AMS Advanced Change Type Details

AMS Advanced Change Type Reference

Version May 23, 2024

AMS Advanced Change Type Reference: AMS Advanced Change Type Details

Table of Contents

What Are AMS Change Types?

Welcome to the AWS Managed Services (AMS) Change Type Reference. Change Types are the method you use when submitting a request for change (RFC) to indicate what change you want and how it should be implemented.

Change types have a four-part classification scheme: category, subcategory, item, and operation, "CSIO" for short. The category and subcategory are higher-level concepts, and the item and operation specify an entity and the operation that is applied to the entity. For example, the change type that creates an EC2 instance has the classification `Deployment | Advanced stack components | EC2 stack | Create`, and the change type that requests administrative access to that instance has the classification `Management | Access | Stack admin access | Grant`. For more information about change types and requests for change (RFCs), see Change management in the *AMS User Guide*.

This document provides a reference for all of the AMS change types. Any request for change (RFC) that you submit to AMS requires that you specify a change type. If none of the existing change types are appropriate for your request, you can use the `Management | Other | Other | Create` or `Management | Other | Other | Update` classifications.

To learn more about using change types, see the following topics in the *AMS User Guide*:

- Understanding Change Types
- Understanding RFCs

For example walkthroughs of each change type, see the **Additional information** section for the change type, Change Types by Classification.

For a comma-separated value file of change types, open this ZIP file: Change type CSV output file (output-12.2023.zip).

> **Note**
>
> At this time, AMS operates in these AWS Regions: US East (Virginia), US West (N. California), US West (Oregon), US East (Ohio), Canada (Central), South America (São Paulo), EU (Ireland), EU (Frankfurt), EU (London), EU (Paris), Asia Pacific (Mumbai), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo)

New Regions are added frequently, however all API calls and CLI operations are run out of `us-east-1`. To learn more, see AWS Regions and availability zones.

Change Types by Classification

Current change type categories are Deployment and Mangement. The Deployment category contains change types that provision AMS resources including by copying or cloning. The Management category contains change types that operate on existing resources.

Change Type Categories

Deployment Category

Change Type Subcategories in the Deployment Category

Advanced Stack Components Subcategory

Change Type Items and Operations in the Advanced Stack Components Subcategory

- ACM | Create Public Certificate
- ACM Certificate With Additional SANs | Create
- AMI | Copy
- AMI | Create
- AMI | Create from Auto Scaling Group
- Application Load Balancer | Create
- Auto Scaling Group | Create
- Cache (ElastiCache Memcached) Stack | Create
- Cache (ElastiCache Redis) Stack | Create
- Database Migration Service (DMS) | Create Replication Instance
- Database Migration Service (DMS) | Create Replication Subnet Group
- Database Migration Service (DMS) | Create Replication Task
- Database Migration Service (DMS) | Create Source Endpoint
- Database Migration Service (DMS) | Create Source Endpoint (MongoDB)
- Database Migration Service (DMS) | Create Source Endpoint (S3)
- Database Migration Service (DMS) | Create Target Endpoint
- Database Migration Service (DMS) | Create Target Endpoint (S3)
- DNS (Private) | Create
- DNS (Public) | Create
- DynamoDB | Create from Backup
- EBS Snapshot | Copy
- EBS Snapshot | Create
- EBS Volume | Create
- EBS Volume | Create from Backup
- EC2 Stack | Create
- EC2 Stack | Create (With Additional Volumes)
- Elastic File System (EFS) | Create
- Elastic File System (EFS) | Create from Backup
- Identity and Access Management (IAM) | Create Access Key

- Identity and Access Management (IAM) | Create Account Alias
- Identity and Access Management (IAM) | Create EC2 Instance Profile
- Identity and Access Management (IAM) | Create Entity or Policy (Read-Write Permissions)
- Identity and Access Management (IAM) | Create Entity or Policy (Review Required)
- Identity and Access Management (IAM) | Create Lambda Execution Role
- Identity and Access Management (IAM) | Create OpenID Connect Provider
- Identity and Access Management (IAM) | Create SAML Identity Provider
- Identity and Access Management (IAM) | Create Service-Linked Role
- Identity and Access Management (IAM) | Create Service-Specific Credentials
- KMS Alias | Create
- KMS Key | Create
- KMS Key | Create (Review Required)
- Listener | Create (For ALB or NLB)
- Load Balancer (ELB) Stack | Create
- Load Balancer (ELB) Stack | Create (With Additional Listeners)
- Network Load Balancer | Create
- OpenSearch | Create Domain
- RDS Database Stack | Create
- RDS Database Stack | Create (For Aurora)
- RDS Database Stack | Create DB Subnet Group
- RDS Database Stack | Create from Backup
- RDS Database Stack | Create from Backup (For Aurora)
- RDS Database Stack | Create from Snapshot
- RDS Snapshot | Copy
- RDS Snapshot | Copy (For Aurora)
- RDS Snapshot | Create
- RDS Snapshot | Create (For Cluster)
- Redshift | Create (Cluster from Snapshot)
- Redshift | Create (Cluster Subnet Group)

- Redshift | Create (Cluster)
- S3 Storage | Create
- S3 Storage | Create Policy (Review Required)
- Security Group | Create
- Security Group | Create (Review Required)
- Storage Gateway | Create from Backup
- Tag | Create
- Tag | Create (Review Required)
- Target Group | Create (For ALB)
- Target Group | Create (For NLB)
- VPC | Add Static Route (Review Required)
- VPC Endpoint (Interface) | Create
- VPN Gateway | Create

ACM | Create Private Certificate

Create a private AWS Certificate Manager (ACM) certificate with email or DNS validation. To create a public ACM certificate, use ct-3ll9hnadql9s1.

Full classification: Deployment | Advanced stack components | ACM | Create private certificate

Change Type Details

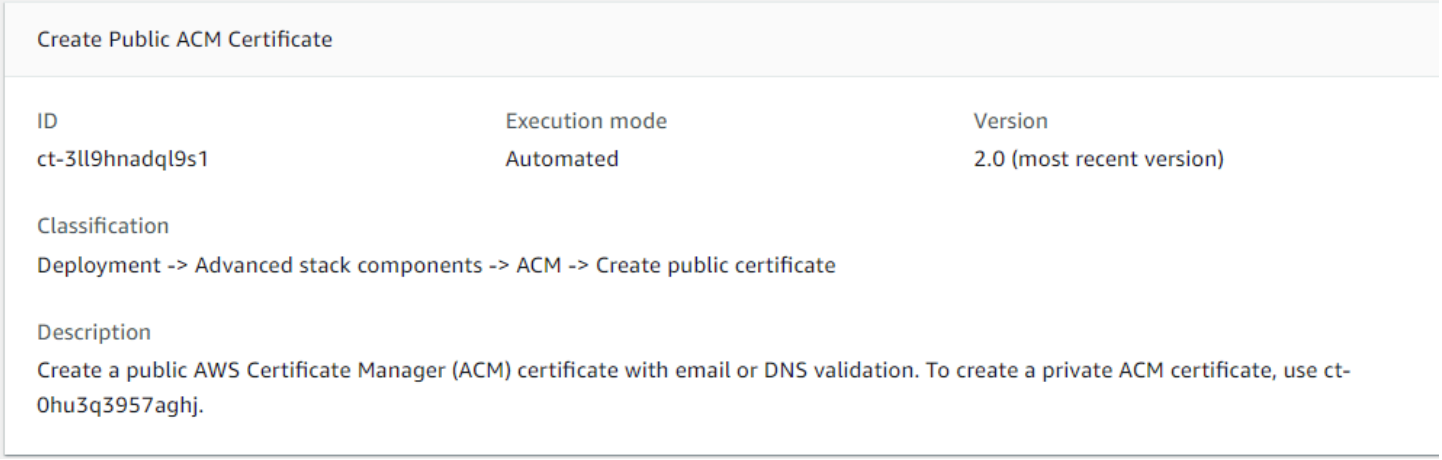
Change type ID	ct-0hu3q3957aghj
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create ACM private certificate

Creating a private ACM with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a private ACM with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0hu3q3957aghj" --change-type-version
 "2.0" --title "ACM_PRIVATE_CREATE" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-RequestACMCertificate\",\"Region\":\"eu-west-1\",
\"Parameters\":{\"DomainName\":[\"www.test.com\"],\"CertificateType\":[\"Private\"],
\"Route53DNSValidation\":[\"False\"],\"CertificateAuthorityArn\":[\"arn:aws:acm-pca:eu-
west-1:000000000000:certificate-authority/6a06b611-xxxx-xxxx-xxxx-80cbff8e0000\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateAcmPrivateParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0hu3q3957aghj"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateAcmPrivateParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-RequestACMCertificateV2",
       "Region": "eu-west-1",
       "Parameters": {
           "DomainName": [
               "www.test.com"
           ],
           "CertificateType": [
               "Private"
           ],
           "Route53DNSValidation": [
               "False"
           ],
           "CertificateAuthorityArn": [
               "arn:aws:acm-pca:eu-west-1:000000000000:certificate-authority/6a06b611-
   xxxx-xxxx-xxxx-80cbff8e0000"
           ]
   ```

```
    }
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateAcmPrivateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAcmPrivateRfc.json
```

4. Modify and save the CreateAcmPrivateRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-0hu3q3957aghj",
"ChangeTypeVersion":     "2.0",
"Title":                 "ACM-Create-Private-RFC"
}
```

5. Create the RFC, specifying the CreateAcmPrivateRfc file and the CreateAcmPrivateParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAcmPrivateRfc.json  --execution-
parameters file://CreateAcmPrivateParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about ACM certificates, see What Is AWS Certificate Manager? and ACM Certificate Characteristic.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0hu3q3957aghj.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-RequestACMCertificateV2",
  "Region": "us-east-1",
```

```
  "Parameters": {
    "DomainName": "www.example-1.com",
    "CertificateAuthorityArn": "arn:aws:acm-pca:us-east-1:000000000000:certificate-
authority/c45863f3-705e-45f6-a3d0-421cf3788800"
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-RequestACMCertificateV2",
  "Region": "us-east-1",
  "Parameters": {
    "DomainName": "www.example-1.com",
    "CertificateType": "Private",
    "CertificateAuthorityArn": "arn:aws:acm-pca:us-east-1:000000000000:certificate-
authority/c45863f3-705e-45f6-a3d0-421cf3788800",
    "SubjectAlternativeNames": [
      "www.example-1.com",
      "www.example-2.com"
    ],
    "Route53DNSValidation": "False"
  }
}
```

ACM | Create Public Certificate

Create a public AWS Certificate Manager (ACM) certificate with email or DNS validation. To create a private ACM certificate, use ct-0hu3q3957aghj.

Full classification: Deployment | Advanced stack components | ACM | Create public certificate

Change Type Details

Change type ID	ct-3ll9hnadql9s1
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required

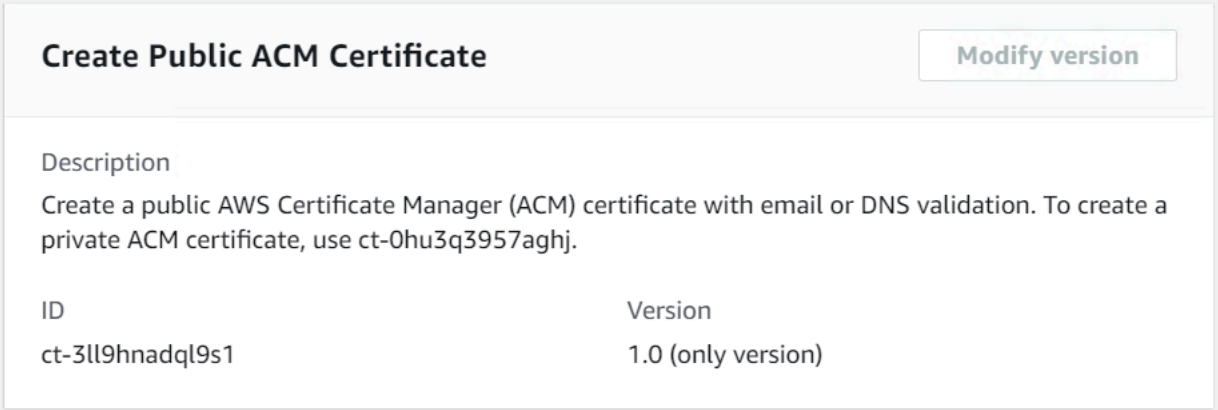
Customer approval	Not required
Execution mode	Automated

Additional Information

Create ACM public certificate

Creating a public ACM with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a public ACM with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3ll9hnadql9s1" --change-type-version
 "1.0" --title "ACM-PUBLIC-CREATE" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-RequestACMCertificate\",\"Region\":\"us-east-1\",\"Parameters
\":{\"DomainName\":[\"www.testing.com\"],\"ValidationMethod\":[\"EMAIL\"],
\"CertificateType\":[\"Public\"],\"ValidationDomain\":[\"\"],\"Route53DNSValidation\":
[\"False\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateAcmPublicParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3ll9hnadql9s1"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateAcmPublicParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-RequestACMCertificate",
       "Region": "us-east-1",
       "Parameters": {
           "DomainName": [
               "www.testing.com"
           ],
           "ValidationMethod": [
               "EMAIL"
           ],
           "CertificateType": [
               "Public"
   ```

```
        ],
        "ValidationDomain": [
            "DOMAIN"
        ],
        "Route53DNSValidation": [
            "False"
        ]
    }
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateAcmPublicRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAcmPublicRfc.json
```

4. Modify and save the CreateAcmPublicRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-3ll9hnadql9s1",
"ChangeTypeVersion":     "1.0",
"Title":                 "ACM-Create-Public-RFC"
}
```

5. Create the RFC, specifying the CreateAcmPublicRfc file and the CreateAcmPublicParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAcmPublicRfc.json  --execution-
parameters file://CreateAcmPublicParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> If set to **EMAIL**, ACM sends validation email to the following five common system addresses where *your_domain* is the domain name you entered when you initially requested a certificate and .com is the top-level domain.
>
> - administrator@your_domain.com

- hostmaster@your_domain.com
- postmaster@your_domain.com
- webmaster@your_domain.com
- admin@your_domain.com

If set to **DNS**, ACM provides you one or more CNAME records to add into your DNS database, ACM uses CNAME records to validate that you own or control a domain. If the **Route53DNSValidation** parameter is set to **true** and the ACM certificate and Route53 are in same AWS account, then the CNAME records is added automatically for the validation. If the **Route53DNSValidation** parameter is set to **false** (in the case of a third party DNS Provider), the CNAME records are stored in AWS Secrets Manager. Add the CNAME records to the DNS database manually.

To learn more about ACM certificates, see What Is AWS Certificate Manager? and ACM Certificate Characteristic.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3ll9hnadql9s1.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-RequestACMCertificateV2",
  "Region": "us-east-1",
  "Parameters": {
    "DomainName": "www.example.com",
    "ValidationMethod": "DNS"
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-RequestACMCertificateV2",
  "Region": "us-east-1",
```

```
  "Parameters": {
    "DomainName": "www.example.com",
    "CertificateType": "Public",
    "ValidationMethod": "DNS",
    "ValidationDomain": "www.example.com",
    "SubjectAlternativeNames": [
      "www.example1.com",
      "www.example2.com"
    ],
    "Route53DNSValidation": "False"
  }
}
```

Change Type Details

Change type ID	ct-3l14e139i5p50
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create ACM certificate with additional SANs

Creating an ACM with the console

The following shows this change type in the AMS console.

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an ACM with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

All parameters:

```
aws amscm create-rfc --title test-acm-certificate --change-type-id ct-3l14e139i5p50
 --change-type-version 1.0 --execution-parameters '{ "Description": "Create
 an ACM certificate", "VpcId": "VPC_ID", "Name": "Create an ACM certificate",
 "StackTemplateId": "stm-ftu71ma6q29bvulv0", "Parameters": { "DomainName":
 "*.example.com", "ValidationDomain": "example.com", "SubjectAlternativeName1":
 "*.example-domain.com", "SubjectAlternativeNameValidationDomain1":
 "example-domain.com", "SubjectAlternativeName2": "*.example.net",
 "SubjectAlternativeNameValidationDomain2": "example.net", "SubjectAlternativeName3":
 "*.example-domain.net", "SubjectAlternativeNameValidationDomain3":
 "example-domain.net", "SubjectAlternativeName4": "*.example.org",
 "SubjectAlternativeNameValidationDomain4": "example.org", "SubjectAlternativeName5":
 "*.example-domain.org", "SubjectAlternativeNameValidationDomain5": "example-
domain.org" }, "TimeoutInMinutes": 60 }'
```

Only required parameters:

```
aws amscm create-rfc --title test-acm-certificate --change-type-id ct-3l14e139i5p50
 --change-type-version 1.0 --execution-parameters '{ "Description": "Create
 an ACM certificate", "VpcId": "VPC_ID", "Name": "Create an ACM certificate",
 "StackTemplateId": "stm-ftu71ma6q29bvulv0", "Parameters": { "DomainName":
 "*.example.com" }, "TimeoutInMinutes": 60 }'
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateAcmParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3l14e139i5p50" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateAcmParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-ftu71ma6q29bvulv0",
   ```

```
"DomainName":    "DOMAIN_NAME"
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateAcmRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAcmRfc.json
```

4. Modify and save the CreateAcmRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-3l14e139i5p50",
"ChangeTypeVersion":     "1.0",
"Title":                 "ACM-Create-RFC"
}
```

5. Create the RFC, specifying the CreateAcmRfc file and the CreateAcmParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAcmRfc.json  --execution-
parameters file://CreateAcmParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> The timeout setting isn't only about execution, but also your validation of the ACM certificate through email validation. Without your validation, the RFC fails.

To learn more about ACM certificates, see What Is AWS Certificate Manager? and ACM Certificate Characteristics.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3l14e139i5p50.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "Parameters": {
    "DomainName": "example.com",
    "ValidationDomain": "example.com",
    "SubjectAlternativeName1": "domain-1.example.com",
    "SubjectAlternativeNameValidationDomain1": "domain-1.example.com",
    "SubjectAlternativeName2": "domain-2.example.com",
    "SubjectAlternativeNameValidationDomain2": "domain-2.example.com",
    "SubjectAlternativeName3": "domain-3.example.com",
    "SubjectAlternativeNameValidationDomain3": "domain-3.example.com",
    "SubjectAlternativeName4": "domain-4.example.com",
    "SubjectAlternativeNameValidationDomain4": "domain-4.example.com",
    "SubjectAlternativeName5": "domain-5.example.com",
    "SubjectAlternativeNameValidationDomain5": "domain-5.example.com"
  },
  "StackTemplateId": "stm-ftu71ma6q29bvulv0",
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567890abcdef"
}
```

AMI | Copy

Copy an Amazon Machine Image (AMI) in your AMS account.

Full classification: Deployment | Advanced stack components | AMI | Copy

Change Type Details

Change type ID	ct-046aizcwg5idf
Current version	1.0
Expected execution duration	60 minutes

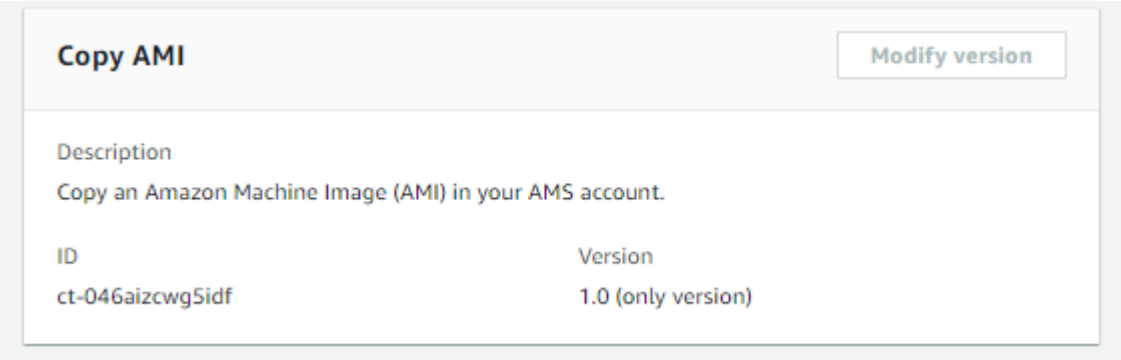
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Copy an AMI

Copying an AMI with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Copying an AMI with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-046aizcwg5idf" --change-type-version "1.0" --
title "Copy AMI" --execution-parameters "{\"DocumentName\":\"AWSManagedServices-CopyAMI
\",\"Region\":\"us-east-1\",\"Parameters\":{\"Name\":[\"AmiName\"],\"SourceImageId
\":[\"ami-1234567890abcdef0\"],\"SourceRegion\":[\"ap-southeast-2\"],\"Encrypted\":
[\"True\"],\"KmsKeyId\":[\"01234567-abcd-abcd-abcd-0123456789ab\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CopyAmiParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-046aizcwg5idf" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CopyAmiParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CopyAMI",
     "Region": "us-east-1",
     "Parameters": {
       "Name": [
         "AmiName"
       ],
       "SourceImageId": [
         "ami-1234567890abcdef0"
       ],
       "SourceRegion": [
         "ap-southeast-2"
       ],
       "Encrypted": [
   ```

```
      "True"
    ],
    "KmsKeyId": [
      "01234567-abcd-abcd-abcd-0123456789ab"
    ]
  }
}
```

3. Output the RFC template JSON file; this example names it CopyAmiRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CopyAmiRfc.json
```

4. Modify and save the CopyAmiRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-046aizcwg5idf",
  "Title": "Copy AMI"
}
```

5. Create the RFC, specifying the CopyAmiRfc file and the CopyAmiParams file:

```
aws amscm create-rfc --cli-input-json file://CopyAmiRfc.json  --execution-
parameters file://CopyAmiParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about copying AMIs, see Copying an AMI.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-046aizcwg5idf.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CopyAMI",
```

```
  "Region": "us-east-1",
  "Parameters": {
    "Name": [
      "AmiName"
    ],
    "SourceImageId": [
      "ami-1234567890abcdef0"
    ],
    "SourceRegion": [
      "ap-southeast-2"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CopyAMI",
  "Region": "us-east-1",
  "Parameters": {
    "Name": [
      "AmiName"
    ],
    "SourceImageId": [
      "ami-1234567890abcdef0"
    ],
    "SourceRegion": [
      "ap-southeast-2"
    ],
    "Encrypted": [
      "True"
    ],
    "KmsKeyId": [
      "arn:aws:kms:us-west-2:111122223333:key/01234567-abcd-abcd-abcd-0123456789ab"
    ]
  }
}
```

AMI | Create

Create an Amazon Machine Image (AMI) based on an existing standalone EC2 instance in your AMS account. The instance must be in the stopped state before running this change type.

Full classification: Deployment | Advanced stack components | AMI | Create

Change Type Details

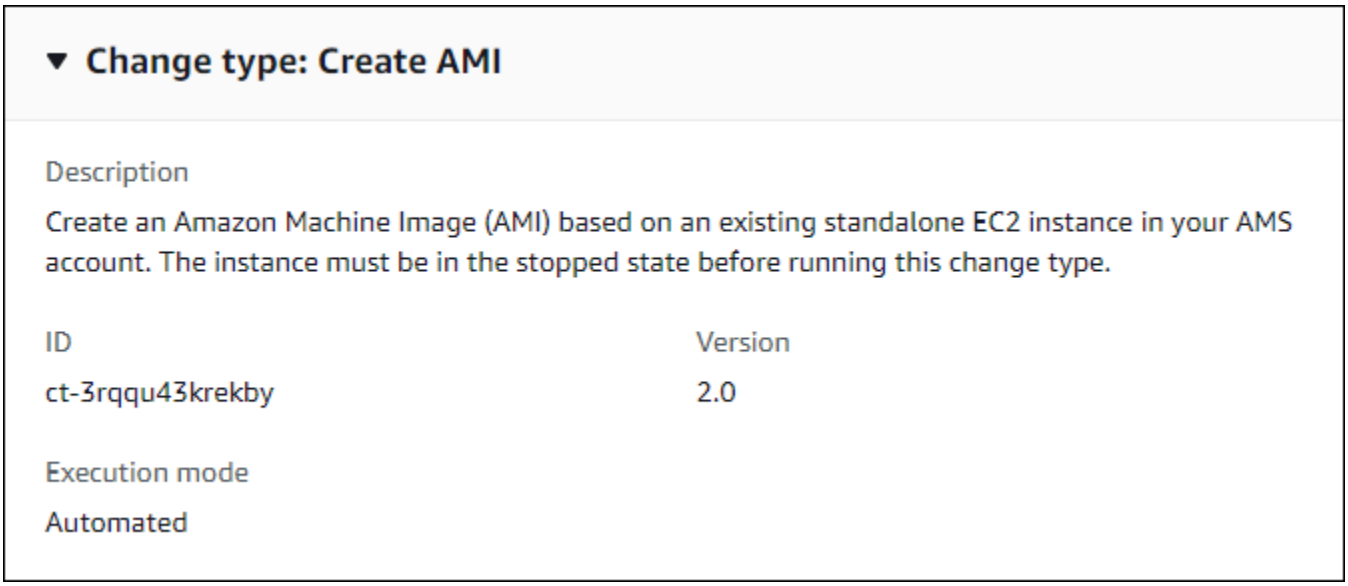
Change type ID	ct-3rqqu43krekby
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create an AMI

Creating an AMI with the console

The following shows this change type in the AMS console.



> **Important**
>
> Before you begin, prepare the EC2 instance that you will use to create the AMI. Without proper preparation, the create AMI RFC is likely to be rejected or fail. For information about preparing your instance to successfully create an AMI, see the instructions included in this tutorial.

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an AMI with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-3rqqu43krekby" --change-type-version "2.0" --title "AMI-Create-IC" --
execution-parameters "{\"AMIName\":\"MyAmi\",\"VpcId\":\"VPC_ID\",\"EC2InstanceId\":
\"INSTANCE_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateAmiParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-3rqqu43krekby" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateAmiParams.json
```

2. Modify and save the execution parameters CreateAmiParams.json file. For example, you can replace the contents with something like this:

```
{
"AMIName":          "My-AMI",
"InstanceId":    "EC2_INSTANCE_ID"
}
```

3. Output the RFC template JSON file to a file in your current folder; this example names it CreateAmiRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAmiRfc.json
```

4. Modify and save the CreateAmiRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":         "ct-3rqqu43krekby",
"ChangeTypeVersion":    "2.0",
"Title":                "AMI-Create-RFC"
}
```

5. Create the RFC, specifying the CreateAmiRfc file and the CreateAmiParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAmiRfc.json  --execution-
parameters file://CreateAmiParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> After you have created a custom AMI, you can submit a service request to AMS to have your existing EC2 Auto Scaling group use the new AMI. For information about creating a service request, see Service Request Examples.

> **Important**
>
> Before you begin, prepare the EC2 instance that you will use to create the AMI. Without proper preparation, the create AMI RFC is likely to be rejected or fail.
> To avoid authentication issues from instances created from the new AMI, run these system commands on the instance after applying custom changes, and prior to calling the Create AMI CT.

> **Important**
>
> If the specified instance isn't stopped and separated from its current domain, the AMI creation RFC fails. Prepare the instance as described.
> For more information, see Create a Standard Amazon Machine Image Using Sysprep.

You can subscribe to an AMS SNS AMI notification topic to receive an alert whenever new AMS AMIs of interest to you are deployed. For more information, see AMS AMI Notification Service.

