What is Amazon HealthLake?

Amazon HealthLake is a HIPAA-eligible service that healthcare providers, health insurance companies, and pharmaceutical companies can use to store, transform, query, and analyze large-scale health data.

Health data is frequently incomplete and inconsistent. It's also often unstructured, with information contained in clinical notes, lab reports, insurance claims, medical images, recorded conversations, and time-series data (for example, heart ECG or brain EEG traces).

Healthcare providers can use HealthLake to store, transform, query, and analyze data in the AWS Cloud. Using the HealthLake integrated medical natural language processing (NLP) capabilities, you can analyze unstructured clinical text from diverse sources. HealthLake transforms unstructured data using natural language processing models, and provides powerful query and search capabilities. You can use HealthLake to organize, index, and structure patient information in a secure, compliant, and auditable manner.

Benefits of Amazon HealthLake

With Amazon HealthLake, you can:

- **Quickly and easily ingest health data** – You can bulk import on-premise Fast Healthcare Interoperability Resources (FHIR) files, including clinical notes, lab reports, insurance claims, and more, to an Amazon Simple Storage Service (Amazon S3) bucket. You can then use the data in downstream applications or workflows.

- **Store your data in the AWS Cloud in a secure, HIPAA-eligible manner that can be audited** – You can store data in FHIR format, so it can be easily queried. HealthLake creates a complete, chronological view of each patient's medical history, and structures it in the R4 FHIR standard format.

- **Transform unstructured data using specialized ML models** – Integrated medical natural language processing (NLP) transforms all of the raw medical text data using specialized ML models that have been trained to understand and extract meaningful information from unstructured healthcare data. With integrated medical NLP, you can automatically extract entities (for example, medical procedures and medications), entity relationships (for example, a medication and its dosage), and entity traits (for example, positive or negative test result or time of procedure) data from your medical text.

- **Use powerful query and search capabilities** – HealthLake supports FHIR CRUD (Create/Read/Update/Delete) and FHIR Search operations.

Amazon HealthLake use cases

You can use Amazon HealthLake for the following healthcare applications:

- **Population health management** – HealthLake helps healthcare organizations analyze population health trends, outcomes, and costs. This helps organization to identify the most appropriate intervention for a patient population, and choose better care management options.

- **Improving quality of care** – HealthLake aids hospitals, health insurance companies, and life sciences organizations close gaps in care, improve quality of care, and reduce cost by compiling a complete view of a patient's medical history.

- **Optimize hospital efficiency** – HealthLake offers hospitals key analytics and machine learning tools to improve efficiency and reduce hospital waste.
Accessing Amazon HealthLake

You can access Amazon HealthLake through the AWS Management Console, AWS Command Line Interface (AWS CLI), or the AWS SDKs.

1. AWS Management Console – Provides a web interface that you can use to access HealthLake.
2. AWS Command Line Interface (AWS CLI) – Provides commands for a broad set of AWS services, including HealthLake, and is supported on Windows, macOS, and Linux. For more information about installing the AWS CLI, see AWS Command Line Interface
3. AWS SDKs – AWS provides SDKs (software development kits) that consist of libraries and sample code for various programming languages and platforms (Java, Python, Ruby, .NET, iOS, Android, and so on). The SDKs provide a convenient way to create programmatic access to HealthLake and AWS. For more information, see the AWS SDK for Python

HIPAA eligibility and data security

This is a HIPAA Eligible Service. For more information about AWS, U.S. Health Insurance Portability and Accountability Act of 1996 (HIPAA), and using AWS services to process, store, and transmit protected health information (PHI), see HIPAA Overview.

Connections to HealthLake containing PHI or personally identifiable information (PII) must be encrypted. By default, all connections to HealthLake use HTTPS over TLS. HealthLake stores encrypted customer content and operates by the AWS Shared Responsibility principle.

Pricing

HealthLake is in preview and is free during the preview period. For information about post-preview pricing, see Amazon HealthLake pricing page.
How Amazon HealthLake works

Amazon HealthLake maintains Data Stores of health records in FHIR-compliant format. You can perform the following tasks using the Amazon HealthLake console, AWS Command Line Interface (AWS CLI), or APIs:

- Create, monitor, and delete a Data Store
- Import your data from an Amazon Simple Storage Service (Amazon S3) bucket into the Data Store
- Query data using Create, Read, Update, and Delete functions
- Use FHIR search functionality
- Transform your data using integrated medical natural language processing (NLP)

Creating and monitoring Data Stores

With Amazon HealthLake, you can create and manage Data Stores for storing R4 FHIR Resources. Use create-fhir-datastore to create a new Data Store, describe-fhir-datastore to learn more about the properties of a Data Store, and list-fhir-datastore to see all Data Stores associated with your account and their status. When a Data Store is no longer needed, you can delete it using delete-fhir-datastore.

Create, Read, Update, Delete (CRUD) operations

Manage and query data using the CreateResource, ReadResource, UpdateResource, and DeleteResource operations for 71 different FHIR resource types. These operations are all handled through an HTTP client.

Integrated medical natural language processing (NLP)

HealthLake has integrated medical natural language processing for the DocumentReference resource type. HealthLake automatically runs the integrated medical NLP on all DocumentReference resources as they are written to the system in an Import operation, during a Create operation, or during an Update operation. The original resource stays unchanged, and the extracted medical information is automatically appended to the resource.

FHIR search functionality

You can search health records that are stored in the Data Store either through a specific resource type with supported search parameters or for resource IDs in the server without specifying the resource type. When a FHIR record is created, it is first saved into Amazon DynamoDB, where it can be read, updated or deleted. After processing, it is then migrated to an Amazon Elasticsearch Service cluster, which makes the data searchable. HealthLake operates with eventual consistency with the Data Store, meaning that there might be a brief latency before the data is searchable within the Data Store.
Import data

Amazon HealthLake enables you to bulk import your files from an Amazon S3 bucket. Use either the console or `start-fhir-import-job` to begin an import job. Afterwards, you can use `describe-fhir-import-job` to monitor the status of the job and discover its properties. After the import job is complete, the data can then be added to a Data Store, transformed, or analyzed and used in downstream applications.

Export data

Amazon HealthLake enables you to bulk export your files to an Amazon S3 bucket. Use either the console or `start-fhir-export-job` to begin an export job. Afterwards, you can use `describe-fhir-export-job` to monitor the status of the job and discover its properties. After the export job is complete, the data can then be visualized using AWS Quicksight or accessed by other AWS services.
Getting started with Amazon HealthLake

To get started using Amazon HealthLake, set up an AWS account and create an AWS Identity and Access Management (IAM) user. To use the AWS Command Line Interface, AWS SDK for Python, or the AWS SDK for Java, download and configure them.

Account set up with Amazon HealthLake

Sign up for AWS

When you sign up for Amazon Web Services (AWS), your AWS account is automatically signed up for all AWS services. For access to Amazon HealthLake during the public preview, you need to request access through the AWS Management Console first.

If you are a new AWS customer, you can get started with Amazon HealthLake for free. For more information, see AWS Free Usage Tier.

If you already have an AWS account, skip to the next section.

To create an AWS account

2. Follow the online instructions.
   - Part of the sign-up procedure involves receiving a phone call and entering a verification code on the phone keypad.

   Record your AWS account ID because you'll need it for the next task.

Create an IAM User

Services in AWS, such as Amazon HealthLake, require that you provide credentials to access them. This allows the service to determine whether you have permissions to access the service's resources.

We strongly recommend that you access AWS using AWS Identity and Access Management (IAM), not the credentials for your AWS account. To use IAM to access AWS, create an IAM user, add the user to an IAM group with administrative permissions, and then grant administrative permissions to the IAM user. You can then access AWS using a special URL and the IAM user's credentials.

The getting started exercises in this guide assume that you have a user with administrator privileges, adminuser.

To create an administrator and sign in to the console

1. Create a user named adminuser in your AWS account. For instructions, see Creating Your First IAM User and Administrators Group in the IAM User Guide.
2. Sign in to the AWS Management Console using a special URL. For more information, see How Users Sign In to Your Account in the IAM User Guide.
3. To ensure that all necessary users and roles have access to HealthLake, attach a permission policy to grant access to the service. The following is an example granting access to HealthLake.
For more information about IAM, see the following:

- AWS Identity and Access Management (IAM)
- Getting started
- IAM User Guide

Next step: Setting up the AWS CLI

Set up the AWS Command Line Interface (AWS CLI)

You don't need the AWS CLI to perform the steps in all the getting started exercises. However, some of the other exercises in this guide do require it.

