on. This is only used for AD Connector directories. This account must have privileges to add a service principal name.

If the AD Connector service account does not have privileges to add a service principal name, you can specify an alternate account with the UserName and Password parameters. These credentials are only used to enable single sign-on and are not stored by the service. The AD Connector service account is not changed.

Type: String

Length Constraints: Minimum length of 1.

Pattern: [a-zA-Z0-9-.]+

Required: No

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

AuthenticationFailedException

An authentication error occurred.

HTTP Status Code: 400

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InsufficientPermissionsException

The account does not have sufficient permission to perform the operation.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 80
X-Amz-Target: DirectoryService_20150416.EnableSso
X-Amz-Date: 20161214T220301Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=88acc99818605aa438eb86b5be59daecce370c7db16e5e84311508e575ea0515

{
  "UserName": "Admin",
  "DirectoryId": "d-926example",
  "Password": "Str0ngP@ssw0rd"
}
```

Example Response

GetDirectoryLimits

Obtains directory limit information for the current Region.

Response Syntax

```
{
    "DirectoryLimits": {
        "CloudOnlyDirectoriesCurrentCount": number,
        "CloudOnlyDirectoriesLimit": number,
        "CloudOnlyDirectoriesLimitReached": boolean,
        "CloudOnlyMicrosoftADCurrentCount": number,
        "CloudOnlyMicrosoftADLimit": number,
        "CloudOnlyMicrosoftADLimitReached": boolean,
        "ConnectedDirectoriesCurrentCount": number,
        "ConnectedDirectoriesLimit": number,
        "ConnectedDirectoriesLimitReached": boolean
    }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**DirectoryLimits (p. 112)**

A `DirectoryLimits (p. 190)` object that contains the directory limits for the current Region.

Type: `DirectoryLimits (p. 190)` object

Errors

For information about the errors that are common to all actions, see `Common Errors (p. 222)`.

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.
Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 2
X-Amz-Date: 20161214T223512Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81

GetSnapshotLimits

Obtains the manual snapshot limits for a directory.

Request Syntax

```
{
  "DirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

DirectoryId (p. 114)

Contains the identifier of the directory to obtain the limits for.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

Response Syntax

```
{
  "SnapshotLimits": {
    "ManualSnapshotsCurrentCount": number,
    "ManualSnapshotsLimit": number,
    "ManualSnapshotsLimitReached": boolean
  }
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

SnapshotLimits (p. 114)

A SnapshotLimits (p. 214) object that contains the manual snapshot limits for the specified directory.

Type: SnapshotLimits (p. 214) object

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.
HTTP Status Code: 400
EntityDoesNotExistException
The specified entity could not be found.

HTTP Status Code: 400
ServiceException
An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 31
X-Amz-Target: DirectoryService_20150416.GetSnapshotLimits
X-Amz-Date: 20161214T224507Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,

ListCertificates

For the specified directory, lists all the certificates registered for a secured LDAP connection.

Request Syntax

```json
{
  "DirectoryId": "string",
  "Limit": number,
  "NextToken": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 117)**

  The identifier of the directory.
  
  Type: String
  
  Pattern: ^d-[0-9a-f]{10}$
  
  Required: Yes

**Limit (p. 117)**

  The number of items that should show up on one page
  
  Type: Integer
  
  
  Required: No

**NextToken (p. 117)**

  A token for requesting another page of certificates if the NextToken response element indicates that more certificates are available. Use the value of the returned NextToken element in your request until the token comes back as null. Pass null if this is the first call.
  
  Type: String
  
  Required: No

Response Syntax

```json
{
  "CertificatesInfo": [
    {
      "CertificateId": "string",
      "CommonName": "string",
      "ExpiryDateTime": number,
      "State": "string"
    }
  ],
}
```
"NextToken": "string"
}

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

CertificatesInfo (p. 117)

A list of certificates with basic details including certificate ID, certificate common name, certificate state.

Type: Array of CertificateInfo (p. 179) objects

NextToken (p. 117)

Indicates whether another page of certificates is available when the number of available certificates exceeds the page limit.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryDoesNotExistException

The specified directory does not exist in the system.

HTTP Status Code: 400

InvalidNextTokenException

The NextToken value is not valid.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

ListIpRoutes

Lists the address blocks that you have added to a directory.

Request Syntax

```
{
  "DirectoryId": "string",
  "Limit": number,
  "NextToken": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 120)**

Identifier (ID) of the directory for which you want to retrieve the IP addresses.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**Limit (p. 120)**

Maximum number of items to return. If this value is zero, the maximum number of items is specified by the limitations of the operation.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**NextToken (p. 120)**

The ListIpRoutes.NextToken value from a previous call to ListIpRoutes (p. 120). Pass null if this is the first call.

Type: String

Required: No

Response Syntax

```
{
  "IpRoutesInfo": [
    {
      "AddedDateTime": number,
      "CidrIp": "string",
      "Description": "string",
      "DirectoryId": "string",
      "IpRouteStatusMsg": "string",
      "IpRouteStatusReason": "string"
    }
  ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**IpRoutesInfo (p. 120)**

A list of **IpRoute (p. 198)**s.

Type: Array of **IpRouteInfo (p. 199)** objects

**NextToken (p. 120)**

If not null, more results are available. Pass this value for the **NextToken** parameter in a subsequent call to **ListIpRoutes (p. 120)** to retrieve the next set of items.

Type: String

Errors

For information about the errors that are common to all actions, see **Common Errors (p. 222)**.

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidNextTokenException**

The **NextToken** value is not valid.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.
Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 43
X-Amz-Target: DirectoryService_20150416.ListIpRoutes
X-Amz-Date: 20161214T225328Z

ListLogSubscriptions

Lists the active log subscriptions for the AWS account.

Request Syntax

```json
{
  "DirectoryId": "string",
  "Limit": number,
  "NextToken": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

DirectoryId (p. 123)

If a DirectoryID is provided, lists only the log subscription associated with that directory. If no DirectoryId is provided, lists all log subscriptions associated with your AWS account. If there are no log subscriptions for the AWS account or the directory, an empty list will be returned.

Type: String

Pattern: ^d-\[0-9a-f\]{10}$

Required: No

Limit (p. 123)

The maximum number of items returned.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

NextToken (p. 123)

The token for the next set of items to return.

Type: String

Required: No

Response Syntax

```json
{
  "LogSubscriptions": [
    {
      "DirectoryId": "string",
      "LogGroupName": "string",
      "SubscriptionCreatedDateTime": number
    }
  ],
  "NextToken": "string"
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

LogSubscriptions (p. 123)

A list of active LogSubscription (p. 202) objects for calling the AWS account.

Type: Array of LogSubscription (p. 202) objects

NextToken (p. 123)

The token for the next set of items to return.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidNextTokenException

The NextToken value is not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

ListSchemaExtensions

Lists all schema extensions applied to a Microsoft AD Directory.

Request Syntax

```
{
    "DirectoryId": "string",
    "Limit": number,
    "NextToken": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 126)**

The identifier of the directory from which to retrieve the schema extension information.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**Limit (p. 126)**

The maximum number of items to return.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**NextToken (p. 126)**

The ListSchemaExtensions.NextToken value from a previous call to ListSchemaExtensions. Pass null if this is the first call.

Type: String

Required: No

Response Syntax

```
{
    "NextToken": "string",
    "SchemaExtensionsInfo": [
        {
            "Description": "string",
            "DirectoryId": "string",
            "EndDateTime": number,
            "SchemaExtensionId": "string",
            "SchemaExtensionStatus": "string",
            "SchemaExtensionStatusReason": "string",
            "StartDateTime": number
        }
    ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

NextToken (p. 126)

If not null, more results are available. Pass this value for the NextToken parameter in a subsequent call to ListSchemaExtensions to retrieve the next set of items.

Type: String

SchemaExtensionsInfo (p. 126)

Information about the schema extensions applied to the directory.

Type: Array of SchemaExtensionInfo (p. 207) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidNextTokenException

The NextToken value is not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: 89f9aae0-c251-11e6-b0d6-83af322c90c

ListTagsForResource

Lists all tags on a directory.

Request Syntax

```json
{
    "Limit": number,
    "NextToken": "string",
    "ResourceId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**Limit (p. 129)**

Reserved for future use.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**NextToken (p. 129)**

Reserved for future use.