Linux Preparation for AMI Create

Download and run the following script to prepare your instance for AMI creation. You must run this script as the root user.

```
curl https://amazon-ams-us-east-1.s3.amazonaws.com/latest/linux/
prepare_instance_for_ami_and_shutdown.sh -o ./prepare_instance_for_ami_and_shutdown.sh
chmod 744 prepare_instance_for_ami_and_shutdown.sh
./prepare_instance_for_ami_and_shutdown.sh
```

Note: The preceding script performs a shut down on the instance and connected users are logged out from the session.

Windows Preparation for AMI Create

Windows Powershell (run as Administrator):

```
Invoke-AMSSysprep
```

The instance is stopped and any connected user is logged out from the current Windows RDP session.

For more info on creating AWS Windows AMIs, see Create a custom Windows AMI.

UserData for AMI Create

If you need user data to be executed on the next boot from your AMI, ensure the following:

- Registry Key `HKEY_LOCAL_MACHINE\SOFTWARE\Amazon\ManagedServices\RunUserDataViaAMSBootModule` is present; if that key is not present, user data will not be run next time.
- To enable user data to be run on next boot:
  1. Start a Windows PowerShell under administrator privilege (run as administrator)
  2. Run the following command:

     ```
     Install-AMSDependencies
     ```

For information about failed AMI Create RFCs, see RFC failure troubleshooting.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3rqqu43krekby.

Example: Required Parameters

```
{
  "InstanceId": "i-01234567890abcdef",
```

```
  "AmiName": "MyAMI"
}
```

Example: All Parameters

```
{
  "InstanceId": "i-12345678",
  "AmiName": "MyAMI",
  "AmiTags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ]
}
```

AMI | Create from Auto Scaling Group

Create an Amazon Machine Image (AMI) from an EC2 Instance in an Auto Scaling group.

Full classification: Deployment | Advanced stack components | AMI | Create from Auto Scaling group

Change Type Details

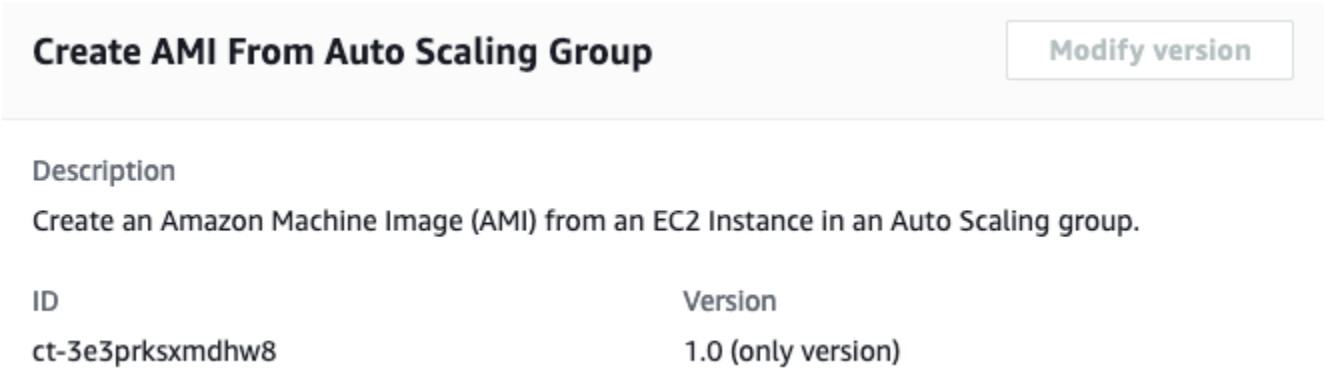
Change type ID	ct-3e3prksxmdhw8
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create AMIs from Auto Scaling groups (ASGs)

Creating an AMI from an ASG with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an AMI from an ASG with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-3e3prksxmdhw8" --change-type-version "2.0" --title "AMI-Create-IC" --
execution-parameters "{\"AMIName\":\"MyAmi\",\"VpcId\":\"VPC_ID\",\"EC2InstanceId\":
\"INSTANCE_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateAmiFromAsgParams.json:

   ```
   aws amscm create-rfc --change-type-id "ct-3e3prksxmdhw8" --change-type-version
    "1.0" --title "Create AMI from an Auto Scaling group" --execution-parameters
    "{\"DocumentName\": \"AWSManagedServices-CreateAmiInAutoScalingGroup\",\"Region
   \": \"us-east-1\",\"Parameters\": {\"AutoScalingGroupName\": [\"stack-ab0123cdef-
   ASG-1ABC2345\"],\"Sysprep\": [\"False\"],\"StopInstance\": [\"False\"]}}"
   ```

2. Modify and save the execution parameters CreateAmiFromAsgParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateAmiInAutoScalingGroup",
     "Region": "us-east-1",
     "Parameters": {
       "AutoScalingGroupName": [
         "stack-ab0123cdef-ASG-1ABC2345"
       ],
       "Sysprep": [
         "False"
       ],
       "StopInstance": [
         "False"
       ]
     }
   }
   ```

3. Output the RFC template JSON file to a file in your current folder; this example names it CreateAmiFromAsgRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAmiFromAsgRfc.json
```

4. Modify and save the CreateAmiFromAsgRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3e3prksxmdhw8",
  "Title": "Create AMI from an Auto Scaling group"
}
```

5. Create the RFC, specifying the CreateAmiFromAsgRfc file and the CreateAmiFromAsgParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAmiFromAsgRfc.json  --execution-
parameters file://CreateAmiFromAsgParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> After you have created a custom AMI, you can submit a service request to AMS to have your existing EC2 Auto Scaling group use the new AMI. For information about creating a service request, see Service Request Examples.

For information about failed AMI Create RFCs, see RFC failure troubleshooting.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3e3prksxmdhw8.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateAmiInAutoScalingGroup",
  "Region" : "us-east-1",
  "Parameters" : {
    "AutoScalingGroupName" : [
      "TestASG"
    ],
    "Sysprep" : [
      "False"
    ],
    "StopInstance" : [
      "False"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateAmiInAutoScalingGroup",
  "Region" : "us-east-1",
  "Parameters" : {
    "AutoScalingGroupName" : [
      "TestASG"
    ],
    "Sysprep" : [
      "False"
    ],
    "StopInstance" : [
      "False"
    ]
  }
}
```

Application Load Balancer | Create

Create an AWS Application Load Balancer (ALB), with additional listeners.

Full classification: Deployment | Advanced stack components | Application Load Balancer | Create

Change Type Details

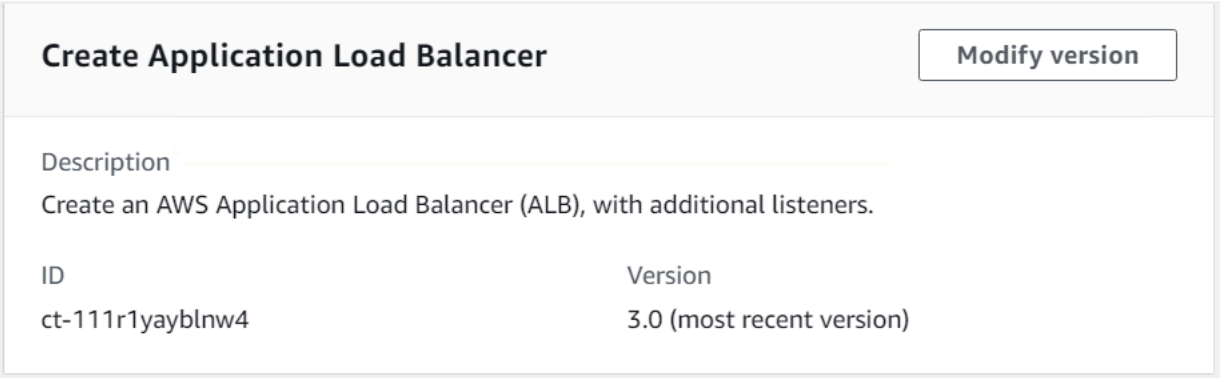
Change type ID	ct-111r1yayblnw4
Current version	3.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create application load balancer (ALB)

Creating an ALB with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an ALB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  --profile saml --region us-east-1 create-rfc --change-type-id
 "ct-111r1yayblnw4" --change-type-version "3.0" --title 'Create ALB' --description
 "My Test ALB"  --execution-parameters ""{\"Description\":\"Test ALB\",\"VpcId\":
\"VPC_ID\",\"Name\":\"TestStack\",\"StackTemplateId\":\"stm-sd7uv500000000000\",
\"TimeoutInMinutes\":360,\"LoadBalancer\":{\"SecurityGroups\":[\"SG_ID\"],\"SubnetIds
\":[\"SUBNET_ID\",\"SUBNET_ID\"]},\"Listener1\":{\"Port\":\"443\",\"Protocol\":
\"HTTPS\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file. For example, you can replace the contents with something like this:

   ```
   aws amscm get-change-type-version --change-type-id "ct-111r1yayblnw4" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateAlbParams.json
   ```

2. Modify and save the CreateAlbParams file. For example:

   ```
   {
   "Description":      "ALB-Create",
   "VpcId":            "VPC_ID",
   "Name":             "My-ALB",
   "StackTemplateId":  "stm-sd7uv500000000000",
   "TimeoutInMinutes" : 360,
   ```

```
"LoadBalancer" : {
    "SecurityGroups" : ["SG_ID"],
    "SubnetIds" : ["SUBNET_ID", "SUBNET_ID"]
  },
  "Listener1" : {
    "Port" : "443",
    "Protocol" : "HTTPS"
  }
}
```

3. Output the RFC template to a file in your current folder. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAlbRfc.json
```

4. Modify and save the CreateAlbRfc.json file. For example:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-111r1yayblnw4",
"Title":                "ALB-Create-RFC"
}
```

5. Create the RFC, specifying the CreateAlbRfc file and the CreateAlbParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAlbRfc.json --execution-
parameters file://CreateAlbParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> As of version 3.0, you can also configure four CloudWatch alarms with customized alarm thresholds.

> **Note**
>
> To open ports and associate all the load balancer resources, submit a Management | Advanced stack components | Security groups | Update RFC.

To learn more about AWS Application Load Balancers, see What Is an Application Load Balancer?

To create an Application Load Balancer listener, see Target Group | Create (For ALB).

To create an Application Load Balancer target group, see Create ALB target group.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-111r1yayblnw4.

Example: Required Parameters

```
{
    "Description" : "Test description",
    "VpcId" : "vpc-1234567890abcdef0",
    "Name" : "TestStack",
    "StackTemplateId" : "stm-sd7uv500000000000",
    "TimeoutInMinutes" : 360,
    "LoadBalancer" : {
      "SecurityGroups" : ["sg-1234567890abcdef0"],
      "SubnetIds" : ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
    },
    "Listener1" : {
      "Port" : "443",
      "Protocol" : "HTTPS"
    }
}
```

Example: All Parameters

```
{
    "Description" : "Test description",
    "VpcId" : "vpc-1234567890abcdef0",
    "Name" : "TestStack",
    "Tags" : [
      {
```

```
        "Key" : "foo",
        "Value" : "bar"
      }
    ],
    "StackTemplateId" : "stm-sd7uv500000000000",
    "TimeoutInMinutes" : 360,
    "LoadBalancer" : {
      "Name" : "MyLoadBalancer",
      "SecurityGroups" : ["sg-1234567890abcdef0"],
      "SubnetIds" : ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"],
      "Public" : "true",
      "DeletionProtection" : "false",
      "IdleTimeout" : "60"
    },
    "Listener1" : {
      "Port" : "443",
      "Protocol" : "HTTPS",
      "SSLCertificateArn" : "arn:aws:acm:ap-southeast-2:012345678912:certificate/
e23c3545-e92d-4542-83b8-63483505b5a5",
      "SSLPolicy" : "ELBSecurityPolicy-TLS-1-2-Ext-2018-06"
    },
    "Listener2" : {
      "Port" : "8080",
      "Protocol" : "HTTP"
    },
    "TargetGroup" : {
      "Name" : "MyTargetGroup",
      "HealthCheckInterval" : "10",
      "HealthCheckPath" : "/thing/index.html",
      "HealthCheckPort" : "8080",
      "HealthCheckProtocol" : "HTTP",
      "HealthCheckTimeout" : "10",
      "HealthyThreshold" : "2",
      "UnhealthyThreshold" : "10",
      "ValidHTTPCode" : "200",
      "TargetPort" : "80",
      "TargetProtocol" : "HTTP",
      "DeregistrationDelayTimeout" : "300",
      "SlowStartDuration" : "30",
      "CookieExpirationPeriod" : "20",
      "TargetType" : "instance"
    },
    "HealthyHostsAlarm": {
      "EvaluationPeriods": "10",
```

```
      "Period": "120",
      "Threshold": "1.0"
    },
    "HTTPCodeELB5XXCountAlarm": {
      "EvaluationPeriods": "5",
      "Period": "360",
      "Threshold": "2.0"
    },
    "TargetConnectionErrorsAlarm": {
      "EvaluationPeriods": "5",
      "Period": "360",
      "Threshold": "2.0"
    },
    "RejectedConnectionCountAlarm": {
      "EvaluationPeriods": "10",
      "Period": "120",
      "Threshold": "1.0"
    }
}
```

Auto Scaling Group | Create

Use to create an Auto Scaling group, the launch configuration to use to create new instances when needed, and CloudWatch metrics and alarms for the group.

Full classification: Deployment | Advanced stack components | Auto Scaling group | Create

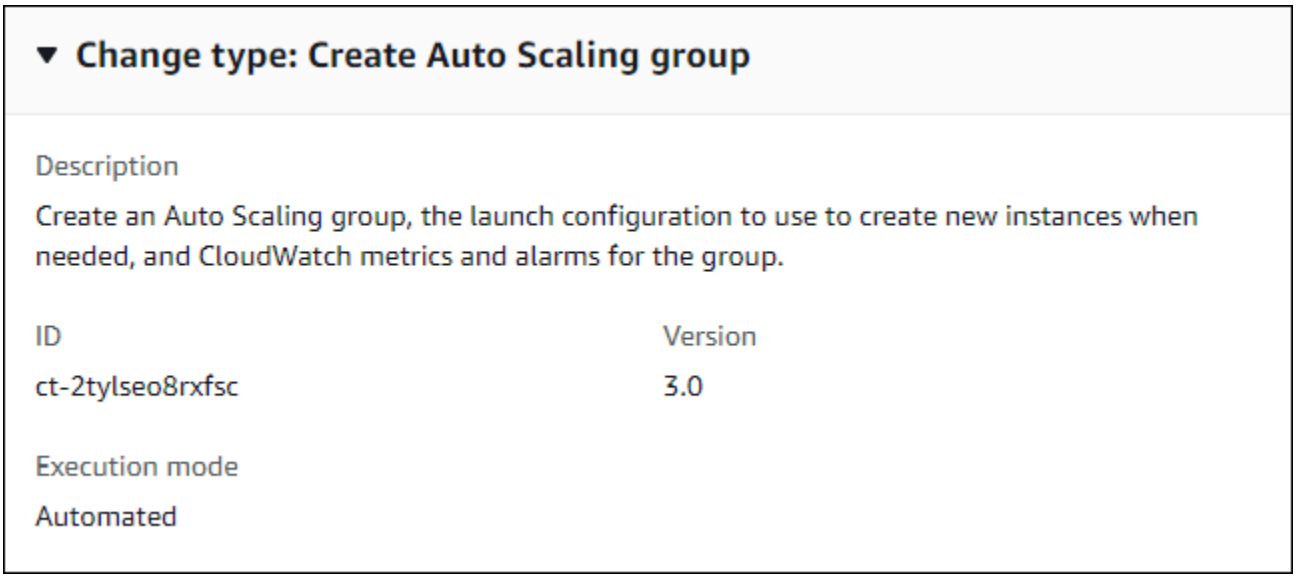
Change Type Details

Change type ID	ct-2tylseo8rxfsc
Current version	4.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create Auto Scaling groups

Creating an Auto Scaling group with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an Auto Scaling group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

1. Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example:

   Required parameters only:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-2tylseo8rxfsc" --change-type-version "3.0" --title "ASG-Create-QC" --execution-
parameters "{\"Description\":\"Create a new ASG\",\"VpcId\":\"VPC_ID\",\"Name\":
\"MyASG\",\"TimeoutInMinutes\":360,\"Parameters\":{\"InstanceAmiId\":\"AMI_ID\",
\"InstanceSubnetId\":\"SUBNET_ID\"}}"
```

   Most parameters, except `Tags` and `UserData`:

```
aws --profile saml amscm create-rfc --change-type-id "ct-2tylseo8rxfsc" --
change-type-version "3.0" --title "Stack-Create-ASG-IC" --execution-parameters
 "{\"Description\":\"MyTestASG\",\"VpcId\":\"VPC_ID\",\"StackTemplateId
\":\"stm-suw38u20000000000\",\"Name\":\"MyTestASG\",\"TimeoutInMinutes
\":60,\"Parameters\":{\"ASGAmiId\":\"ami-0021317f\",\"ASGCooldown\":300,
\"ASGDesiredCapacity\":1,\"ASGEBSOptimized\":false,\"ASGHealthCheckGracePeriod
\":1800,\"ASGIAMInstanceProfile\":\"customer-mc-ec2-instance-profile\",
\"ASGInstanceDetailedMonitoring\":true,\"ASGInstanceRootVolumeIops\":0,
\"ASGInstanceRootVolumeName\":\"TEST\",\"ASGInstanceRootVolumeType\":
\"standard\",\"ASGInstanceType\":\"m4.large\",\"ASGMaxInstances\":1,
\"ASGMinInstances\":1,\"ASGScaleDownMetricName\":\"CPUUtilization\",
\"ASGScaleDownPolicyCooldown\":300,\"ASGScaleDownPolicyEvaluationPeriods\":4,
\"ASGScaleDownPolicyPeriod\":60,\"ASGScaleDownPolicyScalingAdjustment\":-1,
\"ASGScaleDownPolicyStatistic\":\"Average\",\"ASGScaleDownPolicyThreshold
\":35,\"ASGScaleUpMetricName\":\"CPUUtilization\",\"ASGScaleUpPolicyCooldown
\":60,\"ASGScaleUpPolicyEvaluationPeriods\":2,\"ASGScaleUpPolicyPeriod\":60,
\"ASGScaleUpPolicyScalingAdjustment\":2,\"ASGScaleUpPolicyStatistic\":\"Average\",
\"ASGScaleUpPolicyThreshold\":75,\"ASGSubnetIds\":[\"SUBNET1_ID\",\"SUBNET2_ID\"],
\"ASGUserData\":\"\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file in your current folder; this example names it CreateAsgParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-2tylseo8rxfsc" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateAsgParams.json
```

2. Modify and save the schema as follows. For example, you can replace the contents with something like this:

> **Note**
>
> Scripts are newline-delimited (separate with literal: "\n"), also, scripts entered as UserData are executed as the "root" user and do not need to use the "sudo" command. The RFC waits up to six hours for all of the UserData script commands to run before returning a final status of success or failure.

```
{
"Description":                          "Create_WordPress_ASG",
"VpcId":                                "VPC_ID",
"StackTemplateId":                      "stm-suw38u00000000000",
"Name":                                 "WP_ASG",
"Tags":                                 [{"Key": "Name","Value": "WP_ASG"}],
"TimeoutInMinutes":                     60,
"ASGAmiId":                             "AMI_ID",
"ASGLoadBalancerNames":                 ["ELB_NAME"],
"ASGSubnetIds":                         ["PRIVATE_AZ1", "PRIVATE_AZ2"],
"ASGUserData":  "#!/bin/bash \n
                REGION=$(curl 169.254.169.254/latest/meta-data/placement/
availability-zone/ | sed 's/[a-z]$//') \n
                yum -y install ruby httpd \n
                chkconfig httpd on \n
                service httpd start \n
                touch /var/www/html/status \n
                cd /tmp \n
                curl -O https://aws-codedeploy-$REGION.s3.amazonaws.com/latest/
install \n
                chmod +x ./install \n
                ./install auto \n
                chkconfig codedeploy-agent on \n
                service codedeploy-agent start"
}
```

3. Output the JSON template for CreateRfc to a file in your current folder; example names it CreateAsgRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAsgRfc.json
```

4. Modify and save the JSON file as follows. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-2tylseo8rxfsc",
"Title":                "ASG-For-WP-Stack-RFC"
}
```

5. Create the RFC, specifying the CreateAsgRfc file and the execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CreateAsgRfc.json --execution-
parameters file://CreateAsgParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

To learn more, see Amazon Auto Scaling.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2tylseo8rxfsc.

Example: Required Parameters

```
{
```

```
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "StackTemplateId": "stm-suw38u40000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ASGAmiId": "ami-1234567890abcdef0",
    "ASGSubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234abcd",
  "StackTemplateId": "stm-suw38u40000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ASGAmiId": "ami-12345678",
    "ASGCooldown": 300,
    "ASGDesiredCapacity": 1,
```

```
    "ASGEBSOptimized": false,
    "ASGIAMInstanceProfile": "customer-mc-ec2-instance-profile",
    "ASGInstanceDetailedMonitoring": false,
    "ASGInstanceRootVolumeIops": 0,
    "ASGInstanceRootVolumeName": "/dev/xvda",
    "ASGInstanceRootVolumeSize": 8,
    "ASGInstanceRootVolumeType": "standard",
    "ASGInstanceType": "m3.medium",
    "ASGLoadBalancerNames": ["elb1"],
    "ASGMaxInstances": 1,
    "ASGMinInstances": 1,
    "ASGHealthCheckGracePeriod": 600,
    "ASGHealthCheckType":"EC2",
    "ASGScaleDownMetricName": "CPUUtilization",
    "ASGScaleDownPolicyCooldown": 300,
    "ASGScaleDownPolicyEvaluationPeriods": 4,
    "ASGScaleDownPolicyPeriod": 60,
    "ASGScaleDownPolicyScalingAdjustment": -1,
    "ASGScaleDownPolicyStatistic": "Average",
    "ASGScaleDownPolicyThreshold": 35,
    "ASGScaleUpMetricName": "CPUUtilization",
    "ASGScaleUpPolicyCooldown": 60,
    "ASGScaleUpPolicyEvaluationPeriods": 2,
    "ASGScaleUpPolicyPeriod": 60,
    "ASGScaleUpPolicyScalingAdjustment": 2,
    "ASGScaleUpPolicyStatistic": "Average",
    "ASGScaleUpPolicyThreshold": 75,
    "ASGSubnetIds": ["subnet-1234abcd", "subnet-1a2b3c4d"],
    "ASGUserData": "pwd\nls -ltrh\necho \"Hello, World\""
  }
}
```

Cache (ElastiCache Memcached) Stack | Create

Use to create an Amazon ElastiCache cluster (one or more cache nodes) that uses the Memcached engine, and specify CloudWatch metrics and alarms for the cluster.

Full classification: Deployment | Advanced stack components | Cache (ElastiCache Memcached) stack | Create

Change Type Details

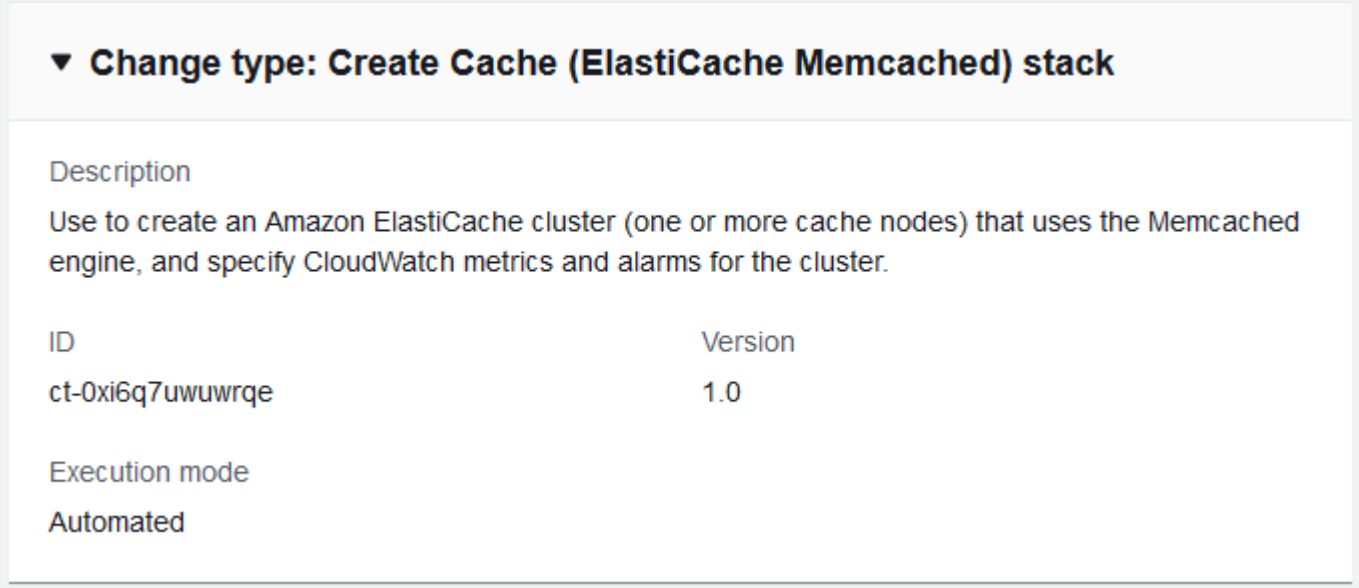
Change type ID	ct-0xi6q7uwuwrqe
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create ElastiCache Memcached stack

Creating a Memcached ElastiCache with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Memcached ElastiCache with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0xi6q7uwuwrqe" --change-type-version "1.0" --
execution-parameters "{\"Description\":\"Test description\",\"VpcId\":\"VPC_ID\",\"Name
\":\"TEST_MEMCACHE\",\"StackTemplateId\":\"stm-sfpo2o00000000000\",\"TimeoutInMinutes
\":60,\"Parameters\":{\"ElastiCacheAvailabilityZones": [ \"eu-west-1b\", \"eu-
west-1c\" ],\"ElastiCacheClusterName\":\"TEST_NAME\",\"ElastiCacheEngine\":\"redis\",
\"ElastiCacheSubnetIds\":[\"SUBNET_ID\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateMemcacheParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0xi6q7uwuwrqe" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateMemcacheParams.json
   ```

2. Modify and save the CreateMemcacheParams file as follows. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "Description": "This is a test description",
  "VpcId": "VPC_ID",
  "StackTemplateId": "stm-sfpo2o00000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ElastiCacheAvailabilityZones": [ "eu-west-1b", "eu-west-1c" ],
    "ElastiCacheClusterName": "test-cluster",
    "ElastiCacheEngine": "memcached",
    "ElastiCacheSubnetIds": [ "SUBNET_ID" , "SUBNET_ID" ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateMemcacheRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateMemcacheRfc.json
```

4. Modify and save the CreateMemcacheRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0xi6q7uwuwrqe",
"Title":                "Memcache-Create-RFC"
}
```

5. Create the RFC, specifying the CreateMemcacheRfc file and the CreateMemcacheParams file:

```
aws amscm create-rfc --cli-input-json file://CreateMemcacheRfc.json --execution-
parameters file://CreateMemcacheParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see Amazon ElastiCache for Memcached.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0xi6q7uwuwrqe.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "StackTemplateId": "stm-sfpo2o00000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ElastiCacheAvailabilityZones": [ "eu-west-1b", "eu-west-1c" ],
    "ElastiCacheClusterName": "some-cluster",
    "ElastiCacheEngine": "memcached",
    "ElastiCacheSubnetIds": [ "subnet-1234567890abcdef0", "subnet-1234567890abcdef1" ]
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
```

```
  "VpcId": "vpc-1234abcd",
  "StackTemplateId": "stm-sfpo2o00000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ElastiCacheAutoMinorVersionUpgrade": true,
    "ElastiCacheAvailabilityZones": ["eu-west-1a","eu-west-1b"],
    "ElastiCacheClusterName": "mmulti-az",
    "ElastiCacheCPUThresholdAlarmOverride": 95,
    "ElastiCacheEngine": "memcached",
    "ElastiCacheEngineVersion": "1.4.25",
    "ElastiCacheInstanceType": "cache.t1.micro",
    "ElastiCacheMultiAZ": true,
    "ElastiCacheNumberOfNodes": 2,
    "ElastiCachePort": 1121,
    "ElastiCachePreferredMaintenanceWindow": "sun:05:00-sun:09:00",
    "ElastiCacheSubnetGroup": "cachegroup",
    "ElastiCacheSubnetIds": ["subnet-1234abcd","subnet-1a2b3c4d"],
    "SecurityGroups": ["sg-1234abcd"]
  }
}
```

Cache (ElastiCache Redis) Stack | Create

Use to create an Amazon ElastiCache cluster (one or more cache nodes) that uses the Redis engine.