**To set up the AWS CLI**

1. Download and configure the AWS CLI. For instructions, see the following topics in the AWS Command Line Interface User Guide:
   - Getting Set Up with the AWS Command Line Interface
   - Configuring the AWS Command Line Interface
2. In the AWS CLI `config` file, add a named profile for the administrator.

   ```
   [profile adminuser]
   aws_access_key_id = adminuser access key ID
   aws_secret_access_key = adminuser secret access key
   region = aws-region
   ```

   You use this profile when running the AWS CLI commands. Under the security principle of least privilege, we recommend that you create a separate IAM role with privileges specific to the tasks being performed. For more information about named profiles, see Named Profiles in the AWS Command Line Interface User Guide. For a list of AWS Regions, see Regions and Endpoints in the Amazon Web Services General Reference.
3. Verify the setup by typing the following help command at the command prompt.

   ```
   aws healthlake help
   ```

   If the AWS CLI is configured correctly, you will see a brief description of Amazon HealthLake and a list of available commands.
Amazon HealthLake (Preview)
Amazon HealthLake Developer Guide
Creating a FHIR Data Store using
the AWS Command Line Interface

4. Amazon HealthLake is available only in the US East Northern Virginia (us-east-1) Region. You don’t
need to specify the "--endpoint" option when using the AWS CLI, but you can if necessary. The
endpoint is https://aws68918.us-east-1.amazonaws.com/.

For example, to list all of the HealthLake FHIR Data Stores that you own, you use the following
command.

```
$ aws healthlake list-fhir-datastores
```

Creating a FHIR Data Store using the AWS Command
Line Interface

The following example demonstrates using the CreateFHIRDatastore operation with the AWS CLI. To
run the example, you must install the AWS CLI.

The example is formatted for Unix, Linux, and macOS. For Windows, replace the backslash (\) Unix
continuation character at the end of each line with a caret (^).

```
aws healthlake create-fhir-datastore
   --datastore-type-version R4
   --preload-data-config PreloadDataType="SYNTHEA"
   --datastore-name "FhirTestDatastore"
```

Creating a FHIR Data Store using the SDK for Python

The following example demonstrates using the CreateFHIRDatastore operation using the AWS SDK
for Python.

```
import boto3
healthlake = boto3.client(service_name='healthlake',
    region_name='us-east-1',
    use_ssl=True)
DataStore_type_version = "R4"
DataStore_name = "TestDatastore123"
preload_type = "SYNTHEA"
preload_option = {'PreloadDataType' : preload_type}
print('Calling CreateFHIRDatastore\n')
create_response = healthlake.create_fhir_Datastore(
    DatastoreTypeVersion=Datastore_type_version,
    DatastoreName=Datastore_name,
    PreloadDataConfig=preload_option)
print ("Create FHIR Datastore response: \n", create_response)
print('End of CreateFHIRDatastore\n')
```
Creating a FHIR Data Store using the AWS SDK for Java

The following example uses the CreateFHIRDatastore operation with Java. To run the example, install the AWS SDK for Java. For instructions on installing the AWS SDK for Java, see Set up the AWS SDK for Java.

```java
import com.amazonaws.auth.AWSCredentials;
import com.amazonaws.auth.AWSCredentialsProvider;
import com.amazonaws.auth.DefaultAWSCredentialsProviderChain;
import com.amazonaws.services.HealthLake.AWSHealthLake;
import com.amazonaws.services.HealthLake.AWSHealthLakeClient;
import com.amazonaws.services.HealthLake.model.CreateFHIRDatastoreRequest;
import com.amazonaws.services.HealthLake.model.CreateFHIRDatastoreResult;
import com.amazonaws.services.HealthLake.model.DescribeFHIRDatastoreRequest;
import com.amazonaws.services.HealthLake.model.DescribeFHIRDatastoreResult;
import com.amazonaws.services.HealthLake.model.FHIRVersion;
import com.amazonaws.services.HealthLake.model.ListFHIRDatastoresRequest;
import com.amazonaws.services.HealthLake.model.ListFHIRDatastoresResult;
import com.amazonaws.services.HealthLake.model.PreloadDataConfig;
import com.amazonaws.services.HealthLake.model.PreloadDataType;

public class App{
    public static void main( String[] args ) {
        // Create credentials using a provider chain. For more information, see
        AWSCredentialsProvider awsCreds = DefaultAWSCredentialsProviderChain.getInstance();
        AWSHealthLake awsHealthLake = AWSHealthLakeClient.builder()
            .withRegion("us-east-1")
            .withCredentials(awsCreds)
            .defaultClient();

        CreateFHIRDatastoreRequest createFHIRDatastoreRequest = new CreateFHIRDatastoreRequest()
            .withDataStoreName("TestDatastore123")
            .withDataStoreTypeVersion(FHIRVersion.R4)
            .withPreloadDataConfig(new PreloadDataConfig()
                .withPreloadDataType(PreloadDataType.SYNTHEA));

    }
}
```

Getting started with an HTTP client

The Amazon HealthLake FHIR APIs aren’t supported by the AWS SDK for Python (Boto). You must use these Representational State Transfer (REST) APIs through a REST client.

Preloaded datatypes

HealthLake supports only SYNTHEA as a preloaded data type. Synthea is a synthetic patient generator that models the medical history of model-generated patients. It’s an open-source Git repository that allows HealthLake to generate FHIR R4-compliant resource bundles so that users can test models without using actual patient data.

The following resource types are available as preloaded Data Stores.
### Supported Synthea resource types

<table>
<thead>
<tr>
<th>Resource Type</th>

Security in Amazon HealthLake

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that is built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to HealthLake, see AWS Services in Scope by Compliance Program.
- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company’s requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using HealthLake. The following topics show you how to configure HealthLake to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your HealthLake resources.

**Topics**
- Data Protection in Amazon HealthLake (p. 10)
- Encryption at rest for Amazon HealthLake (p. 11)
- Encryption in transit for Amazon HealthLake (p. 11)
- Identity and Access Management for Amazon HealthLake (p. 11)
- Logging Amazon HealthLake API Calls with AWS CloudTrail (p. 24)
- Compliance Validation for Amazon HealthLake (p. 26)
- Resilience in Amazon HealthLake (p. 27)
- Infrastructure Security in Amazon HealthLake (p. 27)
- Security best practices in Amazon HealthLake (p. 27)

Data Protection in Amazon HealthLake

The AWS shared responsibility model applies to data protection in Amazon HealthLake. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual user accounts with AWS Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:
• Use multi-factor authentication (MFA) with each account.
• Use SSL/TLS to communicate with AWS resources. We recommend TLS 1.2 or later.
• Set up API and user activity logging with AWS CloudTrail.
• Use AWS encryption solutions, along with all default security controls within AWS services.
• Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.
• If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put sensitive identifying information, such as your customers' account numbers, into free-form fields such as a Name field. This includes when you work with HealthLake or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into HealthLake or other services might get picked up for inclusion in diagnostic logs. When you provide a URL to an external server, don't include credentials information in the URL to validate your request to that server.

Encryption at rest for Amazon HealthLake

The service encrypts customer data at rest by using a service owned AWS Key Management Service (AWS KMS) key to encrypt the data. All service data and metadata is encrypted with a service owned KMS key. Only the service owned KMS-CMK (customer managed key) is supported. Customer-owned KMS-CMK is not supported.

Encryption in transit for Amazon HealthLake

Amazon HealthLake uses TLS 1.2 to encrypt data in transit through the public endpoint and through backend services.

Identity and Access Management for Amazon HealthLake

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be authenticated (signed in) and authorized (have permissions) to use HealthLake resources. IAM is an AWS service that you can use with no additional charge.

Topics
• Audience (p. 12)
• Authenticating with identities (p. 12)
• Managing access using policies (p. 14)
• How Amazon HealthLake works with IAM (p. 15)
• Identity-based policy examples for Amazon HealthLake (p. 20)
Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in HealthLake.

**Service user** – If you use the HealthLake service to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more HealthLake features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in HealthLake, see Troubleshooting Amazon HealthLake identity and access (p. 22).

