  "Parameters": {
    "BackupVaultName": ["backup-vault"],
    "CompleteWindowMinutes": [ "200" ],
    "DeleteAfterDays": [ "10" ],
    "ResourceArn": ["arn:aws:ec2:us-east-1:000000000000:volume/vol-123456789"],
    "StartWindowMinutes": [ "60" ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it StartBackupJobRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > StartBackupJobRfc.json
```

4. Modify and save the StartBackupJobRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-2hhud2lx01tq7",
    "ChangeTypeVersion": "1.0",
    "Title": "AWS Backup Start Backup Job"
}
```

5. Create the RFC, specifying the StartBackupJobRfc file and the StartBackupJobParams file:

```
aws amscm create-rfc --cli-input-json file://StartBackupJobRfc.json --execution-
parameters file://StartBackupJobParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Backup, see AWS Backup: How It Works.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2hhud2lx01tq7.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-StartBackupJob",
  "Region": "us-east-1",
  "Parameters": {
    "ResourceArn": ["arn:aws:ec2:us-east-1:000000000000:volume/vol-123456789"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-StartBackupJob",
  "Region": "us-east-1",
  "Parameters": {
    "BackupVaultName": ["backup-vault"],
    "CompleteWindowMinutes": [ "200" ],
    "DeleteAfterDays": [ "10" ],
    "ResourceArn": ["arn:aws:ec2:us-east-1:000000000000:volume/vol-123456789"],
    "StartWindowMinutes": [ "60" ]
  }
}
```

Backup Job | Stop

Stop an AWS Backup service running, or scheduled, backup job.

Full classification: Management | AWS Backup | Backup job | Stop

Change Type Details

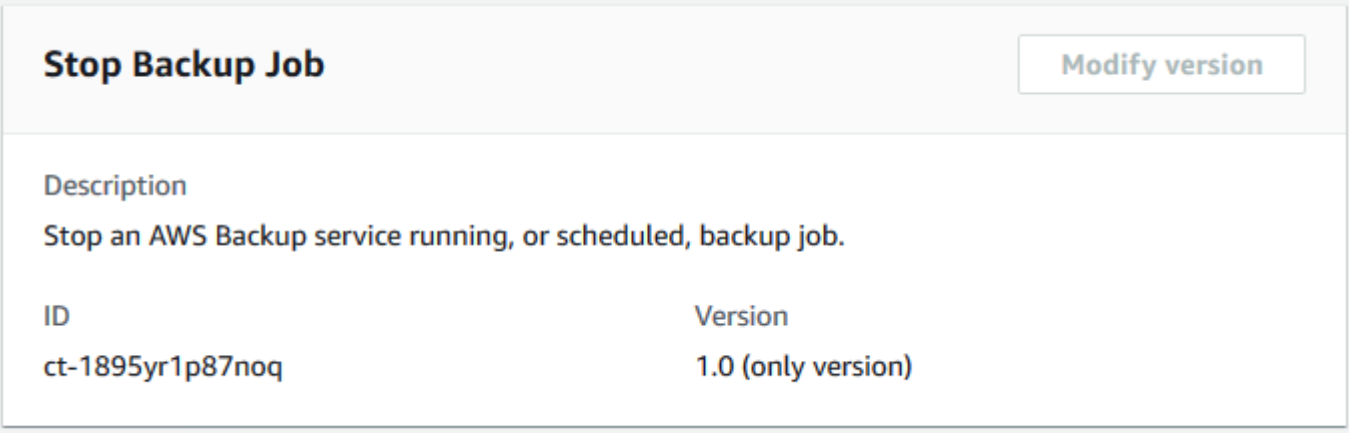
Change type ID	ct-1895yr1p87noq
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Stop AWS Backup job

Stopping a backup job with the console

The following shows this change type in the AMS console.



1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Stopping a backup job with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1895yr1p87noq" --change-type-version
 "1.0" --title "AWS Backup Stop Backup Job" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-StopBackupJob\",\"Region\":\"us-east-1\",\"Parameters\":
{\"BackupJobId\":[\"278bac28-d634-45b4-85b6-3685e99f2ca1\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it StopBackupJobParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1895yr1p87noq" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > StopBackupJobParams.json
   ```

2. Modify and save the StopBackupJobParams file.

   ```
   {
       "DocumentName": "AWSManagedServices-StopBackupJob",
       "Region": "us-east-1",
       "Parameters": {
           "BackupJobId": [
               "278bac28-d634-45b4-85b6-3685e99f2ca1"
           ]
       }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it StopBackupJobRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > StopBackupJobRfc.json
```

4. Modify and save the StopBackupJobRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-1895yr1p87noq",
    "ChangeTypeVersion": "1.0",
    "Title": "AWS Backup Stop Backup Job"
}
```

5. Create the RFC, specifying the StopBackupJobRfc file and the StopBackupJobParams file:

```
aws amscm create-rfc --cli-input-json file://StopBackupJobRfc.json --execution-
parameters file://StopBackupJobParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Backup, see AWS Backup: How It Works.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1895yr1p87noq.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-StopBackupJob",
  "Region": "us-east-1",
  "Parameters": {
    "BackupJobId": [ "76659DD5-1A99-46FE-97AD-D6D0126382CA" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-StopBackupJob",
  "Region": "us-east-1",
  "Parameters": {
    "BackupJobId": [ "2abf2ce0-9096-407c-95a6-4d0b584b9a0a" ]
  }
}
```

Backup Plan | Enable Cross Account Copy (Management Account)

Enable and configure cross-account backup and monitoring in a management account. This automation can only be completed successfully in a management account.

Full classification: Management | AWS Backup | Backup plan | Enable cross account copy (Management account)

Change Type Details

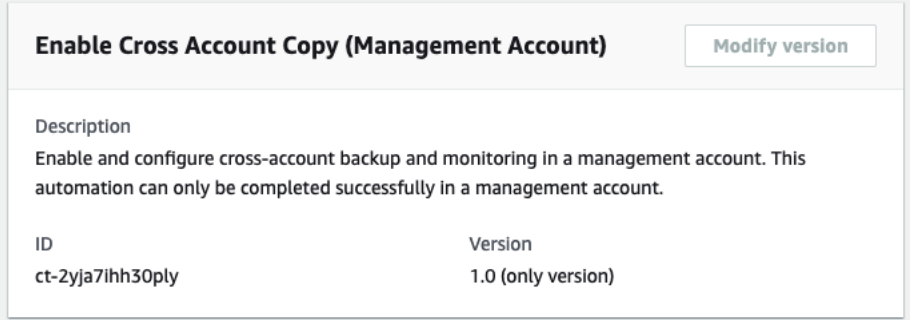
Change type ID	ct-2yja7ihh30ply
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Enable cross account backup plan copy

Enabling cross account backup plan copy with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Enabling cross account backup plan copy with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-2yja7ihh30ply" \
--change-type-version "1.0" --title "ConfigCrossAccountCopyInManagementAccount" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
HandleConfigureCrossAccountBackupInManagementAccount-Admin\",\"Region\":\"ap-
```

```
southeast-2\",\"Parameters\":{\"DestinationAccountId\":[\"123456789012\"],
\"SourceAccountId\":[\"210987654321\"]}}" \
--endpoint-url https://amscm-gamma.us-east-1.amazonaws.com
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it ConfigCrossAcctCopyBackupPlanParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-2yja7ihh30ply"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 ConfigCrossAcctCopyBackupPlanParams.json
```

2. Modify and save the ConfigCrossAcctCopyBackupPlanParams file.

```
{
  "DocumentName": "AWSManagedServices-
HandleConfigureCrossAccountBackupInManagementAccount-Admin",
  "Region": "ap-southeast-2",
  "Parameters": {
      "DestinationAccountId": [
        "123456789012"
      ],
     "SourceAccountId": [
       "210987654321"
      ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it ConfigCrossAcctCopyBackupPlanRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton >
 ConfigCrossAcctCopyBackupPlanRfc.json
```

4. Modify and save the ConfigCrossAcctCopyBackupPlanRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-2yja7ihh30ply",
  "ChangeTypeVersion": "1.0",
  "Title": "ConfigureCrossAcctCopyBackup"
```

```
}
```

5. Create the RFC, specifying the ConfigCrossAcctCopyBackupPlanRfc file and the ConfigCrossAcctCopyBackupPlanParams file:

```
aws amscm create-rfc --cli-input-json file://ConfigCrossAcctCopyBackupPlanRfc.json
 --execution-parameters file://ConfigCrossAcctCopyBackupPlanParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Backup, see AWS Backup: How It Works.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2yja7ihh30ply.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-
HandleConfigureCrossAccountBackupInManagementAccount-Admin",
    "Region": "us-east-1",
    "Parameters": {
      "DestinationAccountId": [ "123456789012" ],
      "SourceAccountId": [ "123456789012" ]
    }
}
```

Backup Plan | Enable Cross Region Copy

Update an existing backup plan rule with copy actions like cross region destination vault, and storage retention settings.

Full classification: Management | AWS Backup | Backup plan | Enable cross region copy

Change Type Details

Change type ID	ct-0fqo03yizfnw6
Current version	1.0

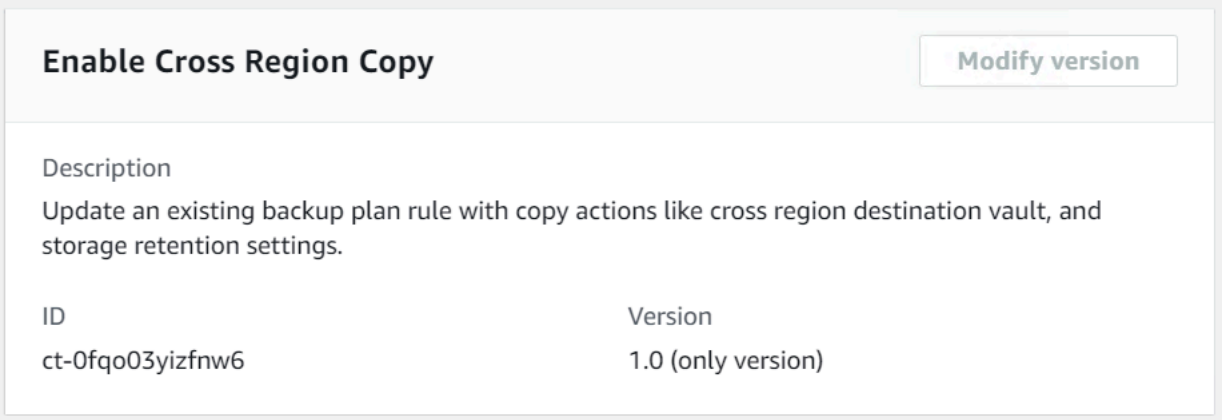
Execution mode	Automated

Additional Information

Enabling a cross region backup plan copy

Enabling a cross-region backup plan copy with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Enabling a cross-region backup plan copy with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-0fqo03yizfnw6" \
--change-type-version "1.0" --title "ConfigureCrossRegionBackup" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
ConfigureCrossRegionBackup\",\"Region\":\"us-east-1\",\"Parameters\":{\"BackupPlanName
\":[\"ConfigureCrossRegionBackup-Plan\"],\"RuleName\":[\"BackupRule1\"],
\"DestinationRegion\":[\"eu-west-1\"],\"DestinationVaultName\":[\"vault-
test-ConfigureCrossRegionBackup\"],\"DeleteAfterNumberOfDays\":[\"250\"],
\"MoveToColdStorageAfterNumberOfDays\":[\"150\"]}}" \
--endpoint-url https://amscm-gamma.us-east-1.amazonaws.com
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it ConfigCrossRegionBackupPlanParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0fqo03yizfnw6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ConfigCrossRegionBackupPlanParams.json
   ```

2. Modify and save the ConfigCrossRegionBackupPlanParams file.

```
{
  "DocumentName": "AWSManagedServices-ConfigureCrossRegionBackup",
  "Region": "us-east-1",
  "Parameters": {
      "BackupPlanName": [ "ConfigureCrossRegionBackup-Plan"],
      "RuleName": ["BackupRule1"],
      "DestinationRegion": [ "eu-west-1"],
      "DestinationVaultName": [ "vault-test-ConfigureCrossRegionBackup"],
      "DeleteAfterNumberOfDays": [ "250"],
      "MoveToColdStorageAfterNumberOfDays": [ "150"]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it ConfigCrossRegionBackupPlanRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ConfigCrossRegionBackupPlanRfc.json
```

4. Modify and save the ConfigCrossRegionBackupPlanRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-0fqo03yizfnw6",
  "ChangeTypeVersion": "1.0",
  "Title": "ConfigureCrossRegionBackup"
}
```

5. Create the RFC, specifying the ConfigCrossRegionBackupPlanRfc file and the ConfigCrossRegionBackupPlanParams file:

```
aws amscm create-rfc --cli-input-json file://ConfigCrossRegionBackupPlanRfc.json --
execution-parameters file://ConfigCrossRegionBackupPlanParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Backup, see AWS Backup: How It Works.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0fqo03yizfnw6.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-ConfigureCrossRegionBackup",
  "Region": "us-east-1",
  "Parameters": {
    "BackupPlanName": [ "backup-vault" ],
    "RuleName": [ "Daily-Backup" ],
    "DestinationRegion": [ "eu-west-1" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-ConfigureCrossRegionBackup",
  "Region": "us-east-1",
  "Parameters": {
    "BackupPlanName": [ "backup-vault" ],
    "RuleName": [ "Daily-Backup" ],
    "DestinationRegion": [ "eu-west-1" ],
    "DestinationVaultName": [ "ams-replication-vault" ],
    "DestinationEncryptionKeyArn": ["arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab"],
    "DeleteAfterNumberOfDays": [ "100" ],
    "MoveToColdStorageAfterNumberOfDays": [ "200" ]
  }
}
```

Backup Plan | Update (Review Required)

Update an existing backup plan. Please note that any changes that you make to a backup plan have no effect on existing backups created by the backup plan. The changes apply only to backups that are created in the future.

Full classification: Management | AWS Backup | Backup plan | Update (review required)

Change Type Details

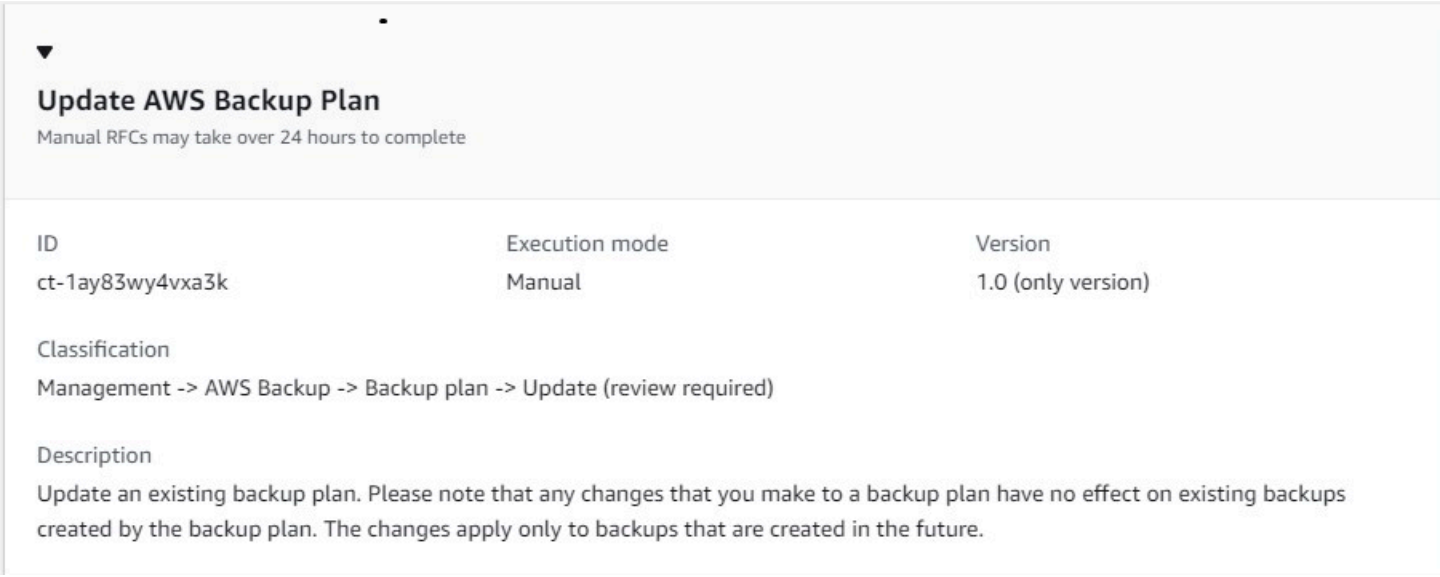
Change type ID	ct-1ay83wy4vxa3k
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update AWS Backup plan (review required)

Updating an AWS Backup plan with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an AWS Backup plan with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1ay83wy4vxa3k" --change-type-version
 "1.0" --title "Update AWSBackup Plan" --execution-parameters ""{\"BackupPlanName
\":\"PLAN_NAME\",\"ResourceTagKey\":\"TAG_KEY\",\"ResourceTagValue\":
\"TAG_VALUE\",\"BackupRuleName\":\"RULE_NAME\",\"BackupRuleVault\":\"VAULT\",
\"BackupRuleCompletionWindowMinutes\":120,\"BackupRuleScheduleExpression\":\"cron(0
 1 ? * * *)\",\"BackupRuleDeleteAfterDays\":90,\"BackupRuleMoveToColdStorageAfterDays
\":365,\"BackupRuleStartWindowMinutes\":60,\"BackupRuleRecoveryPointTagKey
\":\"TAG_KEY\",\"BackupRuleRecoveryPointTagValue\":\"TAG_VALUE\,
\"BackupRuleEnableContinuousBackup\":\"false\",\"BackupRuleCopyActionsDestVaultArn
\":\"VAULT\",\"BackupRuleCAMoveToColdStorageAfterDays\":0,
\"BackupRuleCopyActionsDeleteAfterDays\":90}""
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdateBackupPlanParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-1ay83wy4vxa3k"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 UpdateBackupPlanParams.json
```

2. Modify and save the UpdateBackupPlanParams file.

```
{
  "BackupPlanName": "MyCustomBackupPlan",
  "ResourceTagKey": "custom_backup_test",
  "ResourceTagValue": "true",
  "WindowsVSS": "disabled",
  "BackupRuleName": "BackupRule",
  "BackupRuleVault": "ams-custom-backups",
  "BackupRuleCompletionWindowMinutes": 1440,
  "BackupRuleScheduleExpression": "cron(0 2 ? * * *)",
  "BackupRuleDeleteAfterDays": 0,
  "BackupRuleMoveToColdStorageAfterDays": 0,
  "BackupRuleStartWindowMinutes": 180,
  "BackupRuleRecoveryPointTagKey": "test",
  "BackupRuleRecoveryPointTagValue": "test",
  "BackupRuleEnableContinuousBackup": "false",
  "BackupRuleCopyActionsDestVaultArn": "",
  "BackupRuleCAMoveToColdStorageAfterDays": 0,
  "BackupRuleCopyActionsDeleteAfterDays": 0
}
```

3. Output the RFC template to a file in your current folder; this example names it UpdateBackupPlanRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateBackupPlanRfc.json
```

4. Modify and save the UpdateBackupPlanRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1ay83wy4vxa3k",
  "Title": "Update AWS Backup Plan"
}
```

5. Create the RFC, specifying the UpdateBackupPlanRfc file and the UpdateBackupPlanParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateBackupPlanRfc.json --execution-
parameters file://UpdateBackupPlanParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> Not all resource types supported by AWS Backup are enabled by default. Review the enabled resource types in your account using Getting Started 1: Service Opt-In.

To learn more about AWS Backup, see AWS Backup: How It Works.

Before creating backup plans, confirm supported resources at Feature availability by resource.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1ay83wy4vxa3k.

Example: Required Parameters

```
{
  "BackupPlanName": "MyCustomBackupPlan",
  "BackupRuleName": "BackupRule",
  "BackupRuleVault": "ams-custom-backups"
}
```

Example: All Parameters

```
{
  "BackupPlanName": "MyCustomBackupPlan",
  "ResourceTagKey": "custom_backup_test",
```

```
  "ResourceTagValue": "true",
  "WindowsVSS": "disabled",
  "BackupRuleName": "BackupRule",
  "BackupRuleVault": "ams-custom-backups",
  "BackupRuleCompletionWindowMinutes": 1440,
  "BackupRuleScheduleExpression": "cron(0 2 ? * * *)",
  "BackupRuleDeleteAfterDays": 0,
  "BackupRuleMoveToColdStorageAfterDays": 0,
  "BackupRuleStartWindowMinutes": 180,
  "BackupRuleRecoveryPointTagKey": "test",
  "BackupRuleRecoveryPointTagValue": "test",
  "BackupRuleEnableContinuousBackup": "false",
  "BackupRuleCopyActionsDestVaultArn": "",
  "BackupRuleCAMoveToColdStorageAfterDays": 0,
  "BackupRuleCopyActionsDeleteAfterDays": 0,
  "Priority": "Medium"
}
```

Recovery Point | Delete

Delete one or more recovery points (snapshots) from the specified vault. Use this change type to delete recovery points that were manually created, and recovery points that were created through a backup plan, and that are older than 30 days. The deletion of recovery points cannot be rolled back.

Full classification: Management | AWS Backup | Recovery point | Delete

Change Type Details

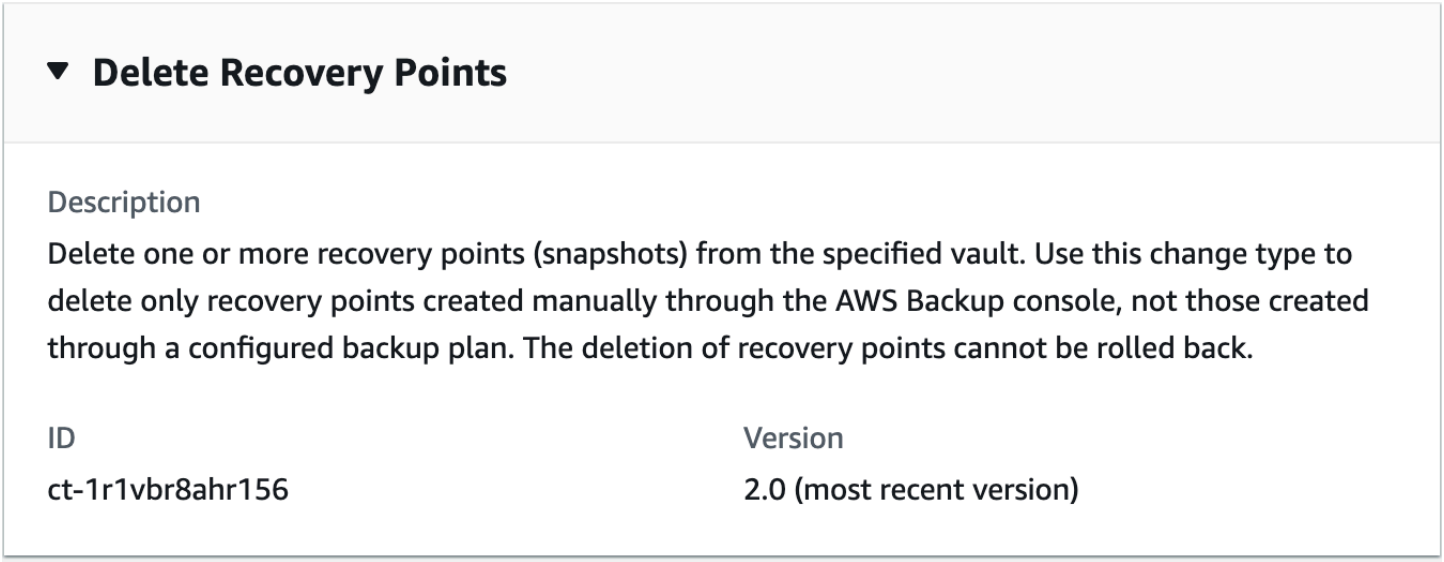
Change type ID	ct-1r1vbr8ahr156
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete AWS Backup recovery points

Deleting recovery points with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting recovery points with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1r1vbr8ahr156" --change-type-version "2.0"
 --title "AWS Backup Delete Recovery Points" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-DeleteRecoveryPoints\",\"Region\":\"us-east-1\",\"Parameters\":
{\"BackupVaultName\":[\"ams-manual-backups\"],\"RecoveryPointArns\":[\"arn:aws:ec2:us-
east-1::snapshot/snap-000000000000000\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it DeleteRecoveryPointsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1r1vbr8ahr156"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteRecoveryPointsParams.json
   ```

2. Modify and save the DeleteRecoveryPointsParams file.

   ```
   {
       "DocumentName": "AWSManagedServices-DeleteRecoveryPoints",
       "Region": "us-east-1",
       "Parameters": {
           "BackupVaultName": [
               "ams-manual-backups"
            ],
           "RecoveryPointArns": [
               "arn:aws:backup:us-east-1:000000000000:recovery-
   point:24f48ec5-79a7-4a40-b992-d97583518f2f",
               "arn:aws:backup:us-east-1:000000000000:recovery-point:3b6a599e-
   b5a3-4028-87b3-be9a1fdc01e8"
           ]
       }
   ```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it DeleteRecoveryPointsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteRecoveryPointsRfc.json
```

4. Modify and save the DeleteRecoveryPointsRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-1r1vbr8ahr156",
    "ChangeTypeVersion": "2.0",
    "Title": "AWS Backup Delete Recovery Points"
}
```

5. Create the RFC, specifying the DeleteRecoveryPointsRfc file and the DeleteRecoveryPointsParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteRecoveryPointsRfc.json --
execution-parameters file://DeleteRecoveryPointsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This CT is now at version 2.0. This reflects development to allow you to delete more than one recovery point at a time.

To learn more about AWS Backup, see AWS Backup: How It Works.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1r1vbr8ahr156.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-DeleteRecoveryPoints",
  "Region": "us-east-1",
  "Parameters": {
    "BackupVaultName": [ "backup-vault" ],
    "RecoveryPointArns": [ "arn:aws:backup:us-east-1:123456789012:recovery-
point:1EB3B5E7-9EB0-435A-A80B-108B488B0D45", "arn:aws:backup:us-
east-1:123456789012:recovery-point:1EB3B5E7-9EB0-435A-A80B-108B488B0D41" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-DeleteRecoveryPoints",
  "Region": "us-east-1",
  "Parameters": {
    "BackupVaultName": [ "backup-vault" ],
    "RecoveryPointArns": [ "arn:aws:backup:us-east-1:123456789012:recovery-
point:1EB3B5E7-9EB0-435A-A80B-108B488B0D45", "arn:aws:backup:us-
east-1:123456789012:recovery-point:1EB3B5E7-9EB0-435A-A80B-108B488B0D41" ]
  }
}
```

AWS Service Subcategory

Change Type Items and Operations in the AWS Service Subcategory

- Self-Provisioned Service | Add
- Self-Provisioned Service | Add (Review Required)

Self-Provisioned Service | Add

Add a specific, allowed, AWS service to your AMS account. This CT validates prerequisites in the account and deploys a service with the default parameters. Not all Self-service provisioning services are supported, the ServiceName parameter for this CT lists the ones that are. For each service that you add, AMS creates a new role so you use the service without AMS management under the AMS Shared Responsibility model. Compliance is a shared responsibility and your

AMS compliance status does not automatically apply to services or applications that you add in this way. Some AWS services do not have compliance certifications. For more information, see the AWS Services in Scope of AWS Assurance Program page. On that page, unless specifically excluded, features of each of the services are considered in scope of the assurance programs, and are reviewed and tested as part of our assessment when you submit this CT.

Full classification: Management | AWS service | Self-provisioned service | Add

Change Type Details

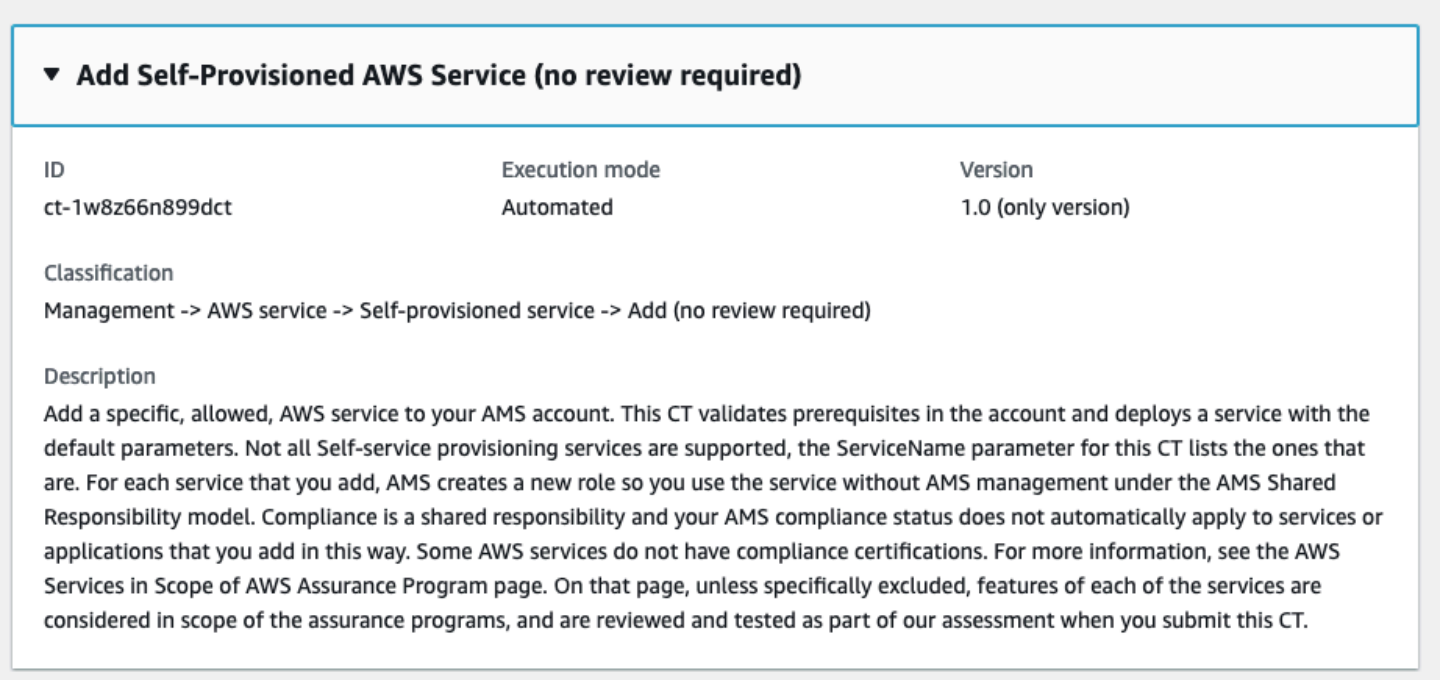
Change type ID	ct-1w8z66n899dct
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add Self-Service Provisioning service

Adding an AMS self-provisioned AWS service with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding an AMS self-provisioned AWS service with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1w8z66n899dct" --change-type-version "1.0"
 --title "Add new Self-provisioned service" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-HandleCreateSSPSResources-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": {\"ServiceName\": \"AWS License Manager\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named AddSspsParameters.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1w8z66n899dct" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AddSspsParameters.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-HandleCreateSSPSResources-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "ServiceName": "AWS License Manager"
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it AddSspsRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > AddSspsRfc.json
   ```

4. Modify and save the AddSspsRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":          "ct-1w8z66n899dct",
   "ChangeTypeVersion":     "1.0",
   ```

```
"Title":                "Add new Self-provisioned service"
}
```

5. Create the RFC, specifying the SelfServeServiceRfc file and the SelfServeServiceParams file:

```
aws amscm create-rfc --cli-input-json file://AddSspsRfc.json  --execution-
parameters file://AddSspsParameters.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- The **ServiceName** field in the console lists the self-provisioned services supported by this CT. Limited to AMS-approved AWS services. For a list, see Setting Up Self-serve Services.
- For self-provisioned services not supported by this CT, or for deployment with custom parameters, use the manual version: Management | AWS service | Self-Provisioned Service | Add (review required) (ct-3qe6io8t6jtny).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1w8z66n899dct.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleCreateSSPSResources-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "ServiceName": "AWS License Manager"
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleCreateSSPSResources-Admin",
  "Region" : "us-east-1",
  "Parameters": {
```

```
    "ServiceName": "AWS License Manager",
    "SAMLProviders": "foo-saml-provider,bar-saml-provider",
    "IAMRole": "testing_role"
  }
}
```

Self-Provisioned Service | Add (Review Required)

Add a specific, allowed, AWS service to your AMS account. AMS adds the necessary permissions to use the service to an existing IAM role that you specify, or creates a new role that allows you to use the service without AMS management under the AMS Shared Responsibility model. Compliance is a shared responsibility and your AMS compliance status does not automatically apply to services or applications that you add in this way. Some AWS services do not have compliance certifications. For more information, go to the AWS Services in Scope of AWS Assurance Program page. On that page, unless specifically excluded, features of each of the services are considered in scope of the assurance programs, and are reviewed and tested as part of the assessment.

Full classification: Management | AWS service | Self-provisioned service | Add (review required)

Change Type Details

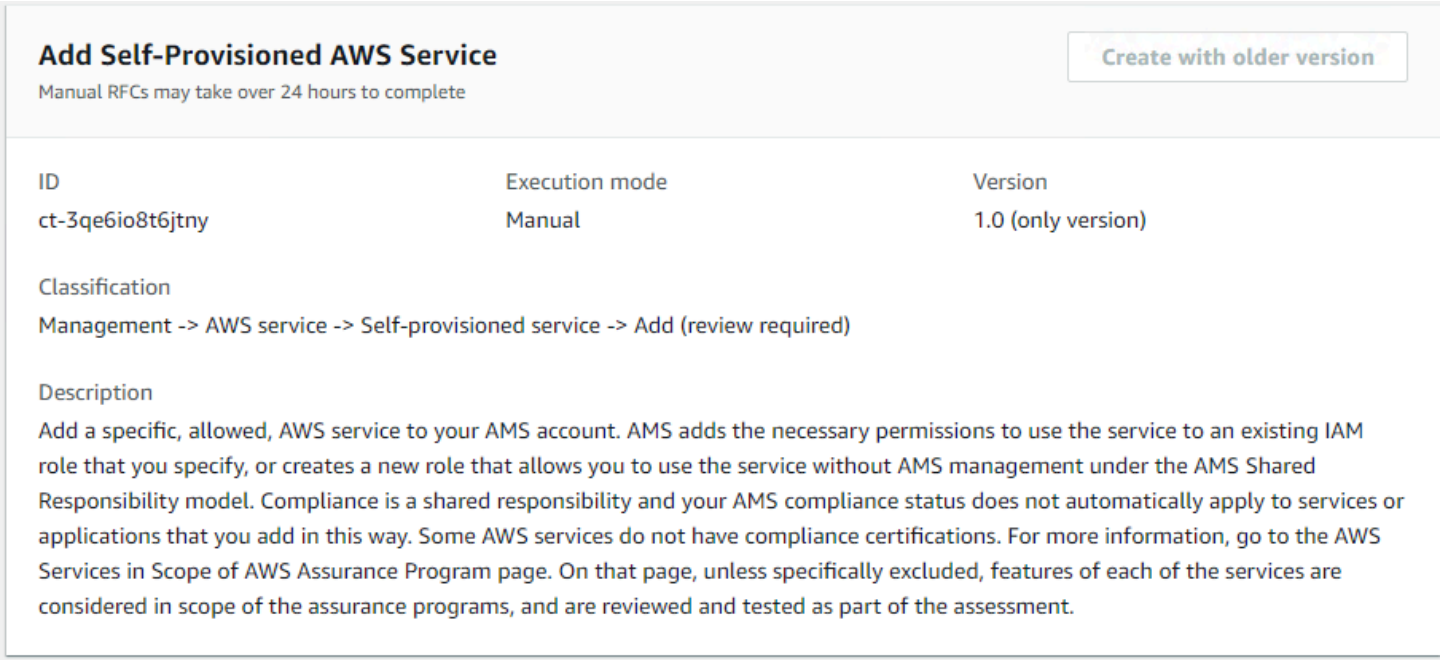
Change type ID	ct-3qe6io8t6jtny
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Add Self-Service Provisioning service (review required)

Adding an AMS self-provisioned AWS service with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding an AMS self-provisioned AWS service with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

All parameters:

```
aws amscm create-rfc --title Add-Self-Serve-Service --change-type-id ct-3qe6io8t6jtny
 --change-type-version 1.0 --execution-parameters '{"ServiceName":"AWS Certificate
 Manager (ACM)","IAMRole":"arn:aws:iam::123456789012:role/customer_security_role",
 "SAMLProviders":"SAML_PROVIDER,SAML_PROVIDER"}'
```

Only required parameters:

```
aws amscm create-rfc --title add-self-serve-service --change-type-id ct-3qe6io8t6jtny
 --change-type-version 1.0 --execution-parameters '{"ServiceName":"AWS License
 Manager"}'
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named SelfServeServiceParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3qe6io8t6jtny"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    SelfServeServiceParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "ServiceName":   "AWS Certificate Manager (ACM)",
   "IAMRole":       "arn:aws:iam::123456789012:role/customer_security_role",
   "SAMLProviders": "SAML_PROVIDER, SAML_PROVIDER"
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it SelfServeServiceRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > SelfServeServiceRfc.json
   ```

4. Modify and save the SelfServeServiceRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-3qe6io8t6jtny",
"ChangeTypeVersion":     "1.0",
"Title":                 "Self-Serve-Service-RFC"
}
```

5. Create the RFC, specifying the SelfServeServiceRfc file and the SelfServeServiceParams file:

```
aws amscm create-rfc --cli-input-json file://SelfServeServiceRfc.json  --execution-
parameters file://SelfServeServiceParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For automated deployment of most self-provisioned services with default roles, use: Management | AWS service | Self-provisioned service | Add (no review required) (ct-1w8z66n899dct). See Add Self-Service Provisioning service. UUse this "review required" change type (ct-3qe6io8t6jtny) for services not supported by ct-1w8z66n899dct or for deployments with custom parameters.
- For a list of which self-provisioned services you can add using CloudFormation Ingest, see CloudFormation Ingest stack: supported resources.
- This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.
- The **ServiceName** parameter is limited to AMS-approved AWS services. For a list, see Setting Up Self-serve Services.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3qe6io8t6jtny.

Example: Required Parameters

```
{
  "ServiceName": "AWS License Manager"
}
```

Example: All Parameters

```
{
  "ServiceName": "AWS License Manager",
  "IAMRole": "arn:aws:iam::123456789012:role/myrole",
  "SAMLProviders": "foo-saml-provider",
  "Priority": "Medium"
}
```

Custom Stack Subcategory

Change Type Items and Operations in the Custom Stack Subcategory

- Stack from CloudFormation Template | Approve Changeset and Update
- Stack from CloudFormation Template | Remediate Drift
- Stack from CloudFormation Template | Remediate Drift (Review Required)
- Stack from CloudFormation Template | Update

Stack from CloudFormation Template | Approve Changeset and Update

Approve and execute an existing ChangeSet to update a CloudFormation stack. This ChangeType is used primarily to approve and apply changes requested using the "Update CloudFormation stack" CT that would cause removal or replacement of resources, but can also be used to execute any existing ChangeSet to update CloudFormation stacks.

Full classification: Management | Custom Stack | Stack from CloudFormation Template | Approve Changeset and Update

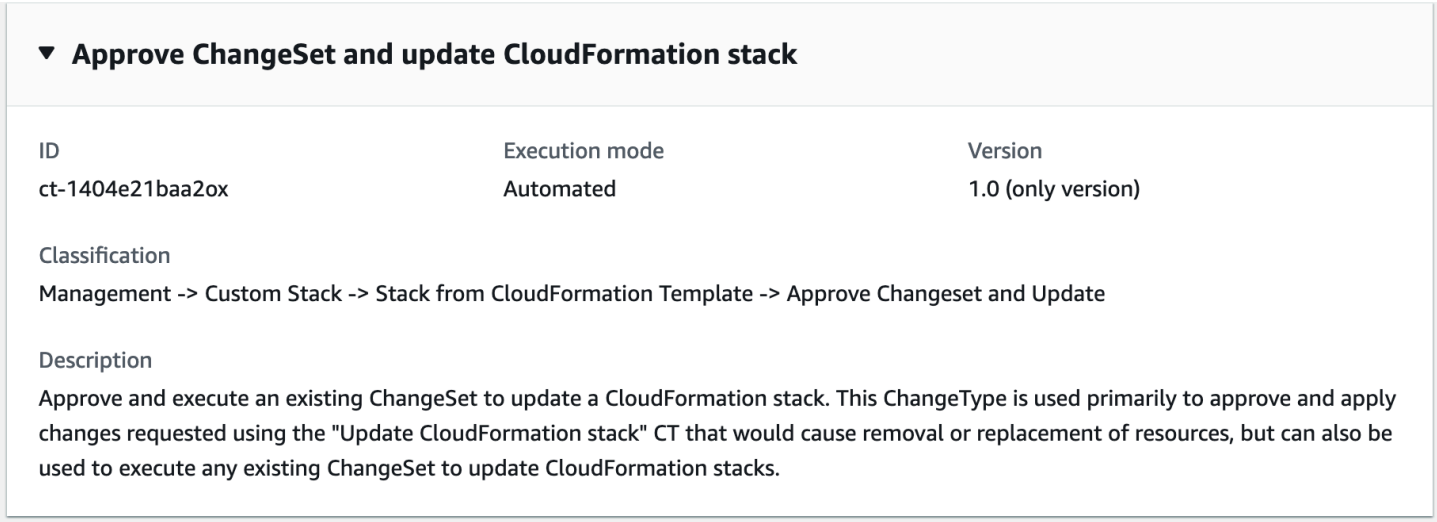
Change Type Details

Change type ID	ct-1404e21baa2ox
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Approve a CloudFormation ingest stack changeset

Approving and updating a CloudFormation ingest stack using the console



To approve and update a CloudFormation ingest stack using the console

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Approving and updating a CloudFormation ingest stack using the CLI

To approve and update a CloudFormation ingest stack using the CLI

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

1. Output the execution parameters JSON schema for this change type to a file in your current folder. This example names it CreateAsgParams.json:

```
aws amscm create-rfc --change-type-id "ct-1404e21baa2ox" --change-
type-version "1.0" --title "Approve Update" --execution-parameters
 file://PATH_TO_EXECUTION_PARAMETERS --profile saml
```

2. Modify and save the schema as follows:

```
{
  "StackId": "STACK_ID",
  "VpcId": "VPC_ID",
  "ChangeSetName": "UPDATE-ef81e2bc-03f6-4b17-a3c7-feb700e78faa",
  "TimeoutInMinutes": 1080
}
```

Tips

Note

If there are multiple resources in a stack, and you want to delete only a subset of the stack resources, use the CloudFormation Update CT; see CloudFormation Ingest Stack: Updating. You can also submit a Management | Other | Other | Update change type and AMS engineers can help you craft the changeset, if needed.

To learn more about AWS CloudFormation, see AWS CloudFormation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1404e21baa2ox.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Stack from CloudFormation Template | Remediate Drift

Remediate the drift (out-of-band changes) in a stack, bringing the stack in sync and enabling you to perform future updates using the available Update CTs. Note: up to 10 drifted resources will be remediated per RFC.

Full classification: Management | Custom Stack | Stack from CloudFormation Template | Remediate drift

Change Type Details

Change type ID	ct-3kinq0u4l33zf
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remediate stack drift

Remediating Stack Drift with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Remediating Stack Drift with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3kinq0u4l33zf" --change-type-version "1.0" --
title "Remediate Stack Drift, no ops review" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-StartDriftRemediation\", \"Region\": \"us-east-1\", \"Parameters
\": {\"StackName\": [\"stack-xxxxxxxxxxxxxxxxx\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RemediateDriftNrrParams.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RemediateDriftNrrParams.json
   ```

2. Modify and save the RemediateDriftNrrParams file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-StartDriftRemediation",
       "Region": "us-east-1",
       "Parameters": {
           "StackName": [
               "stack-xxxxxxxxxxxxxxxxx"
           ]
       }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it RemediateDriftNrrRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RemediateDriftNrrRfc.json
   ```

4. Modify and save the RemediateDriftNrrRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId": "ct-3kinq0u4l33zf",
   "ChangeTypeVersion": "1.0",
   ```

```
"Title": "Remediate stack drift, no ops review"
}
```

5. Create the RFC, specifying the RemediateDriftNrrRfc file and the RemediateDriftNrrParams file:

```
aws amscm create-rfc --cli-input-json file://RemediateDriftNrrRfc.json  --
execution-parameters file://RemediateDriftNrrParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Important

Stack remediation modifies the stack template and/or parameter values. Once remediation is complete, you must update your local template repositories, or any automation, that would be updating the remediated stack, with the latest template and parameters provided in the RFC summary of the remeditation. It is very important to do this, because using the old template and/or parameters can cause destructive changes on the stack resources. For more details, including a list of *Limitations*, see Drift remediation FAQs.

Note

When using "review required" CTs, AMS recommends that you use the ASAP **Scheduling** option (choose **ASAP** in the console, leave start and end time blank in the API/CLI) as these CTs require an AMS operator to examine the RFC, and possibly communicate with you before it can be approved and run. If you schedule these RFCs, be sure to allow at least 24 hours. If approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3kinq0u4l33zf.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-StartDriftRemediation",
    "Region": "us-east-1",
    "Parameters": {
      "StackName": ["stack-a1b2c3d4e5f678900"],
      "DryRun": ["true"]
    }
}
```

Stack from CloudFormation Template | Remediate Drift (Review Required)

Remediate the drift (out-of-band changes) in a stack, bringing the stack in sync and enabling you to perform future updates using the available Update CTs. Drift remediation can be performed on EC2 resource types.