Full classification: Deployment | Advanced stack components | Cache (ElastiCache Redis) stack | Create

Change Type Details

Change type ID	ct-17vnu10suy631

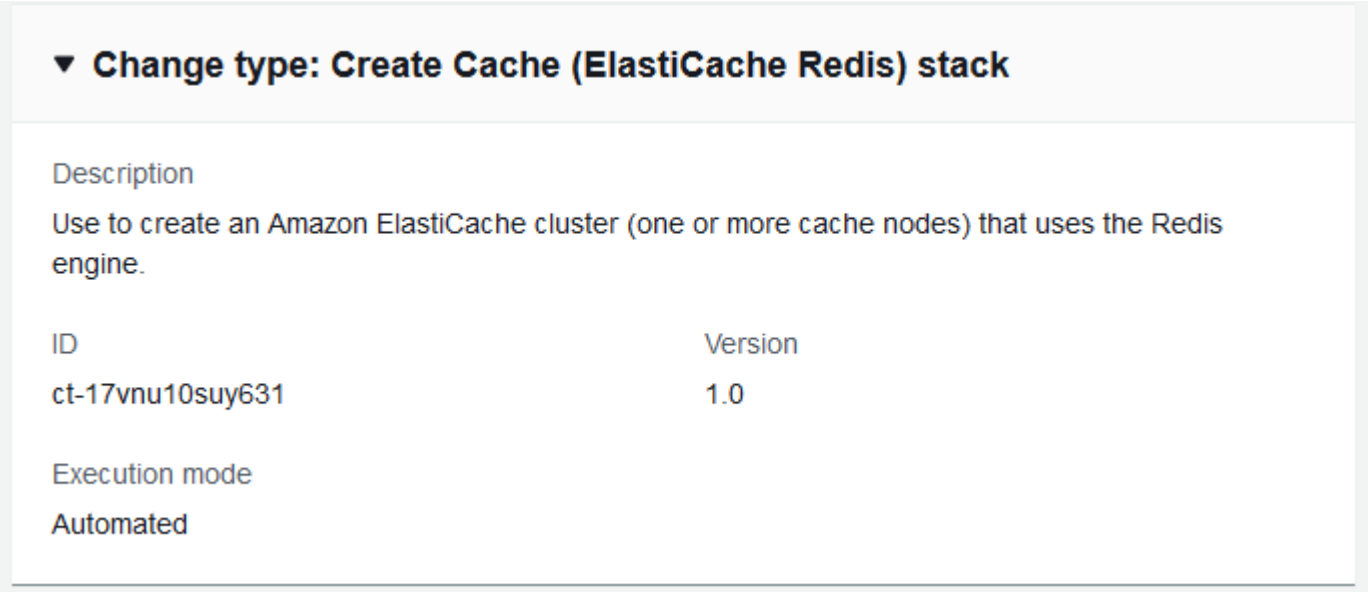
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create ElastiCache Redis stack

Creating a Redis ElastiCache with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Redis ElastiCache with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-17vnu10suy631" --change-type-version "1.0" --
execution-parameters "{\"Description\":\"Test description\",\"VpcId\":\"VPC_ID\",\"Name
\":\"TEST_REDIS\",\"StackTemplateId\":\"stm-sfpo2o00000000000\",\"TimeoutInMinutes
\":60,\"Parameters\":{\"ElastiCacheClusterName\":\"TEST_NAME\",\"ElastiCacheEngine\":
\"redis\",\"ElastiCacheSubnetIds\":[\"SUBNET_ID\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateRedisParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-17vnu10suy631" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateRedisParams.json
   ```

2. Modify and save the CreateRedisParams file as follows. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "This is a test description",
     "VpcId": "VPC_ID",
   ```

```
  "StackTemplateId": "stm-sfpo2o00000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ElastiCacheClusterName": "test-cluster",
    "ElastiCacheEngine": "redis",
    "ElastiCacheSubnetIds": [ "SUBNET_ID" ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateRedisRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRedisRfc.json
```

4. Modify and save the CreateRedisRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-17vnu10suy631",
"Title":                "Redis-Create-RFC"
}
```

5. Create the RFC, specifying the CreateRedisRfc file and the CreateRedisParams file:

```
aws amscm create-rfc --cli-input-json file://CreateRedisRfc.json --execution-
parameters file://CreateRedisParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see Amazon ElastiCache for Redis.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-17vnu10suy631.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "StackTemplateId": "stm-sfpo2o00000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ElastiCacheClusterName": "yet-another-cluster",
    "ElastiCacheEngine": "redis",
    "ElastiCacheSubnetIds": [ "subnet-1234567890abcdef0" ]
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678",
  "StackTemplateId": "stm-sfpo2o00000000000",
  "Name": "Test Stack",
  "Tags": [
    {
```

```
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ElastiCacheAutoMinorVersionUpgrade": true,
    "ElastiCacheBackupSnapshotRetentionLimit": 5,
    "ElastiCacheClusterName": "project-redis",
    "ElastiCacheCPUThresholdAlarmOverride": 95,
    "ElastiCacheEnableBackup": true,
    "ElastiCacheEngine": "redis",
    "ElastiCacheEngineVersion": "2.8.28",
    "ElastiCacheInstanceType": "cache.t1.micro",
    "ElastiCachePort": 6380,
    "ElastiCachePreferredBackupWindow": "01:00-03:00",
    "ElastiCachePreferredMaintenanceWindow": "sun:05:00-sun:09:00",
    "ElastiCacheSnapshotArns": "arn:aws:s3:::my-bucket/snapshot1.rdb",
    "ElastiCacheSnapshotName": "foo-snapshot",
    "ElastiCacheSubnetGroup": "cachegroup",
    "ElastiCacheSubnetIds": ["subnet-ae7321f7","subnet-05f5cf72"],
    "SecurityGroups": ["sg-4b1b522f"]
  }
}
```

Database Migration Service (DMS) | Create Replication Instance

Create a Database Migration Service (DMS) replication instance on an Amazon EC2 instance in an AMS VPC. Use the replication instance to perform your database migration. The replication instance provides high availability and failover support using a Multi-AZ deployment when you select the Multi-AZ option.

Full classification: Deployment | Advanced stack components | Database Migration Service (DMS) | Create replication instance

Change Type Details

Change type ID	ct-27apldkhqr0ol

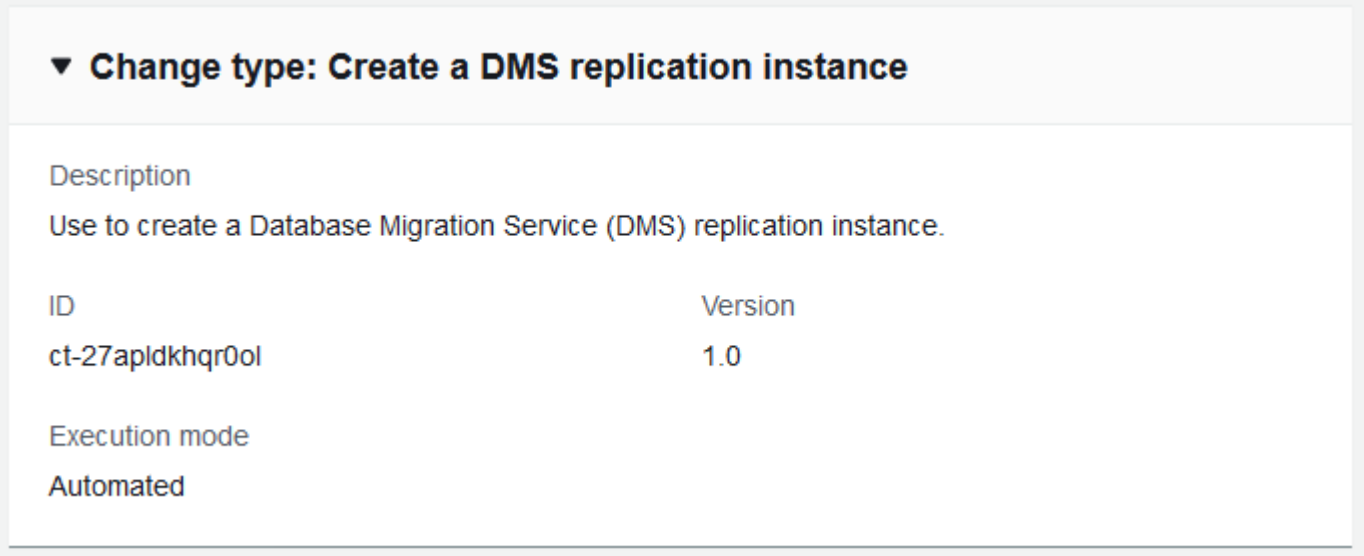
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create AWS DMS replication instance

Creating a AWS DMS replication instance with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a AWS DMS replication instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-27apldkhqr0ol" --change-type-version "1.0" --title "TestDMSRepInstance" --
execution-parameters "{\"Description\":\"DMSTestRepInstance\",\"VpcId\":\"VPC-ID\",
\"Name\":\"REP-INSTANCE-NAME\",\"Parameters\":{\"InstanceClass\":\"dms.t2.micro\",
\"ReplicationSubnetGroupIdentifier\":\"TEST-REP-SG\",\"SecurityGroupIds\":\"SG-ID, SG-
ID\"},\"TimeoutInMinutes\":60,\"StackTemplateId\":\"stm-3n1j5hdrmiiiuqk6v\"}"
```

While your replication instance is being created, you can specify the source and target data stores. The source and target data stores can be on an Amazon Elastic Compute Cloud (Amazon EC2) instance, an AWS S3 Bucket, an Amazon Relational Database Service (Amazon RDS) DB instance, or an on-premises database.

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it CreateDmsRiParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-27apldkhqr0ol" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateDmsRiParams.json
   ```

2. Modify and save the execution parameters CreateDmsRiParams.json file. For example, you can replace the contents with something like this:

```
{
"Description":          "DMSTestRepInstance",
"VpcId":                "VPC_ID",
"Name":                 "Test RI",
"StackTemplateId":      "stm-3n1j5hdrmiiiuqk6v",
"TimeoutInMinutes":     60,
"Parameters":   {
    "Description":                      "DESCRIPTION",
    "InstanceClass":                    "dms.t2.micro",
    "ReplicationSubnetGroupIdentifier": "TEST-REP-SG",
    "SecurityGroupIds":                 ["SG-ID, SG-ID"}
    }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateDmsRiRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDmsRiRfc.json
```

4. Modify and save the CreateDmsRiRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-27apldkhqr0ol",
"Title":                "DMS-RI-Create-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDmsRiRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDmsRiRfc.json --execution-
parameters file://CreateDmsRiParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.
- You must create a replication instance on an EC2 instance in your AMS VPC that has sufficient storage and processing power to perform the tasks you assign and migrate data from your source database to the target database. The required size of this instance varies depending on the amount of data you need to migrate and the tasks that you need the instance to perform. The replication instance provides high availability and failover support using a Multi-AZ deployment when you select the `MultiAZ` option. For more information about replication instances, see Working with an AWS DMS Replication Instance.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-27apldkhqr0ol.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "Parameters": {
    "AllocatedStorage": 50,
    "AutoMinorVersionUpgrade": "true",
    "AvailabilityZone": "us-east-1",
    "EngineVersion": "1.5.0",
    "Identifier": "my-instance",
    "InstanceClass": "dms.t2.micro",
    "KmsKeyId": "12345678-1234-1234-1234-1234567890ab",
    "MultiAZ": "false",
    "PreferredMaintenanceWindow": "sun:06:00-sun:14:00",
    "ReplicationSubnetGroupIdentifier": "my-subnet-group",
    "SecurityGroupIds": ["sg-1234556eaba0a4799", "sg-1234556eaba0a5799"]
  },
  "StackTemplateId": "stm-3n1j5hdrmiiiuqk6v",
  "TimeoutInMinutes": 60,
```

```
  "VpcId": "vpc-01234567890abcdef"
}
```

Database Migration Service (DMS) | Create Replication Subnet Group

Use to create a Database Migration Service (DMS) replication subnet group. Resource creation will fail if the dms-vpc-role IAM role doesn't already exist.

Full classification: Deployment | Advanced stack components | Database Migration Service (DMS) | Create replication subnet group

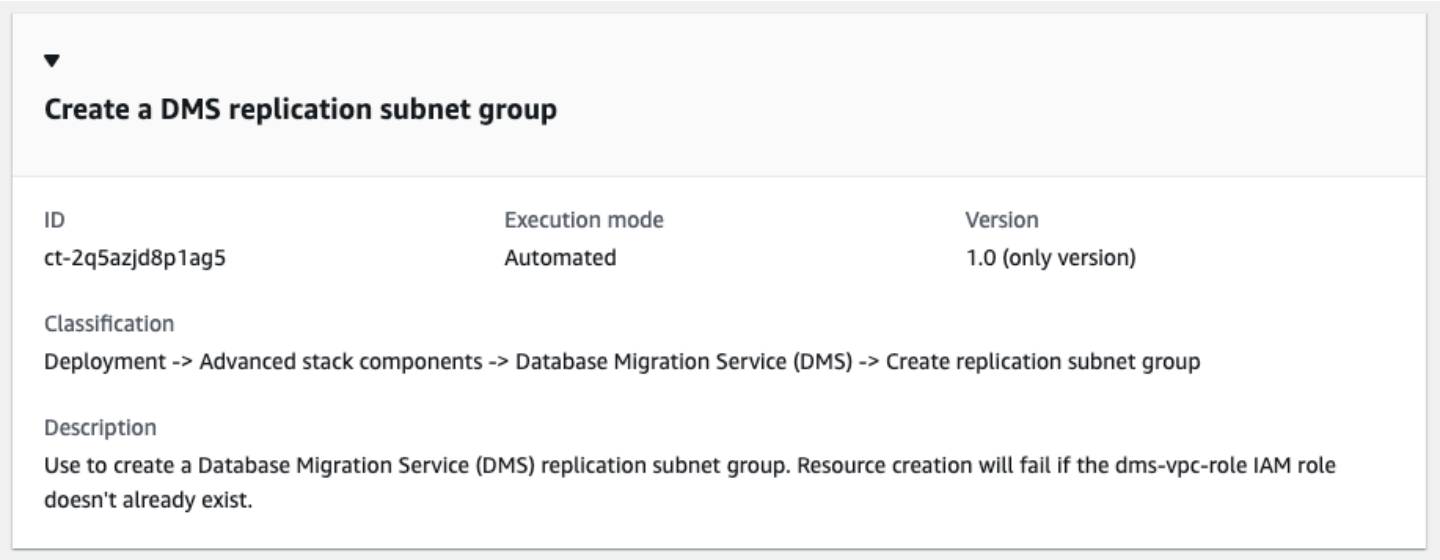
Change Type Details

Change type ID	ct-2q5azjd8p1ag5
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create AWS DMS replication subnet group

Creating a AWS DMS replication subnet group with the console



Note

This CT fails if the `dms-vpc-role` IAM role doesn't exist in the account.

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a AWS DMS replication subnet group with the CLI

> **Note**
>
> This CT fails if the `dms-vpc-role` IAM role doesn't exist in the account.

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-2q5azjd8p1ag5" --change-type-version "1.0" --title "TestDMSRepSG" --execution-
parameters "{\"Description\":\"DMSTestRepSG\",\"VpcId\":\"VPC-ID\",\"Name\":\"Test
 Stack\",\"Parameters\":{\"Description\":\"DESCRIPTION\",\"SubnetIds\":[\"SUBNET-ID\",
 \"SUBNET-ID\"]},\"TimeoutInMinutes\":60,\"StackTemplateId\":\"stm-j637f96ls1h4oy5fj
\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it CreateDmsRsgParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2q5azjd8p1ag5" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateDmsRsgParams.json
   ```

2. Modify and save the execution parameters CreateDmsRsgParams.json file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":          "DMSTestRepSG",
   ```

```
"VpcId":                "VPC_ID",
"TimeoutInMinutes":     60,
"StackTemplateId":      "stm-j637f96ls1h4oy5fj",
"Name":                 "Test RSG",
"Parameters":   {
    "Description":            "DESCRIPTION",
    "SubnetIds":              ["SUBNET_ID", "SUBNET_ID"]
    }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateDmsRsgRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDmsRsgRfc.json
```

4. Modify and save the CreateDmsRsgRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2q5azjd8p1ag5",
"Title":                "DMS-RSG-Create-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDmsRsgRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDmsRsgRfc.json --execution-
parameters file://CreateDmsRsgParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- This CT fails if the `dms-vpc-role` IAM role doesn't exist in the account.
- You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

For more information about DMS replication instances and subnet groups, see Setting Up a Network for a Replication Instance.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2q5azjd8p1ag5.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "Test Stack",
  "Parameters": {
    "Description": "test description",
    "SubnetIds": ["subnet-1234567890abcdef0"]
  },
  "TimeoutInMinutes": 60,
  "StackTemplateId": "stm-j637f96ls1h4oy5fj"
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "key1",
      "Value": "value1"
    },
    {
      "Key": "key2",
      "Value": "value2"
    }
  ],
  "Parameters": {
    "Identifier": "myidentifier",
    "Description": "test description",
    "SubnetIds": ["subnet-12345678"]
  },
  "TimeoutInMinutes": 60,
  "StackTemplateId": "stm-j637f96ls1h4oy5fj"
}
```

Full classification: Deployment | Advanced stack components | Database Migration Service (DMS) | Create replication task

Change Type Details

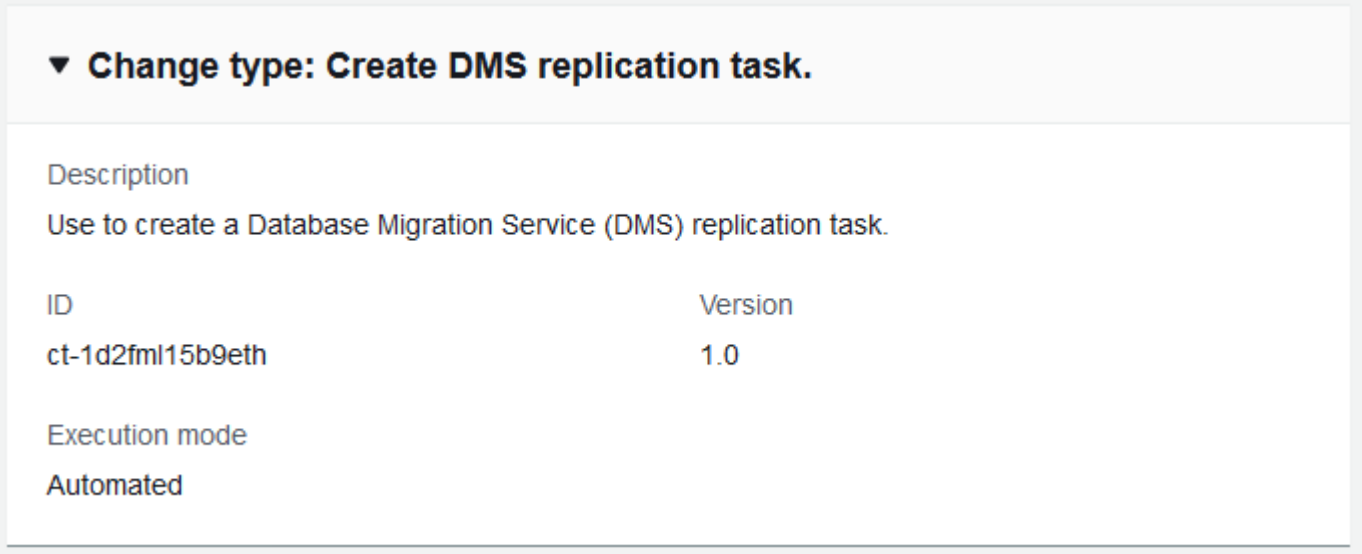
Change type ID	ct-1d2fml15b9eth
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create AWS DMS replication task

Creating a AWS DMS Replication Task with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a AWS DMS Replication Task with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-1d2fml15b9eth" --change-type-version "1.0" --title "TestDMSRepTask" --
execution-parameters "{\"Description\":\"TestRepTask\",\"VpcId\":\"VPC-ID\",\"Name
\":\"DMSRepTask\",\"Parameters\":{\"CdcStartTime\":\1533776569\"MigrationType\":
\"full-load\",\"ReplicationInstanceArn\":\"REP_INSTANCE_ARN\",\"SourceEndpointArn
\":\"SOURCE_ENDPOINT_ARN\",\"TableMappings\":\"{\\\"rules\\\": [{\\\"rule-type
\\\": \\\"selection\\\",\\\"rule-id\\\": \\\"1\\\",\\\"rule-name\\\": \\\"1\\
\",\\\"object-locator\\\": {\\\"schema-name\\\": \\\"Test\\\",\\\"table-name\\
\": \\\"%\\\"}, \\\"rule-action\\\": \\\"include\\\"}] }\",\"TargetEndpointArn
\":\"TARGET_ENDPOINT_ARN\"},\"StackTemplateId\":\"stm-eos7uq0usnmeggdet\",
\"TimeoutInMinutes\":60}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it CreateDmsRtParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-1d2fml15b9eth" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateDmsRtParams.json
```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
"Description":          "DMSTestRepTask",
"VpcId":                "VPC_ID",
"StackTemplateId":      "stm-eos7uq0usnmeggdet",
"Name":                 "Test DMS RT",
"TimeoutInMinutes":     60,
"Parameters":   {
    "CdcStartTime":           "1533776569",
    "MigrationType":          "full-load",
    "ReplicationInstanceArn": "REP_INSTANCE_ARN",
    "SourceEndpointArn":      "SOURCE_ENDPOINT_ARN",
    "TargetEndpointArn":      "TARGET_ENDPOINT_ARN"
    "TableMappings":          {"rules": [{"rule-type": "selection","rule-id":
 "1","rule-name": "1","object-locator": {"schema-name": "Test","table-name": "%"},
 "rule-action": "include"}] }",
    }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateDmsRtRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDmsRtRfc.json
```

4. Modify and save the CreateDmsRtRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1d2fml15b9eth",
"Title":                "DMS-RI-Create-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDmsRtRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDmsRtRfc.json --execution-
parameters file://CreateDmsRtParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

You can create a AWS DMS task that captures three different types of changes or data. For more information, see Working with AWS DMS Tasks, Creating a Task, and Creating Tasks for Ongoing Replication Using AWS DMS.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1d2fml15b9eth.

Example: Required Parameters

```
{
  "Description": "Test Description",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "dmstask01",
  "StackTemplateId": "stm-eos7uq0usnmeggdet",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "MigrationType": "full-load",
    "ReplicationInstanceArn": "arn:aws:dms:us-
east-1:123456789123:rep:6LDPDHOHCSDDSWHJP0UQJPAZLW",
    "SourceEndpointArn": "arn:aws:dms:us-
east-1:123456789123:endpoint:GLYHN8SUXLO5DS4PU4ODJ7KP0O",
    "TableMappings": "{     \"rules\": [         {             \"rule-type\":
 \"selection\",             \"rule-id\": \"1\",             \"rule-name\": \"1\",
       \"object-locator\": {                 \"schema-name\": \"Test\",
   \"table-name\": \"%\"             },             \"rule-action\": \"include\"
  }     ] }",
    "TargetEndpointArn": "arn:aws:dms:us-
east-1:123456789123:endpoint:6PLJC4V60JGPKXN6OUOFWNJIUE"
  }
}
```

Example: All Parameters

```
{
  "Description": "Test Description",
  "VpcId": "vpc-317a9856",
  "Name": "dmstask01",
  "StackTemplateId": "stm-eos7uq0usnmeggdet",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "CdcStartTime": "1533776569",
    "MigrationType": "full-load",
    "ReplicationInstanceArn": "arn:aws:dms:us-

```

Database Migration Service (DMS) | Create Source Endpoint

Use to create a Database Migration Service (DMS) source endpoint.

Full classification: Deployment | Advanced stack components | Database Migration Service (DMS) | Create source endpoint

Change Type Details

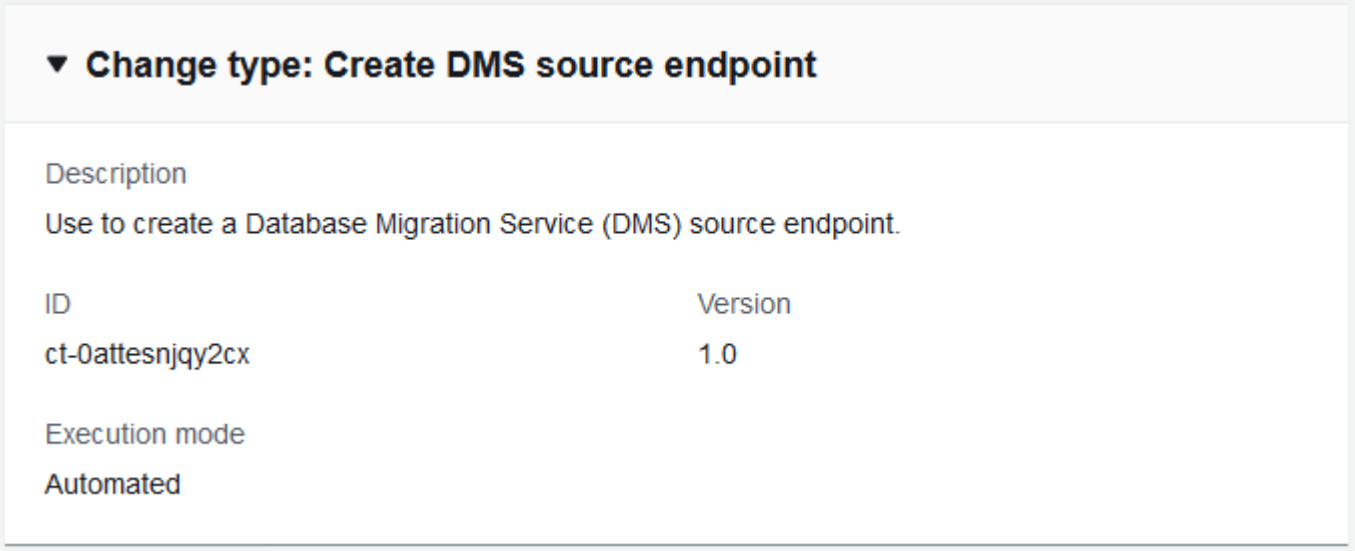
Change type ID	ct-0attesnjqy2cx
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

DMS source endpoint: creating

Creating a DMS Source Endpoint with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a DMS Source Endpoint with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --title "MariaDB-DMS-
Source-Endpoint" --aws-account-id ACCOUNT-ID --change-type-id ct-0attesnjqy2cx --
change-type-version 1.0 --execution-parameters "{\"Description\":\"DESCRIPTION.\",
\"VpcId\":\"VPC-ID\",\"Name\":\"MariaDB-DMS-SE\",\"Parameters\":{\"EngineName\":
\"mariadb\",\"ServerName\":\"mariadb.db.example.com\",\"Port\":3306,\"Username\":
\"DB-USER\",\"Password\":\"DB-PW\"},\"TimeoutInMinutes\":60,\"StackTemplateId\":\"stm-
pud4ghhkp7395n9bc\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateDmsSeParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0attesnjqy2cx" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateDmsSeParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":          "MariaDB-DMS-SE",
   "VpcId":                "VPC_ID",
   "Name":                 "Test SE",
   "StackTemplateId":      "stm-pud4ghhkp7395n9bc",
   "TimeoutInMinutes":     60,
   "Parameters":   {
       "Description":      "DESCRIPTION",
       "EngineName":       "mariadb",
       "ServerName":       "mariadb.db.example.com",
       "Port":             "3306",
       "Username":         "DB-USER",
       "Password":         "DB-PW",}
       }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it CreateDmsSeRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDmsSeRfc.json
```

4. Modify and save the CreateDmsSeRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0attesnjqy2cx",
"Title":                "MariaDB-DMS-Source-Endpoint"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDmsSeRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDmsSeRfc.json --execution-
parameters file://CreateDmsSeParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Before you create the DMS endpoint, make sure that your password doesn't contain unsupported characters. For more information, see Creating source and target endpoints in the *AWS Database Migration Service User Guide*.