**Service administrator** – If you’re in charge of HealthLake resources at your company, you probably have full access to HealthLake. It’s your job to determine which HealthLake features and resources your employees should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with HealthLake, see How Amazon HealthLake works with IAM (p. 15).

**IAM administrator** – If you’re an IAM administrator, you might want to learn details about how you can write policies to manage access to HealthLake. To view example HealthLake identity-based policies that you can use in IAM, see Identity-based policy examples for Amazon HealthLake (p. 20).

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. For more information about signing in using the AWS Management Console, see Signing in to the AWS Management Console as an IAM user or root user in the IAM User Guide.

You must be authenticated (signed in to AWS) as the AWS account root user, an IAM user, or by assuming an IAM role. You can also use your company's single sign-on authentication or even sign in using Google or Facebook. In these cases, your administrator previously set up identity federation using IAM roles. When you access AWS using credentials from another company, you are assuming a role indirectly.

To sign in directly to the AWS Management Console, use your password with your root user email address or your IAM user name. You can access AWS programmatically using your root user or IAM users access keys. AWS provides SDK and command line tools to cryptographically sign your request using your credentials. If you don't use AWS tools, you must sign the request yourself. Do this using Signature Version 4, a protocol for authenticating inbound API requests. For more information about authenticating requests, see Signature Version 4 signing process in the AWS General Reference.

Regardless of the authentication method that you use, you might also be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Using multi-factor authentication (MFA) in AWS in the IAM User Guide.

AWS account root user

When you first create an AWS account, you begin with a single sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you do not use the root user for your everyday tasks, even the administrative ones. Instead, adhere to the best practice of using the root user only to create your first IAM user. Then securely lock away the root user credentials and use them to perform only a few account and service management tasks.
IAM users and groups

An **IAM user** is an identity within your AWS account that has specific permissions for a single person or application. An IAM user can have long-term credentials such as a user name and password or a set of access keys. To learn how to generate access keys, see *Managing access keys for IAM users* in the *IAM User Guide*. When you generate access keys for an IAM user, make sure you view and securely save the key pair. You cannot recover the secret access key in the future. Instead, you must generate a new access key pair.

An **IAM group** is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named *IAMAdmins* and give that group permissions to administer IAM resources.

Users are different from roles. A user is uniquely associated with one person or application, but a role is intended to be assumable by anyone who needs it. Users have permanent long-term credentials, but roles provide temporary credentials. To learn more, see *When to create an IAM user (instead of a role)* in the *IAM User Guide*.

IAM roles

An **IAM role** is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see *Using IAM roles* in the *IAM User Guide*.

IAM roles with temporary credentials are useful in the following situations:

- **Temporary IAM user permissions** – An IAM user can assume an IAM role to temporarily take on different permissions for a specific task.
- **Federated user access** – Instead of creating an IAM user, you can use existing identities from AWS Directory Service, your enterprise user directory, or a web identity provider. These are known as federated users. AWS assigns a role to a federated user when access is requested through an identity provider. For more information about federated users, see *Federated users and roles* in the *IAM User Guide*.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see *How IAM roles differ from resource-based policies* in the *IAM User Guide*.
- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
- **Principal permissions** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. Policies grant permissions to a principal. When you use some services, you might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see *Actions, resources, and condition keys for Amazon HealthLake* in the *Service Authorization Reference*.
- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. Service roles provide access only within your account and cannot be used to grant access to services in other accounts. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see *Creating a role to delegate permissions to an AWS service* in the *IAM User Guide*. 
• **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

• **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the IAM User Guide.

To learn whether to use IAM roles or IAM users, see When to create an IAM role (instead of a user) in the IAM User Guide.

### Managing access using policies

You control access in AWS by creating policies and attaching them to IAM identities or AWS resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. You can sign in as the root user or an IAM user, or you can assume an IAM role. When you then make a request, AWS evaluates the related identity-based or resource-based policies. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the IAM User Guide.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

Every IAM entity (user or role) starts with no permissions. In other words, by default, users can do nothing, not even change their own password. To give a user permission to do something, an administrator must attach a permissions policy to a user. Or the administrator can add the user to a group that has the intended permissions. When an administrator gives permissions to a group, all users in that group are granted those permissions.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the iam:GetRole action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

### Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Creating IAM policies in the IAM User Guide.

Identity-based policies can be further categorized as inline policies or managed policies. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choosing between managed policies and inline policies in the IAM User Guide.

### Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-
based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can't use AWS managed policies from IAM in a resource-based policy.

**Access control lists (ACLs)**

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see [Access control list (ACL) overview](https://docs.aws.amazon.com/AmazonS3/latest/dev/using-access-control-lists.html) in the *Amazon Simple Storage Service Developer Guide*.

**Other policy types**

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of entity's identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the Principal field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see [Permissions boundaries for IAM entities](https://docs.aws.amazon.com/IAM/latest/UserGuide/idPermissionsBndry.html) in the *IAM User Guide*.

- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see [How SCPs work](https://docs.aws.amazon.com/organizations/latest/userguide/what-is-sc-policy.html) in the *AWS Organizations User Guide*.

- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session's permissions are the intersection of the user or role's identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see [Session policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_programmatic_authenticate_temp Sessions.html) in the *IAM User Guide*.

**Multiple policy types**

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see [Policy evaluation logic](https://docs.aws.amazon.com/IAM/latest/UserGuide/sps-policy-v2-policyevaluation.html) in the *IAM User Guide*.

**How Amazon HealthLake works with IAM**

Before you use IAM to manage access to HealthLake, learn what IAM features are available to use with HealthLake.
### IAM features you can use with Amazon HealthLake

<table>
<thead>
<tr>
<th>IAM feature</th>

To get a high-level view of how HealthLake and other AWS services work with most IAM features, see AWS services that work with IAM in the IAM User Guide.

#### Identity-based policies for Amazon HealthLake

| Supports identity-based policies | Yes |

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Creating IAM policies in the IAM User Guide.

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. You can't specify the principal in an identity-based policy because it applies to the user or role to which it is attached. To learn about all of the elements that you can use in a JSON policy, see IAM JSON policy elements reference in the IAM User Guide.

**Identity-based policy examples for Amazon HealthLake**

To view examples of HealthLake identity-based policies, see Identity-based policy examples for Amazon HealthLake (p. 20).

#### Resource-based policies within Amazon HealthLake

| Supports resource-based policies | No |

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-
based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

To enable cross-account access, you can specify an entire account or IAM entities in another account as the principal in a resource-based policy. Adding a cross-account principal to a resource-based policy is only half of establishing the trust relationship. When the principal and the resource are in different AWS accounts, an IAM administrator in the trusted account must also grant the principal entity (user or role) permission to access the resource. They grant permission by attaching an identity-based policy to the entity. However, if a resource-based policy grants access to a principal in the same account, no additional identity-based policy is required. For more information, see How IAM roles differ from resource-based policies in the IAM User Guide.

**Policy actions for Amazon HealthLake**

<table>
<thead>
<tr>
<th>Supports policy actions</th>
<th>Yes</th>
</tr>
</thead>
</table>

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The `Action` element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Policy actions usually have the same name as the associated AWS API operation. There are some exceptions, such as permission-only actions that don't have a matching API operation. There are also some operations that require multiple actions in a policy. These additional actions are called dependent actions.

Include actions in a policy to grant permissions to perform the associated operation.

To see a list of HealthLake actions, see Actions defined by Amazon HealthLake in the Service Authorization Reference.

Policy actions in HealthLake use the following prefix before the action:

```
healthlake
```

To specify multiple actions in a single statement, separate them with commas.

```
"Action": [
  "healthlake:action1",
  "healthlake:action2"
]
```

To view examples of HealthLake identity-based policies, see Identity-based policy examples for Amazon HealthLake (p. 20).

**Policy resources for Amazon HealthLake**

<table>
<thead>
<tr>
<th>Supports policy resources</th>
<th>Yes</th>
</tr>
</thead>
</table>
Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Resource JSON policy element specifies the object or objects to which the action applies. Statements must include either a Resource or a NotResource element. As a best practice, specify a resource using its Amazon Resource Name (ARN). You can do this for actions that support a specific resource type, known as resource-level permissions.

