This is the user guide for Amazon Inspector Classic. For information about the new Amazon Inspector, see the Amazon Inspector User Guide. To access the Amazon Inspector Classic console, open the Amazon Inspector console at https://console.aws.amazon.com/inspector/, and then choose Amazon Inspector Classic in the navigation pane.
What is Amazon Inspector Classic?

Note
The new Amazon Inspector, a completely rearchitected and redesigned version of Amazon Inspector Classic, is now available across AWS Regions. The new Amazon Inspector has expanded coverage to add support for container images residing in Amazon Elastic Container Registry (Amazon ECR) in addition to EC2 instances. The new Amazon Inspector offers multi-account support through integration with AWS Organizations, and continual software vulnerability and network reachability scanning based on common vulnerabilities and exposures (CVEs). We encourage you to explore and use these and other new and improved features, and to benefit from the significantly enhanced security value. To learn about features and pricing for the new Amazon Inspector, see Amazon Inspector. To learn how to move to the new Amazon Inspector, see Moving to the new Amazon Inspector (p. 8).

Amazon Inspector Classic tests the network accessibility of your Amazon EC2 instances and the security state of your applications that run on those instances. Amazon Inspector Classic assesses applications for exposure, vulnerabilities, and deviations from best practices. After performing an assessment, Amazon Inspector Classic produces a detailed list of security findings that is organized by level of severity.

With Amazon Inspector Classic, you can automate security vulnerability assessments throughout your development and deployment pipelines or for static production systems. This allows you to make security testing a regular part of development and IT operations.

Amazon Inspector Classic also offers predefined software called an agent that you can optionally install in the operating system of the EC2 instances that you want to assess. The agent monitors the behavior of the EC2 instances, including network, file system, and process activity. It also collects a wide set of behavior and configuration data (telemetry).

Important
AWS doesn’t guarantee that following the provided recommendations will resolve every potential security issue. The findings generated by Amazon Inspector Classic depend on your choice of rules packages included in each assessment template, the presence of non-AWS components in your system, and other factors. You are responsible for the security of applications, processes, and tools that run on AWS services. For more information, see the AWS Shared Responsibility Model for security.

Note
AWS is responsible for protecting the global infrastructure that runs the services offered in the AWS Cloud. This infrastructure consists of the hardware, software, networking, and facilities that run AWS services. AWS provides several reports from third-party auditors who have verified our compliance with a variety of computer security standards and regulations. For more information, see AWS Cloud Compliance.

For information about Amazon Inspector Classic terminology, see Amazon Inspector Classic terminology and concepts (p. 3).

Benefits of Amazon Inspector Classic

Here are some of the main benefits of Amazon Inspector Classic:

- Integrate automated security checks into your regular deployment and production processes
  – Assess the security of your AWS resources for forensics, troubleshooting, or active auditing
purposes. Run the assessments during the development process, or run them in a stable production environment.

- **Find application security issues** – Automate the security assessment of your applications and proactively identify vulnerabilities. This allows you to develop and iterate on new applications quickly, and assess compliance with best practices and policies.
- **Gain a deeper understanding of your AWS resources** – Stay informed about the activity and configuration data of your AWS resources by reviewing the findings that Amazon Inspector Classic produces.

Features of Amazon Inspector Classic

Here are some of the main features of Amazon Inspector Classic:

- **Configuration scanning and activity monitoring engine** – Amazon Inspector Classic provides an agent that analyzes system and resource configuration. It also monitors activity to determine what an assessment target looks like, how it behaves, and its dependent components. The combination of this telemetry provides a complete picture of the target and its potential security or compliance issues.
- **Built-in content library** – Amazon Inspector Classic includes a built-in library of rules and reports. These include checks against best practices, common compliance standards, and vulnerabilities. The checks include detailed recommended steps for resolving potential security issues.
- **Automation through an API** – Amazon Inspector Classic can be fully automated through an API. This allows you to incorporate security testing into the development and design process, including selecting, executing, and reporting the results of those tests.

Accessing Amazon Inspector Classic

You can work with the Amazon Inspector Classic service in any of the following ways:

**Amazon Inspector Classic Console**

Sign in to the AWS Management Console and open the Amazon Inspector Classic console at https://console.aws.amazon.com/inspector/.

The console is a browser-based interface that lets you access and use the Amazon Inspector Classic service.

**AWS SDKs**

AWS provides software development kits (SDKs) that consist of libraries and sample code for various programming languages and platforms. These include Java, Python, Ruby, .NET, iOS, Android, and more. The SDKs provide a convenient way to create programmatic access to the Amazon Inspector Classic service. For information about the AWS SDKs, including how to download and install them, see [Tools for Amazon Web Services](https://aws.amazon.com/getting-started/tools/).

**Amazon Inspector Classic HTTPS API**

You can access Amazon Inspector Classic and AWS programmatically by using the Amazon Inspector Classic HTTPS API, which lets you issue HTTPS requests directly to the service. For more information, see the [Amazon Inspector Classic API Reference](https://docs.aws.amazon.com/inspector/latest/APIReference/).

**AWS Command Line Tools**

You can use the AWS command line tools to run commands at your system's command line to perform Amazon Inspector Classic tasks. The command line tools are also useful if you want to build scripts that perform AWS tasks. For more information, see the [Amazon Inspector Classic AWS Command Line Interface](https://docs.aws.amazon.com/inspector/latest/cli/).
Amazon Inspector Classic terminology and concepts

As you get started with Amazon Inspector Classic, you can benefit from learning about its key concepts.

Amazon Inspector Classic agent

A software agent that you can install on the EC2 instances that are included in the assessment target. The agent collects a wide set of configuration data (telemetry). For more information, see Amazon Inspector Classic agents (p. 38).

Assessment run

The process of discovering potential security issues through the analysis of your assessment target’s configuration against specified rules packages. During an assessment run, Amazon Inspector monitors, collects, and analyzes configuration data (telemetry) from resources within the specified target. Next, Amazon Inspector analyzes the data and compares it against a set of security rules packages that are specified in the assessment template used during the assessment run. A completed assessment run produces a list of findings, which are potential security issues of various levels of severity. For more information, see Amazon Inspector Classic assessment templates and assessment runs (p. 67).

Assessment target

In the context of Amazon Inspector Classic, a collection of AWS resources that work together as a unit to help you accomplish your business goals. Amazon Inspector Classic evaluates the security state of the resources that constitute the assessment target.

Important

Currently, your Amazon Inspector Classic assessment targets can consist only of EC2 instances. For more information, see Amazon Inspector Classic service limits (p. 4).

To create an Amazon Inspector Classic assessment target, you must first tag your EC2 instances with key-value pairs of your choice. Next, you can create a view of these tagged EC2 instances that have common keys or common values. For more information, see Amazon Inspector Classic assessment targets (p. 53).

Assessment template

A configuration that is used during your assessment run. The template includes the following:

- Rules packages that Amazon Inspector Classic uses to evaluate your assessment target
- Amazon SNS topics that you want Amazon Inspector Classic to send notifications to about assessment run states and findings
- Tags (key-value pairs) that you can assign to findings that are generated by the assessment run
- The duration of the assessment run

Finding

A potential security issue that Amazon Inspector Classic discovers during an assessment run of the specified target. Findings are displayed in the Amazon Inspector Classic console or retrieved through the API. They contain both a detailed description of the security issue and a recommendation on how to fix it. For more information, see Amazon Inspector Classic findings (p. 73).

Rule

In the context of Amazon Inspector Classic, a security check performed during an assessment run. When a rule detects a potential security issue, Amazon Inspector Classic generates a finding that describes the issue.
Rules package

In the context of Amazon Inspector Classic, a collection of rules. A rules package corresponds to a security goal that you might have. You can specify your security goal by selecting the appropriate rules package when you create an Amazon Inspector Classic assessment template. For more information, see Amazon Inspector Classic rules packages and rules (p. 56).

Telemetry

Installed package information and software configuration for an EC2 instance. Amazon Inspector Classic collects the data during an assessment run.

Amazon Inspector Classic service limits

The following table shows the Amazon Inspector Classic limits for an AWS account.

Important
Currently, your assessment targets can consist only of EC2 instances.

The following are Amazon Inspector Classic limits per AWS account per region:

<table>
<thead>
<tr>
<th>Resource</th>
<th>Default Limit</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instances in running assessments</td>
<td>500</td>
<td>The maximum number of EC2 instances that can be included across all running assessments per account per region.</td>
</tr>
<tr>
<td>Assessment runs</td>
<td>50000</td>
<td>The maximum number of assessment runs that you can create per account per region. You can have multiple assessment runs happening at the same time as long as the assessment targets used for these runs do not contain overlapping EC2 instances.</td>
</tr>
<tr>
<td>Assessment Templates</td>
<td>500</td>
<td>The maximum number of assessment templates that you can have at any given time per account per region.</td>
</tr>
<tr>
<td>Assessment Targets</td>
<td>50</td>
<td>The maximum number of assessment targets that you can have at any given time per account per region.</td>
</tr>
</tbody>
</table>

Unless otherwise noted, these limits can be increased upon request by contacting the AWS Support Center.
Amazon Inspector Classic pricing

Amazon Inspector Classic pricing is based on the number of EC2 instances included in each assessment and the rules packages used in those assessments.

Pricing for the network reachability rules package

Amazon Inspector Classic assessments with the network reachability rules packages are priced per instance per assessment (instance-assessment) per month. For example, if you run 1 assessment against 1 instance, that is 1 instance-assessment. If you run 1 assessment against 10 instances, that is 10 instance-assessments. The pricing starts at $0.15 per instance-assessment per month with volume discounting to achieve as low as $0.04 per instance-assessment per month.

Free trial details

<table>
<thead>
<tr>
<th>First 90-days using Amazon Inspector Classic</th>
<th>Per instance-assessment price</th>
</tr>
</thead>
<tbody>
<tr>
<td>First 250 instance-assessments</td>
<td>$0.00</td>
</tr>
</tbody>
</table>

Pricing details

<table>
<thead>
<tr>
<th>In a given month</th>
<th>Per instance-assessment price</th>
</tr>
</thead>
<tbody>
<tr>
<td>First 250 instance-assessments</td>
<td>$0.15</td>
</tr>
<tr>
<td>Next 750 instance-assessments</td>
<td>$0.13</td>
</tr>
<tr>
<td>Next 4,000 instance-assessments</td>
<td>$0.10</td>
</tr>
<tr>
<td>Next 45,000 instance-assessments</td>
<td>$0.07</td>
</tr>
<tr>
<td>All other instance-assessments</td>
<td>$0.04</td>
</tr>
</tbody>
</table>

Pricing for host assessment rules packages

For any combination of Common Vulnerabilities and Exposures (CVE), Center for Internet Security (CIS) benchmarks, Security Best Practices, and Runtime Behavior Analysis included in assessments

Amazon Inspector Classic's host assessment rules packages use an agent deployed on the Amazon EC2 Instances running the applications you want to assess. Assessments with the host rules packages are priced per agent per assessment (agent-assessment) per month. For example, if you run 1 assessment against 1 agent, that is 1 agent-assessment. If you run 1 assessment against 10 agents, that is 10 agent-assessments. The pricing starts at $0.30 per agent-assessment per month with volume discounting to achieve as low as $0.05 per agent-assessment per month.

Free trial details

<table>

Amazon Inspector Classic supported operating systems and Regions

This chapter provides information about the operating systems and AWS Regions that Amazon Inspector Classic supports.

**Important**

Currently, Amazon Inspector Classic assessment targets can consist only of EC2 instances. You can run an agentless assessment with the Network Reachability (p. 57) rules package on any EC2 instances regardless of operating system.

For information about the Amazon Inspector Classic rules packages that are available across supported operating systems, see Amazon Inspector Classic rules packages for supported operating systems (p. 84).

**Topics**

- Supported Linux-based operating systems for the Amazon Inspector Classic agent (p. 6)
- Supported Windows-based operating systems for the Amazon Inspector Classic agent (p. 7)
- Supported AWS Regions (p. 7)

**Supported Linux-based operating systems for the Amazon Inspector Classic agent**

You can use the Amazon Inspector Classic agent on 64-bit x86 and Arm EC2 instances. The agent is compatible with the following versions of Linux-based operating systems:

- **64-bit x86 instances**
  - Amazon Linux 2
  - Ubuntu (20.04 LTS, 18.04 LTS, 16.04 LTS, 14.04 LTS)
  - Debian (10.x, 9.0 - 9.5, 8.0 - 8.7)
  - Red Hat Enterprise Linux (8.x, 7.2 - 7.x, 6.2 - 6.9)
  - CentOS (7.2 - 7.x, 6.2 - 6.9)

- **Arm instances**
Supported Windows-based operating systems for the Amazon Inspector Classic agent

You can use the Amazon Inspector Classic agent only on EC2 instances that run the 64-bit version of the following Windows-based operating systems:

- Windows Server 2019 Base
- Windows Server 2016 Base
- Windows Server 2012 R2
- Windows Server 2012
- Windows Server 2008 R2

Supported AWS Regions

Amazon Inspector Classic is supported in the following AWS Regions:

- US East (Ohio) us-east-2
- US East (N. Virginia) us-east-1
- US West (N. California) us-west-1
- US West (Oregon) us-west-2
- Asia Pacific (Mumbai) ap-south-1
- Asia Pacific (Seoul) ap-northeast-2
- Asia Pacific (Sydney) ap-southeast-2
- Asia Pacific (Tokyo) ap-northeast-1
- Europe (Frankfurt) eu-central-1
- Europe (Ireland) eu-west-1
- Europe (London) eu-west-2
- Europe (Stockholm) eu-north-1
- AWS GovCloud (US-East) gov-us-east-1
- AWS GovCloud (US-West) gov-us-east-2

**Note**
The Network Reachability (p. 57) rules package is not available in the AWS GovCloud (US) Regions.
Moving to the new Amazon Inspector

The new Amazon Inspector is now available globally in AWS Regions. The new Amazon Inspector is a completely rearchitected and redesigned version of the existing Amazon Inspector, now called Amazon Inspector Classic. The following capabilities are the key Amazon Inspector enhancements:

- **Built for scale** – The new Amazon Inspector is built for scale and the dynamic cloud environment. There is no limit to the number of instances or images that can be scanned in an account.
- **Support for container images** – The new Amazon Inspector also scans container images residing in Amazon Elastic Container Registry (Amazon ECR) for software vulnerabilities.
- **Support for multi-account management** – The new Amazon Inspector is integrated with Organizations. This allows you to delegate an administrator account for Amazon Inspector from your organization. The delegated administrator account is a centralized account that consolidates all findings and can configure all member accounts.
- **Uses AWS Systems Manager Agent (SSM Agent)** – With the new Amazon Inspector, you no longer need to install and maintain a stand-alone Amazon Inspector agent on all of your EC2 instances. The new Amazon Inspector leverages the widely-deployed SSM Agent.
- **Automated and continual scanning** – With Amazon Inspector Classic, you manually set up assessment targets, assessment templates, and configure the frequency of the assessments. However, the new version of Amazon Inspector automatically detects all newly launched EC2 instances and eligible container images pushed to Amazon ECR and immediately scans them for software vulnerabilities and unintended network exposure. The resources are automatically re-scanned based on several triggers, including a new EC2 instance being launched, a container image being pushed to Amazon ECR, installation of a new package in an EC2 instance, installation of a patch, or publication of a new Common Vulnerabilities and Exposure (CVE) that impacts the resource.
- **Amazon Inspector risk score** – The new Amazon Inspector calculates an Amazon Inspector risk score to help prioritize your findings. The risk score is calculated by correlating up-to-date CVE information with temporal and environmental factors like network accessibility and exploitability information.
- **More integrations** – All findings are aggregated in a newly designed Amazon Inspector console and pushed to AWS Security Hub and Amazon EventBridge to automate workflows, such as ticketing. Container image related findings are also pushed to Amazon ECR.

To learn about all features and pricing for the new Amazon Inspector, see the Amazon Inspector User Guide.

While we will continue to support Amazon Inspector Classic for some time, and customers can use both the new Amazon Inspector and Amazon Inspector Classic in the same account, we highly encourage you to migrate to the new Amazon Inspector. The following sections walks you through the process of moving from Amazon Inspector Classic to the new Amazon Inspector.

**Topics**

- Step 1: (Optional) Export assessment reports and findings (p. 9)
- Step 2: Delete all scheduled assessment runs in Amazon Inspector Classic (p. 9)
- Step 3: Enable the new Amazon Inspector (p. 9)
Step 1: (Optional) Export assessment reports and findings

To save the assessment reports and findings in Amazon Inspector Classic, generate an assessment report.

To generate an assessment report

1. On the Assessment runs page, locate the assessment run that you want to generate a report for. Make sure that its status is Analysis complete.
2. Under the Reports column for this assessment run, choose the reports icon.

   **Important**
   The reports icon is present in the Reports column only for those assessment runs that took place or will take place after April 25, 2017. That is when assessment reports in Amazon Inspector Classic became available.

3. In the Assessment report dialog box, choose the type of report that you want to view (either a Findings report or a Full report) and the report format (HTML or PDF). Then choose Generate report.

Step 2: Delete all scheduled assessment runs in Amazon Inspector Classic

To disable Amazon Inspector Classic, delete all the assessment templates in your account in all active AWS Regions. Deleting assessment templates stops all your scheduled future assessment runs.

To delete an assessment template

• On the Assessment Templates page, choose the template that you want to delete, and then choose Delete. When prompted for confirmation, choose Yes.

   **Important**
   When you delete an assessment template, all assessment runs, findings, and versions of the reports associated with this template are also deleted.

Step 3: Enable the new Amazon Inspector

You can enable the new Amazon Inspector using the AWS Management Console or the new Amazon Inspector APIs. To get started with the new Amazon Inspector, see Getting Started in the Amazon Inspector User Guide.
Getting started with Amazon Inspector Classic

This tutorial shows you how to set up Amazon Inspector Classic and get started by creating and running your first assessment.

**Important**
To use Amazon Inspector Classic, you must have an AWS account. When you sign up for AWS, your account is automatically signed up for all services in AWS, including Amazon Inspector Classic. If you don't have an AWS account, use the following procedure to create one.

**To sign up for AWS**

2. Follow the online instructions.

   Part of the sign-up procedure involves receiving a phone call and entering a verification code on the phone keypad.

**Topics**
- Prerequisites for using Amazon Inspector Classic (p. 10)
- One-click setup (p. 10)
- Advanced setup (p. 11)

Prerequisites for using Amazon Inspector Classic

When you launch the Amazon Inspector Classic console for the first time, choose **Get Started** and complete the following prerequisite tasks. You must complete these tasks before you can perform an Amazon Inspector Classic assessment run:

- You must have at least one Amazon EC2 instance running in your AWS environment to run an Amazon Inspector Classic assessment. For information about launching EC2 instances, see the Amazon Elastic Compute Cloud Documentation.
- In most cases, the Amazon Inspector agent must be running on each EC2 instance in your assessment target. For information about installing an agent, see Installing Amazon Inspector Classic agents (p. 40). Alternatively, you can use Systems Manager Run Command to install the agent on your Amazon EC2 instances. For more information about Amazon Inspector agents, see Amazon Inspector Classic agents (p. 38).