To learn more, see Sources for Data Migration.

For an S3 source endpoint, see DMS source endpoint for S3: creating.

For a Mongo DB source endpoint, see DMS source endpoint for MongoDB: Creating.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0attesnjqy2cx.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "Parameters": {
    "CertificateArn": "arn:aws:dms:us-
east-1:123456789121:cert:5957UBG4LS4ZJP2PK7YRYET6YE",
    "DatabaseName": "my-database",
    "EndpointIdentifier": "my-endpoint",
    "EngineName": "aurora",
    "KmsKeyId": "12345678-1234-1234-1234-1234567890ab",
    "Password": "$tr0n9PA55w0Rd",
    "Port": 50000,
    "ServerName": "",
    "SslMode": "none",
    "Username": ""
  },
  "StackTemplateId": "stm-pud4ghhkp7395n9bc",
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567890abcdef"
}
```

Database Migration Service (DMS) | Create Source Endpoint (MongoDB)

Use to create a Database Migration Service (DMS) source endpoint for MongoDB.

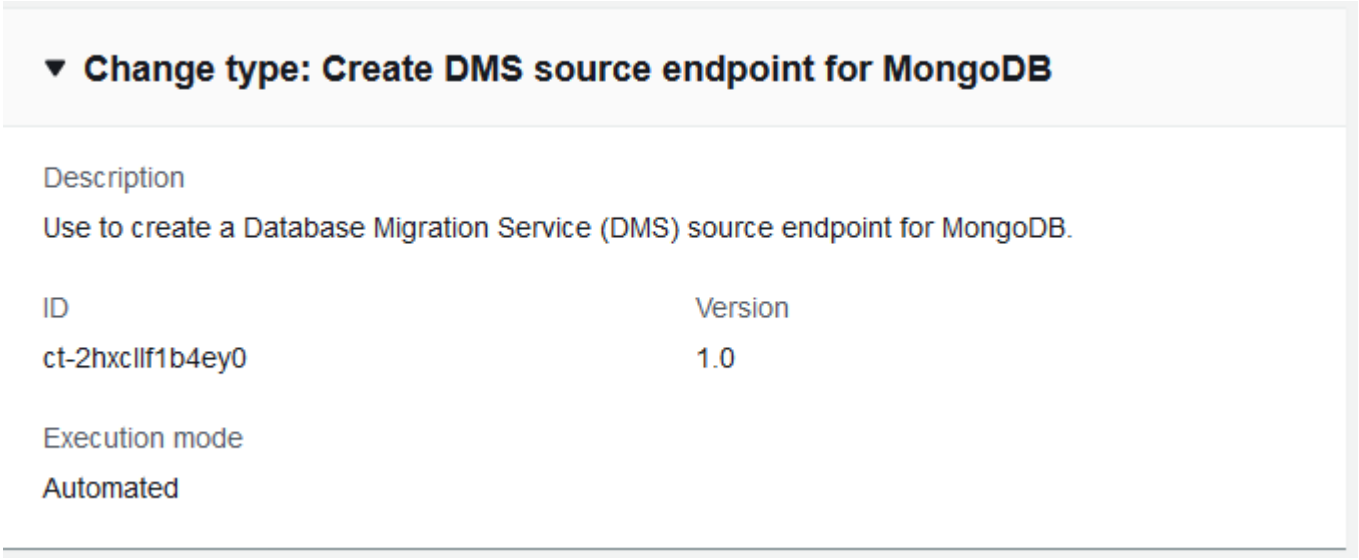
Additional Information

DMS source endpoint for MongoDB: Creating

Creating a DMS Mongo DB Source Endpoint with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a DMS Mongo DB Source Endpoint with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  --profile saml --region us-east-1 create-rfc --change-type-id
 "ct-2hxcllf1b4ey0" --change-type-version "1.0" --title 'DMS_Source_MongoDB'
 --description "DESCRIPTION"  --execution-parameters "{\"Description\":
\"DMS_MongoDB_Source_Endpoint\",\"VpcId\":\"VPC_ID\",\"Name\":\"DMS-Mongo-SE\",
\"StackTemplateId\":\"stm-pud4ghhkp7395n9bc\",\"TimeoutInMinutes\":60,\"Parameters\":
{\"DatabaseName\":\"mytestdb\",\"EngineName\":\"mongodb\",\"Port\":27017,\"ServerName
\":\"test.example.com\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateDmsSeMongoParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2hxcllf1b4ey0"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateDmsSeMongoParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":          "MongoDB-DMS-SE",
   "VpcId":                "VPC_ID",
   "StackTemplateId":      "stm-pud4ghhkp7395n9bc",
   "Name":                 "Test Mongo SE",
   "TimeoutInMinutes":     60,
   "Parameters":   {
       "Description":      "DESCRIPTION",
       "DatabaseName":       "mytestdb",
   ```

```
    "EngineName":       "mongodb",
    "ServerName":       "test.example.com",
    "Port":             "27017"
    }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateDmsSeMongoRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDmsSeMongoRfc.json
```

4. Modify and save the CreateDmsSeMongoRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2hxcllf1b4ey0",
"Title":                "DMS_Source_MongoDB"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDmsSeMongoRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDmsSeMongoRfc.json --execution-
parameters file://CreateDmsSeMongoParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

AMS DMS can use Mongo or any Relational Database Service (RDS) as a source endpoint. For an S3 source endpoint, see DMS source endpoint for S3: creating.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2hxcllf1b4ey0.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "Parameters": {
    "CertificateArn": "arn:aws:dms:us-
east-1:123456789121:cert:5957UBG4LS4ZJP2PK7YRYET6YE",
    "DatabaseName": "my-database",
    "EndpointIdentifier": "my-endpoint",
    "EngineName": "mongodb",
    "MongoDbAuthMechanism": "default",
    "MongoDbAuthSource": "admin",
    "MongoDbAuthType": "no",
    "MongoDbDocsToInvestigate": "1000",
    "MongoDbExtractDocId": "false",
    "MongoDbMetadataMode": "none",
    "Password": "$tr0n9PA55w0Rd",
    "Port": 27017,
    "ServerName": "my-server",
    "SslMode": "none",
    "Username": "my-user"
  },
  "StackTemplateId": "stm-pud4ghhkp7395n9bc",
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567890abcdef"
}
```

Database Migration Service (DMS) | Create Source Endpoint (S3)

Use to create a Database Migration Service (DMS) source endpoint for S3.

Full classification: Deployment | Advanced stack components | Database Migration Service (DMS) | Create source endpoint (S3)

Change Type Details

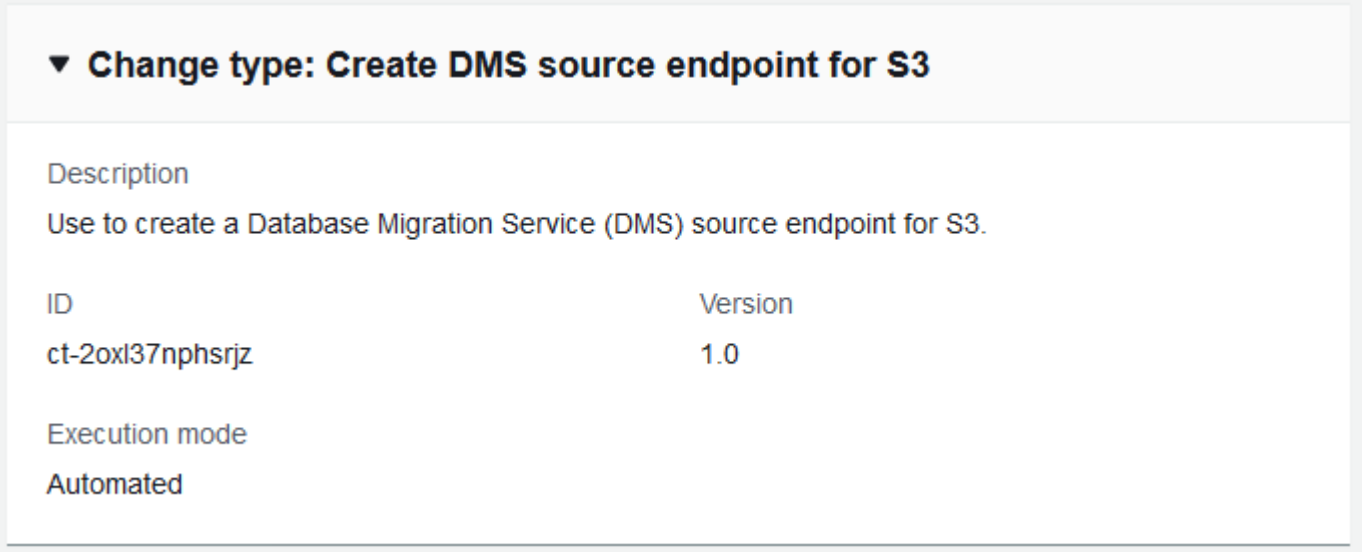
Change type ID	ct-2oxl37nphsrjz
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

DMS source endpoint for S3: creating

Creating a DMS S3 Source Endpoint with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a DMS S3 Source Endpoint with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --title "S3DMSSourceEndpoint"
 --aws-account-id ACCOUNT-ID --change-type-id ct-2oxl37nphsrjz --change-type-version
 1.0 --execution-parameters "{\"Description\":\"TestS3DMS-SE\",\"VpcId\":\"VPC-ID\",
\"Name\":\"S3-DMS-SE\",\"Parameters\":{\"EngineName\":\"s3\",\"S3BucketName\":\"BUCKET-
NAME\",\"S3ExternalTableDefinition\":\"{\\\"TableCount\\\":\\\"1\\\",\\\"Tables\\\":[{\
\\"TableName\\\":\\\"employee\\\",\\\"TablePath\\\":\\\"hr/employee/\\\",\\\"TableOwner
\\\":\\\"hr\\\",\\\"TableColumns\\\":[{\\\"ColumnName\\\":\\\"Id\\\",\\\"ColumnType\\
\":\\\"INT8\\\",\\\"ColumnNullable\\\":\\\"false\\\",\\\"ColumnIsPk\\\":\\\"true\\\"},
{\\\"ColumnName\\\":\\\"LastName\\\",\\\"ColumnType\\\":\\\"STRING\\\",\\\"ColumnLength
\\\":\\\"20\\\"},{\\\"ColumnName\\\":\\\"FirstName\\\",\\\"ColumnType\\\":\\\"STRING\\
\",\\\"ColumnLength\\\":\\\"30\\\"},{\\\"ColumnName\\\":\\\"HireDate\\\",\\\"ColumnType
\\\":\\\"DATETIME\\\"},{\\\"ColumnName\\\":\\\"OfficeLocation\\\",\\\"ColumnType\\
\":\\\"STRING\\\",\\\"ColumnLength\\\":\\\"20\\\"}],\\\"TableColumnsTotal\\\":\\\"5\\
\"}]}\",\"S3ServiceAccessRoleArn\":\"arn:aws:iam::123456789101:role/ams-ops-ct-authors-
dms-s3-test-role\"},\"TimeoutInMinutes\":60,\"StackTemplateId\":\"stm-pud4ghhkp7395n9bc
\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateDmsSeS3Params.json.

```
aws amscm get-change-type-version --change-type-id "ct-2oxl37nphsrjz" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateDmsSeS3Params.json
```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
"Description":          "TestS3DMS-SE",
"VpcId":                "VPC_ID",
"Name":                 "S3-DMS-SE",
"StackTemplateId":      "stm-pud4ghhkp7395n9bc",
"TimeoutInMinutes":     60,
"Parameters":   {
    "EngineName":               "s3",
    "S3BucketName":              "BUCKET-NAME",
    "S3ExternalTableDefinition":  "BUCKET-NAME",
    {"TableCount":                "1",
      "Tables":[{"TableName":"employee","TablePath":"hr/
employee/","TableOwner":"hr","TableColumns":
[{"ColumnName":"Id","ColumnType":"INT8","ColumnNullable":"false","ColumnIsPk":"true"},
{"ColumnName":"LastName","ColumnType":"STRING","ColumnLength":"20"},
{"ColumnName":"FirstName","ColumnType":"STRING","ColumnLength":"30"},
{"ColumnName":"HireDate","ColumnType":"DATETIME"},
{"ColumnName":"OfficeLocation","ColumnType":"STRING","ColumnLength":"20"}],"TableColumnsTot
    "S3ServiceAccessRoleArn":      "arn:aws:iam::123456789101:role/ams-ops-ct-
authors-dms-s3-test-role",
      }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateDmsSeS3Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDmsSeS3Rfc.json
```

4. Modify and save the CreateDmsSeS3Rfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
```

```
"ChangeTypeId":          "ct-2oxl37nphsrjz",
"Title":                 "DMS_Source_S3"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDmsSeS3Rfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDmsSeS3Rfc.json --execution-
parameters file://CreateDmsSeS3Params.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

AMS DMS can use S3 or any Relational Database Service (RDS) source endpoint. For a Mongo DB source endpoint, see DMS source endpoint for MongoDB: Creating.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2oxl37nphsrjz.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "Parameters": {
    "EndpointIdentifier": "my-endpoint",
    "EngineName": "s3",
```

```
    "S3BucketFolder": "my-folder",
    "S3BucketName": "my-bucket",
    "S3CompressionType": "NONE",
    "S3CsvDelimiter": ",",
    "S3CsvRowDelimiter": "\n",
    "S3ExternalTableDefinition": "false",
    "S3ServiceAccessRoleArn": "arn:aws:iam::123456789012:role/my-s3service-role"
  },
  "StackTemplateId": "stm-pud4ghhkp7395n9bc",
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567890abcdef"
}
```

Database Migration Service (DMS) | Create Target Endpoint

Use to create a Database Migration Service (DMS) target endpoint for RDS supported MySQL, MariaDB, PostgreSQL, Oracle and Microsoft SQL server engine.

Full classification: Deployment | Advanced stack components | Database Migration Service (DMS) | Create target endpoint

Change Type Details

Change type ID	ct-3gf8dolbo8x9p
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

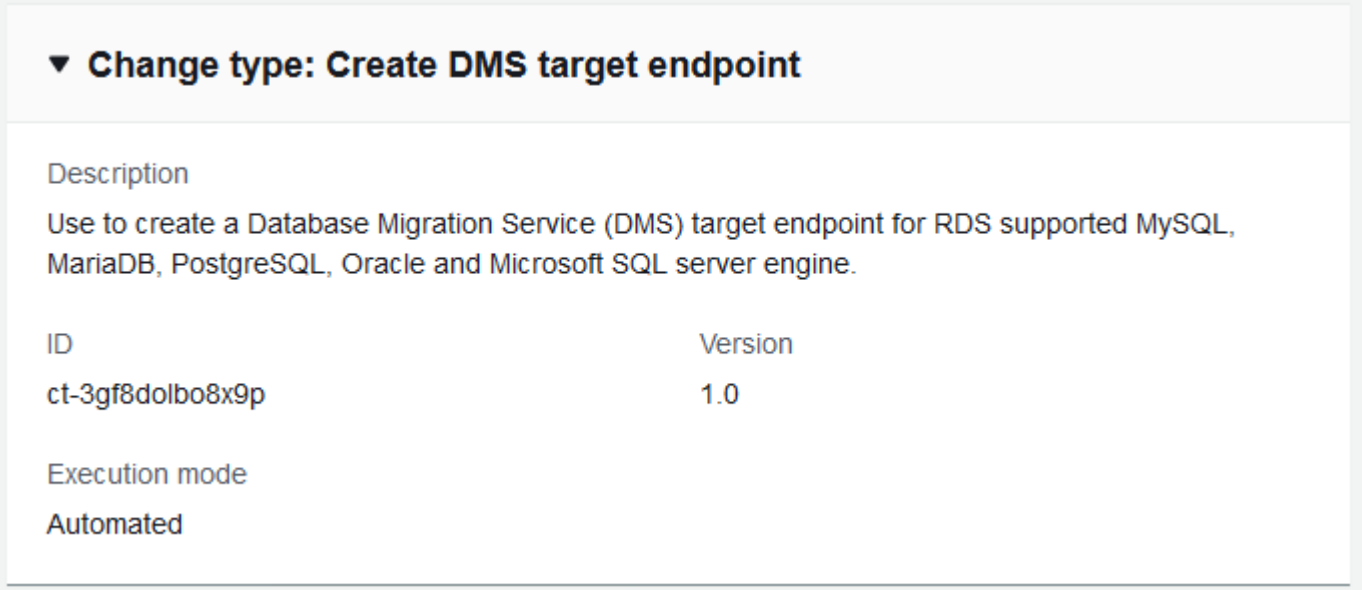
Additional Information

DMS target endpoint: creating

AMS DMS can use S3 or any Relational Database Service (RDS) with MySQL, MariaDB, Oracle, Postgresql, or Microsoft SQL as a target endpoint.

Creating a DMS Target Endpoint with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a DMS Target Endpoint with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-3gf8dolbo8x9p" --change-type-version "1.0" --title "TestDMSTargetEndpointSql" --
execution-parameters "{\"Description\":\"TestSQLTE\",\"VpcId\":\"VPC-ID\",\"Name\":
\"SQLTE-NAME\",\"StackTemplateId\":\"stm-knghtmmgefafdq89u\",\"TimeoutInMinutes\":60,
\"Parameters\":{\"EngineName\":\"mysql\",\"Password\":\"testpw123\",\"Port\":\"3306\",
\"ServerName\":\"mytestdb.d5fga0rf2wpi.ap-southeast-2.rds.amazonaws.com\",\"Username\":
\"USERNAME\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateDmsTeParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3gf8dolbo8x9p" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateDmsTeParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":          "TestSQLTE",
   "VpcId":                "VPC_ID",
   "StackTemplateId":      "stm-knghtmmgefafdq89u",
   "Name":                 "SQLTE-NAME",
   "TimeoutInMinutes":     60,
   "Parameters":   {
       "EngineName":       "mysql",
       "ServerName":       "sql.db.example.com",
       "Port":             "3306",
       "Username":         "DB-USER",
       "Password":         "DB-PW",}
       }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it CreateDmsTeRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDmsTeRfc.json
```

4. Modify and save the CreateDmsTeRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3gf8dolbo8x9p",
"Title":                "SQLDB-DMS-Target-Endpoint"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDmsTeRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDmsTeRfc.json --execution-
parameters file://CreateDmsTeParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

AMS DMS can use S3 or any Relational Database Service (RDS) with MySQL, MariaDB, Oracle, Postgresql, or Microsoft SQL as a target endpoint. For an S3 target endpoint, see DMS target endpoint for S3: creating.

For more information, see Targets for Data Migration.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3gf8dolbo8x9p.

Example: Required Parameters

```
{
  "Description": "Test description.",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "dmstarget01",
  "Tags": [
    {
      "Key": "key1",
      "Value": "value1"
    },
    {
      "Key": "key2",
      "Value": "value2"
    }
  ],
  "StackTemplateId": "stm-knghtmmgefafdq89u",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "EngineName": "mysql",
    "Password": "testpasswrod123",
    "Port": "3306",
    "ServerName": "mytestdb.d5fga0rf2wpi.ap-southeast-2.rds.amazonaws.com",
    "Username": "myuser01"
  }
}
```

Example: All Parameters

```
{
  "Description": "Test description.",
  "VpcId": "vpc-104ed2fb",
  "Name": "dmstarget01",
  "Tags": [
    {
      "Key": "key1",
      "Value": "value1"
    },
    {
      "Key": "key2",
      "Value": "value2"
    }
  ],
```

```
  "StackTemplateId": "stm-knghtmmgefafdq89u",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "CertificateArn": "arn:aws:dms:us-
east-1:123456789121:cert:5957UBG4LS4ZJP2PK7YRYET6YE",
    "DatabaseName": "mytestdb",
    "EndpointIdentifier": "myctdmstarget",
    "EngineName": "mysql",
    "ExtraConnectionAttributes": "targetDbType=MULTIPLE_DATABASES",
    "KmsKeyId": "15a25b6b-b29d-4bc5-af34-88eeb3740a94",
    "Password": "testpasswrod123",
    "Port": "3306",
    "ServerName": "mytestdb.d5fga0rf2wpi.ap-southeast-2.rds.amazonaws.com",
    "SslMode": "verify-full",
    "Username": "myuser01"
  }
}
```

Database Migration Service (DMS) | Create Target Endpoint (S3)

Use to create a Database Migration Service (DMS) target endpoint for S3.

Full classification: Deployment | Advanced stack components | Database Migration Service (DMS) | Create target endpoint (S3)

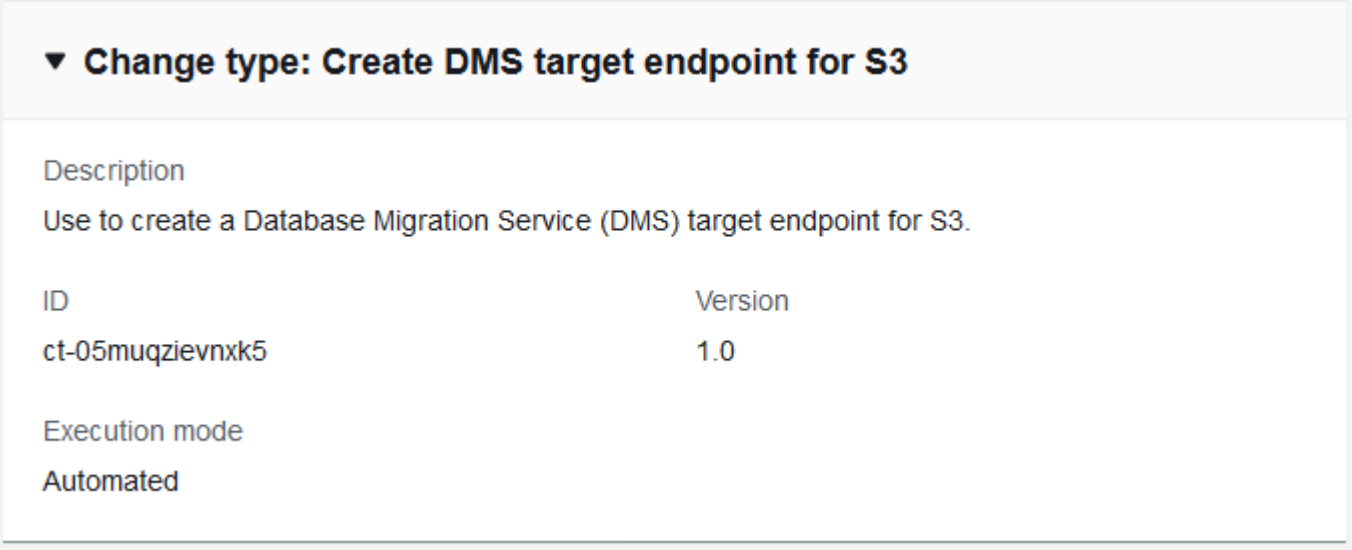
Customer approval	Not required
Execution mode	Automated

Additional Information

DMS target endpoint for S3: creating

Creating a DMS S3 Target Endpoint with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a DMS S3 Target Endpoint with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-05muqzievnxk5" --change-type-version "1.0" --title "TestDMSTargetEndpointS3"
 --execution-parameters "{\"Description\":\"TestS3TE\",\"VpcId\":\"VPC-ID\",\"Name
\":\"S3TE-NAME\",\"StackTemplateId\":\"stm-knghtmmgefafdq89u\",\"TimeoutInMinutes
\":60,\"Parameters\":{\"EngineName\":\"s3\",\"S3BucketName\":\"mybucket.in.s3\",
\"S3ServiceAccessRoleArn\":\"arn:aws:iam::123456789123:role/my-s3-role\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it CreateDmsTeS3Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-05muqzievnxk5" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateDmsTeS3Params.json
   ```

2. Modify and save the execution parameters CreateDmsTeS3Params.json file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":          "TestS3DMS-TE",
   "VpcId":                "VPC_ID",
   "StackTemplateId":      "stm-knghtmmgefafdq89u",
   "Name":                 "DMS-S3-TE",
   "TimeoutInMinutes":     60,
   "Parameters":   {
       "EngineName":       "s3",
       "S3BucketName":      "BUCKET-NAME",
       "S3ServiceAccessRoleArn":       "arn:aws:iam::123456789101:role/ams-ops-ct-
   authors-dms-s3-test-role"
         }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it CreateDmsTeS3Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDmsTeS3Rfc.json
```

4. Modify and save the CreateDmsTeS3Rfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-05muqzievnxk5",
"Title":                "DMS_Target_S3"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDmsTeS3Rfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDmsTeS3Rfc.json --execution-
parameters file://CreateDmsTeS3Params.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

AMS provides a separate change type for creating a target endpoint for S3. For more information, see Using Amazon S3 as a Target for AWS Database Migration Service and Extra Connection Attributes When Using Amazon S3 as a Target for AWS DMS.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-05muqzievnxk5.