Type: String

Required: No

**ResourceId (p. 129)**

Identifier (ID) of the directory for which you want to retrieve tags.

Type: String

Pattern: ^[d]-[0-9a-f]{10}$

Required: Yes

Response Syntax

```json
{
    "NextToken": "string",
    "Tags": [
      {
        "Key": "string",
        "Value": "string"
      }
    ]
}
```
Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

**NextToken (p. 129)**

Reserved for future use.

Type: String

**Tags (p. 129)**

List of tags returned by the ListTagsForResource operation.

Type: Array of Tag (p. 215) objects

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidNextTokenException**

The `NextToken` value is not valid.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

**Example Request**

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
```
Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: fb7da12c-c252-11e6-a96d-2b0686697d23
Content-Type: application/x-amz-json-1.1
Content-Length: 53
Date: Wed, 14 Dec 2016 23:13:54 GMT

{
    "Tags": [
        {
            "Key": "environment",
            "Value": "production"
        }
    ]
}
RegisterCertificate

Registers a certificate for secured LDAP connection.

Request Syntax

```
{
    "CertificateData": "string",
    "DirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**CertificateData (p. 132)**

The certificate PEM string that needs to be registered.

Type: String

Required: Yes

**DirectoryId (p. 132)**

The identifier of the directory.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

Response Syntax

```
{
    "CertificateId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**CertificateId (p. 132)**

The identifier of the certificate.

Type: String

Pattern: ^c-[0-9a-f]{10}$
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

CertificateAlreadyExistsException

The certificate has already been registered into the system.

HTTP Status Code: 400

CertificateLimitExceededException

The certificate could not be added because the certificate limit has been reached.

HTTP Status Code: 400

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryDoesNotExistException

The specified directory does not exist in the system.

HTTP Status Code: 400

DirectoryUnavailableException

The specified directory is unavailable or could not be found.

HTTP Status Code: 400

InvalidCertificateException

The certificate PEM that was provided has incorrect encoding.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

RegisterEventTopic

Associates a directory with an SNS topic. This establishes the directory as a publisher to the specified SNS topic. You can then receive email or text (SMS) messages when the status of your directory changes. You get notified if your directory goes from an Active status to an Impaired or Inoperable status. You also receive a notification when the directory returns to an Active status.

Request Syntax

```
{
  "DirectoryId": "string",
  "TopicName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 135)**

The Directory ID that will publish status messages to the SNS topic.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**TopicName (p. 135)**

The SNS topic name to which the directory will publish status messages. This SNS topic must be in the same region as the specified Directory ID.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [a-zA-Z0-9-_.]+

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400
Examples

The following examples are formatted for legibility.

Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 63
X-Amz-Target: DirectoryService_20150416.RegisterEventTopic
X-Amz-Date: 20161214T232258Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=6e1e2996789f568cf057fa66e70b1ba14d7388510787be6092055ab97a07828

{
  "DirectoryId": "d-926example",
  "TopicName": "snstopicexample"
}

Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: a68a1e79-c19b-11e6-870b-c3330207df37
Content-Type: application/x-amz-json-1.1
Content-Length: 29
Date: Wed, 14 Dec 2016 23:23:01 GMT

{
}

RejectSharedDirectory

Rejects a directory sharing request that was sent from the directory owner account.

Request Syntax

```
{
  "SharedDirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

SharedDirectoryId (p. 138)

Identifier of the shared directory in the directory consumer account. This identifier is different for each directory owner account.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

Response Syntax

```
{
  "SharedDirectoryId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

SharedDirectoryId (p. 138)

Identifier of the shared directory in the directory consumer account.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.
HTTP Status Code: 400
**DirectoryAlreadySharedException**
The specified directory has already been shared with this AWS account.

HTTP Status Code: 400
**EntityDoesNotExistException**
The specified entity could not be found.

HTTP Status Code: 400
**InvalidParameterException**
One or more parameters are not valid.

HTTP Status Code: 400
**ServiceException**
An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**See Also**

RemovelpRoutes

Removes IP address blocks from a directory.

Request Syntax

```json
{
    "CidrIps": [ "string" ],
    "DirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**CidrIps (p. 140)**

IP address blocks that you want to remove.

Type: Array of strings

Pattern: `^((\[0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\.){3}((\[0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\/.){3}((\[0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])\/.){3}((\[0-9]|[1-9][0-9]|1[0-9]{2}|2[0-4][0-9]|25[0-5])(\/[1-9][1-2][0-9]|3[0-2]))$`

Required: Yes

**DirectoryId (p. 140)**

Identifier (ID) of the directory from which you want to remove the IP addresses.

Type: String

Pattern: `^d-[0-9a-f]{10}$`

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**DirectoryUnavailableException**

The specified directory is unavailable or could not be found.

HTTP Status Code: 400
EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 62
X-Amz-Target: DirectoryService_20150416.RemoveIpRoutes
X-Amz-Date: 20161214T233152Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,

RemoveTagsFromResource

Removes tags from a directory.

Request Syntax

```json
{
    "ResourceId": "string",
    "TagKeys": [ "string" ]
}
```

Request Parameters

The request accepts the following data in JSON format.

ResourceId (p. 143)

Identifier (ID) of the directory from which to remove the tag.

Type: String

Pattern: ^[d]-[0-9a-f]{10}$

Required: Yes

TagKeys (p. 143)

The tag key (name) of the tag to be removed.

Type: Array of strings

Pattern: ^\([\p{L}\p{Z}\p{N}_-/:=+\-@]*)$  

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400
InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 58
X-Amz-Target: DirectoryService_20150416.RemoveTagsFromResource
X-Amz-Date: 20161214T234556Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,

ResetUserPassword

Resets the password for any user in your AWS Managed Microsoft AD or Simple AD directory.

You can reset the password for any user in your directory with the following exceptions:

- For Simple AD, you cannot reset the password for any user that is a member of either the **Domain Admins** or **Enterprise Admins** group except for the administrator user.
- For AWS Managed Microsoft AD, you can only reset the password for a user that is in an OU based off of the NetBIOS name that you typed when you created your directory. For example, you cannot reset the password for a user in the **AWS Reserved** OU. For more information about the OU structure for an AWS Managed Microsoft AD directory, see [What Gets Created](https://docs.aws.amazon.com/ directoryservice/latest/adminGuide/index.html) in the *AWS Directory Service Administration Guide*.

### Request Syntax

```json
{
   "DirectoryId": "string",
   "NewPassword": "string",
   "UserName": "string"
}
```

### Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 146)**

Identifier of the AWS Managed Microsoft AD or Simple AD directory in which the user resides.

Type: String

Pattern: `^[a-zA-Z0-9\-]10$`

Required: Yes

**NewPassword (p. 146)**

The new password that will be reset.

Type: String

Required: Yes

**UserName (p. 146)**

The user name of the user whose password will be reset.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Pattern: `^([!@\$-\*/.;\[\]\\|\?\*\%\^\p{NaP}\p{Zs}\p{Zl}\p{Zs}\p{Cn}.]+)$`

Required: Yes
Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryUnavailableException

The specified directory is unavailable or could not be found.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidPasswordException

The new password provided by the user does not meet the password complexity requirements defined in your directory.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

UserDoesNotExistException

The user provided a username that does not exist in your directory.

HTTP Status Code: 400

RestoreFromSnapshot

Restores a directory using an existing directory snapshot.

When you restore a directory from a snapshot, any changes made to the directory after the snapshot date are overwritten.

This action returns as soon as the restore operation is initiated. You can monitor the progress of the restore operation by calling the DescribeDirectories (p. 72) operation with the directory identifier. When the DirectoryDescription.Stage value changes to Active, the restore operation is complete.

Request Syntax

```json
{
  "SnapshotId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

SnapshotId (p. 149)

The identifier of the snapshot to restore from.