One-click setup

The following procedure shows you how to create and run an automatic assessment using a pre-built template and pre-defined scheduling parameters (once a week or one time only) on all available EC2 instances in the current AWS account and Region.

1. Sign in to the AWS Management Console and open the Amazon Inspector Classic console at https://console.aws.amazon.com/inspector/.
2. On the Welcome page, choose the type of assessment that you would like to run. Network Assessments analyze the network configurations of your AWS environment for vulnerabilities, and do not require an Amazon Inspector Classic agent. Host Assessments analyze the on-host software and configurations of your EC2 instances for vulnerabilities, and requires an agent to be installed on the EC2 instances.

Choose either Run weekly (recommended) or Run once. As soon as you make your choice, the service automatically creates the assessment for you. Specifically, the service does the following:

a. Creates a service-linked role (p. 32).

Note
To identify the EC2 instances that are specified in the assessment targets, Amazon Inspector Classic needs to enumerate your EC2 instances and tags. Amazon Inspector Classic gets access to these resources in your AWS account through a service-linked role called AWSServiceRoleForAmazonInspector. For more information about service-linked roles, see Using service-linked roles for Amazon Inspector Classic (p. 32) and Using Service-Linked Roles.

b. If applicable, installs an Amazon Inspector Classic agent (p. 38) on all available Amazon EC2 instances in your AWS account and AWS Region.

Note
The service installs an Amazon Inspector Classic agent only on those EC2 instances that allow AWS Systems Manager Run Command. To use this option, make sure that all of your EC2 instances in the current AWS account and AWS Region have the SSM Agent installed and have an IAM role that allows Run Command. For more information, see Installing the agent on multiple EC2 instances using the Systems Manager Run Command (p. 41).

c. Adds those instances to an assessment target (p. 53).

d. Includes that target in an assessment template (p. 67) with a standardized set of rules packages.

e. Runs the assessment weekly or only once, depending on whether you chose Run weekly (recommended) or Run once.

3. In the Confirmation dialog box, choose OK. Amazon Inspector Classic automatically runs your assessment.

Advanced setup

The following procedure shows you how to choose specific Amazon EC2 instances, rules packages, and scheduling parameters to include in an assessment target and template.

1. On the Welcome page, choose Advanced setup.

2. On the Define an assessment target page, enter the name of your assessment target.

3. For All Instances, you can keep the check box selected to include all EC2 instances in your AWS account and Region in the assessment target. If you want to choose which EC2 instances to include, clear the All Instances check box, and enter the Key and Value tags that are associated with the target EC2 instances. For more information about tagging your EC2 instances, see Tagging Your Amazon EC2 Resources.

4. For Install Agents, you can keep the check box selected by default if your instances allows System Manager Run Command. The service installs an Amazon Inspector Classic agent on all EC2 instances in the assessment target that allow System Manager Run Command. To use this option, make sure that all of your EC2 instances in the current AWS account and AWS region have the SSM Agent installed and have an IAM role that allows Run Command. For more information, see Installing the agent on multiple EC2 instances using the Systems Manager Run Command (p. 41). If you want to manually install the agent, see Installing Amazon Inspector Agents (p. 40).
5. Choose **Next**.
6. On the **Define an assessment template** page, enter the name of your assessment template.
7. For **Rules packages**, choose the rules packages to include in the assessment template. For more information about rules packages, see Amazon Inspector Rules Packages and Rules (p. 56).
8. For **Duration**, choose the duration of your assessment run.
9. For **Assessment Schedule**, you can set a schedule for recurring assessment runs.
10. Choose **Next**.
11. On the **Review** page, review your choices for the assessment target and template. If you are satisfied with the configuration, choose **Create**. If you set an assessment schedule for your assessment template, the assessment automatically runs after you choose **Create**.

   **Note**
   To identify the EC2 instances that are specified in the assessment targets, Amazon Inspector Classic needs to enumerate your EC2 instances and tags. Amazon Inspector Classic gets access to these resources in your AWS account through a service-linked role called AWSServiceRoleForAmazonInspector. For more information about service-linked roles, see Using service-linked roles for Amazon Inspector Classic (p. 32) and Using Service-Linked Roles.

12. If you didn't set up an assessment schedule, navigate to your assessment template through the console, and then choose **Run**.

13. To track the progress of the assessment run, in the navigation pane of the console, choose **Assessment runs**, and then choose **Findings**. For more information about findings, see Amazon Inspector Classic findings (p. 73).
Tutorials for Amazon Inspector Classic

The following tutorials show you how to perform Amazon Inspector Classic assessment runs on the Red Hat Enterprise Linux and Ubuntu operating systems.

Tutorials

- Tutorial: Using Amazon Inspector Classic with Red Hat Enterprise Linux (p. 13)
- Tutorial: Using Amazon Inspector Classic with Ubuntu Server (p. 16)

Amazon Inspector Classic tutorial - Red Hat Enterprise Linux

Before you follow the instructions in this tutorial, we recommend that you get familiar with the Amazon Inspector Classic terminology and concepts (p. 3).

This tutorial shows how to use Amazon Inspector Classic to analyze the behavior of an EC2 instance that runs the Red Hat Enterprise Linux 7.5 operating system. It provides step-by-step instructions on how to navigate the Amazon Inspector Classic workflow. The workflow includes preparing Amazon EC2 instances, running an assessment template, and performing the recommended security fixes generated in the assessment's findings. If you are a first-time user and would like to set up and run an Amazon Inspector Classic assessment with one click, see Creating a Basic Assessment (p. 10).

Topics

- Step 1: Set up an Amazon EC2 instance to use with Amazon Inspector Classic (p. 13)
- Step 2: Modify your Amazon EC2 instance (p. 13)
- Step 3: Create an assessment target and install an agent on the EC2 instance (p. 14)
- Step 4: Create and run your assessment template (p. 14)
- Step 5: Locate and analyze your finding (p. 15)
- Step 6: Apply the recommended fix to your assessment target (p. 16)

Step 1: Set up an Amazon EC2 instance to use with Amazon Inspector Classic

For this tutorial, create one EC2 instance that runs Red Hat Enterprise Linux 7.5, and tag it using the Name key and a value of InspectorEC2InstanceLinux.

Note
For more information about tagging EC2 instances, see Resources and Tags.

Step 2: Modify your Amazon EC2 instance

For this tutorial, you modify your target EC2 instance to expose it to the potential security issue CVE-2018-1111. For more information, see https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2018-1111 and Common vulnerabilities and exposures (p. 60).
Step 3: Create an assessment target and install an agent on the EC2 instance

Amazon Inspector Classic uses assessment targets to designate the AWS resources that you want to evaluate.

To create an assessment target and install an agent on an EC2 instance

1. Sign in to the AWS Management Console and open the Amazon Inspector Classic console at https://console.aws.amazon.com/inspector/.
2. In the navigation pane, choose Assessment targets, and then choose Create.
   
   Do the following:
   
   a. For Name, enter the name for your assessment target.
      
      For this tutorial, enter MyTargetLinux.
   
   b. For Use Tags, choose the EC2 instances that you want to include in this assessment target by entering values for the Key and Value fields.
      
      For this tutorial, choose the EC2 instance that you created in the preceding step by entering Name in the Key field and InspectorEC2InstanceLinux in the Value field.
      
      To include all EC2 instances in your AWS account and Region in the assessment target, select the All Instances check box.
   
   c. Choose Save.
   
   d. Install an Amazon Inspector Classic agent on your tagged EC2 instance. To install an agent on all EC2 instances included in an assessment target, select the Install Agents check box.
      
      Note
      
      You can also install the Amazon Inspector Classic agent using the AWS Systems Manager Run Command (p. 41). To install the agent on all instances in the assessment target, you can specify the same tags that you used when creating the assessment target. Or you can install the Amazon Inspector Classic agent on your EC2 instance manually. For more information, see Installing Amazon Inspector Classic agents (p. 40).
      
   e. Choose Save.

   Note
   
   At this point, Amazon Inspector Classic creates a service-linked role called AWSServiceRoleForAmazonInspector. The role grants Amazon Inspector Classic the necessary access to your resources. For more information, see Creating a service-linked role for Amazon Inspector Classic (p. 33).

Step 4: Create and run your assessment template

To create and run your template

1. In the navigation pane, choose Assessment templates, and then choose Create.
2. For **Name**, enter the name for your assessment template. For this tutorial, enter **MyFirstTemplateLinux**.
3. For **Target name**, choose the assessment target that you created above, **MyTargetLinux**.
4. For **Rules packages**, choose the rules packages that you want to use in this assessment template.
   
   For this tutorial, choose **Common Vulnerabilities and Exposures-1.1**.
5. For **Duration**, specify the duration for your assessment template.
   
   For this tutorial, select **15 minutes**.
6. Choose **Create and run**.

### Step 5: Locate and analyze your finding

A completed assessment run produces a set of findings, or potential security issues that Amazon Inspector Classic discovers in your assessment target. You can review the findings and follow the recommended steps to resolve the potential security issues.

In this tutorial, if you complete the preceding steps, your assessment run produces a finding against the common vulnerability **CVE-2018-1111**.

**To locate and analyze your finding**

1. In the navigation pane, choose **Assessment runs**. Verify that the status of the run for the assessment template called **MyFirstTemplateLinux** is set to **Collecting data**. This indicates that the assessment run is currently in progress, and the telemetry data for your target is being collected and analyzed against the selected rules packages.
2. You can't view the findings generated by the assessment run while it is still in progress. Let the assessment run complete its entire duration. However, for this tutorial, you can stop the run after several minutes.

   The status of **MyFirstTemplateLinux** changes first to **Stopping**, then in a few minutes to **Analyzing**, and then finally to **Analysis complete**. To see this change in status, choose the **Refresh** icon.
3. In the navigation pane, choose **Findings**.

   You can see a new finding of **High** severity called **Instance InspectorEC2InstanceLinux is vulnerable to CVE-2018-1111**.

     **Note**
     
     If you don't see the new finding, choose the **Refresh** icon.

To expand the view and see the details of this finding, choose the arrow to the left of the finding. The details of the finding include the following:

- ARN of the finding
- Name of the assessment run that produced this finding
- Name of the assessment target that produced this finding
- Name of the assessment template that produced this finding
- Assessment run start time
- Assessment run end time
- Assessment run status
- Name of the rules package that includes the rule that triggered this finding
- Amazon Inspector Classic agent ID
- Name of the finding
- Severity of the finding
• Description of the finding
• Recommended remediation steps that you can complete to fix the potential security issue described by the finding

Step 6: Apply the recommended fix to your assessment target

For this tutorial, you modified your assessment target to expose it to the potential security issue CVE-2018-1111. In this procedure, you apply the recommended fix for the issue.

To apply the fix to your target

1. Connect to your instance InspectorEC2InstanceLinux that you created in the preceding section, and run the following command:
   
   ```
sudo yum update dhclient-12:4.2.5-68.el7
   ```

2. On the Assessment templates page, choose MyFirstTemplateLinux, and then choose Run to start a new assessment run using this template.

3. Follow the steps in Step 5: Locate and analyze your finding (p. 15) to see the findings that result from this subsequent run of the MyFirstTemplateLinux template.

Because you resolved the CVE-2018-1111 security issue, you should no longer see a finding for it.

Amazon Inspector Classic tutorial - Ubuntu Server

Before you follow the instructions in this tutorial, we recommend that you get familiar with the Amazon Inspector Classic terminology and concepts (p. 3).

This tutorial shows how to use Amazon Inspector Classic to analyze the behavior of an EC2 instance that runs the Ubuntu Server 16.04 LTS operating system. It provides step-by-step instructions on how to navigate the Amazon Inspector Classic workflow.

If you are a first-time user and would like to set up and run an Amazon Inspector Classic assessment with one click, see Creating a Basic Assessment (p. 10).

Topics

• Step 1: Set up an Amazon EC2 instance to use with Amazon Inspector Classic (p. 16)
• Step 2: Create an assessment target and install an agent on the EC2 instance (p. 17)
• Step 3: Create and run your assessment template (p. 17)
• Step 4: Locate and analyze generated findings (p. 18)
• Step 5: Apply the recommended fix to your assessment target (p. 18)

Step 1: Set up an Amazon EC2 instance to use with Amazon Inspector Classic

To set up an EC2 instance

• For this tutorial, create one EC2 instance running Ubuntu Server 16.04 LTS and tag it using the Name key and a value of InspectorEC2InstanceUbuntu.
Step 2: Create an assessment target and install an agent on the EC2 instance

Amazon Inspector Classic uses assessment targets to designate the AWS resources to evaluate.

To create an assessment target and install an agent on the EC2 instance

1. Sign in to the AWS Management Console and open the Amazon Inspector Classic console at https://console.aws.amazon.com/inspector/.
2. In the navigation pane, choose Assessment targets, and then choose Create.
3. For Name, enter the name for your assessment target. For this tutorial, type MyTargetUbuntu.
4. For Use Tags, choose the EC2 instances that you want to include in this assessment target by entering values for the Key and Value fields. For this tutorial, choose the EC2 instance that you created in the preceding step by entering Name in the Key field and InspectorEC2InstanceUbuntu in the Value field.
5. Install an Amazon Inspector Classic Agent on your tagged EC2 instance. To install an agent on all EC2 instances included in an assessment target, select the Install Agents box.
   
   Note
   You can also install the Amazon Inspector Agent using the Systems Manager Run Command (p. 41). To install the agent on all instances in the assessment target, you can specify the same tags used for creating the assessment target. Or you can install the Amazon Inspector Agent on your EC2 instance manually. For more information, see Installing Amazon Inspector Classic agents (p. 40).
6. Choose Save.

   Note
   At this point, a service-linked role called AWSServiceRoleForAmazonInspector is created to grant Amazon Inspector Classic access to your resources. For more information, see Creating a service-linked role for Amazon Inspector Classic (p. 33).

Step 3: Create and run your assessment template

To create and run your template

1. If you are using Advanced setup, you are directed to the Define an assessment template page. Otherwise, navigate to the Assessment templates page, and then choose Create.
2. For Name, enter the name for your assessment template. For this tutorial, enter MyFirstTemplateUbuntu.
3. For Target name, choose the assessment target that you created above, MyTargetUbuntu.
4. For Rules packages, use the dropdown menu to choose the rules packages that you want to use in this assessment template.
Step 4: Locate and analyze generated findings

A completed assessment run produces a set of findings, or potential security issues that Amazon Inspector Classic discovers in your assessment target. You can review the findings and follow the recommended steps to resolve the potential security issues.

1. Navigate to the Assessment Runs page. Verify that the status of the run for the assessment template called MyFirstTemplateUbuntu that you created in the preceding step is set to Collecting data. This indicates that the assessment run is currently in progress, and the telemetry data for your target is being collected and analyzed against the selected rules packages.

2. You can't view the findings generated by the assessment run while it is still in progress. Let the assessment run complete its entire duration.

   The status of MyFirstTemplateUbuntu changes first to Stopping, then in a few minutes to Analyzing, and then finally to Analysis complete. To see this change in status, choose the Refresh icon.

3. Navigate to the Findings page.

   To expand the view and see the details of a finding, choose the arrow to the left of the finding. The details of the finding include the following:

   • ARN of the finding
   • Name of the assessment run that produced this finding
   • Name of the assessment target that produced this finding
   • Name of the assessment template that produced this finding
   • Assessment run start time
   • Assessment run end time
   • Assessment run status
   • Name of the rules package that includes the rule that triggered the finding
   • Amazon Inspector Classic agent ID
   • Name of the finding
   • Severity of the finding
   • Description of the finding
   • Recommended remediation steps that you can complete to fix the potential security issue described by the finding

Step 5: Apply the recommended fix to your assessment target

In this procedure, you apply an update to fix the uncovered issues.

1. Connect to your instance InspectorEC2InstanceUbuntu, and perform a package update.
2. On the **Assessment templates** page, choose **MyFirstTemplateUbuntu**, and then choose **Run** to start a new run using this template.

3. Follow the steps in **Step 4: Locate and analyze generated findings (p. 18)** to see the findings that result from this subsequent run of the **MyFirstTemplateUbuntu** template.

The package update should have resolved the findings from the first run of the template.
Security in Amazon Inspector Classic

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from data centers and network architectures that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the AWS Compliance Programs. To learn about the compliance programs that apply to Amazon Inspector Classic, see AWS Services in Scope by Compliance Program.

- **Security in the cloud** – Your responsibility is determined by the AWS service that you use. You are also responsible for other factors including the sensitivity of your data, your company’s requirements, and applicable laws and regulations.

This documentation helps you understand how to apply the shared responsibility model when using Amazon Inspector Classic. The following topics show you how to configure Amazon Inspector Classic to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Amazon Inspector Classic resources.

Topics
- Data protection in Amazon Inspector Classic (p. 20)
- Identity and access management for Amazon Inspector Classic (p. 21)
- Logging and monitoring in Amazon Inspector Classic (p. 35)
- Incident response in Amazon Inspector Classic (p. 35)
- Compliance validation for (p. 35)
- Resilience in Amazon Inspector Classic (p. 36)
- Infrastructure security in (p. 36)
- Configuration and vulnerability analysis in Amazon Inspector Classic (p. 36)
- Security best practices for Amazon Inspector Classic (p. 37)

Data protection in Amazon Inspector Classic

The AWS shared responsibility model applies to data protection in Amazon Inspector Classic. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. This content includes the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual user accounts with AWS Identity and Access Management (IAM). That way each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
• Use SSL/TLS to communicate with AWS resources. We recommend TLS 1.2 or later.
• Set up API and user activity logging with AWS CloudTrail.
• Use AWS encryption solutions, along with all default security controls within AWS services.
• Use advanced managed security services such as Amazon Macie, which assists in discovering and securing personal data that is stored in Amazon S3.
• If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.

We strongly recommend that you never put confidential or sensitive information, such as your customers’ email addresses, into tags or free-form fields such as a Name field. This includes when you work with Amazon Inspector Classic or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

Topics
• Encryption of data at rest (p. 21)
• Encryption of data in transit (p. 21)

Encryption of data at rest

The telemetry data that an Amazon Inspector Classic agent generates during assessment runs is formatted in JSON files. These files are delivered in near-real-time over TLS to Amazon Inspector Classic, where they are encrypted with a per-assessment-run, ephemeral AWS KMS-derived key.

The files are securely stored in S3 buckets that are dedicated to Amazon Inspector Classic. The rules engine of Amazon Inspector Classic does the following:
• Accesses the encrypted telemetry data in the S3 bucket
• Decrypts it in memory
• Processes the data against the configured assessment rules to generate findings

Encryption of data in transit

During an assessment, the agent gathers telemetry data from the system to send back to Amazon Inspector Classic over a TLS-protected channel.

Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Identity and access management for Amazon Inspector Classic

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be authenticated (signed in) and authorized (have permissions) to use Amazon Inspector Classic resources. IAM is an AWS service that you can use with no additional charge.
Audience

How you use AWS Identity and Access Management (IAM) differs, depending on the work that you do in Amazon Inspector Classic.

**Service user** – If you use the Amazon Inspector Classic service to do your job, then your administrator provides you with the credentials and permissions that you need. As you use more Amazon Inspector Classic features to do your work, you might need additional permissions. Understanding how access is managed can help you request the right permissions from your administrator. If you cannot access a feature in Amazon Inspector Classic, see Troubleshooting Amazon Inspector Classic identity and access (p. 30).

**Service administrator** – If you’re in charge of Amazon Inspector Classic resources at your company, you probably have full access to Amazon Inspector Classic. It’s your job to determine which Amazon Inspector Classic features and resources your employees should access. You must then submit requests to your IAM administrator to change the permissions of your service users. Review the information on this page to understand the basic concepts of IAM. To learn more about how your company can use IAM with Amazon Inspector Classic, see How Amazon Inspector Classic works with IAM (p. 25).

**IAM administrator** – If you’re an IAM administrator, you might want to learn details about how you can write policies to manage access to Amazon Inspector Classic. To view example Amazon Inspector Classic identity-based policies that you can use in IAM, see Amazon Inspector Classic identity-based policy examples (p. 28).

Authenticating with identities

Authentication is how you sign in to AWS using your identity credentials. For more information about signing in using the AWS Management Console, see Signing in to the AWS Management Console as an IAM user or root user in the IAM User Guide.

You must be authenticated (signed in to AWS) as the AWS account root user, an IAM user, or by assuming an IAM role. You can also use your company’s single sign-on authentication or even sign in using Google or Facebook. In these cases, your administrator previously set up identity federation using IAM roles. When you access AWS using credentials from another company, you are assuming a role indirectly.

To sign in directly to the AWS Management Console, use your password with your root user email address or your IAM user name. You can access AWS programmatically using your root user or IAM users access keys. AWS provides SDK and command line tools to cryptographically sign your request using your credentials. If you don’t use AWS tools, you must sign the request yourself. Do this using Signature Version 4, a protocol for authenticating inbound API requests. For more information about authenticating requests, see Signature Version 4 signing process in the AWS General Reference.

Regardless of the authentication method that you use, you might also be required to provide additional security information. For example, AWS recommends that you use multi-factor authentication (MFA) to increase the security of your account. To learn more, see Using multi-factor authentication (MFA) in AWS in the IAM User Guide.
AWS account root user

When you first create an AWS account, you begin with a single sign-in identity that has complete access to all AWS services and resources in the account. This identity is called the AWS account root user and is accessed by signing in with the email address and password that you used to create the account. We strongly recommend that you do not use the root user for your everyday tasks, even the administrative ones. Instead, adhere to the best practice of using the root user only to create your first IAM user. Then securely lock away the root user credentials and use them to perform only a few account and service management tasks.

IAM users and groups

An IAM user is an identity within your AWS account that has specific permissions for a single person or application. An IAM user can have long-term credentials such as a user name and password or a set of access keys. To learn how to generate access keys, see Managing access keys for IAM users in the IAM User Guide. When you generate access keys for an IAM user, make sure you view and securely save the key pair. You cannot recover the secret access key in the future. Instead, you must generate a new access key pair.

An IAM group is an identity that specifies a collection of IAM users. You can't sign in as a group. You can use groups to specify permissions for multiple users at a time. Groups make permissions easier to manage for large sets of users. For example, you could have a group named IAMAdmins and give that group permissions to administer IAM resources.

IAM roles

An IAM role is an identity within your AWS account that has specific permissions. It is similar to an IAM user, but is not associated with a specific person. You can temporarily assume an IAM role in the AWS Management Console by switching roles. You can assume a role by calling an AWS CLI or AWS API operation or by using a custom URL. For more information about methods for using roles, see Using IAM roles in the IAM User Guide.

IAM roles with temporary credentials are useful in the following situations:

- **Temporary IAM user permissions** – An IAM user can assume an IAM role to temporarily take on different permissions for a specific task.
- **Federated user access** – Instead of creating an IAM user, you can use existing identities from AWS Directory Service, your enterprise user directory, or a web identity provider. These are known as federated users. AWS assigns a role to a federated user when access is requested through an identity provider. For more information about federated users, see Federated users and roles in the IAM User Guide.
- **Cross-account access** – You can use an IAM role to allow someone (a trusted principal) in a different account to access resources in your account. Roles are the primary way to grant cross-account access. However, with some AWS services, you can attach a policy directly to a resource (instead of using a role as a proxy). To learn the difference between roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the IAM User Guide.
- **Cross-service access** – Some AWS services use features in other AWS services. For example, when you make a call in a service, it's common for that service to run applications in Amazon EC2 or store objects in Amazon S3. A service might do this using the calling principal's permissions, using a service role, or using a service-linked role.
- **Principal permissions** – When you use an IAM user or role to perform actions in AWS, you are considered a principal. Policies grant permissions to a principal. When you use some services, you
might perform an action that then triggers another action in a different service. In this case, you must have permissions to perform both actions. To see whether an action requires additional dependent actions in a policy, see Actions, Resources, and Condition Keys for Amazon Inspector Classic in the Service Authorization Reference.

- **Service role** – A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

- **Service-linked role** – A service-linked role is a type of service role that is linked to an AWS service. The service can assume the role to perform an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view, but not edit the permissions for service-linked roles.

- **Applications running on Amazon EC2** – You can use an IAM role to manage temporary credentials for applications that are running on an EC2 instance and making AWS CLI or AWS API requests. This is preferable to storing access keys within the EC2 instance. To assign an AWS role to an EC2 instance and make it available to all of its applications, you create an instance profile that is attached to the instance. An instance profile contains the role and enables programs that are running on the EC2 instance to get temporary credentials. For more information, see Using an IAM role to grant permissions to applications running on Amazon EC2 instances in the IAM User Guide.

To learn whether to use IAM roles or IAM users, see When to create an IAM role (instead of a user) in the IAM User Guide.

### Managing access using policies

You control access in AWS by creating policies and attaching them to IAM identities or AWS resources. A policy is an object in AWS that, when associated with an identity or resource, defines their permissions. You can sign in as the root user or an IAM user, or you can assume an IAM role. When you then make a request, AWS evaluates the related identity-based or resource-based policies. Permissions in the policies determine whether the request is allowed or denied. Most policies are stored in AWS as JSON documents. For more information about the structure and contents of JSON policy documents, see Overview of JSON policies in the IAM User Guide.

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

Every IAM entity (user or role) starts with no permissions. In other words, by default, users can do nothing, not even change their own password. To give a user permission to do something, an administrator must attach a permissions policy to a user. Or the administrator can add the user to a group that has the intended permissions. When an administrator gives permissions to a group, all users in that group are granted those permissions.

IAM policies define permissions for an action regardless of the method that you use to perform the operation. For example, suppose that you have a policy that allows the `iam:GetRole` action. A user with that policy can get role information from the AWS Management Console, the AWS CLI, or the AWS API.

### Identity-based policies

Identity-based policies are JSON permissions policy documents that you can attach to an identity, such as an IAM user, group of users, or role. These policies control what actions users and roles can perform, on which resources, and under what conditions. To learn how to create an identity-based policy, see Creating IAM policies in the IAM User Guide.

Identity-based policies can be further categorized as inline policies or managed policies. Inline policies are embedded directly into a single user, group, or role. Managed policies are standalone policies that you can attach to multiple users, groups, and roles in your AWS account. Managed policies include AWS managed policies and customer managed policies. To learn how to choose between a managed policy or an inline policy, see Choosing between managed policies and inline policies in the IAM User Guide.
Resource-based policies

Resource-based policies are JSON policy documents that you attach to a resource. Examples of resource-based policies are IAM role trust policies and Amazon S3 bucket policies. In services that support resource-based policies, service administrators can use them to control access to a specific resource. For the resource where the policy is attached, the policy defines what actions a specified principal can perform on that resource and under what conditions. You must specify a principal in a resource-based policy. Principals can include accounts, users, roles, federated users, or AWS services.

Resource-based policies are inline policies that are located in that service. You can’t use AWS managed policies from IAM in a resource-based policy.

Access control lists (ACLs)

Access control lists (ACLs) control which principals (account members, users, or roles) have permissions to access a resource. ACLs are similar to resource-based policies, although they do not use the JSON policy document format.

Amazon S3, AWS WAF, and Amazon VPC are examples of services that support ACLs. To learn more about ACLs, see Access control list (ACL) overview in the Amazon Simple Storage Service Developer Guide.

Other policy types

AWS supports additional, less-common policy types. These policy types can set the maximum permissions granted to you by the more common policy types.

- **Permissions boundaries** – A permissions boundary is an advanced feature in which you set the maximum permissions that an identity-based policy can grant to an IAM entity (IAM user or role). You can set a permissions boundary for an entity. The resulting permissions are the intersection of entity’s identity-based policies and its permissions boundaries. Resource-based policies that specify the user or role in the Principal field are not limited by the permissions boundary. An explicit deny in any of these policies overrides the allow. For more information about permissions boundaries, see Permissions boundaries for IAM entities in the IAM User Guide.

- **Service control policies (SCPs)** – SCPs are JSON policies that specify the maximum permissions for an organization or organizational unit (OU) in AWS Organizations. AWS Organizations is a service for grouping and centrally managing multiple AWS accounts that your business owns. If you enable all features in an organization, then you can apply service control policies (SCPs) to any or all of your accounts. The SCP limits permissions for entities in member accounts, including each AWS account root user. For more information about Organizations and SCPs, see How SCPs work in the AWS Organizations User Guide.

- **Session policies** – Session policies are advanced policies that you pass as a parameter when you programmatically create a temporary session for a role or federated user. The resulting session’s permissions are the intersection of the user or role’s identity-based policies and the session policies. Permissions can also come from a resource-based policy. An explicit deny in any of these policies overrides the allow. For more information, see Session policies in the IAM User Guide.

Multiple policy types

When multiple types of policies apply to a request, the resulting permissions are more complicated to understand. To learn how AWS determines whether to allow a request when multiple policy types are involved, see Policy evaluation logic in the IAM User Guide.

How Amazon Inspector Classic works with IAM

Before you use IAM to manage access to Amazon Inspector Classic, you should understand what IAM features are available to use with Amazon Inspector Classic. To get a high-level view of how Amazon
Inspector Classic and other AWS services work with IAM, see AWS Services That Work with IAM in the IAM User Guide.

**Topics**
- Amazon Inspector Classic identity-based policies (p. 26)
- Amazon Inspector Classic resource-based policies (not supported) (p. 27)
- Authorization based on Amazon Inspector Classic tags (not supported) (p. 27)
- Amazon Inspector Classic IAM roles (p. 27)

### Amazon Inspector Classic identity-based policies

With IAM identity-based policies, you can specify allowed or denied actions and resources as well as the conditions under which actions are allowed or denied. Amazon Inspector Classic supports specific actions, resources, and condition keys. To learn about all of the elements that you use in a JSON policy, see IAM JSON Policy Elements Reference in the IAM User Guide.

**Actions**

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.

The **Action** element of a JSON policy describes the actions that you can use to allow or deny access in a policy. Policy actions usually have the same name as the associated AWS API operation. There are some exceptions, such as permission-only actions that don't have a matching API operation. There are also some operations that require multiple actions in a policy. These additional actions are called dependent actions.

Include actions in a policy to grant permissions to perform the associated operation.

Policy actions in Amazon Inspector Classic use the following prefix before the action: inspector:. For example, the inspector:ListFindings permission allows the user permissions to perform the Amazon Inspector Classic ListFindings operation. Policy statements must include either an Action or NotAction element. Amazon Inspector Classic defines its own set of actions that describe tasks that you can perform with this service.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": [  
    "inspector:action1",  
    "inspector:action2"
]
```

You can specify multiple actions using wildcards (*). For example, to specify all actions that begin with the word Describe, include the following action:

```
"Action": "inspector:Describe*"
```

To see a list of Amazon Inspector Classic actions, see Actions Defined by Amazon Inspector Classic in the IAM User Guide.

**Resources**

Administrators can use AWS JSON policies to specify who has access to what. That is, which principal can perform actions on what resources, and under what conditions.
The `Resource` JSON policy element specifies the object or objects to which the action applies. Statements must include either a `Resource` or a `NotResource` element. As a best practice, specify a resource using its Amazon Resource Name (ARN). You can do this for actions that support a specific resource type, known as resource-level permissions.

For actions that don't support resource-level permissions, such as listing operations, use a wildcard (*) to indicate that the statement applies to all resources.

```
"Resource": "*"
```

Amazon Inspector Classic does not support specifying a resource ARN in the `Resource` element of an IAM policy statement. To allow access to Amazon Inspector, specify "Resource": "*" in your policy.

**Condition keys**

Amazon Inspector Classic does not provide any service-specific condition keys, but it does support using some global condition keys. To see all AWS global condition keys, see AWS global condition context keys in the *IAM User Guide*.

**Managed policies for Amazon Inspector Classic**

Amazon Inspector Classic provides the following AWS managed policies, which you can attach to IAM users in your account.

- `AmazonInspectorFullAccess` – Provides full access to Amazon Inspector Classic.
- `AmazonInspectorReadOnlyAccess` – Provides read-only access to Amazon Inspector Classic.

**Examples**

To view examples of Amazon Inspector Classic identity-based policies, see Amazon Inspector Classic identity-based policy examples (p. 28).

**Amazon Inspector Classic resource-based policies (not supported)**

Amazon Inspector Classic does not support resource-based policies.

**Authorization based on Amazon Inspector Classic tags (not supported)**

Amazon Inspector Classic does not support tagging resources or controlling access based on tags.

**Amazon Inspector Classic IAM roles**

An IAM role is an entity within your AWS account that has specific permissions.

**Using temporary credentials with Amazon Inspector Classic**

You can use temporary credentials to sign in with federation, to assume an IAM role, or to assume a cross-account role. You obtain temporary security credentials by calling AWS STS API operations such as `AssumeRole` or `GetFederationToken`.

Amazon Inspector Classic supports using temporary credentials.
Identity-based policy examples

Service-linked roles

Service-linked roles allow AWS services to access resources in other services to complete an action on your behalf. Service-linked roles appear in your IAM account and are owned by the service. An IAM administrator can view but not edit the permissions for service-linked roles.

Amazon Inspector Classic supports service-linked roles. For details about creating or managing Amazon Inspector Classic service-linked roles, see the section called “Using service-linked roles” (p. 32).

Service roles

This feature allows a service to assume a service role on your behalf. This role allows the service to access resources in other services to complete an action on your behalf. Service roles appear in your IAM account and are owned by the account. This means that an IAM administrator can change the permissions for this role. However, doing so might break the functionality of the service.

Amazon Inspector Classic supports service roles.

Amazon Inspector Classic identity-based policy examples

By default, IAM users and roles don't have permission to create or modify Amazon Inspector Classic resources. They also can't perform tasks using the AWS Management Console, AWS CLI, or AWS API. An IAM administrator must create IAM policies that grant users and roles permission to perform specific API operations on the specified resources they need. The administrator must then attach those policies to the IAM users or groups that require those permissions.

To learn how to create an IAM identity-based policy using these example JSON policy documents, see Creating Policies on the JSON Tab in the IAM User Guide.

Topics

- Policy best practices (p. 28)
- Using the Amazon Inspector Classic console (p. 29)
- Allow users to view their own permissions (p. 29)
- Allow a user to perform any describe and list operations on any Amazon Inspector Classic resource (p. 30)
- Example 2: Allow a user to perform describe and list operations only on Amazon Inspector Classic findings (p. 30)

Policy best practices

Identity-based policies are very powerful. They determine whether someone can create, access, or delete Amazon Inspector Classic resources in your account. These actions can incur costs for your AWS account. When you create or edit identity-based policies, follow these guidelines and recommendations:

- Get started using AWS managed policies – To start using Amazon Inspector Classic quickly, use AWS managed policies to give your employees the permissions they need. These policies are already available in your account and are maintained and updated by AWS. For more information, see Get started using permissions with AWS managed policies in the IAM User Guide.
- Grant least privilege – When you create custom policies, grant only the permissions required to perform a task. Start with a minimum set of permissions and grant additional permissions as necessary. Doing so is more secure than starting with permissions that are too lenient and then trying to tighten them later. For more information, see Grant least privilege in the IAM User Guide.
• **Enable MFA for sensitive operations** – For extra security, require IAM users to use multi-factor authentication (MFA) to access sensitive resources or API operations. For more information, see [Using multi-factor authentication (MFA) in AWS](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-auth-mfa.html) in the IAM User Guide.

• **Use policy conditions for extra security** – To the extent that it’s practical, define the conditions under which your identity-based policies allow access to a resource. For example, you can write conditions to specify a range of allowable IP addresses that a request must come from. You can also write conditions to allow requests only within a specified date or time range, or to require the use of SSL or MFA. For more information, see [IAM JSON policy elements: Condition](https://docs.aws.amazon.com/IAM/latest/UserGuide/id-policies-conditions.html) in the IAM User Guide.

### Using the Amazon Inspector Classic console

To access the Amazon Inspector Classic console, you must have a minimum set of permissions. These permissions must allow you to list and view details about the Amazon Inspector Classic resources in your AWS account. If you create an identity-based policy that is more restrictive than the minimum required permissions, the console won’t function as intended for entities (IAM users or roles) with that policy.

To ensure that those entities can still use the Amazon Inspector Classic console, also attach one of the following AWS managed policies to the entities. For more information, see [Adding Permissions to a User](https://docs.aws.amazon.com/IAM/latest/UserGuide/id.PermissionSets-AddPermission.html) in the IAM User Guide.

- AmazonInspectorFullAccess
- AmazonInspectorReadOnlyAccess

You don’t need to allow minimum console permissions for users that are making calls only to the AWS CLI or the AWS API. Instead, allow access to only the actions that match the API operation that you’re trying to perform.

### Allow users to view their own permissions

This example shows how you might create a policy that allows IAM users to view the inline and managed policies that are attached to their user identity. This policy includes permissions to complete this action on the console or programmatically using the AWS CLI or AWS API.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "ViewOwnUserInfo",
            "Effect": "Allow",
            "Action": [
                "iam:GetUserPolicy",
                "iam:ListGroupsForUser",
                "iam:ListAttachedUserPolicies",
                "iam:ListUserPolicies",
                "iam:GetUser"
            ],
            "Resource": ["arn:aws:iam::*:user/${aws:username}"],
        },
        {
            "Sid": "NavigateInConsole",
            "Effect": "Allow",
            "Action": [
                "iam:GetGroupPolicy",
                "iam:GetPolicyVersion",
                "iam:GetPolicy",
                "iam:ListAttachedGroupPolicies",
                "iam:ListGroupPolicies",
                "iam:ListPolicyVersions",
                "iam:ListPolicies"
            ],
        }
    ],
}
```
Allow a user to perform any describe and list operations on any Amazon Inspector Classic resource

The following permissions policy grants a user permission to run all the operations that begin with Describe and List. These operations show information about an Amazon Inspector Classic resource, such as an assessment target or finding. The wildcard character (*) in the Resource element indicates that the operations are allowed for all Amazon Inspector Classic resources that are owned by the account:

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "inspector:Describe*",
        "inspector:List*"
      ],
      "Resource": "*"
    }
  ]
}
```

Example 2: Allow a user to perform describe and list operations only on Amazon Inspector Classic findings

The following permissions policy grants a user permission to run only ListFindings and DescribeFindings operations. These operations show information about Amazon Inspector Classic findings. The wildcard character (*) in the Resource element indicates that the operations are allowed for all Amazon Inspector Classic resources that are owned by the account.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "inspector:DescribeFindings",
        "inspector:ListFindings"
      ],
      "Resource": "*"
    }
  ]
}
```

Troubleshooting Amazon Inspector Classic identity and access

Use the following information to help you diagnose and fix common issues that you might encounter when working with Amazon Inspector Classic and IAM.
Topics

- I am not authorized to perform an action in Amazon Inspector Classic (p. 31)
- I am not authorized to perform iam:PassRole (p. 31)
- I want to view my access keys (p. 31)
- I'm an administrator and want to allow others to access Amazon Inspector Classic (p. 32)
- I want to allow people outside of my AWS account to access my Amazon Inspector Classic resources (p. 32)

I am not authorized to perform an action in Amazon Inspector Classic

If the AWS Management Console tells you that you're not authorized to perform an action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password.