Full classification: Management | Custom Stack | Stack from CloudFormation Template | Remediate drift (review required)

Change Type Details

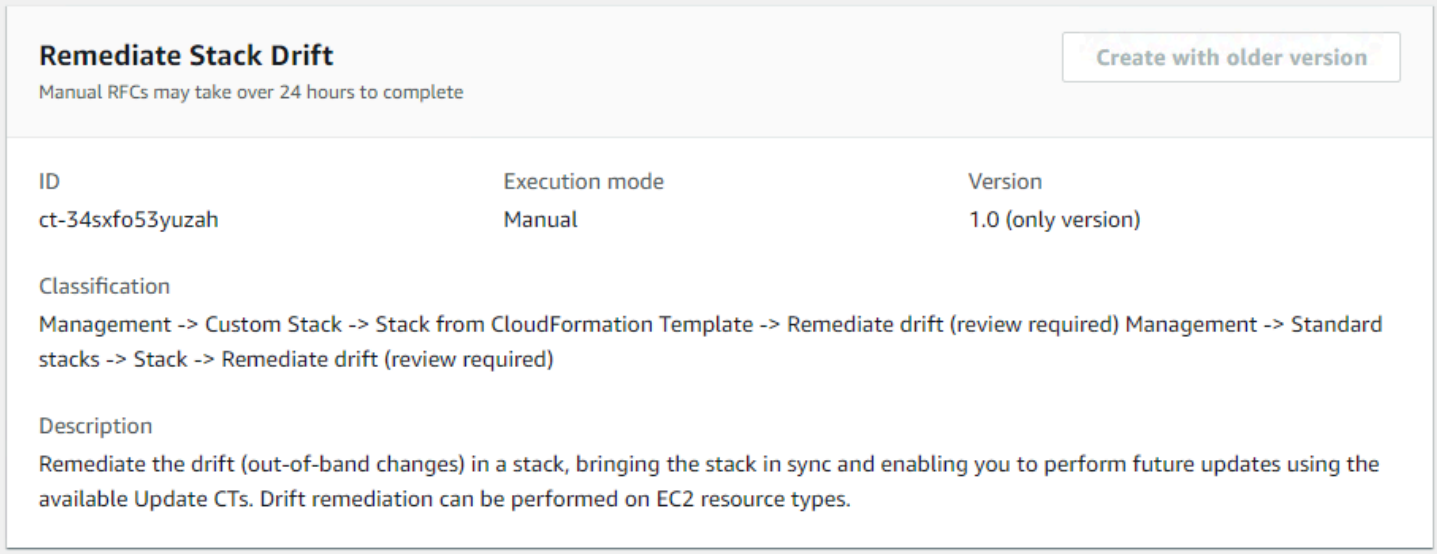
Change type ID	ct-34sxfo53yuzah
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Remediate stack drift (review required)

Remediating Stack Drift (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Remediating Stack Drift (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-34sxfo53yuzah" --change-type-version
 "1.0" --title "Remediate stack drift" --execution-parameters '{"StackName":"stack-
a1b2c3d4e5f67890e","DryRun":false}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RemediateDriftParams.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RemediateDriftParams.json
   ```

2. Modify and save the RemediateDriftParams file. For example, you can replace the contents with something like this:

   ```
   {
   "StackName" : "stack-a1b2c3d4e5f67890e",
   "DryRun" : false
   }
   ```

3. Output the RFC template JSON file to a file; this example names it RemediateDriftRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RemediateDriftRfc.json
   ```

4. Modify and save the RemediateDriftRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId": "ct-34sxfo53yuzah",
   "ChangeTypeVersion": "1.0",
   "Title": "Remediate stack drift"
   ```

```
}
```

5. Create the RFC, specifying the RemediateDriftRfc file and the RemediateDriftParams file:

```
aws amscm create-rfc --cli-input-json file://RemediateDriftRfc.json  --execution-
parameters file://RemediateDriftParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

> **Note**
>
> When using "review required" CTs, AMS recommends that you use the ASAP **Scheduling** option (choose **ASAP** in the console, leave start and end time blank in the API/CLI) as these CTs require an AMS operator to examine the RFC, and possibly communicate with you before it can be approved and run. If you schedule these RFCs, be sure to allow at least 24 hours. If approval does not happen before the scheduled start time, the RFC is rejected automatically.

- There is an automated version of this change type that runs more quickly, though there are some limitations. For more details, see Stack | Remediate Drift.
- Stack remediation modifies the stack template and/or parameter values. Once remediation is complete, you must update your local template repositories, or any automation, that would be updating the remediated stack, with the latest template and parameters provided in the RFC summary of the remeditation. It is very important to do this, because using the old template and/or parameters can cause destructive changes on the stack resources.

  For more details, see Drift remediation FAQs.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-34sxfo53yuzah.

Example: Required Parameters

```
{
  "StackName": "stack-a1b2c3d4e5f678900"
}
```

Example: All Parameters

```
{
  "StackName": "stack-a1b2c3d4e5f678900",
  "DryRun": false,
  "Priority": "Medium"
}
```

Stack from CloudFormation Template | Update

Update the template and/or parameters of a CFN stack. To only update the parameters in an existing stack a modified CFN template is not required, modified parameters can be provided instead. Values for existing parameters are overwritten, values for new parameters are added. To add, delete or modify a resource, or to change attributes not referenced through a parameter, use a modified CFN template. If the update would result in a resource in the stack being replaced or removed, the RFC fails and requires approval through the "Approve ChangeSet and update CloudFormation stack" CT (ct-1404e21baa2ox).

Full classification: Management | Custom Stack | Stack from CloudFormation Template | Update

Change Type Details

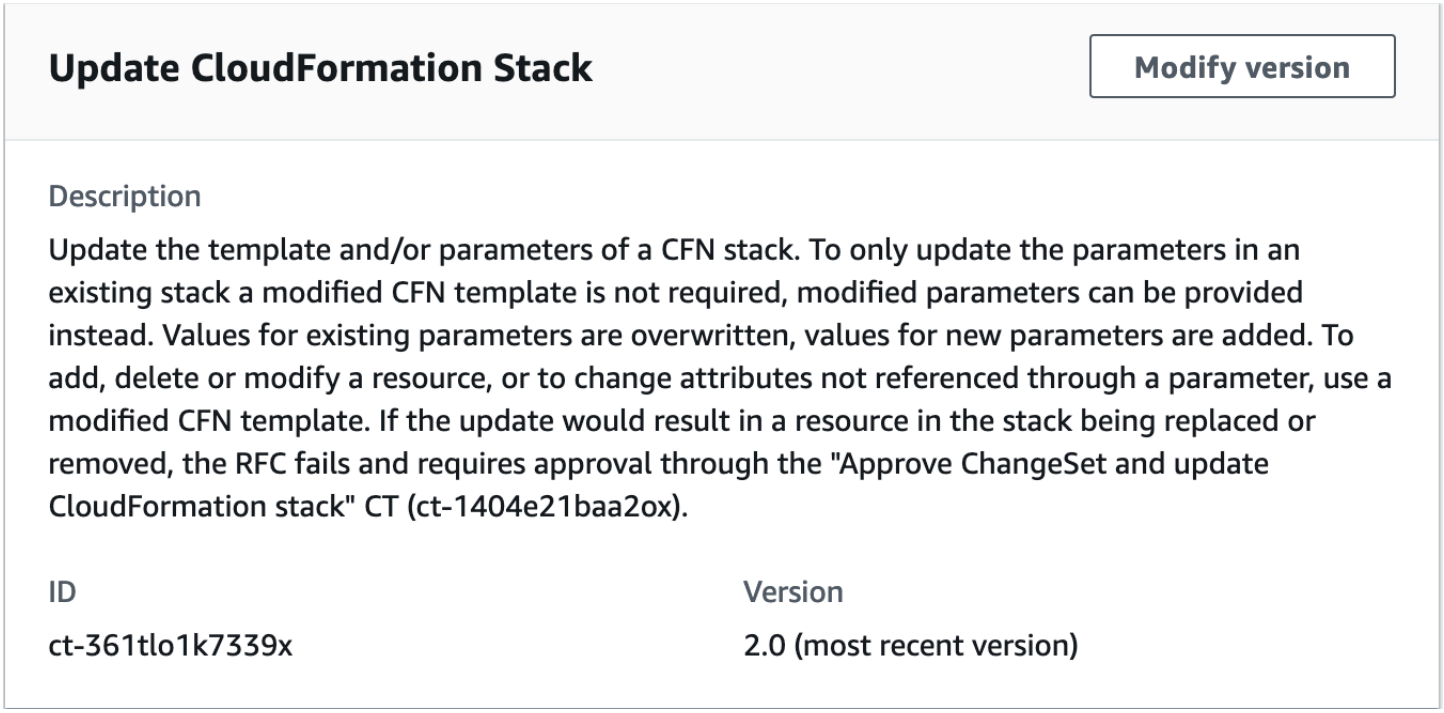
Change type ID	ct-361tlo1k7339x
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required

Customer approval	Not required
Execution mode	Automated

Additional Information

Update AWS CloudFormation ingest stack

Updating a CloudFormation ingest stack using the console



To update a CloudFormation Ingest Stack using the console

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a CloudFormation ingest stack using the CLI

To update a CloudFormation ingest stack using the CLI

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

1. Prepare the AWS CloudFormation template that you want to use to update the stack, and upload it to your S3 bucket. For important details, see AWS CloudFormation Ingest Guidelines, Best Practices, and Limitations.
2. Create and submit the RFC to AMS:
   - Create and save the execution parameters JSON file, include the CloudFormation template parameters that you want. This example names it UpdateCfnParams.json.

     Example UpdateCfnParams.json file with inline parameter updates:

```
{
  "StackId": "stack-yjjoo9aicjyqw4ro2",
  "VpcId": "VPC_ID",
  "CloudFormationTemplate": "{\"AWSTemplateFormatVersion\":\"2010-09-09\",
\"Description\":\"Create a SNS topic\",\"Parameters\":{\"TopicName\":{\"Type
\":\"String\"},\"DisplayName\":{\"Type\":\"String\"}},\"Resources\":{\"SnsTopic
\":{\"Type\":\"AWS::SNS::Topic\",\"Properties\":{\"TopicName\":{\"Ref\":
\"TopicName\"},\"DisplayName\":{\"Ref\":\"DisplayName\"}}}}}",
  "TemplateParameters": [
    {
      "Key": "TopicName",
      "Value": "TopicNameCLI"
    },
    {
      "Key": "DisplayName",
      "Value": "DisplayNameCLI"
    }
  ],
  "TimeoutInMinutes": 1440
}
```

Example UpdateCfnParams.json file with S3 bucket endpoint containing an updated CloudFormation template:

```
{
  "StackId": "stack-yjjoo9aicjyqw4ro2",
  "VpcId": "VPC_ID",
  "CloudFormationTemplateS3Endpoint": "s3_url",
  "TemplateParameters": [
    {
      "Key": "TopicName",
      "Value": "TopicNameCLI"
    },
    {
      "Key": "DisplayName",
      "Value": "DisplayNameCLI"
    }
  ],
  "TimeoutInMinutes": 1080
}
```

3. Create and save the RFC parameters JSON file with the following content. This example names it UpdateCfnRfc.json file.

```
{
   "ChangeTypeId": "ct-361tlo1k7339x",
   "ChangeTypeVersion": "1.0",
   "Title": "cfn-ingest-template-update"
}
```

4. Create the RFC, specifying the UpdateCfnRfc file and the UpdateCfnParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateCfnRfc.json  --execution-
parameters file://UpdateCfnParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- This change type is now at version 2.0. Changes include removing the **AutoApproveUpdateForResources** parameter, which was used in version 1.0 of this CT, and adding two new parameters: **AutoApproveRiskyUpdates** and **BypassDriftCheck**.
- If the S3 bucket exists in an AMS account, you must use your AMS credentials for this command. For example, you may need to append `--profile saml` after obtaining your AMS AWS Security Token Service (AWS STS) credentials.
- All `Parameter` values for resources in the CloudFormation template must have a value, either through a default or a custom value through the parameters section of the CT. You can override the parameter value by structuring the CloudFormation template resources to reference a Parameters key. For examples that show how to do, see CloudFormation ingest stack: CFN validator examples.

  IMPORTANT: Missing parameters not supplied explicitly in the form, default to the currently set values on the existing stack or template.
- For a list of which self-provisioned services you can add using AWS CloudFormation Ingest, see CloudFormation Ingest Stack: Supported Resources.

  To learn more about AWS CloudFormation, see AWS CloudFormation.

Validating a AWS CloudFormation ingest

The template is validated to ensure that it can be created in an AMS account. If it passes validation, it's updated to include any resources or configurations required for it to conform with AMS. This includes adding resources such as Amazon CloudWatch alarms in order to allow AMS Operations to monitor the stack.

The RFC is rejected if any of the following are true:

- RFC JSON Syntax is incorrect or does not follow the given format.
- The provided S3 bucket presigned URL is not valid.
- The template is not valid AWS CloudFormation syntax.
- The template does not have defaults set for all parameter values.
- The template fails AMS validation. For AMS validation steps, see the information later in this topic.

The RFC fails if the CloudFormation stack fails to create due to a resource creation issue.

To learn more about CFN validation and validator, see Template Validation and CloudFormation ingest stack: CFN validator examples.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-361tlo1k7339x.

Example: Required Parameters

```
{
  "StackId": "stack-kiwonebfnadq08sol",
  "VpcId": "vpc-01234567890abcdef",
  "TimeoutInMinutes": 360
}
```

Example: All Parameters

```
Example not available.
```

Directory Service Subcategory

Change Type Items and Operations in the Directory Service Subcategory

- Computer Object | Remove
- Computer Object | Remove SPN
- Directory | Accept Sharing
- Directory | Create AD Trust
- Directory | Share Directory
- Directory | Unshare Directory
- DNS | Add A Record
- DNS | Add CNAME Record
- DNS | Delete Conditional Forwarder
- DNS | Remove Record
- DNS | Update Cluster Permissions

- DNS | Update Conditional Forwarder
- DNS | Update Record Permission
- Users and Groups | Add Group
- Users and Groups | Add Group To Group
- Users and Groups | Add User To Group
- Users and Groups | Remove User from Group

Computer Object | Remove

Remove a stale computer object from Microsoft Active Directory (AD) and the corresponding DNS A and PTR records from DNS. Removing the computer object will prevent anyone from raising access against this host using the AMS access control. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | Computer object | Remove

Change Type Details

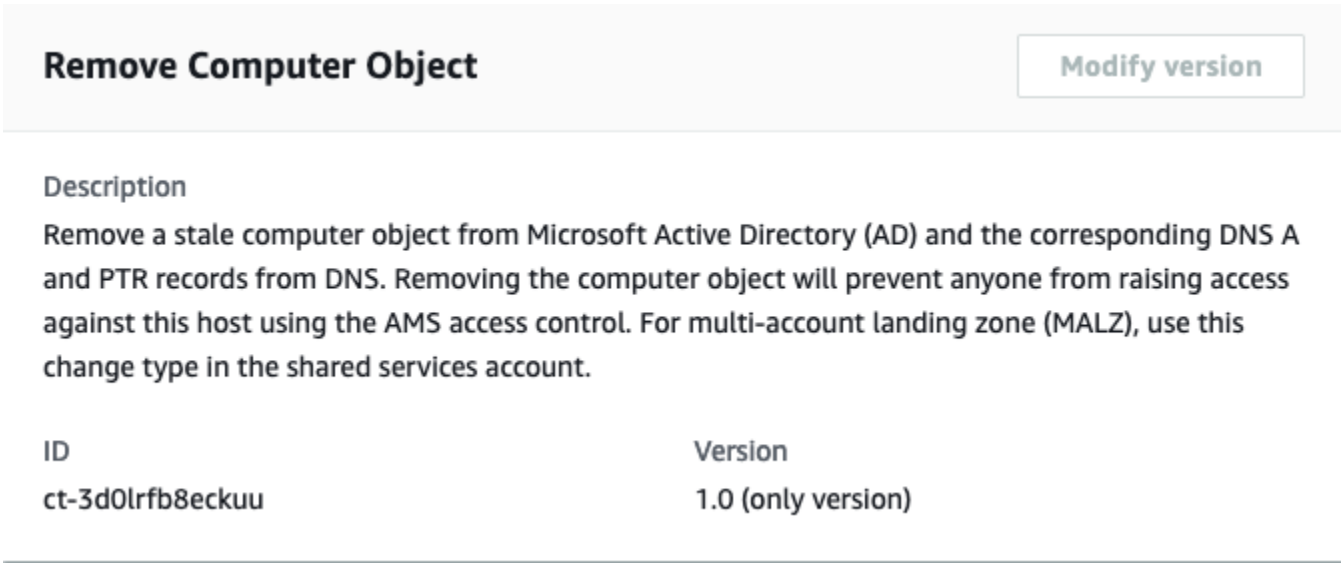
Change type ID	ct-3d0lrfb8eckuu
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remove a computer object

Removing a computer object from an AMS-managed AD with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Removing a computer object from an AMS-managed AD with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3d0lrfb8eckuu" --change-type-version
 "1.0" --title "Remove Computer Object" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-RemoveADComputerObject-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": {\"ADComputerName\": [\"ABRACADABRA\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ComputerObjectRemoveParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3d0lrfb8eckuu"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ComputerObjectRemoveParams.json
   ```

   Modify and save the ComputerObjectRemoveParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-RemoveADComputerObject-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "ADComputerName": [
         "ABRACADABRA"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it ComputerObjectRemoveRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ComputerObjectRemoveRfc.json
   ```

3. Modify and save the ComputerObjectRemoveRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":         "ct-3d0lrfb8eckuu",
   ```

```
"ChangeTypeVersion":    "1.0",
"Title":                "Remove computer object"
}
```

4. Create the RFC, specifying the ComputerObjectRemoveRfc file and the ComputerObjectRemoveParams file:

```
aws amscm create-rfc --cli-input-json file://ComputerObjectRemoveRfc.json --
execution-parameters file://ComputerObjectRemoveParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3d0lrfb8eckuu.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-RemoveADComputerObject-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "Hostname" : [
      "ABRACADABRA"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-RemoveADComputerObject-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
```

```
    "Hostname" : [
      "ABRACADABRA"
    ]
  }
}
```

Computer Object | Remove SPN

Remove the Service Principal Name (SPN) associated with a specified hostname or host alias in Microsoft Active Directory. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | Computer object | Remove SPN

Change Type Details

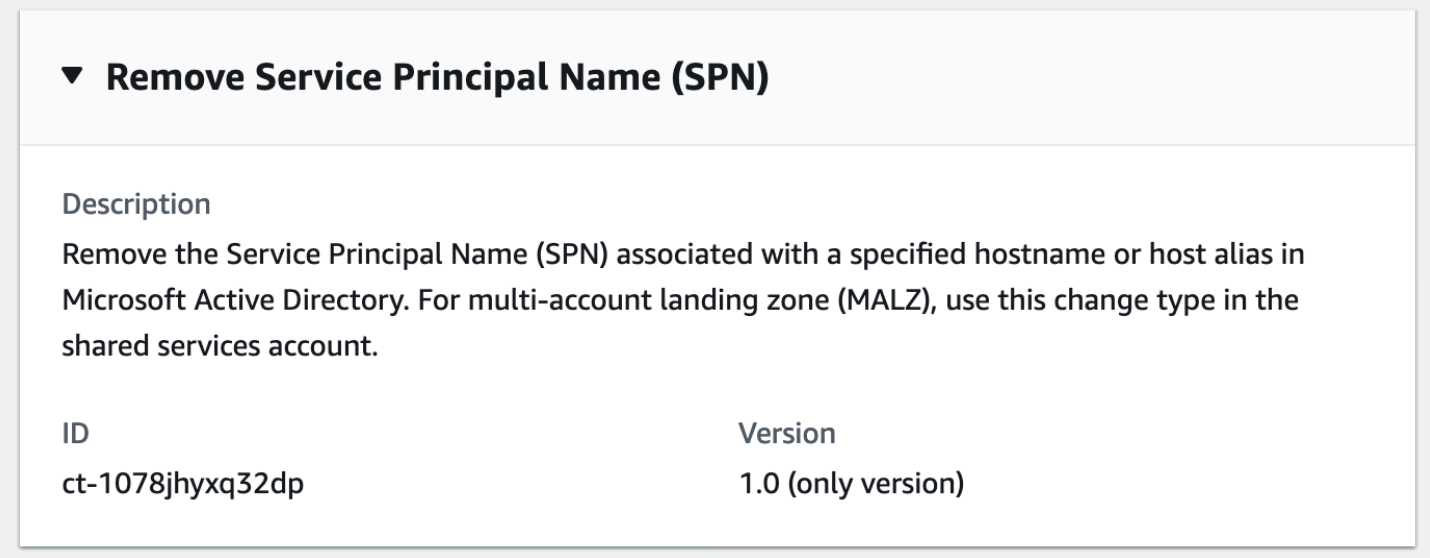
Change type ID	ct-1078jhyxq32dp
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remove a computer object's SPN

Removing a computer object's SPN from an AMS-managed AD with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Removing a computer object's SPN from an AMS-managed AD with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1078jhyxq32dp" --change-type-version
 "1.0" --title "Remove AD Computer SPN" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-RemoveADComputerSPN-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": {\"Hostname\": [\"webserver\"], \"ServiceType\": [\"HOST\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ComputerObjectRemoveSpnParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1078jhyxq32dp"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ComputerObjectRemoveSpnParams.json
   ```

   Modify and save the ComputerObjectRemoveSpnParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-RemoveADComputerSPN-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "Hostname": [
         "webserver"
       ],
       "ServiceType": [
         "HOST"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it ComputerObjectRemoveSpnRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ComputerObjectRemoveSpnRfc.json
   ```

3. Modify and save the ComputerObjectRemoveSpnRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1078jhyxq32dp",
  "Title": "Remove AD Computer SPN"
}
```

4. Create the RFC, specifying the ComputerObjectRemoveSpnRfc file and the ComputerObjectRemoveSpnParams file:

```
aws amscm create-rfc --cli-input-json file://ComputerObjectRemoveSpnRfc.json --
execution-parameters file://ComputerObjectRemoveSpnParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1078jhyxq32dp.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-RemoveADComputerSPN-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "Hostname": ["RDP-12345"],
    "ServiceType": ["HOST"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-RemoveADComputerSPN-Admin",
```

```
  "Region": "us-east-1",
  "Parameters": {
    "Hostname": ["RDP-12345"],
    "ServiceType": ["HOST"],
    "AliasName": ["Valid-Alias123"],
    "GroupManagedServiceAccountName": ["Valid-Name-456"],
    "Port": ["1122"]
  }
}
```

Directory | Accept Sharing

Accept a directory sharing request sent from the directory owner account. This is run in the directory consumer account.

Full classification: Management | Directory Service | Directory | Accept sharing

Change Type Details

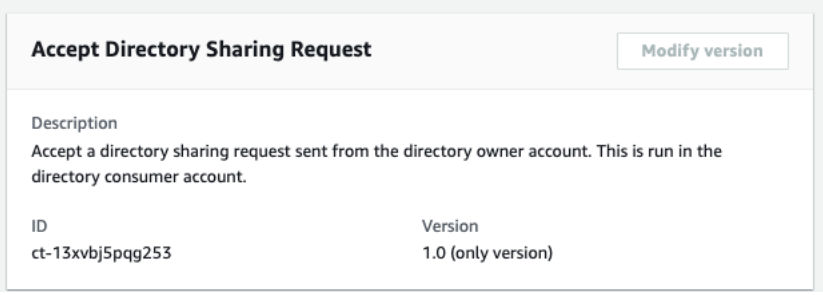
Change type ID	ct-13xvbj5pqg253
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Accept directory sharing request

Accept a directory sharing request with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Accept a directory sharing request with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \ --change-type-id "ct-13xvbj5pqg253" \ --change-type-version
 "1.0" --title "AWS Directory Service accept directory sharing" \ --execution-
parameters "{\"DocumentName\":\"AWSManagedServices-AcceptSharedDirectory\",\"Region
\":\"eu-central-1\",\"Parameters\":{\"SharedDirectoryId\":[\"d-000000000\"],
\"OwnerAccountId\":[\"000000000000\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DirectorySharingParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-13xvbj5pqg253"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 DirectorySharingParams.json
```

   Modify and save the DirectorySharingParams file. For example, you can replace the contents with something like this:

```
{
{
  "DocumentName": "AWSManagedServices-AcceptSharedDirectory",
  "Region": "eu-central-1",
  "Parameters": {
    "SharedDirectoryId": ["d-000000000"],
    "OwnerAccountId": ["000000000000"]
  }
}
```

2. Output the RFC template to a file in your current folder; this example names it DirectorySharingRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DirectorySharingRfc.json
```

3. Modify and save the DirectorySharingRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":         "ct-13xvbj5pqg253",
"ChangeTypeVersion":    "1.0",
"Title":                "AWS Directory Service accept directory sharing"
}
```

4. Create the RFC, specifying the DirectorySharingRfc file and the DirectorySharingParams file:

```
aws amscm create-rfc --cli-input-json file://DirectorySharingRfc.json --execution-
parameters file://DirectorySharingParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type was originally classified as Management | Advanced stack components | Directory service | Accept sharing, and has now been moved to a more user friendly classification. The change type ID, ct-13xvbj5pqg253, has not changed.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-13xvbj5pqg253.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-AcceptSharedDirectory",
  "Region": "us-east-1",
  "Parameters": {
    "SharedDirectoryId": [
      "d-12e456789f"
    ],
    "OwnerAccountId": [
      "123456789012"
    ]
  }
}
```

Directory | Create AD Trust

Create a one-way trust between On-Prem Domain and (AWS) Managed Active Directory. For multi-account landing zone (MALZ), use this change type in the shared services account. Before creating

the trust, you need to make sure that the following prerequisites are met: 1. You must create the AD trust first on the On-Prem Domain and save the trust password in the Secrets Manager. 2. You must set up a Managed Active Directory (MAD) Security Group with an outbound rule that allows all traffic to On-Prem CIDR ranges.

Full classification: Management | Directory Service | Directory | Create AD trust

Change Type Details

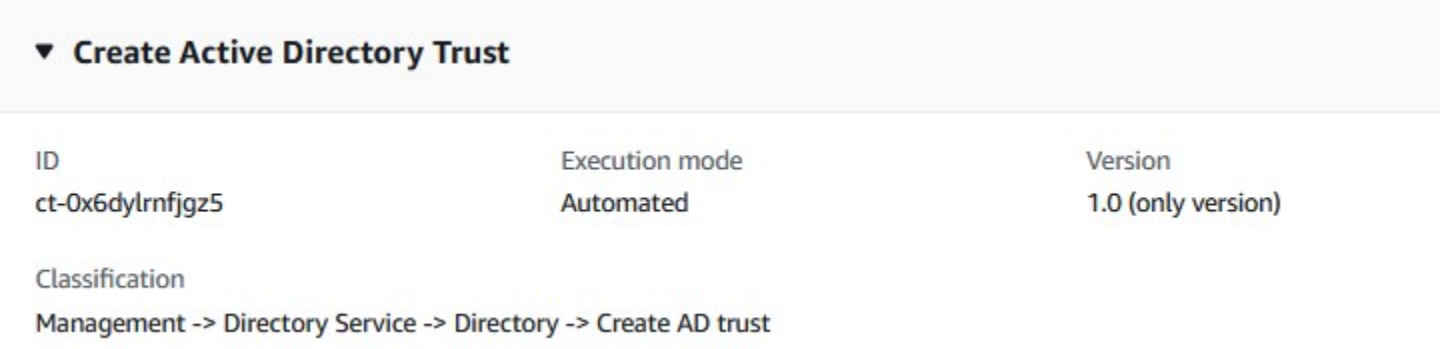
Change type ID	ct-0x6dylrnfjgz5
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create Active Directory Trust

Adding an AD trust with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding an AD trust with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0x6dylrnfjgz5" --change-type-version "1.0" --
title "Create AD Trust" --execution-parameters '
{"DocumentName":"AWSManagedServices-CreateADTrust","Region":"ap-
southeast-2","Parameters":{"DirectoryId":["d-976774e42f"],"RemoteDomainName":
["onprem.local"],"SecretArn":["arn:aws:secretsmanager:ap-
southeast-2:996606605561:secret:customer-shared/CorrectTPW-BI79uu"],"TrustType":
["External"],"ConditionalForwarderIpAddresses":["10.153.28.39"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateADTrustParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0x6dylrnfjgz5" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateADTrustParams.json
   ```

Modify and save the CreateADTrustParams.json file. For example, you can replace the contents with something like this:

```
{
  "DocumentName": "AWSManagedServices-CreateADTrust",
  "Region": "ap-southeast-2",
  "Parameters": {
    "DirectoryId": [
      "d-976774e42f"
    ],
    "RemoteDomainName": [
      "onprem.local"
    ],
    "SecretArn": [
      "arn:aws:secretsmanager:ap-southeast-2:996606605561:secret:customer-shared/
CorrectTPW-BI79uu"
    ],
    "TrustType": [
      "External"
    ],
    "ConditionalForwarderIpAddresses": [
      "10.153.28.39"
    ]
  }
}
```

2. Output the RFC template to a file in your current folder; this example names it CreateADTrustRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateADTrustRfc.json
```

3. Modify and save the CreateADTrustRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-0x6dylrnfjgz5",
  "ChangeTypeVersion": "1.0",
  "Title": "Active Directory Trust"
}
```

4. Create the RFC, specifying the CreateADTrustRfc file and the CreateADTrustParams file:

```
aws amscm create-rfc --cli-input-json file://CreateADTrustRfc.json --execution-
parameters file://CreateADTrustParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0x6dylrnfjgz5.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-CreateADTrust",
    "Region": "us-east-1",
    "Parameters": {
        "DirectoryId": "d-12e456789f",
        "RemoteDomainName": "onprem.local",
        "SecretArn": "arn:aws:secretsmanager:us-east-1:000000000000:secret:customer-
shared/adtrust",
        "TrustType": "External",
        "ConditionalForwarderIpAddresses": "10.153.28.39,10.153.28.40"
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-CreateADTrust",
    "Region": "us-east-1",
    "Parameters": {
        "DirectoryId": "d-12e456789f",
        "RemoteDomainName": "onprem.local",
        "SecretArn": "arn:aws:secretsmanager:us-east-1:000000000000:secret:customer-
shared/adtrust",
```

```
        "TrustType": "External",
        "ConditionalForwarderIpAddresses": "10.153.28.39,10.153.28.40"
    }
}
```

Directory | Share Directory

Share a specified directory in your AWS account (directory owner) with another AWS account (directory consumer). Run this in your Shared Service account that has Managed Active Directory. This change type is only supported for multi-account landing zone (MALZ).

Full classification: Management | Directory Service | Directory | Share directory

Change Type Details

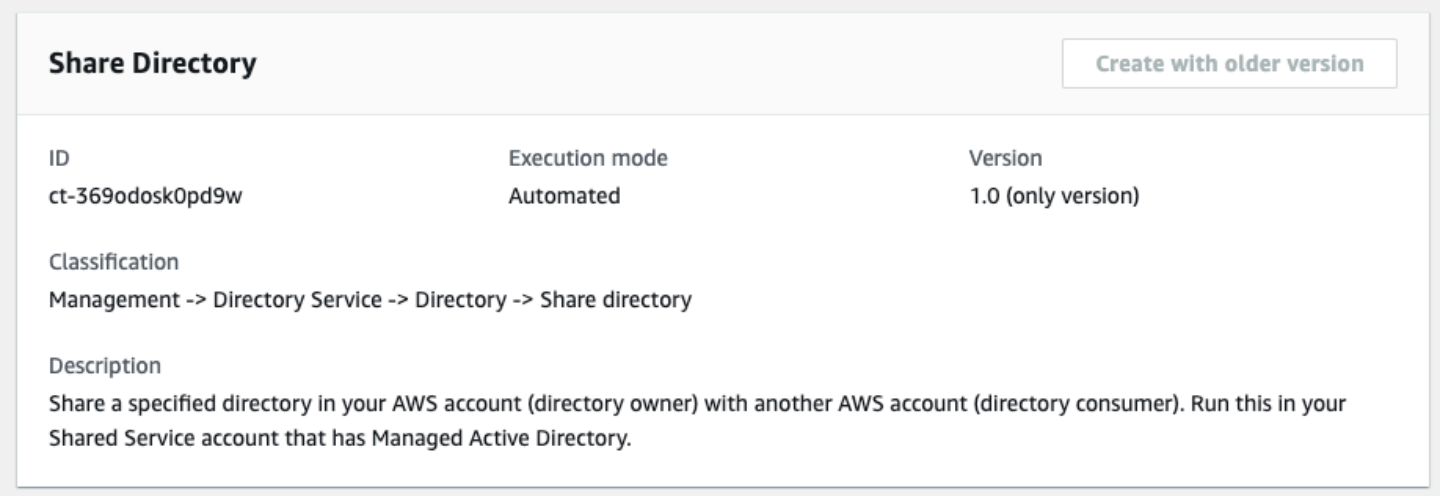
Change type ID	ct-369odosk0pd9w
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Share directory

Share a directory with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Share a directory with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  create-rfc --change-type-id "ct-369odosk0pd9w" --change-type-version
 "1.0" --title "Share Directory" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ShareDirectory\",\"Region\":\"ap-southeast-2\",\"Parameters\":
{\"DirectoryId\":[\"d-123456ab7c\"],\"TargetAccountId\":[\"012345678912\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DirectorySharingParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-369odosk0pd9w"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DirectorySharingParams.json
   ```

   Modify and save the DirectorySharingParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-ShareDirectory",
     "Region": "us-east-1",
     "Parameters": {
       "DirectoryId": [
         "d-123456ab7c"
       ],
       "TargetAccountId": [
         "012345678912"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it DirectorySharingRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DirectorySharingRfc.json
   ```

3. Modify and save the DirectorySharingRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeId": "ct-369odosk0pd9w",
     "ChangeTypeVersion": "1.0",
   ```

```
  "Title": "Share Directory"
}
```

4. Create the RFC, specifying the DirectorySharingRfc file and the DirectorySharingParams file:

```
aws amscm create-rfc --cli-input-json file://DirectorySharingRfc.json --execution-
parameters file://DirectorySharingParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For related CTs, see Directory Service Subcategory.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-369odosk0pd9w.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-ShareDirectory",
  "Region": "us-east-1",
  "Parameters": {
    "DirectoryId": [
      "d-0000000000"
    ],
    "TargetAccountId": [
      "000000000000"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-ShareDirectory",
  "Region": "us-east-1",
  "Parameters": {
```

```
    "DirectoryId": [
      "d-12e456789f"
    ],
    "TargetAccountId": [
      "123456789012"
    ]
  }
}
```

Directory | Unshare Directory

Stops the directory sharing between the directory owner and consumer accounts. Run this in your Shared Service account that has Managed Active Directory. This change type is only supported for multi-account landing zone (MALZ).

Full classification: Management | Directory Service | Directory | Unshare directory

Change Type Details

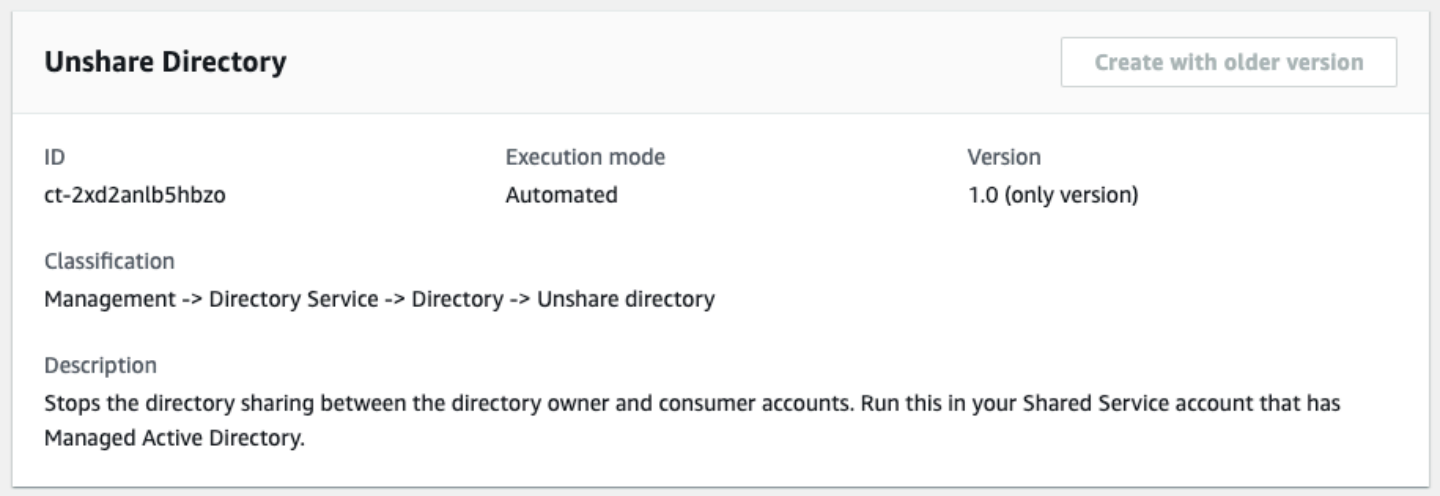
Change type ID	ct-2xd2anlb5hbzo
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Unshare directory

Unshare a directory with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Unshare a directory with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  create-rfc --change-type-id "ct-2xd2anlb5hbzo" --change-type-version
 "1.0" --title "Unshare Directory" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ShareDirectory\",\"Region\":\"ap-southeast-2\",\"Parameters\":
{\"DirectoryId\":[\"d-123456ab7c\"],\"UnshareTarget\":[\"012345678912\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DirectoryUnsharingParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2xd2anlb5hbzo"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DirectoryUnsharingParams.json
   ```

   Modify and save the DirectoryUnsharingParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UnshareDirectory",
     "Region": "us-east-1",
     "Parameters": {
       "DirectoryId": [
         "d-123456ab7c"
       ],
       "UnshareTarget": [
         "012345678912"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it DirectoryUnsharingRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DirectoryUnsharingRfc.json
   ```

3. Modify and save the DirectoryUnsharingRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeId": "ct-2xd2anlb5hbzo",
     "ChangeTypeVersion": "1.0",
   ```

```
  "Title": "Unshare Directory"
}
```

4. Create the RFC, specifying the DirectoryUnsharingRfc file and the DirectoryUnsharingParams file:

```
aws amscm create-rfc --cli-input-json file://DirectoryUnsharingRfc.json --
execution-parameters file://DirectoryUnsharingParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For related CTs, see Directory Service Subcategory.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2xd2anlb5hbzo.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-UnshareDirectory",
  "Region": "us-east-1",
  "Parameters": {
    "DirectoryId": [
      "d-0000000000"
    ],
    "UnshareTarget": [
      "000000000000"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UnshareDirectory",
```

```
  "Region": "us-east-1",
  "Parameters": {
    "DirectoryId": [
      "d-12e456789f"
    ],
    "UnshareTarget": [
      "123456789012"
    ]
  }
}
```

DNS | Add A Record

Add a new static DNS A record in AWS Managed Microsoft Active Directory (AD). For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | DNS | Add A record

Change Type Details

Change type ID	ct-2w3rbmnny1qpo
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add DNS "A" record

Adding a DNS A record with the console

The following shows this change type in the AMS console.

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding a DNS A record with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2w3rbmnny1qpo" --change-type-version
 "1.0" --title "Add DNS A Record" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-CreateDNSARecord-Admin\",\"Region\": \"us-east-1\",\"Parameters
\": {\"RecordName\": [\"web-server\"], \"IPAddress\": [\"132.133.134.135\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ArecordAddParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2w3rbmnny1qpo" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > ArecordAddParams.json
   ```

   Modify and save the ArecordAddParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateDNSARecord-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "RecordName": [
         "web-server"
       ],
       "IPAddress": [
         "132.133.134.135"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it ArecordAddRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ArecordAddRfc.json
   ```

3. Modify and save the ArecordAddRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":          "ct-2w3rbmnny1qpo",
   "ChangeTypeVersion":     "1.0",
   "Title":                 "AWS Directory Service add DNS A record"
   ```

```
}
```

4. Create the RFC, specifying the ArecordAddRfc file and the ArecordAddParams file:

```
aws amscm create-rfc --cli-input-json file://ArecordAddRfc.json --execution-
parameters file://ArecordAddParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> For multi-account landing zone (MALZ), use this change type in the shared services account.