Example: Required Parameters

```
{
  "Description": "Test description.",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "dmstargets301",
  "StackTemplateId": "stm-knghtmmgefafdq89u",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "EngineName": "s3",
    "S3BucketName": "mybucket.in.s3",
    "S3ServiceAccessRoleArn": "arn:aws:iam::123456789123:role/my-s3-role"
  }
}
```

Example: All Parameters

```
{
  "Description": "Test description.",

DNS (Private) | Create

Create a new Route 53 DNS resource record sets and a new private hosted zone for a VPC, and configure traffic routing.

Full classification: Deployment | Advanced stack components | DNS (private) | Create

Change Type Details

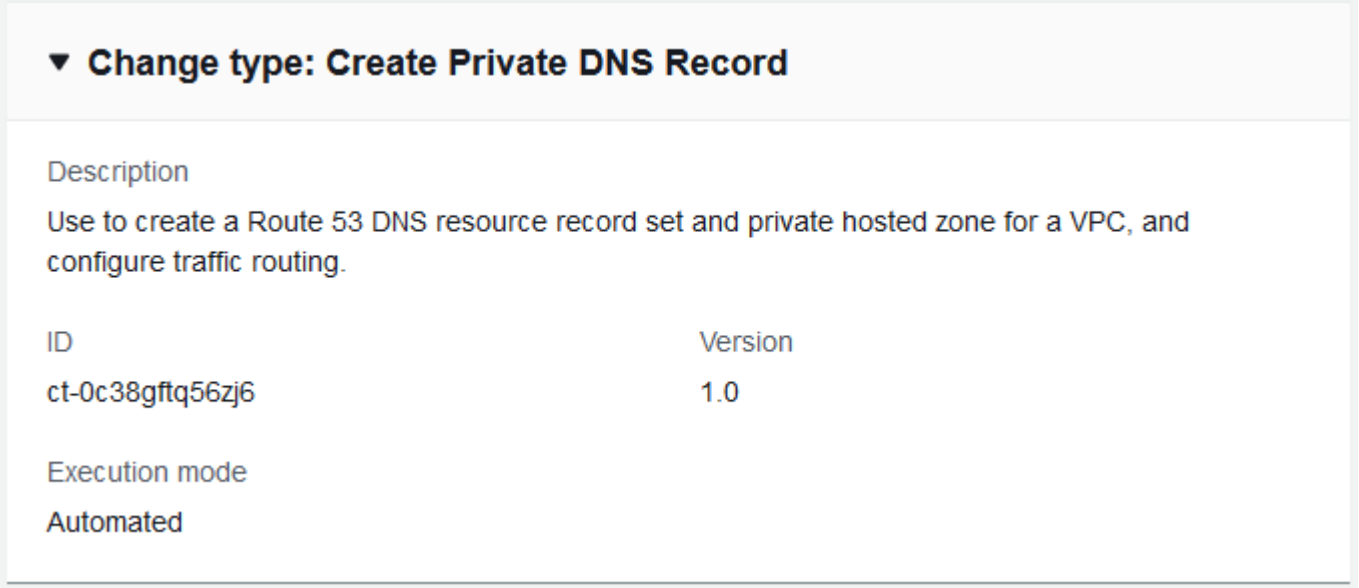
Change type ID	ct-0c38gftq56zj6
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create private DNS Route 53

Creating a private Route 53 hosted zone with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a private Route 53 hosted zone with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-0c38gftq56zj6" \
--change-type-version "2.0" --title "Testing - Creating New Private Hosted Zone" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
CreateAddRoute53Resources\",\"Region\":\"us-east-1\",\"Parameters\":{\"DomainName\":
\"mydomain.com\",\"VPCId\":\"vpc-12345678\",\"DomainType\":\"private\",\"RecordSet\":
[\"[{\\\"Name\\\":\\\"test1.mydomain.com\\\",\\\"Type\\\":\\\"A\\\",\\\"TTL\\\":600,\\
\"ResourceRecords\\\":[\\\"10.1.1.1\\\",\\\"10.1.2.2\\\"]}]}\"]}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateDnsPrivateParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0c38gftq56zj6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateDnsPrivateParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
    "DocumentName": "AWSManagedServices-CreateAddRoute53Resources",
    "Region": "us-east-1",
    "Parameters": {
        "DomainName": "mydomain.com",
        "VpcId": "vpc-12345678",
        "DomainType": "private",
        "RecordSet": [
            "{\"RecordSet\":[{\"Name\":\"test1.mydomain.com\",\"Type\":\"A\",\"TTL
\":600,\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]}]}"
        ]
    }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateDnsPrivateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDnsPrivateRfc.json
```

4. Modify and save the CreateDnsPrivateRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-0c38gftq56zj6",
  "ChangeTypeVersion": "2.0",
  "Title": "Creating New Private Hosted Zone"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDnsPrivateRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDnsPrivateRfc.json --execution-
parameters file://CreateDnsPrivateParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- This CT fails if the specified **RecordSet** contains more than 500 resource records (RRs), or if the CloudFormation template surpasses the maximum body of 51,200 bytes.
- To create a public Route 53 DNS stack, see Create public DNS Route 53.

  To update an existing private Route 53 DNS stack, see Update private DNS Route 53.
- For **RecordSetType** = A, be sure to specify either **AliasTargetDnsName**or **RecordSetValue**.
- You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.
- For more information, see Working with Private Hosted Zones.

  To update your private DNS stack after it's created, see Update private DNS Route 53.

  To create a public Route 53 DNS stack, see Create public DNS Route 53.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0c38gftq56zj6.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateAddRoute53Resources",
  "Region" : "ap-southeast-2",
  "Parameters": {
    "DomainName": "mydomain.com",
    "VPCId": "vpc-5a25bd3f",
    "DomainType": "private",
    "RecordSet": [
      "{\"RecordSet\":[{\"Name\":\"test1.mydomain.com\",\"Type\":\"A\",\"TTL\":\"600\",
\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},{\"Name\":\"test3.mydomain.com
\",\"Type\":\"CNAME\",\"TTL\":\"600\",\"ResourceRecords\":[\"amazon.com\"]},
{\"Name\":\"test4.mydomain.com\",\"Type\":\"A\",\"AliasTarget\":{\"DNSName\":
\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,\"HostedZoneId
\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"weighted.mydomain.com\",\"Weight\":200,
```

```
\"SetIdentifier\":\"Example-Set-Identifier-1\",\"Type\":\"A\",\"AliasTarget\":
{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"geolocationexample.mydomain.com
\",\"SetIdentifier\":\"Example-GeoLocation-Identifier-1\",\"GeoLocation\":
{\"CountryCode\":\"US\",\"SubdivisionCode\":\"WA\"},\"Type\":\"A\",\"AliasTarget
\":{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"examplelatency.mydomain.com\",
\"SetIdentifier\":\"Example-Latency-Identifier-1\",\"Region\":\"ap-southeast-2\",
\"Type\":\"A\",\"TTL\":\"600\",\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},
{\"Name\":\"examplemultivalue.mydomain.com\",\"SetIdentifier\":\"Example-
MultiValue-Identifier-1\",\"MultiValueAnswer\":true,\"Type\":\"A\",\"TTL\":\"600\",
\"ResourceRecords\":[\"10.1.1.1\"]}]}"
    ]
  }
}
```

DNS (Public) | Create

Create a new Route 53 DNS resource record set and a new public hosted zone for a VPC, and configure traffic routing.

Full classification: Deployment | Advanced stack components | DNS (public) | Create

Change Type Details

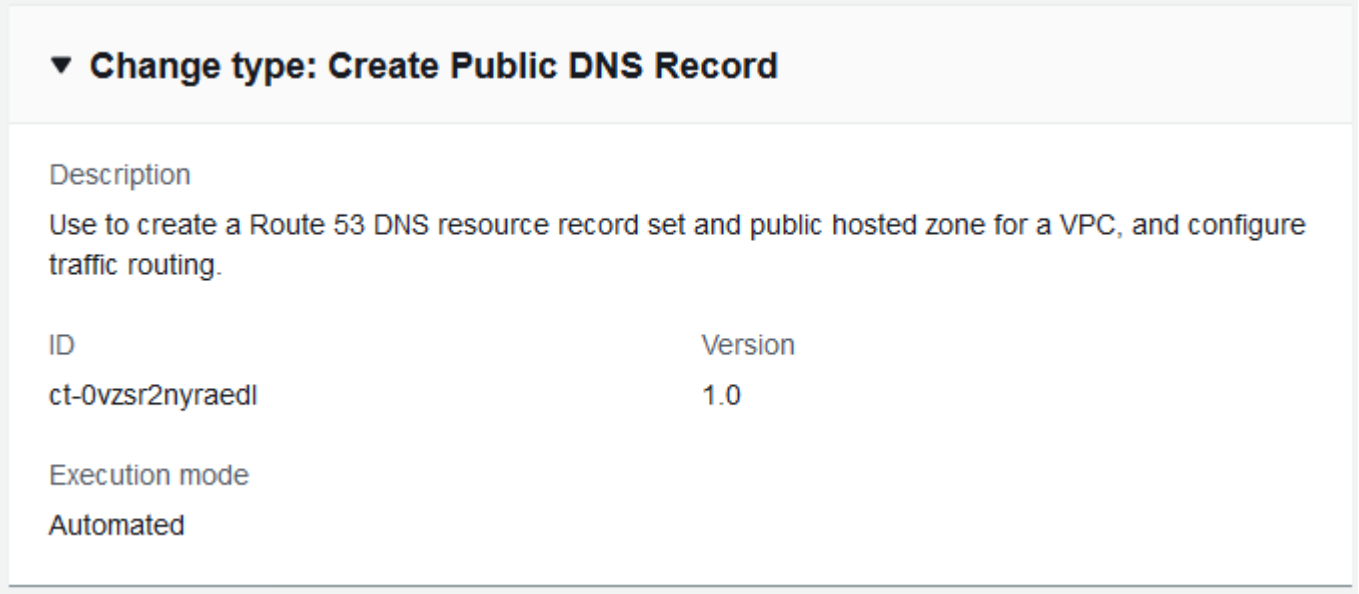
Change type ID	ct-0vzsr2nyraedl
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create public DNS Route 53

Creating a public Route 53 hosted zone with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a public Route 53 hosted zone with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-0vzsr2nyraedl" \
--change-type-version "2.0" --title "Creating New Public Hosted Zone" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
CreateAddRoute53Resources\",\"Region\":\"us-east-1\",\"Parameters\":{\"DomainName
\":\"mydomain.com\",\"DomainType\":\"public\",\"RecordSet\":[\"[{\\\"Name\\\":\\
\"test1.mydomain.com\\\",\\\"Type\\\":\\\"A\\\",\\\"TTL\\\":600,\\\"ResourceRecords\\
\":[\\\"10.1.1.1\\\",\\\"10.1.2.2\\\"]}]}\"]}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateDnsPublicParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0vzsr2nyraedl"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateDnsPublicParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateAddRoute53Resources",
     "Region": "ap-southeast-2",
     "Parameters": {
       "DomainName": "domain.com",
       "DomainType": "public",
       "RecordSet": [
         "{\"RecordSet\":[{\"Name\":\"test1.domain.com\",\"Type\":\"A\",\"TTL\":600,
   \"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},{\"Name\":\"test3.domain.com\",
   \"Type\":\"CNAME\",\"TTL\":600,\"ResourceRecords\":[\"www.google.com\"]},
   ```

```
{\"Name\":\"test4.domain.com\",\"Type\":\"A\",\"AliasTarget\":{\"DNSName\":
\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,\"HostedZoneId
\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"weighted.domain.com\",\"Weight\":200,
\"SetIdentifier\":\"Example-Set-Identifier-1\",\"Type\":\"A\",\"AliasTarget\":
{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"geolocationexample.domain.com\",
\"SetIdentifier\":\"Example-GeoLocation-Identifier-1\",\"GeoLocation\":
{\"CountryCode\":\"US\",\"SubdivisionCode\":\"WA\"},\"Type\":\"A\",\"AliasTarget
\":{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"examplelatency.domain.com\",
\"SetIdentifier\":\"Example-Latency-Identifier-1\",\"Region\":\"ap-southeast-2\",
\"Type\":\"A\",\"TTL\":600,\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},
{\"Name\":\"examplemultivalue.domain.com\",\"SetIdentifier\":\"Example-
MultiValue-Identifier-1\",\"MultiValueAnswer\":true,\"Type\":\"A\",\"TTL\":600,
\"ResourceRecords\":[\"10.1.1.1\"]}]}"
    ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateDnsPublicRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDnsPublicRfc.json
```

4. Modify and save the CreateDnsPublicRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-0vzsr2nyraedl",
"Title":                "DNS-Public-Create-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateDnsPublicRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateDnsPublicRfc.json --execution-
parameters file://CreateDnsPublicParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> To create a private Route 53 DNS stack, see Create private DNS Route 53.

> **Note**
>
> For **RecordSetType** = A, be sure to specify either **AliasTargetDnsName**or **RecordSetValue**.

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

To learn more, see Working with Public Hosted Zones.

To update your public DNS stack after it's created, see Update public DNS Route 53.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0vzsr2nyraedl.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateAddRoute53Resources",
  "Region" : "us-east-1",
  "Parameters": {
    "DomainName": "mydomain.com",
    "DomainType": "public",
```

```
    "RecordSet": [
      "{\"RecordSet\":[{\"Name\":\"test1.mydomain.com\",\"Type\":\"A\",\"TTL\":\"600\",
\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},{\"Name\":\"test3.mydomain.com
\",\"Type\":\"CNAME\",\"TTL\":\"600\",\"ResourceRecords\":[\"amazon.com\"]},
{\"Name\":\"test4.mydomain.com\",\"Type\":\"A\",\"AliasTarget\":{\"DNSName\":
\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,\"HostedZoneId
\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"weighted.mydomain.com\",\"Weight\":200,
\"SetIdentifier\":\"Example-Set-Identifier-1\",\"Type\":\"A\",\"AliasTarget\":
{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"geolocationexample.mydomain.com
\",\"SetIdentifier\":\"Example-GeoLocation-Identifier-1\",\"GeoLocation\":

\"ResourceRecords\":[\"10.1.1.1\"]}]}"
    ]
  }
}
```

DynamoDB | Create from Backup

Create an Amazon DynamoDB stack from backup.

Full classification: Deployment | Advanced stack components | DynamoDB | Create from backup

Change Type Details

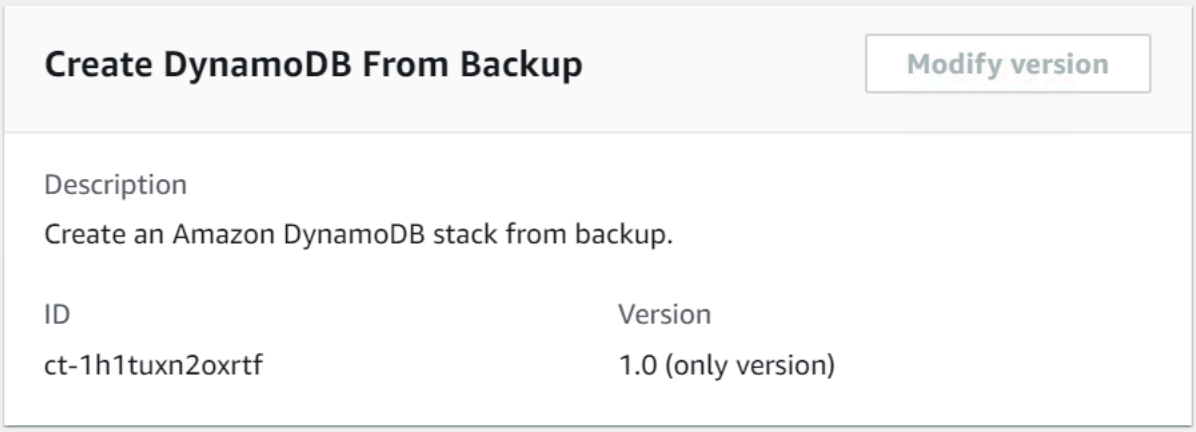
Change type ID	ct-1h1tuxn2oxrtf
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

DynamoDB (creating from backup)

Creating a DynamoDb with an AWS Backup with the Console

Screenshot of this change type, in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a DynamoDb with an AWS Backup with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-1h1tuxn2oxrtf" \
--change-type-version "1.0" --title "AWS Backup Start Restore Job for DynamoDB" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-StartRestoreJobDynamoDB
\",\"Region\":\"us-east-1\",\"Parameters\":{\"BackupVaultName\":[\"Default\"],
\"RecoveryPointArn\":[\"arn:aws:dynamodb:us-east-1:000000000000:table/table-name/
backup/00000000000000-00000000\"],\"TargetTableName\":[\"TARGET_TABLE_NAME\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it RestoreJobRestoreDynamoDbParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1h1tuxn2oxrtf"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    RestoreJobRestoreDynamoDbParams.json
   ```

2. Modify and save the RestoreJobRestoreDynamoDbParams file.

   ```
   {
     "DocumentName": "AWSManagedServices-StartRestoreJobDynamoDB",
     "Region": "us-east-1",
     "Parameters": {
       "BackupVaultName": ["Default"],
       "RecoveryPointArn": ["arn:aws:dynamodb:us-east-1:000000000000:table/table-name/
   backup/00000000000000-00000000"],
       "TargetTableName": ["TARGET_TABLE_NAME"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it RestoreJobRestoreDynamoDbRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RestoreJobRestoreDynamoDbRfc.json
   ```

4. Modify and save the RestoreJobRestoreDynamoDbRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-1h1tuxn2oxrtf",
    "ChangeTypeVersion": "1.0",
    "Title": "AWS Backup Start Restore Job for DynamoDB"
}
```

5. Create the RFC, specifying the RestoreJobRestoreDynamoDbRfc file and the RestoreJobRestoreDynamoDbParams file:

```
aws amscm create-rfc --cli-input-json file://RestoreJobRestoreDynamoDbRfc.json --
execution-parameters file://RestoreJobRestoreDynamoDbParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS, see Amazon DynamoDB.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1h1tuxn2oxrtf.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-StartRestoreJobDynamoDB",
  "Region": "us-east-1",
  "Parameters": {
    "BackupVaultName": ["Vault01"],
    "RecoveryPointArn": ["arn:aws:dynamodb:us-east-1::table/xyz-test/
backup/01585118622000-75ee13f1"],
```

```
    "TargetTableName": ["New-TargetTable"]
  }
}
```

EBS Snapshot | Copy

Copy an Elastic Block Store (EBS) snapshot in your AMS account.

Full classification: Deployment | Advanced stack components | EBS snapshot | Copy

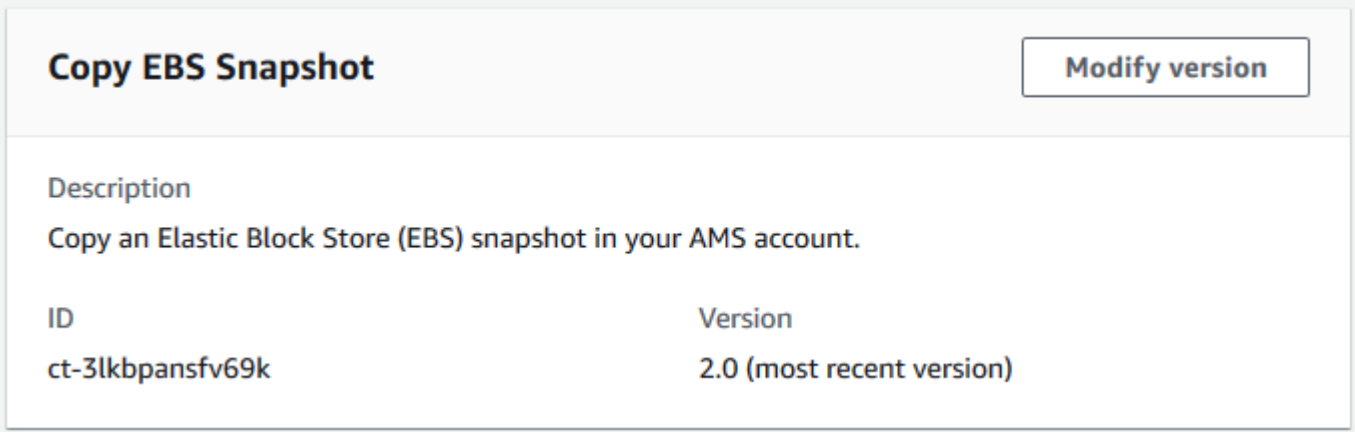
Change Type Details

Change type ID	ct-3lkbpansfv69k
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Copy EBS snapshot

Copying EBS Snapshots with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Copying EBS Snapshots with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3lkbpansfv69k" --change-type-version
 "2.0" --title "Copy EBS snapshot" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-CopyEBSSnapshot\",\"Region\":\"us-east-1\",\"Parameters\":
{\"SourceSnapshotId\":[\"SNAPSHOT_ID\"],\"SourceRegion\":[\"ap-southeast-2\"],
\"KmsKeyId\":[\"KEY_ID\"],\"Description\":[\"test-snapshot\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CopyEbsSnpshtParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3lkbpansfv69k" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CopyEbsSnpshtParams.json
   ```

2. Modify and save the CopyEbsSnpshtParams file. For example, you can replace the contents with something like this:

```
{
  "DocumentName": "AWSManagedServices-CopyEBSSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SourceSnapshotId": [
      "SNAPSHOT_ID"
    ],
    "SourceRegion": [
      "ap-southeast-2"
    ],
    "KmsKeyId": [
      "KEY_ID"
    ],
    "Description": [
      "test-snapshot"
    ]
  }
}
```

3. Output the RFC template JSON file to a file; this example names it CopyEbsSnpshtRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CopyEbsSnpshtRfc.json
```

4. Modify and save the CopyEbsSnpshtRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "2.0",
  "ChangeTypeId": "ct-3lkbpansfv69k",
  "Title": "Copy EBS snapshot"
}
```

5. Create the RFC, specifying the CopyEbsSnpshtRfc file and the CopyEbsSnpshtParams file:

```
aws amscm create-rfc --cli-input-json file://CopyEbsSnpshtRfc.json  --execution-
parameters file://CopyEbsSnpshtParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> A typical use for the EBS snapshot share and copy CTs would be:
>
> 1. In account A, use the Share EBS snapshot CT to share the snapshot with account B.
> 2. In account B, use the EBS snapshot copy CT to copy the snapshot to the AWS Region for account B.

> **Important**
>
> This change type version, 2.0, removes several parameters, **TargetParameterName**, **Targets**, **MaxConcurrency**, and **MaxErrors**; and introduces one new parameter, **SourceSnapshotId**.

To learn more about Amazon EBS snapshots, see Amazon EBS Snapshots.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3lkbpansfv69k.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CopyEBSSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SourceRegion": [
      "us-east-1"
    ],
    "SourceSnapshotId": [
      "snap-1234567890abcdef0"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CopyEBSSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SourceRegion": [
      "us-east-1"
    ],
    "SourceSnapshotId": [
      "snap-1234567890abcdef0"
    ],
    "KmsKeyId": [
      "01234567-abcd-abcd-abcd-0123456789ab"
    ],
    "Description": [
      "my-snapshot"
    ]
  }
}
```

EBS Snapshot | Create

Create an Elastic Block Store (EBS) snapshot from an EBS volume. The volume must be attached to an EC2 instance.

Full classification: Deployment | Advanced stack components | EBS snapshot | Create

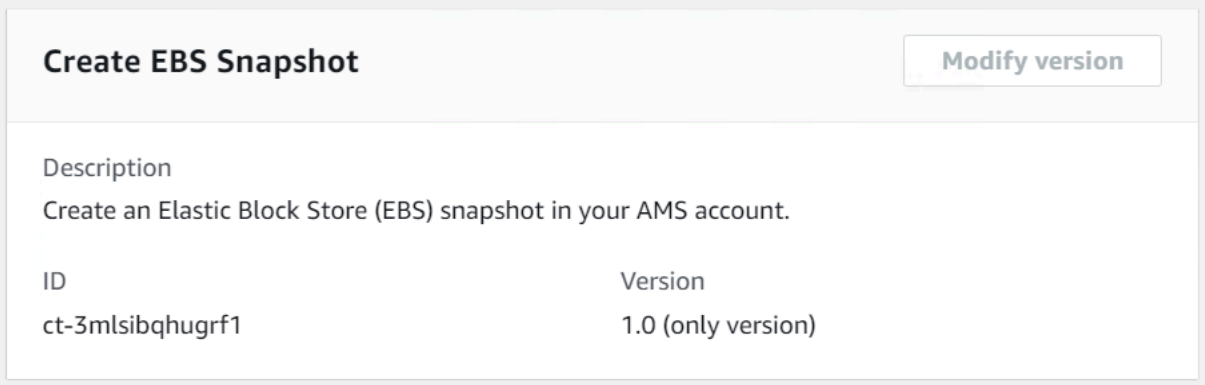
Change Type Details

Change type ID	ct-3mlsibqhugrf1
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create EBS snapshot

Creating EBS Snapshots with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating EBS Snapshots with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3mlsibqhugrf1" --change-type-version
 "1.0" --title "Create EBS snapshot" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-CreateEBSSnapshot\",\"Region\":\"us-east-1\",\"Parameters\":
{\"VolumeId\":[\"VOL_ID\"],\"Description\":[\"My snapshot\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateEbsSnpshtParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3mlsibqhugrf1"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateEbsSnpshtParams.json
   ```

2. Modify and save the CreateEbsSnpshtParams file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-CreateEBSSnapshot",
       "Region": "us-east-1",
       "Parameters": {
           "VolumeId": [
               "VOL_ID"
           ],
           "Description": [
               "My snapshot"
           ]
       }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it CreateEbsSnpshtRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateEbsSnpshtRfc.json
   ```

4. Modify and save the CreateEbsSnpshtRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3mlsibqhugrf1",
  "Title": "Create EBS snapshot"
}
```

5. Create the RFC, specifying the CreateEbsSnpshtRfc file and the CreateEbsSnpshtParams file:

```
aws amscm create-rfc --cli-input-json file://CreateEbsSnpshtRfc.json  --execution-
parameters file://CreateEbsSnpshtParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS snapshots, see Amazon EBS Snapshots.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3mlsibqhugrf1.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateEBSSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "VolumeId": [
      "vol-1234567890abcdef0"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateEBSSnapshot",
```

```
  "Region": "us-east-1",
  "Parameters": {
    "VolumeId": [
      "vol-1234567890abcdef0"
    ],
    "Description": [
      "my-snapshot"
    ]
  }
}
```

EBS Volume | Create

Creates up to five EBS volumes, and attaches them to an existing EC2 instance that you specify. Does not create a root volume.

Full classification: Deployment | Advanced stack components | EBS Volume | Create

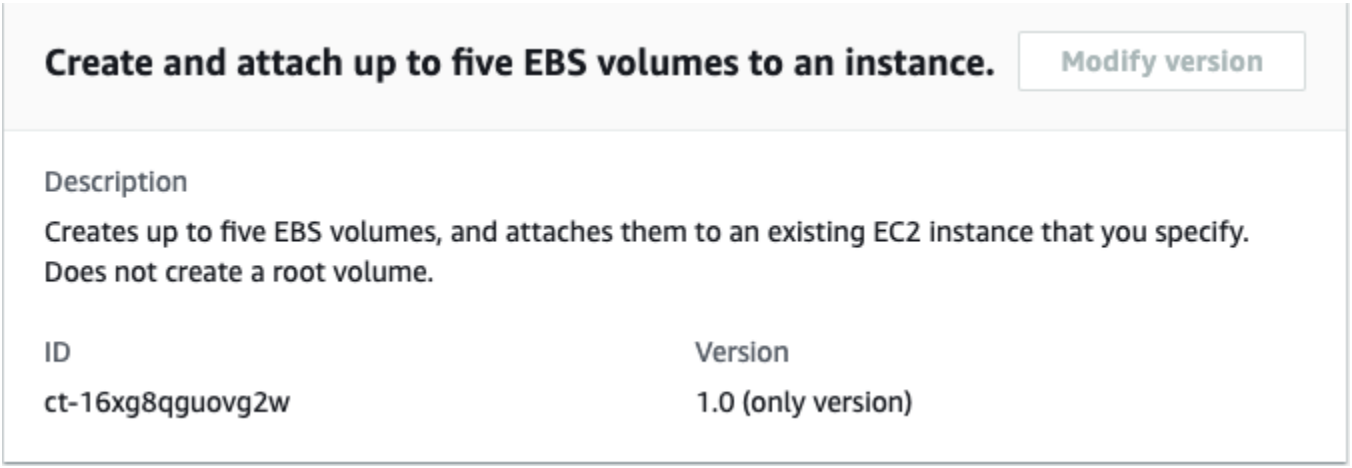
Change Type Details

Change type ID	ct-16xg8qguovg2w
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create EBS volume

Creating EBS Volumes with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating EBS Volumes with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-16xg8qguovg2w" --change-type-version "1.0"
 --title "EBS-Create-RFC" --execution-parameters "{\"Description\": \"Create 2 volumes
 and attach to i-12345678901234567\",\"VpcId\": \"vpc-0a60eb65b4EXAMPLE\",\"Name\":
 \"EBSVolumeStack\",\"StackTemplateId\": \"stm-hrnfpt7l0qqumcelt\",\"TimeoutInMinutes
\":\"45\",\"Parameters\": {\"AvailabilityZone\": \"us-east-1d\",\"InstanceId\":
 \"i-12345678901234567\",\"Volume1Name\": \"/dev/xvdf\",\"Volume1Size\": \"20\",
\"Volume1Type\": \"gp3\",\"Volume1Iops\": \"3000\",\"Volume1Throughput\": \"125\",
\"Volume2Name\": \"/dev/xvdg\",\"Volume2Size\": \"20\",\"Volume2Iops\": \"200\",
\"Volume2Type\": \"io2\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateEbsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-16xg8qguovg2w" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateEbsParams.json
   ```