For actions that don't support resource-level permissions, such as listing operations, use a wildcard (*) to indicate that the statement applies to all resources.

```
"Resource": "*"
```

To see a list of HealthLake resource types and their ARNs, see Resources defined by Amazon HealthLake in the Service Authorization Reference. To learn with which actions you can specify the ARN of each resource, see Actions defined by Amazon HealthLake.

To view examples of HealthLake identity-based policies, see Identity-based policy examples for Amazon HealthLake (p. 20).

### Policy condition keys for Amazon HealthLake

| Supports policy condition keys | Yes |

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The Condition element (or Condition block) lets you specify conditions in which a statement is in effect. The Condition element is optional. You can create conditional expressions that use condition operators, such as equals or less than, to match the condition in the policy with values in the request.

If you specify multiple Condition elements in a statement, or multiple keys in a single Condition element, AWS evaluates them using a logical AND operation. If you specify multiple values for a single condition key, AWS evaluates the condition using a logical OR operation. All of the conditions must be met before the statement's permissions are granted.

You can also use placeholder variables when you specify conditions. For example, you can grant an IAM user permission to access a resource only if it is tagged with their IAM user name. For more information, see IAM policy elements: variables and tags in the IAM User Guide.

AWS supports global condition keys and service-specific condition keys. To see all AWS global condition keys, see AWS global condition context keys in the IAM User Guide.

To see a list of HealthLake condition keys, see Condition keys for Amazon HealthLake in the Service Authorization Reference. To learn with which actions and resources you can use a condition key, see Actions defined by Amazon HealthLake.

To view examples of HealthLake identity-based policies, see Identity-based policy examples for Amazon HealthLake (p. 20).

### Access control lists (ACLs) in Amazon HealthLake

| Supports ACLs | No |
Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

**Attribute-based access control (ABAC) with Amazon HealthLake**

<table>
<thead>
<tr>
<th>Supports ABAC (tags in policies)</th>
<th>Partial</th>
</tr>
</thead>
</table>

Attribute-based access control (ABAC) is an authorization strategy that defines permissions based on attributes. In AWS, these attributes are called *tags*. You can attach tags to IAM entities (users or roles) and to many AWS resources. Tagging entities and resources is the first step of ABAC. Then you design ABAC policies to allow operations when the principal’s tag matches the tag on the resource that they are trying to access.

ABAC is helpful in environments that are growing rapidly and helps with situations where policy management becomes cumbersome.

To control access based on tags, you provide tag information in the *condition element* of a policy using the `aws:ResourceTag/key-name`, `aws:RequestTag/key-name`, or `aws:TagKeys` condition keys.

For more information about ABAC, see What is ABAC? in the *IAM User Guide*. To view a tutorial with steps for setting up ABAC, see Use attribute-based access control (ABAC) in the *IAM User Guide*.

**Using temporary credentials with Amazon HealthLake**

<table>
<thead>
<tr>
<th>Supports temporary credentials</th>
<th>Yes</th>
</tr>
</thead>
</table>

Some AWS services don't work when you sign in using temporary credentials. For additional information, including which AWS services work with temporary credentials, see AWS services that work with IAM in the *IAM User Guide*.

You are using temporary credentials if you sign in to the AWS Management Console using any method except a user name and password. For example, when you access AWS using your company's single sign-on (SSO) link, that process automatically creates temporary credentials. You also automatically create temporary credentials when you sign in to the console as a user and then switch roles. For more information about switching roles, see Switching to a role (console) in the *IAM User Guide*.

You can manually create temporary credentials using the AWS CLI or AWS API. You can then use those temporary credentials to access AWS. AWS recommends that you dynamically generate temporary credentials instead of using long-term access keys. For more information, see Temporary security credentials in IAM.

**Cross-service principal permissions for Amazon HealthLake**

<table>
<thead>
<tr>
<th>Supports principal permissions</th>
<th>Yes</th>
</tr>
</thead>
</table>

When you use an IAM user or role to perform actions in AWS, you are considered a principal. Policies grant permissions to a principal. When you use some services, you might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see Actions, resources, and condition keys for Amazon HealthLake in the *Service Authorization Reference*. 
Service roles for Amazon HealthLake

| Supports service roles | Yes |

A service role is an IAM role that a service assumes to perform actions on your behalf. Service roles provide access only within your account and cannot be used to grant access to services in other accounts. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

Warning
Changing the permissions for a service role might break HealthLake functionality. Edit service roles only when HealthLake provides guidance to do so.

Service-linked roles for Amazon HealthLake

| Supports service-linked roles | No |

A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

For details about creating or managing service-linked roles, see AWS services that work with IAM. Find a service in the table that includes a Yes in the Service-linked role column. Choose the Yes link to view the service-linked role documentation for that service.

Identity-based policy examples for Amazon HealthLake

By default, IAM users and roles don't have permission to create or modify HealthLake resources. They also can't perform tasks using the AWS Management Console, AWS CLI, or AWS API. An IAM administrator must create IAM policies that grant users and roles permission to perform actions on the resources that they need. The administrator must then attach those policies to the IAM users or groups that require those permissions.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see Creating policies on the JSON tab in the IAM User Guide.

Topics
- Policy best practices (p. 20)
- Using the Amazon HealthLake console (p. 21)
- Allow users to view their own permissions (p. 21)

Policy best practices

Identity-based policies are very powerful. They determine whether someone can create, access, or delete HealthLake resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- Get started using AWS managed policies – To start using HealthLake quickly, use AWS managed policies to give your employees the permissions they need. These policies are already available in
your account and are maintained and updated by AWS. For more information, see Get started using permissions with AWS managed policies in the IAM User Guide.

- **Grant least privilege** – When you create custom policies, grant only the permissions required to perform a task. Start with a minimum set of permissions and grant additional permissions as necessary. Doing so is more secure than starting with permissions that are too lenient and then trying to tighten them later. For more information, see Grant least privilege in the IAM User Guide.

- **Enable MFA for sensitive operations** – For extra security, require IAM users to use multi-factor authentication (MFA) to access sensitive resources or API operations. For more information, see Using multi-factor authentication (MFA) in AWS in the IAM User Guide.

- **Use policy conditions for extra security** – To the extent that it's practical, define the conditions under which your identity-based policies allow access to a resource. For example, you can write conditions to specify a range of allowable IP addresses that a request must come from. You can also write conditions to allow requests only within a specified date or time range, or to require the use of SSL or MFA. For more information, see IAM JSON policy elements: Condition in the IAM User Guide.

### Using the Amazon HealthLake console

To access the Amazon HealthLake console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the HealthLake resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won't function as intended for entities (IAM users or roles) with that policy.

You don't need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that you're trying to perform.

To ensure that users and roles can still use the HealthLake console, also attach an IAM policy to the entities. For more information, see Adding permissions to a user in the IAM User Guide. Users can manage access to the console through the service managed policies AmazonHealthLakeFullAccess and AmazonHealthLakeReadOnlyAccess.

### Allow users to view their own permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "ViewOwnUserInfo",
         "Effect": "Allow",
         "Action": [
            "iam:GetUserPolicy",
            "iam:ListGroupsForUser",
            "iam:ListAttachedUserPolicies",
            "iam:ListUserPolicies",
            "iam:GetUser"
         ],
         "Resource": ["arn:aws:iam::*:user/${aws:username}"],
      },
      {
         "Sid": "NavigateInConsole",
         "Effect": "Allow",
         "Action": [
            "iam:GetGroupPolicy",
            "iam:GetPolicyVersion",
```
Troubleshooting Amazon HealthLake identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with HealthLake and IAM.

Topics

- I am not authorized to perform an action in Amazon HealthLake (p. 22)
- I am not authorized to perform iam:PassRole (p. 22)
- I want to view my access keys (p. 23)
- I'm an administrator and want to allow others to access Amazon HealthLake (p. 23)
- I want to allow people outside of my AWS account to access my Amazon HealthLake resources (p. 23)

I am not authorized to perform an action in Amazon HealthLake

If the AWS Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password.

The following example error occurs when the mateojackson IAM user tries to use the console to view details about a fictional my-example-widget resource but does not have the fictional healthlake:GetWidget permissions.

```
User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform:
    healthlake:GetWidget on resource: my-example-widget
```

In this case, Mateo asks his administrator to update his policies to allow him to access the my-example-widget resource using the healthlake:GetWidget action.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the iam:PassRole action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password. Ask that person to update your policies to allow you to pass a role to HealthLake.

Some AWS services allow you to pass an existing role to that service, instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.
The following example error occurs when an IAM user named marymajor tries to use the console to perform an action in HealthLake. However, the action requires the service to have permissions granted by a service role. Mary does not have permissions to pass the role to the service.