Type: String

Pattern: ^s-[0-9a-f]{10}$

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400
**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**Examples**

The following examples are formatted for legibility.

**Example Request**

```
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 30
X-Amz-Target: DirectoryService_20150416.RestoreFromSnapshot
X-Amz-Date: 20161214T235310Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161214/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=5c6be5a543a9df855e15ed75c131318330c4acfcf9b791515e8b3524e2430c180f

{
    "SnapshotId": "s-9267f6da4e"
}
```

**Example Response**

```
HTTP/1.1 200 OK
x-amzn-RequestId: 78ebab96-c258-11e6-a4dc-e5519684970a
Content-Type: application/x-amz-json-1.1
Content-Length: 2
Date: Wed, 14 Dec 2016 23:53:12 GMT

{
}
```

**See Also**

ShareDirectory

Shares a specified directory (DirectoryId) in your AWS account (directory owner) with another AWS account (directory consumer). With this operation you can use your directory from any AWS account and from any Amazon VPC within an AWS Region.

When you share your AWS Managed Microsoft AD directory, AWS Directory Service creates a shared directory in the directory consumer account. This shared directory contains the metadata to provide access to the directory within the directory owner account. The shared directory is visible in all VPCs in the directory consumer account.

The ShareMethod parameter determines whether the specified directory can be shared between AWS accounts inside the same AWS organization (ORGANIZATIONS). It also determines whether you can share the directory with any other AWS account either inside or outside of the organization (HANDSHAKE).

The ShareNotes parameter is only used when HANDSHAKE is called, which sends a directory sharing request to the directory consumer.

Request Syntax

```json
{
  "DirectoryId": "string",
  "ShareMethod": "string",
  "ShareNotes": "string",
  "ShareTarget": {
    "Id": "string",
    "Type": "string"
  }
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 152)**

Identifier of the AWS Managed Microsoft AD directory that you want to share with other AWS accounts.

Type: String

Pattern: \d-[0-9a-f]{10}$

Required: Yes

**ShareMethod (p. 152)**

The method used when sharing a directory to determine whether the directory should be shared within your AWS organization (ORGANIZATIONS) or with any AWS account by sending a directory sharing request (HANDSHAKE).

Type: String

Valid Values: ORGANIZATIONS | HANDSHAKE

Required: Yes
ShareNotes (p. 152)

A directory share request that is sent by the directory owner to the directory consumer. The request includes a typed message to help the directory consumer administrator determine whether to approve or reject the share invitation.

Type: String
Length Constraints: Maximum length of 1024.
Required: No

ShareTarget (p. 152)

Identifier for the directory consumer account with whom the directory is to be shared.

Type: ShareTarget (p. 211) object
Required: Yes

Response Syntax

```
{
  "SharedDirectoryId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

SharedDirectoryId (p. 153)

Identifier of the directory that is stored in the directory consumer account that is shared from the specified directory (DirectoryId).

Type: String
Pattern: ^d-[0-9a-f]{10}$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

AccessDeniedException

You do not have sufficient access to perform this action.

HTTP Status Code: 400

ClientException

A client exception has occurred.

HTTP Status Code: 400
DirectoryAlreadySharedException

The specified directory has already been shared with this AWS account.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

InvalidTargetException

The specified shared target is not valid.

HTTP Status Code: 400

OrganizationsException

Exception encountered while trying to access your AWS organization.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

ShareLimitExceededException

The maximum number of AWS accounts that you can share with this directory has been reached.

HTTP Status Code: 400

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

See Also

StartSchemaExtension

Applies a schema extension to a Microsoft AD directory.

Request Syntax

```json
{
    "CreateSnapshotBeforeSchemaExtension": boolean,
    "Description": "string",
    "DirectoryId": "string",
    "LdifContent": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**CreateSnapshotBeforeSchemaExtension (p. 156)**

If true, creates a snapshot of the directory before applying the schema extension.

Type: Boolean

Required: Yes

**Description (p. 156)**

A description of the schema extension.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: `^[\(\[a-zA-Z0-9-_]\]\[a-zA-Z0-9-_@#%*+=?:./!\-]*$`

Required: Yes

**DirectoryId (p. 156)**

The identifier of the directory for which the schema extension will be applied to.

Type: String

Pattern: `^d-[0-9a-f]{10}$`

Required: Yes

**LdifContent (p. 156)**

The LDIF file represented as a string. To construct the LdifContent string, precede each line as it would be formatted in an ldif file with \n. See the example request below for more details. The file size can be no larger than 1MB.

Type: String

Required: Yes
Response Syntax

```json
{
   "SchemaExtensionId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response. The following data is returned in JSON format by the service.

**SchemaExtensionId (p. 157)**

The identifier of the schema extension that will be applied.

Type: String

Pattern: ^e-[0-9a-f]{10}$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**DirectoryUnavailableException**

The specified directory is unavailable or could not be found.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**SnapshotLimitExceededException**

The maximum number of manual snapshots for the directory has been reached. You can use the GetSnapshotLimits (p. 114) operation to determine the snapshot limits for a directory.

HTTP Status Code: 400
Examples

The following examples are formatted for legibility.

Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 320
X-Amz-Target: DirectoryService_20150416.StartSchemaExtension
X-Amz-Date: 20161219T190703Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161219/us-west-2/ds/aws4_request,

UnshareDirectory

Stops the directory sharing between the directory owner and consumer accounts.

Request Syntax

```
{
    "DirectoryId": "string",
    "UnshareTarget": {
        "Id": "string",
        "Type": "string"
    }
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 160)**

The identifier of the AWS Managed Microsoft AD directory that you want to stop sharing.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**UnshareTarget (p. 160)**

Identifier for the directory consumer account with whom the directory has to be unshared.

Type: UnshareTarget (p. 218) object

Required: Yes

Response Syntax

```
{
    "SharedDirectoryId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**SharedDirectoryId (p. 160)**

Identifier of the directory stored in the directory consumer account that is to be unshared from the specified directory (DirectoryId).

Type: String
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**DirectoryNotSharedException**

The specified directory has not been shared with this AWS account.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidTargetException**

The specified shared target is not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Update Conditional Forwarder

Updates a conditional forwarder that has been set up for your AWS directory.

Request Syntax

```
{
    "DirectoryId": "string",
    "DnsIpAddrs": [ "string" ],
    "RemoteDomainName": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 162)**

The directory ID of the AWS directory for which to update the conditional forwarder.

Type: String

Pattern: `^[d-][0-9a-f]{10}$`

Required: Yes

**DnsIpAddrs (p. 162)**

The updated IP addresses of the remote DNS server associated with the conditional forwarder.

Type: Array of strings

Pattern: `^(?:25[0-5]|2[0-4]\d|1\d\d|\d\d?\.){3}(?:25[0-5]|2[0-4]\d|1\d\d|\d\d?)$`

Required: Yes

**RemoteDomainName (p. 162)**

The fully qualified domain name (FQDN) of the remote domain with which you will set up a trust relationship.

Type: String

Pattern: `^[a-zA-Z0-9-]+[\.-]+[a-zA-Z0-9-]+$`

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).
ClientException

A client exception has occurred.

HTTP Status Code: 400

DirectoryUnavailableException

The specified directory is unavailable or could not be found.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

Examples

The following examples are formatted for legibility.

Example Request

```plaintext
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 107
X-Amz-Target: DirectoryService_20150416.UpdateConditionalForwarder
X-Amz-Date: 20161215T183823Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256

Credential=AKIAI7E3BYXS3example/20161215/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=84648cead858ef1ef7db75ce248aa3e22a78139b109eec6122dc3c495b71085

{
  "DirectoryId":"d-926example",
  "RemoteDomainName":"sales.example.com",
  "DnsIpAddrs": ["172.168.101.11"]
}
```

Example Response

UpdateNumberOfDomainControllers

Adds or removes domain controllers to or from the directory. Based on the difference between current value and new value (provided through this API call), domain controllers will be added or removed. It may take up to 45 minutes for any new domain controllers to become fully active once the requested number of domain controllers is updated. During this time, you cannot make another update request.

Request Syntax

```json
{
    "DesiredNumber": number,
    "DirectoryId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**DesiredNumber (p. 165)**

The number of domain controllers desired in the directory.