The following example error occurs when the mateojackson IAM user tries to use the console to create an assessment template but does not have inspector:CreateAssessmentTemplate permissions.

User: arn:aws:iam::123456789012:user/mateojackson is not authorized to perform: inspector:CreateAssessmentTemplate

In this case, Mateo asks his administrator to update his policies to allow him access to the inspector:CreateAssessmentTemplate action.

I am not authorized to perform iam:PassRole

If you receive an error that you're not authorized to perform the iam:PassRole action, then you must contact your administrator for assistance. Your administrator is the person that provided you with your user name and password. Ask that person to update your policies to allow you to pass a role to Amazon Inspector Classic.

Some AWS services allow you to pass an existing role to that service, instead of creating a new service role or service-linked role. To do this, you must have permissions to pass the role to the service.

The following example error occurs when an IAM user named marymajor tries to use the console to perform an action in Amazon Inspector Classic. However, the action requires the service to have permissions granted by a service role. Mary does not have permissions to pass the role to the service.

User: arn:aws:iam::123456789012:user/marymajor is not authorized to perform: iam:PassRole

In this case, Mary asks her administrator to update her policies to allow her to perform the iam:PassRole action.

I want to view my access keys

After you create your IAM user access keys, you can view your access key ID at any time. However, you can't view your secret access key again. If you lose your secret key, you must create a new access key pair.

Access keys consist of two parts: an access key ID (for example, AKIAIOSFODNN7EXAMPLE) and a secret access key (for example, wJalrXUtcnFEMI/K7MDENG/bPxRfYiZEXamlEYXq4OA). Like a user name and password, you must use both the access key ID and secret access key together to authenticate your requests. Manage your access keys as securely as you do your user name and password.
**Important**

Do not provide your access keys to a third party, even to help find your canonical user ID. By doing this, you might give someone permanent access to your account.

When you create an access key pair, you are prompted to save the access key ID and secret access key in a secure location. The secret access key is available only at the time you create it. If you lose your secret access key, you must add new access keys to your IAM user. You can have a maximum of two access keys. If you already have two, you must delete one key pair before creating a new one. To view instructions, see Managing access keys in the *IAM User Guide*.

I'm an administrator and want to allow others to access Amazon Inspector Classic

To allow others to access Amazon Inspector Classic, you must create an IAM entity (user or role) for the person or application that needs access. They will use the credentials for that entity to access AWS. You must then attach a policy to the entity that grants them the correct permissions in Amazon Inspector Classic.

To get started right away, see Creating your first IAM delegated user and group in the *IAM User Guide*.

I want to allow people outside of my AWS account to access my Amazon Inspector Classic resources

You can create a role that users in other accounts or people outside of your organization can use to access your resources. You can specify who is trusted to assume the role. For services that support resource-based policies or access control lists (ACLs), you can use those policies to grant people access to your resources.

To learn more, consult the following:

- To learn whether Amazon Inspector Classic supports these features, see How Amazon Inspector Classic works with IAM (p. 25).
- To learn how to provide access to your resources across AWS accounts that you own, see Providing access to an IAM user in another AWS account that you own in the *IAM User Guide*.
- To learn how to provide access to your resources to third-party AWS accounts, see Providing access to AWS accounts owned by third parties in the *IAM User Guide*.
- To learn how to provide access through identity federation, see Providing access to externally authenticated users (identity federation) in the *IAM User Guide*.
- To learn the difference between using roles and resource-based policies for cross-account access, see How IAM roles differ from resource-based policies in the *IAM User Guide*.

Using service-linked roles for Amazon Inspector Classic

Amazon Inspector Classic uses AWS Identity and Access Management (IAM) service-linked roles. A service-linked role is a unique type of IAM role that is linked directly to Amazon Inspector Classic. Service-linked roles are predefined by Amazon Inspector Classic and include all the permissions that the service requires to call other AWS services on your behalf.

A service-linked role makes setting up Amazon Inspector Classic easier because you don’t have to manually add the necessary permissions. Amazon Inspector Classic defines the permissions of its service-linked roles, and unless defined otherwise, only Amazon Inspector Classic can assume its roles. The
defined permissions include the trust policy and the permissions policy, and that permissions policy can't be attached to any other IAM entity.

You can delete a service-linked role only after first deleting your assessment targets for an AWS account in all the Regions where you have Amazon Inspector running.

For information about other services that support service-linked roles, see AWS Services That Work with IAM and look for the services that have Yes in the Service-Linked Role column. Choose a Yes with a link to view the service-linked role documentation for that service.

**Service-linked role permissions for Amazon Inspector Classic**

Amazon Inspector Classic uses the service-linked role named AWSServiceRoleForAmazonInspector. The AWSServiceRoleForAmazonInspector service-linked role trusts Amazon Inspector to assume the role.

The permissions policy of the role allows Amazon Inspector Classic to complete the following action on the specified resources:

- Action: `iam:CreateServiceLinkedRole` on `arn:aws:iam::*:role/aws-service-role/inspector.amazonaws.com/AWSServiceRoleForAmazonInspector`

For the AWSServiceRoleForAmazonInspector role to be successfully created, the IAM identity (user, role, or group) that you use when you work with Amazon Inspector Classic must have the required permissions. To grant the required permissions, attach the AmazonInspectorFullAccess managed policy to the IAM user, group, or role. For more information about the managed policy, see the section called “Managed policies for Amazon Inspector Classic” (p. 27).

For more information about service-linked roles, see Service-Linked Role Permissions in the IAM User Guide.

**Creating a service-linked role for Amazon Inspector Classic**

You don't need to manually create the AWSServiceRoleForAmazonInspector service-linked role.

The AWSServiceRoleForAmazonInspector service-linked role is created automatically, but you might need to do some minimal setup first. The following sections describe the details of setting up and using the AWSServiceRoleForAmazonInspector service-linked role.

**If you are getting started with Amazon Inspector Classic for the first time**

- The AWSServiceRoleForAmazonInspector service-linked role is created automatically when you go through the Get Started with Amazon Inspector Classic wizard on the console or when you run the CreateAssessmentTarget API operation.

- The AWSServiceRoleForAmazonInspector service-linked role is created for your AWS account only in the Region that you are currently signed in to. It grants Amazon Inspector Classic access to the resources in your AWS account only in that Region. If you then use the same AWS account to go through the Get Started with Amazon Inspector Classic console wizard or run the CreateAssessmentTarget API operation in other Regions, the same service-linked role that is already created in your AWS account is applied in these other Regions and grants Amazon Inspector Classic access to the resources in your AWS account in those Regions.

**If you already have Amazon Inspector Classic running in your AWS account**

- If you already have Amazon Inspector Classic running in your AWS account, the IAM role that grants Amazon Inspector Classic access to your resources already exists in your AWS account. In this case,
Using service-linked roles

the AWSServiceRoleForAmazonInspector service-linked role is generated when you create an assessment target or an assessment template (either through the Amazon Inspector Classic console or the API operations). This newly created service-linked role replaces the previously created IAM role that up until now granted Amazon Inspector Classic access to your resources.

You can also create the AWSServiceRoleForAmazonInspector service-linked role manually by choosing the Manage Amazon Inspector service-linked role link in the Accounts Setting section on the Amazon Inspector Dashboard page. This newly created service-linked role replaces the previously created IAM role that up until now granted Amazon Inspector Classic access to your resources.

Note
This previously created IAM role is not deleted. It remains intact, but it is no longer used to grant Amazon Inspector Classic access to your resources. You can use the IAM console to further manage or delete this IAM role.

- The AWSServiceRoleForAmazonInspector service-linked role is created for your AWS account only in the Region that you are currently signed in to. It grants Amazon Inspector Classic access to the resources in your AWS account only in this Region. Suppose you use the same AWS account to create an assessment target or an assessment template for your Amazon Inspector Classic service running in other Regions. In that case, the same service-linked role that is already created in your AWS account is applied. This role grants Amazon Inspector Classic access to the resources in your AWS account in those Regions.

You can also use the IAM console to create an Inspector service-linked role. In the IAM CLI or the IAM API, create a service-linked role with the Amazon Inspector service name. For more information, see Creating a Service-Linked Role in the IAM User Guide.

If you delete this service-linked role, and then need to create it again, you can use the same process to recreate the role in your account. When you Get started with Amazon Inspector Classic again, the service-linked role is automatically created for you again.

Editing a service-linked role for Amazon Inspector Classic

Amazon Inspector Classic does not allow you to edit the AWSServiceRoleForAmazonInspector service-linked role. After you create a service-linked role, you can't change the name of the role because various entities might reference the role. However, you can edit the description of the role using IAM. For more information, see Editing a Service-Linked Role in the IAM User Guide.

Deleting a service-linked role for Amazon Inspector Classic

If you no longer need to use a feature or service that requires a service-linked role, we recommend that you delete that role. That way you don't have an unused entity that is not actively monitored or maintained. However, you must clean up the resources for your service-linked role before you can manually delete it.

Note
If the Amazon Inspector Classic service is using the role when you try to delete the resources, then the deletion might fail. If that happens, wait for a few minutes and try the operation again.

To delete Amazon Inspector Classic resources used by AWSServiceRoleForAmazonInspector

- Delete your assessment targets for this AWS account in all the Regions where you have Amazon Inspector running. For more information, see Amazon Inspector Classic assessment targets (p. 53).

To manually delete the service-linked role using IAM
Use the IAM console, the IAM CLI, or the IAM API to delete the AWSServiceRoleForAmazonInspector service-linked role. For more information, see Deleting a Service-Linked Role in the IAM User Guide.

Logging and monitoring in Amazon Inspector Classic

Amazon Inspector Classic is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon Inspector Classic. CloudTrail captures all API calls for Amazon Inspector Classic as events, including calls from the Amazon Inspector Classic console and code calls to the Amazon Inspector Classic API operations.

For information on using CloudTrail logging in Amazon Inspector Classic, see Logging Amazon Inspector Classic API calls with AWS CloudTrail (p. 87).

You can monitor Amazon Inspector Classic using Amazon CloudWatch, which collects and processes raw data into readable, near-real time metrics. By default, Amazon Inspector Classic sends metric data to CloudWatch in 5-minute periods.

For information on using CloudWatch with Amazon Inspector Classic, see Monitoring Amazon Inspector Classic using Amazon CloudWatch (p. 90).

Incident response in Amazon Inspector Classic

Incident response for Amazon Inspector Classic is an AWS responsibility. AWS has a formal, documented policy and program that governs incident response.

AWS operational issues with broad impact are posted on the AWS Service Health Dashboard.

Operational issues are also posted to individual accounts via the AWS Health Dashboard. For information on how to use the AWS Health Dashboard, see the AWS Health User Guide.

Compliance validation for

Third-party auditors assess the security and compliance of as part of multiple AWS compliance programs. These include SOC, PCI, FedRAMP, HIPAA, and others.

For a list of AWS services in scope of specific compliance programs, see AWS Services in Scope by Compliance Program. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using is determined by the sensitivity of your data, your company’s compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- Security and Compliance Quick Start Guides – These deployment guides discuss architectural considerations and provide steps for deploying security- and compliance-focused baseline environments on AWS.
- Architecting for HIPAA Security and Compliance Whitepaper – This whitepaper describes how companies can use AWS to create HIPAA-compliant applications.
Resilience in Amazon Inspector Classic

The AWS global infrastructure is built around AWS Regions and Availability Zones. AWS Regions provide multiple physically separated and isolated Availability Zones, which are connected with low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

Amazon Inspector Classic is highly available and executes queries using compute resources across multiple Availability Zones. It automatically routes queries appropriately if a particular Availability Zone is unreachable.

Amazon Inspector Classic uses Amazon S3 as its underlying data store, which makes your data highly available and durable. Amazon S3 provides durable infrastructure to store important data. It is designed for durability of 99.999999999% of objects. Your data is redundantly stored across multiple facilities and multiple devices in each facility.

Infrastructure security in

As a managed service, is protected by the AWS global network security procedures that are described in the Amazon Web Services: Overview of Security Processes whitepaper.

You use AWS published API calls to access through the network. Clients must support Transport Layer Security (TLS) 1.0 or later. We recommend TLS 1.2 or later. Clients must also support cipher suites with perfect forward secrecy (PFS) such as Ephemeral Diffie-Hellman (DHE) or Elliptic Curve Ephemeral Diffie-Hellman (ECDHE). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

For more information about network and agent security, see the section called “Network and Amazon Inspector Classic agent security” (p. 38).

Configuration and vulnerability analysis in Amazon Inspector Classic

Amazon Inspector Classic offers predefined software called an agent that you can optionally install in the operating system of the EC2 instances that you want to assess. The agent collects a wide set of
configuration data, known as telemetry. For more information about Amazon Inspector Classic agents, see "Amazon Inspector Classic agents" (p. 38).

Security best practices for Amazon Inspector Classic

Amazon Inspector Classic provides a number of security features to consider as you develop and implement your own security policies. These best practices are general guidelines and don’t represent a complete security solution. Because these best practices might not be appropriate or sufficient for your environment, treat them as helpful considerations rather than prescriptions.

For the list of security best practices for Amazon Inspector Classic, see the section called “Security best practices for Amazon Inspector Classic” (p. 62).
Amazon Inspector Classic agents

The Amazon Inspector Classic agent is an entity that collects installed package information and software configuration for an Amazon EC2 instance. Though not required in all cases, you should install the Amazon Inspector Classic agent on each of your target Amazon EC2 instances in order to fully assess their security.

For more information about how to install, uninstall, and reinstall the agent, how to verify whether the installed agent is running, and how to configure proxy support for the agent, see Working with Amazon Inspector Classic agents on Linux-based operating systems (p. 43) and Working with Amazon Inspector Classic agents on Windows-based operating systems (p. 46).

**Note**
An Amazon Inspector Classic agent is not required to run the Network Reachability (p. 57) rules package.

**Important**
The Amazon Inspector Classic agent relies on Amazon EC2 instance metadata to function correctly. It accesses instance metadata using version 1 or version 2 of the Instance Metadata Service (IMDSv1 or IMDSv2). See Instance Metadata and User Data to learn more about EC2 instance metadata and access methods.

**Topics**
- Amazon Inspector Classic agent privileges (p. 38)
- Network and Amazon Inspector Classic agent security (p. 38)

- (Optional) Verify the signature of the Amazon Inspector Classic agent installation script on Windows-based operating systems (p. 51)

Amazon Inspector Classic agent privileges

You must have administrative or root permissions to install the Amazon Inspector Classic agent. On supported Linux-based operating systems, the agent consists of a user mode executable that runs with root access. On supported Windows-based operating systems, the agent consists of an updater service and an agent service, each running in user mode with LocalSystem privileges.

Network and Amazon Inspector Classic agent security

The Amazon Inspector Classic agent initiates all communication with the Amazon Inspector Classic service. This means that the agent must have an outbound network path to public
Amazon Inspector Classic agent updates

As updates for the Amazon Inspector Classic agent become available, they are automatically downloaded from Amazon S3 and applied. This also updates any required dependencies. The auto-update feature eliminates the need for you to track and manually maintain the versioning of the agents that you have installed on your EC2 instances. All updates are subject to audited Amazon change control processes to ensure compliance with applicable security standards.

To further ensure the security of the agent, all communication between the agent and the auto-update release site (S3) is performed over a TLS connection, and the server is authenticated. All binaries involved in the auto-update process are digitally signed, and the signatures are verified by the updater before installation. The auto-update process is executed only during non-assessment periods. If any errors are detected, the update process can rollback and retry the update. Finally, the agent update process serves to upgrade only the agent capabilities. None of your specific information is ever sent from the agent to Amazon Inspector Classic as part of the update workflow. The only information that is communicated as part of the update process is the basic installation success or fail telemetry and, if applicable, any update failure diagnostic information.

Telemetry data lifecycle

The telemetry data that is generated by the Amazon Inspector Classic agent during assessment runs is formatted in JSON files. The files are delivered in near-real-time over TLS to Amazon Inspector Classic, where they are encrypted with a per-assessment-run, ephemeral KMS-derived key. The files are securely stored in an Amazon S3 bucket this is dedicated for Amazon Inspector Classic. The rules engine of Amazon Inspector Classic accesses the encrypted telemetry data in the S3 bucket, decrypts it in memory, and processes the data against the configured assessment rules to generate findings. The telemetry data that is stored in S3 is retained only to allow for assistance with support requests. It isn’t used or aggregated by Amazon for any other purpose. After 30 days, telemetry data is permanently deleted according to a standard S3 bucket lifecycle policy for Amazon Inspector Classic data. Currently, Amazon Inspector Classic does not provide an API or an S3 bucket access mechanism to collected telemetry.
Access control from Amazon Inspector Classic into AWS accounts

As a security service, Amazon Inspector Classic accesses your AWS accounts and resources only when it needs to find EC2 instances to assess by querying for tags. It does this through standard IAM access through the role created during the initial setup of the Amazon Inspector Classic service. During an assessment, all communications with your environment are initiated by the Amazon Inspector Classic agent that is installed locally on EC2 instances. The Amazon Inspector Classic service objects that are created, such as assessment targets, assessment templates, and findings generated by the service, are stored in a database managed by and accessible only to Amazon Inspector Classic.

Amazon Inspector Classic agent limits

For information about Amazon Inspector Classic agent limits, see Amazon Inspector Classic service limits (p. 4).

Installing Amazon Inspector Classic agents

You can install the Amazon Inspector Classic agent using the Systems Manager Run Command on multiple instances (including both Linux-based and Windows-based instances). Alternatively, you can install the agent individually by signing in to each EC2 instance. The procedures in this chapter provide instructions for both methods.