```
User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform: iam:PassRole
```

In this case, Mary asks her administrator to update her policies to allow her to perform the `iam:PassRole` action.

I want to view my access keys

After you create your IAM user access keys, you can view your access key ID at any time. However, you can't view your secret key. If you lose your secret key, you must create a new access key pair.

Access keys consist of two parts: an access key ID (for example, AKIAIOSFODNN7EXAMPLE) and a secret access key (for example, wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY). Like a user name and password, you must use both the access key ID and secret access key together to authenticate your requests. Manage your access keys as securely as you do your user name and password.

**Important**

Do not provide your access keys to a third party, even to help find your canonical user ID. By doing this, you might give someone permanent access to your account.

When you create an access key pair, you are prompted to save the access key ID and secret access key in a secure location. The secret access key is available only at the time you create it. If you lose your secret access key, you must add new access keys to your IAM user. You can have a maximum of two access keys. If you already have two, you must delete one key pair before creating a new one. To view instructions, see Managing access keys in the IAM User Guide.

I'm an administrator and want to allow others to access Amazon HealthLake

To allow others to access HealthLake, you must create an IAM entity (user or role) for the person or application that needs access. They will use the credentials for that entity to access AWS. You must then attach a policy to the entity that grants them the correct permissions in HealthLake.

To get started right away, see Creating your first IAM delegated user and group in the IAM User Guide.

I want to allow people outside of my AWS account to access my Amazon HealthLake resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether HealthLake supports these features, see How Amazon HealthLake works with IAM (p. 15).
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the IAM User Guide.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the IAM User Guide.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the IAM User Guide.
To learn the difference between using roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.

Logging Amazon HealthLake API Calls with AWS CloudTrail

Amazon HealthLake is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in HealthLake. CloudTrail captures all API calls for HealthLake as events. The calls captured include calls from the HealthLake console and code calls to the HealthLake API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for HealthLake. If you don't configure a trail, you can still view the most recent events in the CloudTrail console in Event history. Using the information collected by CloudTrail, you can determine the request that was made to HealthLake, the IP address from which the request was made, who made the request, when it was made, and additional details.

To learn more about CloudTrail, see the AWS CloudTrail User Guide.

Amazon HealthLake Information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in HealthLake, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for HealthLake, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for Creating a Trail
- CloudTrail Supported Services and Integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

All HealthLake actions are logged by CloudTrail and are documented in the HealthLake API reference and in this Developer Guide for actions performed through an HTTP client. For example, calls to the following actions generate entries in the CloudTrail log files:

- DescribeFHIRImportJob
- DescribeFHIRExportJob
- StartFHIRImportJob
- StartFHIRExportJob
- CreateFHIRDatastore
- ListFHIRDatastores
- DeleteFHIRDatastore
- DescribeFHIRDatastore
- UpdateResource
- CreateResource
Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the CloudTrail userIdentity Element.

Understanding Amazon HealthLake Log File Entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following example shows a CloudTrail log entry that demonstrates the CreateFHIRDatastore action.

```json
{
    "eventVersion": "1.08",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AROA2B3ZHOADD2OJ4AHJX:git full_access_iam_role580074395690222150",
        "arn": "arn:aws:sts::691207106566:assumed-role/colossusfrontend_full_access_iam_role/_iam_role580074395690222150",
        "accountId": "AccountID",

Compliance Validation for Amazon HealthLake

Third-party auditors assess the security and compliance of Amazon HealthLake as part of multiple AWS compliance programs. For HealthLake this includes HIPAA.

To learn whether HealthLake or other AWS services are in scope of specific compliance programs, see AWS Services in Scope by Compliance Program. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.
- **Architecting for HIPAA Security and Compliance Whitepaper** – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.

  **Note**
  Not all services are compliant with HIPAA.

- **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.
- **Evaluating Resources with Rules** in the AWS Config Developer Guide – The AWS Config service assesses how well your resource configurations comply with internal practices, industry guidelines, and regulations.
- **AWS Security Hub** – This AWS service provides a comprehensive view of your security state within AWS that helps you check your compliance with security industry standards and best practices.
- **AWS Audit Manager** – This AWS service helps you continuously audit your AWS usage to simplify how you manage risk and compliance with regulations and industry standards.
Resilience in Amazon HealthLake

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

In addition to the AWS global infrastructure, HealthLake offers several features to help support your data resiliency and backup needs.

Infrastructure Security in Amazon HealthLake

As a managed service, Amazon HealthLake is protected by the AWS global network security procedures that are described in the Amazon Web Services: Overview of Security Processes whitepaper.

You use AWS published API calls to access HealthLake through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

Security best practices in Amazon HealthLake

Amazon HealthLake provides a number of security features to consider as you develop and implement your own security policies. The following best practices are general guidelines and don’t represent a complete security solution. Because these best practices might not be appropriate or sufficient for your environment, treat them as helpful considerations rather than prescriptions.

- Implement least privilege access.
- Limit access to sensitive and important auditing functions.
- When creating resources through the update or bulk import APIs, do not use PHI or PII, including the names of datastores and jobs, in any visible fields or in the logical FHIR ID (LID).
- Enable AWS CloudTrail to audit Amazon HealthLake use and to ensure that there is no unexpected activity.
- Review best practices for using Amazon S3 buckets securely. To learn more, see Security best practices in the Amazon S3 user guide.
Creating and monitoring FHIR Data Stores in Amazon HealthLake

Important notice

Amazon HealthLake protects customer data under the AWS Shared Responsibility Model policies. Remember that customer-inputed names should never contain personally identifiable information (PII) or protected health information (PHI). For more information, see the HealthLake Security chapter.

Creating and monitoring FHIR resources

With Amazon HealthLake, you can create and manage Data Stores for storing FHIR resources. Use the following operations to create and monitor the Data Store:

- **CreateFHIRDataStore** – Creates a Data Store that can ingest and export FHIR data.
- **DescribeFHIRDataStore** – Gets the properties associated with the FHIR datastore, including Data Store ID, Data Store Arn, Data Store name, Data Store status, created at, Data Store type version, and Data Store endpoint. These items are used in subsequent operations.
- **ListFHIRDataStores** – Lists all FHIR Data Stores that are in the user’s account, regardless of Data Store status.
- **DeleteFHIRDataStores** – Deletes a FHIR Data Store and all of the data included within.

Creating a Data Store example

The following example demonstrates how to create a Data Store using the AWS Command Line Interface (*AWS CLI) You can also use either the console or the create-fhir-datastore API to create a Data Store.

```bash
aws healthlake create-fhir-datastore \
  --region us-east-1 \
  --datastore-type-version R4 \
  --preload-data-config PreloadDataType="SYNTHEA" \
  --datastore-name "FhirTestDatastore"
```

The JSON response includes the Data Store ID, Amazon Resource Name (ARN), and confirmation that the Data Store is being created. When the Data Store is ready to ingest data, the status is "ACTIVE". The following is the example JSON response.

```json
{
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
    "DatastoreStatus": "CREATING",
    "DatastoreId": ":(Datastore ID)"
}
```
Describing a Data Store example

To learn the properties of a Data Store, use the `describe-fhir-datastore` API, the console, or the AWS CLI command as shown in the following example.

```
aws healthlake describe-fhir-datastore
  --datastore-id "1f2f459836ac6c513ce899f9e4f66a59"
  --region us-east-1
```

In the JSON response, you can learn the DatastoreName, DatastoreArn (ARN), DatastoreEndpoint, DatastoreStatus, DatastoreTypeVersion, and DatastoreId, as shown in the following example.

```
{
  "DatastoreProperties": {
    "PreloadDataConfig": {
      "PreloadDataType": "SYNTHEA"
    },
    "DatastoreName": "FhirTestDatastore",
    "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
    "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
    "DatastoreStatus": "CREATING",
    "DatastoreTypeVersion": "R4",
    "DatastoreId": "(Datastore ID)"
  }
}
```