Type: Integer

Valid Range: Minimum value of 2.

Required: Yes

**DirectoryId (p. 165)**

Identifier of the directory to which the domain controllers will be added or removed.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**DirectoryUnavailableException**

The specified directory is unavailable or could not be found.

HTTP Status Code: 400
DomainControllerLimitExceededException

The maximum allowed number of domain controllers per directory was exceeded. The default limit per directory is 20 domain controllers.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

UnsupportedOperationException

The operation is not supported.

HTTP Status Code: 400

UpdateRadius

Updates the Remote Authentication Dial In User Service (RADIUS) server information for an AD Connector or Microsoft AD directory.

Request Syntax

```
{  
   "DirectoryId": "string",
   "RadiusSettings": {  
      "AuthenticationProtocol": "string",
      "DisplayLabel": "string",
      "RadiusPort": number,
      "RadiusRetries": number,
      "RadiusServers": [ "string" ],
      "RadiusTimeout": number,
      "SharedSecret": "string",
      "UseSameUsername": boolean
   }
}
```

Request Parameters

The request accepts the following data in JSON format.

**DirectoryId (p. 167)**

The identifier of the directory for which to update the RADIUS server information.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: Yes

**RadiusSettings (p. 167)**

A RadiusSettings (p. 205) object that contains information about the RADIUS server.

Type: RadiusSettings (p. 205) object

Required: Yes

Response Elements

If the action is successful, the service sends back an HTTP 200 response with an empty HTTP body.

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

**ClientException**

A client exception has occurred.

HTTP Status Code: 400
EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

Examples

The following examples are formatted for legibility.

Example Request

POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 262
X-Amz-Target: DirectoryService_20150416.UpdateRadius
X-Amz-Date: 20161215T184937Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256

Credential=AKIAI7E3BYXS3example/20161215/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=6cc8097b61ad0ee23e166193d317a066feee582d252b57923a0781dc011a686

{
    "DirectoryId":"d-926example",
    "RadiusSettings":{
        "DisplayLabel":"MyRadius",
        "UseSameUsername":true,
        "RadiusTimeout":1,
        "AuthenticationProtocol":"PAP",
        "RadiusPort":1027,
        "RadiusRetries":1,
        "SharedSecret":"12345678",
        "RadiusServers":[
            "172.168.101.113"
        ]
    }
}

Example Response

HTTP/1.1 200 OK
x-amzn-RequestId: fcd40ac9-c247-11e6-a7ca-f9a52a6a0390
Content-Type: application/x-amz-json-1.1
Content-Length: 2
Date: Thu, 15 Dec 2016 18:49:39 GMT

UpdateTrust

Updates the trust that has been set up between your AWS Managed Microsoft AD directory and an on-premises Active Directory.

Request Syntax

```
{
   "SelectiveAuth": "string",
   "TrustId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**SelectiveAuth (p. 170)**

Updates selective authentication for the trust.

- Type: String
- Valid Values: Enabled | Disabled
- Required: No

**TrustId (p. 170)**

Identifier of the trust relationship.

- Type: String
- Pattern: ^t-[0-9a-f]{10}$
- Required: Yes

Response Syntax

```
{
   "RequestId": "string",
   "TrustId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**RequestId (p. 170)**

The AWS request identifier.

- Type: String
Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).

ClientException

A client exception has occurred.

HTTP Status Code: 400

EntityDoesNotExistException

The specified entity could not be found.

HTTP Status Code: 400

InvalidParameterException

One or more parameters are not valid.

HTTP Status Code: 400

ServiceException

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

VerifyTrust

AWS Directory Service for Microsoft Active Directory allows you to configure and verify trust relationships.

This action verifies a trust relationship between your AWS Managed Microsoft AD directory and an external domain.

Request Syntax

```json
{
   "TrustId": "string"
}
```

Request Parameters

The request accepts the following data in JSON format.

**TrustId (p. 172)**

The unique Trust ID of the trust relationship to verify.

Type: String

Pattern: ^t-[0-9a-f]{10}$

Required: Yes

Response Syntax

```json
{
   "TrustId": "string"
}
```

Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

**TrustId (p. 172)**

The unique Trust ID of the trust relationship that was verified.

Type: String

Pattern: ^t-[0-9a-f]{10}$

Errors

For information about the errors that are common to all actions, see Common Errors (p. 222).
**ClientException**

A client exception has occurred.

HTTP Status Code: 400

**EntityDoesNotExistException**

The specified entity could not be found.

HTTP Status Code: 400

**InvalidParameterException**

One or more parameters are not valid.

HTTP Status Code: 400

**ServiceException**

An exception has occurred in AWS Directory Service.

HTTP Status Code: 500

**UnsupportedOperationException**

The operation is not supported.

HTTP Status Code: 400

---

**Examples**

The following examples are formatted for legibility.

**Example Request**

```http
POST / HTTP/1.1
Host: ds.us-west-2.amazonaws.com
Accept-Encoding: identity
Content-Length: 27
X-Amz-Target: DirectoryService_20150416.VerifyTrust
X-Amz-Date: 20161215T191010Z
User-Agent: aws-cli/1.11.24 Python/2.7.9 Windows/7 botocore/1.4.81
Content-Type: application/x-amz-json-1.1
Authorization: AWS4-HMAC-SHA256
Credential=AKIAI7E3BYXS3example/20161215/us-west-2/ds/aws4_request,
SignedHeaders=content-type;host;x-amz-date;x-amz-target,
Signature=249c3fb0ac94d57cc9abb43f6422fe237fce723dd9462a4666712e46e3b5371

{
"TrustId": "t-9267353df0"
}
```

**Example Response**

```http
HTTP/1.1 200 OK
x-amzn-RequestId: 3343bc79-c18f-11e6-ba7f-e33ae22bc363
Content-Type: application/x-amz-json-1.1
Content-Length: 26
Date: Thu, 15 Dec 2016 19:10:12 GMT
```

Data Types

The AWS Directory Service API contains several data types that various actions use. This section describes each data type in detail.

**Note**
The order of each element in a data type structure is not guaranteed. Applications should not assume a particular order.

The following data types are supported:

- Attribute (p. 176)
- Certificate (p. 177)
- CertificateInfo (p. 179)
- Computer (p. 180)
- ConditionalForwarder (p. 181)
- DirectoryConnectSettings (p. 182)
- DirectoryConnectSettingsDescription (p. 184)
- DirectoryDescription (p. 186)
- DirectoryLimits (p. 190)
- DirectoryVpcSettings (p. 192)
- DirectoryVpcSettingsDescription (p. 193)
- DomainController (p. 194)
- EventTopic (p. 196)
- IpRoute (p. 198)
- IpRouteInfo (p. 199)
- LDAPSSettingInfo (p. 201)
- LogSubscription (p. 202)
- OwnerDirectoryDescription (p. 203)
- RadiusSettings (p. 205)
- SchemaExtensionInfo (p. 207)
- SharedDirectory (p. 209)
- ShareTarget (p. 211)
- Snapshot (p. 212)
- SnapshotLimits (p. 214)
- Tag (p. 215)
- Trust (p. 216)
- UnshareTarget (p. 218)
Attribute

Represents a named directory attribute.

Contents

Name

The name of the attribute.

Type: String

Length Constraints: Minimum length of 1.

Required: No

Value

The value of the attribute.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
Certificate

Information about the certificate.

Contents

CertificateId

The identifier of the certificate.
Type: String
Pattern: ^c-[0-9a-f]{10}$
Required: No

CommonName

The common name for the certificate.
Type: String
Required: No

ExpiryDateTime

The date and time when the certificate will expire.
Type: Timestamp
Required: No

RegisteredDateTime

The date and time that the certificate was registered.
Type: Timestamp
Required: No

State

The state of the certificate.
Type: String
Valid Values: Registering | Registered | RegisterFailed | Deregistering | Deregistered | DeregisterFailed
Required: No

StateReason

Describes a state change for the certificate.
Type: String
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:
• AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java
• AWS SDK for Ruby V3
CertificateInfo

Contains general information about a certificate.