As another option, you can quickly install the agent on all Amazon EC2 instances included in an assessment target by selecting the Install Agents check box on the Define an Assessment target page on the console.

Topics
- Amazon Linux 2 AMI with the Amazon Inspector Classic Agent (p. 40)
- Installing the agent on multiple EC2 instances using the Systems Manager Run Command (p. 41)
- Installing the agent on a Linux-based EC2 instance (p. 41)
- Installing the agent on a Windows-based EC2 instance (p. 42)

Note
The procedures in this chapter apply to all AWS Regions that are supported by Amazon Inspector Classic.

Amazon Linux 2 AMI with the Amazon Inspector Classic Agent

To skip the manual Amazon Inspector Classic agent installation on the Amazon Linux EC2 instances that you want to include in your assessment targets, you can use the Amazon Linux 2 AMI with Amazon Inspector Agent. This AMI has the agent preinstalled and requires no additional steps to install or set up the agent. To start using Amazon Inspector Classic with these EC2 instances, tag them to match the assessment target that you want. The configuration of Amazon Linux 2 AMI with Amazon Inspector Agent enhances security by focusing on two main security goals: limiting access and reducing software vulnerabilities.
Installing the agent on multiple EC2 instances using the Systems Manager Run Command

You can install the Amazon Inspector Classic agent on your EC2 instances using the Systems Manager Run Command. This enables you to install the agent remotely and on multiple instances (both Linux-based and Windows-based instances with the same command) at once.

**Important**
Agent installation using the Systems Manager Run Command is not currently supported for the Debian operating system.

**Important**
To use this option, make sure that your EC2 instance has the SSM Agent installed and has an IAM role that allows Run Command. The SSM Agent is installed, by default, on Amazon EC2 Windows instances and Amazon Linux instances. Amazon EC2 Systems Manager requires an IAM role for EC2 instances that processes commands and a separate role for users executing commands. For more information, see Installing and configuring SSM Agent and Configuring security roles for System Manager.

To install the agent on multiple EC2 instances using the Systems Manager Run Command

2. In the navigation pane under **Instances & nodes**, choose **Run Command**.
3. Choose **Run a command**.
4. For **Command document**, choose the document named **AmazonInspector-ManageAWSAgent** that is owned by Amazon. This document contains the script for installing the Amazon Inspector Classic agent on EC2 instances.
5. For **Targets**, you can select EC2 instances using different methods. To install the agent on all of the instances in the assessment target, you can specify the tags that were used to create the assessment target.
6. Provide your choices for the rest of the available options using the instructions in Running commands from the console, and then choose **Run**.

**Note**
You can also install the agent on multiple EC2 instances (both Linux-based and Windows-based) when you create an assessment target, or you can use the **Install Agents with Run Command** button for an existing target. For more information, see Creating an assessment target (p. 54).

Installing the agent on a Linux-based EC2 instance

Perform the following procedure to install the Amazon Inspector Classic agent on a Linux-based EC2 instance.

**To install the agent on a Linux-based EC2 instance**

1. Sign in to your EC2 instance running a Linux-based operating system where you want to install the Amazon Inspector Classic agent.
Installing the agent on a Windows-based EC2 instance

Perform the following procedure to install the Amazon Inspector Classic agent on a Windows-based EC2 instance.

**Installing the agent on a Windows-based EC2 instance**

Perform the following procedure to install the Amazon Inspector Classic agent on a Windows-based EC2 instance.
To install the agent on a Windows-based EC2 instance

1. Sign in to your EC2 instance running a Windows-based operating system where you want to install the agent.

   **Note**
   For more information about the operating systems that Amazon Inspector Classic supports, see Amazon Inspector Classic supported operating systems and Regions (p. 6).

2. Download the following .exe file:

3. Open a command prompt window (with administrative permissions), navigate to the location where you saved the downloaded AWSAgentInstall.exe, and run the .exe file to install the agent.

   **Note**
   As updates for the agent become available, they are automatically downloaded from Amazon S3 and applied. For more information, see Amazon Inspector Classic agent updates (p. 39).
   If you want to skip this auto-update process, run the following command when you install the agent:

   AWSAgentInstall.exe AUTOUPDATE=No

---

Working with Amazon Inspector Classic agents on Linux-based operating systems

You can install, remove, verify, and modify the behavior of Amazon Inspector Classic agents. Sign in to your Amazon EC2 instance running a Linux-based operating system, and run any of the following procedures. For more information about the operating systems that are supported for Amazon Inspector Classic, see Amazon Inspector Classic supported operating systems and Regions (p. 6).

**Important**
The Amazon Inspector Classic agent relies on Amazon EC2 instance metadata to function correctly. It accesses instance metadata using version 1 or version 2 of the Instance Metadata Service (IMDSv1 or IMDSv2). See Instance Metadata and User Data to learn more about EC2 instance metadata and access methods.

**Note**
The commands in this section function in all AWS Regions that are supported by Amazon Inspector Classic.

**Topics**
- Verifying that the Amazon Inspector Classic agent is running (p. 44)
- Stopping the Amazon Inspector Classic agent (p. 44)
- Starting the Amazon Inspector Classic agent (p. 44)
- Modifying Amazon Inspector Classic agents settings (p. 44)
- Configuring proxy support for an Amazon Inspector Classic agent (p. 44)
- Uninstalling the Amazon Inspector Classic agent (p. 45)
Verifying that the Amazon Inspector Classic agent is running

- To verify that the agent is installed and running, sign in to your EC2 instance and run the following command:

  ```
sudo /opt/aws/awsagent/bin/awsagent status
  ```

  This command returns the status of the currently running agent, or an error stating that the agent cannot be contacted.

Stopping the Amazon Inspector Classic agent

- To stop the agent, run the following command:

  ```
sudo /etc/init.d/awsagent stop
  ```

Starting the Amazon Inspector Classic agent

- To start the agent, run the following command:

  ```
sudo /etc/init.d/awsagent start
  ```

Modifying Amazon Inspector Classic agents settings

After the Amazon Inspector Classic agent is installed and running on your EC2 instance, you can modify the settings in the `agent.cfg` file to alter the agent's behavior. On Linux-based operating systems, the `agent.cfg` file is located in the `/opt/aws/awsagent/etc` directory. After you modify and save the `agent.cfg` file, you must stop and start the agent for the changes to take effect.

**Important**
We highly recommend that you modify the `agent.cfg` file only with the guidance of AWS Support.

Configuring proxy support for an Amazon Inspector Classic agent

To get proxy support for an agent on a Linux-based operating system, use an agent-specific configuration file with specific environment variables. For more information, see [https://wiki.archlinux.org/index.php/proxy_settings](https://wiki.archlinux.org/index.php/proxy_settings).

Complete one of the following procedures:

**To install an agent on an EC2 instance that uses a proxy server**

1. Create a file called `awsagent.env` and save it in the `/etc/init.d/` directory.
2. Edit `awsagent.env` to include these environment variables in the following format:

   ```
   • export https_proxy=hostname:port
   • export http_proxy=hostname:port
   ```
Uninstalling the Amazon Inspector Classic agent

To uninstall the agent

1. Sign in to your EC2 instance running a Linux-based operating system where you want to uninstall the agent.

   **Note**
   For more information about the operating systems that are supported for Amazon Inspector Classic, see Amazon Inspector Classic supported operating systems and Regions (p. 6).

2. To uninstall the agent, use one of the following commands:

   • On Amazon Linux, CentOS, and Red Hat, run the following command:
     
     ```bash
     sudo yum remove 'AwsAgent*'  
     ```

   • On Ubuntu Server, run the following command:
     
     ```bash
     sudo apt-get purge 'awsagent*'  
     ```
Working with Amazon Inspector Classic agents on Windows-based operating systems

You can start, stop, and modify the behavior of Amazon Inspector Classic agents. Sign in to your EC2 instance running a Windows-based operating system and perform any of the procedures in this chapter. For more information about the operating systems that are supported for Amazon Inspector Classic, see Amazon Inspector Classic supported operating systems and Regions (p. 6).

**Important**
The Amazon Inspector Classic agent relies on Amazon EC2 instance metadata to function correctly. It accesses instance metadata using version 1 or version 2 of the Instance Metadata Service (IMDSv1 or IMDSv2). See Instance Metadata and User Data to learn more about EC2 instance metadata and access methods.

**Note**
The commands in this chapter function in all AWS Regions that are supported by Amazon Inspector Classic.

**Topics**
- Starting or stopping an Amazon Inspector Classic agent or verifying that the agent is running (p. 46)
- Modifying Amazon Inspector Classic agent settings (p. 47)
- Configuring proxy support for an Amazon Inspector Classic agent (p. 47)
- Uninstalling the Amazon Inspector Classic agent (p. 48)

**Starting or stopping an Amazon Inspector Classic agent or verifying that the agent is running**

**To start, stop, or verify an agent**

1. On your EC2 instance, choose **Start**, **Run**, and then enter `services.msc`.
2. If the agent is successfully running, two services are listed with their status set to **Started** or **Running** in the **Services** window: **AWS Agent Service** and **AWS Agent Updater Service**.
3. To start the agent, right-click **AWS Agent Service**, and then choose **Start**. If the service successfully starts, the status is updated to **Started** or **Running**.
4. To stop the agent, right-click **AWS Agent Service**, and then choose **Stop**. If the service successfully stops, the status is cleared (appears as blank). We don't recommend stopping the **AWS Agent Updater Service** because it disables the installation of all future enhancements and fixes to the agent.
5. To verify that the agent is installed and running, sign in to your EC2 instance, and open a command prompt using administrative permissions. Navigate to `C:/Program Files/Amazon Web Services/AWS Agent`, and then run the following command:

   `AWSAgentStatus.exe`

   This command returns the status of the currently running agent, or an error stating that the agent can't be contacted.
Modifying Amazon Inspector Classic agent settings

After the Amazon Inspector Classic agent is installed and running on your EC2 instance, you can modify the settings in the agent.cfg file to alter the agent's behavior. On Windows-based operating systems, the file is located in the C:\ProgramData\Amazon Web Services\AWS Agent directory. After you modify and save the agent.cfg file, you must stop and start the agent for the changes to take effect.

**Important**
We highly recommend that you modify the agent.cfg file only with the guidance of AWS Support.

Configuring proxy support for an Amazon Inspector Classic agent

To get proxy support for an agent on a Windows-based operating system, use the WinHTTP proxy. To set up the WinHTTP proxy using the netsh utility, see Netsh Commands for Windows Hypertext Transfer Protocol (WINHTTP).

**Important**
Only HTTPS proxies are supported for Windows-based instances.

Complete one of the following procedures:

**To install an agent on an EC2 instance that uses a proxy server**

1. Download the following .exe file: https://d1wk0tzptsntt1.cloudfront.net/windows/installer/latest/AWSAgentInstall.exe
2. Open a command prompt window or PowerShell window (using administrative permissions).
   Navigate to the location where you saved the downloaded AWSAgentInstall.exe, and then run the following command:
   ```shell
   .\AWSAgentInstall.exe /install USEPROXY=1
   ```

**To configure proxy support on an EC2 instance with a running agent**

1. To configure proxy support, the version of the Amazon Inspector Classic agent that is running on your EC2 instance must be 1.0.0.59 or later. If you enabled the auto-update process for the agent, you can verify that your agent's version is 1.0.0.59 or later by using the Starting or stopping an Amazon Inspector Classic agent or verifying that the agent is running (p. 46) procedure. If you didn't enable the auto-update process for the agent, you must install the agent on this EC2 instance again by following the Installing the agent on a Windows-based EC2 instance (p. 42) procedure.
2. Open the registry editor (regedit.exe).
3. Navigate to the following registry key: "HKEY_LOCAL_MACHINE/SOFTWARE/Amazon Web Services/AWS Agent Updater".
4. Inside this registry key, create a registry DWORD(32bit) value called "UseProxy".
5. Double-click on the value, and set the value to 1.
6. Enter services.msc, locate the AWS Agent Service and the AWS Agent Updater Service in the Services window, and restart each process. After both processes have successfully restarted, run the AWSAgentStatus.exe file (see step 5 in Starting or stopping an Amazon Inspector Classic agent or verifying that the agent is running (p. 46)). View the status of your agent and verify that it is using the configured proxy.
Uninstalling the Amazon Inspector Classic agent

To uninstall the agent

1. Sign in to your EC2 instance running a Windows-based operating system where you want to uninstall the Amazon Inspector Classic agent.

   Note
   For more information about the operating systems that are supported for Amazon Inspector Classic, see Amazon Inspector Classic supported operating systems and Regions (p. 6).

2. On your EC2 instance, navigate to Control Panel, Add/Remove Programs.

3. In the list of installed programs, choose AWS Agent, and then choose Uninstall.

(Optional) Verify the signature of the Amazon Inspector Classic agent installation script on Linux-based operating systems

This topic describes the recommended process of verifying the validity of the Amazon Inspector Classic agent's installations script for Linux-based operating systems.

Whenever you download an application from the internet, we recommend that you authenticate the identity of the software publisher and check that the application is not altered or corrupted since it was published. This protects you from installing a version of the application that contains a virus or other malicious code.

If after running the steps in this topic, you determine that the software for the Amazon Inspector Classic agent is altered or corrupted, do NOT run the installation file. Instead, contact AWS Support.

Amazon Inspector Classic agent files for Linux-based operating systems are signed using GnuPG, an open source implementation of the Pretty Good Privacy (OpenPGP) standard for secure digital signatures. GnuPG (also known as GPG) provides authentication and integrity checking through a digital signature. Amazon EC2 publishes a public key and signatures that you can use to verify the downloaded Amazon EC2 CLI tools. For more information about PGP and GnuPG (GPG), see http://www.gnupg.org.

The first step is to establish trust with the software publisher. Download the public key of the software publisher, check that the owner of the public key is who they claim to be, and then add the public key to your keyring. Your keyring is a collection of known public keys. After you establish the authenticity of the public key, you can use it to verify the signature of the application.

Topics
- Installing the GPG tools (p. 48)
- Authenticating and importing the public key (p. 49)
- Verify the signature of the package (p. 50)

Installing the GPG tools

If your operating system is Linux or Unix, the GPG tools are likely already installed. To test whether the tools are installed on your system, type gpg at a command prompt. If the GPG tools are installed,
you see a GPG command prompt. If the GPG tools are not installed, you see an error stating that the command cannot be found. You can install the GnuPG package from a repository.

To install GPG tools on Debian-based Linux
- From a terminal, run the following command: `apt-get install gnupg`.

To install GPG tools on Red Hat–based Linux
- From a terminal, run the following command: `yum install gnupg`.

Authenticating and importing the public key

The next step in the process is to authenticate the Amazon Inspector Classic public key and add it as a trusted key in your GPG keyring.

To authenticate and import the Amazon Inspector Classic public key

1. Obtain a copy of our public GPG build key by doing one of the following:
   - Download from https://d1wk0ztzpsntt1.cloudfront.net/linux/latest/inspector.gpg.
   - Copy the key from the following text and paste it into a file called `inspector.key`. Make sure to include everything that follows:

   -----BEGIN PGP PUBLIC KEY BLOCK-----
   Version: GnuPG v2.0.18 (GNU/Linux)

   mQINBFYD1fEBEADFpFn7mdCtssmcfDoga4+PhY9bd0AD68yhp2m9Hv3BOzle/MX18s1f0gRg2wWhnIaexHwobLWkDw2paRxp1NMQ9qRe8Pbg0ewheLrQu59dwdQCMcw90gf9m1lkVjvDqV0qNHh1B2OFknPDxMFRhcmjLDKYCY3+MODEhnlK2StIH2KeWeX

   LF09+3sEl1NrsMib0KRLDeBt3EuDasBZg0qkjDhJuEsqiCy
   =iEhB
   -----END PGP PUBLIC KEY BLOCK-----

2. At a command prompt in the directory where you saved `inspector.key`, use the following command to import the Amazon Inspector Classic public key into your keyring:

   gpg --import inspector.key

Version Latest 49
Verify the signature of the package

The command returns results that are similar to the following:

```
gpg: key 58360418: public key "Amazon Inspector <inspector@amazon.com>" imported
  gpg: Total number processed: 1
  gpg:            imported: 1 (RSA: 1)
gpg: Total number processed: 1
```

Make a note of the key value; you need it in the next step. In the preceding example, the key value is 58360418.

3. Verify the fingerprint by running the following command, replacing `key-value` with the value from the preceding step:

```
gpg --fingerprint key-value
```

This command returns results similar to the following:

```
pub 4096R/58360418 2015-09-24
  Key fingerprint = DDA0 D4C5 10AE 3C20 6F46 6DC0 2474 0960 5836 0418
  uid Amazon Inspector <inspector@amazon.com>
```

Additionally, the fingerprint string should be identical to `DDA0 D4C5 10AE 3C20 6F46 6DC0 2474 0960 5836 0418`, as shown in the preceding example. Compare the key fingerprint that is returned to the one published on this page. They should match. If they don't match, don't install the Amazon Inspector Classic agent installation script, and contact AWS Support.

Verify the signature of the package

After you install the GPG tools, authenticate and import the Amazon Inspector Classic public key, and verify that the public key is trusted, you are ready to verify the signature of the installation script.

To verify the installation script signature

1. At a command prompt, run the following command to download the signature file for the installation script:

```
```

2. Verify the signature by running the following command at a command prompt in the directory where you saved install.sig and the Amazon Inspector Classic installation file. Both files must be present.

```
gpg --verify ./install.sig
```

The output should look something like the following:

```
gpg: Signature made Thu 24 Sep 2015 03:19:09 PM UTC using RSA key ID 58360418
gpg: Good signature from "Amazon Inspector <inspector@amazon.com>" [unknown]
gpg: WARNING: This key is not certified with a trusted signature!
gpg: Primary key fingerprint: DDA0 D4C5 10AE 3C20 6F46 6DC0 2474 0960 5836 0418
```

If the output contains the phrase `Good signature from "Amazon Inspector <inspector@amazon.com>", it means that the signature has successfully been verified, and you can proceed to run the Amazon Inspector Classic installation script.
If the output includes the phrase **BAD signature**, check whether you performed the procedure correctly. If you continue to get this response, don't run the installation file that you downloaded previously, and contact AWS Support.

The following are details about the warnings you might see:

- **WARNING: This key is not certified with a trusted signature! There is no indication that the signature belongs to the owner.** This refers to your personal level of trust in your belief that you possess an authentic public key for Amazon Inspector Classic. In an ideal world, you would visit an AWS office and receive the key in person. However, more often you download it from a website. In this case, the website is an AWS website.

- **gpg: no ultimately trusted keys found.** This means that the specific key is not "ultimately trusted" by you (or by other people whom you trust).

For more information, see [http://www.gnupg.org](http://www.gnupg.org).

---

**(Optional) Verify the signature of the Amazon Inspector Classic agent installation script on Windows-based operating systems**

This topic describes the recommended process of verifying the validity of the Amazon Inspector Classic agent's installations script for Windows-based operating systems.