Listing Data Stores example

Use the `list-fhir-datastores` API or the console to find the names, properties, and statuses of the Data Stores associated with your account as shown in the following example. You can also set filters to focus your listings to 'ACTIVE' Data Stores only, as shown in the example.

```
aws healthlake list-fhir-datastores
  --region us-east-1
  --filter DatastoreStatus=ACTIVE
```

The following is the response in JSON.

```
{
  "DatastorePropertiesList": [
    {
      "PreloadDataConfig": {
        "PreloadDataType": "SYNTHEA"
      },
      "DatastoreName": "FhirTestDatastore",
      "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
      "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
      "DatastoreStatus": "ACTIVE",
      "DatastoreTypeVersion": "R4",
      "CreatedAt": 1605574003.209
    }
  ]
}```
Deleting a Data Store example

To delete a data store and all information in it, use the `DeleteFHIRDataStore` command using the AWS CLI as shown in the following example. You can also delete a data store using the `delete-fhir-datastore` API or the console. Deleting a Data Store removes all of the FHIR resource versions contained within the Data Store and the underlying infrastructure. Logs related to a deleted Data Store are retained within the service account in accordance with HIPAA guidelines.

Deleting a Data Store is an asynchronous operation. When you start deleting a Data Store, the Data Store status changes to `DELETING`. It remains in the `DELETING` state until all of the FHIR data from the Data Store is removed along with the underlying infrastructure necessary to support the data. Once the data and infrastructure are removed, the status of the Data Store changes to `DELETED`. After deletion, the Data Store appears in the `DescribeFHIRDataStore` and `ListFHIRDataStores` operations for seven days. After seven days the Data Store will no longer appear in the results.

```
aws healthlake delete-fhir-datastore
  --datastore-id (Data Store ID)
```

As shown in the following example JSON response, the status changes to "DELETING" to confirm that the Data Store and its contents are in the process of being deleted.

```
{
  "DatastoreEndpoint": "https://healthlake.us-east-1.amazonaws.com/datastore/(Datastore ID)/r4/",
  "DatastoreArn": "arn:aws:healthlake:us-east-1:(AWS Account ID):datastore/(Datastore ID)",
  "DatastoreStatus": "DELETING",
  "DatastoreId": "(Datastore ID)"
}
```
Managing FHIR resources in Amazon HealthLake

Amazon HealthLake enables users to manage their FHIR resources in a Data Store through an HTTP client or the console.

Managing FHIR resources

Use the Amazon HealthLake FHIR REST APIs to can create, read, update, and delete resources in an active Data Store. To see all of the active Data Store's FHIR-related capabilities, see the capability statement for the active Data Store through either `GET Capabilities` in an HTTP client or the console. FHIR resources are validated against the FHIR R4 Structure Definition. If a resource is invalid, an OperationOutcome message will result with details explaining the exception.

The following table lists the actions that are supported by HealthLake.

**Supported Operations**

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Instance-level, Type-level or Whole-system interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read</td>
<td>Read the current state of the resource</td>
<td>Instance-level</td>
</tr>
<tr>
<td>Update</td>
<td>Update a resource by its ID (or create it if it's new)</td>
<td>Instance-level</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete a resource</td>
<td>Instance-level</td>
</tr>
<tr>
<td>Create</td>
<td>Create a new resource with a server-assigned ID</td>
<td>Type-level</td>
</tr>
<tr>
<td>Search</td>
<td>Search the resource type based on filter criteria</td>
<td>Type-level</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Get a capability statement for the system</td>
<td>Whole-system level</td>
</tr>
</tbody>
</table>

The following table lists the 71 resources types supported by HealthLake. You can use these resources as search criteria or as part of analysis workflows.

**Supported FHIR Resource Types**

<table>
<thead>
<tr>
<th>Account</th>
<th>DocumentReference</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActivityDefinition</td>
<td>Encounter</td>
<td>Patient</td>
</tr>
<tr>
<td>AllergyIntolerance</td>
<td>Endpoint</td>
<td>PaymentNotice</td>
</tr>
<tr>
<td>Appointment</td>
<td>EpisodeofCare</td>
<td>PaymentReconciliation</td>
</tr>
</tbody>
</table>
Example: Using Create with POST

The following example shows up to create a patient FHIR resource using POST.

```
POST /datastore/(Datastore ID)/r4/Patient/ HTTP/1.1
Host: healthlake.us-east-1.amazonaws.com
Content-Type: application/json
Authorization: AWS4-HMAC-SHA256 Credential=(Redacted)

{
    "resourceType": "Patient",
    "active": true,
    "name": [
        {
            "use": "official",
            "family": "Doe",
            "given": ["John", "Doe"]
        }
    ],
    "gender": "male",
    "birthDate": "1990-01-01",
    "id": "patient1"}
```
"Jane"
"
{"use": "usual",
 "given": [
 "Jane"
 ]
},
"gender": "female",
 "birthDate": "1966-09-01"
}

To confirm creation of the patient resource, you get the following JSON response.

{  
 "resourceType": "Patient",
 "active": true,
 "name": [
 {  
 "use": "official",
 "family": "Doe",
 "given": [
 "Jane"
 ]
 },
 {  
 "use": "usual",
 "given": [
 "Jane"
 ]
 },
 "gender": "female",
 "birthDate": "1966-09-01"
}

---

Example: Reading a resource with GET

The following example shows how to read a patient FHIR resource using GET and using the logical ID (LID) to define the resource.

GET /datastore/(Datastore ID)/r4/Patient/2de04858-ba65-44c1-8af1-f2fe69a977d9 HTTP/1.1
Host: healthlake.us-east-1.amazonaws.com
Content-Type: application/json
Authorization: AWS4-HMAC-SHA256 Credential=(Redacted)

You receive the following JSON in response.

{  
 "resourceType": "Patient",

Example: Updating a resource using PUT

The following example shows how to use **PUT** to update a patient FHIR resource to correct inaccurate patient information.

```
PUT /datastore/(Datastore ID)/r4/Patient/2de04858-ba65-44c1-8af1-f2fe69a977d9 HTTP/1.1
Host: healthlake.us-east-1.amazonaws.com
Content-Type: application/json
Authorization: AWS4-HMAC-SHA256 Credential=(Redacted)

{
  "id": "2de04858-ba65-44c1-8af1-f2fe69a977d9",
  "resourceType": "Patient",
  "active": true,
  "name": [
    {
      "use": "official",
      "family": "Doe",
      "given": [
        "Jane"
      ]
    },
    {
      "use": "usual",
      "given": [
        "Jane"
      ]
    }
  ],
  "gender": "female",
  "birthDate": "1985-12-31"
}
```

You receive the following JSON in response to confirm the change.

```
"active": true,
"name": [
  {
    "use": "official",
    "family": "Doe",
    "given": [
      "Jane"
    ]
  },
  {
    "use": "usual",
    "given": [
      "Jane"
    ]
  }
],
"gender": "female",
"birthDate": "1966-09-01",
"meta": {
  "lastUpdated": "2020-11-23T06:24:13.202Z"
},
"id": "2de04858-ba65-44c1-8af1-f2fe69a977d9"
```
Example: Deleting a resource

The following example shows how to delete a patient FHIR resource.

```
DELETE /datastore/(Datastore ID)/r4/Patient/2de04858-ba65-44c1-8af1-f2fe69a977d9 HTTP/1.1
Host: healthlake.us-east-1.amazonaws.com
Content-Type: application/json
Authorization: AWS4-HMAC-SHA256 Credential=(Redacted)
```

You receive the following response, confirming that the resource is no longer in the Data Store.