Contents

CertificateId

The identifier of the certificate.

Type: String

Pattern: ^c-[0-9a-f](10)$

Required: No

CommonName

The common name for the certificate.

Type: String

Required: No

ExpiryDateTime

The date and time when the certificate will expire.

Type: Timestamp

Required: No

State

The state of the certificate.

Type: String

Valid Values: Registering | Registered | RegisterFailed | Deregistering | Deregistered | DeregisterFailed

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
Computer

Contains information about a computer account in a directory.

Contents

ComputerAttributes

An array of Attribute (p. 176) objects containing the LDAP attributes that belong to the computer account.

Type: Array of Attribute (p. 176) objects

Required: No

ComputerId

The identifier of the computer.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [\&\w+-.@]+

Required: No

ComputerName

The computer name.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
ConditionalForwarder

Points to a remote domain with which you are setting up a trust relationship. Conditional forwarders are required in order to set up a trust relationship with another domain.

Contents

DnsIpAddrs

The IP addresses of the remote DNS server associated with RemoteDomainName. This is the IP address of the DNS server that your conditional forwarder points to.

Type: Array of strings

Pattern: ^(?:(?:25[0-5]|2[0-4]\[0-9\]|1\?[0-9]\?[0-9]?).){3}(?:25[0-5]|2[0-4]\[0-9\]|1\?[0-9]\?[0-9]?)$

Required: No

RemoteDomainName

The fully qualified domain name (FQDN) of the remote domains pointed to by the conditional forwarder.

Type: String

Pattern: ^([a-zA-Z0-9]+[\.-])+([a-zA-Z0-9])+$

Required: No

ReplicationScope

The replication scope of the conditional forwarder. The only allowed value is Domain, which will replicate the conditional forwarder to all of the domain controllers for your AWS directory.

Type: String

Valid Values: Domain

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
## DirectoryConnectSettings

Contains information for the [ConnectDirectory](#) operation when an AD Connector directory is being created.

### Contents

**CustomerDnsIps**

A list of one or more IP addresses of DNS servers or domain controllers in the on-premises directory.

- **Type:** Array of strings
- **Pattern:** `^(?:(?:25[0-5]|2[0-4]\.[0-9]|1[0-9][0-9]?|\.[0-9])\d+)$`
- **Required:** Yes

**CustomerUserName**

The user name of an account in the on-premises directory that is used to connect to the directory. This account must have the following permissions:

- Read users and groups
- Create computer objects
- Join computers to the domain

- **Type:** String
- **Length Constraints:** Minimum length of 1.
- **Pattern:** `[a-zA-Z0-9._-]+`
- **Required:** Yes

**SubnetIds**

A list of subnet identifiers in the VPC in which the AD Connector is created.

- **Type:** Array of strings
- **Pattern:** `^(subnet-[0-9a-f]{8}|subnet-[0-9a-f]{17})$`
- **Required:** Yes

**VpcId**

The identifier of the VPC in which the AD Connector is created.

- **Type:** String
- **Pattern:** `^(vpc-[0-9a-f]{8}|vpc-[0-9a-f]{17})$`
- **Required:** Yes

### See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java
• AWS SDK for Ruby V3
DirectoryConnectSettingsDescription

Contains information about an AD Connector directory.

Contents

AvailabilityZones

A list of the Availability Zones that the directory is in.

Type: Array of strings

Required: No

ConnectIps

The IP addresses of the AD Connector servers.

Type: Array of strings

Required: No

CustomerUserName

The user name of the service account in the on-premises directory.

Type: String

Length Constraints: Minimum length of 1.

Pattern: \[a-zA-Z0-9._-]+\$

Required: No

SecurityGroupId

The security group identifier for the AD Connector directory.

Type: String

Pattern: \^\(sg-[0-9a-f]{8}|sg-[0-9a-f]{17}\)$

Required: No

SubnetIds

A list of subnet identifiers in the VPC that the AD Connector is in.

Type: Array of strings

Pattern: \^\(subnet-[0-9a-f]{8}|subnet-[0-9a-f]{17}\)$

Required: No

VpcId

The identifier of the VPC that the AD Connector is in.

Type: String

Pattern: \^\(vpc-[0-9a-f]{8}|vpc-[0-9a-f]{17}\)$
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
DirectoryDescription

Contains information about an AWS Directory Service directory.

Contents

**AccessUrl**

The access URL for the directory, such as http://<alias>.awsapps.com. If no alias has been created for the directory, <alias> is the directory identifier, such as d-xxxxxxxxxx.

Type: String

Required: No

**Alias**

The alias for the directory. If no alias has been created for the directory, the alias is the directory identifier, such as d-xxxxxxxxxx.

Type: String

Pattern: ^(?![d-])(\[a-zA-Z\]+)-(\[-]*[a-zA-Z]*)+$

Required: No

**ConnectSettings**

A **DirectoryConnectSettingsDescription** (p. 184) object that contains additional information about an AD Connector directory. This member is only present if the directory is an AD Connector directory.

Type: **DirectoryConnectSettingsDescription** (p. 184) object

Required: No

**Description**

The description for the directory.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: ^([a-zA-Z0-9_\-\@\#%\+=?:/.\s-])*$

Required: No

**DesiredNumberOfDomainControllers**

The desired number of domain controllers in the directory if the directory is Microsoft AD.

Type: Integer

Valid Range: Minimum value of 2.

Required: No

**DirectoryId**

The directory identifier.
Type: String
Pattern: ^d-[0-9a-f]{10}$
Required: No

**DnsIpAddrs**

The IP addresses of the DNS servers for the directory. For a Simple AD or Microsoft AD directory, these are the IP addresses of the Simple AD or Microsoft AD directory servers. For an AD Connector directory, these are the IP addresses of the DNS servers or domain controllers in the on-premises directory to which the AD Connector is connected.

Type: Array of strings
Pattern: ^(\d{1,3}\.){3}\d{1,3}$
Required: No

**Edition**

The edition associated with this directory.

Type: String
Valid Values: Enterprise | Standard
Required: No

**LaunchTime**

Specifies when the directory was created.

Type: Timestamp
Required: No

**Name**

The fully qualified name of the directory.

Type: String
Required: No

**OwnerDirectoryDescription**

Describes the AWS Managed Microsoft AD directory in the directory owner account.

Type: **OwnerDirectoryDescription** (p. 203) object
Required: No

**RadiusSettings**

A **RadiusSettings** (p. 205) object that contains information about the RADIUS server configured for this directory.

Type: **RadiusSettings** (p. 205) object
Required: No

**RadiusStatus**

The status of the RADIUS MFA server connection.
Type: String

Valid Values: Creating | Completed | Failed

Required: No

**ShareMethod**

The method used when sharing a directory to determine whether the directory should be shared within your AWS organization (ORGANIZATIONS) or with any AWS account by sending a shared directory request (HANDSHAKE).

Type: String

Valid Values: ORGANIZATIONS | HANDSHAKE

Required: No

**ShareNotes**

A directory share request that is sent by the directory owner to the directory consumer. The request includes a typed message to help the directory consumer administrator determine whether to approve or reject the share invitation.

Type: String

Length Constraints: Maximum length of 1024.

Required: No

**ShareStatus**

Current directory status of the shared AWS Managed Microsoft AD directory.

Type: String

Valid Values: Shared | PendingAcceptance | Rejected | Rejecting | RejectFailed | Sharing | ShareFailed | Deleted | Deleting

Required: No

**ShortName**

The short name of the directory.

Type: String

Pattern: ^[^\/:*?"<>|\.]+$\[^\/:*?"<>|\]*$

Required: No

**Size**

The directory size.