Whenever you download an application from the internet, we recommend that you authenticate the identity of the software publisher and check that the application is not altered or corrupted since it was published. This protects you from installing a version of the application that contains a virus or other malicious code.

If after running the steps in this topic, you determine that the software for the Amazon Inspector Classic agent is altered or corrupted, do NOT run the installation file. Instead, contact AWS Support.

To verify the validity of the downloaded agent installation script on Windows-based operating systems, make sure that the thumbprint of its Amazon Services LLC signer certificate is equal to this value:

**16 67 49 A7 B8 CC 5B 8A 57 1D DF 4B 7A 37 9D B1 6A 5E 65 80**

To verify this value, perform the following procedure:

1. Right-click the downloaded `AWSAgentInstall.exe`, and open the **Properties** window.
2. Choose the **Digital Signatures** tab.
3. From the **Signature List**, choose **Amazon Services LLC**, and then choose **Details**.
4. Choose the **General** tab, if not already selected, and then choose **View Certificate**.
5. Choose the **Details** tab, and then choose **All** in the **Show** dropdown list, if not already selected.
6. Scroll down until you see the **Thumbprint** field and then choose **Thumbprint**. This displays the entire thumbprint value in the lower window.

- If the thumbprint value in the lower window is identical to the following value:

  **16 67 49 A7 B8 CC 5B 8A 57 1D DF 4B 7A 37 9D B1 6A 5E 65 80**

  then your downloaded agent installation script is authentic and can be safely installed.
(Optional) Verify the signature of the Amazon Inspector Classic agent installation script on Windows-based operating systems

- If the thumbprint value in the lower details window is not identical to the value above, do not run AWSAgentInstall.exe.
Amazon Inspector Classic assessment targets

You can use Amazon Inspector Classic to evaluate whether your AWS assessment targets (your collections of AWS resources) have potential security issues that you should address.

**Important**
Currently, your assessment targets can consist only of EC2 instances that run on supported operating systems. For information about supported operating systems and supported AWS Regions, see the section called "Supported operating systems and Regions" (p. 6).

**Note**
For information about launching EC2 instances, see the Amazon Elastic Compute Cloud documentation.

**Topics**
- Tagging resources to create an assessment target (p. 53)
- Amazon Inspector Classic assessment target limits (p. 53)
- Creating an assessment target (p. 54)
- Deleting an assessment target (p. 54)

Tagging resources to create an assessment target

To create an assessment target for Amazon Inspector Classic to assess, you start by tagging the EC2 instances that you want to include in your target. Tags are words or phrases that act as metadata for identifying and organizing your instances and other AWS resources. Amazon Inspector Classic uses the tags that you create to identify the instances that belong to your target.

Every AWS tag consists of a key and value pair of your choice. For example, you might choose to name your key "Name" and your value "MyFirstInstance". After you tag your instances, you use the Amazon Inspector Classic console to add the instances to your assessment target. It is not necessary that any instance match more than one tag key-value pair.

When you tag your EC2 instances to build assessment targets, you can create your own custom tag keys or use tag keys created by others in the same AWS account. You can also use the tag keys that AWS automatically creates. For example, AWS automatically creates a **Name** tag key for the EC2 instances that you launch.

You can add tags to EC2 instances when you create them, or you can add, change, or remove those tags one at a time on the console page for each EC2 instance. You can also add tags to multiple EC2 instances at once using the Tag Editor.

For more information, see Tag Editor. For more information about tagging EC2 instances, see Resources and Tags.

Amazon Inspector Classic assessment target limits

You can create up to 50 assessment targets per AWS account. For more information, see Amazon Inspector Classic service limits (p. 4).
Creating an assessment target

You can use the Amazon Inspector Classic console to create assessment targets.

To create an assessment target

1. Sign in to the AWS Management Console and open the Amazon Inspector Classic console at https://console.aws.amazon.com/inspector/.
2. In the navigation pane, choose Assessment Targets, and then choose Create.
3. For Name, enter a name for your assessment target.
4. Do one of the following:
   - To include all EC2 instances in this AWS account and Region in this assessment target, select the All instances check box.
   - To choose the EC2 instances that you want to include in this assessment target, for Use Tags, enter the tag key names and key-value pairs.
5. (Optional) While creating a target, you can select the Install Agents check box to install the agent on all EC2 instances in this target. To use this option, your EC2 instances must have the SSM Agent installed and an IAM role that allows Run Command. The SSM Agent is installed, by default, on Amazon EC2 Windows instances and Amazon Linux instances. Amazon EC2 Systems Manager requires an IAM role for EC2 instances that process commands and a separate role for users that execute commands. For more information, see Installing and Configuring SSM Agent and Configuring Security Roles for System Manager.
   - Important
     If an EC2 instance already has an agent running on it, using this option replaces the agent currently running on the instance with the latest agent version.
   - Note
     For your existing assessment targets, you can choose the Install Agents with Run Command button to install the agent on all EC2 instances in this target.
   - Note
     You can also install the agent on multiple EC2 instances (both Linux-based and Windows-based instances with the same command) remotely by using the Systems Manager Run Command. For more information, see Installing the Amazon Inspector Agent on Multiple EC2 Instances Using the Systems Manager Run Command (p. 41).
6. Choose Save.

Note
You can use the Preview Target button on the Assessment Targets page to review all EC2 instances included in the assessment target. For each EC2 instance, you can review the hostname, instance ID, IP address, and, if applicable, the status of the agent. The agent status can have the following values: HEALTHY, UNHEALTHY, and UNKNOWN. Amazon Inspector Classic displays an UNKNOWN status when it can't determine whether there is an agent running on the EC2 instance.

Deleting an assessment target

To delete an assessment target, perform the following procedure.
To delete an assessment target

- On the Assessment targets page, choose the target that you want to delete, and then choose Delete. When prompted for confirmation, choose Yes.

  **Important**
  When you delete an assessment target, all assessment templates, assessment runs, findings, and versions of the reports that are associated with the target are also deleted.

You can also delete an assessment target by using the `DeleteAssessmentTarget` API.
Amazon Inspector Classic rules packages and rules

You can use Amazon Inspector Classic to assess your assessment targets (collections of AWS resources) for potential security issues and vulnerabilities. Amazon Inspector Classic compares the behavior and the security configuration of the assessment targets to selected security rules packages. In the context of Amazon Inspector Classic, a rule is a security check that Amazon Inspector Classic performs during the assessment run.

In Amazon Inspector Classic, rules are grouped into distinct rules packages either by category, severity, or pricing. This gives you choices for the kinds of analysis that you can perform. For example, Amazon Inspector Classic offers a large number of rules that you can use to assess your applications. But you might want to include a smaller subset of the available rules to target a specific area of concern or to uncover specific security problems. Companies with large IT departments might want to determine whether their application is exposed to any security threat. Others might want to focus only on issues with the severity level of High.

- Severity levels for rules in Amazon Inspector Classic (p. 56)
- Rules packages in Amazon Inspector Classic (p. 57)

Severity levels for rules in Amazon Inspector Classic

Each Amazon Inspector Classic rule has an assigned severity level. This reduces the need to prioritize one rule over another in your analysis. It can also help you determine your response when a rule highlights a potential problem.

High, Medium, and Low levels all indicate a security issue that can result in compromised information confidentiality, integrity, and availability within your assessment target. The levels are distinguished by how likely the issue is to result in a compromise and how urgent it is to fix the issue.

The Informational level simply highlights a security configuration detail of your assessment target.

Here are the recommended ways to respond to issues based on their severity:

- **High** – High severity issues are extremely urgent. Amazon Inspector Classic recommends that you treat this security issue as an emergency and implement an immediate remediation.
- **Medium** – Medium severity issues are somewhat urgent. Amazon Inspector Classic recommends that you fix this issue at the next possible opportunity, for example, during your next service update.
- **Low** – Low severity issues are less urgent. Amazon Inspector Classic recommends that you fix this issue as part of one of your future service updates.
- **Informational** – These issues are purely informational. Based on your business and organization goals, you can either simply make note of this information or use it to improve the security of your assessment target.
Rules packages in Amazon Inspector Classic

An Amazon Inspector assessment can use any combination of the following rules packages:

**Network assessments:**
- Network Reachability (p. 57)

**Host assessments:**
- Common vulnerabilities and exposures (p. 60)
- Center for Internet Security (CIS) Benchmarks (p. 60)
- Security best practices for Amazon Inspector Classic (p. 62)

Network Reachability

The rules in the Network Reachability package analyze your network configurations to find security vulnerabilities of your EC2 instances. The findings that Amazon Inspector generates also provide guidance about restricting access that is not secure.

The Network Reachability rules package uses the latest technology from the AWS Provable Security initiative.

The findings generated by these rules show whether your ports are reachable from the internet through an internet gateway (including instances behind Application Load Balancers or Classic Load Balancers), a VPC peering connection, or a VPN through a virtual gateway. These findings also highlight network configurations that allow for potentially malicious access, such as mismanaged security groups, ACLs, IGWs, and so on.

These rules help automate the monitoring of your AWS networks and identify where network access to your EC2 instances might be misconfigured. By including this package in your assessment run, you can implement detailed network security checks without having to install scanners and send packets, which are complex and expensive to maintain, especially across VPC peering connections and VPNs.

**Important**
An Amazon Inspector Classic agent is not required to assess your EC2 instances with this rules package. However, an installed agent can provide information about the presence of any processes listening on the ports. Do not install an agent on an operating system that Amazon Inspector Classic does not support. If an agent is present on an instance that runs an unsupported operating system, then the Network Reachability rules package will not work on that instance.

**Important**
This rules package does not support Amazon EC2 Classic networks.

For more information, see Amazon Inspector Classic rules packages for supported operating systems (p. 84).

Configurations analyzed

Network Reachability rules analyze the configuration of the following entities for vulnerabilities:
- Amazon EC2 instances
Reachability routes

Network Reachability rules check for the following reachability routes, which correspond to the ways in which your ports can be accessed from outside of your VPC:

- **Internet** - Internet gateways (including Application Load Balancers and Classic Load Balancers)
- **PeeredVPC** - VPC peering connections
- **VGW** - Virtual private gateways

Findings types

An assessment that includes the Network Reachability rules package can return the following types of findings for each reachability route:

- **RecognizedPort** (p. 58)
- **UnrecognizedPortWithListener** (p. 59)
- **NetworkExposure** (p. 60)

**RecognizedPort**

A port that is typically used for a well-known service is reachable. If an agent is present on the target EC2 instance, the generated finding will also indicate whether there is an active listening process on the port. Findings of this type are given a severity based on the security impact of the well-known service:

- **RecognizedPortWithListener** – A recognized port is externally reachable from the public internet through a specific networking component, and a process is listening on the port.
- **RecognizedPortNoListener** – A port is externally reachable from the public internet through a specific networking component, and there are no processes listening on the port.
- **RecognizedPortNoAgent** – A port is externally reachable from the public internet through a specific networking component. The presence of a process listening on the port can't be determined without installing an agent on the target instance.

The following table shows a list of recognized ports:
### Findings types

<table>
<thead>

</table>

**UnrecognizedPortWithListener**

A port that is not listed in the preceding table is reachable and has an active listening process on it. Because findings of this type show information about listening processes, they can be generated only when an Amazon Inspector agent is installed on the target EC2 instance. Findings of this type are given Low severity.
Network Exposure

Findings of this type show aggregate information on the ports that are reachable on your EC2 instance. For each combination of elastic network interfaces and security groups on an EC2 instance, these findings show the reachable set of TCP and UDP port ranges. Findings of this type have the severity of Informational.

Common vulnerabilities and exposures

The rules in this package help verify whether the EC2 instances in your assessment targets are exposed to common vulnerabilities and exposures (CVEs). Attacks can exploit unpatched vulnerabilities to compromise the confidentiality, integrity, or availability of your service or data. The CVE system provides a reference method for publicly known information security vulnerabilities and exposures. For more information, see https://cve.mitre.org/.

If a particular CVE appears in a finding that is produced by an Amazon Inspector Classic assessment, you can search https://cve.mitre.org/ for the ID of the CVE (for example, CVE-2009-0021). The search results can provide detailed information about this CVE, its severity, and how to mitigate it.

The rules included in this package help you assess whether your EC2 instances are exposed to the CVEs in the following regional lists:

- US East (N. Virginia)
- US East (Ohio)
- US West (N. California)
- US West (Oregon)
- EU (Ireland)
- EU (Frankfurt)
- EU (London)
- EU (Stockholm)
- Asia Pacific (Tokyo)
- Asia Pacific (Seoul)
- Asia Pacific (Mumbai)
- Asia Pacific (Sydney)
- AWS GovCloud West (US)
- AWS GovCloud East (US)

The CVE rules package is updated regularly; this list includes the CVEs that are included in assessments runs that occur at the same time that this list is retrieved.

For more information, see Amazon Inspector Classic rules packages for supported operating systems (p. 84).

Center for Internet Security (CIS) Benchmarks

The CIS Security Benchmarks program provides well-defined, unbiased, consensus-based industry best practices to help organizations assess and improve their security. AWS is a CIS Security Benchmarks Member company. For a list of Amazon Inspector Classic certifications, see the Amazon Web Services page on the CIS website.
Amazon Inspector Classic currently provides the following CIS Certified rules packages to help establish secure configuration postures for the following operating systems:

**Amazon Linux**

- CIS Benchmark for Amazon Linux 2 Benchmark v1.0.0 Level 1
- CIS Benchmark for Amazon Linux 2 Benchmark v1.0.0 Level 2
- CIS Benchmark for Amazon Linux Benchmark v2.1.0 Level 1
- CIS Benchmark for Amazon Linux Benchmark v2.1.0 Level 2
- CIS Benchmark for Amazon Linux 2014.09-2015.03 v1.1.0 Level 1

**CentOS Linux**

- CIS Benchmark for CentOS Linux 7 Benchmark v2.2.0 Level 1 Server
- CIS Benchmark for CentOS Linux 7 Benchmark v2.2.0 Level 2 Server
- CIS Benchmark for CentOS Linux 7 Benchmark v2.2.0 Level 1 Workstation
- CIS Benchmark for CentOS Linux 7 Benchmark v2.2.0 Level 2 Workstation
- CIS Benchmark for CentOS Linux 6 Benchmark v2.0.2 Level 1 Server
- CIS Benchmark for CentOS Linux 6 Benchmark v2.0.2 Level 2 Server
- CIS Benchmark for CentOS Linux 6 Benchmark v2.0.2 Level 1 Workstation
- CIS Benchmark for CentOS Linux 6 Benchmark v2.0.2 Level 2 Workstation

**Red Hat Enterprise Linux**

- CIS Benchmark for Red Hat Enterprise Linux 7 Benchmark v2.1.1 Level 1 Server
- CIS Benchmark for Red Hat Enterprise Linux 7 Benchmark v2.1.1 Level 2 Server
- CIS Benchmark for Red Hat Enterprise Linux 7 Benchmark v2.1.1 Level 1 Workstation
- CIS Benchmark for Red Hat Enterprise Linux 7 Benchmark v2.1.1 Level 2 Workstation
- CIS Benchmark for Red Hat Enterprise Linux 6 Benchmark v2.0.2 Level 1 Server
- CIS Benchmark for Red Hat Enterprise Linux 6 Benchmark v2.0.2 Level 2 Server
- CIS Benchmark for Red Hat Enterprise Linux 6 Benchmark v2.0.2 Level 1 Workstation
- CIS Benchmark for Red Hat Enterprise Linux 6 Benchmark v2.0.2 Level 2 Workstation

**Ubuntu**

- CIS Benchmark for Ubuntu Linux 18.04 LTS Benchmark v1.0.0 Level 1 Server
- CIS Benchmark for Ubuntu Linux 18.04 LTS Benchmark v1.0.0 Level 2 Server
- CIS Benchmark for Ubuntu Linux 18.04 LTS Benchmark v1.0.0 Level 1 Workstation
- CIS Benchmark for Ubuntu Linux 18.04 LTS Benchmark v1.0.0 Level 2 Workstation
- CIS Benchmark for Ubuntu Linux 16.04 LTS Benchmark v1.1.0 Level 1 Server
- CIS Benchmark for Ubuntu Linux 16.04 LTS Benchmark v1.1.0 Level 2 Server
- CIS Benchmark for Ubuntu Linux 16.04 LTS Benchmark v1.1.0 Level 1 Workstation
- CIS Benchmark for Ubuntu Linux 16.04 LTS Benchmark v1.1.0 Level 2 Workstation
- CIS Benchmark for Ubuntu Linux 14.04 LTS Benchmark v2.0.0 Level 1 Server
Security best practices for Amazon Inspector Classic

Use Amazon Inspector Classic rules to help determine whether your systems are configured securely.

If a specific CIS benchmark appears in a finding that is produced by an Amazon Inspector Classic assessment run, you can download a detailed PDF description of the benchmark from https://benchmarks.cisecurity.org/ (free registration required). The benchmark document provides detailed information about this CIS benchmark, its severity, and how to mitigate it.

For more information, see Amazon Inspector Classic rules packages for supported operating systems (p. 84).
Important
Currently, you can include in your assessment targets EC2 instances that are running either Linux-based or Windows-based operating systems.
During an assessment run, the rules described in this section generate findings only for the EC2 instances that are running Linux-based operating systems. The rules do not generate findings for EC2 instances that are running Windows-based operating systems.
For more information, see Amazon Inspector Classic rules packages for supported operating systems (p. 84).

Topics
- Disable root login over SSH (p. 63)
- Support SSH version 2 only (p. 63)
- Disable password authentication Over SSH (p. 64)
- Configure password maximum age (p. 64)
- Configure password minimum length (p. 64)
- Configure password complexity (p. 65)
- Enable ASLR (p. 65)
- Enable DEP (p. 66)
- Configure permissions for system directories (p. 66)

Disable root login over SSH

This rule helps determine whether the SSH daemon is configured to permit logging in to your EC2 instance as root.

Severity

Medium (p. 56)

Finding

There is an EC2 instance in your assessment target that is configured to allow users to log in with root credentials over SSH. This increases the likelihood of a successful brute-force attack.

Resolution

We recommend that you configure your EC2 instance to prevent root account logins over SSH. Instead, log in as a non-root user and use sudo to escalate privileges when necessary. To disable SSH root account logins, set PermitRootLogin to no in the /etc/ssh/sshd_config file, and then restart ssdh.

Support SSH version 2 only

This rule helps determine whether your EC2 instances are configured to support SSH protocol version 1.

Severity

Medium (p. 56)

Finding

An EC2 instance in your assessment target is configured to support SSH-1, which contains inherent design flaws that greatly reduce its security.
Resolution

We recommend that you configure EC2 instances in your assessment target to support only SSH-2 and later. For OpenSSH, you can achieve this by setting Protocol 2 in the /etc/ssh/sshd_config file. For more information, see man sshd_config.

Disable password authentication Over SSH

This rule helps determine whether your EC2 instances are configured to support password authentication over the SSH protocol.

Severity

Medium (p. 56)

Finding

An EC2 instance in your assessment target is configured to support password authentication over SSH. Password authentication is susceptible to brute-force attacks and should be disabled in favor of key-based authentication where possible.