```
204 No Content Response Code
```
Importing files to a FHIR Data Store

After your FHIR Data Store has been created, you can import files from an Amazon Simple Storage Service (Amazon S3) bucket. During preview, you can load up to 1 GB of documents per job. The maximum number of files per job is 100. The maximum size per file is 50 MB. You can use the console to create and manage import jobs, or use the import APIs. Amazon HealthLake accepts input files in newline delimited JSON (.ndjson) format, where each line consists of a valid FHIR resource. The APIs start and describe ongoing import jobs.

Performing an import

You can start an import job using either the Amazon HealthLake console or the Amazon HealthLake import API, start-fhir-import-job API.

Importing files using the APIs

Prerequisites

When you use the Amazon HealthLake APIs, you must first create an AWS Identity Access and Management (IAM) policy and attach it to an IAM role. To learn more about IAM roles and trust policies, see IAM Policies and Permissions.

To import files (API)

1. Upload your data into an S3 bucket.
2. To start a new import job, use the start-FHIR--import-job operation. When you start the job, tell HealthLake the name of the S3 bucket that contains the input files.
3. To learn more about a FHIR import job, use the describe-fhir-import-job operation to get the job's ID, ARN, name, start time, end time, and current status.

Importing files using the console

To import files (console)

1. Upload your data into an S3 bucket.
2. To start a new import job, identify the S3 bucket and either create or identify the IAM role that you want to use. To learn more about IAM roles and trust policies, see IAM Roles.
3. Monitor the status of your job. The console shows the status of all imports that are in progress.

IAM policies for import jobs

The IAM role that calls the Amazon HealthLake APIs must have a policy that grants access to the S3 buckets that contain the input files. It must also be assigned a trust relationship that enables HealthLake to assume the role. To learn more about IAM roles and trust policies, see IAM Roles.

The role must have the following policy.
Example: Starting and monitoring import jobs using the AWS CLI

The following example shows how to use the AWS CLI to start and monitor an import job. You can also use the `start-fhir-import-job` API or the console.

```bash
aws healthlake start-fhir-import-job \
  --input-data-config S3Uri="s3://(Bucket Name)/(Prefix Name)" \
  --datastore-id (Datastore ID) \
  --data-access-role-arn "arn:aws:iam::(AWS Account ID):role/(Role Name)" \
  --region us-east-1
```

You receive the following confirmation that the import job has begun.

```json
{}
```
To monitor the status of an import job or to learn its configuration properties, use the `describe-fhir-import-job` API or the AWS CLI command as shown in the following example.

```bash
aws healthlake describe-fhir-import-job \
  --datastore-id (Datastore ID) \ 
  --job-id c145fbb27b192af392f8ce6e7838e34f \ 
  --region us-east-1
```

You receive the following information in response.

```json
{
  "ImportJobProperties": {
    "InputDataConfig": {
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/"
    },
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "COMPLETED",
    "JobId": "c145fbb27b192af392f8ce6e7838e34f",
    "SubmitTime": 1606272542.161,
    "EndTime": 1606272609.497,
    "DatastoreId": "(Datastore ID)"
  }
}
```
Exporting files from a FHIR Data Store

After your data has been imported to a Data Store, you can export files to an Amazon Simple Storage Service (Amazon S3) bucket for analysis or downstream applications using other AWS services. Amazon HealthLake exports files in newline delimited JSON (.ndjson) format, where each line consists of a valid FHIR resource.

Performing an export

You can start an export job using either the Amazon HealthLake console or the Amazon HealthLake export API, start-fhir-export-job API.

Exporting from your Data Store

Prerequisites

Before using the Amazon HealthLake APIs, you must create an AWS Identity Access and Management (IAM) policy and attach it to an IAM role. To learn more about IAM roles and trust policies, see IAM Policies and Permissions.

To export files

1. Create an S3 bucket. The S3 bucket must be in the same AWS region as the service, and BlockPublicAccess must be turned on for all options. To learn more, see Using Amazon S3 block public access.
2. Create and add an IAM policy that enables a user to access HealthLake. The following is an example policy.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "iam:PassRole",
         "Resource": "*",
         "Condition": {
            "StringEquals": {
               "iam:PassedToService": [
                  "healthlake.amazonaws.com"
               ]
            }
         }
      }
   ]
}
```
3. Create a data access role. HealthLake uses this to write the output S3 bucket.
4. Add a trust policy to the data access role. The following is an example trust policy.

```json
{
   "Version": "2012-10-17",
   "Statement": [
```
5. Add a permission policy to the data access role that enables the role to access the S3 bucket.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "s3:ListBucket",
        "s3:GetBucketPublicAccessBlock",
        "s3:GetEncryptionConfiguration"
      ],
      "Resource": [
        "arn:aws:s3:::(Bucket Name)"
      ],
      "Effect": "Allow"
    },
    {
      "Action": [
        "s3:PutObject"
      ],
      "Resource": [
        "arn:aws:s3:::(Bucket Name)/*"
      ],
      "Effect": "Allow"
    }
  ]
}
```

6. Use the `start-fhir-export-job` operation to begin a bulk export job.

7. To get the ID, ARN, name, start time, end time, and current status of a FHIR export job, use `describe-fhir-export-job`.

**Exporting files (console)**

**To Export files (console)**

1. Create an output S3 bucket in the same region as HealthLake.
2. To start a new export job, identify the output S3 bucket and either create or identify the IAM role that you want to use. To learn more about IAM roles and trust policies, see [IAM Roles](#).
3. Monitor the status of your job. The console shows the status of all imports that are in progress.

**Example: Starting export jobs**

The following example shows how to use the AWS CLI to start and monitor an export job. You can also use the `start-fhir-export-job API or the console.`
You receive the following confirmation that the export job has begun.

```
{
  "DatastoreId": "(Datastore ID)",
  "JobStatus": "SUBMITTED",
  "JobId": "9b9a51943afaedd0a8c0c26c49135a31"
}
```

To monitor the status of an export job or to learn its configuration properties, use the `describe-fhir-export-job` API or the AWS CLI command as shown in the following example.

```
aws healthlake describe-fhir-export-job
  --datastore-id (Datastore ID) \n  --job-id 9b9a51943afaedd0a8c0c26c49135a31 \n```

You receive the following information in response.

```
{
  "ExportJobProperties": {
    "DataAccessRoleArn": "arn:aws:iam::(AWS Account ID):role/(Role Name)",
    "JobStatus": "IN_PROGRESS",
    "JobId": "9009813e9d69ba7cf79bcb3468780f16",
    "SubmitTime": 1609175692.715,
    "OutputDataConfig": {
      "S3Uri": "s3://(Bucket Name)/(Prefix Name)/59593b2d0367ce252b5e66bf5fd6b574-FHIR_EXPORT-9009813e9d69ba7cf79bcb3468780f16/",
    },
    "DatastoreId": "(Datastore ID)"
  }
}
```
Using FHIR search functionality in Amazon HealthLake

Amazon HealthLake provides the basic FHIR search functionality, enabling users to query a Data Store based on parameters or resource IDs to navigate to specific records of interest.

Using FHIR search in Amazon HealthLake

You can search for a specific resource type with supported search parameters. You can also search for resource IDs in the server without specifying the resource type. For more information about FHIR-supported searches, see the FHIR Search Documentation.

The following parameters are supported in HealthLake.

- **Number** – Searches for a numerical value.
- **Date/DateTime** – Searches for a date or time reference.
- **String** – Searches for a sequence of characters.
- **Token** – Searches for a close-to-exact match against a string of characters, often against a pair of values.
- **Composite** – Searches for multiple parameters for a single resource type, using the AND operation.
- **Quantity** – Searches for a number, system, and code as values. A number is required, but system and code are optional.
- **Reference** – Searches for references to other FHIR resources. An example is a search for a reference to a patient within an Observation resource.
- **URI** – Searches for a string of characters that unambiguously identifies a particular resource.
- **Special** – Searches based on integrated medical NLP extensions.

To see which search parameters are supported for each resource type, use GETCapabilities in your FHIR HTTP client.

Supported search parameters and search modifiers in HealthLake

Common search parameters are present for all FHIR resources regardless of type. The following tables provide details about supported search parameter types, modifiers, comparators, common search parameters, and search operations.

Supported search parameters

<table>
<thead>
<tr>
<th>Search parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_id</td>
<td>Resource id (not a full URL)</td>
</tr>
</tbody>
</table>
Supported search parameters and search modifiers in HealthLake

<table>
<thead>
<tr>
<th>Search parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>_lastUpdated</td>
<td>Date last updated. Server has discretion on the boundary precision.</td>
</tr>
<tr>
<td>_tag</td>
<td>Search by a resource tag.</td>
</tr>
<tr>
<td>_profile</td>
<td>Search for all resources tagged with a profile.</td>
</tr>
</tbody>
</table>

Search modifiers allow for different types of matching logic on string-based fields. For example, you can specify that a larger string should contain a smaller string, or you can specify that the string should be an exact match of the string that is passed in.