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2w3rbmnny1qpo.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateDNSARecord-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "RecordName": ["web-server"],
    "IPAddress": ["123.1.2.3"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateDNSARecord-Admin",
  "Region": "us-east-1",
  "Parameters": {
```

```
    "RecordName": ["web-server"],
    "IPAddress": ["123.1.2.3"],
    "TTLValue": ["01:00:01"]
  }
}
```

DNS | Add CNAME Record

Create a new DNS CNAME record in AWS Managed Microsoft Active Directory (AD). CNAME records must always point to another domain name, never directly to an IP address. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | DNS | Add CNAME record

Change Type Details

Change type ID	ct-2murl5xzbxoxf
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add DNS CNAME record in AMS

> **Note**
>
> To create a CNAME record in AWS, see How do I create alias records for services hosted in AWS?.

Adding a DNS CNAME record with the console

The following shows this change type in the AMS console.

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding a DNS CNAME record with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2murl5xzbxoxf" --change-type-version
 "1.0" --title "Add DNS CNAME Record" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-CreateDNSCnameRecord-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": {\"RecordName\": [\"host1.mycompany.com\"], \"RecordCname\": [\"web-
server\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CnameRecordAddParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2w3rbmnny1qpo" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CnameRecordAddParams.json
   ```

   Modify and save the CnameRecordAddParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateDNSCnameRecord-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "RecordName": [
         "host1.mycompany.com"
       ],
       "RecordCname": [
         "web-server"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it CnameRecordAddRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CnameRecordAddRfc.json
   ```

3. Modify and save the CnameRecordAddRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":          "ct-2murl5xzbxoxf",
   "ChangeTypeVersion":     "1.0",
   ```

```
"Title":                "AWS Directory Service add DNS CNAME record"
}
```

4. Create the RFC, specifying the CnameRecordAddRfc file and the CnameRecordAddParams file:

```
aws amscm create-rfc --cli-input-json file://CnameRecordAddRfc.json --execution-
parameters file://CnameRecordAddParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For multi-account landing zone (MALZ), use this change type in the Shared Services account.
- For information about Directory Service, see the Directory Service Admin Guide. To learn about CNAME records, see CNAME record type.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2murl5xzbxoxf.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateDNSCnameRecord-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "RecordName": ["hostname123.example.com"],
    "RecordCname": ["webserver"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateDNSCnameRecord-Admin",
  "Region": "us-east-1",
  "Parameters": {
```

```
    "RecordName": ["hostname123.example.com"],
    "RecordCname": ["webserver"]
  }
}
```

DNS | Delete Conditional Forwarder

Delete AD DNS conditional forwarder for a remote domain. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | DNS | Delete conditional forwarder

Change Type Details

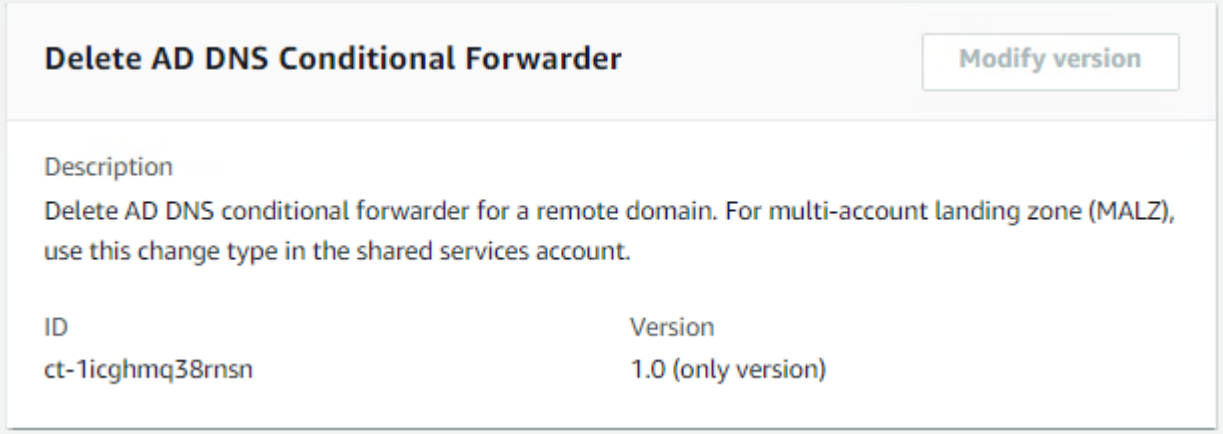
Change type ID	ct-1icghmq38rnsn
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete a DNS conditional forwarder

Deleting DNS conditional forwarders with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting DNS conditional forwarders with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1icghmq38rnsn" --change-type-version
 "1.0" --title "AWSManagedServices-DeleteADDNSConditionalForwarder" --execution-
parameters "{\"DocumentName\": \"AWSManagedServices-DeleteADDNSConditionalForwarder-
Admin\",\"Region\": \"us-east-1\",\"Parameters\": {\"RemoteDomainName\":
 [\"test.forwarders.com\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CondForwardDeleteParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1icghmq38rnsn"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CondForwardDeleteParams.json
   ```

   Modify and save the CondForwardDeleteParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-DeleteADDNSConditionalForwarder-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "RemoteDomainName": [
         "test.forwarders.com"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it CondForwardDeleteRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CondForwardDeleteRfc.json
   ```

3. Modify and save the CondForwardDeleteRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-1icghmq38rnsn",
     "Title": "Delete AD DNS Conditional Forwarder"
   ```

```
}
```

4. Create the RFC, specifying the CondForwardDeleteRfc file and the CondForwardDeleteParams file:

```
aws amscm create-rfc --cli-input-json file://CondForwardDeleteRfc.json --execution-
parameters file://CondForwardDeleteParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1icghmq38rnsn.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-DeleteADDNSConditionalForwarder-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "RemoteDomainName": ["test.test1.com"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-DeleteADDNSConditionalForwarder-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "RemoteDomainName": ["test.test1.com"]
  }
}
```

DNS | Remove Record

Remove the specified DNS resource record name, either an A or CNAME, or pointer record (PTR), from the specified DNS zone. By default, only the static record is removed per specified RecordName for A or CNAME records. Use the RecordData parameter to remove duplicates if there are multiple records with the same Host Name (RecordType A), either dynamic or static. For a PTR record type, all the static and dynamic records will be removed. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | DNS | Remove record

Change Type Details

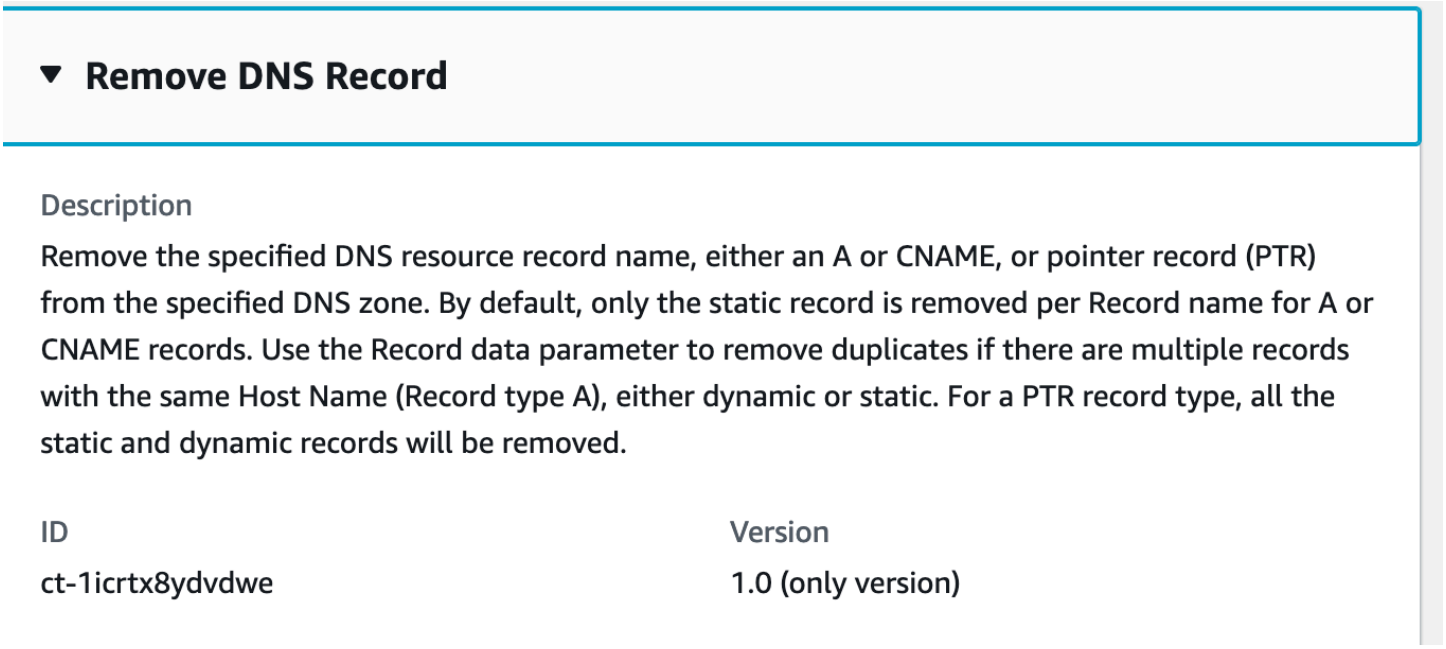
Change type ID	ct-1icrtx8ydvdwe
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remove record

Removing a DNS record with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Removing a DNS record with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1icrtx8ydvdwe" --change-type-version
 "1.0" --title "Remove DNS Record" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-RemoveDNSRecord-Admin\",\"Region\": \"us-east-1\",\"Parameters\":
 {\"RecordName\": [\"web-server\"], \"RecordType\": [\"CNAME\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RecordRemoveParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1icrtx8ydvdwe" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > RecordRemoveParams.json
   ```

   Modify and save the RecordRemoveParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-RemoveDNSRecord-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "RecordName": [
         "web-server"
       ],
       "RecordType": [
         "CNAME"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it RecordRemoveRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RecordRemoveRfc.json
   ```

3. Modify and save the RecordRemoveRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-1icrtx8ydvdwe",
"ChangeTypeVersion":     "1.0",
"Title":                 "Remove DNS record"
}
```

4. Create the RFC, specifying the RecordRemoveRfc file and the RecordRemoveParams file:

```
aws amscm create-rfc --cli-input-json file://RecordRemoveRfc.json --execution-
parameters file://RecordRemoveParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1icrtx8ydvdwe.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-RemoveDNSRecord-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "RecordName": ["123.123.123.123"],
    "RecordType": ["PTR"]
  }
}
```

Example: All Parameters

```
{
```

```
  "DocumentName": "AWSManagedServices-RemoveDNSRecord-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "RecordName": ["web-server"],
    "RecordType": ["CNAME"],
    "RecordData": ["123.123.123.123"]
  }
}
```

DNS | Update Cluster Permissions

Grants full control to the Cluster object on the Listener object to bring the SQL Server Listener object online. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | DNS | Update cluster permissions

Change Type Details

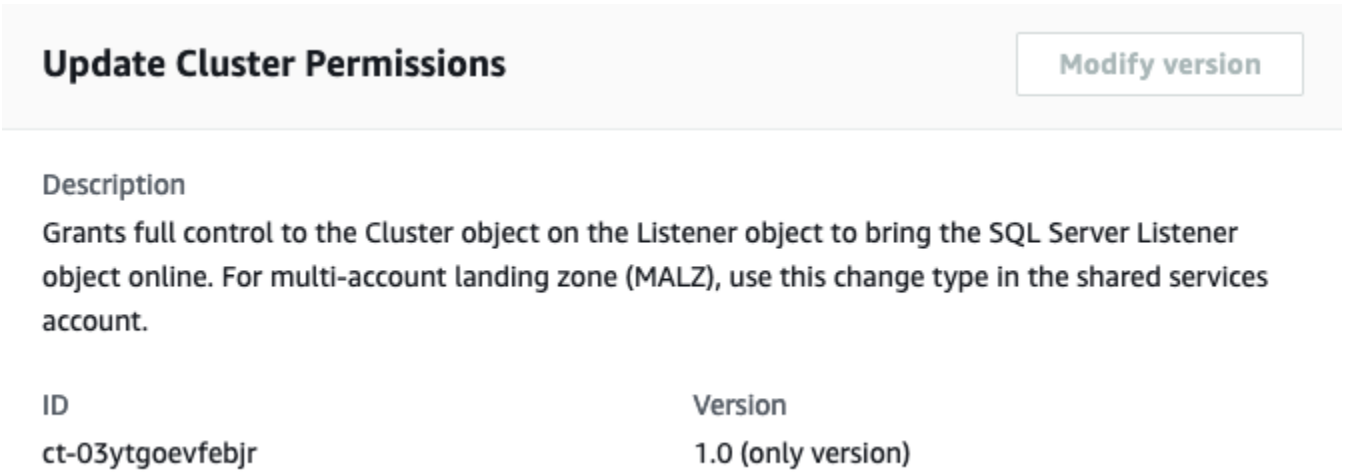
Change type ID	ct-03ytgoevfebjr
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update cluster permissions

Updating cluster permissions with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating cluster permissions with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-03ytgoevfebjr" --change-type-version "1.0"
 --title "Update Cluster Permissions" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-UpdateClusterDNSPermission-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": {\"ClusterName\": [\"EC2-SAMPLE-AGL\"],\"ClusterNodeComputerName\":
[\"EC2SAMPLE-01A1MR9\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ClusterPermissionsUpdateParams.json:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateClusterDNSPermission-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "ClusterName": ["EC2-SAMPLE-AGL"],
       "ClusterNodeComputerName": ["EC2SAMPLE-01A1MR9"]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it ClusterPermissionsUpdateRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ClusterPermissionsUpdateRfc.json
   ```

3. Modify and save the ClusterPermissionsUpdateRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":          "ct-03ytgoevfebjr",
   "ChangeTypeVersion":     "1.0",
   "Title":                 "Update Cluster Permissions"
   }
   ```

4. Create the RFC, specifying the ClusterPermissionsUpdateRfc file and the ClusterPermissionsUpdateParams file:

   ```
   aws amscm create-rfc --cli-input-json file://ClusterPermissionsUpdateRfc.json --
   execution-parameters file://ClusterPermissionsUpdateParams.json
   ```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For additional information, see DirectoryService section.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-03ytgoevfebjr.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateClusterDNSPermission-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "ClusterName": ["EC2-O6G85G-AGL"],
    "ClusterNodeComputerName": ["EC2AMAZ-O6G3MR9"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateClusterDNSPermission-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "ClusterName": ["EC2-O6G85G-AGL"],
    "ClusterNodeComputerName": ["EC2AMAZ-O6G3MR9"]
  }
}
```

DNS | Update Conditional Forwarder

Update AD DNS conditional forwarder for a remote domain. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | DNS | Update conditional forwarder

Change Type Details

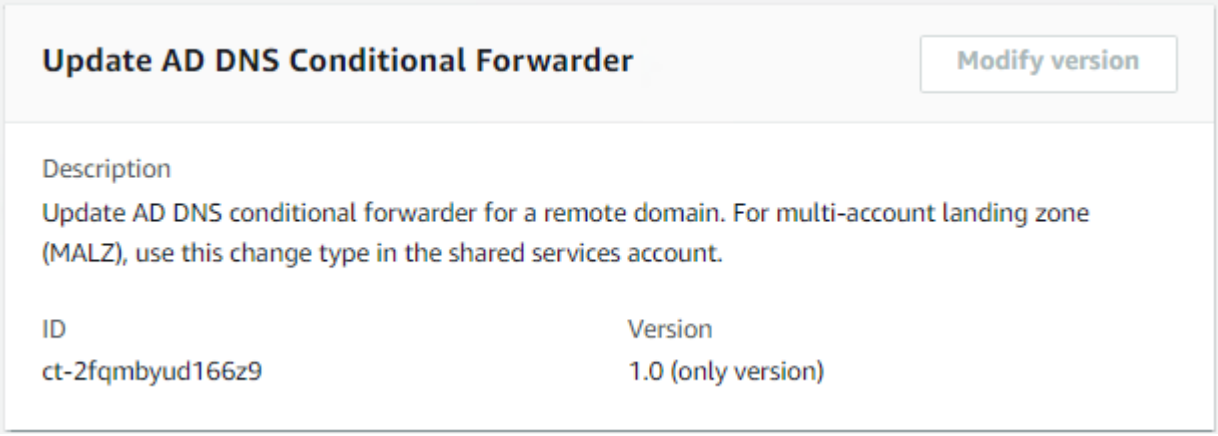
Change type ID	ct-2fqmbyud166z9
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update a DNS conditional forwarder

Updating DNS conditional forwarders with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating DNS conditional forwarders with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2fqmbyud166z9" --change-type-version
 "1.0" --title "AWSManagedServices-UpdateADDNSConditionalForwarder" --execution-
parameters "{\"DocumentName\": \"AWSManagedServices-UpdateADDNSConditionalForwarder-
Admin\",\"Region\": \"us-east-1\",\"Parameters\": {\"RemoteDomainName\":
 [\"test.forwarders.com\"], \"IpAddresses\": [\"10.0.0.3\", \"10.0.0.4"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CondForwardUpdateParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2fqmbyud166z9"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CondForwardUpdateParams.json
   ```

   Modify and save the CondForwardUpdateParams file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-UpdateADDNSConditionalForwarder-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "RemoteDomainName": [
      "Domain_Name"
    ],
    "IPAddresses": [
      "132.133.134.135", "135.134.133.132"
    ]
  }
}
```

2. Output the RFC template to a file in your current folder; this example names it CondForwardUpdateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CondForwardUpdateRfc.json
```

3. Modify and save the CondForwardUpdateRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-2fqmbyud166z9",
"ChangeTypeVersion":     "1.0",
"Title":                 "Update conditional forwarders"
}
```

4. Create the RFC, specifying the CondForwardUpdateRfc file and the CondForwardUpdateParams file:

```
aws amscm create-rfc --cli-input-json file://CondForwardUpdateRfc.json --execution-
parameters file://CondForwardUpdateParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2fqmbyud166z9.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-UpdateADDNSConditionalForwarder-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "RemoteDomainName": ["test.test1.com"],
    "IPAddresses": ["10.0.0.1", "10.0.0.2"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-UpdateADDNSConditionalForwarder-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "RemoteDomainName": ["test.test1.com"],
    "IPAddresses": ["10.0.0.1", "10.0.0.2"]
  }
}
```

DNS | Update Record Permission

Grant permissions to the computer object to update DNS records after failover. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | DNS | Update record permission

Change Type Details

Change type ID	ct-1eft8s6vdhz0w
Current version	1.0
Expected execution duration	60 minutes

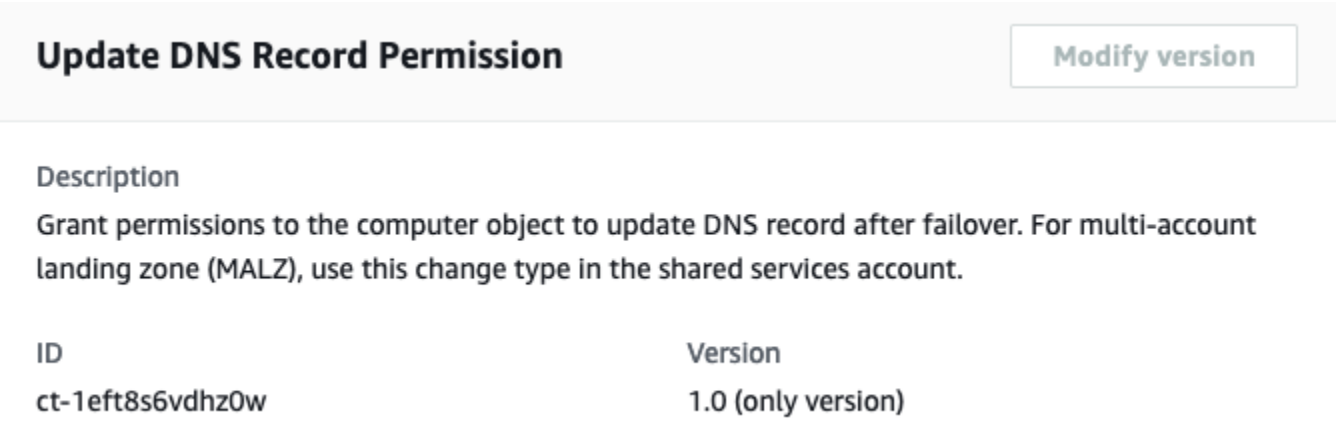
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update DNS record permission

Updating DNS record permissions with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating DNS record permissions with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1eft8s6vdhz0w" --change-type-version
 "1.0" --title "Update DNS Record" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-UpdateDNSRecordsPermission-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": {\"RecordNames\": [\"EC2CLUS-SAMPLE\",\"EC2SAmPL1-AWS\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateDNSRecordsPermissionParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1eft8s6vdhz0w"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateDNSRecordsPermissionParams.json
   ```

   Modify and save the UpdateDNSRecordsPermissionParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateDNSRecordsPermission-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "RecordNames": ["EC2CLUS-SAMPLE","EC2SAmPL1-AWS"]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it UpdateDNSRecordsPermissionRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateDNSRecordsPermissionRfc.json
```

3. Modify and save the UpdateDNSRecordsPermissionRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1eft8s6vdhz0w",
  "Title": "Update DNS record"
}
```

4. Create the RFC, specifying the UpdateDNSRecordsPermissionRfc file and the UpdateDNSRecordsPermissionParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateDNSRecordsPermissionRfc.json --
execution-parameters file://UpdateDNSRecordsPermissionParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1eft8s6vdhz0w.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateDNSRecordsPermission-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "RecordNames": ["EC2CLUS-SAMPl1,EC2G90BI1-AWS"]
  }
}
```

Example: All Parameters

```
{
```

```
  "DocumentName": "AWSManagedServices-UpdateDNSRecordsPermission-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "RecordNames": ["EC2CLUS-SAMPl1,EC2G90BI1-AWS"]
  }
}
```

Users and Groups | Add Group

Create an Active Directory (AD) group in the AMS managed AD. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | Users and groups | Add group

Change Type Details

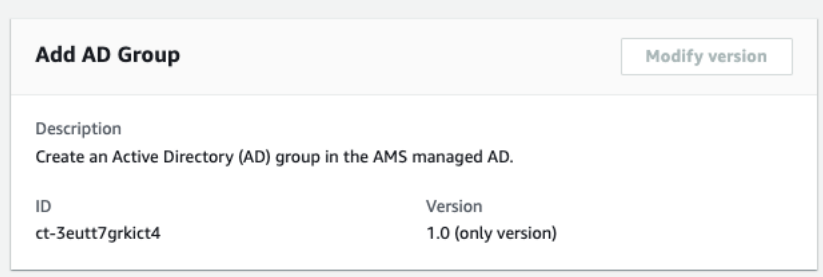
Change type ID	ct-3eutt7grkict4
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add Active Directory group

Adding an AD group with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding an AD group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3eutt7grkict4" --change-type-version
 "1.0" --title "Create AD group" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-CreateADGroup-Admin\",\"Region\":\"us-east-1\",\"Parameters\":
{\"GroupName\":[\"my-group\"],\"GroupDescription\":[\"Group description\"],\"GroupScope
\":[\"DomainLocal\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AdGroupAddParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-3eutt7grkict4" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > AdGroupAddParams.json
```

   Modify and save the AdGroupAddParams file. For example, you can replace the contents with something like this:

```
{
  "DocumentName" : "AWSManagedServices-CreateADGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "GroupName" : ["my-group"],
    "GroupDescription" : ["Group description"],
    "GroupScope" : ["DomainLocal"]
  }
}
```

2. Output the RFC template to a file in your current folder; this example names it AdGroupAddRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AdGroupAddRfc.json
```

3. Modify and save the AdGroupAddRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3eutt7grkict4",
  "Title": "Create AD group"
}
```

4. Create the RFC, specifying the AdGroupAddRfc file and the AdGroupAddParams file:

```
aws amscm create-rfc --cli-input-json file://AdGroupAddRfc.json --execution-
parameters file://AdGroupAddParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3eutt7grkict4.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateADGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "GroupName" : ["my-group"],
    "GroupDescription" : ["Group description"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateADGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "GroupName" : ["my-group"],
    "GroupDescription" : ["Group description"],
    "GroupScope" : ["DomainLocal"]
  }
}
```

Users and Groups | Add Group To Group

Add an Active Directory (AD) group in the trusted domain to an AD group in the AMS managed AD. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | Users and groups | Add group to group

Change Type Details

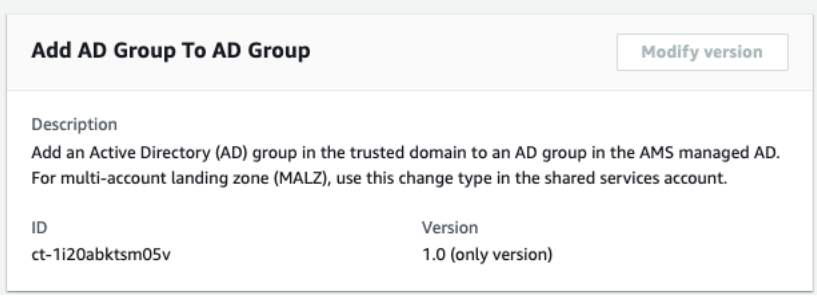
Change type ID	ct-1i20abktsm05v
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add an AD group to an AD group

Adding an AD group to an AMS-managed AD group with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding an AD group to an AMS-managed AD group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1i20abktsm05v" --change-type-version
 "1.0" --title "Add AD group to AD group" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-AddADGroupToADGroup-Admin\",\"Region\":\"us-east-1\",\"Parameters
\":{\"NestedGroupName\":[\"my-nested-group\"],\"GroupName\":[\"my-parent-group\"],
\"TrustedDomainFQDN\":[\"my-domain.com\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it GroupToGroupAddParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1i20abktsm05v"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    GroupToGroupAddParams.json
   ```

   Modify and save the GroupToGroupAddParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName" : "AWSManagedServices-AddADGroupToADGroup-Admin",
     "Region" : "us-east-1",
     "Parameters" : {
       "NestedGroupName" : ["my-nested-group"],
   ```

```
    "GroupName" : ["my-parent-group"],
    "TrustedDomainFQDN" : ["my-domain.com"]
  }
}
```

2. Output the RFC template to a file in your current folder; this example names it GroupToGroupAddRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > GroupToGroupAddRfc.json
```

3. Modify and save the GroupToGroupAddRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-1i20abktsm05v",
"ChangeTypeVersion":     "1.0",
"Title":                 "Add AD group to AD group"
}
```

4. Create the RFC, specifying the GroupToGroupAddRfc file and the GroupToGroupAddParams file:

```
aws amscm create-rfc --cli-input-json file://GroupToGroupAddRfc.json --execution-
parameters file://GroupToGroupAddParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1i20abktsm05v.

Example: Required Parameters

```
{
```

```
  "DocumentName" : "AWSManagedServices-AddADGroupToADGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "NestedGroupName" : ["nested-group"],
    "GroupName" : ["parent-group"],
    "TrustedDomainFQDN" : ["my-test-domain.com"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddADGroupToADGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "NestedGroupName" : ["nested-group"],
    "GroupName" : ["parent-group"],
    "TrustedDomainFQDN" : ["my-test-domain.com"]
  }
}
```

Users and Groups | Add User To Group

Add an Active Directory (AD) user to an AD group in the AMS managed AD. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | Users and groups | Add user to group

Change Type Details

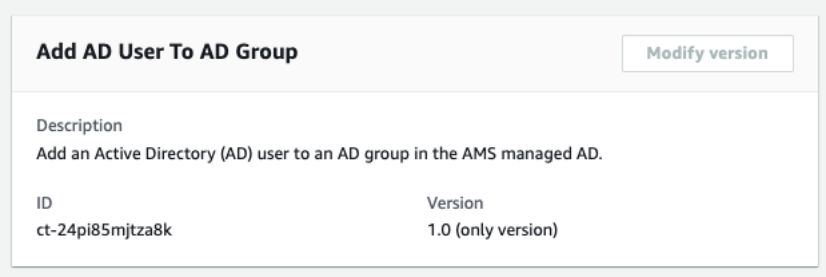
Change type ID	ct-24pi85mjtza8k
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add an AD user to an AD group

Adding an AD user to an AMS-managed AD group with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding an AD user to an AMS-managed AD group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-24pi85mjtza8k" --change-type-version
 "1.0" --title "Add AD user to AD group" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-AddADUserToGroup-Admin\",\"Region\":\"us-east-1\",\"Parameters
\":{\"UserName\":[\"my-user\"],\"GroupName\":[\"my-group\"],\"DomainFQDN\":[\"my-
domain.com\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UserToGroupAddParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-24pi85mjtza8k" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UserToGroupAddParams.json
   ```

   Modify and save the UserToGroupAddParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName" : "AWSManagedServices-AddADUserToGroup-Admin",
     "Region" : "us-east-1",
     "Parameters" : {
       "UserName" : ["my-user"],
       "GroupName" : ["my-group"],
       "DomainFQDN" : ["my-domain.com"]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it UserToGroupAddRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UserToGroupAddRfc.json
   ```

3. Modify and save the UserToGroupAddRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":         "ct-24pi85mjtza8k",
   ```

```
"ChangeTypeVersion":    "1.0",
"Title":                "Add AD user to AD group"
}
```

4. Create the RFC, specifying the UserToGroupAddRfc file and the UserToGroupAddParams file:

```
aws amscm create-rfc --cli-input-json file://UserToGroupAddRfc.json --execution-
parameters file://UserToGroupAddParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-24pi85mjtza8k.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddADUserToGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "UserName" : ["my-user"],
    "GroupName" : ["parent-group"],
    "DomainFQDN" : ["my-test-domain.com"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddADUserToGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "UserName" : ["my-user"],
    "GroupName" : ["parent-group"],
```

```
    "DomainFQDN" : ["my-test-domain.com"]
  }
}
```

Users and Groups | Remove User from Group

Remove an Active Directory (AD) user from an AD group in the AMS managed AD. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Management | Directory Service | Users and groups | Remove user from group

Change Type Details

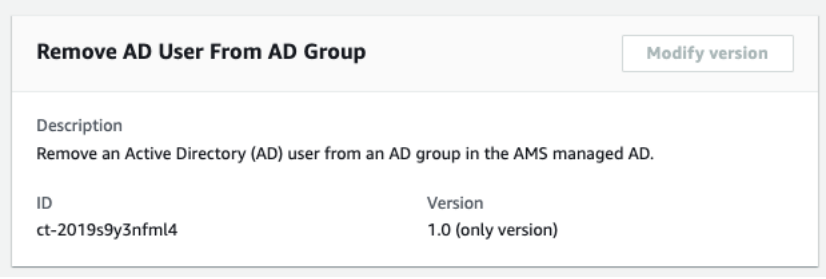
Change type ID	ct-2019s9y3nfml4
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remove an AD user from an AD group

Removing an AD user from an AMS-managed AD group with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Removing an AD user from an AMS-managed AD group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2019s9y3nfml4" --change-type-version "1.0"
 --title "Remove AD user from AD group" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-RemoveADUserFromGroup-Admin\",\"Region\":\"us-east-1\",
\"Parameters\":{\"UserName\":[\"my-user\"],\"GroupName\":[\"my-group\"],\"DomainFQDN\":
[\"my-domain.com\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UserFromGroupRemoveParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2019s9y3nfml4"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UserFromGroupRemoveParams.json
   ```

Modify and save the UserFromGroupRemoveParams file. For example, you can replace the contents with something like this:

```
{
  "DocumentName" : "AWSManagedServices-RemoveADUserFromGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "UserName" : ["my-user"],
    "GroupName" : ["my-group"],
    "DomainFQDN" : ["my-domain.com"]
  }
}
```

2. Output the RFC template to a file in your current folder; this example names it UserFromGroupRemoveRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UserFromGroupRemoveRfc.json
```

3. Modify and save the UserFromGroupRemoveRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-2019s9y3nfml4",
"ChangeTypeVersion":     "1.0",
"Title":                 "Remove AD user from AD group"
}
```

4. Create the RFC, specifying the UserFromGroupRemoveRfc file and the UserFromGroupRemoveParams file:

```
aws amscm create-rfc --cli-input-json file://UserFromGroupRemoveRfc.json --
execution-parameters file://UserFromGroupRemoveParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Directory Service, see the Directory Service Admin Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2019s9y3nfml4.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-RemoveADUserFromGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "UserName" : ["my-user"],
    "GroupName" : ["my-group"],
    "DomainFQDN" : ["my-domain.com"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-RemoveADUserFromGroup-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "UserName" : ["my-user"],
    "GroupName" : ["my-group"],
    "DomainFQDN" : ["my-domain.com"]
  }
}
```

Host Security Subcategory

Change Type Items and Operations in the Host Security Subcategory

- Malware Full System Scan | Disable (Review Required)
- Trend Micro DSM | Add Login (Read-Only)

Malware Full System Scan | Disable (Review Required)

Use to disable periodic malware full system scan feature in all EC2 instances deployed in a single VPC.

Full classification: Management | Host security | Malware full system scan | Disable (review required)

Change Type Details

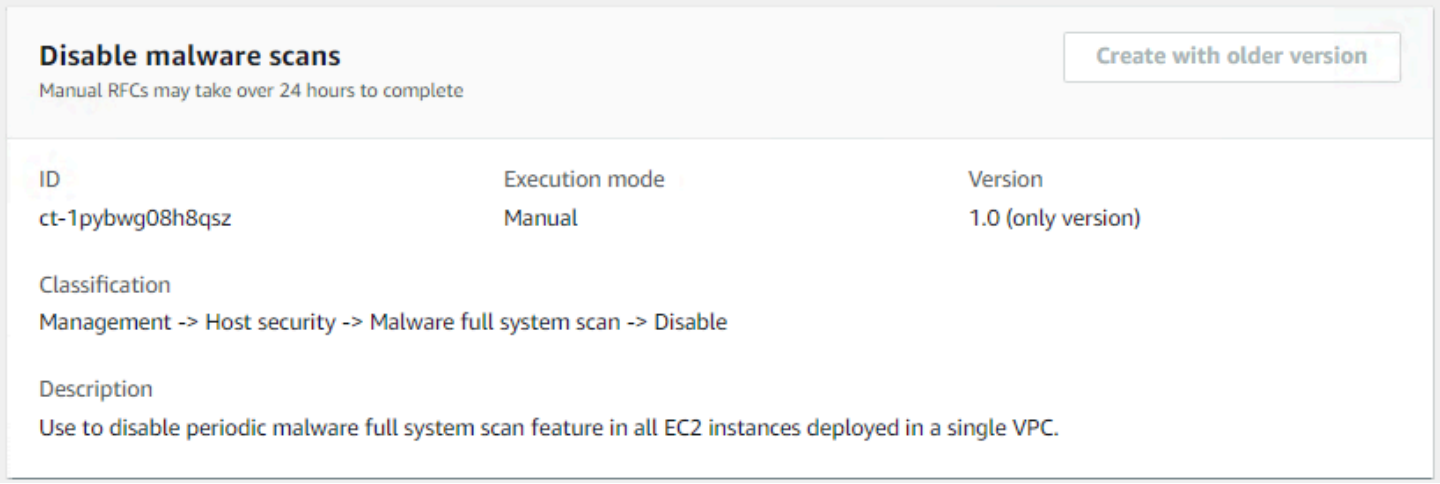
Change type ID	ct-1pybwg08h8qsz
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Disable malware scanning on a VPC

Disabling malware scanning with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Disabling malware scanning with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1pybwg08h8qsz" --change-type-version "1.0"
 --title "Disable malware scanning" --execution-parameters "{\"VpcId\": \"VPC-ID\",
\"Priority\": \"High\}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it DisableMalwareScanParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1pybwg08h8qsz"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DisableMalwareScanParams.json
   ```

2. Modify and save the DisableMalwareScanParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-TerminateStandaloneInstances",
   ```

```
  "Region": "us-east-1",
  "Confirmation": "terminate instances",
  "Parameters": {
    "InstanceIds": [
      "i-1234567890abcdef0"
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it DisableMalwareScanRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DisableMalwareScanRfc.json
```

4. Modify and save the DisableMalwareScanRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "cct-1pybwg08h8qsz",
    "ChangeTypeVersion": "1.0",
    "Title": "Disable malware scanning"
}
```

5. Create the RFC, specifying the DisableMalwareScanRfc file and the DisableMalwareScanParams file:

```
aws amscm create-rfc --cli-input-json file://DisableMalwareScanRfc.json  --
execution-parameters file://DisableMalwareScanParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1pybwg08h8qsz.

Example: Required Parameters

```
{
  "VpcId": "vpc-28abd91e"
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-28abd91e",
  "Priority": "Medium"
}
```

Trend Micro DSM | Add Login (Read-Only)

Request a read-only login to the Trend Micro console for your account.

Full classification: Management | Host security | Trend Micro DSM | Add login (read-only)

Change Type Details

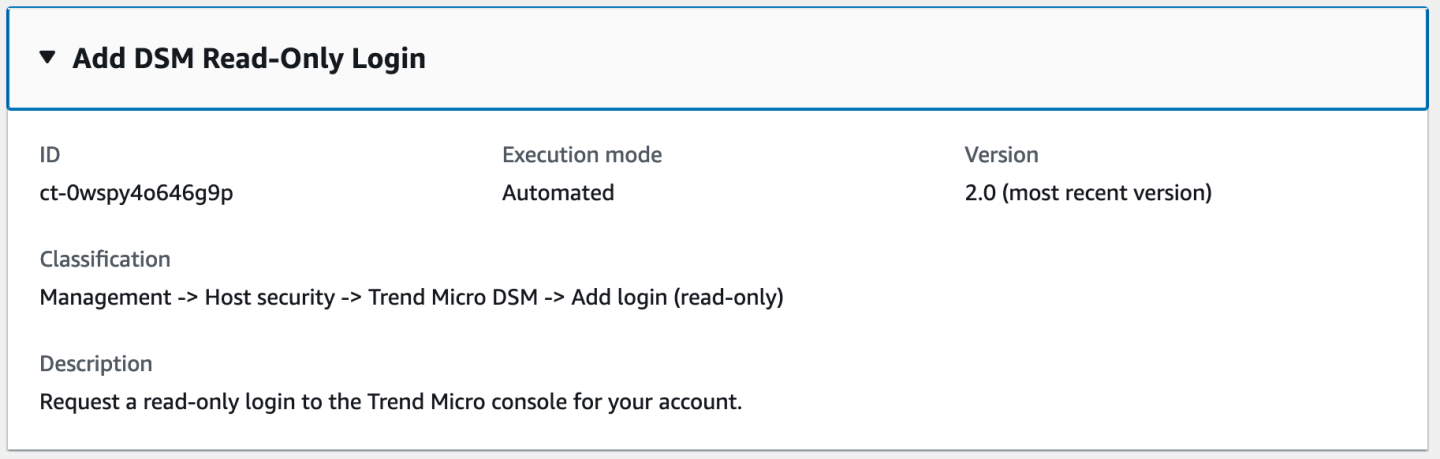
Change type ID	ct-0wspy4o646g9p
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add Trend Micro login (read only)

Adding a Trend Micro login (read only) with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding a Trend Micro login (read only) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0wspy4o646g9p" --change-type-version "2.0"
 --title "Trend Micro Console Access" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-CreateEPSDSMReadOnlyUser\",\"Region\":\"us-east-1\",\"Parameters
\":{\"Username\":[\"eps-dsm-read-only-user\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it AddTrendMicroLoginParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0wspy4o646g9p"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    AddTrendMicroLoginParams.json
   ```

2. Modify and save the AddTrendMicroLoginParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-CreateEPSDSMReadOnlyUser",
       "Region": "us-east-1",
       "Parameters": {
           "Username": [
               "eps-dsm-read-only-user"
           ]
       }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it AddTrendMicroLoginRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > AddTrendMicroLoginRfc.json
   ```

4. Modify and save the AddTrendMicroLoginRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-0wspy4o646g9p",
"Title":                "Trend Micro Console Access"
}
```

5. Create the RFC, specifying the AddTrendMicroLoginRfc file and the AddTrendMicroLoginParams file:

```
aws amscm create-rfc --cli-input-json file://AddTrendMicroLoginRfc.json  --
execution-parameters file://AddTrendMicroLoginParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0wspy4o646g9p.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateEPSDSMReadOnlyUser",
  "Region": "us-east-1",
  "Parameters": {
  "Username": ["eps-dsm-read-only-user"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateEPSDSMReadOnlyUser",
  "Region": "us-east-1",
  "Parameters": {
  "Username": ["eps-dsm-read-only-user"],
  "FullName": ["Alejandro Rosalez"],
  "Description": ["This user is created for eps read only access"]
  }
}
```

Managed Account Subcategory

Change Type Items and Operations in the Managed Account Subcategory

- Automated IAM Provisioning With Read-Write Permissions | Enable (Review Required)
- Automated IAM Provisioning With Read-Write Permissions | Update Custom Deny List (Review Required)
- Developer Mode | Enable (Review Required)
- Direct Change Mode | Enable
- DNS | Migrate To Route 53
- Stack Access Duration | Override (Review Required)

Automated IAM Provisioning With Read-Write Permissions | Enable (Review Required)

Enable Automated IAM provisioning with read-write permissions in the account used to submit this CT. Once enabled, a new role 'AWSManagedServicesIAMProvisionAdminRole' is created in that account. Additionally, you can use three related change types (ct-1n9gfnog5x7fl, ct-1e0xmuy1diafq, ct-17cj84y7632o6) to create, update, or delete IAM roles and policies using Automated IAM provisioning with read-write permissions, which employs an automated review process with a predefined set of rules for IAM and AMS. Before using, we recommend a good familiarity with IAM rules. To confirm that an account has Automated IAM provisioning enabled, look for the IAM role 'AWSManagedServicesIAMProvisionAdminRole' in the IAM console for that account.

Full classification: Management | Managed account | Automated IAM provisioning with read-write permissions | Enable (review required)

Change Type Details

Change type ID	ct-1706xvvk6j9hf
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create IAM entity or policy

Creating IAM entity or policy with the console

Create Entity or Policy (read-write permissions)

ID	Execution mode	Version
ct-1n9gfnog5x7fl	Automated	1.0 (only version)

Classification

Deployment -> Advanced stack components -> Identity and Access Management (IAM) -> Create entity or policy (read-write permissions)

Description

Create Identity and Access Management (IAM) role or policy with read-write permissions. You must have enabled this feature with change type ct-1706xvvk6j9hf before submitting this request. Automated IAM provisioning with read-write permissions runs over 200 validations to help ensure successful outcomes.

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM entity or policy with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id ID` command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1n9gfnog5x7fl" --change-type-
version "1.0" --title "Create role or policy" --execution-parameters
 '{"DocumentName":"AWSManagedServices-HandleAutomatedIAMProvisioningCreate-
Admin","Region":"us-east-1","Parameters":{"ValidateOnly":"No"},"RoleDetails":
{"Roles":[{"RoleName":"RoleTest01","Description":"This is a test
 role","AssumeRolePolicyDocument":"{"Version":"2012-10-17","Statement":[{"Effect":"Allow","Prin
{"AWS":"arn:aws:iam::123456789012:root"},"Action":"sts:AssumeRole"}]}","ManagedPolicyArns":
["arn:aws:iam::123456789012:policy/policy01","arn:aws:iam::123456789012:policy/
policy02"],"Path":"/","MaxSessionDuration":"7200","PermissionsBoundary":"arn:aws:iam::12345678
permission_boundary01","InstanceProfile":"No"}]},"ManagedPolicyDetails":
{"Policies":[{"ManagedPolicyName":"TestPolicy01","Description":"This is customer
 policy","Path":"/test/","PolicyDocument":"{"Version":"2012-10-17","Statement":
[{"Sid":"AllQueueActions","Effect":"Allow","Action":"sqs:ListQueues","Resource":"*","Condition"
{"ForAllValues:StringEquals":{"aws:tagKeys":["temporary"]}}}]}"}]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamResourceParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-1n9gfnog5x7fl"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 CreateIamResourceParams.json
```

2. Modify and save the CreateIamResourceParams file; example creates an IAM Role with policy documents pasted inline.