Resolution

We recommend that you disable password authentication over SSH on your EC2 instances and enable support for key-based authentication instead. This significantly reduces the likelihood of a successful brute-force attack. For more information, see https://aws.amazon.com/articles/1233/. If password authentication is supported, it is important to restrict access to the SSH server to trusted IP addresses.

Configure password maximum age

This rule helps determine whether the maximum age for passwords is configured on your EC2 instances.

Severity

Medium (p. 56)

Finding

An EC2 instance in your assessment target is not configured for a maximum age for passwords.

Resolution

If you are using passwords, we recommend that you configure a maximum age for passwords on all EC2 instances in your assessment target. This requires users to regularly change their passwords and reduces the chances of a successful password guessing attack. To fix this issue for existing users, use the chage command. To configure a maximum age for passwords for all future users, edit the PASS_MAX_DAYS field in the /etc/login.defs file.

Configure password minimum length

This rule helps determine whether a minimum length for passwords is configured on your EC2 instances.

Severity

Medium (p. 56)

Finding

An EC2 instance in your assessment target is not configured for a minimum length for passwords.
Resolution

If you are using passwords, we recommend that you configure a minimum length for passwords on all EC2 instances in your assessment target. Enforcing a minimum password length reduces the risk of a successful password guessing attack. You can do this by using the following option in the `pwquality.conf` file: `minlen`. For more information, see https://linux.die.net/man/5/pwquality.conf.

If `pwquality.conf` is not available on your instance, you can set the `minlen` option using the `pam_cracklib.so` module. For more information, see `man pam_cracklib`.

The `minlen` option should be set to 14 or greater.

Configure password complexity

This rule helps determine whether a password complexity mechanism is configured on your EC2 instances.

Severity

Medium (p. 56)

Finding

No password complexity mechanism or restrictions are configured on EC2 instances in your assessment target. This allows users to set simple passwords, which increases the chances of unauthorized users gaining access and misusing accounts.

Resolution

If you are using passwords, we recommend that you configure all EC2 instances in your assessment target to require a level of password complexity. You can do this by using the following options in the `pwquality.conf` file: `lcredit`, `ucredit`, `dcredit`, and `ocredit`. For more information, see https://linux.die.net/man/5/pwquality.conf.

If `pwquality.conf` is not available on your instance, you can set the `lcredit`, `ucredit`, `dcredit`, and `ocredit` options using the `pam_cracklib.so` module. For more information, see `man pam_cracklib`.

The expected value for each of these options is less than or equal to -1, as shown below:

- `lcredit <= -1`, `ucredit <= -1`, `dcredit <= -1`, `ocredit <= -1`

Additionally, the `remember` option must be set to 12 or greater. For more information, see `man pam_unix`.

Enable ASLR

This rule helps determine whether address space layout randomization (ASLR) is enabled on the operating systems of the EC2 instances in your assessment target.

Severity

Medium (p. 56)

Finding

An EC2 instance in your assessment target does not have ASLR enabled.
Enable DEP

This rule helps determine whether Data Execution Prevention (DEP) is enabled on the operating systems of the EC2 instances in your assessment target.

**Note**
This rule is not supported for EC2 instances with ARM processors.

**Severity**
Medium (p. 56)

**Finding**
An EC2 instance in your assessment target does not have DEP enabled.

**Resolution**
We recommend that you enable DEP on the operating systems of all EC2 instances in your assessment target. Enabling DEP protects your instances from security compromises using buffer-overflow techniques.

Configure permissions for system directories

This rule checks permissions on system directories that contain binaries and system configuration information. It checks that only the root user (a user who logs in by using root account credentials) has write permissions for these directories.

**Severity**
High (p. 56)

**Finding**
An EC2 instance in your assessment target contains a system directory that is writable by non-root users.

**Resolution**
To improve the security of your assessment target and to prevent privilege escalation by malicious local users, configure all system directories on all EC2 instances in your target to be writable only by users who log in by using root account credentials.
Amazon Inspector Classic helps you discover potential security issues by using security rules to analyze your AWS resources. Amazon Inspector Classic monitors and collects behavioral data (telemetry) about your resources. The data includes information about the use of secure channels, network traffic among running processes, and details of communication with AWS services. Next, Amazon Inspector Classic analyzes and compares the data against a set of security rules packages. Finally, Amazon Inspector Classic produces a list of findings that identify potential security issues of various levels of severity.

To get started, you create an assessment target (a collection of the AWS resources that you want Amazon Inspector Classic to analyze). Next, you create an assessment template (a blueprint that you use to configure your assessment). You use the template to start an assessment run, which is the monitoring and analysis process that results in a set of findings.

**Topics**

- Amazon Inspector Classic assessment templates (p. 67)
- Amazon Inspector Classic assessment templates limits (p. 68)
- Creating an assessment template (p. 68)
- Deleting an assessment template (p. 69)
- Assessment runs (p. 69)
- Amazon Inspector Classic assessment runs limits (p. 70)
- Setting up automatic assessment runs through a Lambda function (p. 70)
- Setting up an SNS topic for Amazon Inspector Classic notifications (p. 71)

**Amazon Inspector Classic assessment templates**

An assessment template allows you to specify a configuration for your assessment runs, including the following:

- Rules packages that Amazon Inspector Classic uses to evaluate your assessment target
- Duration of the assessment run – You can set the duration of an assessment run anywhere between 3 minutes to 24 hours. We recommend setting the duration of assessment runs to 1 hour.
- Amazon SNS topics that Amazon Inspector Classic sends notifications to about your assessment run states and findings
- Amazon Inspector Classic attributes (key-value pairs) that you can assign to findings that are generated by the assessment run that uses this assessment template

After Amazon Inspector Classic creates the assessment template, you can tag it like any other AWS resource. For more information, see Tag Editor. Tagging assessment templates enables you to organize them and get better oversight of your security strategy. For example, Amazon Inspector Classic offers a large number of rules that you can assess your assessment targets against. You might want to include various subsets of the available rules in your assessment templates to target specific areas of concern.
or to uncover specific security issues. Tagging assessment templates allows you to locate and run them quickly at any time in accordance with your security strategy and goals.

**Important**
After you create an assessment template, you can't modify it.

## Amazon Inspector Classic assessment templates limits

You can create up to 500 assessment templates for each AWS account.

For more information, see Amazon Inspector Classic service limits (p. 4).

## Creating an assessment template

**To create an assessment template**

1. Sign in to the AWS Management Console and open the Amazon Inspector Classic console at https://console.aws.amazon.com/inspector/.
2. In the navigation pane, choose **Assessment Templates**, and then choose **Create**.
3. For **Name**, enter a name for your assessment template.
4. For **Target name**, choose an assessment target to analyze.
   
   **Note**
   When you create an assessment template, you can use the **Preview Target** button on the **Assessment Templates** page to review all EC2 instances included in the assessment target. For each EC2 instance, you can review the hostname, instance ID, IP address, and, if applicable, the status of the agent. The agent status can have the following values: **HEALTHY**, **UNHEALTHY**, and **UNKNOWN**. Amazon Inspector Classic displays an **UNKNOWN** status when it can't determine whether there is an agent running on the EC2 instance.
   You can also use the **Preview Target** button on the **Assessment Templates** page to review EC2 instances that make up assessment targets included in your previously created templates.
5. For **Rules packages**, choose one or more rules packages to include in your assessment template.
6. For **Duration**, specify the duration for your assessment template.
7. (Optional) For **SNS topics**, specify an SNS topic that you want Amazon Inspector Classic to send notifications to about assessment run states and findings. Amazon Inspector Classic can send SNS notifications about the following events:
   - An assessment run has started
   - An assessment run has ended
   - An assessment run's status has changed
   - A finding was generated
   
   For more information about setting up an SNS topic, see Setting up an SNS topic for Amazon Inspector Classic notifications (p. 71).
8. (Optional) For **Tag**, enter values for **Key** and **Value**. You can add multiple tags to the assessment template.
9. (Optional) For **Attributes added to findings**, enter values for **Key** and **Value**. Amazon Inspector Classic applies the attributes to all findings that are generated by the assessment template. You
Deleting an assessment template

To delete an assessment template, perform the following procedure.

**To delete an assessment template**

- On the **Assessment Templates** page, choose the template that you want to delete, and then choose **Delete**. When prompted for confirmation, choose **Yes**.

  **Important**
  
  When you delete an assessment template, all assessment runs, findings, and versions of the reports associated with this template are also deleted.

You can also delete an assessment template by using the **DeleteAssessmentTemplate** API.

Assessment runs

After you create an assessment template, you can use it to start assessment runs. You can start multiple runs using the same template as long as you stay within the runs limit for each AWS account. For more information, see **Amazon Inspector Classic assessment runs limits** (p. 70).

If you use the Amazon Inspector Classic console, you must start the first run of your new assessment template from the **Assessment templates** page. After you start the run, you can use the **Assessment runs** page to monitor the run's progress. Use the **Run**, **Cancel**, and **Delete** buttons to start, cancel, or delete a run. You can also view the run's details, including the ARN of the run, the rules packages selected for the run, the tags and attributes that you applied to the run, and more.

For subsequent runs of the assessment template, you can use the **Run**, **Cancel**, and **Delete** buttons on either the **Assessment templates** page or the **Assessment runs** page.

Deleting an assessment run

To delete an assessment run, perform the following procedure.
To delete a run

- On the Assessment runs page, choose the run that you want to delete, and then choose Delete. When prompted for confirmation, choose Yes.

  **Important**
  When you delete a run, all findings and all versions of the report from that run are also deleted.

You can also delete a run by using the `DeleteAssessmentRun` API.

---

### Amazon Inspector Classic assessment runs limits

You can create up to 50,000 assessment runs for each AWS account.

You can have multiple runs occurring at the same time as long as the targets used for the runs don’t contain overlapping EC2 instances.

For more information, see Amazon Inspector Classic service limits (p. 4).

### Setting up automatic assessment runs through a Lambda function

If you want to set up a recurring schedule for your assessment, you can configure your assessment template to run automatically by creating a Lambda function using the AWS Lambda console. For more information, see Lambda Functions.

To set up automatic assessment runs using the AWS Lambda console, perform the following procedure.

**To set up automatic runs through a Lambda function**

1. Sign in to the AWS Management Console, and open the AWS Lambda console.
2. In the navigation pane, choose either Dashboard or Functions, and then choose Create a Lambda Function.
3. On the Create function page, choose Browse serverless app repository, then enter inspector in the search field.
4. Choose the inspector-scheduled-run blueprint.
5. On the Review, configure, and deploy page, set up a recurring schedule for automated runs by specifying a CloudWatch event that triggers your function. To do this, enter a rule name and description, and then choose a schedule expression. The schedule expression determines how often the run occurs, for example, every 15 minutes or once a day. For more information about CloudWatch events and concepts, see What is Amazon CloudWatch Events?

   If you select the Enable trigger check box, the run begins immediately after you finish creating your function. Subsequent automated runs follow the recurrence pattern that you specify in the Schedule expression field. If you don’t select the Enable trigger check box while creating the function, you can edit the function later to enable this trigger.

6. On the Configure function page, specify the following:
   - For Name, enter a name for your function.
   - (Optional) For Description, enter a description that will help you identify your function later.
For **runtime**, keep the default value of **Node.js 8.10**. AWS Lambda supports the **inspector-scheduled-run** blueprint only for the **Node.js 8.10** runtime.

The assessment template that you want to run automatically using this function. You do this by providing the value for the environment variable called **assessmentTemplateArn**.

Keep the handler set to the default value of **index.handler**.

The permissions for your function using the **Role** field. For more information, see AWS Lambda Permissions Model.

To run this function, you need an IAM role that allows AWS Lambda to start the runs and write log messages about the runs, including any errors, to Amazon CloudWatch Logs. AWS Lambda assumes this role for every recurring automated run. For example, you can attach the following sample policy to this IAM role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "inspector:StartAssessmentRun",
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:PutLogEvents"
      ],
      "Resource": "*"
    }
  ]
}
```

To run this function, you need an IAM role that allows AWS Lambda to start the runs and write log messages about the runs, including any errors, to Amazon CloudWatch Logs. AWS Lambda assumes this role for every recurring automated run. For example, you can attach the following sample policy to this IAM role:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "inspector:StartAssessmentRun",
        "logs:CreateLogGroup",
        "logs:CreateLogStream",
        "logs:PutLogEvents"
      ],
      "Resource": "*"
    }
  ]
}
```

7. Review your selections, and then choose **Create function**.

---

### Setting up an SNS topic for Amazon Inspector Classic notifications

Amazon Simple Notification Service (Amazon SNS) is a web service that sends messages to subscribing endpoints or clients. You can use Amazon SNS to set up notifications for Amazon Inspector Classic.

**To set up an SNS topic for notifications**

1. Create an SNS topic. See Tutorial: Creating an Amazon SNS Topic. When you create the topic, expand the **Access policy - optional** section. Then do the following to permit the assessment to send messages to the topic:

   a. For **Choose method**, choose Basic.
   b. For **Define who can publish messages to the topic**, choose Only the specified AWS accounts, and then enter the ARN for the account in the Region that you're creating the topic in:

      - US East (Ohio) - `arn:aws:iam::646659390643:root`
      - US East (N. Virginia) - `arn:aws:iam::316112463485:root`
      - US West (N. California) - `arn:aws:iam::166987590008:root`
      - US West (Oregon) - `arn:aws:iam::758058086616:root`
      - Asia Pacific (Mumbai) - `arn:aws:iam::162588757376:root`
      - Asia Pacific (Seoul) - `arn:aws:iam::526946625049:root`
      - Asia Pacific (Sydney) - `arn:aws:iam::454640832652:root`
Setting up an SNS topic for Amazon Inspector Classic notifications

- Asia Pacific (Tokyo) - arn:aws:iam::406045910587:root
- Europe (Frankfurt) - arn:aws:iam::537503971621:root
- Europe (Ireland) - arn:aws:iam::357557129151:root
- Europe (London) - arn:aws:iam::146838936955:root
- Europe (Stockholm) - arn:aws:iam::453420244670:root

c. For Define who can subscribe to this topic, choose Only the specified AWS accounts, and then enter the ARN for the account in the Region in which you're creating the topic.
d. To protect yourself against Inspector being used as a confused deputy as detailed in Confused deputy problem in the IAM User Guide, do the following:
   i. Choose Advanced. This will navigate you to the JSON editor.
   ii. Add the following condition:

      "Condition": {
          "StringEquals": {
              "aws:SourceAccount": <your account Id here>,
              "aws:SourceArn": "arn:aws:inspector:*:*:*"
          }
      }

e. (Optional) For additional information about aws:SourceAccount and aws:SourceArn, see Global condition context keys in the IAM User Guide.
f. Update other settings for the topic as needed, and then choose Create topic.

2. (Optional) To create an encrypted SNS topic, see Encryption at rest in the SNS Developer Guide.
3. To protect yourself against Inspector being used as a confused deputy for your KMS key, follow the additional steps below:
   a. Go to your CMK in the KMS console.
   b. Choose Edit.
   c. Add the following condition:

      "Condition": {
          "StringEquals": {
              "aws:SourceAccount": <your account Id here>,
              "aws:SourceArn": "arn:aws:sns:*:*:*"
          }
      }

4. Create a subscription to the topic that you created. For more information, see Tutorial: Subscribing an Endpoint to an Amazon SNS Topic.
5. To confirm that the subscription is configured correctly, publish a message to the topic. For more information, see Tutorial: Publishing a Message to an Amazon SNS Topic.
Amazon Inspector Classic findings

*Findings* are potential security issues that Amazon Inspector Classic discovers during an assessment of your assessment target. Findings are displayed on the Amazon Inspector Classic console or through the API. Findings contain detailed descriptions of the security issues and recommendations for resolving them.

After Amazon Inspector generates the findings, you can track them by assigning Amazon Inspector Classic attributes to them. These attributes consist of key-value pairs.

Tracking your findings with attributes can be useful for managing the workflow of your security strategy. For example, after you create and run an assessment, it generates a list of findings of various levels of severity, urgency, and interest to you, based on your security goals and approach. You might want to follow one finding's recommendation steps right away to resolve a potentially urgent security issue. Or you might want to postpone resolving another finding until your next upcoming service update. For example, to track a finding to resolve right away, you can create and assign to a finding an attribute with a key-value pair of *Status* / *Urgent*. You could also use attributes to distribute the workload of resolving potential security issues. For example, to give Bob (who is a security engineer on your team) the task of resolving a finding, you can assign to a finding an attribute with a key-value pair of *Assigned Engineer* / *Bob*.

Working with findings

Complete the following procedure on any of the generated Amazon Inspector Classic findings.

**To locate, analyze, and assign attributes to findings**

2. After you run an assessment, navigate to the *Findings* page in the Amazon Inspector Classic console to view your findings.

   You can also see your findings in the *Notable Findings* section on the *Dashboard* page of the Amazon Inspector Classic console.

   **Note**
   
   You can't view the findings that are generated by an assessment run while it is still in progress. However, you can view a subset of findings if you stop the assessment before it completes its duration. In a production environment, we recommend that you let every assessment run through its entire duration so that it can produce a full set of findings.

3. To view the details of a specific finding, choose the *Expand* widget next to that finding. The details of the finding include the following:

   - Name of the assessment target that includes the EC2 instance where this finding was registered.
   - Name of the assessment template that was used to produce this finding.
   - Assessment run start time.
   - Assessment run end time.
   - Assessment run status.
   - Name of the rules package that includes the rule that triggered this finding.
   - Name of the finding.
   - Severity of the finding.
• Native severity details from the Common Vulnerability Scoring System (CVSS). These include CVSS vector and CVSS score metrics (including CVSS version 2.0 and 3.0) for the findings triggered by the rules in the Common Vulnerabilities and Exposures rules package. For details about the CVSS, see https://www.first.org/cvss/.
• Native severity details from the Center of Internet Security (CIS). These include the CIS weight metric for the findings triggered by the rules in the CIS Benchmarks package. For more information about CIS weight metric, see https://www.cisecurity.org/.
• Description of the finding.
• Recommended steps that you can complete to fix the potential security issue described by the finding.

4. To assign attributes to a finding, choose a finding, and then choose Add/Edit Attributes.

You can also assign attributes to findings as you create an assessment template. To do that, you configure the new template to automatically assign attributes to all findings that are generated by the assessment run. You can use the Key and Value fields from the Tags for findings from this assessment field. For more information, see Amazon Inspector Classic assessment templates and assessment runs (p. 67).

5. To export findings to a spreadsheet, choose the down arrow in the upper-right corner of the Findings page. In the dialog box, choose Export all columns or Export visible columns.

Note that in the exported content, all datetime values are epoch timestamps.

6. To filter your current findings enter a single string you want to filter on, such as an instance ID or CVE number, in the filter bar above the findings table. To show or hide additional information columns, choose the settings icon in the upper-right corner of the Findings page.