Type: String

Valid Values: Small | Large

Required: No

**SsoEnabled**

Indicates if single sign-on is enabled for the directory. For more information, see [EnableSso](p. 109) and [DisableSso](p. 101).
Type: Boolean
Required: No

Stage
The current stage of the directory.
Type: String
Valid Values: Requested | Creating | Created | Active | Inoperable | Impaired | Restoring | RestoreFailed | Deleting | Deleted | Failed
Required: No

StageLastUpdatedDateTime
The date and time that the stage was last updated.
Type: Timestamp
Required: No

StageReason
Additional information about the directory stage.
Type: String
Required: No

Type
The directory size.
Type: String
Valid Values: SimpleAD | ADConnector | MicrosoftAD | SharedMicrosoftAD
Required: No

VpcSettings
A DirectoryVpcSettingsDescription (p. 193) object that contains additional information about a directory. This member is only present if the directory is a Simple AD or Managed AD directory.
Type: DirectoryVpcSettingsDescription (p. 193) object
Required: No

See Also
For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
DirectoryLimits

Contains directory limit information for a Region.

**Contents**

**CloudOnlyDirectoriesCurrentCount**

The current number of cloud directories in the Region.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**CloudOnlyDirectoriesLimit**

The maximum number of cloud directories allowed in the Region.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**CloudOnlyDirectoriesLimitReached**

Indicates if the cloud directory limit has been reached.

Type: Boolean

Required: No

**CloudOnlyMicrosoftADCurrentCount**

The current number of AWS Managed Microsoft AD directories in the region.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**CloudOnlyMicrosoftADLimit**

The maximum number of AWS Managed Microsoft AD directories allowed in the region.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**CloudOnlyMicrosoftADLimitReached**

Indicates if the AWS Managed Microsoft AD directory limit has been reached.

Type: Boolean

Required: No

**ConnectedDirectoriesCurrentCount**

The current number of connected directories in the Region.
Type: Integer

Valid Range: Minimum value of 0.

Required: No

**ConnectedDirectoriesLimit**

The maximum number of connected directories allowed in the Region.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**ConnectedDirectoriesLimitReached**

Indicates if the connected directory limit has been reached.

Type: Boolean

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
DirectoryVpcSettings

Contains VPC information for the CreateDirectory (p. 30) or CreateMicrosoftAD (p. 36) operation.

Contents

SubnetIds

The identifiers of the subnets for the directory servers. The two subnets must be in different Availability Zones. AWS Directory Service creates a directory server and a DNS server in each of these subnets.

Type: Array of strings

Pattern: ^(subnet-[0-9a-f]{8}|subnet-[0-9a-f]{17})$

Required: Yes

VpcId

The identifier of the VPC in which to create the directory.

Type: String

Pattern: ^(vpc-[0-9a-f]{8}|vpc-[0-9a-f]{17})$

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
DirectoryVpcSettingsDescription

Contains information about the directory.

Contents

AvailabilityZones

The list of Availability Zones that the directory is in.

Type: Array of strings

Required: No

SecurityGroupId

The domain controller security group identifier for the directory.

Type: String

Pattern: ^(sg-[0-9a-f]{8}|sg-[0-9a-f]{17})$

Required: No

SubnetIds

The identifiers of the subnets for the directory servers.

Type: Array of strings

Pattern: ^(subnet-[0-9a-f]{8}|subnet-[0-9a-f]{17})$

Required: No

VpcId

The identifier of the VPC that the directory is in.

Type: String

Pattern: ^(vpc-[0-9a-f]{8}|vpc-[0-9a-f]{17})$

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
DomainController

Contains information about the domain controllers for a specified directory.

Contents

AvailabilityZone
The Availability Zone where the domain controller is located.
Type: String
Required: No

DirectoryId
Identifier of the directory where the domain controller resides.
Type: String
Pattern: ^d-[0-9a-f]{10}$
Required: No

DnsIpAddr
The IP address of the domain controller.
Type: String
Required: No

DomainControllerId
Identifies a specific domain controller in the directory.
Type: String
Pattern: ^dc-[0-9a-f]{10}$
Required: No

LaunchTime
Specifies when the domain controller was created.
Type: Timestamp
Required: No

Status
The status of the domain controller.
Type: String
Valid Values: Creating | Active | Impaired | Restoring | Deleting | Deleted | Failed
Required: No
**StatusLastUpdatedAt DateTime**

The date and time that the status was last updated.

Type: Timestamp

Required: No

**StatusReason**

A description of the domain controller state.

Type: String

Required: No

**SubnetId**

Identifier of the subnet in the VPC that contains the domain controller.

Type: String

Pattern: ^subnet-[0-9a-f]{8}|subnet-[0-9a-f]{17}$

Required: No

**VpcId**

The identifier of the VPC that contains the domain controller.

Type: String

Pattern: ^vpc-[0-9a-f]{8}|vpc-[0-9a-f]{17}$

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
EventTopic

Information about SNS topic and AWS Directory Service directory associations.

Contents

**CreatedDateTime**

The date and time of when you associated your directory with the SNS topic.

Type: Timestamp

Required: No

**DirectoryId**

The Directory ID of an AWS Directory Service directory that will publish status messages to an SNS topic.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

**Status**

The topic registration status.

Type: String

Valid Values: Registered | Topic not found | Failed | Deleted

Required: No

**TopicArn**

The SNS topic ARN (Amazon Resource Name).

Type: String

Required: No

**TopicName**

The name of an AWS SNS topic the receives status messages from the directory.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 256.

Pattern: [a-zA-Z0-9_-]+

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

* AWS SDK for C++
• AWS SDK for Go
• AWS SDK for Java
• AWS SDK for Ruby V3
IpRoute

IP address block. This is often the address block of the DNS server used for your on-premises domain.

Contents

CidrIp

IP address block using CIDR format, for example 10.0.0.0/24. This is often the address block of the DNS server used for your on-premises domain. For a single IP address use a CIDR address block with /32. For example 10.0.0.0/32.

Type: String

Pattern: ^((\[0-9\]|\[1-9]\[0-9\]|1\[0-9\]{2}|2\[0-4]\[0-9\]|25\[0-5\])\.)\{3\}(\[0-9\]|\[1-9]\[0-9\]|1\[0-9\]{2}|2\[0-4]\[0-9\]|25\[0-5\])(/\([1-9]\|1[0-2]9|0-9\)]3(0-2)))$

Required: No

Description

Description of the address block.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: ^([a-zA-Z0-9_@#%*+=:?./!\s-])$\[\]a-zA-Z0-9_@#%*+=:?./!\s-]*$

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
IpRouteInfo

Information about one or more IP address blocks.

Contents

AddedDateTime

The date and time the address block was added to the directory.

Type: Timestamp

Required: No

CidrIp

IP address block in the IpRoute (p. 198).

Type: String

Pattern: ^((\[0-9\]|1-9\[0-9]\|1[0-9]\{2\}|2[0-4]\[0-9]\|25[0-5])\.)\{3\}(\[0-9]\|1-9\] \[0-9]\|1[0-9]\{2\}|2[0-4]\[0-9]\|25[0-5])\(/([1-9]\|1-2\] [0-9]\|3[0-2]))$

Required: No

Description

Description of the IpRouteInfo (p. 199).

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: ^([a-zA-Z0-9-_.])\[a-zA-Z0-9-_.@#%*+=?/:./!\s-]*$

Required: No

DirectoryId

Identifier (ID) of the directory associated with the IP addresses.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

IpRouteStatusMsg

The status of the IP address block.

Type: String

Valid Values: Adding | Added | Removing | Removed | AddFailed | RemoveFailed

Required: No

IpRouteStatusReason

The reason for the IpRouteStatusMsg.

Type: String

Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
LDAPSSettingInfo

Contains general information about the LDAPS settings.

Contents

**LastUpdatedDateTime**

The date and time when the LDAPS settings were last updated.

Type: Timestamp

Required: No

**LDAPSStatus**

The state of the LDAPS settings.

Type: String

Valid Values: Enabling | Enabled | EnableFailed | Disabled

Required: No

**LDAPSStatusReason**

Describes a state change for LDAPS.

Type: String

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
LogSubscription

Represents a log subscription, which tracks real-time data from a chosen log group to a specified destination.