```
{
  "DocumentName": "AWSManagedServices-HandleAutomatedIAMProvisioningCreate-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "ValidateOnly": "No"
  },
  "RoleDetails": {
    "Roles": [
      {
        "RoleName": "RoleTest01",
        "Description": "This is a test role",
        "AssumeRolePolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root\"},
\"Action\":\"sts:AssumeRole\"}]}",
        "ManagedPolicyArns": [
          "arn:aws:iam::123456789012:policy/policy01",
          "arn:aws:iam::123456789012:policy/policy02"
        ],
        "Path": "/",
        "MaxSessionDuration": "7200",
        "PermissionsBoundary": "arn:aws:iam::123456789012:policy/
permission_boundary01",
        "InstanceProfile": "No"
      }
    ]
  },
  "ManagedPolicyDetails": {
    "Policies": [
      {
        "ManagedPolicyName": "TestPolicy01",
        "Description": "This is customer policy",
        "Path": "/test/",
```

```
        "PolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"AllQueueActions\",\"Effect\":\"Allow\",\"Action\":\"sqs:ListQueues\",\"Resource
\":\"*\",\"Condition\":{\"ForAllValues:StringEquals\":{\"aws:tagKeys\":[\"temporary
\"]}}}]}"
      }
    ]
  }
}
```

3. Output the RFC template JSON file to a file named CreateIamResourceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateIamResourceRfc.json
```

4. Modify and save the CreateIamResourceRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1n9gfnog5x7fl",
  "Title": "Create entity or policy (read-write permissions)"
}
```

5. Create the RFC, specifying the CreateIamResourceRfc file and the CreateIamResourceParams file:

```
aws amscm create-rfc --cli-input-json file://CreateIamResourceRfc.json  --
execution-parameters file://CreateIamResourceParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- After an IAM role is provisioned in your account, depending on the role and the policy document you attach to the role, you may need to onboard the role in your federation solution.
- For information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM) and for policy information, see Managed policies and inline policies. For information about AMS permissions, see Deploying IAM resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1706xvvk6j9hf.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "SAMLIdentityProviderArns": ["arn:aws:iam::123456789012:saml-provider/customer-saml"],
  "IamEntityArns": ["arn:aws:iam::123456789012:role/test-role-one",
 "arn:aws:iam::123456789012:role/test-role-two"],
  "CustomerCustomDenyActionsList1": "ec2:Create*,ec2:Delete*,sso-admin:*,resource-explorer-2:*",
  "Priority": "High"
}
```

Automated IAM Provisioning With Read-Write Permissions | Update Custom Deny List (Review Required)

Update the list of customer-defined denied actions for Automated IAM Provisioning. Make sure to provide the complete list of deny actions, including previously provisioned actions. The provided list replaces the previous list.

Full classification: Management | Managed account | Automated IAM provisioning with read-write permissions | Update custom deny list (review required)

Change Type Details

Change type ID	ct-2r9xvd3sdsic0
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required

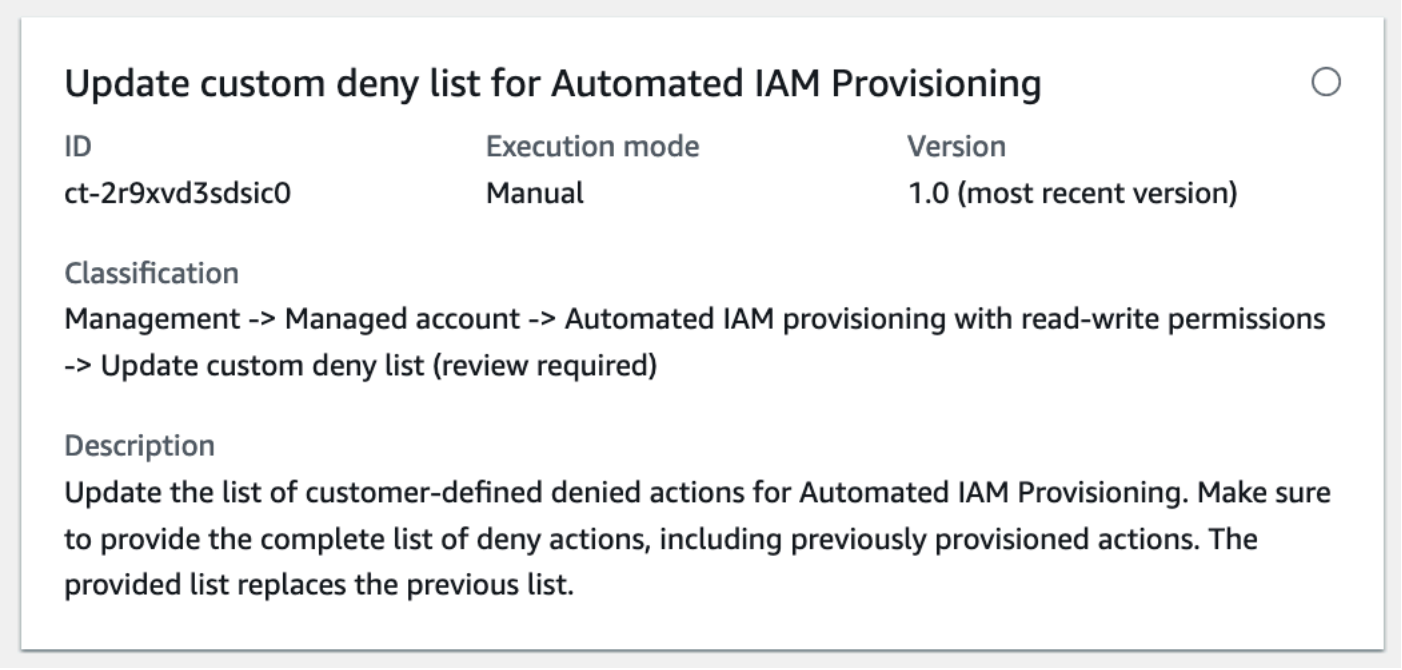
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update custom deny list for AMS Automated IAM Provisioning

Update custom deny list with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Update custom deny list with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2r9xvd3sdsic0" --change-type-version "1.0" --
title "Update custom deny list for Automated IAM Provisioning" --execution-parameters
 "{\"CustomerCustomDenyActionsList1\":\"ec2:RunInstances,s3:PutBucket,sagemaker:*\",
\"Priority\":\"High\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CustomerCustomDenyActionsList.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2r9xvd3sdsic0"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CustomerCustomDenyActionsList.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-CustomerCustomDenyActionsList",
       "Region": "us-east-1",
       "Parameters": {
     "CustomerCustomDenyActionsList1": "ec2:RunInstances,s3:PutBucket,sagemaker:*",
     "Priority": "High"
   }
   ```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it CustomerCustomDenyActionsListRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton >
 CustomerCustomDenyActionsListRfc.json
```

4. Modify and save the CustomerCustomDenyActionsListRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-2r9xvd3sdsic0",
  "Title": "Update custom deny list for Automated IAM Provisioning"
}
```

5. Create the RFC, specifying the CreateAcmPublicRfc file and the CreateAcmPublicParams file:

```
aws amscm create-rfc --cli-input-json file://CustomerCustomDenyActionsListRfc.json
 --execution-parameters file://CustomerCustomDenyActionsListParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2r9xvd3sdsic0.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "CustomerCustomDenyActionsList1": "ec2:Create*,ec2:Delete*,sso-admin:*,resource-
explorer-2:*",
  "Priority": "High"
```

```
}
```

Developer Mode | Enable (Review Required)

Enable Developer Mode (Dev Mode). Dev mode provides you with elevated permissions, in AMS Plus accounts, to provision and update AWS resources outside of the AMS change management process. Dev mode does this by leveraging native AWS API calls within the AMS Virtual Private Cloud (VPC), enabling you to design and implement infrastructure and applications in your managed environment. When using an account that has Dev mode enabled, continuity management, patch management, and change management are provided for resources provisioned through the AMS change management process or by using an AMS Amazon Machine Image (AMI). However, these AMS management features are not offered for resources provisioned through native AWS APIs. Rather, you are responsible for monitoring infrastructure resources that are provisioned outside of the AMS change management process. Dev mode is limited to accounts with non-production workloads. With elevated permissions, you have an increased responsibility to ensure adherence to internal controls.

Full classification: Management | Managed account | Developer mode | Enable (review required)

Change Type Details

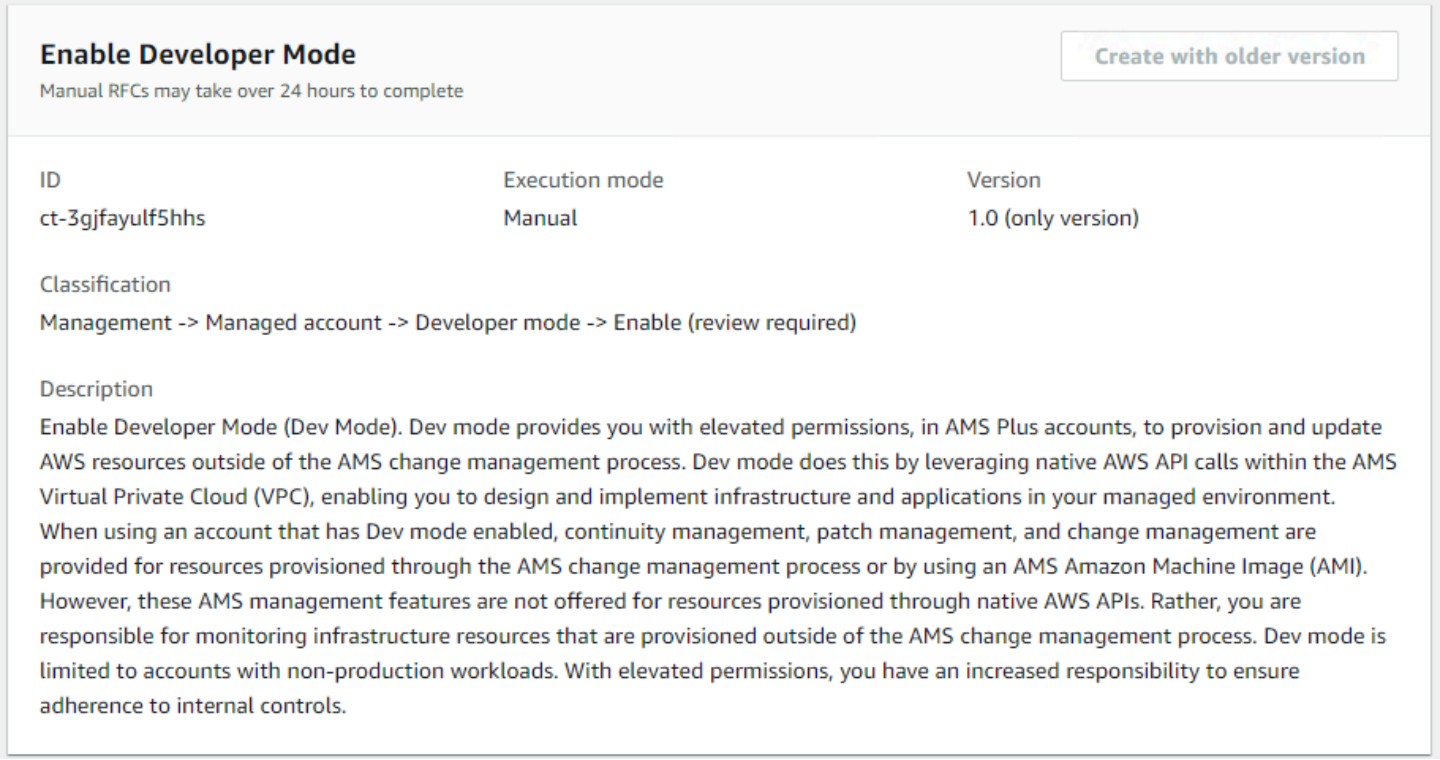
Change type ID	ct-3gjfayulf5hhs
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Enable Developer mode (review required)

Enabling Developer mode (review required) with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Enabling Developer mode (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Application account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3gjfayulf5hhs" --change-type-version "1.0" --
title "RFC Title" --execution-parameters "{\"Enable\":\"Yes\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it EnableDevModeParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3gjfayulf5hhs" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > EnableDevModeParams.json
   ```

2. Modify and save the EnableDevModeParams file. For example, you can replace the contents with something like this:

   ```
   {"Enable": "Yes"}
   ```

3. Output the RFC template JSON file to a file; this example names it EnableDevModeRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > EnableDevModeRfc.json
   ```

4. Modify and save the EnableDevModeRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-3gjfayulf5hhs",
   "Title":                "Enable-Dev-Mode-RFC"
   }
   ```

5. Create the RFC, specifying the EnableDevModeRfc file and the EnableDevModeParams file:

```
aws amscm create-rfc --cli-input-json file://EnableDevModeRfc.json  --execution-
parameters file://EnableDevModeParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

> **Note**
>
> When using "review required" CTs, AMS recommends that you use the ASAP **Scheduling** option (choose **ASAP** in the console, leave start and end time blank in the API/CLI) as these CTs require an AMS operator to examine the RFC, and possibly communicate with you before it can be approved and run. If you schedule these RFCs, be sure to allow at least 24 hours. If approval does not happen before the scheduled start time, the RFC is rejected automatically.

- Resources that you create using developer mode can be managed by AMS only if they are created using AMS change management processes.
- For more information about Developer mode, see AMS Developer Mode.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3gjfayulf5hhs.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Enable": "Yes",
  "Priority": "Medium"
}
```

Direct Change Mode | Enable

Enable Direct Change mode (DCM). DCM grants native AWS access to provision and update AWS resources. The resources and changes to them are fully supported by AMS, including monitoring, patch, backup, and incident response management.

Full classification: Management | Managed account | Direct Change mode | Enable

Change Type Details

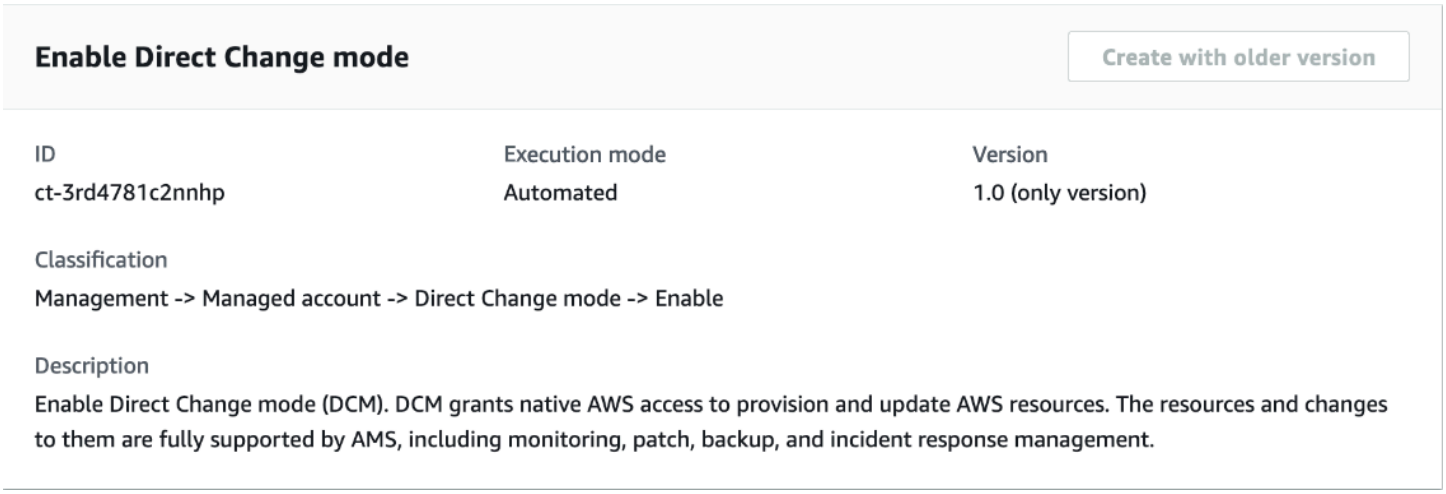
Change type ID	ct-3rd4781c2nnhp
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Enable Direct Change mode

Enabling Direct Change mode with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Enabling Direct Change mode with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
```

```
--change-type-id "ct-3rd4781c2nnhp" \
--change-type-version "1.0" \
--title "Enable Direct Change Mode" \
--execution-parameters "{\"samlIdentityProviderArns\":\"arn:aws:iam::123456789123:saml-provider/valid-name\",\"iamEntityArns\":\"arn:aws:iam::123456789123:role/valid-role-name1\",\"awsServicePrincipals\":\"ec2.amazonaws.com\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it EnableDCMParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3rd4781c2nnhp" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > EnableDCMParams.json
   ```

2. Modify and save the EnableDCMParams file. For example, you can replace the contents with something like this:

   ```
   {
     "samlIdentityProviderArns": "arn:aws:iam::123456789123:saml-provider/valid-name",
     "iamEntityArns": "arn:aws:iam::123456789123:role/valid-role-name,
     "awsServicePrincipals": "ec2.amazonaws.com"
   }
   ```

3. Output the RFC template JSON file to a file named EnableDCMRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > EnableDCMRfc.json
   ```

4. Modify and save the EnableDCMRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-3rd4781c2nnhp",
   "Title":                "Enable-DCM-RFC"
   }
   ```

5. Create the RFC, specifying the EnableDCMRfc file and the EnableDCMParams file:

   ```
   aws amscm create-rfc --cli-input-json file://EnableDCMRfc.json  --execution-
   parameters file://EnableDCMParams.json
   ```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Direct Change mode, see Direct Change Mode.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3rd4781c2nnhp.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "SamlIdentityProviderArns": [
    "SAML1",
    "SAML2"
  ],
  "AwsServicePrincipals": [
    "Service1",
    "Service2"
  ],
  "IamEntityArns": [
    "role1",
    "role2"
  ]
}
```

DNS | Migrate To Route 53

Change the DNS resolution in your Amazon VPC by enabling Route 53 as the default DNS resolver for your SALZ account. This transition from Microsoft AD to Route 53 Resolver involves redirecting DNS traffic within your VPC through strategically implemented Route 53 Resolver Endpoints and Conditional Forwarders. These forwarders act as rules to intelligently route DNS queries, ensuring

seamless resolution for various destinations. It's essential to plan the migration during a scheduled maintenance window to minimize potential disruptions caused by DNS changes.

Full classification: Management | Managed account | DNS | Migrate to Route 53

Change Type Details

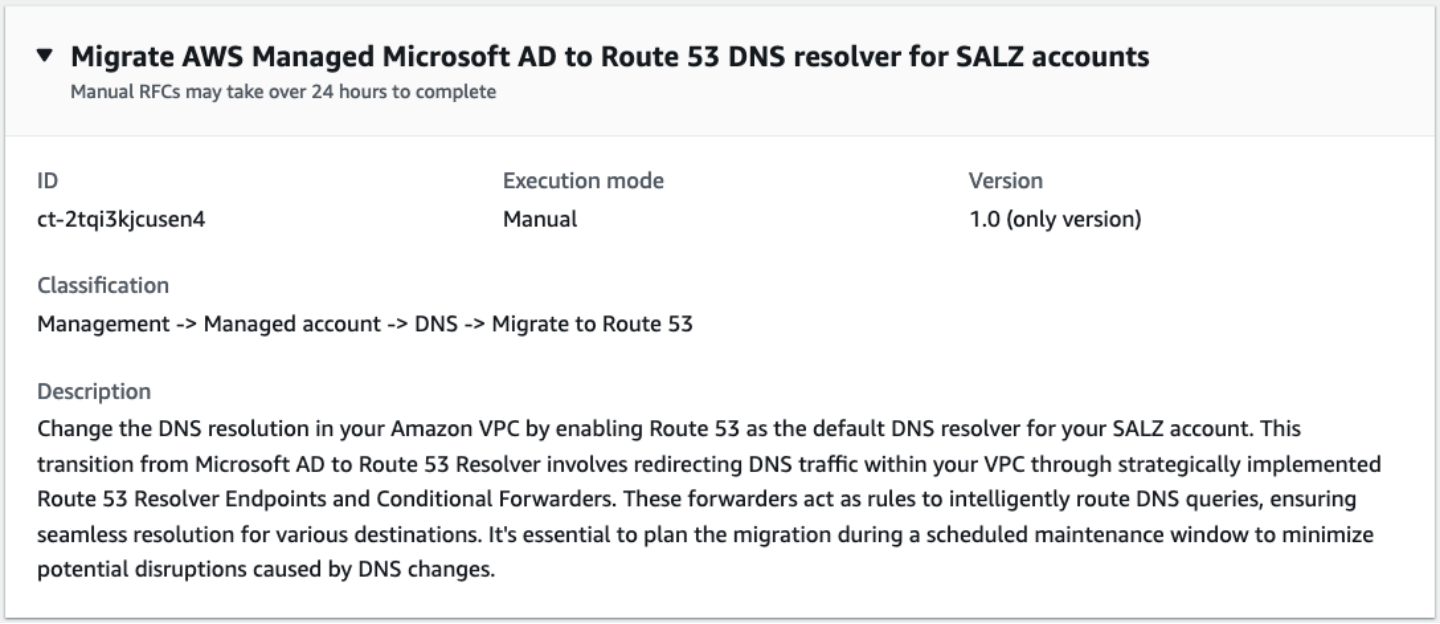
Change type ID	ct-2tqi3kjcusen4
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Migrate AWS Managed Microsoft AD to Route 53 DNS resolver for SALZ accounts

Migrate AWS Managed Microsoft AD to Route 53 with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Migrate AWS Managed Microsoft AD to Route 53 DNS resolver with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Required parameters only:

```
aws amscm create-rfc --change-type-id "ct-2tqi3kjcusen4" --change-type-version "1.0" --
title "Migrate AWS managed Microsoft AD to Route 53 DNS resolver for SALZ accounts" --
execution-parameters "{}"
```

All required and optional parameters:

```
aws amscm create-rfc --change-type-id "ct-2tqi3kjcusen4" --change-type-version "1.0" --
title "Migrate AWS managed Microsoft AD to Route 53 DNS resolver for SALZ accounts" --
execution-parameters "{\"Priority\":\"Medium\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateMigrateToRoute53RequiredParams.json.

```
aws amscm get-change-type-version --change-type-id "ct-2tqi3kjcusen4"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 CreateMigrateToRoute53RequiredParams.json
```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
  "Priority": "Medium"
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateMigrateToRoute53RequiredRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton >
 CreateMigrateToRoute53RequiredRfc.json
```

4. Modify and save the CreateMigrateToRoute53RequiredRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-2tqi3kjcusen4",
"ChangeTypeVersion":     "1.0",
"Title":                 "Migrate AWS managed Microsoft AD to Route 53 DNS resolver
 for SALZ accounts"
}
```

5. Create the RFC, specifying the CreateMigrateToRoute53RequiredRfc file and the CreateMigrateToRoute53RequiredParams file:

```
aws amscm create-rfc --cli-input-json file://CreateMigrateToRoute53RequiredRfc.json
  --execution-parameters file://CreateMigrateToRoute53RequiredParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2tqi3kjcusen4.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Stack Access Duration | Override (Review Required)

Use to override maximum stack access time for all stacks in this account for single landing zone (SALZ) and for all stacks of the member accounts of an organization for multi-landing zone (MALZ). For multi-landing zone (MALZ), please raise a request for change (RFC) from shared-services account with this change type (CT) ID. Access can be overridden from a minimum of 1 hour to a maximum of 120 hours, default stack access is granted for 12 hours.

Full classification: Management | Managed account | Stack access duration | Override (review required)

Change Type Details

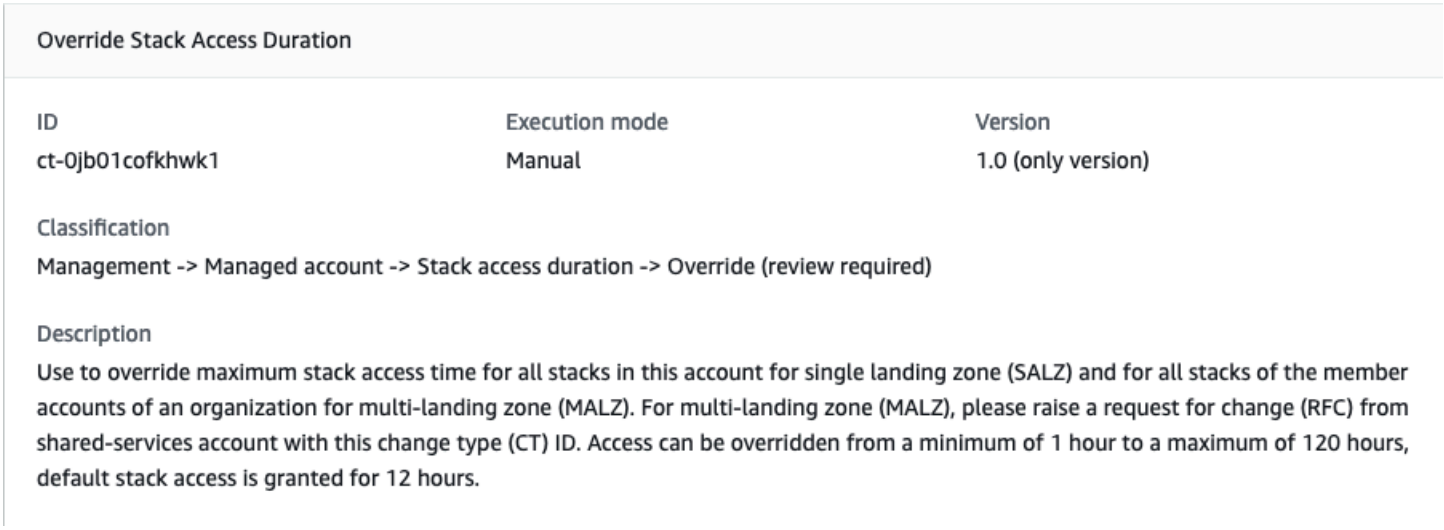
Change type ID	ct-0jb01cofkhwk1
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Override Stack Access Duration (Review required)

Override stack access duration with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Override stack access duration with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title="Override Stack Access Duration" --description="Override
 Stack Access Duration" --ct-id="ct-0jb01cofkhwk1" --ct-version="1.0" --input-
params="{\"TimeRequestedInHours\": 15,\"Priority\":\"High\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file. This example names it OverrideStackAccessDurationParameters.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0jb01cofkhwk1"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    OverrideStackAccessDurationParameters.json
   ```

2. Modify and save the OverrideStackAccessDurationParameters.json file. For example, you can replace the contents with something like this:

   ```
   {
     "TimeRequestedInHours": 15,
     "Priority": "High"
   }
   ```

3. Output the RFC template JSON file to a file named OverrideStackAccessDuration.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > OverrideStackAccessDuration.json
   ```

4. Modify and save the OverrideStackAccessDuration.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-0jb01cofkhwk1",
     "Title": "Override Stack Access Duration"
   }
   ```

5. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://OverrideStackAccessDuration.json --
execution-parameters file://OverrideStackAccessDurationParameters.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0jb01cofkhwk1.

Example: Required Parameters

```
{
    "TimeRequestedInHours": 120
}
```

Example: All Parameters

```
{
    "TimeRequestedInHours": 15,
    "Priority": "High"
}
```

Managed Firewall Subcategory

Change Type Items and Operations in the Managed Firewall Subcategory

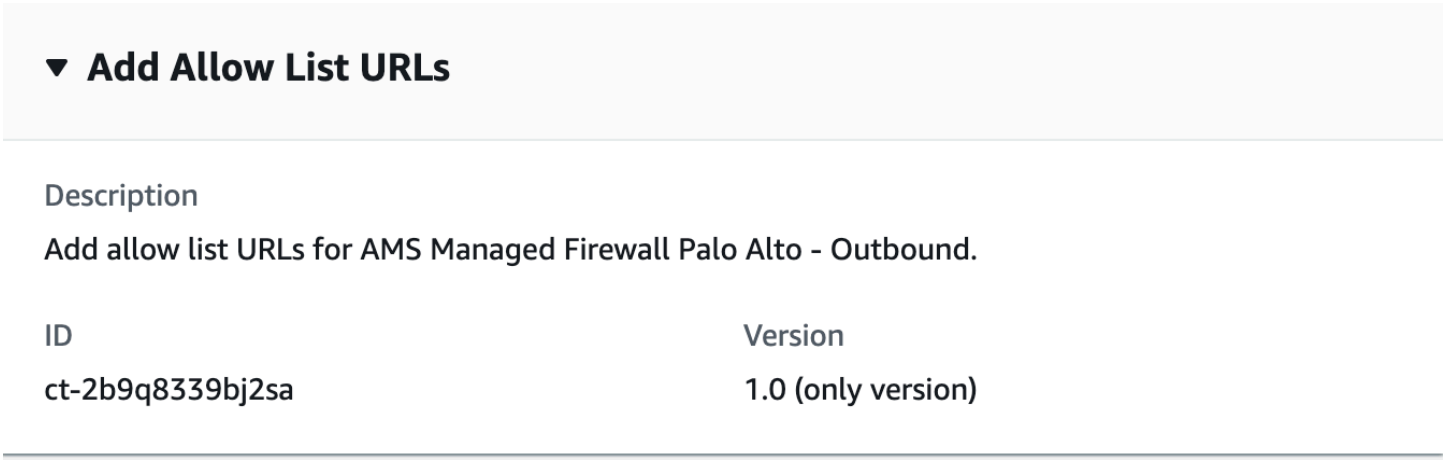
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add URLs to managed Palo Alto outbound firewall

Adding outbound URLs to your managed Palo Alto firewall with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding outbound URLs to your managed Palo Alto firewall with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2b9q8339bj2sa" --change-type-version "2.0" --
title "Add URLs to Allow List" --execution-parameters "{ \"RequestType\": \"AddURLs\",
 \"Parameters\": { \"URLs\": [ \"amazon.com/\", \"*.website.com\\" ], "AllowListName":
 "CustomAllowList" } } "
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AddPaUrlsParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2b9q8339bj2sa" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AddPaUrlsParams.json
   ```

2. Modify and save the AddPaUrlsParams file. For example, you can replace the contents with something like this:

   ```
   {
     "RequestType": "AddURLs",
     "Parameters": {
         "URLs": [
             "amazon.com/",
   ```

```
            "*.website.com/"
        ],
        "AllowListName": "CustomAllowList"
    }
}
```

3. Output the RFC template JSON file to a file named AddPaUrlsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AddPaUrlsRfc.json
```

4. Modify and save the AddPaUrlsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-2b9q8339bj2sa",
"Title":                "Add-Urls-RFC"
}
```

5. Create the RFC, specifying the AddPaUrls Rfc file and the AddPaUrlsParams file:

```
aws amscm create-rfc --cli-input-json file://AddPaUrlsRfc.json  --execution-
parameters file://AddPaUrlsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change has a new version and a new schema.

> **Note**
>
> If you are a Beta customer for AMS Palo Alto managed firewall, do not use this change type, it does not work with Beta accounts. Use the Management | Other | Other | Update (ct-0xdawir96cy7k) instead.

To learn more about Palo Alto managed firewall in AMS, seeManaged Palo Alto egress firewall.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2b9q8339bj2sa.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "RequestType": "AddURLs",
  "Parameters": {
    "URLs": ["amazon.com/","*.amazon.com/","www.*.com/","amazon.co1m/","amazon.c-
m/","ama-zon.com/","long.sub.domain.amazon.com/","long.sub.*.amazon.com/"],
    "AllowListName": "test_file"
  }
}
```

Outbound (Palo Alto) | Delete Allow List

Delete an allow list file for AMS managed Palo Alto firewall - Outbound.

Full classification: Management | Managed Firewall | Outbound (Palo Alto) | Delete allow list

Change Type Details

Change type ID	ct-2fzh1wckpl7f5
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete allow list from managed Palo Alto outbound firewall

Deleting an allow list from your managed Palo Alto firewall with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an allow list from your managed Palo Alto firewall with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2fzh1wckpl7f5" --change-type-version "1.0" --
title "Delete Allow List" --execution-parameters "{ \"RequestType\": \"DeleteAllowList
\", \"Parameters\": { "AllowListName": "CustomAllowList" } } "
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteAllowListParams.json.

```
aws amscm get-change-type-version --change-type-id "ct-2mf36chtp1ejh"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 DeleteAllowListParams.json
```

2. Modify and save the DeleteAllowListParams file. For example, you can replace the contents with something like this:

```
{
  "RequestType": "DeleteAllowList",
  "Parameters": {
      "AllowListName": "CustomAllowList"
  }
}
```

3. Output the RFC template JSON file to a file named DeleteAllowListRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteAllowListRfc.json
```

4. Modify and save the DeleteAllowListRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2fzh1wckpl7f5",
"Title":                "Delete-Allow-List-RFC"
}
```

5. Create the RFC, specifying the DeleteAllowList Rfc file and the DeleteAllowListParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteAllowListRfc.json  --execution-
parameters file://DeleteAllowListParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting a security policy from your managed Palo Alto firewall with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1taxucdyi84iy" --change-type-version
 "1.0" --title "Delete Security Policy" --execution-parameters "{ \"RequestType\":
 \"DeleteSecurityPolicy\", \"Parameters\": { "SecurityPolicyName": "custom-sec-
name" } } "
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteSecurityPolicyParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1taxucdyi84iy"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteSecurityPolicyParams.json
   ```

2. Modify and save the DeleteSecurityPolicyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "RequestType": "DeleteSecurityPolicy",
     "Parameters": {
         "SecurityPolicyName": "custom-sec-name"
     }
   }
   ```

3. Output the RFC template JSON file to a file named DeleteSecurityPolicyRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteSecurityPolicyRfc.json
   ```

4. Modify and save the DeleteSecurityPolicyRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-1taxucdyi84iy",
   "Title":                "Delete-Security-Policy-RFC"
   ```

```
}
```

5. Create the RFC, specifying the DeleteSecurityPolicy Rfc file and the DeleteSecurityPolicyParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteSecurityPolicyRfc.json  --
execution-parameters file://DeleteSecurityPolicyParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Palo Alto managed firewall in AMS, see Managed Palo Alto egress firewall.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1taxucdyi84iy.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Parameters": {
    "SecurityPolicyName": "custom-sec-pol"
  },
  "RequestType": "DeleteSecurityPolicy"
}
```

Outbound (Palo Alto) | Remove URLs

Remove URLs from an allow list file for AMS managed Palo Alto firewall - Outbound.

Full classification: Management | Managed Firewall | Outbound (Palo Alto) | Remove URLs

Change Type Details

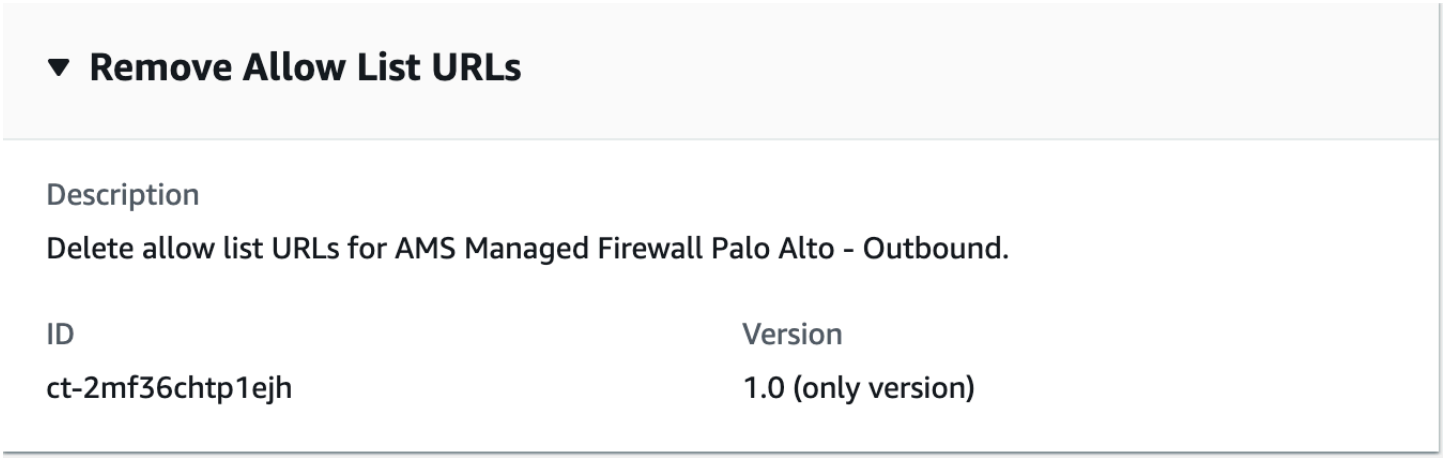
Change type ID	ct-2mf36chtp1ejh
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remove URLS from managed Palo Alto outbound firewall

Removing outbound URLs from your managed Palo Alto firewall with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Removing outbound URLs from your managed Palo Alto firewall with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2mf36chtp1ejh" --change-type-version "2.0"
 --title "Remove URLs from Allow List" --execution-parameters "{ \"RequestType\":
 \"RemoveURLs\", \"Parameters\": { \"URLs\": [ \"amazon.com/\", \"*.website.com/\" ],
 "AllowListName": "CustomAllowList" } } "
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RemovePaUrlsParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2mf36chtp1ejh" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > RemovePaUrlsParams.json
   ```

2. Modify and save the RemovePaUrlsParams file. For example, you can replace the contents with something like this:

   ```
   {
     "RequestType": "RemoveURLs",
     "Parameters": {
         "URLs": [
   ```

```
            "amazon.com/",
            "*.website.com/"
        ],
        "AllowListName": "CustomAllowList"
    }
}
```

3. Output the RFC template JSON file to a file named RemovePaUrlsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > RemovePaUrlsRfc.json
```

4. Modify and save the RemovePaUrlsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-2mf36chtp1ejh",
"Title":                "Remove-Urls-RFC"
}
```

5. Create the RFC, specifying the RemovePaUrls Rfc file and the RemovePaUrlsParams file:

```
aws amscm create-rfc --cli-input-json file://RemovePaUrlsRfc.json  --execution-
parameters file://RemovePaUrlsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change has a new version and a new schema.