**Supported search modifiers**

<table>
<thead>
<tr>
<th>Search modifier</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>:missing</td>
<td>All parameters except Composite</td>
</tr>
<tr>
<td>:exact</td>
<td>String</td>
</tr>
<tr>
<td>:contains</td>
<td>String</td>
</tr>
<tr>
<td>:not</td>
<td>Token</td>
</tr>
<tr>
<td>:text</td>
<td>Token</td>
</tr>
<tr>
<td>:identifier</td>
<td>Reference</td>
</tr>
</tbody>
</table>

Search comparators allow you to control the nature of the matching for number, date, and quantity fields. The following table lists search comparators and their definitions.

**Supported search comparators**

<table>
<thead>
<tr>
<th>Search comparator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eq</td>
<td>The value for the parameter in the resource is equal to the provided value.</td>
</tr>
<tr>
<td>ne</td>
<td>The value for the parameter in the resource is not equal to the provided value.</td>
</tr>
<tr>
<td>gt</td>
<td>The value for the parameter in the resource is greater than the provided value.</td>
</tr>
<tr>
<td>lt</td>
<td>The value for the parameter in the resource is less than the provided value.</td>
</tr>
<tr>
<td>ge</td>
<td>The value for the parameter in the resource is greater or equal to the provided value.</td>
</tr>
<tr>
<td>le</td>
<td>The value for the parameter in the resource is less or equal to the provided value.</td>
</tr>
<tr>
<td>sa</td>
<td>The value for the parameter in the resource starts after the provided value.</td>
</tr>
<tr>
<td>eb</td>
<td>The value for the parameter in the resource ends before the provided value.</td>
</tr>
</tbody>
</table>
Managing invalid search parameters

HealthLake manages invalid search parameters based on FHIR guidance. To specify how the server should handle unknown or unsupported search parameters, define the handling parameter in the HTTP header as follows.

- **handling = strict** – The server should return an error for unknown or unsupported search parameters.
- **handling = lenient** – The server should ignore unknown or unsupported search parameters.

Search with GET example

The following example demonstrates how to search DocumentReferences for streptococcal diagnosis and amoxicillin medication using an HTTP client with a GET search for the following input in HTTP.

```
GET /datastore/(Datastore ID)/r4/DocumentReference?_lastUpdated=le2021-12-19&infer-icd10cm-entity-text-concept-score;=streptococcal|0.6&infer-rxnorm-entity-text-concept-score=Amoxicillin|0.8 HTTP/1.1
Host: healthlake.us-east-1.amazonaws.com
Content-Type: application/json
Authorization: AWS4-HMAC-SHA256 Credential= (Redacted)
```

You will receive the following JSON response.

```
{
  "resourceType": "Bundle",
  "type": "searchset",
  "entry": [
    {
      "resource": {
        "resourceType": "DocumentReference",

Integrated medical natural language processing (NLP)

Amazon HealthLake automatically integrates with natural language processing (NLP) for the DocumentReference resource type. The integrated medical NLP output is provided as an extension to the existing DocumentReference resource. The integration involves reading the text data within the resource, and then calling the following integrated medical NLP operations: DetectEntities-V2, InferICD10-CM, and InferRxNorm. The response of each of the integrated medical NLP APIs is appended to the DocumentReference resource as an extension that is searchable. This enables users to identify patients through elements of their records that were previously buried within unstructured text. When you create a resource in HealthLake, the resource is updated with the response from the integrated medical NLP operations. These extensions follow the FHIR format for extensions with an identifying URL, and the respective value for the URL.

Important notice

The Amazon HealthLake data transformations feature (integrated medical NLP) is not a substitute for professional medical advice, diagnosis, or treatment. HealthLake integrated medical NLP provides confidence scores that indicate the level of confidence in the accuracy of the detected entities. Identify the right confidence threshold for your use case, and use high confidence thresholds in situations that require high accuracy. In certain use cases, results should be reviewed and verified by appropriately trained human reviewers.

Restrictions for integrated medical NLP

Integration with medical NLP is nearly seamless. However, there are two constraints:

- Integrated medical NLP operations have an input quota of 10 K characters. If the DocumentReference object is larger than the quota for the operation, HealthLake does not initiate the operation.
- If a Data Store is deleted before the operation is initiated, an update fails.

Search parameters

The following table lists the searchable attributes for integrated medical NLP.

<table>
<thead>
<tr>
<th>Search parameters</th>
<th>Finds matches for</th>
</tr>
</thead>
<tbody>
<tr>
<td>detectEntities-entity-category</td>
<td>Entity Category within the DetectEntities subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>detectEntities-entity-text</td>
<td>Entity Text within the DetectEntities subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>detectEntities-entity-type</td>
<td>Entity Type within the DetectEntities subextension within the AWS CM Extension</td>
</tr>
</tbody>
</table>
Search parameters

<table>
<thead>
<tr>
<th>Search parameters</th>
<th>Finds matches for</th>
</tr>
</thead>
<tbody>
<tr>
<td>detectEntities-entity-score</td>
<td>Entity Score within the DetectEntities subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-icd10cm-entity-text</td>
<td>Entity Text within the InferICD10CM subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-icd10cm-entity-score</td>
<td>Entity Score within the InferICD10CM subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-icd10cm-entity-concept-code</td>
<td>Entity Concept Code within the InferICD10CM subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-icd10cm-entity-concept-description</td>
<td>Entity Concept Description within the InferICD10CM subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-rxnorm-entity-score</td>
<td>Entity Score within the InferRxNorm subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-rxnorm-entity-text</td>
<td>Entity Text within the InferRxNorm subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-rxnorm-entity-concept-code</td>
<td>Entity Concept Code within the InferRxNorm subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-rxnorm-entity-concept-description</td>
<td>Entity Concept Description within the InferRxNorm subextension within the AWS CM Extension</td>
</tr>
<tr>
<td>infer-rxnorm-entity-concept-score</td>
<td>Entity Concept Score within the InferRxNorm subextension within the AWS CM Extension</td>
</tr>
</tbody>
</table>

To match the criteria where EntityText and EntityCategory are part of the same entity, HealthLake provides special search. The following table describes the special search parameters that are supported within HealthLake.

**Search parameters**

<table>
<thead>
<tr>
<th>Search parameters</th>
<th>Matches returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>detectEntities-entity-text-category</td>
<td>If there is at least one entity in the DetectEntities subextension that matches both the entityText and entityCategory.</td>
</tr>
<tr>
<td>detectEntities-entity-type-score</td>
<td>If there is at least one entity in the DetectEntities subextension that matches both the entityType and entityScore.</td>
</tr>
<tr>
<td>detectEntities-entity-text-score</td>
<td>If there is at least one entity in the DetectEntities subextension that matches both the entityText and entityScore.</td>
</tr>
<tr>
<td>detectEntities-entity-text-type</td>
<td>If there is at least one entity in the DetectEntities subextension that matches both the entityText and entityType.</td>
</tr>
</tbody>
</table>
The following example shows how integrated medical NLP detects entities and adds information to the FHIR resource for enrichment. The initial record would read as follows.

```json
{
    "resourceType": "DocumentReference",
    "text": {
        "status": "generated",
        "div": "<div xmlns="http://www.w3.org/1999/xhtml">
        Document: urn:oid:129.6.58.92.88336</div>
    },
    "status": "current",
    "content": [
        {
            "attachment": {
                "contentType": "text/plain",
                "data": "CjIwMTktMTItMzEKCiMgQ2hpZWYgQ29tcGxhaW50Ck5vIGNvbXBsYWludHMuCgojIEhpc3Rvcnkgb2YgUHJlc2Vydml2ZSB0aGlzIGFwcGxlIHRvY3VtZW50IGF2YXllYXRpdmUgY29uZHVjdGVkOgotIG1lZGljYXRpb24gcmVjb25jaWxpYXRpb24gKHByb2NlZHVyZSkK"
            }
        }
    ]
}
```
After enrichment, the resource will have the following information when read. This is a truncated record for clarity. Included in the response is whether the operation was successful or unsupported.

```json
{
    "resourceType": "DocumentReference",
    "status": "current",
    "content": [
        {
            "attachment": {
                "contentType": "text/plain",
                "data": "CjIwMTktMTItMzEKCiMgQ2hpZlYqZ29tIGxhaW50CK5vIGVlbXBsYW1lHMuCgojIEhpc3Rvcnkgb2YgUHJlc2VudCBJbGxuZXN0ZSBB
"
            }
        }
    ],