Contents

DirectoryId

Identifier (ID) of the directory that you want to associate with the log subscription.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

LogGroupName

The name of the log group.

Type: String

Pattern: ^[-._/#A-Za-z0-9]+$

Required: No

SubscriptioncreatedAtDateTime

The date and time that the log subscription was created.

Type: Timestamp

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
OwnerDirectoryDescription

Describes the directory owner account details that have been shared to the directory consumer account.

Contents

AccountId

Identifier of the directory owner account.

Type: String

Pattern: ^\d{12}$

Required: No

DirectoryId

Identifier of the AWS Managed Microsoft AD directory in the directory owner account.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

DnsIpAddrs

IP address of the directory's domain controllers.

Type: Array of strings

Pattern: ^(?:(?:25\[0-5]|2[0-4]\[0-9]|1\[0-9]{2}|\[0-9]{1,3})\.(?:25\[0-5]|2[0-4]\[0-9]|1\[0-9]{2}|\[0-9]{1,3})\.(?:25\[0-5]|2[0-4]\[0-9]|1\[0-9]{2}|\[0-9]{1,3})\.(?:25\[0-5]|2[0-4]\[0-9]|1\[0-9]{2}|\[0-9]{1,3})$\n
Required: No

RadiusSettings

A RadiusSettings object that contains information about the RADIUS server.

Type: RadiusSettings object

Required: No

RadiusStatus

Information about the status of the RADIUS server.

Type: String

Valid Values: Creating | Completed | Failed

Required: No

VpcSettings

Information about the VPC settings for the directory.

Type: DirectoryVpcSettingsDescription object

Required: No
See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
RadiusSettings

Contains information about a Remote Authentication Dial In User Service (RADIUS) server.

Contents

AuthenticationProtocol

The protocol specified for your RADIUS endpoints.

Type: String

Valid Values: PAP | CHAP | MS-CHAPv1 | MS-CHAPv2

Required: No

DisplayLabel

Not currently used.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: No

RadiusPort

The port that your RADIUS server is using for communications. Your on-premises network must allow inbound traffic over this port from the AWS Directory Service servers.

Type: Integer

Required: No

RadiusRetries

The maximum number of times that communication with the RADIUS server is attempted.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 10.

Required: No

RadiusServers

An array of strings that contains the IP addresses of the RADIUS server endpoints, or the IP addresses of your RADIUS server load balancer.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 256.

Required: No

RadiusTimeout

The amount of time, in seconds, to wait for the RADIUS server to respond.

Type: Integer

Required: No

**SharedSecret**

Required for enabling RADIUS on the directory.

Type: String

Required: No

**UseSameUsername**

Not currently used.

Type: Boolean

Required: No

---

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
SchemaExtensionInfo

Information about a schema extension.

Contents

Description

A description of the schema extension.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: ^([a-zA-Z0-9\-_])\[\a-zA-Z0-9_@#%*+=?:./!\s-]*$

Required: No

DirectoryId

The identifier of the directory to which the schema extension is applied.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

EndDateTime

The date and time that the schema extension was completed.

Type: Timestamp

Required: No

SchemaExtensionId

The identifier of the schema extension.

Type: String

Pattern: ^e-[0-9a-f]{10}$

Required: No

SchemaExtensionStatus

The current status of the schema extension.

Type: String

Valid Values: Initializing | CreatingSnapshot | UpdatingSchema | Replicating | CancelInProgress | RollbackInProgress | Cancelled | Failed | Completed

Required: No

SchemaExtensionStatusReason

The reason for the SchemaExtensionStatus.

Type: String

Required: No
**StartDateTime**

The date and time that the schema extension started being applied to the directory.

Type: Timestamp

Required: No

---

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
SharedDirectory

Details about the shared directory in the directory owner account for which the share request in the directory consumer account has been accepted.

Contents

CreatedDateTime

The date and time that the shared directory was created.

Type: Timestamp
Required: No

LastUpdatedDateTime

The date and time that the shared directory was last updated.

Type: Timestamp
Required: No

OwnerAccountId

Identifier of the directory owner account, which contains the directory that has been shared to the consumer account.

Type: String
Pattern: ^\d{12}$
Required: No

OwnerDirectoryId

Identifier of the directory in the directory owner account.

Type: String
Pattern: ^d-[0-9a-f]{10}$
Required: No

SharedAccountId

Identifier of the directory consumer account that has access to the shared directory (OwnerDirectoryId) in the directory owner account.

Type: String
Pattern: ^\d{12}$
Required: No

SharedDirectoryId

Identifier of the shared directory in the directory consumer account. This identifier is different for each directory owner account.

Type: String
Pattern: ^d-[0-9a-f]{10}$
ShareMethod

The method used when sharing a directory to determine whether the directory should be shared within your AWS organization (ORGANIZATIONS) or with any AWS account by sending a shared directory request (HANDSHAKE).

Type: String

Valid Values: ORGANIZATIONS | HANDSHAKE

Required: No

ShareNotes

A directory share request that is sent by the directory owner to the directory consumer. The request includes a typed message to help the directory consumer administrator determine whether to approve or reject the share invitation.

Type: String

Length Constraints: Maximum length of 1024.

Required: No

ShareStatus

Current directory status of the shared AWS Managed Microsoft AD directory.

Type: String

Valid Values: Shared | PendingAcceptance | Rejected | Rejecting | RejectFailed | Sharing | ShareFailed | Deleted | Deleting

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
ShareTarget

Identifier that contains details about the directory consumer account.

Contents

Id

Identifier of the directory consumer account.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: Yes

Type

Type of identifier to be used in the Id field.

Type: String

Valid Values: ACCOUNT

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
Snapshot

Describes a directory snapshot.

Contents

**DirectoryId**

The directory identifier.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

**Name**

The descriptive name of the snapshot.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 128.

Pattern: ^(\[a-zA-Z0-9_])\\[a-zA-Z0-9_@#%*+=?:./!\s-]*$

Required: No

**SnapshotId**

The snapshot identifier.

Type: String

Pattern: ^s-[0-9a-f]{10}$

Required: No

**StartTime**

The date and time that the snapshot was taken.

Type: Timestamp

Required: No

**Status**

The snapshot status.

Type: String

Valid Values: Creating | Completed | Failed

Required: No

**Type**

The snapshot type.

Type: String

Valid Values: Auto | Manual
Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
SnapshotLimits

Contains manual snapshot limit information for a directory.

Contents

ManualSnapshotsCurrentCount

The current number of manual snapshots of the directory.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

ManualSnapshotsLimit

The maximum number of manual snapshots allowed.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

ManualSnapshotsLimitReached

Indicates if the manual snapshot limit has been reached.

Type: Boolean

Required: No

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
Tag

Metadata assigned to a directory consisting of a key-value pair.

Contents

Key

Required name of the tag. The string value can be Unicode characters and cannot be prefixed with "aws:". The string can contain only the set of Unicode letters, digits, white-space, ' ', ':', '/', '=', '+', '-' (Java regex: "^([\p{L}\p{Z}\p{N}_.:/=+\-]*)$").

Type: String

Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-]*)$

Required: Yes

Value

The optional value of the tag. The string value can be Unicode characters. The string can contain only the set of Unicode letters, digits, white-space, ' ', ':', '/', '=', '+', '-' (Java regex: "^([\p{L}\p{Z}\p{N}_.:/=+\-]*)$").

Type: String

Length Constraints: Minimum length of 0. Maximum length of 256.

Pattern: ^([\p{L}\p{Z}\p{N}_.:/=+\-]*)$

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
Trust

Describes a trust relationship between an AWS Managed Microsoft AD directory and an external domain.

Contents

**CreatedDateTime**

The date and time that the trust relationship was created.

Type: Timestamp

Required: No

**DirectoryId**

The Directory ID of the AWS directory involved in the trust relationship.

Type: String

Pattern: ^d-[0-9a-f]{10}$

Required: No

**LastUpdatedDateTime**

The date and time that the trust relationship was last updated.