To learn more about Palo Alto managed firewall in AMS, see Managed Palo Alto egress firewall.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2mf36chtp1ejh.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Parameters": {
    "URLs": ["amazon.com/","*.amazon.com/","www.*.com/","amazon.co1m/","amazon.c-
m/","ama-zon.com/","long.sub.domain.amazon.com/","long.sub.*.amazon.com/"],
    "AllowListName": "test_file"
  },
  "RequestType": "RemoveURLs"
}
```

Outbound (Palo Alto) | Update Security Policy

Update a security policy for AMS managed Palo Alto firewall - Outbound.

Full classification: Management | Managed Firewall | Outbound (Palo Alto) | Update security policy

Change Type Details

Change type ID	ct-0mss4i7neuj7f
Current version	1.0
Expected execution duration	60 minutes

Customer approval	Not required
Execution mode	Automated

Additional Information

Update security policy for managed Palo Alto outbound firewall

Updating a security policy for your managed Palo Alto firewall with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a security policy for your managed Palo Alto firewall with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC

parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0mss4i7neuj7f" --change-type-version
 "1.0" --title "Update Security Policy" --execution-parameters "{ \"RequestType\":
 \"UpdateSecurityPolicy\", \"Parameters\": { "SecurityPolicyName": "custom-sec-name",
 "SourceAddressesToAdd": ["3.0.0.0"], "DestinationAddressesToAdd": ["4.0.0.0"],
 "AllowListsToAdd": [], "ServicePortsToAdd": { "TCPPortsToAdd": [30] "UDPPortsToAdd":
 [40] }, "SourceAddressesToRemove": [], "DestinationAddressesToRemove": [],
 "AllowListsToRemove": [], "ServicePortsToRemove": { "TCPPortsToRemove": [],
 "UDPPortsToRemove": [] }, "ActionType": "Allow", "EnablePolicy": aws amscm
 create-rfc --change-type-id "ct-0mss4i7neuj7f" --change-type-version "1.0"
 --title "Update Security Policy" --execution-parameters "{ \"RequestType\":
 \"UpdateSecurityPolicy\", \"Parameters\": { "SecurityPolicyName": "custom-
sec-name", "SourceAddressesToAdd": ["3.0.0.0"], "DestinationAddressesToAdd":
```

```
["4.0.0.0"], "AllowListsToAdd": [], "ServicePortsToAdd": { "TCPPortsToAdd":
[30] "UDPPortsToAdd": [40] }, "SourceAddressesToRemove": [SOURCE_ADDRESSES],
"DestinationAddressesToRemove": [DEST_ADDRESSES], "AllowListsToRemove": [],
"ServicePortsToRemove": { "TCPPortsToRemove": [TCP_PORT], "UDPPortsToRemove":
[UDP_PORT] }, "ActionType": "Allow", "EnablePolicy": true } " } "
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateSecurityPolicyParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0mss4i7neuj7f"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateSecurityPolicyParams.json
   ```

2. Modify and save the UpdateSecurityPolicyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "RequestType": "UpdateSecurityPolicy",
     "Parameters": {
         "SecurityPolicyName": "custom-sec-name",
         "SourceAddressesToAdd": ["3.0.0.0"],
         "DestinationAddressesToAdd": ["4.0.0.0"],
         "AllowListsToAdd": [],
         "ServicePortsToAdd": {
               "TCPPortsToAdd": [30],
               "UDPPortsToAdd": [40]
         },
         "SourceAddressesToRemove": [],
         "DestinationAddressesToRemove": [],
         "AllowListsToRemove": [],
         "ServicePortsToRemove": {
               "TCPPortsToRemove": [],
               "UDPPortsToRemove": []
         },
         "ActionType": "Allow",
         "EnablePolicy": true
     }
   }
   ```

3. Output the RFC template JSON file to a file named UpdateSecurityPolicyRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateSecurityPolicyRfc.json
```

4. Modify and save the UpdateSecurityPolicyRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0mss4i7neuj7f",
"Title":                "Update-Security-Policy-RFC"
}
```

5. Create the RFC, specifying the UpdateSecurityPolicy Rfc file and the UpdateSecurityPolicyParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateSecurityPolicyRfc.json  --
execution-parameters file://UpdateSecurityPolicyParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Palo Alto managed firewall in AMS, see Managed Palo Alto egress firewall.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0mss4i7neuj7f.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "Parameters": {
      "SecurityPolicyName": "custom-sec-pol",
      "SourceAddressesToAdd": ["10.0.0.1", "10.50.0.0/16"],
```

```
      "DestinationAddressesToAdd": ["1.1.1.1", "88.0.0.0/8", "amazon.com"],
      "ServicePortsToAdd": {"TCPPortsToAdd": [1000, 1200]},
      "SourceAddressesToRemove": ["10.0.1.1", "10.80.55.0/24"],
      "DestinationAddressesToRemove": ["8.8.8.8", "7.60.33.155/32", "google.com"],
      "ServicePortsToRemove": {"TCPPortsToRemove": [9000, 3333]},
      "ActionType": "Allow",
      "EnablePolicy": false
    },
    "RequestType": "UpdateSecurityPolicy"
}
```

Managed Landing Zone Subcategory

Change Type Items and Operations in the Managed Landing Zone Subcategory

- Application Account | Confirm Offboarding
- Application Account | Delete VPC
- Management Account | Delete StackSets Stack (Review Required)
- Management Account | Enable Developer Mode
- Management Account | Move Account To OU
- Management Account | Offboard Application Account
- Management Account | Update StackSets Stack (Review Required)
- Networking Account | Associate TGW Attachment
- Networking Account | Disable TGW Propagation
- Networking Account | Disassociate TGW Attachment
- Networking Account | Enable TGW Propagation
- Networking Account | Remove TGW Static Route

Application Account | Confirm Offboarding

Confirm offboarding of the specified application account. Run this from the application account that you want offboarded. Once confirmed, run the Execute offboarding CT (ct-0vdiy51oyrhhm) from the associated management account. Note that this offboarding is intended for account closure and cannot be undone

Full classification: Management | Managed landing zone | Application account | Confirm offboarding

Change Type Details

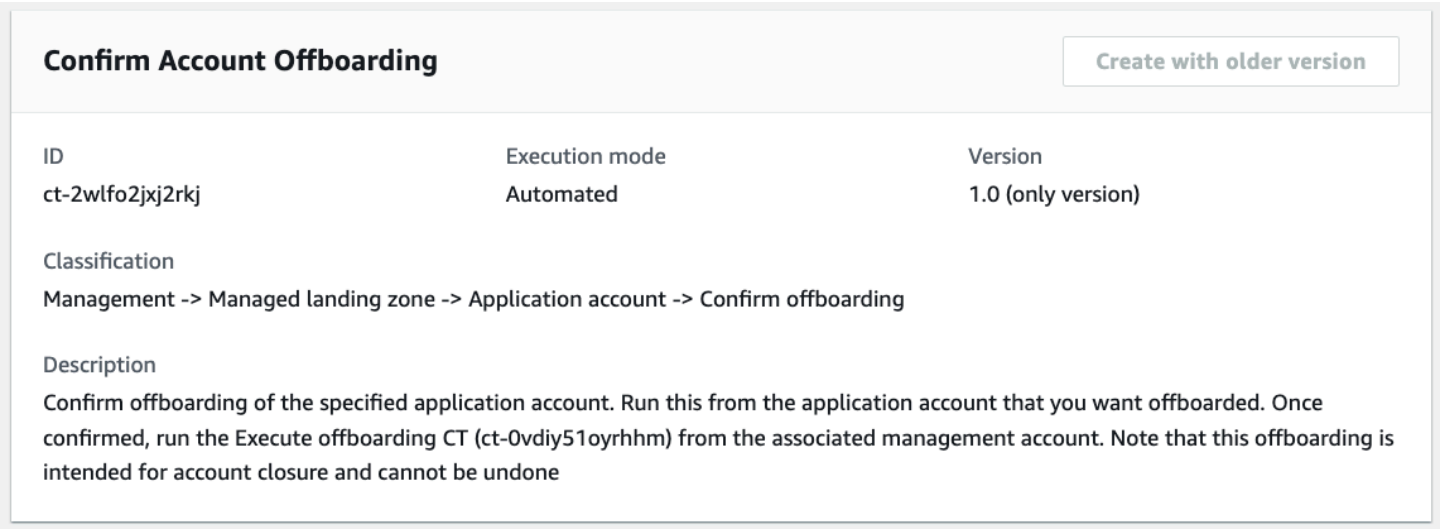
Change type ID	ct-2wlfo2jxj2rkj
Current version	1.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Confirm offboarding

Application account: Confirming offboarding with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Application account: Confirming offboarding with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Note

Run this change type from your Application account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2wlfo2jxj2rkj" --change-type-version "1.0" --
title "Confirm Offboarding" --execution-parameters "{\"AccountID\": \"000000000000\",
\"AccountEmail\": \"email@amazon.com\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ConfirmAppAcctOffBParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2wlfo2jxj2rkj"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ConfirmAppAcctOffBParams.json
   ```

2. Modify and save the ConfirmAppAcctOffBParams file. For example, you can replace the contents with something like this:

```
{
  "AccountID": "000000000000",
  "AccountEmail": "email@amazon.com",
}
```

3. Output the RFC template JSON file to a file; this example names it ConfirmAppAcctOffBRfc.json:

```
    aws amscm create-rfc --generate-cli-skeleton > ConfirmAppAcctOffBRfc.json
```

4. Modify and save the ConfirmAppAcctOffBRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-2wlfo2jxj2rkj",
  "Title": "Confirm Offboarding"
}
```

5. Create the RFC, specifying the ConfirmAppAcctOffBRfc file and the ConfirmAppAcctOffBParams file:

```
    aws amscm create-rfc --cli-input-json file://ConfirmAppAcctOffBRfc.json  --
execution-parameters file://ConfirmAppAcctOffBParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For application accounts (other than Customer Managed), run this from the Application account that you want offboarded. Once confirmed, run the Offboard application account CT (ct-0vdiy51oyrhhm) from the associated management account. Offboarding is intended for account closure and cannot be undone.
- Do not use this CT for Customer Managed application accounts. Go directly to Offboard application account CT (ct-0vdiy51oyrhhm).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2wlfo2jxj2rkj.

Example: Required Parameters

```
{
  "RequestType": "OffboardingConfirmation",
  "Parameters": {
    "AccountId": "000000000000",
    "AccountEmail": "example@email.com"
  }
}
```

Example: All Parameters

```
{
  "RequestType": "OffboardingConfirmation",
  "Parameters": {
    "AccountId": "000000000000",
    "AccountEmail": "example@email.com"
  }
}
```

Application Account | Delete VPC

Delete the virtual private cloud (VPC) in a managed landing zone application account.

Full classification: Management | Managed landing zone | Application account | Delete VPC

Change Type Details

Change type ID	ct-2paw0y79kvr3l
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required

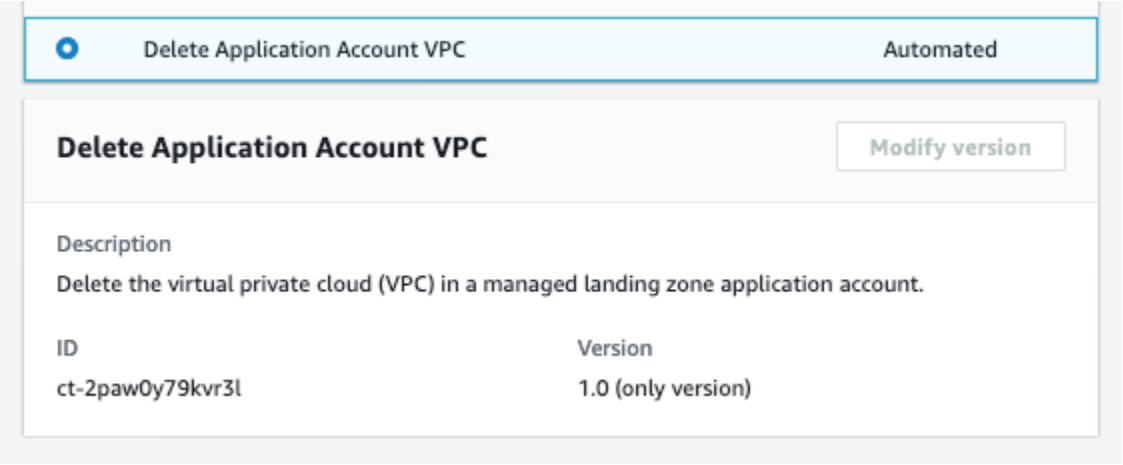
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete VPC

Application account: deleting a VPC with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Application account: deleting a VPC with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Note

Run this change type from your Application account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
       aws amscm create-rfc --change-type-id "ct-2paw0y79kvr3l" --change-type-version
"1.0" --title "Delete VPC" --execution-parameters "{\"VPCId\":\"VPC_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteAppAcctVpcParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2paw0y79kvr3l"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteAppAcctVpcParams.json
   ```

2. Modify and save the DeleteAppAcctVpcParams file. For example, you can replace the contents with something like this:

   ```
       {
   "VPCId": "VPC_ID"
       }
   ```

3. Output the RFC template JSON file to a file; this example names it DeleteAppAcctVpcRfc.json:

```
    aws amscm create-rfc --generate-cli-skeleton > DeleteAppAcctVpcRfc.json
```

4. Modify and save the DeleteAppAcctVpcRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion" : "1.0",
"ChangeTypeId" : "ct-2paw0y79kvr3l",
"Title" : "App-Acct-Vpc-RFC"
}
```

5. Create the RFC, specifying the DeleteAppAcctVpcRfc file and the DeleteAppAcctVpcParams file:

```
    aws amscm create-rfc --cli-input-json file://DeleteAppAcctVpcRfc.json  --
execution-parameters file://DeleteAppAcctVpcParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about VPCs, see Working with VPCs and subnets.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2paw0y79kvr3l.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "VPCId": "vpc-0078e69aa52274dea"
}
```

Management Account | Delete StackSets Stack (Review Required)

Delete AWS CloudFormation (CFN) StackSets-created stacks and instances.

Full classification: Management | Managed landing zone | Management account | Delete StackSets stack (review required)

Change Type Details

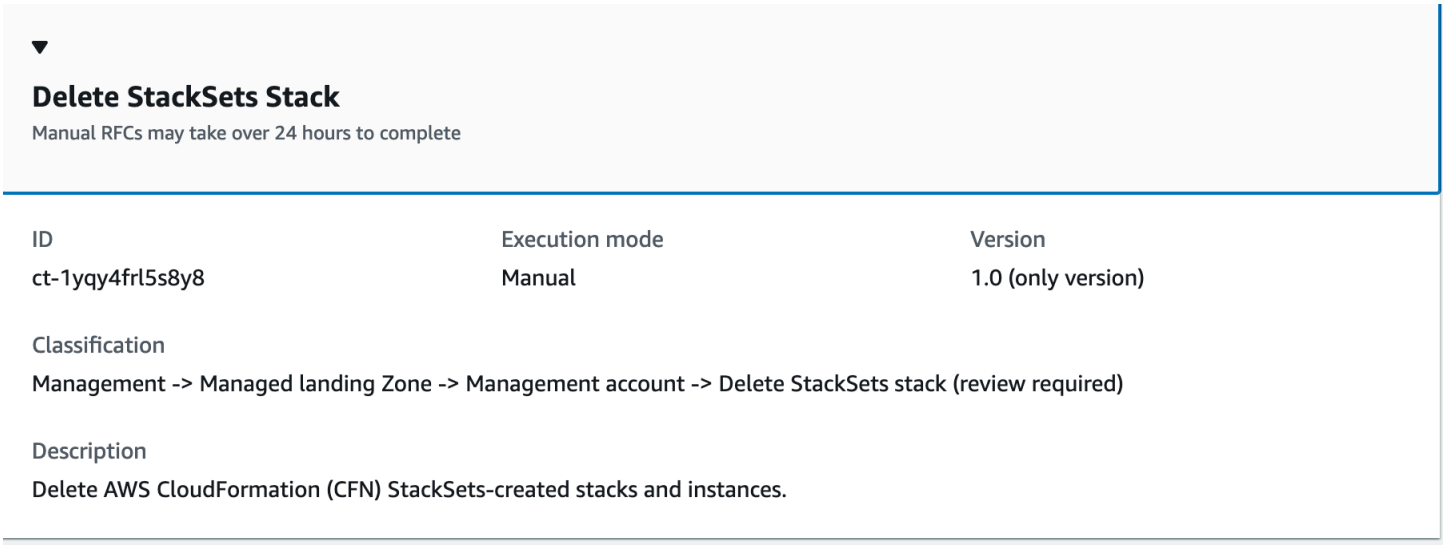
Change type ID	ct-1yqy4frl5s8y8
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Delete a Stacksets stack

Deleting a Stacksets stack with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting a Stacksets stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id ID` command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id ID` command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1yqy4frl5s8y8" --change-type-version "1.0" --
title "Delete StackSets Stack" --execution-parameters "{\"Name\": \"Stackset name\",
 \"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteStacksetsStackParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-1yqy4frl5s8y8"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 DeleteStacksetsStackParams.json
```

2. Modify and save the DeleteStacksetsStackParams file. For example, you can replace the contents with something like this:

```
{
   "Name": "Stackset name",
   "Region": "us-east-1",
   "Priority": "High"
 }
```

3. Output the RFC template JSON file to a file; this example names it DeleteStacksetsStackRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteStacksetsStackRfc.json
```

4. Modify and save the DeleteStacksetsStackRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1yqy4frl5s8y8",
  "Title": "Delete StackSets Stack"
}
```

5. Create the RFC, specifying the DeleteStacksetsStack Rfc file and the DeleteStacksetsStackParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteStacksetsStackRfc.json  --
execution-parameters file://DeleteStacksetsStackParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For AWS CloudFormation details, see Delete a stack set

- For general AWS CloudFormation information on stack sets, see StackSets concepts
- To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1yqy4frl5s8y8.

Example: Required Parameters

```
{
  "Name": "test-stackset"
}
```

Example: All Parameters

```
{
  "Name": "test-stackset",
  "Region": "us-east-1",
  "Priority": "High"
}
```

Management Account | Enable Developer Mode

Enable Developer Mode for an existing application account. Note that, in Developer mode, you are responsible for monitoring infrastructure resources that are provisioned outside of the AMS change management process.

Full classification: Management | Managed landing zone | Management account | Enable developer mode

Change Type Details

Change type ID	ct-1opjmhuddw194
Current version	1.0
Expected execution duration	3600 minutes

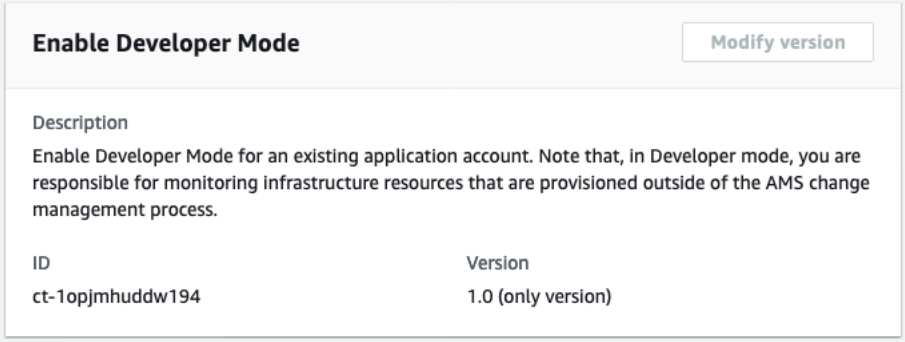
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Enable Developer mode

Management account: Enabling Management account Developer mode with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Enabling Management account Developer mode with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Note

Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-1opjmhuddw194" \
--change-type-version "1.0" --title "Enable developer mode" \
--execution-parameters "{\"ApplicationAccountId\": \"ACCOUNT_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it EnableDevModeParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1opjmhuddw194" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > EnableDevModeParams.json
   ```

2. Modify and save the EnableDevModeParams file. For example, you can replace the contents with something like this:

   ```
   {
   "ApplicationAccountId":"ACCOUNT_ID"
   }
   ```

3. Output the RFC template JSON file to a file; this example names it EnableDevModeRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > EnableDevModeRfc.json
   ```

4. Modify and save the EnableDevModeRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-1opjmhuddw194",
  "ChangeTypeVersion": "1.0",
  "Title": "Enable developer mode"
}
```

5. Create the RFC, specifying the EnableDevMode Rfc file and the EnableDevModeParams file:

```
aws amscm create-rfc --cli-input-json file://EnableDevModeRfc.json  --execution-
parameters file://EnableDevModeParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about developer mode, see Developer mode.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1opjmhuddw194.

Example: Required Parameters

```
{
  "ApplicationAccountId": "123456789012"
}
```

Example: All Parameters

```
Example not available.
```

Management Account | Move Account To OU

Move an account under an AWS organizational unit (OU) to a different OU.

Full classification: Management | Managed landing zone | Management account | Move account to OU

Change Type Details

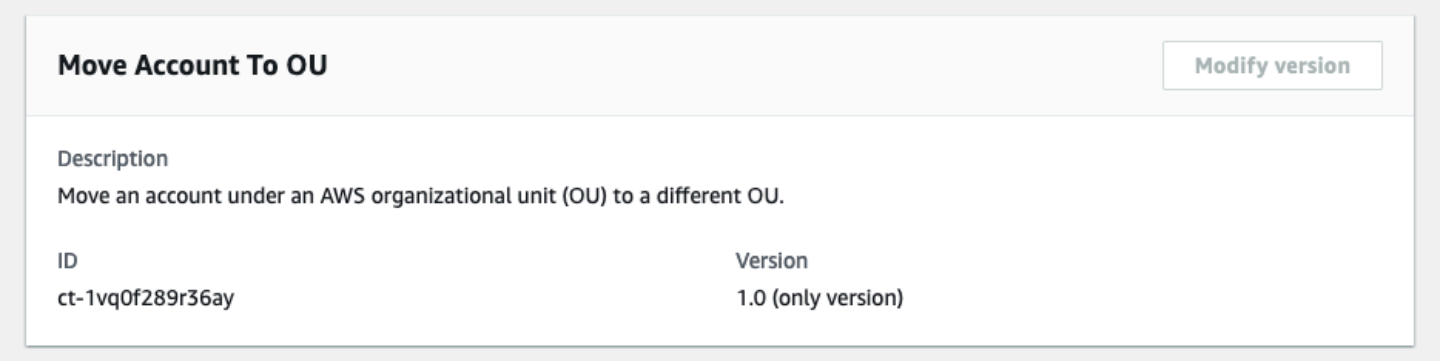
Change type ID	ct-1vq0f289r36ay
Current version	1.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Move account to OU

Moving an account to a different OU with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Moving an account to a different OU with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Note

Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-1vq0f289r36ay" \
--change-type-version "1.0" --title "Move Account To OU" \
--execution-parameters "{ \"AccountId\": \"ACCOUNT_ID\", \"TargetOUPath\":
 \"applications:managed:OU1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it MvAcctToOuParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1vq0f289r36ay" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > MvAcctToOuParams.json
   ```

2. Modify and save the MvAcctToOuParams file. For example, you can replace the contents with something like this:

```
{
    "AccountId": "ACCOUNT_ID",
    "TargetOUPath": "applications:managed:OU1",
}
```

3. Output the RFC template JSON file to a file; this example names it MvAcctToOuRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > MvAcctToOuRfc.json
```

4. Modify and save the MvAcctToOuRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1vq0f289r36ay",
"Title":                "Move-Acct-To-OU-RFC"
}
```

5. Create the RFC, specifying the MvAcctToOuRfc file and the MvAcctToOuParams file:

```
aws amscm create-rfc --cli-input-json file://MvAcctToOuRfc.json  --execution-
parameters file://MvAcctToOuParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> When moving accounts between OUs having custom SCPs, functionality may break due to SCPs being applied or a security posture compromised due to SCPs being removed.
> When moving accounts from an OU having a custom stackset (with CloudFormation auto-deployment feature enabled (see Manage automatic deployments for a stack set with service-managed permissions, to an OU which does not have this stackset, AWS CloudFormation would remove the stackset instance from the account. This may cause

functionality loss. Vice versa, you should be aware of the addition of unwanted stackset instances when moving to a new OU.
When an account is moved, it may no longer have access to resources specified by OU based policy conditions (aws:PrincipalOrgID) in IAM/S3, (see AWS global condition context keys.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1vq0f289r36ay.

Example: Required Parameters

```
{
    "AccountId": "123456789012",
    "TargetOUPath": "applications:development"
}
```

Example: All Parameters

```
Example not available.
```

Management Account | Offboard Application Account

Offboard the specified application account. Run this from the management account for the application account that you want offboarded. You must first confirm the offboarding request by submitting the Confirm offboarding CT (ct-2wlfo2jxj2rkj) from the application account. If you are offboarding a customer-managed account, then ct-2wlfo2jxj2rkj is not needed. Only use these CTs when you plan to terminate all resources within the specified account and close the account. After you successfully submit both CTs, AMS can't undo the offboarding, repurpose the account, or help you to remediate issues in the account.

Full classification: Management | Managed landing zone | Management account | Offboard application account

Change Type Details

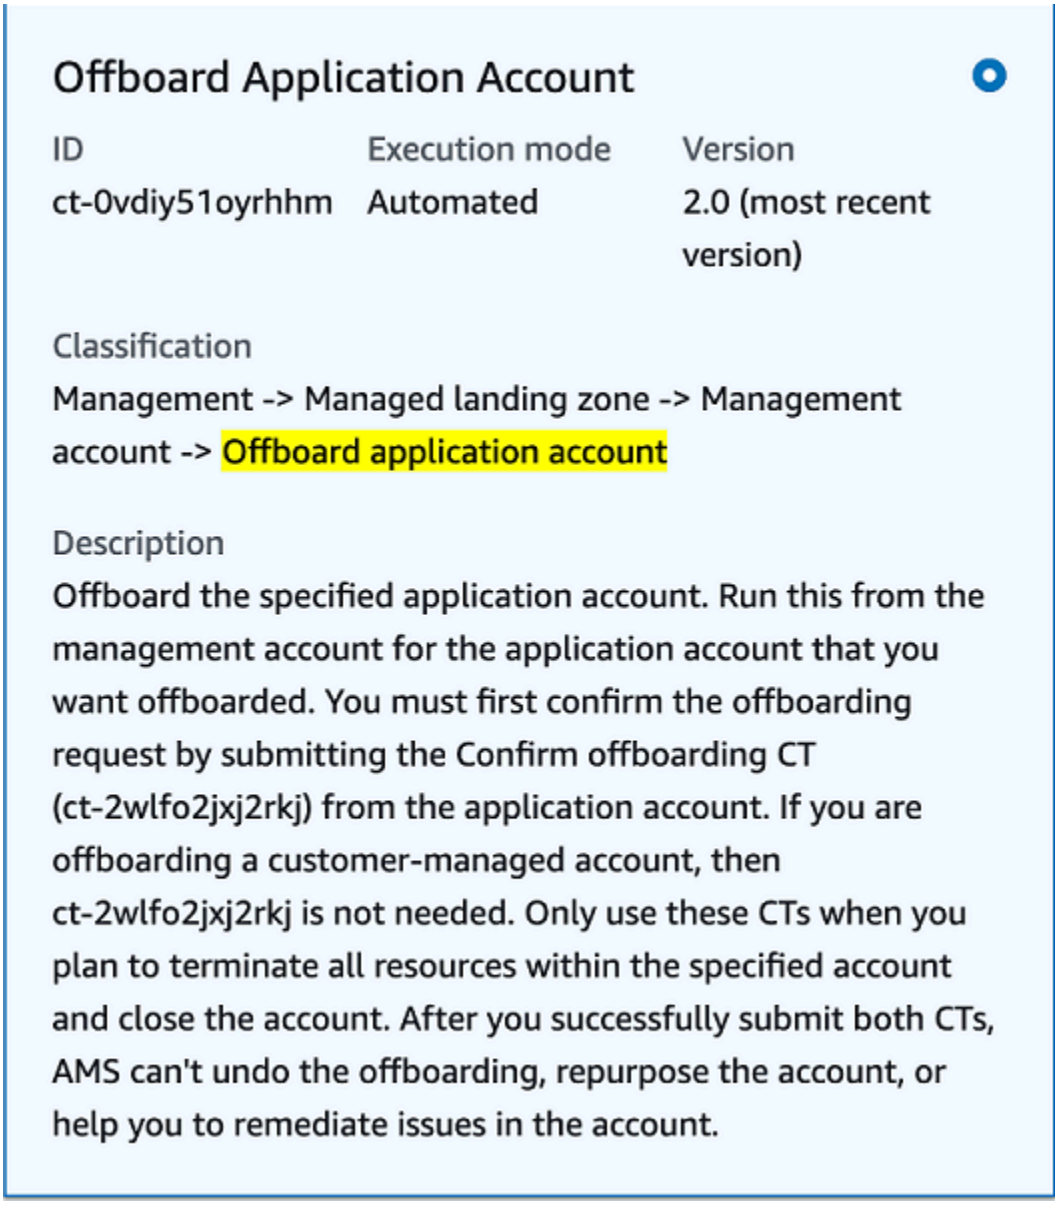
Change type ID	ct-0vdiy51oyrhhm
Current version	2.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Management account: Offboard Application account

Management account: Offboarding an Application account with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Offboarding an Application account with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from the Management account associated with the application account being offboarded.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0vdiy51oyrhhm" --change-type-version
 "2.0" --title "Run Offboarding" --execution-parameters "{\"AccountID\":
 \"000000000000\",\"AccountEmail\": \"email@amazon.com\",\"Confirmation\": \"confirm\",
\"DeleteTransitGatewayAttachment\":true}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RunAppAcctOffBParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0vdiy51oyrhhm" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > RunAppAcctOffBParams.json
   ```

2. Modify and save the RunAppAcctOffBParams file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "AccountID": "000000000000",
  "AccountEmail": "email@amazon.com",
  "Confirmation": "confirm",
  "DeleteTransitGatewayAttachment" : true
}
```

3. Output the RFC template JSON file to a file; this example names it RunAppAcctOffBRfc.json:

```
    aws amscm create-rfc --generate-cli-skeleton > RunAppAcctOffBRfc.json
```

4. Modify and save the RunAppAcctOffBRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "2.0",
  "ChangeTypeId": "ct-0vdiy51oyrhhm",
  "Title": "Execute Offboarding"
}
```

5. Create the RFC, specifying the RunAppAcctOffBRfc file and the RunAppAcctOffBParams file:

```
    aws amscm create-rfc --cli-input-json file://RunAppAcctOffBRfc.json  --
execution-parameters file://RunAppAcctOffBParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- First step to offboarding the AMS multi-account landing zone Application account is to submit the Confirm application account offboarding CT (ct-2wlfo2jxj2rkj) from the application account.
- There is no prerequisite or confirmation CT for Customer Managed application accounts.
- Note that offboarding is irreversible.
- If you intend to self-operate the account after offboarding from AMS, then make sure to specify `DeleteTransitGatewayAttachment` parameter as `false` to retain connectivity.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0vdiy51oyrhhm.

Example: Required Parameters

```
{
  "RequestType": "OffboardingExecution",
  "Parameters": {
    "AccountId": "000000000000",
    "AccountEmail": "example@email.com",
    "Confirmation": "confirm",
    "DeleteTransitGatewayAttachment": true
  }
}
```

Example: All Parameters

```
{
  "RequestType": "OffboardingExecution",
  "Parameters": {
    "AccountId": "000000000000",
    "AccountEmail": "example@email.com",
    "Confirmation": "confirm",
    "DeleteTransitGatewayAttachment": true
  }
}
```

Management Account | Update StackSets Stack (Review Required)

Update an existing AWS CloudFormation (CFN) StackSets stack to deploy, or to update, the instances of the stack.

Full classification: Management | Managed landing zone | Management account | Update StackSets stack (review required)

Change Type Details

Change type ID	ct-1v9g9n30woc8h

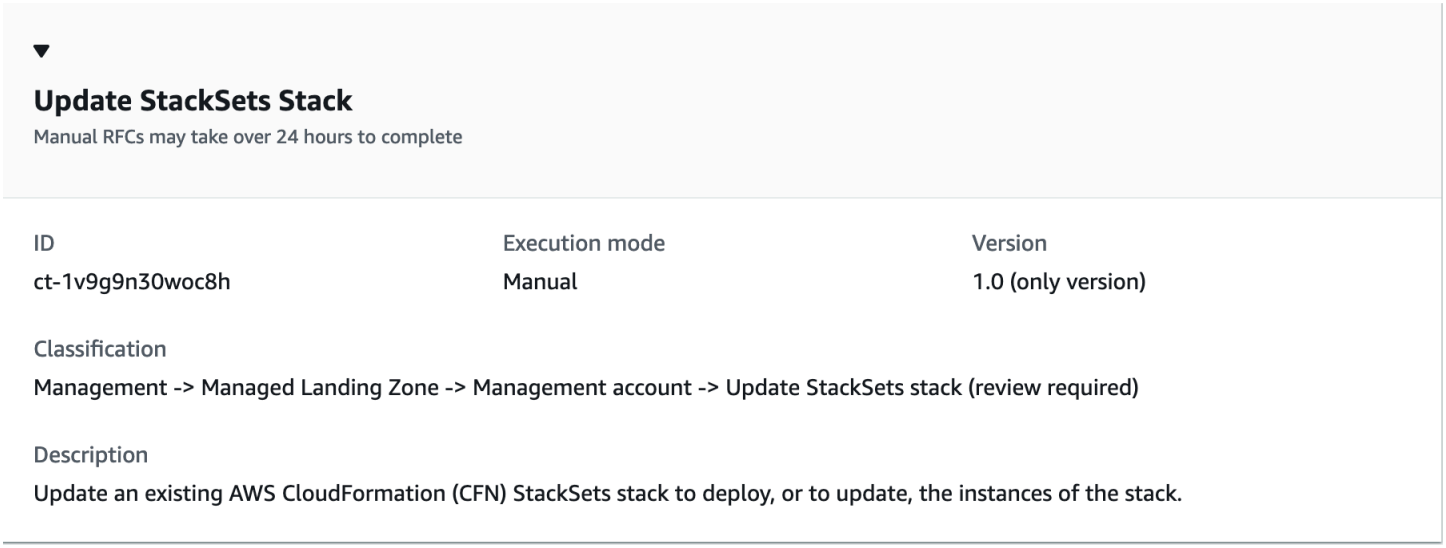
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update a Stacksets stack

Updating a Stacksets stack with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a Stacksets stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1v9g9n30woc8h" --change-type-version "1.0"
 --title "Update StackSets Stack" --execution-parameters "{\"Name\": \"Stackset name\",
 \"Region\": \"us-east-1\", \"OuId\": \"ou-cccc-00000000\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateStacksetsStackParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1v9g9n30woc8h"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateStacksetsStackParams.json
   ```

2. Modify and save the UpdateStacksetsStackParams file. For example, you can replace the contents with something like this:

   ```
   {
      "CloudFormationTemplate": "CFN Template",
   ```

```
   "CloudFormationTemplateS3Endpoint": "S3 link to the template",
   "Description": "Update Test-Stackset",
   "Name": "test-stackset",
   "OuId": ["ou-cccc-00000000"],
   "Region": "us-east-1",
   "Parameters": [
     { "Name": "test-value",
       "Value": "test-value" }
   ],
   "Tags": [
     {
       "Key": "key1",
       "Value": "value1"
     },
     {
       "Key": "key2",
       "Value": "value2"
     }
    ],
    "Priority": "High"
}
```

3. Output the RFC template JSON file to a file; this example names it UpdateStacksetsStackRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateStacksetsStackRfc.json
```

4. Modify and save the UpdateStacksetsStackRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1v9g9n30woc8h",
  "Title": "Update StackSets Stack"
}
```

5. Create the RFC, specifying the UpdateStacksetsStack Rfc file and the UpdateStacksetsStackParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateStacksetsStackRfc.json  --
execution-parameters file://UpdateStacksetsStackParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For AWS CloudFormation details, see Create a stack set
- For general AWS CloudFormation information on stack sets, see StackSets concepts
- To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1v9g9n30woc8h.

Example: Required Parameters

```
{
  "Name": "test-stackset",
  "OuId": ["ou-cccc-00000000"],
  "Region": "us-east-1",
  "Priority": "High"
}
```

Example: All Parameters

```
{
  "CloudFormationTemplate": "template",
  "CloudFormationTemplateS3Endpoint": "https://s3.amazonaws.com/cf-
templates-33kj7hiuwdk9-us-east-1/2017261mYA-stm-dynamic-sqs-no-params-
sept-2017.template",
  "Description": "AMSTestCT - Update Test-Stackset",
  "Name": "test-stackset",
  "OuId": ["ou-cccc-00000000"],
  "Region": "us-east-1",
  "Parameters": [
    { "Name": "test-value",
      "Value": "test-value" }
  ],
```

```
  "Tags": [
    {
      "Key": "key1",
      "Value": "value1"
    },
    {
      "Key": "key2",
      "Value": "value2"
    }
  ],
  "Priority": "High"
}
```

Networking Account | Associate TGW Attachment

Associate transit gateway (TGW) attachment to the transit gateway (TGW) route table. Use this change type for multi-account landing zone (MALZ) in Networking account only.

Full classification: Management | Managed landing zone | Networking account | Associate TGW attachment

Change Type Details

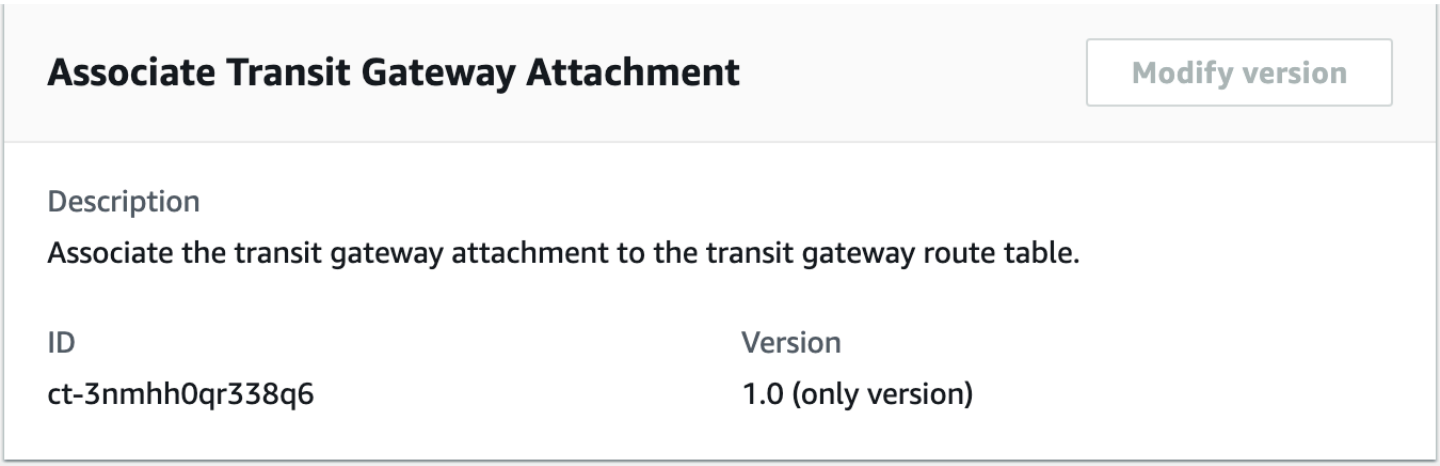
Change type ID	ct-3nmhh0qr338q6
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Associate TGW attachment

Networking account: Associate a TGW attachment with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Networking account: Associate a TGW attachment with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3nmhh0qr338q6" --change-type-version "1.0"
 --title "Associate Transit Gateway Attachment" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-AssociateTGWAttachment\",\"Region\": \"us-east-1\",
\"Parameters\": {\"TransitGatewayAttachmentId\": [\"tgw-attach-0878cf82a40721d19\"],
\"TransitGatewayRouteTableId\": [\"tgw-rtb-06ddc751c0c0c881c\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AssociateTgwAttachmentParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3nmhh0qr338q6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    AssociateTgwAttachmentParams.json
   ```

2. Modify and save the AssociateTgwAttachmentParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-AssociateTGWAttachment",
     "Region": "us-east-1",
     "Parameters": {
       "TransitGatewayAttachmentId": [ "tgw-attach-0878cf82a40721d19" ],
       "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it AssociateTgwAttachmentRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > AssociateTgwAttachmentRfc.json
   ```

4. Modify and save the AssociateTgwAttachmentRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-3nmhh0qr338q6",
     "Title": "Associate Transit Gateway Attachment"
   }
   ```

5. Create the RFC, specifying the AssociateTgwAttachmentRfc file and the AssociateTgwAttachmentParams file:

```
aws amscm create-rfc --cli-input-json file://AssociateTgwAttachmentRfc.json  --
execution-parameters file://AssociateTgwAttachmentParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This Change Type is only valid in Multi-account Landing Zone (MALZ) Networking accounts.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3nmhh0qr338q6.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-AssociateTGWAttachment",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayAttachmentId": [ "tgw-attach-0878cf82a40721d19" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-AssociateTGWAttachment",
```

```
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayAttachmentId": [ "tgw-attach-0878cf82a40721d19" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
  }
}
```

Networking Account | Disable TGW Propagation

Disable the Transit Gateway (TGW) attachment from propagating routes to the TGW route table. For multi-account landing zone (MALZ), use this change type in the Network account only.

Full classification: Management | Managed landing zone | Networking account | Disable TGW propagation

Change Type Details

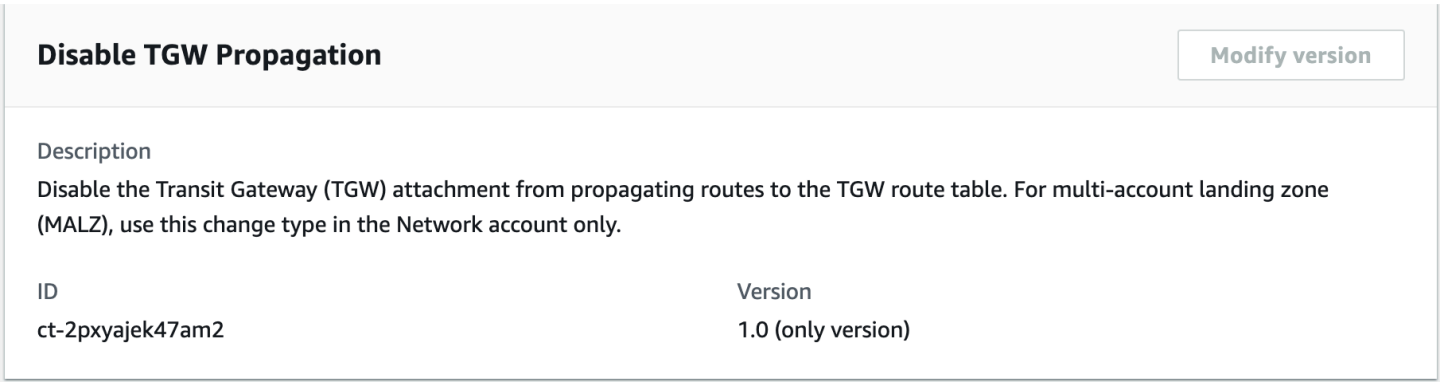
Change type ID	ct-2pxyajek47am2
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Disable TGW propagation

Networking account: Disable TGW propagation with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Networking account: Disable TGW propagation with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2pxyajek47am2" --change-type-version "1.0"
 --title "Disable Transit Gateway Propagation" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-DisableTGWRouteTablePropagation\",\"Region\": \"us-east-1\",
\"Parameters\": {\"TransitGatewayAttachmentId\": [\"tgw-attach-01234567890abcdef\"],
\"TransitGatewayRouteTableId\": [\"tgw-rtb-01234567890abcdef\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it TgwPropagationDisableParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2pxyajek47am2"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    TgwPropagationDisableParams.json
   ```

2. Modify and save the TgwPropagationDisableParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-DisableTGWRouteTablePropagation",
     "Region": "us-east-1",
     "Parameters": {
       "TransitGatewayAttachmentId": [ "tgw-attach-01234567890abcdef" ],
       "TransitGatewayRouteTableId": [ "tgw-rtb-01234567890abcdef" ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it TgwPropagationDisableRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > TgwPropagationDisableRfc.json
   ```

4. Modify and save the TgwPropagationDisableRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-2pxyajek47am2",
     "Title": "Disable Transit Gateway Propagation"
   }
   ```

5. Create the RFC, specifying the TgwPropagationDisableRfc file and the TgwPropagationDisableParams file:

```
aws amscm create-rfc --cli-input-json file://TgwPropagationDisableRfc.json  --
execution-parameters file://TgwPropagationDisableParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This Change Type is only valid in Multi-account Landing Zone (MALZ) Networking accounts.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2pxyajek47am2.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-DisableTGWRouteTablePropagation",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayAttachmentId": [ "tgw-attach-01234567890abcdef" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-01234567890abcdef" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-DisableTGWRouteTablePropagation",
```

```
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayAttachmentId": [ "tgw-attach-01234567890abcdef" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-01234567890abcdef" ]
  }
}
```

Networking Account | Disassociate TGW Attachment

Disassociate transit gateway (TGW) attachment from the transit gateway (TGW) route table. Use this change type for multi-account landing zone (MALZ) in Networking account only.

Full classification: Management | Managed landing zone | Networking account | Disassociate TGW attachment

Change Type Details

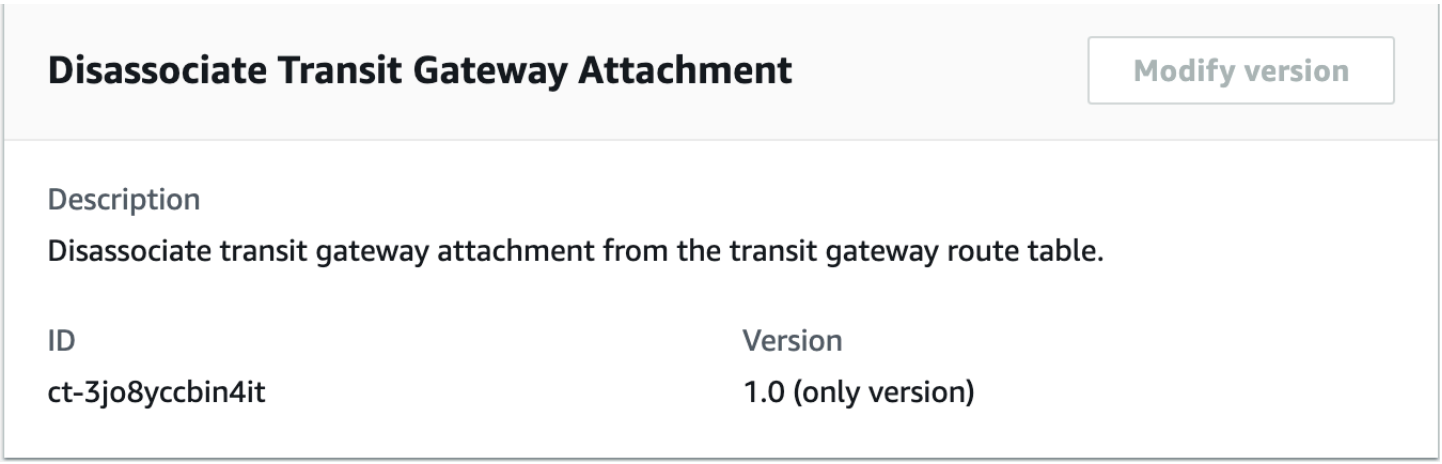
Change type ID	ct-3jo8yccbin4it
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Disassociate TGW attachment

Networking account: Disassociate a TGW attachment with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Networking account: Disassociate a TGW attachment with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3jo8yccbin4it" --change-type-version "1.0"
 --title "Disassociate a TGW attachment" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-CreateRouteInTGWRouteTable\",\"Region\": \"us-east-1\",
\"Parameters\": {\"TransitGatewayAttachmentId\": [\"tgw-attach-0878cf82a40721d19\"],
\"TransitGatewayRouteTableId\": [\"tgw-rtb-06ddc751c0c0c881c\"], \"Blackhole\":
 [\"false\"], \"DestinationCidrBlock\": [\"10.0.0.0/24\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DisassociateTgwAttachmentParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3jo8yccbin4it"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DisassociateTgwAttachmentParams.json
   ```

2. Modify and save the DisassociateTgwAttachmentParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-DisassociateTGWAttachment",
     "Region": "us-east-1",
     "Parameters": {
       "TransitGatewayAttachmentId": [ "tgw-attach-0878cf82a40721d19" ],
       "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it DisassociateTgwAttachmentRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DisassociateTgwAttachmentRfc.json
   ```

4. Modify and save the DisassociateTgwAttachmentRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-3jo8yccbin4it",
     "Title": "Disassociate a TGW attachment"
   }}
   ```

5. Create the RFC, specifying the DisassociateTgwAttachmentRfc file and the DisassociateTgwAttachmentParams file:

```
aws amscm create-rfc --cli-input-json file://DisassociateTgwAttachmentRfc.json  --
execution-parameters file://DisassociateTgwAttachmentParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This Change Type is only valid in Multi-account Landing Zone (MALZ) Networking accounts.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3jo8yccbin4it.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-DisassociateTGWAttachment",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayAttachmentId": [ "tgw-attach-0878cf82a40721d19" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-DisassociateTGWAttachment",
```

```
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayAttachmentId": [ "tgw-attach-0878cf82a40721d19" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
  }
}
```

Networking Account | Enable TGW Propagation

Enable the Transit Gateway (TGW) attachment to propagate routes to the TGW route table. For multi-account landing zone (MALZ), use this change type in the Network account only.