2. Modify and save the CreateEbsParams file. For example, you can replace the contents with something like this:

   ```
   {
     "Description":    "Create 2 volumes and attach to i-12345678901234567.",
     "VpcId":          "vpc-0a60eb65b4EXAMPLE",
     "Name":           "EBSVolumeStack",
     "StackTemplateId": "stm-hrnfpt7l0qqumcelt",
     "TimeoutInMinutes": "45",
     "Parameters": {
       "AvailabilityZone": "us-east-1a",
       "InstanceId":       "i-12345678901234567",
       "Volume1Name":      "/dev/xvdf",
       "Volume1Size":      "20",
       "Volume1Type":      "gp3"
       "Volume1Iops": "3000",
       "Volume1Throughput": "125",
       "Volume2Name": "/dev/xvdg",
   ```

```
    "Volume2Size": "20",
    "Volume2Iops": "200",
    "Volume2Type": "io2"
  }
}
```

3. Output the RFC template JSON file to a file; this example names it CreateEbsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateEbsRfc.json
```

4. Modify and save the CreateEbsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-16xg8qguovg2w",
"Title":                "EBS-Create-RFC"
}
```

5. Create the RFC, specifying the CreateEbsRfc file and the CreateEbsParams file:

```
aws amscm create-rfc --cli-input-json file://CreateEbsRfc.json  --execution-
parameters file://CreateEbsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS, see Amazon Elastic Block Store (EBS).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-16xg8qguovg2w.

Example: Required Parameters

```
{
    "Description": "This is a test description",
    "VpcId": "vpc-1234567890abcdef0",
```

```
    "Name": "Test Stack",
    "Parameters": {
      "AvailabilityZone": "us-west-2a",
      "InstanceId": "i-04ca00332c8e8c226",
      "Volume1Name": "/dev/xvdbb",
      "Volume1Size": "100",
      "Volume1Type": "gp2"
    },
    "TimeoutInMinutes": 60,
    "StackTemplateId": "stm-hrnfpt7l0qqumcelt"
  }
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "key1",
      "Value": "value1"
    },
    {
      "Key": "key2",
      "Value": "value2"
    }
  ],
  "Parameters": {
    "AvailabilityZone": "us-west-2a",
    "InstanceId": "i-04ca00332c8e8c226",
    "Volume1Iops": "3000",
    "Volume1Throughput": "125",
    "Volume1KmsKeyId": "225bc21e-fc82-4388-8c91-855f3cadb63c",
    "Volume1Name": "/dev/xvdbb",
    "Volume1Size": "100",
    "Volume1Snapshot": "snap-12345678",
    "Volume1Type": "gp3",
    "Volume2Iops": "3000",
    "Volume2Throughput": "125",
    "Volume2KmsKeyId": "225bc21e-fc82-4388-8c91-855f3cadb63c",
    "Volume2Name": "/dev/xvdbc",
    "Volume2Size": "100",
```

```
    "Volume2Snapshot": "snap-12345678",
    "Volume2Type": "gp3",
    "Volume3Iops": "3000",
    "Volume3Throughput": "125",
    "Volume3KmsKeyId": "225bc21e-fc82-4388-8c91-855f3cadb63c",
    "Volume3Name": "/dev/xvdbd",
    "Volume3Size": "100",
    "Volume3Snapshot": "snap-12345678",
    "Volume3Type": "gp3",
    "Volume4Iops": "3000",
    "Volume4Throughput": "125",
    "Volume4KmsKeyId": "225bc21e-fc82-4388-8c91-855f3cadb63c",
    "Volume4Name": "/dev/xvdbe",
    "Volume4Size": "100",
    "Volume4Snapshot": "snap-12345678",
    "Volume4Type": "gp3",
    "Volume5Iops": "3000",
    "Volume5Throughput": "125",
    "Volume5KmsKeyId": "225bc21e-fc82-4388-8c91-855f3cadb63c",
    "Volume5Name": "/dev/xvdbf",
    "Volume5Size": "100",
    "Volume5Snapshot": "snap-12345678",
    "Volume5Type": "gp3"
  },
  "TimeoutInMinutes": 60,
  "StackTemplateId": "stm-hrnfpt7l0qqumcelt"
}
```

EBS Volume | Create from Backup

Create an AWS Elastic Block Store (EBS) stack from backup.

Full classification: Deployment | Advanced stack components | EBS Volume | Create from backup

Change Type Details

Change type ID	ct-063qsm82cfxu6
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required

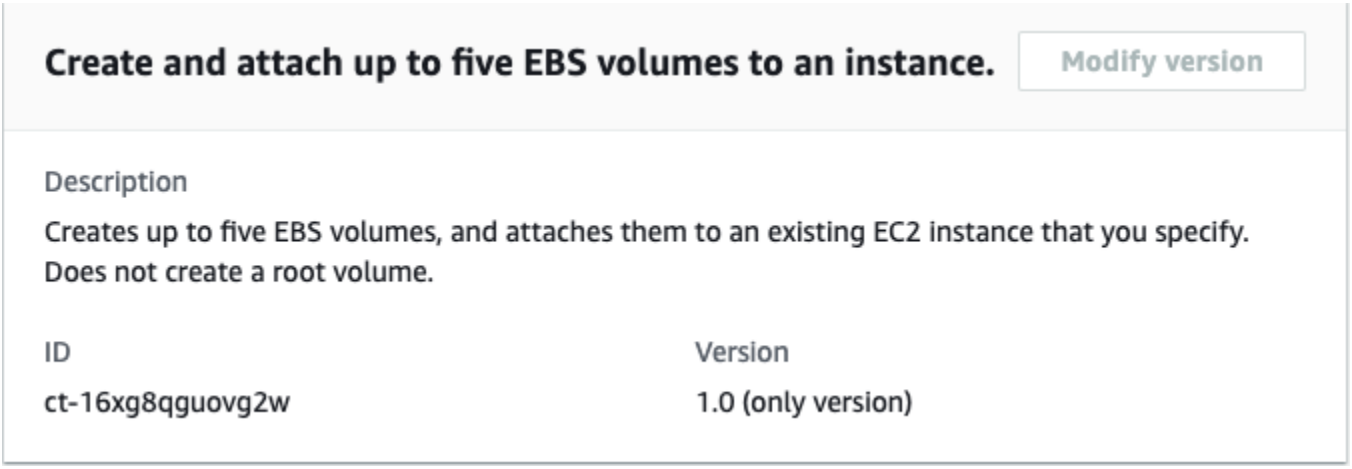
Customer approval	Not required
Execution mode	Automated

Additional Information

Create EBS volume from backup

Creating EBS with an AWS Backup with the Console

Screenshot of this change type, in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating EBS with an AWS Backup with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-063qsm82cfxu6" \
--change-type-version "1.0" --title "EBS Create From Backup" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-StartRestoreJobEBS
\",\"Region\":\"us-east-1\",\"Parameters\":{\"AvailabilityZone\":[\"us-east-1a\"],
\"BackupVaultName\":[\"Default\"],\"RecoveryPointArn\":[\"arn:aws:ec2:us-
east-1::snapshot/snap-0000000000000000\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it EbsCreateFromBackupParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-063qsm82cfxu6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    EbsCreateFromBackupParams.json
   ```

2. Modify and save the EbsCreateFromBackupParams file.

   ```
   {
     "DocumentName": "AWSManagedServices-StartRestoreJobEBS",
     "Region": "us-east-1",
     "Parameters": {
       "AvailabilityZone": ["us-east-1a"],
       "BackupVaultName": ["Default"],
       "RecoveryPointArn": ["arn:aws:ec2:us-east-1::snapshot/snap-0000000000000000"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it EbsCreateFromBackupRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > EbsCreateFromBackupRfc.json
```

4. Modify and save the EbsCreateFromBackupRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-063qsm82cfxu6",
    "ChangeTypeVersion": "1.0",
    "Title": "EBS Create From Backup"
}
```

5. Create the RFC, specifying the EbsCreateFromBackupRfc file and the EbsCreateFromBackupParams file:

```
aws amscm create-rfc --cli-input-json file://EbsCreateFromBackupRfc.json --
execution-parameters file://EbsCreateFromBackupParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS, see Amazon Elastic Block Store (EBS).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-063qsm82cfxu6.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-StartRestoreJobEBS",
  "Region": "us-east-1",
  "Parameters": {
    "AvailabilityZone": ["us-east-1a"],
    "BackupVaultName": ["Vault01"],
    "RecoveryPointArn": ["arn:aws:ec2:us-east-1::snapshot/snap-00000000000000000"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-StartRestoreJobEBS",
  "Region": "us-east-1",
  "Parameters": {
    "AvailabilityZone": ["us-east-1a"],
    "BackupVaultName": ["Vault01"],
    "IOPS": ["250"],
    "RecoveryPointArn": ["arn:aws:ec2:us-east-1::snapshot/snap-00000000000000000"],
    "VolumeSize": ["100"],
    "VolumeType": ["gp3"],
    "Throughput": ["125"]
  }
}
```

EC2 Stack | Create

Use to create an Amazon Elastic Compute Cloud (EC2) instance.

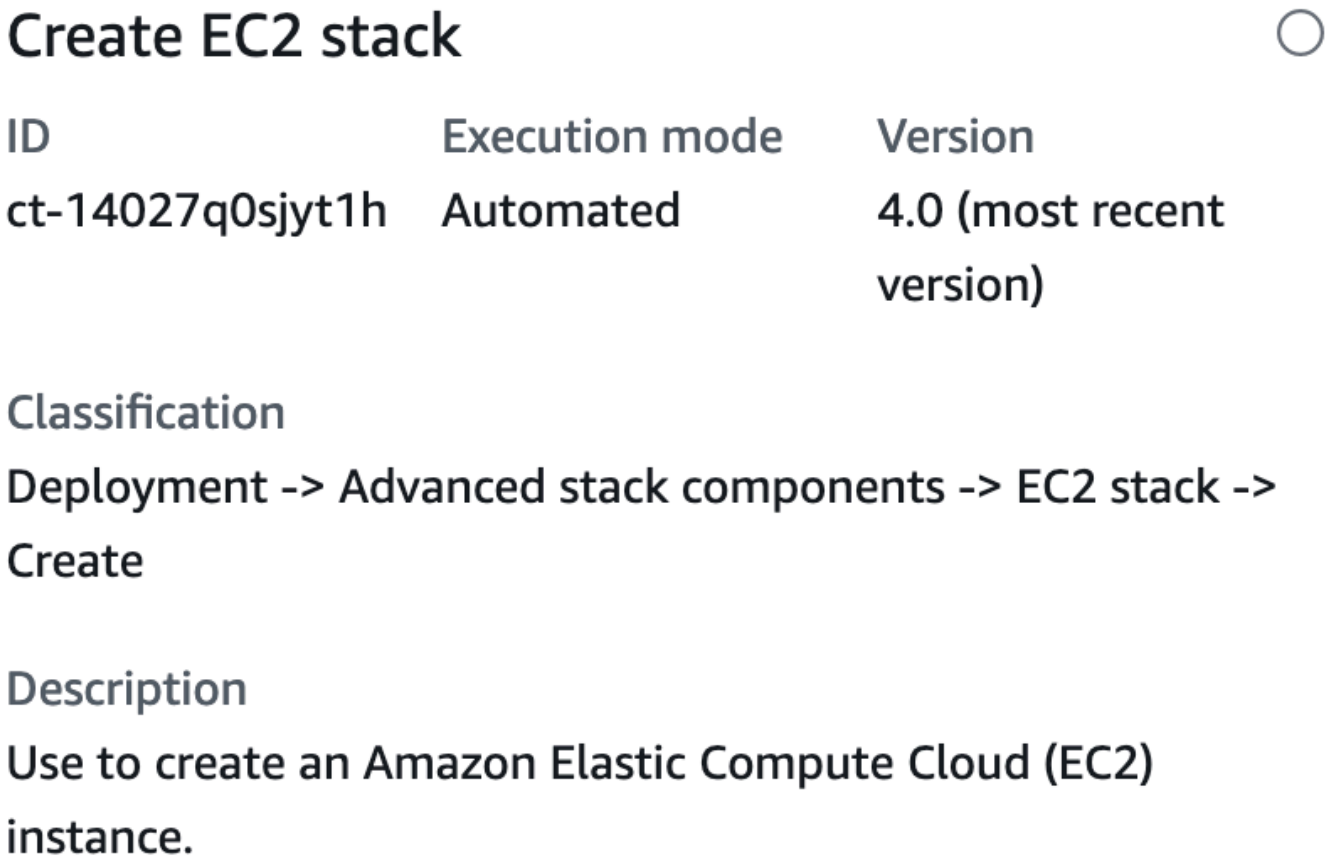
Current version	5.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create stack

Creating an EC2 instance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an EC2 instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-14027q0sjyt1h" --change-type-version "4.0"
 --title "EC2-Create-RFC" --execution-parameters "{\"Description\": \"Create a new
 EC2 Instance stack\",\"VpcId\": \"vpc-0a60eb65b4EXAMPLE\",\"Name\": \"My-EC2\",
\"TimeoutInMinutes\": 60,\"Parameters\": {\"InstanceAmiId\": \"ami-1234567890EXAMPLE\",
\"InstanceDetailedMonitoring\": false,\"InstanceEBSOptimized\": false,\"InstanceProfile
\": \"customer-mc-ec2-instance-profile\",\"InstanceRootVolumeIops\": 3000,
\"InstanceRootVolumeType\": \"gp3\",\"InstanceType\": \"t2.large\",\"InstanceUserData
\": \"\",\"InstanceSubnetId\": \"subnet-0bb1c79de3EXAMPLE\",\"EnforceIMDSV2\":
 \"false\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it CreateEC2Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-14027q0sjyt1h" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateEC2Params.json
   ```

2. Modify and save the CreateEC2Params file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "Create a new EC2 Instance stack",
     "VpcId": "vpc-0a60eb65b4EXAMPLE",
   ```

```
  "Name": "My-EC2",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "InstanceAmiId": "ami-1234567890EXAMPLE",
    "InstanceDetailedMonitoring": false,
    "InstanceEBSOptimized": false,
    "InstanceProfile": "customer-mc-ec2-instance-profile",
    "InstanceRootVolumeIops": 3000,
    "InstanceRootVolumeType": "gp3",
    "InstanceType": "t2.large",
    "InstanceUserData": "",
    "InstanceSubnetId": "subnet-0bb1c79de3EXAMPLE",
    "EnforceIMDSV2": "false"
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateEC2Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateEC2Rfc.json
```

4. Modify and save the CreateEC2Rfc.json file. For example, you can replace the contents with something like this:.

```
{
"ChangeTypeVersion":    "4.0",
"ChangeTypeId":         "ct-14027q0sjyt1h",
"Title":                "EC2-Create-RFC"
}
```

5. Create the RFC, specifying the CreateEC2Rfc file and the CreateEC2Params file:

```
aws amscm create-rfc --cli-input-json file://CreateEC2Rfc.json  --execution-
parameters file://CreateEC2Params.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Security Groups

Starting with version 3.0 of this change type, AMS does not attach the default AMS security groups if you specify your own security groups. If you do not specify your own security groups in the request, AMS attaches the AMS default security groups. In previous versions, AMS attached the default security groups whether or not you provided your own security groups.

Currently, if you specify custom security groups, you must also specify the IDs of the default AMS security groups for your account, `mc-initial-garden-SG-name` and `mc-initial-garden-SG-name`.

Instance Types

AMS does not recommend the **t2.micro/t3.micro** and **t2.nano/t3.nano** types. These are smaller instance types, and can degrade the performance of your application and AMS tools. EC2 instances need enough capacity to support AMS tools such as EPS, SSM, and Cloudwatch in addition to the application workload. For more information, see Choosing the Right EC2 Instance Type for Your Application.

To create an EC2 stack with additional volumes, see EC2 Stack | Create (with Additional Volumes).

You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

If needed, see EC2 instance stack create fail.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-14027q0sjyt1h.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
```

```
  "Name": "Test Stack",
  "TimeoutInMinutes": 360,
  "Parameters": {
    "InstanceAmiId": "ami-1234567890abcdef0",
    "InstanceSubnetId": "subnet-1234567890abcdef0",
    "EnforceIMDSV2": "true"
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "InstanceAmiId": "ami-a0b1c2d3",
    "InstanceDetailedMonitoring": false,
    "InstanceEBSOptimized": false,
    "InstanceProfile": "customer-mc-ec2-instance-profile",
    "InstanceRootVolumeIops": 3000,
    "InstanceRootVolumeName": "/dev/xvda",
    "InstanceRootVolumeSize": 60,
    "InstanceRootVolumeType": "gp3",
    "InstancePrivateStaticIp": "172.16.0.0",
    "InstanceSubnetId": "subnet-a0b1c2d3",
    "InstanceType": "t2.large",
    "InstanceUserData": "pwd\nls -ltrh\necho \"Hello, World\"",
    "EnforceIMDSV2": "true"
  }
}
```

EC2 Stack | Create (With Additional Volumes)

Create an Amazon Elastic Compute Cloud (EC2) instance with up to five additional volumes.

Full classification: Deployment | Advanced stack components | EC2 stack | Create (with additional volumes)

Change Type Details

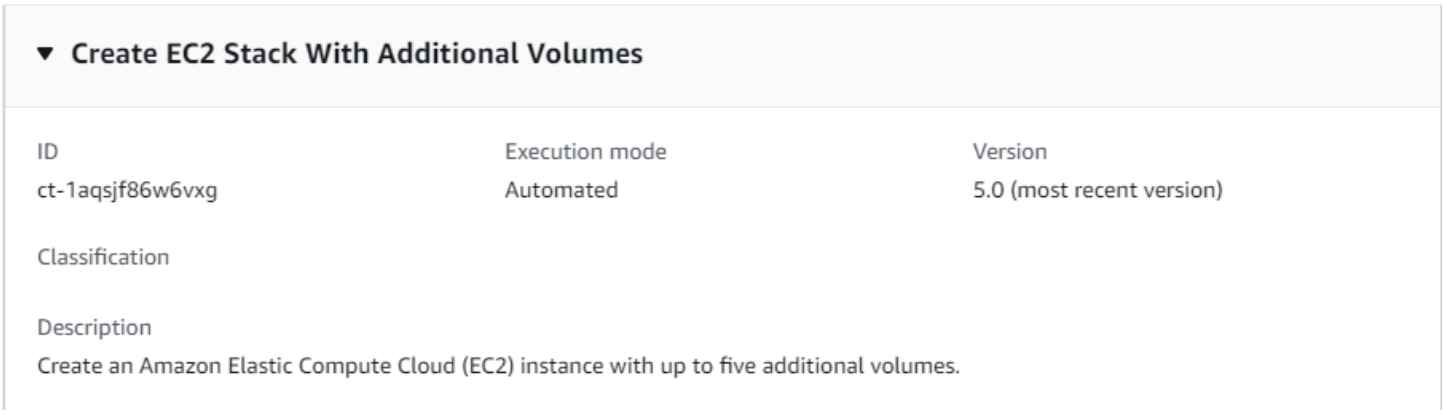
Change type ID	ct-1aqsjf86w6vxg
Current version	5.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create stack (with additional volumes)

Creating an EC2 instance and additional volumes with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an EC2 instance and additional volumes with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id ID` command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID (example shows required parameters only). For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1aqsjf86w6vxg" --change-type-version "4.0"
 --title "EC2-Create-A-V-QC" --execution-parameters "{\"Description\":\"My EC2 stack
 with addl vol\",\"VpcId\":\"VPC_ID\",\"Name\":\"My Stack\",\"StackTemplateId\":
\"stm-nn8v8ffhcal611bmo\",\"TimeoutInMinutes\":60,\"Parameters\":{\"InstanceAmiId\":
\"AMI_ID\",\"InstanceSubnetId\":\"SUBNET_ID\"}}
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateEC2AVParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1aqsjf86w6vxg" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateEC2AVParams.json
   ```

2. Modify and save the CreateEC2AVParams file (example shows most parameters). For example, you can replace the contents with something like this:

```
{
"Description":      "EC2-Create-1-Addl-Volumes",
"VpcId":            "VPC_ID",
"StackTemplateId":  "stm-nn8v8ffhcal611bmo",
"Name":             "My-EC2-1-Addl-Volume",
"TimeoutInMinutes": 60,
"Parameters":   {
    "InstanceAmiId":    "AMI_ID",
    "InstanceSecurityGroupIds": "SECURITY_GROUP_ID",
    "InstanceCoreCount": 1,
    "InstanceThreadsPerCore": 2,
    "InstanceDetailedMonitoring": "true",
    "InstanceEBSOptimized": "false",
    "InstanceProfile": "customer-mc-ec2-instance-profile",
    "InstanceRootVolumeIops": 100,
    "InstanceRootVolumeName": "/dev/xvda",
    "InstanceRootVolumeSize": 50,
    "InstanceRootVolumeType": "io1",
    "RootVolumeKmsKeyId": "default",
    "InstancePrivateStaticIp": "10.27.0.100",
    "InstanceSecondaryPrivateIpAddressCount": 0,
    "InstanceTerminationProtection": "false",
    "InstanceType": "t3.large",
    "CreditSpecification": "unlimited",
    "InstanceUserData": "echo $",
    "Volume1Encrypted": "true",
    "Volume1Iops":      "IOPS"
    "Volume1KmsKeyId":  "KMS_MASTER_KEY_ID",
    "Volume1Name":      "xvdh"
    "Volume1Size":      "2 GiB",
    "Volume1Snapshot":  "SNAPSHOT_ID",
    "Volume1Type":      "iol",
    "InstanceSubnetId": "SUBNET_ID"
    }
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateEC2AVRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateEC2AVRfc.json
```

4. Modify and save the CreateEC2AVRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "4.0",
"ChangeTypeId":         "ct-1aqsjf86w6vxg",
"Title":                "EC2-Create-1-Addl-Volume-RFC"
}
```

5. Create the RFC, specifying the CreateEC2AVRfc file and the CreateEC2AVParams file:

```
aws amscm create-rfc --cli-input-json file://CreateEC2AVRfc.json  --execution-
parameters file://CreateEC2AVParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Important

There is a new version of this change type, v 4.0, that uses a different StackTemplateId (stm-nn8v8ffhcal611bmo). This is important if you're submitting the RFC with this change type at the command line. The new version introduces two new parameters (**RootVolumeKmsKeyId** and **CreditSpecification**) and changes the default for one existing parameter (**InstanceType**).

Instance Types

- If you choose to specify the number of cores or threads, you must specify values for both. Use the parameters `InstanceCoreCount` and `InstanceThreadsPerCore`. To find valid combinations of cores/threads, see CPU cores and threads per CPU core per instance type .

- AMS does not recommend the **t2.micro/t3.micro** or **t2.nano/t3.nano** instance types. These are too small to support AMS tools such as EPS, SSM, and Cloudwatch in addition to your business workload. For more information, see Choosing the Right EC2 Instance Type for Your Application.
- In version 4.0, the default type was raised from **t2.large** to **t3.large**. T3 instances launch with 'unlimited credits' by default. You won't experience CPU throttling even if the instance consumes all CPU credits. You can, instead, choose T2 instances and use the CreditSpecification unlimited option.
- For more information about Amazon EC2, including size recommendations, see Amazon Elastic Compute Cloud Documentation.

To update your EC2 stack with additional volumes after they're created, see EC2 Instance stack: Updating (With Additional Volumes)

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1aqsjf86w6vxg.

Example: Required Parameters

```
{
  "Description" : "Test description",
  "VpcId" : "vpc-12345678901234567",
  "Name" : "TestStack",
  "StackTemplateId" : "stm-nn8v8ffhcal611bmp",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
    "InstanceAmiId" : "ami-1234567890abcdef0",
    "InstanceSubnetId" : "subnet-1234567890abcdef0",
    "EnforceIMDSV2": "true"
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678",
```

```
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "key1",
      "Value": "value1"
    },
    {
      "Key": "key2",
      "Value": "value2"
    }
  ],
  "Parameters": {
    "InstanceAmiId": "ami-12345678",
    "InstanceCoreCount": 0,
    "InstanceThreadsPerCore": 0,
    "InstanceRootVolumeName": "/dev/xvda",
    "InstanceRootVolumeSize": 100,
    "InstanceSubnetId": "subnet-12345678",
    "InstanceDetailedMonitoring": "false",
    "InstanceEBSOptimized": "false",
    "InstanceProfile": "customer-mc-ec2-instance-profile",
    "InstanceRootVolumeIops": 1000,
    "InstanceRootVolumeType": "io1",
    "InstancePrivateStaticIp": "172.16.0.10",
    "InstanceSecondaryPrivateIpAddressCount" : 1,
    "InstanceTerminationProtection" : "true",
    "InstanceType": "t2.small",
    "InstanceUserData": "#!/bin/bash\\npwd\\nls -ltrh\\necho \"Hello, World\"",
    "Volume1Iops": 100,
    "Volume1KmsKeyId": "12345678-1234-1234-1234-1234567890ab",
    "Volume1Name": "/dev/sdf",
    "Volume1Size": 100,
    "Volume1Type": "io1",
    "Volume2Iops": 100,
    "Volume2KmsKeyId": "12345678-1234-1234-1234-1234567890ab",
    "Volume2Name": "/dev/sdg",
    "Volume2Size": 100,
    "Volume2Type": "io1",
    "Volume3Iops": 100,
    "Volume3KmsKeyId": "12345678-1234-1234-1234-1234567890ab",
    "Volume3Name": "/dev/sdh",
    "Volume3Size": 100,
    "Volume3Type": "io1",
    "Volume4Iops": 100,
```

```
    "Volume4KmsKeyId": "12345678-1234-1234-1234-1234567890ab",
    "Volume4Name": "/dev/sdi",
    "Volume4Size": 100,
    "Volume4Type": "io1",
    "Volume5Iops": 100,
    "Volume5KmsKeyId": "12345678-1234-1234-1234-1234567890ab",
    "Volume5Name": "/dev/sdj",
    "Volume5Size": 100,
    "Volume5Type": "io1",
    "EnforceIMDSV2": "true"
  },
  "TimeoutInMinutes": 60,
  "StackTemplateId": "stm-nn8v8ffhcal611bmp"
}
```

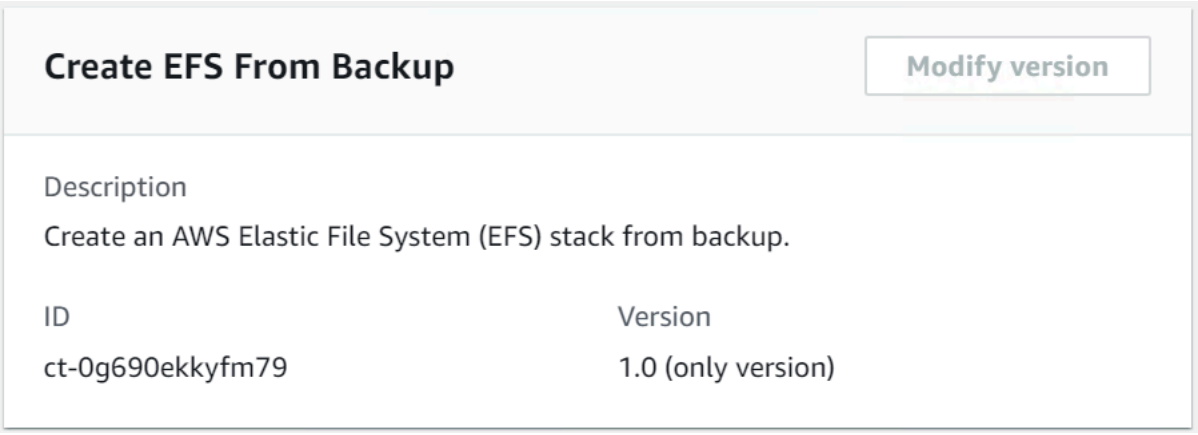
Additional Information

Create EFS

Creating an Elastic File System with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an Elastic File System with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 ct-2uw99b8hpncnu --change-type-version 1.0 --title "TEST-EFS-RFC" --description
 "TEST-EFS-RFC" --execution-parameters "{\"Description\":\"TEST-EFS\",\"Name\":\"Test-
EFS-Stack\",\"VpcId\":\"VPC_ID\",\"TimeoutInMinutes\":60,\"Parameters\":{\"Encrypted
\":true,\"PerformanceMode\":\"generalPurpose\",\"MountTargets\":[{\"AvailabilityZone\":
\"us-east-1a\"}]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateEfsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2uw99b8hpncnu" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateEfsParams.json
   ```

2. Modify and save the CreateEfsParams file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":      "EFS-Create",
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-sdhopv00000000000",
   "Name":             "My-EFS",

   "Parameters":   {
       "ELBSubnetIds":  ["PUBLIC_SUBNET"],
       }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it CreateEfsRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateEfsRfc.json
   ```

4. Modify and save the CreateEfsRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-2uw99b8hpncnu",
   "Title":                "EFS-Create-RFC"
   ```

```
}
```

5. Create the RFC, specifying the CreateEfsRfc file and the CreateEfsParams file:

```
aws amscm create-rfc --cli-input-json file://CreateEfsRfc.json --execution-
parameters file://CreateEfsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> Currently AMS has a known issue that is preventing the auto-mounting of the EFS by using the UserData field when creating new instances.