Type: Timestamp

Required: No

**RemoteDomainName**

The Fully Qualified Domain Name (FQDN) of the external domain involved in the trust relationship.

Type: String

Pattern: ^([a-zA-Z0-9]+[\.-])+([a-zA-Z0-9]+[.]$?

Required: No

**SelectiveAuth**

Current state of selective authentication for the trust.

Type: String

Valid Values: Enabled | Disabled

Required: No

**StateLastUpdatedDateTime**

The date and time that the TrustState was last updated.

Type: Timestamp

Required: No

**TrustDirection**

The trust relationship direction.
Type: String

Valid Values: One-Way: Outgoing | One-Way: Incoming | Two-Way

Required: No

**TrustId**

The unique ID of the trust relationship.

Type: String

Pattern: ^t-[0-9a-f]{10}$

Required: No

**TrustState**

The trust relationship state.

Type: String

Valid Values: Creating | Created | Verifying | VerifyFailed | Verified | Updating | UpdateFailed | Updated | Deleting | Deleted | Failed

Required: No

**TrustStateReason**

The reason for the TrustState.

Type: String

Required: No

**TrustType**

The trust relationship type. Forest is the default.

Type: String

Valid Values: Forest | External

Required: No

**See Also**

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
UnshareTarget

Identifier that contains details about the directory consumer account with whom the directory is being unshared.

Contents

Id

Identifier of the directory consumer account.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 64.

Required: Yes

Type

Type of identifier to be used in the Id field.

Type: String

Valid Values: ACCOUNT

Required: Yes

See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Go
- AWS SDK for Java
- AWS SDK for Ruby V3
Logging AWS Directory Service API Calls with CloudTrail

The AWS Directory Service API is integrated with AWS CloudTrail, a service that captures API calls made by or on behalf of AWS Directory Service in your AWS account and delivers the log files to an Amazon S3 bucket that you specify. CloudTrail captures API calls from the AWS Directory Service console and from code calls to the AWS Directory Service APIs. Using the information collected by CloudTrail, you can determine what request was made to AWS Directory Service, the source IP address from which the request was made, who made the request, when it was made, and so on. To learn more about CloudTrail, see the AWS CloudTrail User Guide.

AWS Directory Service Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in AWS Directory Service, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for AWS Directory Service, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for Creating a Trail
- CloudTrail Supported Services and Integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

When CloudTrail logging is enabled in your AWS account, all API calls made to AWS Directory Service actions are tracked in log files. AWS Directory Service records are written together with other AWS service records in a log file. CloudTrail determines when to create and write to a new file based on a time period and file size. All calls made to the AWS Directory Service API or CLI calls are logged by CloudTrail.

Every log entry contains information about who generated the request. The user identity information in the log helps you determine whether the request was made with root or IAM user credentials, with temporary security credentials for a role or federated user, or by another AWS service. For more information, see the userIdentity field in the CloudTrail Event Reference.

You can store your log files in your bucket for as long as you want, but you can also define Amazon S3 lifecycle rules to archive or delete log files automatically. By default, your log files are encrypted by using Amazon S3 server-side encryption (SSE).

You can choose to have CloudTrail publish Amazon SNS notifications when new log files are delivered if you want to take quick action upon log file delivery. For more information, see Configuring Amazon SNS Notifications.
You can also aggregate AWS Directory Service log files from multiple AWS regions and AWS accounts into a single Amazon S3 bucket. For more information, see Aggregating CloudTrail Log Files to a Single Amazon S3 Bucket.

Understanding AWS Directory Service Log File Entries

CloudTrail log files can contain one or more log entries, where each entry is made up of multiple JSON-formatted events. A log entry represents a single request from any source and includes information about the requested action, any parameters, the date and time of the action, and so on. The log entries are not guaranteed to be in any particular order; that is, they are not an ordered stack trace of the public API calls.

Sensitive information, such as passwords, authentication tokens, file comments, and file contents are redacted in the log entries.

The following example shows an example of a CloudTrail log entry for AWS Directory Service:

```
{
  "Records" : [
    {
      "eventVersion" : "1.02",
      "userIdentity" :
      {
        "type" : "IAMUser",
        "principalId" : "<user_id>",
        "arn" : "<user_arn>",
        "accountId" : "<account_id>",
        "accessKeyId" : "<access_key_id>",
        "userName" : "<username>"
      },
      "eventTime" : "<event_time>",
      "eventSource" : "ds.amazonaws.com",
      "eventName" : "CreateDirectory",
      "awsRegion" : "<region>",
      "sourceIPAddress" : "<IP_address>",
      "userAgent" : "<user_agent>",
      "requestParameters" :
      {
        "name" : "<name>",
        "shortName" : "<short_name>",
        "vpcSettings" :
        {
          "vpcId" : "<vpc_id>",
          "subnetIds" : [ "<subnet_id_1>", "<subnet_id_2>" ]
        },
        "type" : "<size>",
        "setAsDefault" : <option>,
        "password" : "***OMITTED***"
      },
      "responseElements" :
      {
        "requestId" : "<request_id>",
        "directoryId" : "<directory_id>"

Common Errors

This section lists the errors common to the API actions of all AWS services. For errors specific to an API action for this service, see the topic for that API action.

**AccessDeniedException**

You do not have sufficient access to perform this action.

HTTP Status Code: 400

**IncompleteSignature**

The request signature does not conform to AWS standards.

HTTP Status Code: 400

**InternalFailure**

The request processing has failed because of an unknown error, exception or failure.

HTTP Status Code: 500

**InvalidAction**

The action or operation requested is invalid. Verify that the action is typed correctly.

HTTP Status Code: 400

**InvalidClientTokenId**

The X.509 certificate or AWS access key ID provided does not exist in our records.

HTTP Status Code: 403

**InvalidParameterCombination**

Parameters that must not be used together were used together.

HTTP Status Code: 400

**InvalidParameterValue**

An invalid or out-of-range value was supplied for the input parameter.

HTTP Status Code: 400

**InvalidQueryParameter**

The AWS query string is malformed or does not adhere to AWS standards.

HTTP Status Code: 400

**MalformedQueryString**

The query string contains a syntax error.

HTTP Status Code: 404

**MissingAction**

The request is missing an action or a required parameter.

HTTP Status Code: 400
MissingAuthenticationToken

The request must contain either a valid (registered) AWS access key ID or X.509 certificate.

HTTP Status Code: 403

MissingParameter

A required parameter for the specified action is not supplied.

HTTP Status Code: 400

OptInRequired

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

RequestExpired

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

ServiceUnavailable

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

ThrottlingException

The request was denied due to request throttling.

HTTP Status Code: 400

ValidationError

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
Document History

The following table describes the important changes to the documentation in this release of the AWS Directory Service API Reference.

- **Latest documentation update:** October 5, 2018

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>
<th>Date Changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trusts</td>
<td>Added updates to support selective authentication and external trusts</td>
<td>October 5, 2018</td>
</tr>
<tr>
<td>Directory sharing</td>
<td>Added directory sharing related APIs</td>
<td>September 25, 2018</td>
</tr>
<tr>
<td>Log subscription</td>
<td>Added 3 APIs to support log subscriptions</td>
<td>September 25, 2018</td>
</tr>
<tr>
<td>Reset password</td>
<td>Added reset user password APIs</td>
<td>May 8, 2018</td>
</tr>
<tr>
<td>Domain controllers</td>
<td>Added domain controller related APIs</td>
<td>July 6, 2017</td>
</tr>
<tr>
<td>New API examples</td>
<td>Added examples to each API in the guide.</td>
<td>December 16, 2016</td>
</tr>
<tr>
<td>Schema extensions</td>
<td>Added 3 APIs for schema extensions with AWS Managed Microsoft AD.</td>
<td>November 14, 2016</td>
</tr>
<tr>
<td>Microsoft AD</td>
<td>Added documentation for AWS Managed Microsoft AD.</td>
<td>November 17, 2015</td>
</tr>
<tr>
<td>New guide</td>
<td>This is the first release of the AWS Directory Service API Reference Guide.</td>
<td>May 14, 2015</td>
</tr>