Full classification: Management | Managed landing zone | Networking account | Enable TGW propagation

Change Type Details

Change type ID	ct-1f9hi4bephqa9
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Enable TGW propagation

Networking account: enable TGW propagation with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Networking account: Enable TGW propagation with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1f9hi4bephqa9" --change-type-version "1.0"
 --title "Enable Transit Gateway Propagation" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-EnableTGWRouteTablePropagation\",\"Region\": \"us-east-1\",
\"Parameters\": {\"TransitGatewayAttachmentId\": [\"tgw-attach-01234567890abcdef\"],
\"TransitGatewayRouteTableId\": [\"tgw-rtb-01234567890abcdef\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it TgwPropagationEnableParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1f9hi4bephqa9"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    TgwPropagationEnableParams.json
   ```

2. Modify and save the TgwPropagationEnableParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-EnableTGWRouteTablePropagation",
     "Region": "us-east-1",
     "Parameters": {
       "TransitGatewayAttachmentId": [ "tgw-attach-01234567890abcdef" ],
       "TransitGatewayRouteTableId": [ "tgw-rtb-01234567890abcdef" ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it TgwPropagationEnableRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > TgwPropagationEnableRfc.json
   ```

4. Modify and save the TgwPropagationEnableRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-1f9hi4bephqa9",
     "Title": "Enable Transit Gateway Propagation"
   }
   ```

5. Create the RFC, specifying the TgwPropagationEnableRfc file and the TgwPropagationEnableParams file:

```
aws amscm create-rfc --cli-input-json file://TgwPropagationEnableRfc.json  --
execution-parameters file://TgwPropagationEnableParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This Change Type is only valid in Multi-account Landing Zone (MALZ) Networking accounts.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1f9hi4bephqa9.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-EnableTGWRouteTablePropagation",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayAttachmentId": [ "tgw-attach-01234567890abcdef" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-01234567890abcdef" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-EnableTGWRouteTablePropagation",
  "Region": "us-east-1",
```

```
  "Parameters": {
    "TransitGatewayAttachmentId": [ "tgw-attach-01234567890abcdef" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-01234567890abcdef" ]
  }
}
```

Networking Account | Remove TGW Static Route

Remove the specified TGW static route from the specified transit gateway (TGW) route table. Use this multi-account landing zone (MALZ) change type only in a Networking account.

Full classification: Management | Managed landing zone | Networking account | Remove TGW static route

Change Type Details

Change type ID	ct-0rmgrnr9w8mzh
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remove TGW static route

Networking account: Remove a TGW static route with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Networking account: Remove a TGW static route with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0rmgrnr9w8mzh" --change-type-version
 "1.0" --title "Remove TGW Static Route" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-RemoveRouteFromTGWRouteTable\",\"Region\": \"us-east-1\",
\"Parameters\": {\"TransitGatewayRouteTableId\": \"tgw-rtb-06ddc751c0c0c881c\",
 \"DestinationCidrBlock\": \"10.16.1.0/24\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RemoveTgwStaticRouteParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0rmgrnr9w8mzh"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    RemoveTgwStaticRouteParams.json
   ```

2. Modify and save the RemoveTgwStaticRouteParams file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-RemoveRouteFromTGWRouteTable",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayRouteTableId": "tgw-rtb-06ddc751c0c0c881c",
    "DestinationCidrBlock": "10.16.1.0/24"
  }
}
```

3. Output the RFC template JSON file to a file; this example names it RemoveTgwStaticRouteRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > RemoveTgwStaticRouteRfc.json
```

4. Modify and save the RemoveTgwStaticRouteRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-0rmgrnr9w8mzh",
  "Title": "Remove TGW Static Route"
}
```

5. Create the RFC, specifying the RemoveTgwStaticRouteRfc file and the RemoveTgwStaticRouteParams file:

```
aws amscm create-rfc --cli-input-json file://RemoveTgwStaticRouteRfc.json  --
execution-parameters file://RemoveTgwStaticRouteParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This Change Type is only valid in Multi-account Landing Zone (MALZ) Networking accounts.

To learn more about AMS multi-account landing zones, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0rmgrnr9w8mzh.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-RemoveRouteFromTGWRouteTable",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayRouteTableId": ["tgw-rtb-06ddc751c0c0c881c"],
    "DestinationCidrBlock": ["10.16.1.0/24"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-RemoveRouteFromTGWRouteTable",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayRouteTableId": ["tgw-rtb-06ddc751c0c0c881c"],
    "DestinationCidrBlock": ["10.16.1.0/24"]
  }
}
```

Monitoring and Notification Subcategory

Change Type Items and Operations in the Monitoring and Notification Subcategory

- CloudWatch | Enable Non-Root Volumes Monitoring
- GuardDuty IP Set | Delete (Review Required)
- GuardDuty IP Set | Update (Review Required)
- GuardDuty Threat Intel Set | Delete (Review Required)
- GuardDuty Threat Intel Set | Update (Review Required)
- SNS | Subscribe To DirectCustomerAlerts
- SQS | Update

CloudWatch | Enable Non-Root Volumes Monitoring

Enable monitoring on non-root volumes of an EC2 instance.

Full classification: Management | Monitoring and notification | CloudWatch | Enable Non-Root Volumes Monitoring

Change Type Details

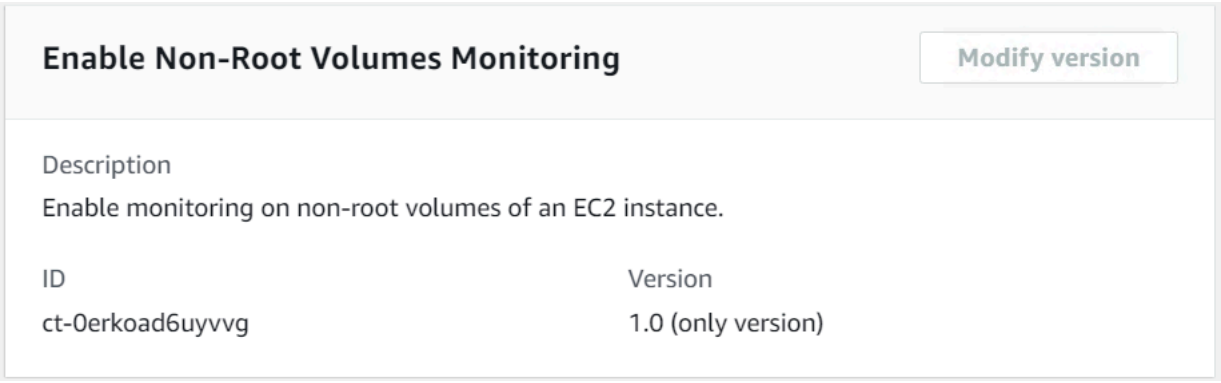
Change type ID	ct-0erkoad6uyvvg
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Enable CloudWatch non-root volumes monitoring

Enabling CloudWatch non-root volume monitoring with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Enabling CloudWatch non-root volume monitoring with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id ID` command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0erkoad6uyvvg" --change-type-version "1.0"
 --title "Enable Non-Root Volumes Monitoring" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-DeployNonRootVolumeMonitoring\",\"Region\":\"us-east-1\",
\"Parameters\":{\"InstanceId\":[\"i-1234567890abcdef0\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file in your current folder; this example names it CwNonRootVolumeMonitoringParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0erkoad6uyvvg"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CwNonRootVolumeMonitoringParams.json
   ```

2. Modify and save the CwNonRootVolumeMonitoringParams.json file. For example, you can replace the contents with something like this:

```
{
    "DocumentName": "AWSManagedServices-DeployNonRootVolumeMonitoring",
    "Region": "us-east-1",
    "Parameters": {
        "InstanceId": [
            "i-1234567890abcdef0"
        ]
    }
}
```

3. Output the JSON template for CreateRfc to a file in your current folder; this example names it CwNonRootVolumeMonitoringRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CwNonRootVolumeMonitoringRfc.json
```

4. Modify and save the CwNonRootVolumeMonitoringRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0erkoad6uyvvg",
"Title":                "CW-NON-ROOT-VOL-MONITORING-RFC"
}
```

5. Create the RFC, specifying the CwNonRootVolumeMonitoringRfc file and the execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CwNonRootVolumeMonitoringRfc.json --
execution-parameters file://CwNonRootVolumeMonitoringParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about CloudWatch, see Enable or disable detailed monitoring for your instances.

The EC2 instance alart `Non-root volume usage` is **DISABLED** by default. If you require alert generation based on this alarm, then you must enable it using this RFC.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0erkoad6uyvvg.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-DeployNonRootVolumeMonitoring",
  "Region": "us-east-1",
  "Parameters": {
    "InstanceId": [
      "i-1234567890abcdef0"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-DeployNonRootVolumeMonitoring",
  "Region": "us-east-1",
  "Parameters": {
    "InstanceId": [
      "i-1234567890abcdef0"
    ]
  }
}
```

GuardDuty IP Set | Delete (Review Required)

Use to delete an Amazon GuardDuty IPSet instance which is a list of trusted IP addresses that have been whitelisted for highly secure communication with your AWS environment.

Full classification: Management | Monitoring and notification | GuardDuty IP set | Delete (review required)

Change Type Details

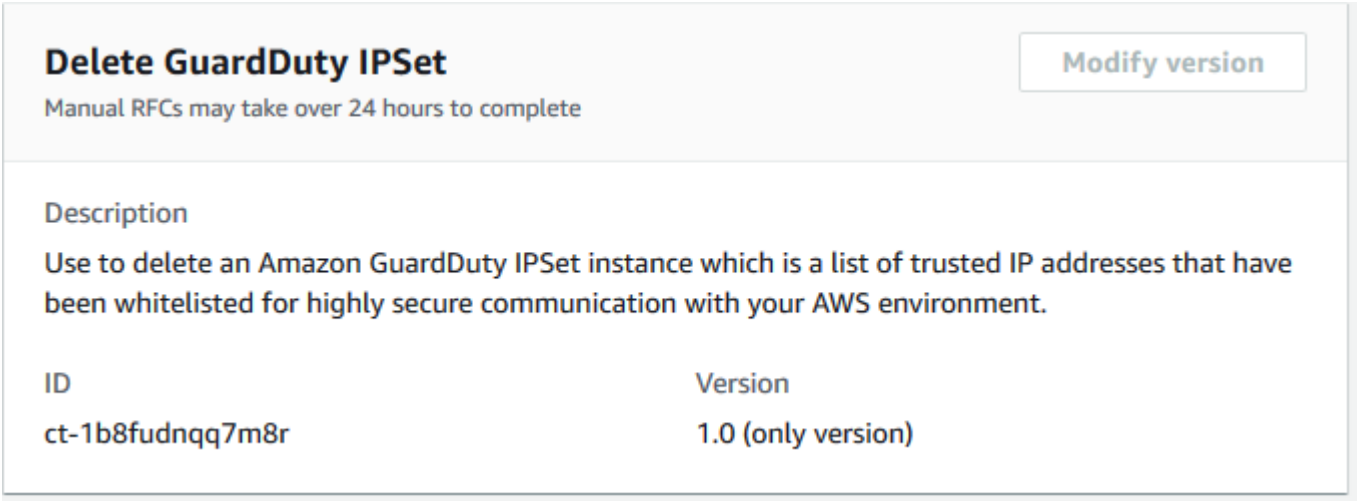
Change type ID	ct-1b8fudnqq7m8r
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Delete GuardDuty IP set (review required)

Deleting an IP set for GuardDuty (review required) with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an IP set for GuardDuty (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1b8fudnqq7m8r" --change-type-
version "1.0" --title "Delete Amazon GuardDuty IP Set" --execution-parameters
 "{\"DetectorId\": \"00000000000000000000000000000000\", \"IpSetId\":
 \"00000000000000000000000000000000\", \"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteGdIpSetParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-08avsj2e9mc7g" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeleteGdIpSetParams.json
   ```

2. Modify and save the DeleteGdIpSetParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DetectorId": "00000000000000000000000000000000",
     "IpSetId": "00000000000000000000000000000000",
     "Region": "us-east-1"
   ```

```
}
```

3. Output the RFC template JSON file to a file named DeleteGdIpSetRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteGdIpSetRfc.json
```

4. Modify and save the DeleteGdIpSetRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-08avsj2e9mc7g",
"Title":                "DELETE_GD_IP_SET"
}
```

5. Create the RFC, specifying the DeleteGdIpSetRfc Rfc file and the DeleteGdIpSetParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteGdIpSetRfc.json  --execution-
parameters file://DeleteGdIpSetParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about Amazon GuardDuty, see Amazon GuardDuty.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1b8fudnqq7m8r.

Example: Required Parameters

```
{
```

```
  "IpSetId": "0cb0141ab9fbde177613ab9436212e90",
  "Region": "us-east-1"
}
```

Example: All Parameters

```
{
  "DetectorId": "12abc34d567e8fa901bc2d34e56789f0",
  "IpSetId": "0cb0141ab9fbde177613ab9436212e90",
  "Region": "us-east-1",
  "Priority": "Medium"
}
```

GuardDuty IP Set | Update (Review Required)

Use to update an Amazon GuardDuty IPSet instance which is a list of trusted IP addresses that have been whitelisted for highly secure communication with your AWS environment.

Full classification: Management | Monitoring and notification | GuardDuty IP set | Update (review required)

Change Type Details

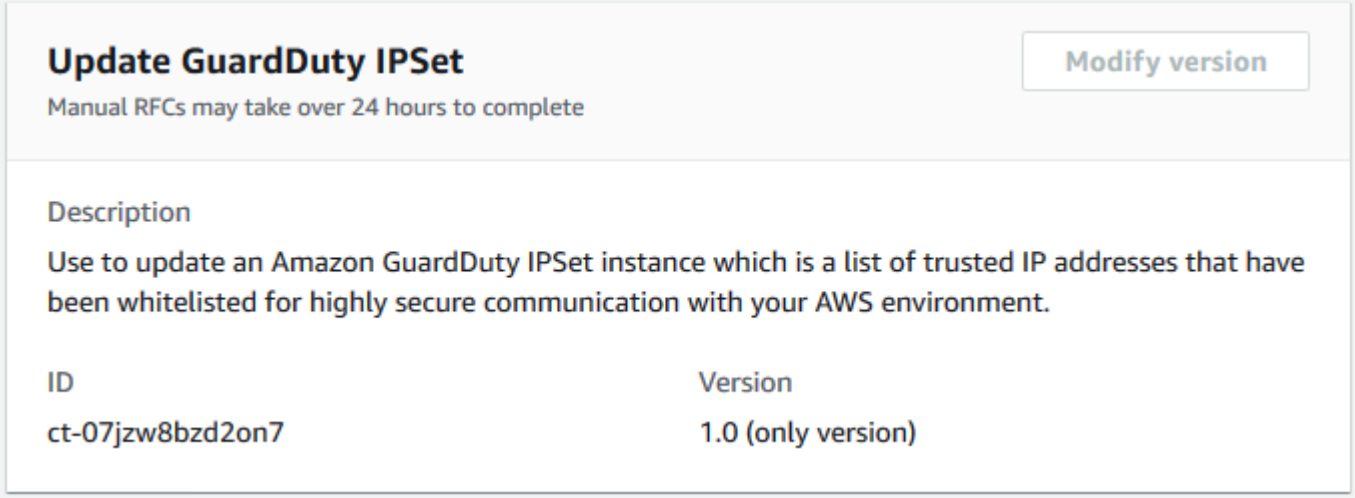
Change type ID	ct-07jzw8bzd2on7
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update GuardDuty IP set (review required)

Updating an IP set for GuardDuty (review required) with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an IP set for GuardDuty (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-07jzw8bzd2on7" --change-type-version "1.0"
 --title "Update Amazon GuardDuty IP Set" --execution-parameters "{\"Activate\": true,
 \"DetectorId\": \"00000000000000000000000000000000\", \"Name\": \"trusted-ips\",
 \"IpSet\": \"https://s3.us-west-2.amazonaws.com/my-bucket/my-object-key\", \"IpSetId
\": \"00000000000000000000000000000000\", \"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateGdIpSetParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-07jzw8bzd2on7" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateGdIpSetParams.json
   ```

2. Modify and save the UpdateGdIpSetParams file. For example, you can replace the contents with something like this:

   ```
   {
     "Activate": true,
     "DetectorId": "00000000000000000000000000000000",
     "Name": "trusted-ips",
     "IpSet": "https://s3.us-west-2.amazonaws.com/my-bucket/my-object-key",
     "IpSetId": "00000000000000000000000000000000",
     "Region": "us-east-1"
   }
   ```

3. Output the RFC template JSON file to a file named UpdateGdIpSetRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateGdIpSetRfc.json
   ```

4. Modify and save the UpdateGdIpSetRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   ```

```
"ChangeTypeId":         "ct-07jzw8bzd2on7",
"Title":                "UPDATE_GD_IP_SET"
}
```

5. Create the RFC, specifying the UpdateGdIpSet Rfc file and the UpdateGdIpSetParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateGdIpSetRfc.json  --execution-
parameters file://UpdateGdIpSetParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

For more information about Amazon GuardDuty and creating IP sets, see Amazon GuardDuty and CreateIPSet.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-07jzw8bzd2on7.

Example: Required Parameters

```
{
  "DetectorId": "12abc34d567e8fa901bc2d34e56789f0",
  "IpSetId": "0cb0141ab9fbde177613ab9436212e90",
  "Region": "us-east-1"
}
```

Example: All Parameters

```
{
  "Activate": true,
```

```
  "DetectorId": "12abc34d567e8fa901bc2d34e56789f0",
  "IpSet": "https://s3.amazonaws.com/guarddutylists/sample.txt",
  "IpSetId": "0cb0141ab9fbde177613ab9436212e90",
  "Name": "Sample IPSet",
  "Region": "us-east-1",
  "Priority": "Medium"
}
```

GuardDuty Threat Intel Set | Delete (Review Required)

Use to delete an Amazon GuardDuty ThreatIntelSet instance which is a list of known malicious IP addresses.

Full classification: Management | Monitoring and notification | GuardDuty threat intel set | Delete (review required)

Change Type Details

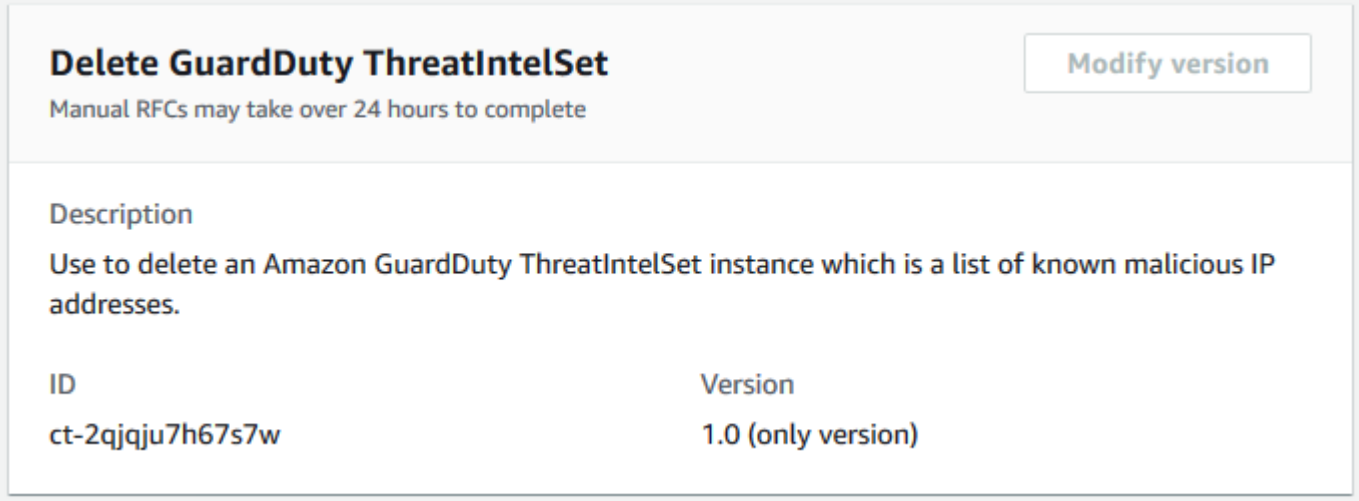
Change type ID	ct-2qjqju7h67s7w
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Delete GuardDuty Threat intel set (review required)

Deleting a Threat intel set for GuardDuty (review required) with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting a Threat intel set for GuardDuty (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2qjqju7h67s7w" --change-type-version
 "1.0" --title "Delete Amazon GuardDuty Threat Intel Set" --execution-parameters
 "{\"DetectorId\": \"00000000000000000000000000000000\", \"ThreatIntelSetId\":
 \"00000000000000000000000000000000\", \"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteGdThreatIntelSetParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2qjqju7h67s7w"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteGdThreatIntelSetParams.json
   ```

2. Modify and save the DeleteGdThreatIntelSetParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DetectorId": "00000000000000000000000000000000",
     "ThreatIntelSetId": "00000000000000000000000000000000",
     "Region": "us-east-1"
   }
   ```

3. Output the RFC template JSON file to a file named DeleteGdThreatIntelSetRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteGdThreatIntelSetRfc.json
   ```

4. Modify and save the DeleteGdThreatIntelSetRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-2qjqju7h67s7w",
   "Title":                "DELETE_GD_THREAT_INTEL_SET"
   }
   ```

5. Create the RFC, specifying the DeleteGdThreatIntelSet Rfc file and the DeleteGdThreatIntelSetParams file:

   ```
   aws amscm create-rfc --cli-input-json file://DeleteGdThreatIntelSetRfc.json  --
   execution-parameters file://DeleteGdThreatIntelSetParams.json
   ```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

For more information about Amazon GuardDuty and Threat Intel sets, see Amazon GuardDuty.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2qjqju7h67s7w.

Example: Required Parameters

```
{
  "Region": "us-east-1",
  "ThreatIntelSetId": "0cb0141ab9fbde177613ab9436212e90"
}
```

Example: All Parameters

```
{
  "DetectorId": "12abc34d567e8fa901bc2d34e56789f0",
  "Region": "us-east-1",
  "ThreatIntelSetId": "0cb0141ab9fbde177613ab9436212e90",
  "Priority": "Medium"
}
```

GuardDuty Threat Intel Set | Update (Review Required)

Use to update an Amazon GuardDuty ThreatIntelSet instance which is a list of trusted IP addresses that have been whitelisted for highly secure communication with your AWS environment.

Full classification: Management | Monitoring and notification | GuardDuty threat intel set | Update (review required)

Change Type Details

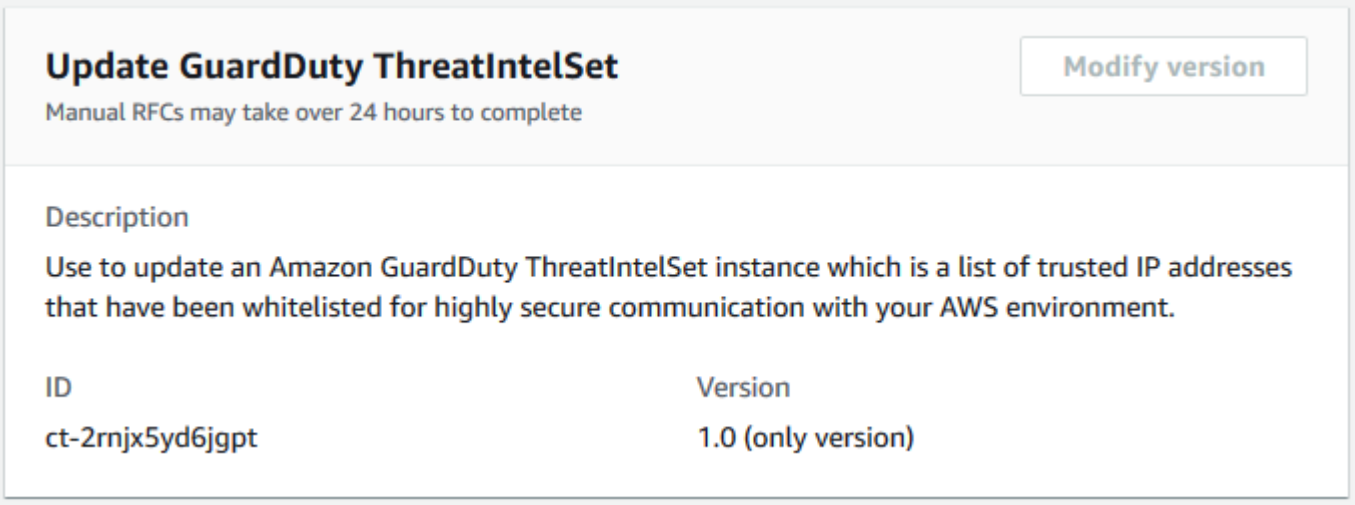
Change type ID	ct-2rnjx5yd6jgpt
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update GuardDuty Threat intel set (review required)

Updating a Threat intel set for GuardDuty (review required) with the console

THh following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a Threat intel set for GuardDuty (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2rnjx5yd6jgpt" --change-type-version
 "1.0" --title "Update Amazon GuardDuty Threat Intel Set" --execution-parameters
 "{\"Activate\": true, \"DetectorId\": \"00000000000000000000000000000000\", \"Name
\": \"blacklisted-ips\", \"ThreatIntelSet\": \"https://s3.us-west-2.amazonaws.com/my-
bucket/my-object-key\", \"ThreatIntelSetId\": \"00000000000000000000000000000000\",
 \"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateGdThreatIntelSetParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2rnjx5yd6jgpt"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateGdThreatIntelSetParams.json
   ```

2. Modify and save the UpdateGdThreatIntelSetParams file. For example, you can replace the contents with something like this:

```
{
  "Activate": true,
  "DetectorId": "00000000000000000000000000000000",
  "Name": "blacklisted-ips",
  "ThreatIntelSet": "https://s3.us-west-2.amazonaws.com/my-bucket/my-object-key",
  "ThreatIntelSetId": "00000000000000000000000000000000",
  "Region": "us-east-1"
}
```

3. Output the RFC template JSON file to a file named UpdateGdThreatIntelSetRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateGdThreatIntelSetRfc.json
```

4. Modify and save the UpdateGdThreatIntelSetRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2rnjx5yd6jgpt",
"Title":                "CREATE_GD_IP_SET"
}
```

5. Create the RFC, specifying the UpdateGdThreatIntelSet Rfc file and the UpdateGdThreatIntelSetParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateGdThreatIntelSetRfc.json  --
execution-parameters file://UpdateGdThreatIntelSetParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

For more information about Amazon GuardDuty and creating Threat Intel sets, see Amazon Guard Duty and CreateThreatIntelSet.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2rnjx5yd6jgpt.

Example: Required Parameters

```
{
  "DetectorId": "12abc34d567e8fa901bc2d34e56789f0",
  "ThreatIntelSetId": "0cb0141ab9fbde177613ab9436212e90",
  "Region": "us-east-1"
}
```

Example: All Parameters

```
{
  "Activate": true,
  "DetectorId": "12abc34d567e8fa901bc2d34e56789f0",
  "ThreatIntelSet": "https://s3.amazonaws.com/guarddutylists/sample.txt",
  "ThreatIntelSetId": "0cb0141ab9fbde177613ab9436212e90",
  "Name": "Sample ThreatIntelSet",
  "Region": "us-east-1",
  "Priority": "Medium"
}
```

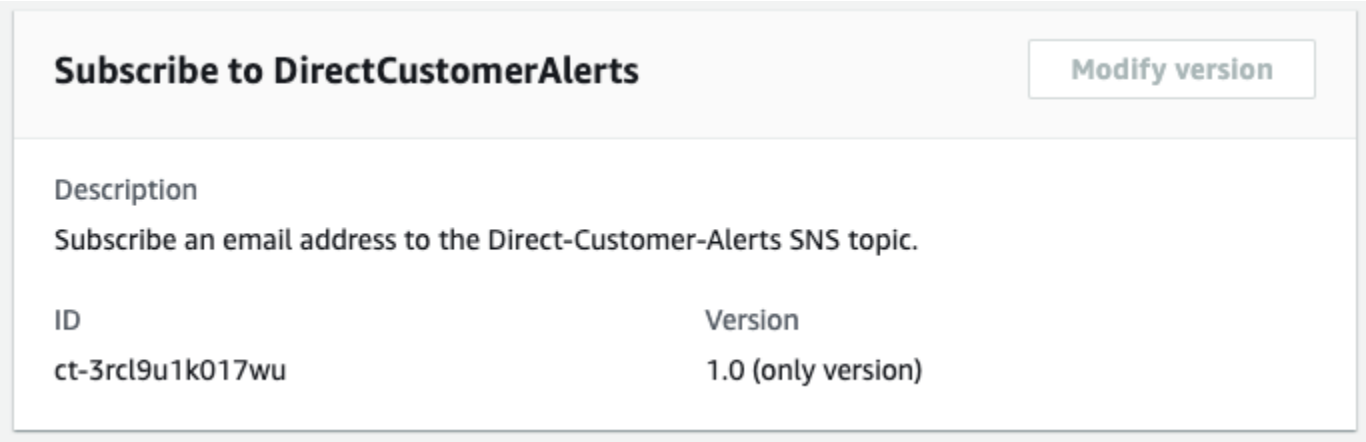
Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Subscribing to the Direct-Customer-Alerts SNS topic with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:?

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3rcl9u1k017wu" --change-type-version "1.0" --
title "Subscribe-Direct-Customer-Alerts" --execution-parameters "{\"Email\": \"sample-
email@example.com\", \"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it SnsSubscribeParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3rcl9u1k017wu" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > SnsSubscribeParams.json
   ```

2. Modify and save the SnsSubscribeParams file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":      "SnsTopicSub-Create",
   "VpcId": "VPC_ID",
   "Name":             "My-SnsTopicSub",
   "Parameters":{
       "TopicName": "mytopic-cli-all-params",
       "DisplayName": "testsns",
       "Subscription1Protocol": "email",
       "Subscription1Endpoint": "abc@xyz.com",
       "Subscription1RawMessageDelivery": "false",
       "Subscription2Protocol": "sms",
       "Subscription2Endpoint": "+61500444777",
       "Subscription2RawMessageDelivery": "false",
   ```

```
    "KmsMasterKeyId": "arn:aws:kms:us-east-1:123456789101:key/
cfe0542d-3be9-4166-9eac-d0cd6af61445"
    }
}
```

3. Output the RFC template JSON file to a file named SnsSubscribeRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > SnsSubscribeRfc.json
```

4. Modify and save the SnsSubscribeRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3rcl9u1k017wu",
"Title":                "Subscribe-Direct-Customer-Alerts-RFC"
}
```

5. Create the RFC, specifying the SnsSubscribe Rfc file and the SnsSubscribeParams file:

```
aws amscm create-rfc --cli-input-json file://SnsSubscribeRfc.json  --execution-
parameters file://SnsSubscribeParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an SQS queue with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0hi7z7tyikjf6" --change-type-version
 "1.0" --title "Update Amazon SQS Queue" --execution-parameters "{\"VpcId\":
 \"VPC_ID\", \"StackId\": \"STACK_ID\", \"Parameters\": {\"SQSDelaySeconds\": 0,
 \"SQSMaximumMessageSize\": 262144, \"SQSMessageRetentionPeriod\": 345600,
 \"SQSQueueName\": \"MyQueueName\", \"SQSReceiveMessageWaitTimeSeconds\": 0,
 \"SQSVisibilityTimeout\": 60}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateSqsInstanceParams.json.

```
aws amscm get-change-type-version --change-type-id "ct-0hi7z7tyikjf6"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 UpdateSqsInstanceParams.json
```

2. Modify and save the UpdateSqsInstanceParams file. For example, you can replace the contents with something like this:

```
{
  "VpcId": "VPC_ID",
  "StackId": "STACK_ID",
  "Parameters": {
    "SQSDelaySeconds": 0,
    "SQSMaximumMessageSize": 262144,
    "SQSMessageRetentionPeriod": 345600,
    "SQSQueueName": "MyQueueName",
    "SQSReceiveMessageWaitTimeSeconds": 0,
    "SQSVisibilityTimeout": 60
  }
}
```

3. Output the RFC template JSON file to a file named UpdateSqsInstanceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateSqsInstanceRfc.json
```

4. Modify and save the UpdateSqsInstanceRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0hi7z7tyikjf6",
"Title":                "Sqs-Instance-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateSqsTopicSub Rfc file and the UpdateSqsTopicSubParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateSqsInstanceRfc.json  --
execution-parameters file://UpdateSqsInstanceParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon Simple Queue Service (SQS), see Amazon Simple Queue Service.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0hi7z7tyikjf6.

Example: Required Parameters

```
{
  "VpcId": "vpc-01234567890abcdef",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {
    "SQSQueueName": "mytestsqs"
  }
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-12345678",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {
    "SQSDelaySeconds": 0,
    "SQSMaximumMessageSize": 262144,
    "SQSMessageRetentionPeriod": 345600,
    "SQSQueueName": "mytestsqs",
    "SQSReceiveMessageWaitTimeSeconds": 0,
    "SQSVisibilityTimeout": 0
  }
}
```

Change Type Details

Change type ID	ct-1e1xtak34nx76
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create Other Other CTs

Creating an Other Other Create RFC with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an Other Other Create RFC with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1e1xtak34nx76" --change-type-version "1.0" --
title "TITLE" --execution-parameters "{\"Comment\": \"WHAT_TO_CREATE\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named OtherCreateParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1e1xtak34nx76" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > OtherCreateParams.json
   ```

2. Modify and save the OtherCreateParams file (example includes optional `Priority` parameter). For example, you can replace the contents with something like this:

   ```
   {
   "Comment":          "WHAT-TO-CREATE",
   "Priority":         "Medium"
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it OtherCreateRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > OtherCreateRfc.json
   ```

4. Modify and save the OtherCreateRfc.json file. For example, you can replace the contents with something like this:.

   ```
   {
   "ChangeTypeId":         "ct-1e1xtak34nx76",
   "ChangeTypeVersion":    "1.0",
   "Title":                "TITLE"
   }
   ```

5. Create the RFC, specifying the OtherCreateRfc file and the OtherCreateParams file:

```
aws amscm create-rfc --cli-input-json file://OtherCreateRfc.json  --execution-
parameters file://OtherCreateParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> To update an existing resource, use Update Other Other CTs.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Use this CT when you can't find a change type for what you want; however, if you are unsure about specifying parameters in an existing CT, it is better to submit a service request for help. For information on submitting service requests, see Service Request Examples.

To update an existing resource, use Update Other Other CTs.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1e1xtak34nx76.

Example: Required Parameters

```
{
  "Comment": "This is a test comment"
}
```

Example: All Parameters

```
{
```

```
  "Comment": "This is a test comment",
  "Priority": "High",
  "RelatedIds": ["foo", "bar", "baz"]
}
```

Other | Update (Review Required)

Use to request a manual update to a resource.

Full classification: Management | Other | Other | Update (review required)

Change Type Details

Change type ID	ct-0xdawir96cy7k
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update Other Other CTs

Creating an Other Other Update RFC with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an Other Other Update RFC with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0xdawir96cy7k" --change-type-version "1.0"
 --title "TITLE" --execution-parameters "{\"Comment\": \"What you want changed\",
 \"Priority\": \"Medium\" \"RelatedIds\":[\"RESOURCE_ID\",\"RESOURCE_ID\"]}}"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named OtherUpdateParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0xdawir96cy7k" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > OtherUpdateParams.json
   ```

2. Modify and save the OtherUpdateParams file. For example, you can replace the contents with something like this:

   ```
   {
   "Comment":          "WHAT-TO-UPDATE",
   "Priority":         "Medium",
   "RelatedIds":       ["RESOURCE_ID", "RESOURCE_ID"]
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it OtherUpdateRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > OtherUpdateRfc.json
   ```

4. Modify and save the OtherUpdateRfc.json file. For example, you can replace the contents with something like this:.

   ```
   {
   "ChangeTypeId":         "ct-0xdawir96cy7k",
   "ChangeTypeVersion":    "1.0",
   "Title":                "TITLE"
   }
   ```

5. Create the RFC, specifying the OtherUpdateRfc file and the OtherUpdateParams file:

```
aws amscm create-rfc --cli-input-json file://OtherUpdateRfc.json  --execution-
parameters file://OtherUpdateParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Important

Updating or Deleting stacks can have unwanted and unanticipated consequences. AMS prefers to *not* update or delete stacks or stack resources on behalf of customers for this reason. Note, that AMS will only update or delete resources on your behalf (through a submitted Mangement | Other | Other | Update change type) that are not possible to update or delete using the appropriate, automated, change type to delete.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Use this CT when you can't find a change type for what you want; however, if you are unsure about specifying parameters in an existing CT, it is better to submit a service request for help. For information on submitting service requests, see Service Request Examples.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0xdawir96cy7k.

Example: Required Parameters

```
{
  "Comment": "This is a test comment"
}
```

Example: All Parameters

```
{
  "Comment": "This is a test comment",
  "Priority": "High",
  "RelatedIds": ["foo", "bar", "baz"]
}
```

Patching Subcategory

- Patch Window | Update

On Demand Patching | Run

Run on-demand SSM patching on specified instances; either a list of instances or instances with the specified tag/key pair.

Full classification: Management | Patching | On demand patching | Run

Change Type Details

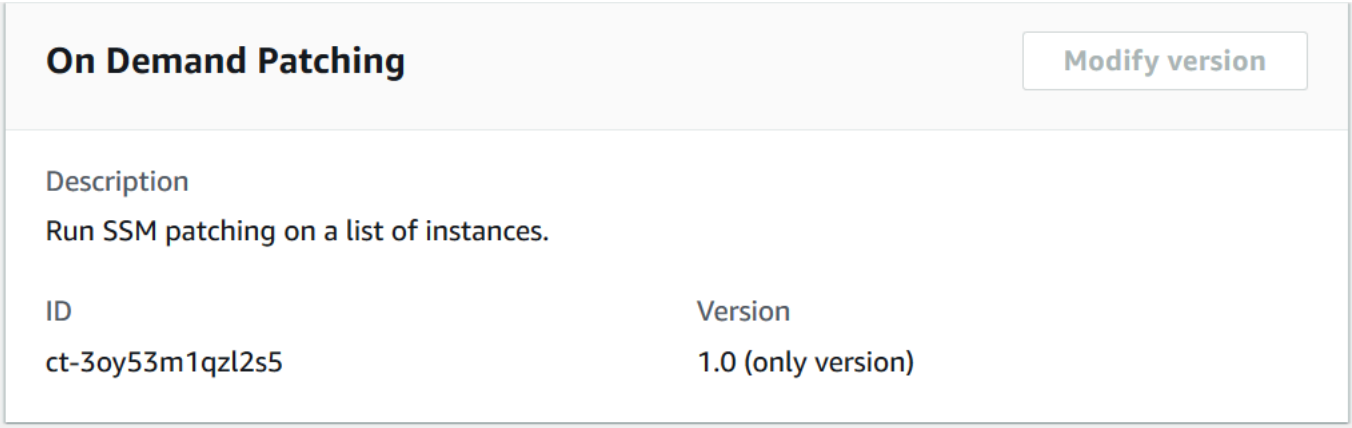
Change type ID	ct-3oy53m1qzl2s5
Current version	1.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Run on-demand patching

Running Patching On Demand with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Running Patching On Demand with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
   aws amscm create-rfc --title my-test-patchbaseline --change-type-
id ct-3oy53m1qzl2s5 --change-type-version 1.0 --execution-parameters
 '{"Name":"test-ODP","PatchingTargets":[{"Key":"tag:Patch Group","Values":"[test-
odp]"}],"StartInactiveInstances":"True", "BackupVaultName":"test-backup-vault-name",
 "BackupIamRole":"test-backup-iam-role", "BackupRetentionInDays":"10"}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it RunOndemandPatchParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3oy53m1qzl2s5"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    RunOndemandPatchParams.json
   ```

2. Modify and save the RunOndemandPatchParams file.

   ```
   {
     "Name": "test-ODP",
     "PatchingTargets": [
       {
         "Key": "InstanceIds",
         "Values": ["INSTANCE_ID"]
       }
     ],
     "StartInactiveInstances": "True",
     "BackupVaultName": "test-backup-vault-name",
     "BackupIamRole": "test-backup-iam-role",
     "BackupRetentionInDays": "10"
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it RunOndemandPatchRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RunOndemandPatchRfc.json
   ```

4. Modify and save the RunOndemandPatchRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3oy53m1qzl2s5",
"Title":                "Run-Ondemand-Patch-RFC"
}
```

5. Create the RFC, specifying the RunOndemandPatchRfc file and the RunOndemandPatchParams file:

```
aws amscm create-rfc --cli-input-json file://RunOndemandPatchRfc.json --execution-
parameters file://RunOndemandPatchParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Inactive instances**
>
> If you set **StartInactiveInstances** to **True**, inactive instances are started, patched, and returned to their original stopped state after patching is completed.

> **Concurrency limits**
>
> Any concurrently running maintenance windows will impact the safe limit execution of this RFC. This is because SSM automation is limited to 100 concurrent runs per account. Automations exceeding the concurrency limit are added to a queue of up to 1,000 executions. If a maintenance window is running on 50 instances, that leaves room for only 50 more to be concurrent runs for on-demand patching, adding any additional instances to the queue to be run once the in-progress executions are complete.

To learn more about AMS Patch Orchestrator and setting up SSM patch baseline and patch window, see Patch Orchestrator in the AMS Multi-account landing zone User Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3oy53m1qzl2s5.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "description",
  "Name": "Test1",
  "PatchingTargets": [
    {
      "Key": "tag:Patch Group",
      "Values": [
        "testGroup"
      ]
    }
  ],
  "StartInactiveInstances": "True",
  "BackupVaultName": "backup-vault-name",
  "BackupIamRole": "backup-iam-role",
  "BackupRetentionInDays": "1"
}
```

Patch Window | Set Status

Enable or disable an existing AWS Systems Manager (SSM) patch window. If the window is enabled, any task associated with it runs on the next occurrence of the maintenance window. If disabled, any future occurrences of the window no longer run. Occurrences of the window that are already running continue to run until completion.