For more information, see Amazon Elastic File System Documentation.

This change type creates an EFS and mounts targets in your specified Availability Zones. You only need to specify an Availability Zone to create a mount target, but you can optionally specify a specific subnet to create the mount target in, and a private IP address to give the mount target within that subnet. If you only specify an Availability Zone, AMS picks a subnet/IP address to give the mount target. For an example of creating an EFS, , see Create EFS.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2uw99b8hpncnu.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "VpcId": "vpc-1234567890abcdef0",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "Encrypted": true,
```

```
    "PerformanceMode": "generalPurpose",
    "MountTargets": [
      {
        "AvailabilityZone": "us-east-1a"
      }
    ]
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "VpcId": "vpc-12345678",
  "TimeoutInMinutes": 60,
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "Parameters": {
    "Encrypted": true,
    "KmsKeyId": "1234abcd-12ab-34cd-56ef-1234567890ab",
    "PerformanceMode": "generalPurpose",
    "MountTargets": [
      {
        "AvailabilityZone": "us-east-1a",
        "SubnetId": "subnet-12345678",
        "IpAddress": "10.0.0.1"
      }
    ]
  }
}
```

Elastic File System (EFS) | Create from Backup

Create an AWS Elastic File System (EFS) stack from backup.

Full classification: Deployment | Advanced stack components | Elastic File System (EFS) | Create from backup

Change Type Details

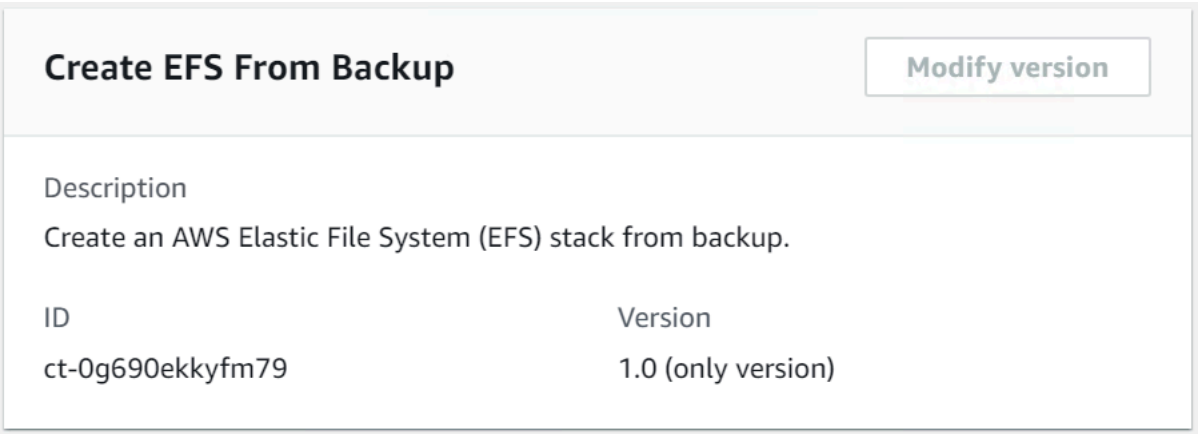
Change type ID	ct-0g690ekkyfm79
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create EFS from backup

Creating EFS with an AWS Backup with the Console

Screenshot of this change type, in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating EFS with an AWS Backup with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-0g690ekkyfm79" \
--change-type-version "1.0" --title "EFS Create From Backup" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-StartRestoreJobEFS
\",\"Region\":\"us-east-1\",\"Parameters\":{\"BackupVaultName\":[\"Default\"],
\"RecoveryPointArn\":[\"RECOVERY_POINT_ARN\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it EfsCreateFromBackupParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0g690ekkyfm79"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    EfsCreateFromBackupParams.json
   ```

2. Modify and save the EfsCreateFromBackupParams file.

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-StartRestoreJobEFS",
  "Region": "us-east-1",
  "Parameters": {
    "BackupVaultName": ["Default"],
    "EnableEncryption": ["true"],
    "KmsKeyId": ["arn:aws:kms:us-
east-1:000000000000:key/00000000-0000-0000-0000-000000000000"],
    "PerformanceMode": ["maxIO"],
    "RecoveryPointArn": ["arn:aws:backup:us-east-1:000000000000:recovery-
point:00000000-0000-0000-0000-000000000000"],
    "RestoreToNewFileSystem": ["true"]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it EfsCreateFromBackupRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > EfsCreateFromBackupRfc.json
```

4. Modify and save the EfsCreateFromBackupRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-0g690ekkyfm79",
    "ChangeTypeVersion": "1.0",
    "Title": "EFS Create From Backup"
}
```

5. Create the RFC, specifying the EfsCreateFromBackupRfc file and the EfsCreateFromBackupParams file:

```
aws amscm create-rfc --cli-input-json file://EfsCreateFromBackupRfc.json --
execution-parameters file://EfsCreateFromBackupParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Backup, see AWS Backup: How It Works.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0g690ekkyfm79.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-StartRestoreJobEFS",
  "Region": "us-east-1",
  "Parameters": {
    "BackupVaultName": ["Vault01"],
    "RecoveryPointArn": ["arn:aws:ec2:us-east-1::snapshot/snap-00000000000000000"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-StartRestoreJobEFS",
  "Region": "us-east-1",
  "Parameters": {
    "BackupVaultName": ["Vault01"],
    "EnableEncryption": ["true"],
    "ItemsToRestore": ["/dir1", "/dir2"],
    "KmsKeyId": ["arn:aws:kms:us-
east-1:000000000000:key/00000000-0000-0000-0000-000000000000"],
    "PerformanceMode": ["maxIO"],
    "RecoveryPointArn": ["arn:aws:ec2:us-east-1::snapshot/snap-00000000000000000"],
    "RestoreToNewFileSystem": ["true"]
  }
}
```

Identity and Access Management (IAM) | Create Access Key

Create a new AWS secret access key and corresponding AWS access key ID for the specified user.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create access key

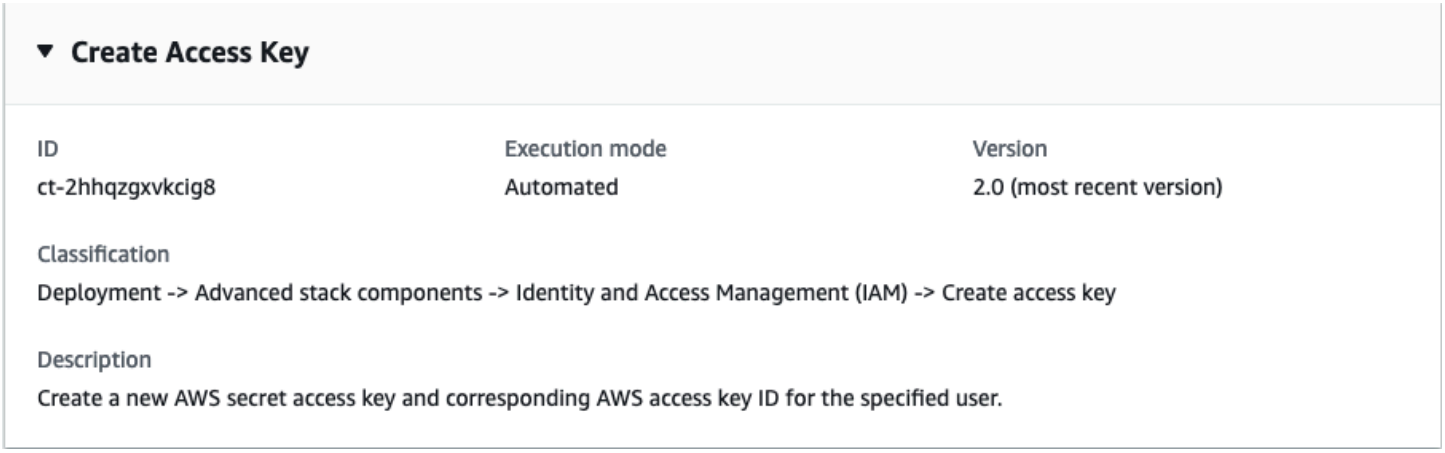
Change Type Details

Change type ID	ct-2hhqzgxvkcig8
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create access key

Creating access key with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating access key with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Note

When pasting in a policy document, note that the RFC only accepts policy pastes up to 5,000 characters. If your file has more than 5,000 characters, create a service request to upload the policy and then refer to that service request in the RFC that you open for IAM.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2hhqzgxvkcig8" --change-type-version
 "2.0" --title "Create access key" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-CreateIAMAccessKey\",\"Region\": \"us-east-1\",\"Parameters\":
 {\"UserARN\": \"arn:aws:iam::012345678910:user/myusername\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamAccessKeyParameters.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2hhqzgxvkcig8"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateIamAccessKeyParameters.json
   ```

2. Modify and save the CreateIamAccessKeyParameters.json file; example creates an IAM Role with policy documents pasted inline.

```
{
    "DocumentName": "AWSManagedServices-CreateIAMAccessKey",
    "Region": "ap-southeast-2",
    "Parameters": {
        "UserARN": "arn:aws:iam::012345678910:user/myusername"
    }
  }
}
```

3. Output the RFC template JSON file to a file named CreateIamAccessKeyRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateIamAccessKeyRfc.json
```

4. Modify and save the CreateIamAccessKeyRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "2.0",
  "ChangeTypeId": "ct-2hhqzgxvkcig8",
  "Title": "Create IAM access key"
}
```

5. Create the RFC, specifying the CreateIamAccessKeyRfc.json file and the CreateIamAccessKeyParameters.json file:

```
aws amscm create-rfc --cli-input-json file://CreateIamAccessKeyRFC.json --
execution-parameters file://CreateIamAccessKeyParameters.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM) and for policy information, see Managed policies and inline policies. For information about AMS permissions, see Deploying IAM resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2hhqzgxvkcig8.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateIAMAccessKeyV2",
  "Region": "us-east-1",
  "Parameters": {
    "UserARN": "arn:aws:iam::012345678910:user/myusername"
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateIAMAccessKeyV2",
  "Region": "us-east-1",
  "Parameters": {
    "UserARN": "arn:aws:iam::012345678910:user/myusername"
  }
}
```

Identity and Access Management (IAM) | Create Account Alias

Create an AWS account alias. Note that an AWS account can have only one alias. This operation fails if the AWS account already has an alias. To update an existing account alias, use the Update Account Alias (ct-3skaisgnq0pf8) change type.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create account alias

Change Type Details

Change type ID	ct-36x3u7v2oklwd
Current version	1.0
Expected execution duration	60 minutes

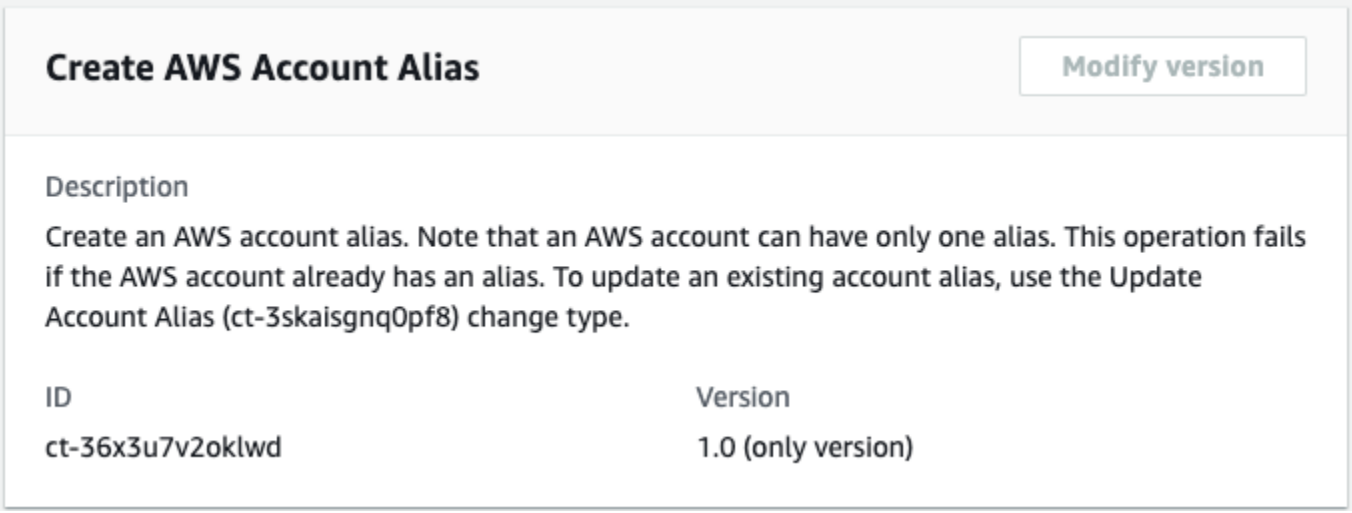
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create IAM account alias

Creating IAM account alias with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM account alias with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-36x3u7v2oklwd" --change-type-
version "1.0" --title "Create Account Alias" --execution-parameters
 '{"DocumentName":"AWSManagedServices-CreateAccountAlias","Region":"us-
east-1","Parameters":{"AWSAccountAlias":["my-alias"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamAccountAliasParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-36x3u7v2oklwd"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateIamAccountAliasParams.json
   ```

2. Modify and save the CreateIamAccountAliasParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
       "DocumentName": "AWSManagedServices-CreateAccountAlias",
       "Region": "us-east-1",
       "Parameters": {
           "AWSAccountAlias": [
           "my-alias"
           ]
       }
   }
   ```

3. Output the RFC template JSON file to a file named CreateIamAccountAliasRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateIamAccountAliasRfc.json
```

4. Modify and save the CreateIamAccountAliasRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-36x3u7v2oklwd",
    "ChangeTypeVersion": "1.0",
    "Title": "Create Account Alias"
}
```

5. Create the RFC, specifying the CreateIamAccountAliasRfc file and the CreateIamAccountAliasParams file:

```
aws amscm create-rfc --cli-input-json file://CreateIamAccountAliasRfc.json  --
execution-parameters file://CreateIamAccountAliasParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-36x3u7v2oklwd.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateAccountAlias",
  "Region": "us-east-1",
```

```
  "Parameters": {
    "AWSAccountAlias": ["myalias"]
  }
}
```

Identity and Access Management (IAM) | Create EC2 Instance Profile

Create an IAM instance profile to use with EC2 instances. Each ARN specified in the parameters creates a part of the IAM policy. Use the Preview option to see what the completed, generated, policy looks like before it is created and implemented.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create EC2 instance profile

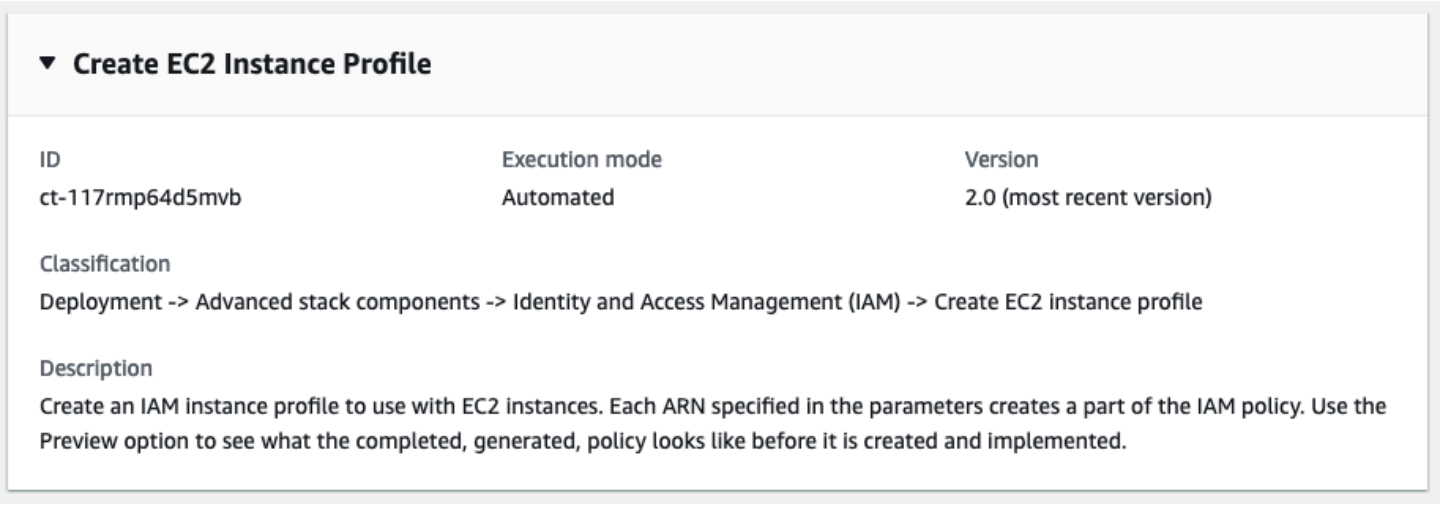
Change Type Details

Change type ID	ct-117rmp64d5mvb
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create IAM EC2 profile

Creating IAM EC2 profiles with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM EC2 profiles with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE (required parameters only):

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-117rmp64d5mvb" --change-type-version
 "2.0" --title "new EC2 instance profile" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-HandleCreateIAMRole-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": { \"RoleName\": \"customer_application_instance_profile\",
 \"ServicePrincipal\": \"ec2.amazonaws.com\", \"Preview\": \"No\" }}"
```

TEMPLATE CREATE (all parameters):

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamEc2ProfileParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-117rmp64d5mvb"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateIamEc2ProfileParams.json
   ```

2. Modify and save the CreateIamEc2ProfileParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName": "AWSManagedServices-HandleCreateIAMRole-Admin",
     "Region": "us-east-1",
     "Parameters": {
     "RoleName": "customer_application_instance_profile",
     "ServicePrincipal": "ec2.amazonaws.com",
     "Preview": "No"
     }
   }
   ```

3. Output the RFC template JSON file to a file named CreateIamEc2ProfileRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateIamEc2ProfileRfc.json
   ```

4. Modify and save the CreateIamEc2ProfileRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"ChangeTypeVersion": "2.0",
"ChangeTypeId": "ct-117rmp64d5mvb",
"Title": "Create New EC2 Instance Profile"
}
```

5. Create the RFC, specifying the CreateIamEc2ProfileRfc file and the CreateIamEc2ProfileParams file:

```
aws amscm create-rfc --cli-input-json file://CreateIamEc2ProfileRfc.json  --
execution-parameters file://CreateIamEc2ProfileParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-117rmp64d5mvb.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleCreateIAMRole-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "RoleName": "customer_application_instance_profile",
    "ServicePrincipal": "ec2.amazonaws.com",
    "Preview": "No"
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleCreateIAMRole-Admin",
  "Region" : "us-east-1",
  "Parameters": {
```

```
    "CloudWatchAlarmReadAccess": ["arn:aws:cloudwatch:us-
east-1:123456789012:alarm:myalarm*"],
    "CloudWatchAlarmWriteAccess": ["arn:aws:cloudwatch:us-
east-1:123456789012:alarm:myalarm*"],
    "CloudWatchLogsReadAccess": ["arn:aws:logs:us-east-1:123456789012:log-
group:myparam*:log-stream:mylogstream"],
    "CloudWatchLogsWriteAccess": ["arn:aws:logs:us-east-1:123456789012:log-
group:mylogs*"],
    "CloudWatchMetricsReadAccess": ["*"],
    "CloudWatchMetricsWriteAccess": ["Company/AppMetric"],
    "DynamoDBDataReadWriteAccess": ["arn:aws:dynamodb:us-east-1:123456789012:table/
mytable*"],
    "DynamoDBResourceReadAccess": ["arn:aws:dynamodb:us-east-1:123456789012:table/
anotherTable"],
    "KMSCryptographicOperationAccess": ["arn:aws:kms:us-
east-1:123456789012:key/97f43232-6bdc-4830-b54c-2d2926ba69aa"],
    "KMSReadAccess": ["arn:aws:kms:us-east-1:123456789012:key/97f43232-6bdc-4830-

\"}]}"
  }
}
```

Identity and Access Management (IAM) | Create Entity or Policy (Read-Write Permissions)

Create Identity and Access Management (IAM) role or policy with read-write permissions. You must have enabled this feature with change type ct-1706xvvk6j9hf before submitting this request. Automated IAM provisioning with read-write permissions runs over 200 validations to help ensure successful outcomes.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create entity or policy (read-write permissions)

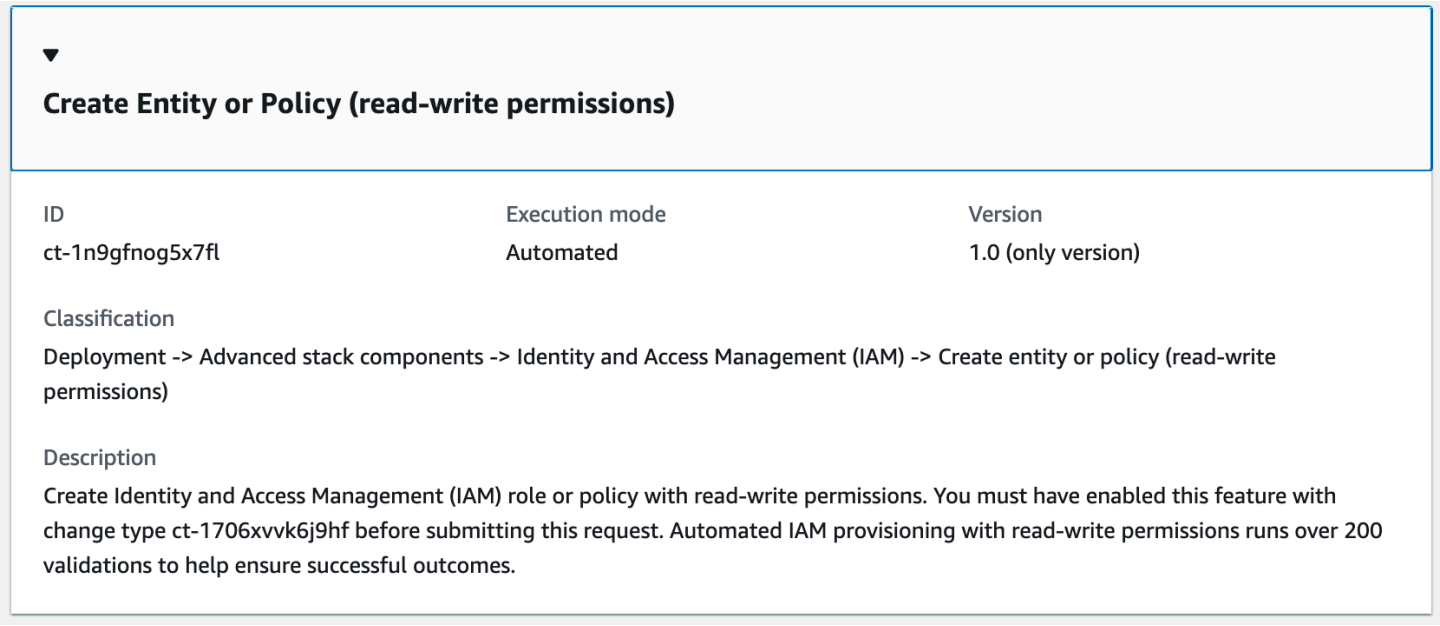
Change Type Details

Change type ID	ct-1n9gfnog5x7fl
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Automated

Additional Information

Create IAM entity or policy

Creating IAM entity or policy with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM entity or policy with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1n9gfnog5x7fl" --change-type-
version "1.0" --title "Create role or policy" --execution-parameters
 '{"DocumentName":"AWSManagedServices-HandleAutomatedIAMProvisioningCreate-
Admin","Region":"us-east-1","Parameters":{"ValidateOnly":"No"},"RoleDetails":
{"Roles":[{"RoleName":"RoleTest01","Description":"This is a test
 role","AssumeRolePolicyDocument":"{"Version":"2012-10-17","Statement":[{"Effect":"Allow","Prin
{"AWS":"arn:aws:iam::123456789012:root"},"Action":"sts:AssumeRole"}]}","ManagedPolicyArns":
["arn:aws:iam::123456789012:policy/policy01","arn:aws:iam::123456789012:policy/
policy02"],"Path":"/","MaxSessionDuration":"7200","PermissionsBoundary":"arn:aws:iam::12345678
permission_boundary01","InstanceProfile":"No"}]},"ManagedPolicyDetails":
{"Policies":[{"ManagedPolicyName":"TestPolicy01","Description":"This is customer
 policy","Path":"/test/","PolicyDocument":"{"Version":"2012-10-17","Statement":
[{"Sid":"AllQueueActions","Effect":"Allow","Action":"sqs:ListQueues","Resource":"*","Condition"
{"ForAllValues:StringEquals":{"aws:tagKeys":["temporary"]}}}]}"}]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamResourceParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1n9gfnog5x7fl"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateIamResourceParams.json
   ```

2. Modify and save the CreateIamResourceParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName": "AWSManagedServices-HandleAutomatedIAMProvisioningCreate-Admin",
     "Region": "us-east-1",
     "Parameters": {
   ```

```
    "ValidateOnly": "No"
  },
  "RoleDetails": {
    "Roles": [
      {
        "RoleName": "RoleTest01",
        "Description": "This is a test role",
        "AssumeRolePolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root\"},
\"Action\":\"sts:AssumeRole\"}]}",
        "ManagedPolicyArns": [
          "arn:aws:iam::123456789012:policy/policy01",
          "arn:aws:iam::123456789012:policy/policy02"
        ],
        "Path": "/",
        "MaxSessionDuration": "7200",
        "PermissionsBoundary": "arn:aws:iam::123456789012:policy/
permission_boundary01",
        "InstanceProfile": "No"
      }
    ]
  },
  "ManagedPolicyDetails": {
    "Policies": [
      {
        "ManagedPolicyName": "TestPolicy01",
        "Description": "This is customer policy",
        "Path": "/test/",
        "PolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"AllQueueActions\",\"Effect\":\"Allow\",\"Action\":\"sqs:ListQueues\",\"Resource
\":\"*\",\"Condition\":{\"ForAllValues:StringEquals\":{\"aws:tagKeys\":[\"temporary
\"]}}}]}"
      }
    ]
  }
}
```