7. To delete findings, navigate to the Assessment runs page and choose the run that resulted in the findings that you want to delete. Then choose Delete. When prompted for confirmation, choose Yes.

    Important
    You can't delete individual findings in Amazon Inspector Classic. When you delete an assessment run, all findings and all versions of the report from that run are also deleted.

You can also delete an assessment run by using the DeleteAssessmentRun API.
Assessment reports

An Amazon Inspector Classic assessment report is a document that details what is tested in the assessment run and the results of the assessment. You can store the reports, share them with your team for remediation actions, or use them to augment your compliance audit data. You can generate a report for an assessment run after the run has successfully completed.

**Note**

You can generate reports only for assessment runs that occur after April 25, 2017, which is when assessment reports in Amazon Inspector Classic became available.

You can view the following types of assessment reports:

- **Findings report** – this report contains the following information:
  - Summary of the assessment
  - EC2 instances evaluated during the assessment run
  - Rules packages included in the assessment run
  - Detailed information about each finding, including all EC2 instances that had the finding
- **Full report** – this report contains all the information that is included in a findings report, and additionally provides the list of rules that were checked against the instances in the assessment target.

**To generate an assessment report**

1. On the Assessment runs page, locate the assessment run that you want to generate a report for. Make sure that its status is set to Analysis complete.
2. Under the Reports column for this assessment run, choose the reports icon.

  **Important**

  The reports icon is present in the Reports column only for those assessment runs that took place or will take place after April 25, 2017. That is when assessment reports in Amazon Inspector Classic became available.

3. In the Assessment report dialog box, choose the type of report that you want to view (either a Findings or a Full report) and the report format (HTML or PDF). Then choose Generate report.

You can also generate assessment reports through the GetAssessmentReport API.

To delete an assessment report, perform the following procedure.

**To delete a report**

- On the Assessment runs page, choose the run that the report that you want to delete is based on, and then choose Delete. When prompted for confirmation, choose Yes.

  **Important**

  In Amazon Inspector Classic, you can't delete individual reports. When you delete an assessment run, all versions of the report from that run and all findings are also deleted.

You can also delete an assessment run by using the DeleteAssessmentRun API.
Exclusions in Amazon Inspector Classic

Exclusions are an output of Amazon Inspector Classic assessment runs. Exclusions show which of your security checks can’t be completed and how to resolve the issues. For example, issues can be caused by the absence of an agent on the specified target's EC2 instances, the use of an unsupported operating system, or unexpected errors.

You can view exclusions on the Assessment runs page on the console. For more information, see Viewing post-assessment exclusions (p. 83).

To avoid incurring unnecessary AWS fees, Amazon Inspector Classic allows you to preview exclusions before running an assessment. You can find the previews on the Assessment templates page on the console. For more information, see Previewing exclusions (p. 82).

Note
You can generate post-assessment exclusions only for runs that occur after June 25, 2018. That's when exclusions in Amazon Inspector Classic became available. However, exclusion previews are available for all assessment templates regardless of date.

Topics
- Exclusion types (p. 76)
- Previewing exclusions (p. 82)
- Viewing post-assessment exclusions (p. 83)

Exclusion types

Amazon Inspector Classic can produce the following exclusion types.

<table>
<thead>
<tr>
<th>Exclusion Type</th>
<th>Description</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>No instances in target</td>
<td>There are no EC2 instances with the tags specified in the assessment target.</td>
<td>Check that the tags in your assessment target match the tags of your target EC2 instance.</td>
</tr>
<tr>
<td>Agent is already running</td>
<td>An assessment run is already in progress on the target EC2 instance.</td>
<td>Wait until the current assessment run on the target EC2 instance has completed.</td>
</tr>
</tbody>
</table>
## Exclusion types

<table>
<thead>
<tr>
<th>Exclusion Type</th>
<th>Description</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent not found</td>
<td>An Amazon Inspector Classic agent was not found on the target EC2 instance.</td>
<td>Install or reinstall an Amazon Inspector Classic agent on the target EC2 instance. For more information, see Installing Amazon Inspector Classic agents (p. 40).</td>
</tr>
<tr>
<td>Agent is unhealthy</td>
<td>The Amazon Inspector Classic agent on the target EC2 instance is in an unhealthy state.</td>
<td>Check the status of the Amazon Inspector Classic agent on this instance and take necessary action. For more information, see Inspector Agents.</td>
</tr>
<tr>
<td>Exclusion Type</td>
<td>Description</td>
<td>Recommendation</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Unsupported OS version</td>
<td>The operating system of the target EC2 instance is not supported for Amazon Inspector Classic assessments.</td>
<td>Remove the target EC2 instance from the assessment target, or create a target that doesn't include this instance. For a list of supported operating systems, see Amazon Inspector Classic Supported Operating Systems and Regions.</td>
</tr>
<tr>
<td>Deprecated rules package</td>
<td>The assessment template includes a deprecated rules package.</td>
<td>Create an assessment template without the deprecated rules package, and use it for future assessment runs.</td>
</tr>
<tr>
<td>Exclusion Type</td>
<td>Description</td>
<td>Recommendation</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rules package not supported by OS</td>
<td>The operating system of the target EC2 instance is not supported by a rules package included in the assessment template.</td>
<td>Create an assessment template without the conflicting rules packages or remove the target EC2 instance from the assessment template. For a list of rules package support by operating system, see <a href="#">Rules Package Availability Across Supported Operating Systems</a>.</td>
</tr>
<tr>
<td>Rules evaluation error for single instance</td>
<td>An internal error has caused the rules evaluation to fail for this instance.</td>
<td>Attempt to run your assessment again. Contact support if the exclusion persists when you rerun the assessment.</td>
</tr>
<tr>
<td>Rules evaluation error</td>
<td>An internal error has caused the rules evaluation to fail for your assessment.</td>
<td>Attempt to run the assessment again. Contact support if the exclusion persists when you rerun the assessment.</td>
</tr>
<tr>
<td>Exclusion Type</td>
<td>Description</td>
<td>Recommendation</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Network Reachability error – internet</td>
<td>An internal error has caused a Network Reachability evaluation to fail on checks for ports reachable from the internet. You might get findings for other Network Reachability types.</td>
<td>Attempt to run the assessment again. Contact support if the exclusion persists when you rerun the assessment.</td>
</tr>
<tr>
<td>Network Reachability error – internet through an Application Load Balancer</td>
<td>An internal error has caused a Network Reachability evaluation to fail on checks for ports reachable from the internet through an Application Load Balancer. You might get findings for other Network Reachability types.</td>
<td>Attempt to run the assessment again. Contact support if the exclusion persists when you rerun the assessment.</td>
</tr>
<tr>
<td>Exclusion Type</td>
<td>Description</td>
<td>Recommendation</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
<td>----------------</td>
</tr>
<tr>
<td>Network Reachability error – internet through an Elastic Load Balancing load balancer</td>
<td>An internal error has caused a Network Reachability evaluation to fail on checks for ports reachable from the internet though an Elastic Load Balancing load balancer. You might get findings for other Network Reachability types.</td>
<td>Attempt to run the assessment again. Contact support if the exclusion persists when you rerun the assessment.</td>
</tr>
<tr>
<td>Network Reachability error –VPN</td>
<td>An internal error has caused a Network Reachability evaluation to fail on checks for ports reachable from VPN. You might get findings for other Network Reachability types.</td>
<td>Attempt to run the assessment again. Contact support if the exclusion persists when you rerun the assessment.</td>
</tr>
</tbody>
</table>
### Previewing exclusions

Amazon Inspector Classic allows you to preview potential exclusions before running an assessment.

**To preview assessment exclusions**

2. In the navigation pane, choose **Assessment templates**.
3. Expand a template, and in the **Assessment templates** section, choose **Preview exclusions**.
4. Review the descriptions of all detected exclusions and the recommendations for addressing them.
You can also list and describe exclusions by using the `ListExclusions` and `DescribeExclusions` operations.

Viewing post-assessment exclusions

After an assessment run, you can view details about any exclusions.

To view details about exclusions

1. Sign in to the AWS Management Console and open the Amazon Inspector Classic console at https://console.aws.amazon.com/inspector/.
2. In the navigation pane, choose Assessment runs.
3. In the Exclusions column, choose the active link that is associated with an assessment run.
4. Review the descriptions of all detected exclusions and the recommendations for addressing them.

You can also list and describe exclusions by using the `ListExclusions` and `DescribeExclusions` operations.
Amazon Inspector Classic rules packages for supported operating systems

You can run Amazon Inspector Classic rules packages on the EC2 instances that are included in your assessment targets. The following table shows the availability of rules packages for supported operating systems.

**Important**
You can run an agentless assessment with the Network Reachability (p. 57) rules package on any EC2 instance regardless of operating system.

**Note**
For more information about supported operating systems, see Amazon Inspector Classic supported operating systems and Regions (p. 6).

Logging Amazon Inspector Classic API calls with AWS CloudTrail

Amazon Inspector Classic is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service in Amazon Inspector Classic. CloudTrail captures all API calls for Amazon Inspector Classic as events, including calls from the Amazon Inspector Classic console and code calls to the Amazon Inspector Classic API operations. If you create a trail, you can enable continuous delivery of CloudTrail events to an Amazon S3 bucket, including events for Amazon Inspector Classic. If you don't configure a trail, you can still view the most recent events on the CloudTrail console in Event history. Using the information collected by CloudTrail, you can determine the request that was made to Amazon Inspector Classic, the IP address the request was made from, who made the request, when it was made, and more.

To learn more about CloudTrail, see the AWS CloudTrail User Guide. For a full list of Amazon Inspector Classic API operations, see Actions in the Amazon Inspector Classic API Reference.

Amazon Inspector Classic information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in Amazon Inspector Classic, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing Events with CloudTrail Event History.

For an ongoing record of events in your AWS account, including events for Amazon Inspector Classic, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail on the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see the following:

- Overview for Creating a Trail
- CloudTrail Supported Services and Integrations
- Configuring Amazon SNS Notifications for CloudTrail
- Receiving CloudTrail Log Files from Multiple Regions and Receiving CloudTrail Log Files from Multiple Accounts

CloudTrail logs all Amazon Inspector Classic operations, including read-only operations, such as ListAssessmentRuns and DescribeAssessmentTargets, and management operations, such as AddAttributesToFindings and CreateAssessmentTemplate.

**Note**

CloudTrail logs only the request information of Amazon Inspector Classic read-only operations. Both request and response information is logged for all other Amazon Inspector Classic operations.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root or AWS Identity and Access Management (IAM) user credentials
• Whether the request was made with temporary security credentials for a role or federated user
• Whether the request was made by another AWS service

For more information, see CloudTrail userIdentity Element.

Understanding Amazon Inspector Classic log file entries

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, and other request parameters. CloudTrail log files aren't an ordered stack trace of the public API calls, so they don't appear in any specific order.

The following example shows a CloudTrail log entry that demonstrates the Amazon Inspector Classic CreateResourceGroup operation:

```
{
    "eventVersion": "1.03",
    "userIdentity": {
        "type": "AssumedRole",
        "principalId": "AIDACKCEVSQ6C2EXAMPLE",
        "arn": "arn:aws:iam::444455556666:user/Alice",
        "accountId": "444455556666",
        "accessKeyId": "AKIAI44QH8DHBEXAMPLE",
        "sessionContext": {
            "attributes": {
                "mfaAuthenticated": "false",
                "creationDate": "2016-04-14T17:05:54Z"
            },
            "sessionIssuer": {
                "type": "Role",
                "principalId": "AIDACKCEVSQ6C2EXAMPLE",
                "arn": "arn:aws:iam::444455556666:user/Alice",
                "accountId": "444455556666",
                "userName": "Alice"
            }
        }
    },

"apiVersion": "v20160216",
"recipientAccountid": "444455556666"}
Monitoring Amazon Inspector Classic using Amazon CloudWatch

You can monitor Amazon Inspector Classic using Amazon CloudWatch, which collects and processes raw data into readable, near real-time metrics. By default, Amazon Inspector Classic sends metric data to CloudWatch in 5-minute periods. You can use the AWS Management Console, the AWS CLI, or an API to view the metrics that Amazon Inspector Classic sends to CloudWatch.

For more information about Amazon CloudWatch, see the Amazon CloudWatch User Guide.

Amazon Inspector Classic CloudWatch metrics

The Amazon Inspector Classic namespace includes the following metrics.

AssessmentTargetARN metrics:

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TotalMatchingAgents</td>
<td>Number of agents that match this target</td>
</tr>
<tr>
<td>TotalHealthyAgents</td>
<td>Number of agents that match this target that are healthy</td>
</tr>
<tr>
<td>TotalAssessmentRuns</td>
<td>Number of assessment runs for this target</td>
</tr>
<tr>
<td>TotalAssessmentRunFindings</td>
<td>Number of findings for this target</td>
</tr>
</tbody>
</table>

AssessmentTemplateARN metrics:

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TotalMatchingAgents</td>
<td>Number of agents that match this template</td>
</tr>
<tr>
<td>TotalHealthyAgents</td>
<td>Number of agents that match this template that are healthy</td>
</tr>
<tr>
<td>TotalAssessmentRuns</td>
<td>Number of assessment runs for this template</td>
</tr>
<tr>
<td>TotalAssessmentRunFindings</td>

Configuring Amazon Inspector Classic using AWS CloudFormation

For reference information about Amazon Inspector Classic resources that are supported by AWS CloudFormation, see the following topics:

- AWS::Inspector::AssessmentTarget
- AWS::Inspector::AssessmentTemplate
- AWS::Inspector::ResourceGroup

**Important**
For lists of the ARNs of Amazon Inspector Classic rules packages in supported AWS Regions, see Amazon Inspector Classic ARNS for rules packages (p. 97).
Integration with AWS Security Hub

AWS Security Hub provides you with a comprehensive view of your security state in AWS and helps you to check your environment against security industry standards and best practices. Security Hub collects security data from across AWS accounts, services, and supported third-party partner products and helps you to analyze your security trends and identify the highest priority security issues.

The integration with Security Hub enables you to send findings from to Security Hub. Security Hub can then include those findings in its analysis of your security posture.

Contents
- How sends findings to Security Hub (p. 93)
- Types of findings that sends (p. 93)
- Latency for sending findings (p. 94)
- Retrying when Security Hub is not available (p. 94)
- Updating existing findings in Security Hub (p. 94)
- Typical finding from (p. 94)
- Enabling and configuring the integration (p. 95)
- How to stop sending findings (p. 95)

How sends findings to Security Hub

In Security Hub, security issues are tracked as findings. Some findings come from issues that are detected by other AWS services or by third-party partners. Security Hub also has a set of rules that it uses to detect security issues and generate findings.

Security Hub provides tools to manage findings from across all of these sources. You can view and filter lists of findings and view details for a finding. See Viewing findings in the AWS Security Hub User Guide. You can also track the status of an investigation into a finding. See Taking action on findings in the AWS Security Hub User Guide.

All findings in Security Hub use a standard JSON format called the AWS Security Finding Format (ASFF). The ASFF includes details about the source of the issue, the affected resources, and the current status of the finding. See AWS Security Finding Format (ASFF) in the AWS Security Hub User Guide.

is one of the AWS services that sends findings to Security Hub.

Types of findings that sends

sends all of the findings it generates to Security Hub.

sends the findings to Security Hub using the AWS Security Finding Format (ASFF). In ASFF, the Types field provides the finding type. Findings from can have the following values for Types.

- Software and Configuration Checks/Vulnerabilities/CVE
- Software and Configuration Checks/Industry and Regulatory Standards/CIS Host Hardening Benchmarks
Latency for sending findings

When creates a new finding, it is usually sent to Security Hub within five minutes.

Retrying when Security Hub is not available

If Security Hub is not available, retries sending the findings until they are received.

Updating existing findings in Security Hub

After it sends a finding to Security Hub, updates the finding to reflect additional observations of the finding activity. This will result in fewer findings in Security Hub than in .

Typical finding from

sends findings to Security Hub using the AWS Security Finding Format (ASFF).

Here is an example of a typical finding from .

  }
}
```
Enabling and configuring the integration

When you enable both and Security Hub, the integration is enabled automatically. begins to send findings to Security Hub.

How to stop sending findings

To stop sending findings to Security Hub, you can use either the Security Hub console or the API.
See Disabling and enabling the flow of findings from an integration (console) or Disabling the flow of findings from an integration (Security Hub API, AWS CLI) in the AWS Security Hub User Guide.
Amazon Inspector Classic ARNs

Each resource type and rules package in Amazon Inspector Classic has a unique Amazon Resource Name (ARN) associated with it.

Contents
- ARNs for Amazon Inspector Classic resources (p. 97)
- Amazon Inspector Classic ARNS for rules packages (p. 97)
  - US East (Ohio) (p. 98)
  - US East (N. Virginia) (p. 98)
  - US West (N. California) (p. 99)
  - US West (Oregon) (p. 99)
  - Asia Pacific (Mumbai) (p. 100)
  - Asia Pacific (Seoul) (p. 100)
  - Asia Pacific (Sydney) (p. 100)
  - Asia Pacific (Tokyo) (p. 101)
  - Europe (Frankfurt) (p. 101)
  - Europe (Ireland) (p. 102)
  - Europe (London) (p. 102)
  - Europe (Stockholm) (p. 102)
  - AWS GovCloud (US-East) (p. 103)
  - AWS GovCloud (US-West) (p. 103)

ARNs for Amazon Inspector Classic resources

In Amazon Inspector Classic, the primary resources are resource groups, assessment targets, assessment templates, assessment runs, and findings. These resources have unique Amazon Resource Names (ARNs) associated with them, as shown in the following table.

<table>
<thead>
<tr>
<th>Resource Type</th>
<th>ARN Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource group</td>
<td>arn:aws:inspector:{region:account-id:resourcegroup}/{ID}</td>
</tr>
<tr>
<td>Assessment target</td>
<td>arn:aws:inspector:{region:account-id:target}/{ID}</td>
</tr>
<tr>
<td>Assessment template</td>
<td>arn:aws:inspector:{region:account-id:target:template:template-ID}/run/{ID}</td>
</tr>
<tr>
<td>Assessment run</td>
<td>arn:aws:inspector:{region:account-id:target:template:template-ID}/run/{ID}/finding/{ID}</td>
</tr>
</tbody>
</table>

Amazon Inspector Classic ARNS for rules packages

The following tables show the ARNs for Amazon Inspector Classic rules packages in all supported Regions.
Topics

- US East (Ohio) (p. 98)
- US East (N. Virginia) (p. 98)
- US West (N. California) (p. 99)
- US West (Oregon) (p. 99)
- Asia Pacific (Mumbai) (p. 100)
- Asia Pacific (Seoul) (p. 100)
- Asia Pacific (Sydney) (p. 100)
- Asia Pacific (Tokyo) (p. 101)
- Europe (Frankfurt) (p. 101)
- Europe (Ireland) (p. 102)
- Europe (London) (p. 102)
- Europe (Stockholm) (p. 102)
- AWS GovCloud (US-East) (p. 103)
- AWS GovCloud (US-West) (p. 103)