Full classification: Management | Patching | Patch window | Set status

Change Type Details

Change type ID	ct-3vfxkiudtovm9

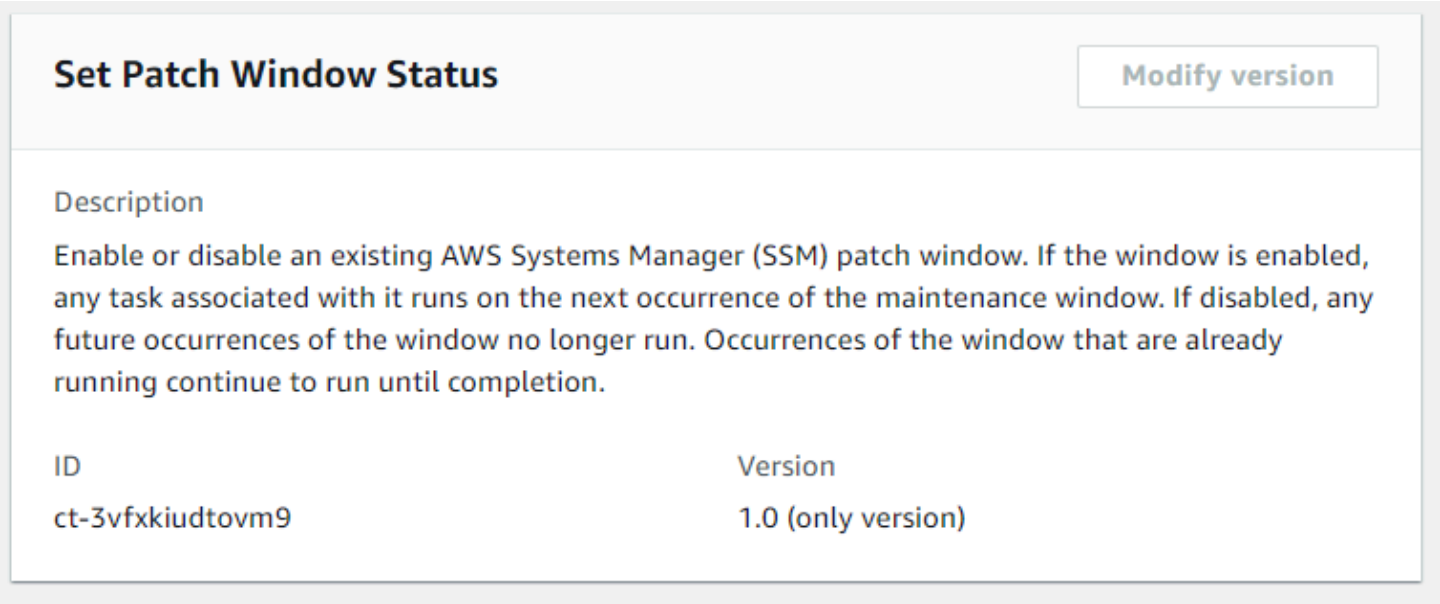
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Set SSM Patch window status

Set SSM Patch window status with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Set SSM Patch window status with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3vfxkiudtovm9" --change-type-version
 "1.0" --title "Set patch window status" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-SetPatchenanceWindowStatus\",\"Region\":\"us-east-1\",\"Parameters
\":{\"MaintenanceWindowId\":[\"mw-1234567890abcdef0\"],\"Enabled\":[true]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it SetPatchWinStatusParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3vfxkiudtovm9"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    SetPatchWinStatusParams.json
   ```

2. Modify and save the SetPatchWinStatusParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-SetPatchenanceWindowStatus",
     "Region": "us-east-1",
     "Parameters":
   ```

```
  {
    "MaintenanceWindowId": [
      "mw-1234567890abcdef0"
    ],
    "Enabled": [
      true
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it SetPatchWinStatusRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > SetPatchWinStatusRfc.json
```

4. Modify and save the SetPatchWinStatusRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3vfxkiudtovm9",
  "Title": "Set patch window status"
}
```

5. Create the RFC, specifying the SetPatchWinStatusRfc file and the SetPatchWinStatusParams file:

```
aws amscm create-rfc --cli-input-json file://SetPatchWinStatusRfc.json  --
execution-parameters file://SetPatchWinStatusParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about doing this, see AWS Systems Manager Maintenance Windows.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3vfxkiudtovm9.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-SetSsmMaintenanceWindowStatus",
  "Region" : "us-east-1",
  "Parameters" : {
    "MaintenanceWindowId" : [
      "mw-1234567890abcdef0"
    ],
    "Enabled" : [
      true
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-SetSsmMaintenanceWindowStatus",
  "Region" : "us-east-1",
  "Parameters" : {
    "MaintenanceWindowId" : [
      "mw-1234567890abcdef0"
    ],
    "Enabled" : [
      true
    ]
  }
}
```

Patch Window | Update

Modify patch maintenance window settings created using version 1 of change type ct-0el2j07llrxs7.

Full classification: Management | Patching | Patch window | Update

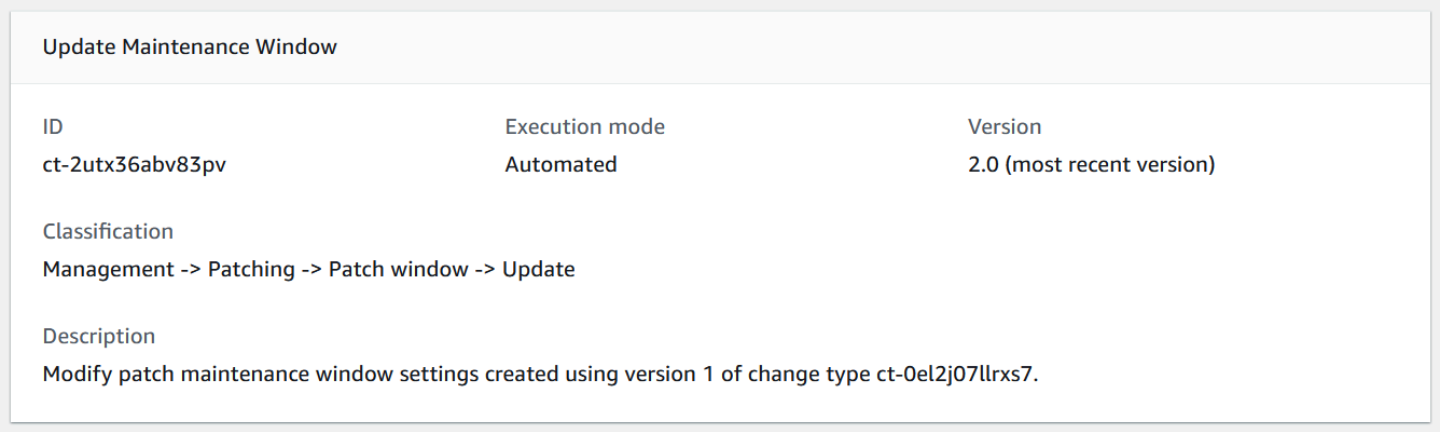
Additional Information

Update SSM Patch Window

Updating a patch window with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a patch window with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2utx36abv83pv" --change-type-version
 "2.0" --title "Patch-Window-Update-RFC" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-UpdateMaintenanceWindow\",\"Region\":\"us-east-1\",\"Parameters\":
{\"Duration\":[\"3\"],\"NotificationEmails\":[\"example@email.com\"],\"PatchGroupName
\":[\"MyApp\"],\"Schedule\":[\"cron(0 15 ? 9 TUE *)\"],\"ScheduleTimezone\":[\"UTC\"],
\"EmailAction\":[\"Add\"],\"OnlyCheckForMaintenanceWindowDrift\":[\"False\"],\"WindowId
\":[\"mw-012345678910abcef\"],\"BypassDriftDetection\":[\"False\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdatePatchWindowParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2utx36abv83pv"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdatePatchWindowParams.json
   ```

2. Modify and save the UpdatePatchWindowParams file.

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateMaintenanceWindow",
     "Region": "us-east-1",
     "Parameters": {
       "Duration": [
         "3"
       ],
       "NotificationEmails": [
         "example@email.com"
       ],
   ```

```
    "PatchGroupName": [
      "MyApp"
    ],
    "Schedule": [
      "cron(0 15 ? 9 TUE *)"
    ],
    "ScheduleTimezone": [
      "UTC"
    ],
    "EmailAction": [
      "Add"
    ],
    "OnlyCheckForMaintenanceWindowDrift": [
      "False"
    ],
    "WindowId": [
      "mw-012345678910abcef"
    ],
    "BypassDriftDetection": [
        "False"
    ]
}
}
```

3. Output the RFC template to a file in your current folder; this example names it UpdatePatchWindowRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdatePatchWindowRfc.json
```

4. Modify and save the UpdatePatchWindowRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-2utx36abv83pv",
"Title":                "Patch-Window-Update-RFC"
}
```

5. Create the RFC, specifying the UpdatePatchWindowRfc file and the UpdatePatchWindowParams file:

```
aws amscm create-rfc --cli-input-json file://UpdatePatchWindowRfc.json --execution-
parameters file://UpdatePatchWindowParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the SSM patch baseline, look in the execution output: Use the stack_id to view the patch baseline in the Systems Manager console.

Tips

- This solution uses custom logic to detect drift in AWS resources not yet supported by CloudFormation (AWS::SSM::MaintenanceWindow & AWS::SSM::MaintenanceWindowTarget). We recommend executing this change type with the parameter **OnlyCheckForMaintenanceWindowDrift=True** for the most accurate report of drifted AMS Patch maintance window resources.
- To learn more about AWS SSM patch windows, see "Maintenance Window" at Patching your Windows EC2 instances using AWS Systems Manager Patch Manager.
- To delete a custom Maintenance Window, see Delete stack.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2utx36abv83pv.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateMaintenanceWindow",
  "Region": "us-east-1",
  "Parameters": {
    "EmailAction": [ "None" ],
    "OnlyCheckForMaintenanceWindowDrift": [ "True" ],
    "WindowId": [ "mw-012345678910abcef" ],
    "BypassDriftDetection": [ "False" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateMaintenanceWindow",
  "Region": "us-east-1",
  "Parameters": {
    "Duration": [ "2" ],
    "EmailAction": [ "Add" ],
    "NotificationEmails": [ "nobody@amazon.com" ],
    "OnlyCheckForMaintenanceWindowDrift": [ "False" ],
    "PatchGroupName": [ "Test" ],
    "Schedule": [ "cron(0 17 * * ? *)" ],
    "ScheduleTimezone": [ "UTC" ],
    "WindowId": [ "mw-012345678910abcef" ],
    "BypassDriftDetection": [ "False" ]
  }
}
```

Standalone Resources Subcategory

Change Type Items and Operations in the Standalone Resources Subcategory

- EC2 Instance | Terminate
- RDS Instance | Terminate

EC2 Instance | Terminate

Terminate up to fifty EC2 instances. The automation checks that none of the instances are part of an Auto Scaling group and none have termination protection enabled. Instances meeting either of those criteria are not terminated. Standalone resources for testing purposes are created by AMS upon your request, they are not part of a stack and can't be deleted with ct-0q0bic0ywqk6c.

Full classification: Management | Standalone resources | EC2 instance | Terminate

Change Type Details

Change type ID	ct-3dfubbpesm2v9
Current version	1.0
Expected execution duration	150 minutes

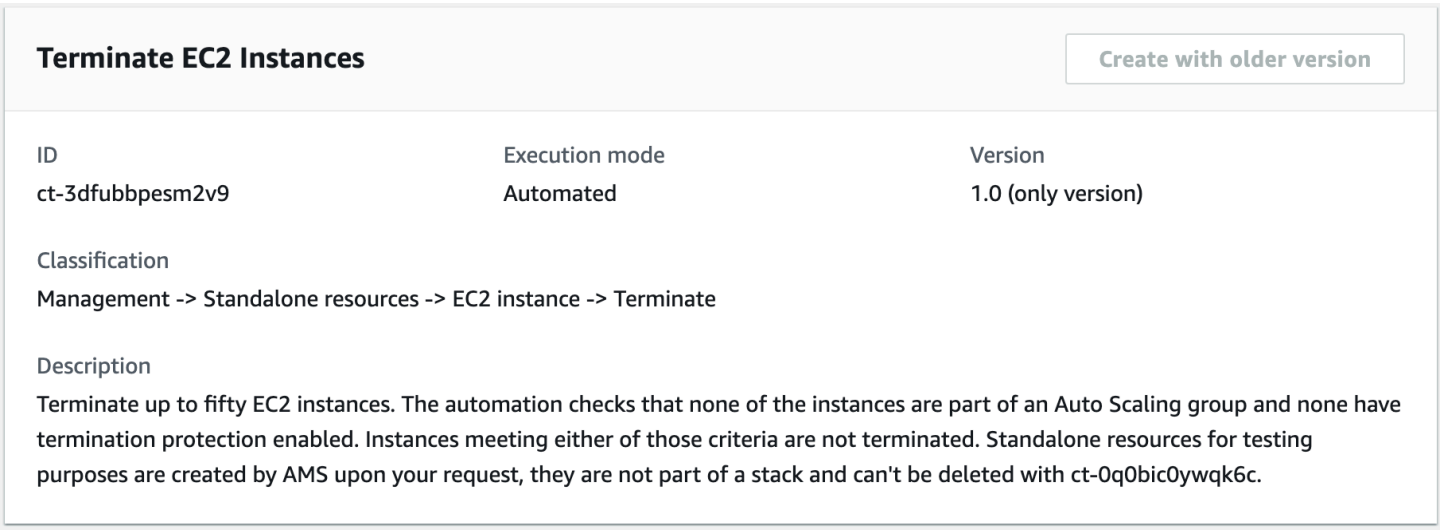
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Terminate instances

Terminating standalone EC2 instances with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Terminating standalone EC2 instances with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Only specify the parameters you want to change. Absent parameters retain the existing values.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3dfubbpesm2v9" --change-type-version "1.0"
 --title "Terminate standalone instances" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-TerminateStandaloneInstances\",\"Region\": \"us-east-1\",
\"Confirmation\": \"terminate instances\",\"Parameters\": {\"InstanceIds\":
 [\"i-1234567890abcdef0\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it TerminateStandaloneEc2sParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3dfubbpesm2v9"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    TerminateStandaloneEc2sParams.json
   ```

2. Modify and save the TerminateStandaloneEc2sParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-TerminateStandaloneInstances",
     "Region": "us-east-1",
     "Confirmation": "terminate instances",
     "Parameters": {
       "InstanceIds": [
         "i-1234567890abcdef0"
       ]
     }
   ```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it TerminateStandaloneEc2sRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > TerminateStandaloneEc2sRfc.json
```

4. Modify and save the TerminateStandaloneEc2sRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-3dfubbpesm2v9",
    "ChangeTypeVersion": "1.0",
    "Title": "Terminate standalone EC2 instance"
}
```

5. Create the RFC, specifying the TerminateStandaloneEc2sRfc file and the TerminateStandaloneEc2sParams file:

```
aws amscm create-rfc --cli-input-json file://TerminateStandaloneEc2sRfc.json  --
execution-parameters file://TerminateStandaloneEc2sParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about termination protection, see How do I protect my data against accidental EC2 instance termination?.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3dfubbpesm2v9.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-TerminateStandaloneInstances",
    "Region": "us-east-1",
    "Confirmation": "terminate instances",
```

```
    "Parameters": {
        "InstanceIds": [
            "i-1234567890abcdef0"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-TerminateStandaloneInstances",
    "Region": "us-east-1",
    "Confirmation": "terminate instances",
    "Parameters": {
        "InstanceIds": ["i-1234567890abcdef0"]
    }
}
```

RDS Instance | Terminate

Terminate a standalone DB instance or cluster. The automation checks that the DB instance, or cluster, is not part of a CloudFormation stack and does not have termination protection enabled. Please note that deleting the DB cluster deletes all the automated backups for that DB cluster and those backups can't be recovered. Standalone resources for testing purposes are created by AMS upon your request, they are not part of a stack and they can't be deleted with ct-0q0bic0ywqk6c.

Full classification: Management | Standalone resources | RDS instance | Terminate

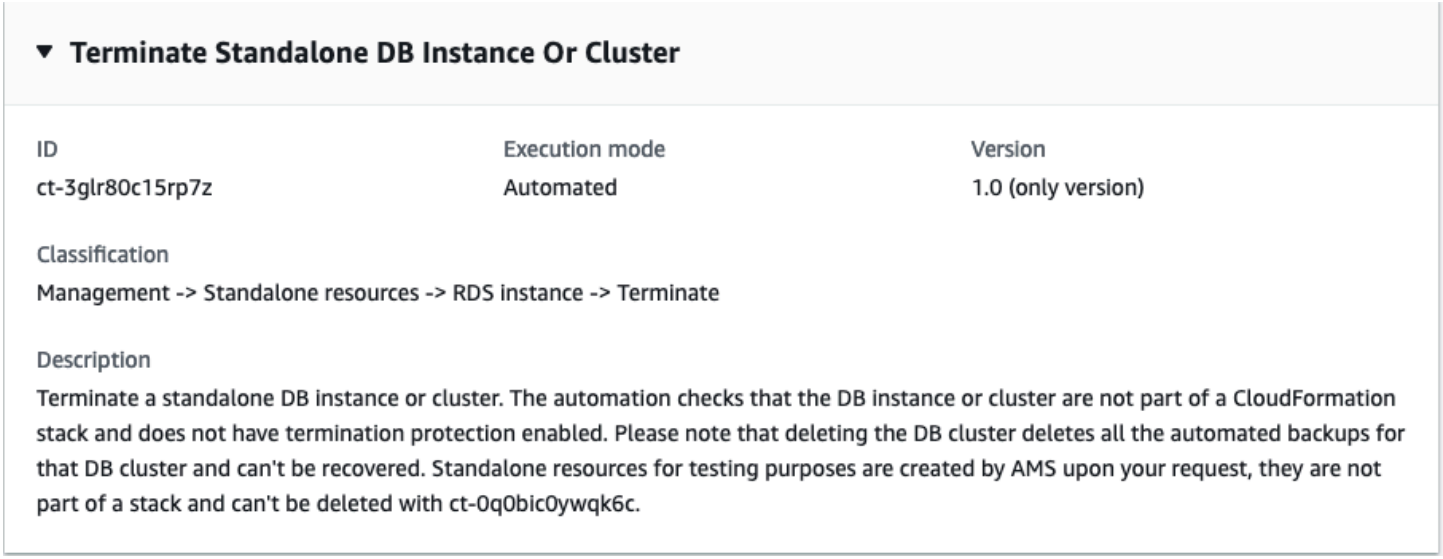
Current version	1.0
Expected execution duration	150 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Terminate Standalone RDS instance or cluster

Terminating standalone RDS instance or cluster with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Terminating standalone RDS instance or cluster with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Only specify the parameters you want to change. Absent parameters retain the existing values.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3glr80c15rp7z" --change-type-version
 "1.0" --title "Terminate Standalone DB Instance Or Cluster" --execution-
parameters "{\"DocumentName\": \"TerminateStandaloneDBInstanceOrCluster\",
\"Region\": \"us-east-1\",\"Parameters\": {\"DBIdentifierArn\": [\"arn:aws:rds:us-
east-1:123456789101:db:testdb-instance-1\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it TerminateStandaloneDBParameters.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3glr80c15rp7z"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    TerminateStandaloneDBParameters.json
   ```

2. Modify and save the TerminateStandaloneDBParameters.json file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   TerminateStandaloneDBParameters.json
   {
     "DocumentName": "TerminateStandaloneDBInstanceOrCluster",
     "Region": "us-east-1",
     "DBIdentifierArn": [
         "arn:aws:rds:us-east-1:123456789101:db:testdb-instance-1"
       ]
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it TerminateStandaloneDB.json:

```
aws amscm create-rfc --generate-cli-skeleton > TerminateStandaloneDB.json
```

4. Modify and save the TerminateStandaloneDB.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3glr80c15rp7z",
  "Title": "Terminate Standalone DB Instance Or Cluster"
}
```

5. Create the RFC, specifying the TerminateStandaloneDB.json file and the TerminateStandaloneDBParameters file:

```
aws amscm create-rfc --cli-input-json file://TerminateStandaloneDB.json --
execution-parameters file://TerminateStandaloneDBParameters.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about RDS deletion protection, see Deletion Protection.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3glr80c15rp7z.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-TerminateStandaloneDBInstanceOrCluster",
    "Region": "us-east-1",
    "Confirmation": "permanently delete",
    "Parameters": {
        "DBIdentifierArn": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance"
```

```
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-TerminateStandaloneDBInstanceOrCluster",
    "Region": "us-east-1",
    "Confirmation": "permanently delete",
    "Parameters": {
      "DBIdentifierArn": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
      "CreateFinalSnapshot": true,
      "DeleteAutomatedBackups": false,
      "FinalDBSnapshotIdentifier": "final-db-snapshot"
    }
  }
```

Standard Stacks Subcategory

Change Type Items and Operations in the Standard Stacks Subcategory

- Stack | Delete
- Stack | Reboot
- Stack | Remediate Drift
- Stack | Remediate Drift (Review Required)
- Stack | Start
- Stack | Stop
- Stack | Update Termination Protection

Stack | Delete

Delete an existing stack and its resources from your account. The effects of deleting a resource vary. For details, see the appropriate AWS documentation for the resource. Note that termination protection on a resource in the stack causes the RFC to fail. To check for a resource's termination protection status, see the corresponding AWS console.

Full classification: Management | Standard stacks | Stack | Delete

Change Type Details

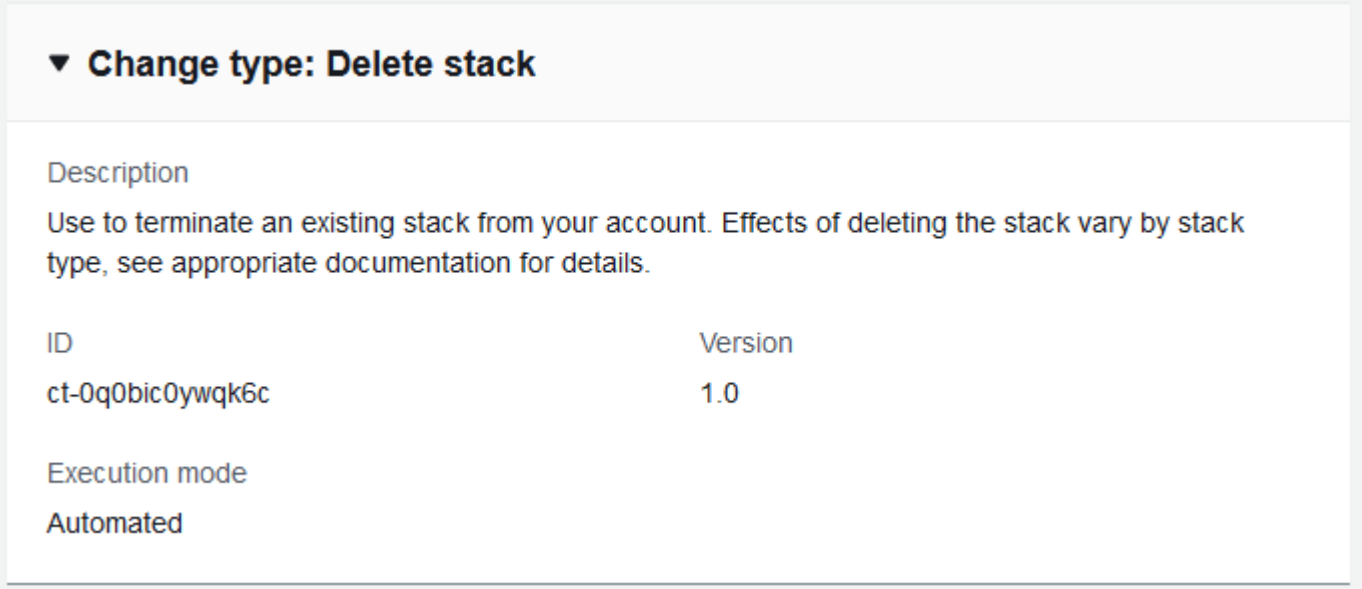
Change type ID	ct-0q0bic0ywqk6c
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete stack

Deleting a Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting a Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0q0bic0ywqk6c" --change-type-version "1.0" --
title "Delete My Stack" --execution-parameters "{\"StackId\":\"STACK_ID\"}"
```

TEMPLATE CREATE:

1. Output the RFC template to a file in your current folder; this example names it DeleteStackRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteStackRfc.json
   ```

2. Modify and save the DeleteStackRfc.json file.

   The internal quotation marks in the ExecutionParameters JSON extension must be escaped with a backslash (\). Example without start and end time:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-0q0bic0ywqk6c",
   "Title":                "Delete-My-Stack-RFC"
   ```

```
"ExecutionParameters":  "{
        \"StackId\":\"STACK_ID\"}"
}
```

3. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://DeleteStackRfc.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> If deleting an S3 bucket, it must be emptied of objects first.

> **Important**
>
> Deleting stacks can have unwanted and unanticipated consequences. For important caveats, see RFC Troubleshooting section RFCs for Delete Stack.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0q0bic0ywqk6c.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "StackId": "stack-a1b2c3d4e5f67890e",
  "TimeoutInMinutes": 720
}
```

Stack | Reboot

Use to reboot all running EC2 and RDS DB instances in the specified stack.

Full classification: Management | Standard stacks | Stack | Reboot

Change Type Details

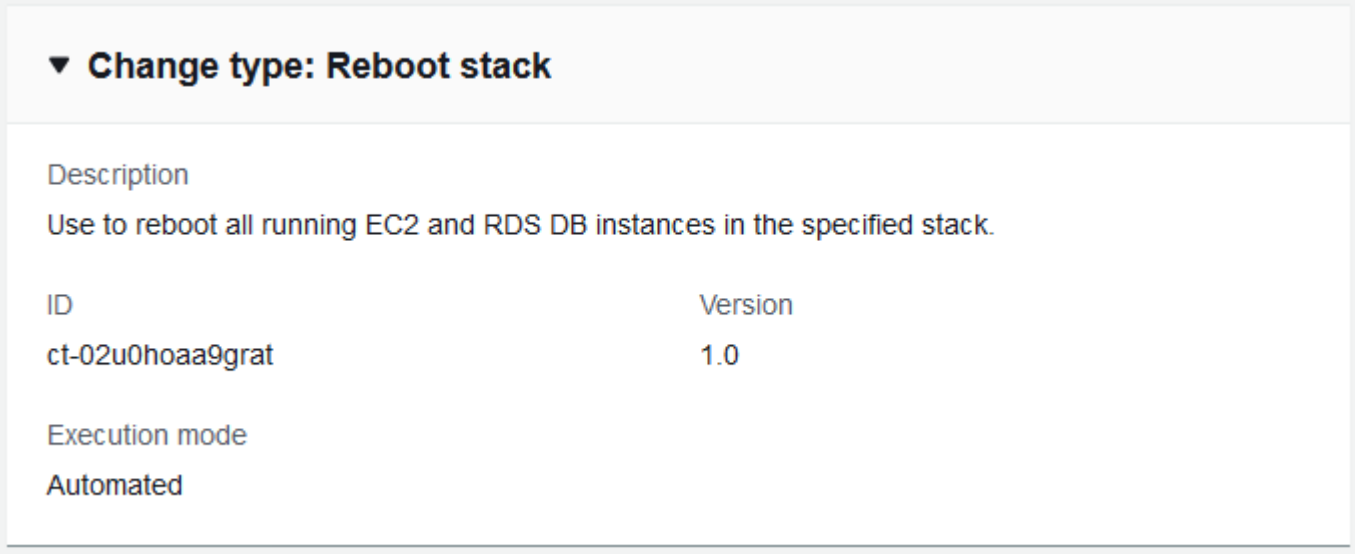
Change type ID	ct-02u0hoaa9grat
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Reboot stack

Rebooting a Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Rebooting a Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-02u0hoaa9grat" --change-type-version "1.0" --
title "Reboot My Stack" --execution-parameters "{\"StackId\":\"STACK_ID\"}"
```

TEMPLATE CREATE:

1. Output the RFC template to a file in your current folder. This example names it RebootStackRfc.json. Note that since there is only one execution parameter for stopping (rebooting, or starting) an instance, the execution parameter can be in the schema JSON file itself and there is no need to create a separate execution parameters JSON file.

   ```
   aws amscm create-rfc --generate-cli-skeleton > StopInstanceRfc.json
   ```

2. Modify and save the RebootStackRfc.json file.

The internal quotation marks in the `ExecutionParameters` JSON extension must be escaped with a backslash (\). Example:

```
{
"ChangeTypeId":          "ct-02u0hoaa9grat",
"Title":                 "Reboot-My-EC2-RFC",
"TimeoutInMinutes":      60,
"ExecutionParameters":   "{
        \"StackId\":\"STACK_ID\"
    }"
}
```

3. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://RebootStackRfc.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Application Load Balancers, see Application Load Balancers.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-02u0hoaa9grat.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "StackId": "stack-f16bbbeea61df041f"
}
```

Stack | Remediate Drift

Remediate the drift (out-of-band changes) in a stack, bringing the stack in sync and enabling you to perform future updates using the available Update CTs. Note: up to 10 drifted resources will be remediated per RFC.

Full classification: Management | Standard stacks | Stack | Remediate drift

Change Type Details

Change type ID	ct-3kinq0u4l33zf
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remediate stack drift

Remediating Stack Drift with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Remediating Stack Drift with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3kinq0u4l33zf" --change-type-version "1.0" --
title "Remediate Stack Drift, no ops review" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-StartDriftRemediation\", \"Region\": \"us-east-1\", \"Parameters
\": {\"StackName\": [\"stack-xxxxxxxxxxxxxxxxx\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RemediateDriftNrrParams.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RemediateDriftNrrParams.json
   ```

2. Modify and save the RemediateDriftNrrParams file. For example, you can replace the contents with something like this:

```
{
    "DocumentName": "AWSManagedServices-StartDriftRemediation",
    "Region": "us-east-1",
    "Parameters": {
        "StackName": [
            "stack-xxxxxxxxxxxxxxxxx"
        ]
    }
}
```

3. Output the RFC template JSON file to a file; this example names it RemediateDriftNrrRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > RemediateDriftNrrRfc.json
```

4. Modify and save the RemediateDriftNrrRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId": "ct-3kinq0u4l33zf",
"ChangeTypeVersion": "1.0",
"Title": "Remediate stack drift, no ops review"
}
```

5. Create the RFC, specifying the RemediateDriftNrrRfc file and the RemediateDriftNrrParams file:

```
aws amscm create-rfc --cli-input-json file://RemediateDriftNrrRfc.json  --
execution-parameters file://RemediateDriftNrrParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Important

Stack remediation modifies the stack template and/or parameter values. Once remediation is complete, you must update your local template repositories, or any automation, that would be updating the remediated stack, with the latest template and parameters provided

in the RFC summary of the remediation. It is very important to do this, because using the old template and/or parameters can cause destructive changes on the stack resources. For more details, including a list of *Limitations*, see Drift remediation FAQs.

Note

When using "review required" CTs, AMS recommends that you use the ASAP **Scheduling** option (choose **ASAP** in the console, leave start and end time blank in the API/CLI) as these CTs require an AMS operator to examine the RFC, and possibly communicate with you before it can be approved and run. If you schedule these RFCs, be sure to allow at least 24 hours. If approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3kinq0u4l33zf.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-StartDriftRemediation",
    "Region": "us-east-1",
    "Parameters": {
      "StackName": ["stack-a1b2c3d4e5f678900"],
      "DryRun": ["true"]
    }
}
```

Stack | Remediate Drift (Review Required)

Remediate the drift (out-of-band changes) in a stack, bringing the stack in sync and enabling you to perform future updates using the available Update CTs. Drift remediation can be performed on EC2 resource types.

Full classification: Management | Standard stacks | Stack | Remediate drift (review required)

Change Type Details

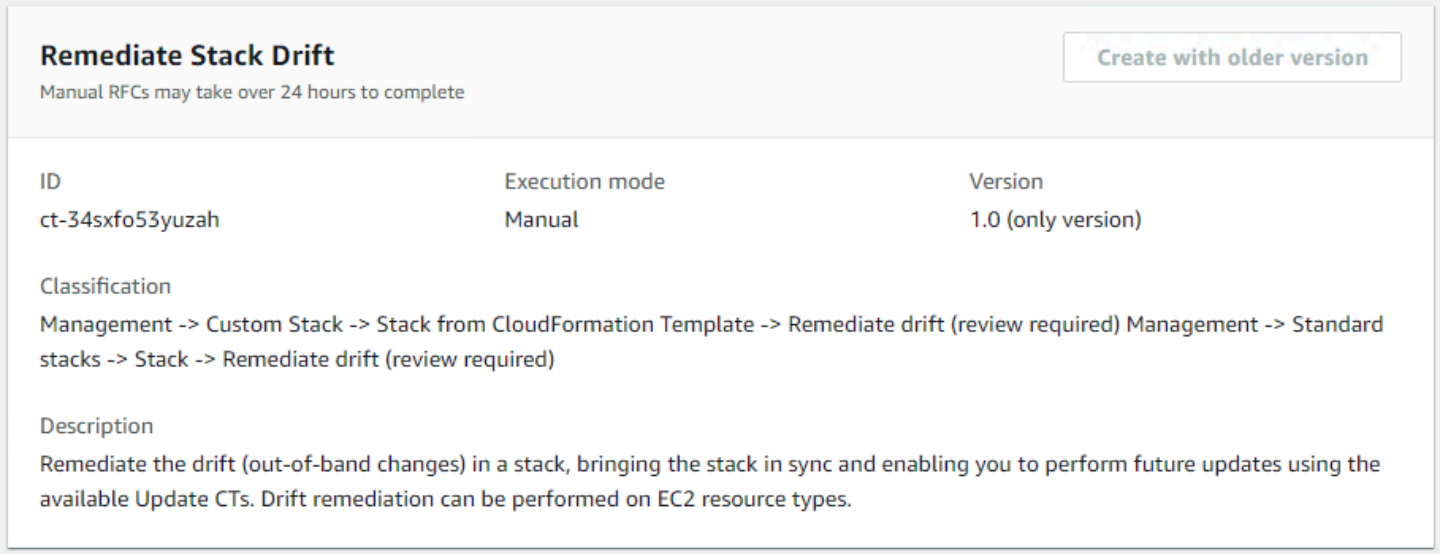
Change type ID	ct-34sxfo53yuzah
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Remediate stack drift (review required)

Remediating Stack Drift (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Remediating Stack Drift (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-34sxfo53yuzah" --change-type-version
 "1.0" --title "Remediate stack drift" --execution-parameters '{"StackName":"stack-
a1b2c3d4e5f67890e","DryRun":false}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RemediateDriftParams.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RemediateDriftParams.json
   ```

2. Modify and save the RemediateDriftParams file. For example, you can replace the contents with something like this:

   ```
   {
   "StackName" : "stack-a1b2c3d4e5f67890e",
   "DryRun" : false
   }
   ```

3. Output the RFC template JSON file to a file; this example names it RemediateDriftRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > RemediateDriftRfc.json
```

4. Modify and save the RemediateDriftRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId": "ct-34sxfo53yuzah",
"ChangeTypeVersion": "1.0",
"Title": "Remediate stack drift"
}
```

5. Create the RFC, specifying the RemediateDriftRfc file and the RemediateDriftParams file:

```
aws amscm create-rfc --cli-input-json file://RemediateDriftRfc.json  --execution-
parameters file://RemediateDriftParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

> **Note**
>
> When using "review required" CTs, AMS recommends that you use the ASAP **Scheduling** option (choose **ASAP** in the console, leave start and end time blank in the API/CLI) as these CTs require an AMS operator to examine the RFC, and possibly communicate with you before it can be approved and run. If you schedule these RFCs, be sure to allow at least 24 hours. If approval does not happen before the scheduled start time, the RFC is rejected automatically.

- There is an automated version of this change type that runs more quickly, though there are some limitations. For more details, see Stack | Remediate Drift.
- Stack remediation modifies the stack template and/or parameter values. Once remediation is complete, you must update your local template repositories, or any automation, that would be updating the remediated stack, with the latest template and parameters provided in the RFC summary of the remeditation. It is very important to do this, because using the old template and/or parameters can cause destructive changes on the stack resources.

  For more details, see Drift remediation FAQs.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-34sxfo53yuzah.

Example: Required Parameters

```
{
  "StackName": "stack-a1b2c3d4e5f678900"
}
```

Example: All Parameters

```
{
  "StackName": "stack-a1b2c3d4e5f678900",
  "DryRun": false,
  "Priority": "Medium"
}
```

Stack | Start

Use to start all stopped EC2 instances in the specified stack.

Full classification: Management | Standard stacks | Stack | Start

Change Type Details

Change type ID	ct-1h5xgl9cr4bzy
Current version	1.0

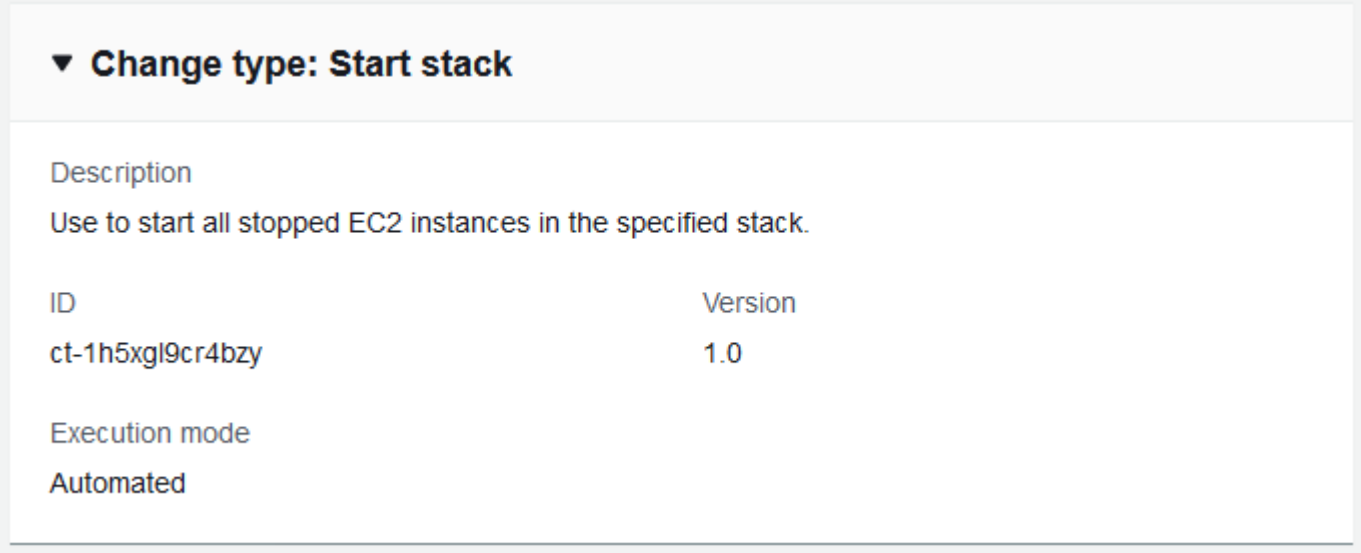
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Start stack

Starting a Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Starting a Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1h5xgl9cr4bzy" --change-type-version "1.0" --
title "Start My Stack" --execution-parameters "{\"StackId\":\"STACK_ID\"}"
```

TEMPLATE CREATE:

1. Output the RFC template to a file in your current folder. This example names it StartInstanceRfc.json. Note that since there is only one execution parameter for starting a stack, the execution parameter can be in the schema JSON file itself and there is no need to create a separate execution parameters JSON file.

   ```
   aws amscm create-rfc --generate-cli-skeleton > StartStackRfc.json
   ```

2. Modify and save the StartStackRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":          "ct-1h5xgl9cr4bzy",
   "Title":                 "Start-My-EC2-RFC",
   "TimeoutInMinutes":      60,
   "ExecutionParameters":   "{
           \"StackId\":\"STACK_ID\"
       }"
   }
   ```

3. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://StartStackRfc.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about Application Load Balancers, see Application Load Balancers.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1h5xgl9cr4bzy.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "StackId": "stack-f16bbbeea61df041f"
}
```

Stack | Stop

Use to stop all running EC2 instances in the specified stack.

Full classification: Management | Standard stacks | Stack | Stop

Change Type Details

Change type ID	ct-3dgbnh6gpst4d
Current version	1.0
Expected execution duration	60 minutes

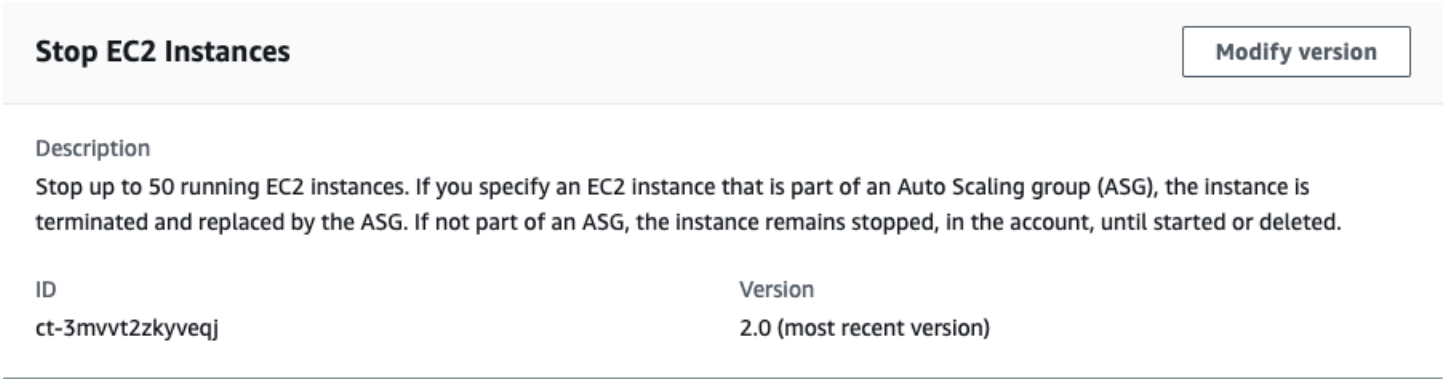
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Stop stack

Stopping an EC2 instance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Stopping an EC2 instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3mvvt2zkyveqj" --change-type-version
 "3.0" --title "Stop EC2 Instances" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-StopInstances\",\"Region\":\"us-east-1\",\"Parameters\":
{\"InstanceIds\":[\"i-1234567890abcdef0\", \"i-1234567890abcdef1\"],\"ForceStop\":
[\"false\"],\"StopASGInServiceInstances\":[\"false\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it StopEC2Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3mvvt2zkyveqj" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > StopEC2Params.json
   ```

2. Modify and save the StopEC2Params file.

   ```
   {
   "DocumentName" : "AWSManagedServices-StopInstances",
   "Region" : "us-east-1",
   "Parameters" : {
       "InstanceIds" : [
       "i-1234567890abcdef0",
       "i-1234567890abcdef1"
       ],
       "ForceStop": [
       "false"
       ],
       "StopASGInServiceInstances": [
       "false"
       ]
   }
   ```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it StopEC2Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > StopEC2Rfc.json
```

4. Modify and save the StopEC2Rfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "3.0",
"ChangeTypeId": "ct-3mvvt2zkyveqj",
"Title": "Stop EC2 Instances"
}
```

5. Create the RFC, specifying the StopEC2Rfc file and the StopEC2Params file:

```
aws amscm create-rfc --cli-input-json file://StopEC2Rfc.json --execution-parameters
 file://StopEC2Params.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is now at version 3.0. The schema has been changed so you can stop up to fifty instances.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3dgbnh6gpst4d.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "StackId": "stack-f16bbbeea61df041f"
}
```

Stack | Update Termination Protection

Update existing defined termination protection for stacks.

Full classification: Management | Standard stacks | Stack | Update termination protection

Change Type Details

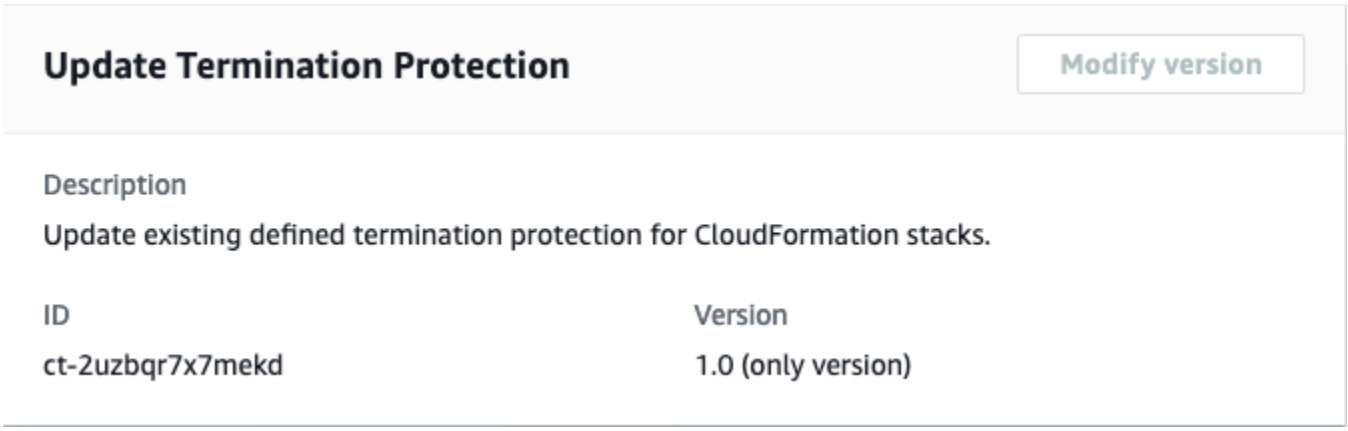
Change type ID	ct-2uzbqr7x7mekd
Current version	1.0
Expected execution duration	10 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update AWS CloudFormation stacks termination protection

Updating an AWS CloudFormation termination protection stack with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an AWS CloudFormation stack termination protection with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Only specify the parameters you want to change. Absent parameters retain the existing values.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-2uzbqr7x7mekd" \
--change-type-version "1.0" \
--title "Enable termination protection on CFN stack" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
ManageResourceTerminationProtection\",\"Region\":\"us-east-1\",\"Parameters\":
{\"ResourceId\":[\"stack-psvnq6cupymio3enl\"],\"TerminationProtectionDesiredState\":
[\"enabled\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it EnableTermProCFNParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2uzbqr7x7mekd"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    EnableTermProCFNParams.json
   ```

2. Modify and save the EnableTermProCFNParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-ManageResourceTerminationProtection",
     "Region": "us-east-1",
     "Parameters": {
       "ResourceId": ["stack-psvnq6cupymio3enl"],
       "TerminationProtectionDesiredState": ["enabled"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it EnableTermProCFNRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > EnableTermProCFNRfc.json
   ```

4. Modify and save the EnableTermProCFNRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
       "ChangeTypeId": "ct-2uzbqr7x7mekd",
       "ChangeTypeVersion": "1.0",
   ```

```
    "Title": "Enable termination protection on CFN instance"
}
```

5. Create the RFC, specifying the EnableTermProCFNRfc file and the EnableTermProCFNParams file:

```
aws amscm create-rfc --cli-input-json file://EnableTermProCFNRfc.json  --execution-
parameters file://EnableTermProCFNParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> There is a related CT for Amazon EC2, EC2 stack: Updating termination protection.

To learn more about termination protection, see Protecting a stack from being deleted.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2uzbqr7x7mekd.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-ManageResourceTerminationProtection",
  "Region": "eu-west-1",
  "Parameters": {
    "ResourceId": ["stack-1234567890abcd"],
    "TerminationProtectionDesiredState": ["enabled"]
  }
}
```

Change Type Schemas

Change type schemas specify the execution input parameters for a change type.

  "description": "Add a specific, allowed, AWS service to your AMS account. This
 CT validates prerequisites in the account and deploys a service with the default
 parameters. Not all Self-service provisioning services are supported, the ServiceName
 parameter for this CT lists the ones that are. For each service that you add, AMS
 creates a new role so you use the service without AMS management under the AMS Shared
 Responsibility model. Compliance is a shared responsibility and your AMS compliance
 status does not automatically apply to services or applications that you add in this
 way. Some AWS services do not have compliance certifications. For more information,
 see the AWS Services in Scope of AWS Assurance Program page. On that page, unless
 specifically excluded, features of each of the services are considered in scope of
 the assurance programs, and are reviewed and tested as part of our assessment when you
 submit this CT.",

 "description": "Enable Developer Mode (Dev Mode). Dev mode provides you with elevated
permissions, in AMS Plus accounts, to provision and update AWS resources outside
of the AMS change management process. Dev mode does this by leveraging native AWS
API calls within the AMS Virtual Private Cloud (VPC), enabling you to design and
implement infrastructure and applications in your managed environment. When using
an account that has Dev mode enabled, continuity management, patch management, and
change management are provided for resources provisioned through the AMS change
management process or by using an AMS Amazon Machine Image (AMI). However, these
AMS management features are not offered for resources provisioned through native
AWS APIs. Rather, you are responsible for monitoring infrastructure resources that
are provisioned outside of the AMS change management process. Dev mode is limited
to accounts with non-production workloads. With elevated permissions, you have an
increased responsibility to ensure adherence to internal controls.",

Document history

The following table describes the documentation for this release of AMS.

- **API version: 2019-05-21**
- **Latest documentation update:** May 23, 2024

Change	Description	Link(s)
New CT	Management | Advanced stack components | S3 storage | Add event notification. New CT.	ct-0o4zi9bzg74lp
Updated CT	Deployment | Standalone resources | EC2 instance | Create for WIGS (review required). Updated CT.	ct-36emj2uapfbu8
Deprecated CT	Deployment | Advanced stack components | AWS Identity and Access Management (IAM) | Create Entity or Policy (Read Permissions). Deprecated CT	
New CT	Management | Managed account | Automated IAM provisioning with read-write permissions | Update custom deny list (review required). New CT.	ct-2r9xvd3sdsic0
Updated CT	Management | Managed landing zone | Management account | Offboard application account. Updated CT.	ct-0vdiy51oyrhhm
New CT	Management | Managed Account | DNS | Migrate to Route 53.	ct-2tqi3kjcusen4

Change	Description	Link(s)
	New CT.	
Updated CT	Management | Advanced Stack Components | EBS Volume | Delete. Updated CT.	ct-3e3h8u0sp5z80
Updated CT	Deployment | Managed landing zone | Networking account | Add static route. Updated Additional Information section.	ct-3r2ckznmt0a59
Updated CT	Deployment | Advanced Stack Components | Identity and Access Management (IAM) | Create Service-Linked role. Added `CustomSuffix` input parameter.	ct-2eof6j3mlcwhf
Updated CT	Deployment | Managed Landing Zone | Management Account | Create Custom SCP (review required). Added a note in the Tips section.	ct-33ste5yc7hprs
New CT	Management | Advanced Stack Components | Route 53 Resolver | Disassociate resolver rules from VPC. New CT.	ct-2pfarpvczsstr
Updated CT	Management | Patching | Patch window | Update. Updated CT.	ct-2utx36abv83pv
Updated CT	Management | Advanced Stack Components | RDS database stack | Update deletion protection. Updated CT.	ct-2syhk4sr7cvyw
New CT	Management | Advanced Stack Components | RDS database stack | Update enhanced monitoring. New CT.	ct-3jx80fquylzhf

Change	Description	Link(s)
Updated CT	Deployment | Directory Service | DNS | Create Group Managed Service Account. Updated CT.	ct-2qhl8j1pjnbgn
Updated CT	Management | AWS Backup | Backup plan | Update. Updated CT.	ct-1ay83wy4vxa3k
Updated CT	Management | Advanced Stack Components | RDS database stack | Update master password. Updated CT.	ct-2052miu12d8fn
Updated CT	Deployment | Advanced Stack Components | ACM | Create private certificate. Updated CT.	ct-3ll9hnadql9s1
Updated CT	Deployment | Advanced Stack Components | EC2 stack | Create (with additional volumes). Updated Tips section.	ct-1aqsjf86w6vxg
Updated CT	Deployment | Advanced Stack Components | Database Migration Service (DMS) | Create Source Endpoint. Updated Tips section.	Database Migration Service (DMS) | Create Source Endpoint
New CT	Management | Advanced Stack Components | Route 53 Resolver | Associate VPC with Resolver Rule. New CT	ct-2pbqoffhclpek

Change	Description	Link(s)
Updated CT	Management | Advanced Stack Components | KMS key | Update. New CT	ct-3ovo7px2vsa6n
Updated CT	Management | Advanced Stack Components | Security group | Associate. New CT	ct-12lyw7otiyr6f
Updated CT	Management | Advanced Stack Components | Security group | Disassociate. New CT	ct-13lk0noacn6ua
Updated CT	Management | Advanced Stack Components | S3 storage | Update policy (review required). New CT	ct-0fpjlxa808sh2
Updated CT	Management | Advanced Stack Components | RDS database stack | Rotate DB certificate. New CT	ct-1ezarc5xph3tq
Updated CT	Management | Advanced Stack Components | Tag | Update (review required). New CT	ct-0zko7t3rk2efb
New CT	Management | Advanced stack components | KMS key | Share (review required). New CT	ct-05yb337abq3x5
Updated CT	Management | Advanced stack components | KMS key | Update (review required). New version	ct-3ovo7px2vsa6n

Change	Description	Link(s)
New CT	Management | Directory Service | Directory | Create AD trust.	ct-0x6dylrnfjgz5
Updated CT	Deployment | Advanced stack components | Identity and Access Management (IAM) | Create access key. Version 2.	ct-2hhqzgxvkcig8
Updated CT	Deployment | Advanced stack components | Redshift | Create (cluster subnet group). New required parameterSubnetGroupDescription.	ct-0q43l40hxrzum
Updated CTs	Deployment | Advanced stack components | EC2 Stack | Create. Deployment | Ingestion | Stack from migration partner migrated instance | Create. New optional parameter EnforceIMDSv2.	ct-14027q0sjyt1h ct-257p9zjk14ija
New CT	Management | Managed account | Stack access duration | Override (review required).	ct-0jb01cofkhwk1
New CTs	Deployment | Advanced Stack Components | Identity and Access Management (IAM) | Create entity or policy (read-write permissions). Management | Advanced Stack Components | Identity and Access Management (IAM) | Update entity or policy (read-write permissions). Management | Advanced Stack Components | Identity and Access Management (IAM) | Delete entity or policy (read-write permissions). Management | Managed account | Automated IAM provisioning with read-write permissions | Enable (review required)	ct-1n9gfnog5x7fl ct-1e0xmuy1diafq ct-17cj84y7632o6 ct-1706xvvk6j9hf

Change	Description	Link(s)
New CTs	Deployment | Managed landing zone | Management account | Create stacksets stack, ct-16pknsfa8lul7. Management | Managed landing zone | Management account | Delete stacksets stack, ct-1yqy4frl5s8y8. Management | Managed landing zone | Management account | Update stacksets stack, ct-1v9g9n30woc8h.	ct-16pknsfa8lul7 ct-1yqy4frl5s8y8 ct-1v9g9n30woc8h
Updated CT	Management | Access | Stack admin access | Grant, ct-1dmlg9g1l91h6. Version 3.0 adds support for a custom maximum stack access time. Submit an RFC with the Management | Other | Other | Update (review required) (ct-0xdawir96cy7k) change type in the SALZ account or MALZ Shared Services account to customize this value.	ct-1dmlg9g1l91h6
Updated CT	Management | Access | Stack admin access | Update, ct-0ikpop8zqhkxg. Version 3.0 adds support for a custom maximum stack access time. Submit an RFC with the Management | Other | Other | Update (review required) (ct-0xdawir96cy7k) change type in the SALZ account or MALZ Shared Services account to customize this value.	ct-0ikpop8zqhkxg
Updated CT	Management | Access | Stack read-only access | Grant, ct-199h35t7uz6jl. Version 3.0 adds support for a custom maximum stack access time. Submit an RFC with the Management | Other | Other | Update (review required) (ct-0xdawir96cy7k) change type in the SALZ account or MALZ Shared Services account to customize this value.	ct-199h35t7uz6jl

Change	Description	Link(s)
Updated CT	Management | Access | Stack read-only access | Update, ct-3kh1wiizlne1i. Version 3.0 adds support for a custom maximum stack access time. Submit an RFC with the Management | Other | Other | Update (review required) (ct-0xdawir96cy7k) change type in the SALZ account or MALZ Shared Services account to customize this value.	ct-3kh1wiizlne1i
Updated CT	Management | Access | Stack admin access | Grant, ct-1dmlg9g1l91h6. Version 3.0 is the default version, adding support for multiple usernames and access times up to 12 hours (previously 8).	ct-1dmlg9g1l91h6
Updated CT	Management | Access | Stack admin access | Update, ct-0ikpop8zqhkxg. Version 3.0 is the default version, adding support for multiple usernames and access times up to 12 hours (previously 8).	ct-0ikpop8zqhkxg
Updated CT	Management | Access | Stack read-only access | Grant, ct-199h35t7uz6jl. Version 3.0 is the default version, adding support for multiple usernames and access times up to 12 hours (previously 8).	ct-199h35t7uz6jl
Updated CT	Management | Access | Stack read-only access | Update, ct-3kh1wiizlne1i. Version 3.0 is the default version, adding support for multiple usernames and access times up to 12 hours (previously 8).	ct-3kh1wiizlne1i
New CT	Management | Advanced stack components | Bastions | Update bastion instance size (review required), ct-0tmpmp1wpgkr9.	ct-0tmpmp1wpgkr9

Change	Description	Link(s)
New CT	Management | Advanced stack components | Bastions | Update bastion instance or session counts (review required) ct-1962s5oczal9z.	ct-1962s5oczal9z
New CT	Management | Advanced stack components | Bastions | Add CIDR Ingress (review required) ct-36zubwzxp44a4.	ct-36zubwzxp44a4
New CT	Management | Advanced stack components | EC2 instance stack | Associate private ip addresses (review required), ct-1pvlhug439gl2.	ct-1pvlhug439gl2
New CT	Management | Advanced stack components | EC2 instance stack | Update instance detailed monitoring, ct-0tmpmp1wpgkr9.	ct-0tmpmp1wpgkr9
New CT	Deployment | Advanced stack components | VPC | Add static route (review required), ct-06bwg93ukgg8t.	ct-06bwg93ukgg8t
Updated CT	Management | Advanced stack components | AMI | Deregister (multiple), ct-26vhhlj9jmlpf Version 2.0 supports deregistering multiple AMIs in one request.	ct-26vhhlj9jmlpf
Updated CT	Management | Advanced stack components | Security group | Authorize ingress rule, ct-3j2zstluz6dxq. Updated to version 3.0.	ct-3j2zstluz6dxq
Updated CT	Management | Advanced stack components | Security group | Revoke ingress rule, ct-1vjbacfr4ufdv. Updated to version 3.0.	ct-1vjbacfr4ufdv
Updated CT	Deployment | AMS Resource Scheduler | Solution | Deploy, ct-0ywnhc8e5k9z5. Version 2 requires the Action (deploy or update) parameter.	ct-0ywnhc8e5k9z5

Change	Description	Link(s)
Updated CT	Management | AMS Resource Scheduler | Solution | Update, ct-2c7ve50jost1v. Version 2 requires the Action (deploy or update) parameter.	ct-2c7ve50jost1v
Updated CT	Deployment | Advanced stack components | Auto Scaling group | Create, ct-2tylseo8rxfsc. New optional parameter EnforceIMDSv2.	ct-2tylseo8rxfsc
Updated CT	Deployment | Standard stacks | High availability two-tier stack | Create, ct-06mjngx5flwto. New optional parameter EnforceIMDSv2.	ct-06mjngx5flwto
New CT	Management | Directory Service | Directory | Share Directory, ct-369odosk0pd9w.	ct-369odosk0pd9w
New CT	Management | Directory Service | Directory | Unshare Directory , ct-2xd2anlb5hbzo.	ct-2xd2anlb5hbzo
Updated CT	Management | Host security | Trend Micro DSM | Add login (read-only) , ct-0wspy4o646g9p. Version 2 has new parameters and examples. It does not require a review.	ct-0wspy4o646g9p
Updated CT	Management | Advanced stack components | AMI | Deregister, ct-26vhhlj9jmlpf. Version 2 supports deleting or deregistering multiple AMIs.	ct-26vhhlj9jmlpf
Updated CT	Deployment | Directory Service | DNS | Create conditional forwarder, ct-3nba0wtdugnan. Conditional forwarder now supports up to 5 IP addresses.	ct-3nba0wtdugnan

Change	Description	Link(s)
Updated CT	Management | Directory Service | DNS | Update conditional forwarder, ct-2fqmbyud166z9. Conditional forwarder now supports up to 5 IP addresses.	ct-2fqmbyud166z9
Updated CT	Management | Advanced stack components | EC2 instance stack | Change hostname (Linux), ct-2781aqd6f6svs. Version 2 does not require a review.	ct-2781aqd6f6svs
Updated CT	Deployment | Advanced stack components | Auto Scaling group | Create, ct-2tylseo8rxfsc. Version 3 has new parameter descriptions.	ct-2tylseo8rxfsc
Updated CT walkthrough	Management | Managed landing zone | Application account | Confirm offboarding, ct-2wlfo2jxj2rkj. Added tips.	ct-2wlfo2jxj2rkj
Updated CT walkthroughs	Management | Advanced stack components | DNS (private) | Update, ct-1d55pi44ff21u and Deployment | Advanced stack components | DNS (private) | Create, ct-0c38gftq56zj6. Added tips about 500 limit on RRs.	ct-1d55pi44ff21u and ct-0c38gftq56zj6
New CT	Deployment | Advanced stack components | VPCEndpoint (Interface) | Create, ct-3oafsdbzjtuqp.	ct-3oafsdbzjtuqp
New CT	Deployment | Advanced stack components | S3 storage | Update encryption, ct-128svy9nn2yj8.	ct-128svy9nn2yj8
New CT	Deployment | Advanced stack components | S3 storage | Update versioning, ct-2hh93eyzmwbkd.	ct-2hh93eyzmwbkd
New CT	Deployment | Advanced stack components | RDS database stack | Update instance type, ct-13swbwdxg106z.	ct-13swbwdxg106z

Change	Description	Link(s)
New CT	Deployment | Advanced stack components | RDS database stack | Update MultiAZ setting, ct-36jq7gvwyty8h.	ct-36jq7gvwyty8h
New CT	Deployment | Advanced stack components | RDS database stack | Update storage, ct-0loed9dzig1ze.	ct-0loed9dzig1ze
Updated CT	Deployment | Advanced stack components | RDS snapshot | Copy, ct-1c0jrxd3su5oe. Added support for multi-region (MRK) KMS keys.	ct-1c0jrxd3su5oe
Updated CT	Management | Advanced stack components | EC2 instance stack | Replace instance profile, ct-37kcp2v1mriu6. Updated to version 2.0 with new parameters.	ct-37kcp2v1mriu6
Updated CT	Deployment | Advanced stack components | EC2 stack | Create (with additional volumes), ct-1aqsjf86w6vxg. Added support for specifying core count and threads per core.	ct-1aqsjf86w6vxg
Updated CT	Deployment | Advanced stack components | KMS key | Create, ct-1d84keiri1jhg. Added guidance for deleting a key, and a warning that deletion does not occur automatically.	ct-1d84keiri1jhg
Updated CTs	Deployment | Advanced stack components | Tag | Create, ct-3cx7we852p3af. Updated parameters, description, and console screenshot.	ct-3cx7we852p3af
Updated CTs	Management | Advanced stack components | Tag | Update, ct-0xqwmtn1hfh8u. Updated parameters, description, and console screenshot.	ct-0xqwmtn1hfh8u

Change	Description	Link(s)
Updated CTs	Management | Advanced stack components | Tag | Delete, ct-2zebb2czoxpjd. Updated parameters, description, and console screenshot.	ct-2zebb2czoxpjd
Updated CTs	Management | Standalone resources | EC2 instance | Terminate , ct-3dfubbpesm2v9. Updated parameters, description, and console screenshot.	ct-3dfubbpesm2v9
Updated CT	Management | Advanced stack components | EC2 instance stack | Update DeleteOnTermination (review required), ct-2aaaqid7asjy6. Updated description of the DeleteOnTermination parameter.	ct-2aaaqid7asjy6
Updated CT	Management | Advanced stack components | KMS key | Update, ct-3ovo7px2vsa6n. Updated the description of the KeyRotation parameter.	ct-3ovo7px2vsa6n
Updated CT	Management | Advanced stack components | RDS database stack | Update master user password, ct-2052miu12d8fn. Updated examples and tips with additional guidance for using SSM Parameter Store or AWS Secrets Manager	ct-2052miu12d8fn
Updated CT	Management | Advanced stack components | Target group | Detach instances, ct-37bq2l9c8fzxv. Updated description of InstancesIds parameter.	ct-37bq2l9c8fzxv

Change	Description	Link(s)
Updated CTs	Added support for GP3 storage, and choice of SQL character sets to: • Deployment | Advanced stack components | RDS database stack | Create • Management | Advanced stack components | RDS database stack | Update	ct-2z60dyvto9g6c and ct-12w49boaiwtzp
Updated CTs	Added support for multi-Region KMS keys (MRK) to: • Deployment | Advanced stack components | S3 storage | Create • Management | Advanced stack components | S3 storage | Update	ct-1a68ck03fn98r and ct-1gi93jhvj28eg
CT Name Change	Deployment | Advanced stack components | OpenSearch | Create domain, ct-0azen3a9anxzj is removed and replaced with Deployment | Advanced stack components | OpenSearch | Create domain, ct-281et7bs9ep4s. This update included a change to the OpenSearch | Create domain schema.	ct-281et7bs9ep4s
New CT	Management | Managed landing zone | Networking account | Remove TGW static route, ct-0rmgrnr9w8mzh.	ct-0rmgrnr9w8mzh
New CT	Deployment | AMS Resource Scheduler | Solution | Deploy, ct-2c7ve50jost1v.	ct-0ywnhc8e5k9z5

Change	Description	Link(s)
Updated CTs	Management | Advanced stack components | DNS (private) | Create, ct-0c38gftq56zj6. Management | Advanced stack components | DNS (private) | Update, ct-1d55pi44ff21u. Management | Advanced stack components | DNS (public) | Create, ct-0vzsr2nyraedl. Management | Advanced stack components | DNS (public) | Update, ct-1hzofpphabs3i. Parameters and CLI examples have changed for version 2.0.	ct-0c38gftq56zj6, ct-1d55pi44ff21u, ct-0vzsr2nyraedl, and ct-1hzofpphabs3i
Updated CTs	Deployment | Advanced stack components | RDS database stack | Create (for Aurora), ct-2jvzjwunghrhy. Deployment | Advanced stack components | RDS database stack | Create from backup (for Aurora), ct-2wllq61djysxz. Management | Advanced stack components | RDS database stack | Update (for Aurora), ct-2dphvdy1krpj6. Updated descriptions, added min/max parameters serverless scaling, and added InstanceType values.	ct-2jvzjwunghrhy, ct-2wllq61djysxz, and ct-2dphvdy1krpj6
Updated CT	Management | Advanced stack components | EC2 instance stack | Resize, ct-15mazjj88xc69. Updated description, parameters, and CLI examples for version 2.0.	ct-15mazjj88xc69
New CT	Management | AMS Resource Scheduler | Solution | Update, ct-2c7ve50jost1v.	ct-2c7ve50jost1v

Change	Description	Link(s)
Updated CT	Management| AMS Resource Scheduler | Solution | Deploy, ct-0ywnhc8e5k9z5. Removed SALZ restriction and added Action parameter.	ct-0ywnhc8e5k9z5
New CT	Deployment | Advanced stack components | Identity and Access Management (IAM) | Create access key, ct-2hhqzgxvkcig8.	ct-2hhqzgxvkcig8
New CT	Management | Advanced stack components | Identity and Access Management (IAM) | Deleate or deactivate access key, ct-37qquo9wbpa8x.	ct-37qquo9wbpa8x
Updated CT	Deployment | Advanced stack components | Application Load Balancer | Create, ct-111r1yayblnw4. Added parameter TargetGroup to optionally specify a load balancer TargetGroup.	ct-111r1yayblnw4
Updated CT	Management | Managed landing zone | Application account | Confirm Offboarding, ct-2wlfo2jxj2rkj. Added a tip not to use this for Customer Managed application accounts.	ct-2wlfo2jxj2rkj
Updated CT	Management | Managed landing zone | Management account | Offboard application account, ct-0vdiy51oyrhhm. Added a tip: when applied to Customer Managed application accounts, there is no confirmation step.	ct-0vdiy51oyrhhm
Updated CT	Deployment | Advanced stack components | KMS alias | Create, ct-2svg4k2fqi4ak. Updated the AliasName pattern to reject names with prohibited prefixes.	ct-2svg4k2fqi4ak

Change	Description	Link(s)
New Content	The What Are AMS Change Types? file now has a link to a zip file with a current comma-separated value (CSV) file of change types.	Change type CSV output file
New CT	Management | Advanced stack components | EBS snapshot | Archive, ct-059ewa92tc2i1.	ct-059ewa92tc2i1
New CT	Management | Advanced stack components | Identity and Access Management (IAM) | Update max session duration, ct-1fzddqrr20c2i.	ct-1fzddqrr20c2i
New CT	Deployment | Advanced stack components | RDS snapshot | Create (Cluster), ct-2zqwr34epwzx1.	ct-2zqwr34epwzx1
New CT	Management | Standalone resources | RDS instance | Terminate , ct-3glr80c15rp7z.	ct-3glr80c15rp7z
New CT	Management | Advanced stack components | RDS snapshot | Delete, ct-0idxb0xsg1ui6.	ct-0idxb0xsg1ui6
New CT	Deployment | Managed landing zone | Networking account | Create transit gateway route table, ct-3dscwaeyi6cup.	ct-3dscwaeyi6cup
New CT	Management | Advanced stack components | S3 storage | Manage lifecycle configuration, ct-1ax768xtu8c9q.	ct-1ax768xtu8c9q
Updated CT	Deployment | Advanced stack components | EC2 stack | Create, ct-14027q0sjyt1h. Added a tip not to select instance types that are too small.	ct-14027q0sjyt1h
Updated CT	Management | Advanced stack components | Application Load Balancer | Update, ct-1a1zzgi2nb83d. Updated the description of the LoadBalancerSubnetIds parameter.	ct-1a1zzgi2nb83d

Change	Description	Link(s)
Updated CT	Deployment | Patching | SSM patch window | Create, ct-0el2j07llrxs7. Replaced references to Route 53 hosted zones with SSM window creation.	ct-0el2j07llrxs7
Updated CT	Management | AWS service | Self-provisioned service | Add, ct-1w8z66n899dct. List of service names updated to include AWS Private Certificate Authority (PCA)	ct-1w8z66n899dct
Updated CT	Management | AWS service | Self-provisioned service | Add (review required), ct-3qe6io8t6jtny. List of service names updated to include AWS Private Certificate Authority (PCA)	ct-3qe6io8t6jtny
Updated CT	Management | Patching | On demand patching | Run, ct-3oy53m1qzl2s5. Added a note regarding the StartInactiveInstances parameter. Inactive instances return to their inactive state after patching.	ct-3oy53m1qzl2s5
Updated CT	Management | Advanced stack components | Tag | Bulk update, ct-3047c34zuvswh. Added Supported Resources section and a link to Tag bulk update notes.	ct-3047c34zuvswh
Updated CT	Management | Advanced stack components | Tag | Bulk update (review required), ct-0k4b96aatyqgl. Added Supported Resources section and a link to Tag bulk update notes.	ct-0k4b96aatyqgl
New CT	Deployment | Advanced stack components | RDS snapshot | Copy (for Aurora), ct-19fdy7np55xiu.	ct-19fdy7np55xiu

Change	Description	Link(s)
New CT	Management | Advanced stack components | RDS database stack | Start Aurora Cluster, ct-02ocqy2i0jx3t.	ct-02ocqy2i0jx3t
New CT	Management | Advanced stack components | RDS database stack | Stop Aurora Cluster, ct-37vqa0oggka3q.	ct-37vqa0oggka3q
Updated CT schema	Management | AWS service | Self-provisioned service | Add, ct-1w8z66n899dct. The AWS Codepipeline service was removed from the possible services you could add with this CT.	ct-1w8z66n899dct
Updated CT schema	Deployment | Advanced stack components | AMI | Copy, ct-046aizcwg5idf. The **Region** parameter was updated to add: "This must be the account onboarded Region."	ct-046aizcwg5idf
Updated CT schemas	Management | Directory Service | DNS | Add A record, ct-2w3rbmnny1qpo Management | Directory Service | DNS | Add CNAME record, ct-2murl5xzbxoxf Management | Directory Service | DNS | Remove record, ct-1icrtx8ydvdwe Improved examples.	ct-2w3rbmnny1qpo ct-2murl5xzbxoxf ct-1icrtx8ydvdwe
Updated CT tips	Deployment | Advanced stack components | RDS database stack | Create from snapshot, ct-20san5sgtwd9e. Added a note: "You can't restore a DB instance from a DB snapshot that is both shared and encrypted. Instead, you can make a copy of the DB snapshot and restore the DB instance from the copy. To copy the shared snapshot, please use the following CT: RDS Snapshot | Copy".	ct-20san5sgtwd9e

Change	Description	Link(s)
Updated CT schemas	Deployment/Advanced stack components/Tag/Create, ct-3cx7we852p3af. Management/Advanced stack components/Tag/Delete, ct-2zebb2czoxpjd. Management/Advanced stack components/Tag/Update, ct-0xqwmtn1hfh8u. For all three, the **ResourceArns** parameter description was updated.	ct-3cx7we852p3af ct-2zebb2czoxpjd ct-0xqwmtn1hfh8u
Updated CT tips	Management | Directory Service | DNS | Add A record, ct-2w3rbmnny1qpo. Management | Directory Service | DNS | Add CNAME record, ct-2murl5xzbxoxf. Added a note: "For multi-account landing zone (MALZ), use this change type in the shared services account."	ct-2w3rbmnny1qpo ct-2murl5xzbxoxf
Updated content	Updated **Tips** section with information on "Linux Preparation for AMI Create," "Windows Preparation for AMI Create," and "UserData for AMI Create."	AMI | Create.
New content	Example walkthroughs for each change type have been moved here from the retired *AMS Advanced Change Management Guide*. All change types with execution mode=manual are now appended with "(review required)" to the Operation name. All change types with execution mode=automated are now appended with nothing (any cases of "(auto)" or "(no review required)" are removed).	Change Types by Classification.
New CT	Management | Managed account | Direct Change mode | Enable, CT ID: ct-3rd4781c2nnhp.	ct-3rd4781c2nnhp

Change	Description	Link(s)
Updated CTs	Change types that included "Master account" in their classific ation have all been updated to "Management account."	Managed Landing Zone Subcategory
	Removed the space in pattern for parameter: `IpProtocol .`	ct-3j2zst luz6dxq ct-0lqrua jvhwsbk ct-111fhp lhx9axe ct-1vjbac fr4ufdv
New CTs:	Management | Advanced stack components | EC2 instance stack | Change time zone (ct-3g9dbtun44mal)	ct-3g9dbt un44mal
	Management | Advanced stack components | RDS database stack | Update deletion protection	ct-2syhk4 sr7cvyw
	Deployment | Advanced stack components | Identity and Access Management (IAM) | Create service-specific credentials	ct-2ni31o yto1i5k
	Management | Advanced stack components | Identity and Access Management (IAM) | Reset service-specific credentials	ct-22cbvc 1yujhec
Updated CTs:	Deployment| Managed landing zone | Management Account | Create custom SCP (review required) (ct-33ste5yc7hprs) and Deployment| Managed landing zone | Networking account | Create application route table (review required) (ct-1urj9 4c3hdfu5) Change classification to include "(review required)" appended to the Operation name.	ct-33ste5 yc7hprs and ct-1urj94 c3hdfu5

Change	Description	Link(s)
	Deployment | Advanced stack components | Database Migration Service (DMS) | Start replication task (ct-1yq7hhqse71yg) Updated to indicate the **DocumentName** and **Region are required parameters**; previously, they were erroneously listed as optional.	ct-1yq7hhqse71yg
	Deployment | AWS Backup | Backup plan | Create (ct-2hyozbpa0sx0m) Added note to warn that not all resources types supported by AWS Backup are enabled by default. Find which services are in Getting Started 1: Service Opt-In. If changes need to be made, open an RFC using CT ct-1e1xtak34nx76.	ct-2hyozbpa0sx0m
	Deployment | Advanced stack components | Identity and Access Management (IAM) | Create EC2 instance profile (ct-117rmp64d5mvb) and Deployment | Advanced stack components | Identity and Access Management (IAM) | Create Lambda execution role (ct-1k3oui719dcju) New Version: 2.0. Updated to make JSON copy-paste easier.	ct-117rmp64d5mvb and ct-1k3oui719dcju
	Deployment | Advanced stack components | RDS database stack | Create (ct-2z60dyvto9g6c) Added a new value for the **RDSDBEngine** parameter: mariadb.	ct-2z60dyvto9g6c
	Deployment | Advanced stack components | RDS database stack | Update (ct-12w49boaiwtzp) Extended the expected duration time to 360 minutes from 60 minutes.	ct-12w49boaiwtzp

Change	Description	Link(s)
Updated CTs "Additional Information"	Added an important note about limitations on the resources that can be remediated.	ct-34sxfo53yuzah
New CTs:	Management | AWS service | Self-provisioned service | Add Self-Service Provisioning service (no review required)	ct-1w8z66n899dct
	Deployment | Advanced stack components | Identity and Access Management (IAM) | Create service-linked role	ct-2eof6j3mlcwhf
	Management | Advanced stack components | ACM | Delete certificate	ct-1q8q56cmwqj9m
	Management | Managed landing zone | Application account | Confirm offboarding	ct-2wlfo2jxj2rkj
	Management | Managed landing zone | Application account | Offboard application account	ct-0vdiy51oyrhhm
	Deployment | Managed landing zone | Management account | Create Accelerate account	ct-0vdiy51oyrhhm
Updated CTs:		

Change	Description	Link(s)
Management | AMS Resource Scheduler | Schedule | Add (ct-2bxelbn765ive) and Management | AMS Resource Scheduler | Schedule | Update (ct-3u61cd4edns0x) The **SSMMaintenanceWindow** can now take a list of AWS Systems Manager existing maintenence windows.	ct-2bxelbn765ive and ct-3u61cd4edns0x	
New CTs:	Deployment | Advanced stack components | Identity and Access Managment (IAM) | Create OpenID Connect provider	ct-30ecvfi3tq4k3

Change	Description	Link(s)
Updated CTs:	Deployment | Advanced stack components | RDS database stack | Create This update adds performance insights options.	ct-2z60dyvto9g6c
Updated CTs "Additional Information"	Many CTs had non-standard "Additional Information" sections without links to the corresponding walkthrough, this has been fixed.	January 27, 2022
New CTs:	Management | Advanced stack components | Application Load Balancer | Add listener certificate ct-3g6fq83nxg1a7	January 13, 2022
	Management | Advanced stack components | Application Load Balancer | Remove listener certificate ct-0tpbr6lfa3zng	
	Management | Advanced stack components | Load Balancer (ELB) stack | Replace listener certificate ct-0aqx5t0pgfzbg	
	Management | Advanced stack components | Network Load Balancer | Add listener certificate ct-35p977vul06df	
	Management | Advanced stack components | Network Load Balancer | Remove listener certificate ct-3929xwf222jri	
	Management | Managed landing zone | Networking account | Disable TGW propagation ct-2pxyajek47am2	

Change	Description	Link(s)
	Management | Managed landing zone | Networking account | Enable TGW propagation ct-1f9hi4bephqa9	
	Management | Standalone resources | EC2 instance | Terminate ct-3dfubbpesm2v9	
Updated CTs:	Management | Advanced stack components | EC2 Instance Stack | Gather log4j information (v2.0) ct-19f40lfm5umy8	This update provides an option to target all instances in the region.
	Management | Advanced stack components | Database Migration Service (DMS) | Start replication task and Management | Advanced stack components | Database Migration Service (DMS) | Stop replication task ct-1yq7hhqse71yg and ct-1vd3y4ygbqmfk	This change updates the task ARN regular expression to the allow tasks containing the a dash (-).
	Management | Advanced stack components | EC2 instance stack | Change hostname (Linux) ct-2781aqd6f6svs	Automated, with additional parameters, and moved to version 2.0.

Change	Description	Link(s)
	Management | Advanced stack components | EC2 instance stack | Restore volumes ct-0ffvihqwjvqj1	This update adds two optional parameters, **RootVolumeType** and **VolumeTypes**.

Change	Description	Link(s)
	A **Priority** parameter has been added to all `execution mode=manual` change types (CTs). For additional information, see RFC scheduling.	The changed CTs are: `Deployment/Monitoring and notification/GuardDuty IP set/CreateDeployment/Monitoring and notification/GuardDuty threat intel set/CreateManagement/Monitoring and notification/GuardDuty IP set/DeleteManagement/Monitoring`

New CTs:	Management | Advanced Stack Components | EC2 Instance Stack | Gather log4j information Single instance scan use v1.0, Multi instance scan use v2.0. ct-19f40lfm5umy8	December 20, 2021
New CTs:	Management | Directory service | DNS | Delete conditional forwarder ct-1icghmq38rnsn	December 17, 2021
	Management | Directory service | DNS | Update conditional forwarder ct-2fqmbyud166z9	December 17, 2021
New CTs:	Deployment | Directory service | DNS | Create conditional forwarder ct-3nba0wtdugnan	November 30, 2021
	Deployment | Directory service | DNS | Create group managed service account ct-2qhl8j1pjnbgn	November 30, 2021
	Management | Directory service | DNS | Update record permission ct-1eft8s6vdhz0w	November 30, 2021
	Management | Directory service | DNS | Update cluster permissions ct-03ytgoevfebjr	November 30, 2021

Change	Description	Link(s)
	Deployment | Advanced stack components | Identity and Access Management (IAM) | Create EC2 instance profile ct-117rmp64d5mvb	November 30, 2021
	Deployment | Advanced stack components | Identity and Access Management (IAM) | Create Lambda execution role ct-1k3oui719dcju	November 30, 2021
New CTs:	Management | Managed landing zone | Management account | Move Account to OU ct-1vq0f289r36ay	October 28, 2021
Updated CTs:	Deployment | AWS Backup | Backup plan | Create ct-2hyozbpa0sx0m. Additional parameters were for creating backup copies across accounts.	November 11, 2021
	Management | Advanced stack components | EBS snapshot | Delete ct-30bfiwxjku1nu. The CT description was expanded to mention some cavaets.	October 28, 2021
	Management | Advanced stack components | EC2 instance | Start ct-03t7kvuwx6rgr. The CT schema was updated so you can start mulitple EC2 instances.	
	Management | Advanced stack components | EC2 instance | Stop ct-3mvvt2zkyveqj. The CT schema was updated so you can stop mulitple EC2 instances. There's also a new parameter, **ForceStop**.	

Change	Description	Link(s)
	Management | AWS Backup | Recovery point | Delete ct-1r1vbr8ahr156. The CT schema was updated so you can delete mulitple recovery points.	
Updated CTs:	Deployment | Advanced stack components | Redshift | Create (cluster from snapshot) version 1.0 ct-3jrqmeq7j0wke. A new parameter, NodeType, was added.	October 14, 2021
Missing Examples	Many change type examples were missing, this has been fixed.	September 30, 2021
New CTs:	Management | Directory Service | Computer object | Remove SPN ct-1078jhyxq32dp	September 30, 2021
	Deployment | Managed landing zone | Networking account | Disassociate TGW attachment ct-3jo8yccbin4it	September 30, 2021
	Deployment | Managed landing zone | Networking account | Associate TGW attachment ct-3nmhh0qr338q6	September 30, 2021
	Deployment | Managed landing zone | Networking account | Add static route ct-3r2ckznmt0a59	September 30, 2021
	Deployment | Managed landing zone | Management account | Create Developer Mode account (with VPC) ct-38xcr0q86k9lh	September 30, 2021

Change	Description	Link(s)
	Management | Advanced stack components | Security Group | Delete (no review required) ct-18r16ldqil6w9	September 30, 2021
	Management | Advanced stack components | Security Group | Disassociate (no review required) ct-13lk0noacn6ua	September 30, 2021
Updated CTs:	Management | Advanced stack components | AMI | Deregister ct-26vhhlj9jmlpf This CT has a new parameter "DeleteSnapshots" to allow deleting snapshots associated with AMI.	September 30, 2021
	Management | Advanced stack components | AMI | Deregister ct-2r2bffv9u6q4m A note was added that you cannot use the CT with Aurora MySQL or Aurora PostgreSQL.	September 30, 2021
New CTs:	Classification (two): Management | Standard stacks | Stack | Remediate drift (auto) Management | Custom stack | Stack | Remediate drift (auto) ct-3kinq0u4l33zf.	September 16, 2021
	Management | AWS Backup | Backup plan | Enable cross account copy (Management account) ct-2yja7ihh30ply.	September 16, 2021
	Management | Advanced stack components | EC2 instance stack | Encrypt instance volumes ct-0hahohe17csnc.	September 16, 2021
Updated CTs:	Deployment | Advanced stack components | Database Migration Service (DMS) | Create replication subnet group This CT (ct-2q5azjd8p1ag5) will fail if the 'dms-vpc-role' IAM role doesn't exist in the account. ct-2q5azjd8p1ag5.	September 16, 2021

Change	Description	Link(s)
	Deployment | Advanced stack components | EC2 stack | Create The note for **InstanceType** has been updated to this "Any EC2 instance created within AMS environments have pre-configured AMS components and agents like EPS, SSM, Cloudwatch etc., which occupy the resource's capacity along with the applicati on workload. Therefore AMS does not recommend using the t2.micro/t3.micro and t2.nano/t3.nano instance types as they can impact the performance of the application and AMS tooling running on the instances. For more information, see Choosing the Right EC2 Instance Type for Your Application. ct-14027q0sjyt1h.	September 16, 2021
	Deployment | Advanced stack components | EC2 stack | Create (with additional volumes) The note for **InstanceType** has been updated to this "Any EC2 instance created within AMS environments have pre-configured AMS components and agents like EPS, SSM, Cloudwatch etc., which occupy the resource's capacity along with the applicati on workload. Therefore AMS does not recommend using the t2.micro/t3.micro and t2.nano/t3.nano instance types as they can impact the performance of the application and AMS tooling running on the instances. For more information, see Choosing the Right EC2 Instance Type for Your Application. ct-1aqsjf86w6vxg.	September 16, 2021
	Management | Advanced stack components | Security Group | Associate There is a new version and support for additional resource types. ct-12lyw7otiyr6f.	September 16, 2021

Change	Description	Link(s)
New information, a note about the difference in usage for the change types if using a single-account landing zone or multi-account landing zone account.	Deployment | AMS Resource Scheduler | Solution | Deploy ct-0ywnhc8e5k9z5. Management | AMS Resource Scheduler | State | Enable ct-2wrvu4kca9xky. Management | AMS Resource Scheduler | State | Disable ct-14v49adibs4db.	August 26, 2021