3. Output the RFC template JSON file to a file named CreateIamResourceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateIamResourceRfc.json
```

4. Modify and save the CreateIamResourceRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1n9gfnog5x7fl",
  "Title": "Create entity or policy (read-write permissions)"
}
```

5. Create the RFC, specifying the CreateIamResourceRfc file and the CreateIamResourceParams file:

```
aws amscm create-rfc --cli-input-json file://CreateIamResourceRfc.json  --
execution-parameters file://CreateIamResourceParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- After an IAM role is provisioned in your account, depending on the role and the policy document you attach to the role, you may need to onboard the role in your federation solution.
- For information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM) and for policy information, see Managed policies and inline policies. For information about AMS permissions, see Deploying IAM resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1n9gfnog5x7fl.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-HandleAutomatedIAMProvisioningCreate-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "ValidateOnly": "No"
  },
  "RoleDetails": {
    "Roles": [
      {
```

```
        "RoleName": "RoleTest01",
        "AssumeRolePolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root\"},
\"Action\":\"sts:AssumeRole\"}]}"
      }
    ]
  },
  "ManagedPolicyDetails": {
    "Policies": [
      {
        "ManagedPolicyName": "TestPolicy01",
        "Description": "This is customer policy",
        "Path": "/test/",
        "PolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"AllQueueActions\",\"Effect\":\"Allow\",\"Action\":\"sqs:ListQueues\",\"Resource\":\"*
\",\"Condition\":{\"ForAllValues:StringEquals\":{\"aws:tagKeys\":[\"temporary\"]}}}]}"
      }
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-HandleAutomatedIAMProvisioningCreate-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "ValidateOnly": "No"
  },
  "RoleDetails": {
    "Roles": [
      {
        "RoleName": "RoleTest01",
        "Description": "This is a test role",
        "AssumeRolePolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root\"},
\"Action\":\"sts:AssumeRole\"}]}",
        "ManagedPolicyArns": [
          "arn:aws:iam::123456789012:policy/policy01",
          "arn:aws:iam::123456789012:policy/policy02"
        ],
        "Path": "/",
        "MaxSessionDuration": "7200",
```

```
        "PermissionsBoundary": "arn:aws:iam::123456789012:policy/
permission_boundary01",
        "InstanceProfile": "No"
      }
    ]
  },
  "ManagedPolicyDetails": {
    "Policies": [
      {
        "ManagedPolicyName": "TestPolicy01",
        "Description": "This is customer policy",
        "Path": "/test/",
        "PolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"AllQueueActions\",\"Effect\":\"Allow\",\"Action\":\"sqs:ListQueues\",\"Resource\":\"*
\",\"Condition\":{\"ForAllValues:StringEquals\":{\"aws:tagKeys\":[\"temporary\"]}}}]}"
      }
    ]
  }
}
```

Identity and Access Management (IAM) | Create Entity or Policy (Review Required)

Create Identity and Access Management (IAM) user, role, or policy.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create entity or policy (review required)

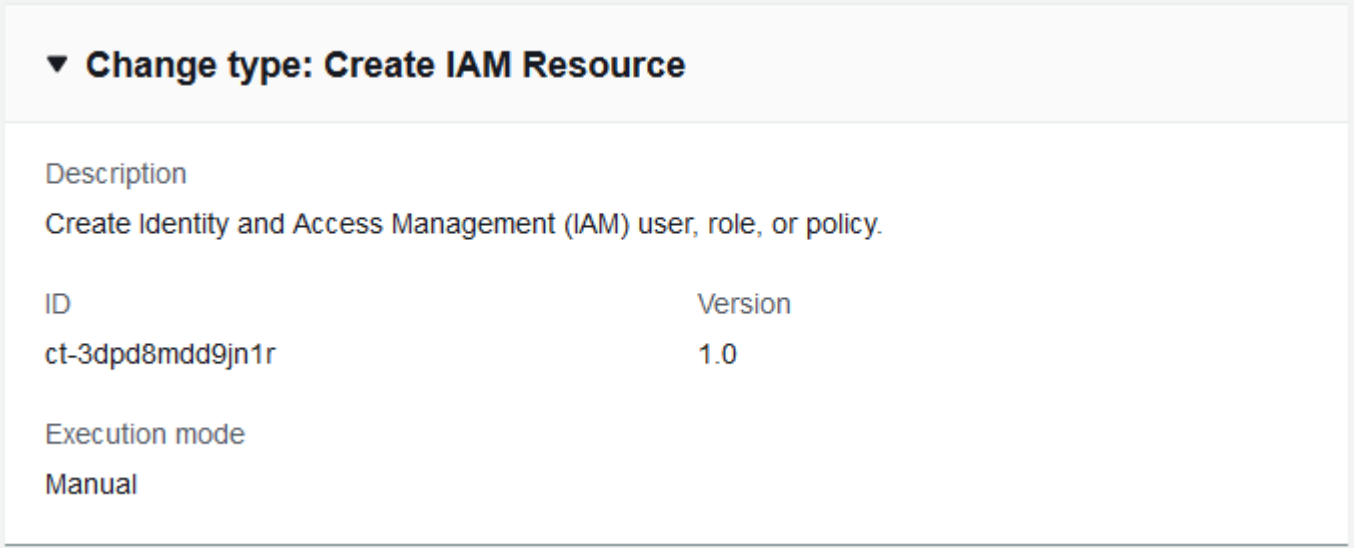
Change Type Details

Change type ID	ct-3dpd8mdd9jn1r
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create IAM entity or policy (review required)

Creating IAM resources (review required) with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM resources (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

> **Note**
>
> When pasting in a policy document, note that the RFC only accepts policy pastes up to 20,480 characters. If your file has more than 20,480 characters, create a service request to upload the policy and then refer to that service request in the RFC that you open for IAM.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3dpd8mdd9jn1r" --change-type-version "1.0"
 --title "TestIamCreate" --execution-parameters "{\"UseCase\":\"IAM_RESOURCE_DETAILS\",
\"IAM Role\":[{\"RoleName\":\"ROLE_NAME\",\"TrustPolicy\":\"TRUST_POLICY\",
\"RolePermissions\":\"ROLE_PERMISSIONS\"}],\"Operation\":\"Create\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamResourceParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3dpd8mdd9jn1r"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateIamResourceParams.json
   ```

2. Modify and save the CreateIamResourceParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "UseCase": "IAM_RESOURCE_DETAILS",
     "IAM Role": [
       {
         "RoleName": "codebuild_ec2_test_role",
         "TrustPolicy": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Effect\":
   \"Allow\",\"Principal\":{\"Service\":\"codebuild.amazonaws.com\"},\"Action\":
   \"sts:AssumeRole\"}]}",
         "RolePermissions": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":
   \"Allow\",\"Action\":[\"ec2:DescribeInstanceStatus\"],\"Resource\":\"*\"}]}"
   ```

```
    }
  ],
  "Operation": "Create"
}
```

3. Output the RFC template JSON file to a file named CreateIamResourceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateIamResourceRfc.json
```

4. Modify and save the CreateIamResourceRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "1.0",
"ChangeTypeId": "ct-3dpd8mdd9jn1r",
"Title": "Create IAM Role"
}
```

5. Create the RFC, specifying the CreateIamResourceRfc file and the CreateIamResourceParams file:

```
aws amscm create-rfc --cli-input-json file://CreateIamResourceRfc.json  --
execution-parameters file://CreateIamResourceParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- After an IAM role is provisioned in your account, you must onboard the role in your federation solution.
- When pasting in a policy document, note that the RFC only accepts policy pastes up to 20,480 characters. If your policy has more than 20,480 characters, create a service request to upload the policy, and then refer to that service request in the RFC that you open for IAM.
- This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

- For information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM) and for policy information, see Managed policies and inline policies. For information about AMS permissions, see Deploying IAM resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3dpd8mdd9jn1r.

Example: Required Parameters

```
{
  "UseCase": "Use case...",
  "Operation": "Create"
}
```

Example: All Parameters

```
{
  "UseCase": "Use case...",
  "IAM User": [
    {
      "UserName": "user-a",
      "AccessType": "Console access",
      "UserPermissions": "Power User permissions",
      "Tags": [
        {
          "Key": "foo",
          "Value": "bar"
        },
        {
          "Key": "testkey",
          "Value": "testvalue"
        }
      ]
    }
  ],
  "IAM Role": [
    {
      "RoleName": "role-b",
      "TrustPolicy": "Trust policy example",
      "RolePermissions": "Role permissions example",
```

```
      "Tags": [
        {
          "Key": "foo",
          "Value": "bar"
        },
        {
          "Key": "testkey",
          "Value": "testvalue"
        }
      ]
    }
  ],
  "IAM Policy": [
    {
      "PolicyName": "policy1",
      "PolicyDocument": "Policy document example 1",
      "RelatedResources": [
        "resourceA",
        "resourceB"
      ]
    },
    {
      "PolicyName": "policy2",
      "PolicyDocument": "Policy document example 2",
      "RelatedResources": [
        "resourceC",
        "resourceD"
      ]
    }
  ],
  "Operation": "Create",
  "Priority": "Medium"
}
```

Identity and Access Management (IAM) | Create Lambda Execution Role

Create an Lambda execution role to use with Lambda Function. Each ARN specified in the parameters creates a part of the IAM policy. Use the Preview option to see what the completed, generated, policy looks like before it is created and implemented.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create Lambda execution role

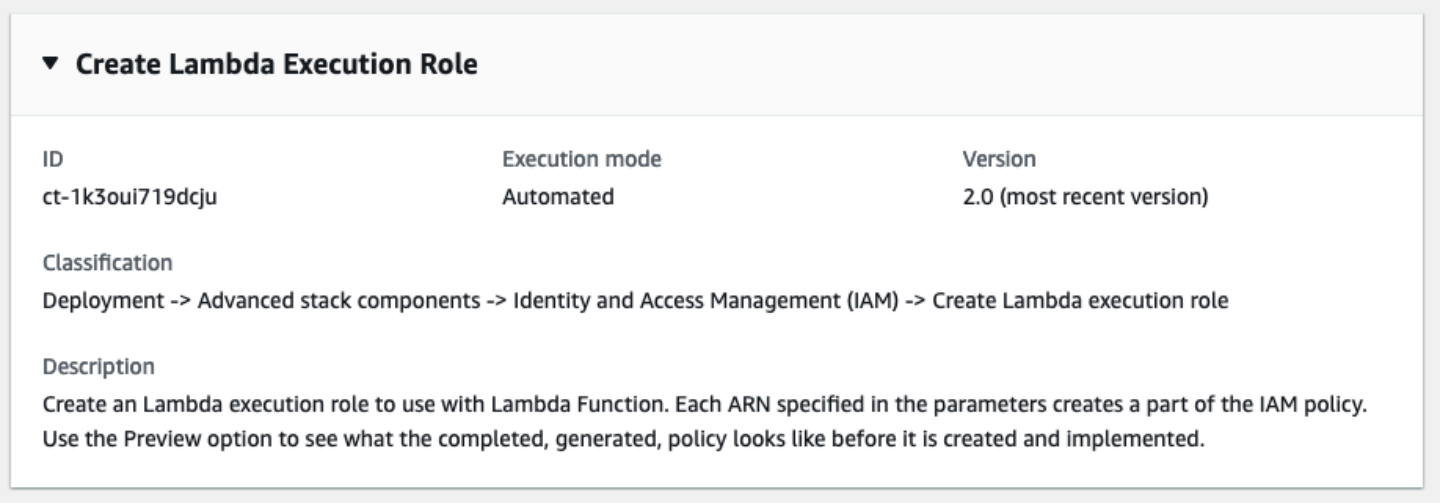
Change Type Details

Change type ID	ct-1k3oui719dcju
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create IAM Lambda execution role

Creating IAM Lambda execution roles with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM Lambda execution roles with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE (required parameters only):

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1k3oui719dcju" --change-type-version "2.0"
 --title "Create IAM Lambda Execution Role" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-HandleCreateIAMRole-Admin\",\"Region\":\"us-east-1\",
\"Parameters\":{\"ServicePrincipal\":[\"lambda.amazonaws.com\"],\"RoleName\":[\"test-
application-ec2-instance-profile\"],\"LambdaFunctionArns": [\"arn:aws:lambda:us-
east-1:123456789012:function:testing\"]}"
```

TEMPLATE CREATE (all parameters):

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamLambdaExeRoleParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1k3oui719dcju"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateIamLambdaExeRoleParams.json
   ```

2. Modify and save the CreateIamLambdaExeRoleParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-HandleCreateIAMRole-Admin",
  "Region": "us-east-1",
  "Parameters": {
     "ServicePrincipal" : "lambda.amazonaws.com",
     "RoleName" : "customer_lambda_execution_role",
     "VPCAccess" : "No",
     "Preview" : "No",
     "LambdaFunctionArns": ["arn:aws:lambda:us-east-1:123456789012:function:dabba"]
  }
}
```

3. Output the RFC template JSON file to a file named CreateIamLambdaExeRoleRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateIamLambdaExeRoleRfc.json
```

4. Modify and save the CreateIamLambdaExeRoleRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "2.0",
"ChangeTypeId": "ct-1k3oui719dcju",
"Title": "Create IAM Lambda Execution Role"
}
```

5. Create the RFC, specifying the CreateIamLambdaExeRoleRfc file and the CreateIamLambdaExeRoleParams file:

```
aws amscm create-rfc --cli-input-json file://CreateIamLambdaExeRoleRfc.json  --
execution-parameters file://CreateIamLambdaExeRoleParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is now at version 2.0 with improvements in the create RFC Console experience and the change makes it easier to copy and paste JSON.

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1k3oui719dcju.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleCreateIAMRole-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "ServicePrincipal" : "lambda.amazonaws.com",
    "RoleName" : "customer_lambda_execution_role",
    "VPCAccess" : "No",
    "Preview" : "No",
    "LambdaFunctionArns": ["arn:aws:lambda:us-east-1:083904590739:function:dabba"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleCreateIAMRole-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "ServicePrincipal": "lambda.amazonaws.com",
    "RoleName" : "customer_lambda_execution_role",
    "RolePath": "/test/",
    "Preview": "No",
    "LambdaFunctionArns": ["arn:aws:lambda:us-east-1:083904590739:function:dabba"],
    "VPCAccess": "Yes",
    "CloudWatchAlarmReadAccess": ["arn:aws:cloudwatch:us-
east-1:123456789012:alarm:myalarm*"],
    "CloudWatchAlarmWriteAccess": ["arn:aws:cloudwatch:us-

  }
}
```

Identity and Access Management (IAM) | Create OpenID Connect Provider

Create an IAM OpenID Connect provider for the Amazon Elastic Kubernetes Service (Amazon EKS) cluster.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create OpenID Connect provider

Change Type Details

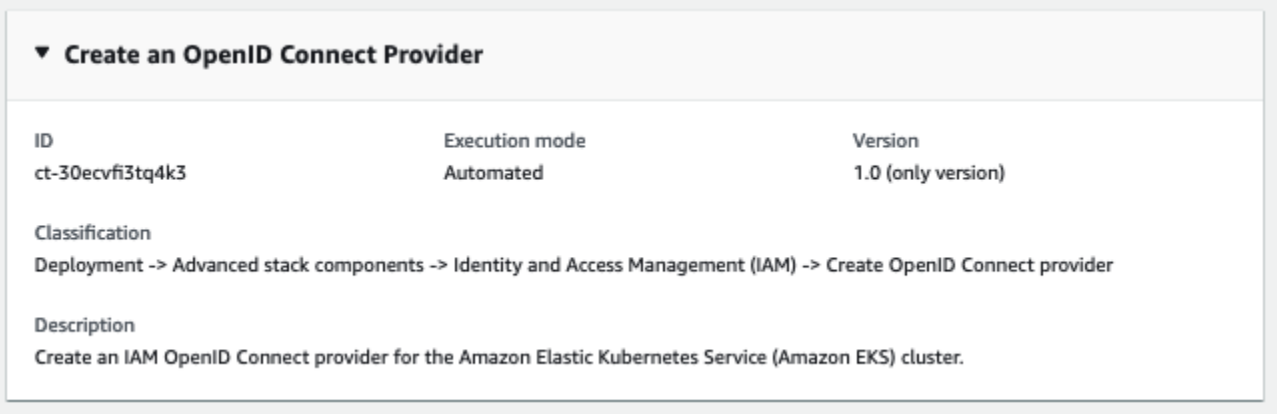
Change type ID	ct-30ecvfi3tq4k3

Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create IAM OpenID Connect provider

Creating an IAM OpenID Connect provider with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an IAM OpenID Connect provider with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Note

When pasting in a policy document, note that the RFC only accepts policy pastes up to 5,000 characters. If your file has more than 5,000 characters, create a service request to upload the policy and then refer to that service request in the RFC that you open for IAM.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-30ecvfi3tq4k3" --change-type-version "1.0"
 --title "Create OpenID Connect provider" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-HandleAssociateIAMOpenIDProvider-Admin\",\"Region\": \"us-
east-1\",\"Parameters\": {\"ClusterName\": [\"test-cluster\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamOpenIdParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-30ecvfi3tq4k3"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateIamOpenIdParams.json
   ```

2. Modify and save the CreateIamOpenIdParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName": "AWSManagedServices-HandleAssociateIAMOpenIDProvider-Admin",
     "Region": "us-east-1",
   ```

```
  "Parameters": {
    "ClusterName": [
      "test-cluster"
    ]
  }
}
```

3. Output the RFC template JSON file to a file named CreateIamOpenIdRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateIamOpenIdRfc.json
```

4. Modify and save the CreateIamOpenIdRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-30ecvfi3tq4k3",
  "Title": "Create OpenID Connect provider"
}
```

5. Create the RFC, specifying the CreateIamOpenIdRfc file and the CreateIamOpenIdParams file:

```
aws amscm create-rfc --cli-input-json file://CreateIamOpenIdRfc.json  --execution-
parameters file://CreateIamOpenIdParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-30ecvfi3tq4k3.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAssociateIAMOpenIDProvider-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "ClusterName" : [
      "test-cluster"
    ]
  }
}
```

Identity and Access Management (IAM) | Create SAML Identity Provider

Create an IAM identity provider using the SAML metadata document file that you stored in your chosen S3 bucket.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create SAML identity provider

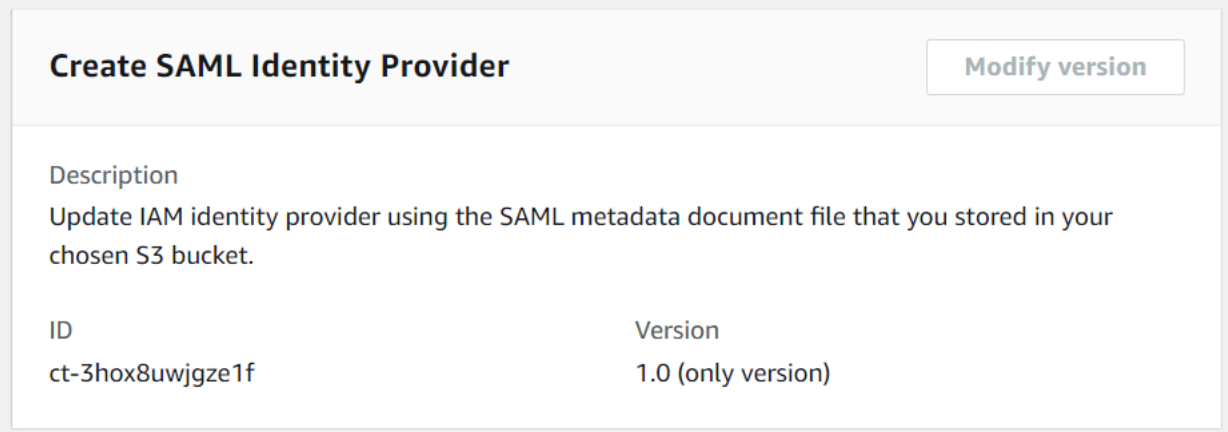
Change Type Details

Change type ID	ct-3hox8uwjgze1f
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create IAM SAML identity provider

Creating IAM SAML IDPs with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM SAML IDPs with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3hox8uwjgze1f" --change-type-version "1.0"
 --title "Create SAML Identity Provider" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-HandleCreateSamlProvider-Admin\",\"Region\":\"us-east-1\",
\"Parameters\":{\"SAMLMetadataDocumentURL\":[\"s3://bucket.name/idp-metadata.xml\"],
\"Name\":[\"customer-saml\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateIamSamlIdpParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3hox8uwjgze1f"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateIamSamlIdpParams.json
   ```

2. Modify and save the CreateIamSamlIdpParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName" : "AWSManagedServices-HandleCreateSamlProvider-Admin",
     "Region" : "us-east-1",
     "Parameters" : {
       "SAMLMetadataDocumentURL" : [
         "s3://bucket.name/idp-metadata.xml"
       ],
       "Name" : [
         "customer-saml"
       ]
     }
   }
   ```

3. Output the RFC template JSON file to a file named CreateIamSamlIdpRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateIamSamlIdpRfc.json
   ```

4. Modify and save the CreateIamSamlIdpRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "1.0",
"ChangeTypeId": "ct-3hox8uwjgze1f",
"Title": "Create IAM SAML identity provider"
}
```

5. Create the RFC, specifying the CreateIamSamlIdpRfc file and the CreateIamSamlIdpParams file:

```
aws amscm create-rfc --cli-input-json file://CreateIamSamlIdpRfc.json  --execution-
parameters file://CreateIamSamlIdpParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3hox8uwjgze1f.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleCreateSamlProvider-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "SAMLMetadataDocumentURL" : [
      "s3://mybucket/path/to/metadata.xml"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleCreateSamlProvider-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "SAMLMetadataDocumentURL" : [
      "s3://mybucket/path/to/metadata.xml"
    ],
    "Name" : [
      "customer-saml"
    ]
  }
}
```

Identity and Access Management (IAM) | Create Service-Linked Role

Create an IAM service-linked role linked to an AWS service that you specify.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create Service-Linked role

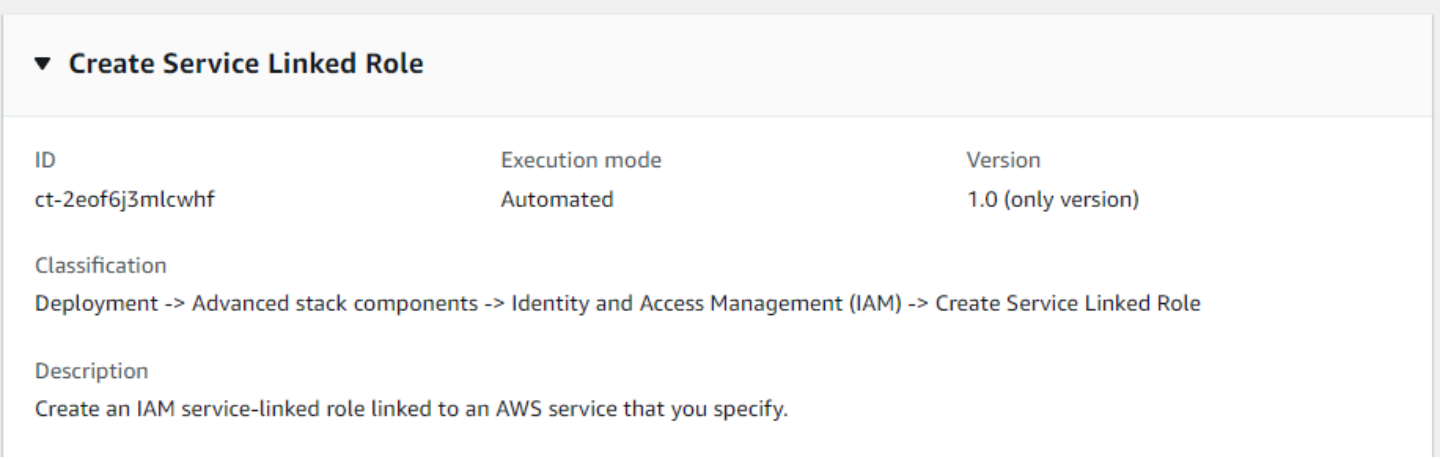
Change Type Details

Change type ID	ct-2eof6j3mlcwhf
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create IAM service-linked role

Creating IAM service-linked roles with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM service-linked roles with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

> **Note**
>
> When pasting in a policy document, note that the RFC only accepts policy pastes up to 5,000 characters. If your file has more than 5,000 characters, create a service request to upload the policy and then refer to that service request in the RFC that you open for IAM.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2eof6j3mlcwhf" --change-type-version "1.0"
 --title "Create service-linked role" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-CreateServiceLinkedRole-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": {\"AWSServiceName\": [\"acm.amazonaws.com\"],\"Description\":
 [\"AWSServiceRoleForCertificateManager\"]}}"
```

```
aws amscm create-rfc --change-type-id "ct-2eof6j3mlcwhf" --change-type-version "1.0"
 --title "Create service-linked role" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-CreateServiceLinkedRole-Admin\",\"Region\": \"us-east-1\",
\"Parameters\": {\"AWSServiceName\": [\"acm.amazonaws.com\"],\"Description\":
 [\"AWSServiceRoleForCertificateManager\",\"CustomSuffix\": [\"CustomSuffix-Dev\"]}}"
```

TEMPLATE CREATE:

1. Save a CreateSlrRfc.json file.

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-2eof6j3mlcwhf",
     "Title": "Create service-linked role"
   }
   ```

2. Save a CreateSlrParams.json file. For example, you can replace the contents with something like this:

   ```
   {
   "DocumentName": "AWSManagedServices-CreateServiceLinkedRole-Admin",
   ```

```
"Region": "us-east-1",
"Parameters": {
 "AWSServiceName": [ "acm.amazonaws.com" ],
 "Description" : ["AWSServiceRoleForCertificateManager" ],
 "CustomSuffix" : ["CustomSuffix-Dev" ]
}
}
```

3. Create the RFC, specifying the CreateSlrRfc file and the CreateSlrParams files:

```
aws amscm create-rfc --cli-input-json file://CreateSlrRfc.json --execution-
parameters file://CreateSlrParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

For more information about service-linked roles, see Using service-linked roles.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2eof6j3mlcwhf.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateServiceLinkedRole-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "AWSServiceName" : [
      "autoscaling.amazonaws.com"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateServiceLinkedRole-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "AWSServiceName": [
      "autoscaling.amazonaws.com"
    ],
    "CustomSuffix": [
      "test123"
    ],
    "Description": [
      ""
    ]
  }
}
```

Identity and Access Management (IAM) | Create Service-Specific Credentials

Generate a set of credentials consisting of a user name and password, to use to access the specified service.

Full classification: Deployment | Advanced stack components | Identity and Access Management (IAM) | Create service-specific credentials

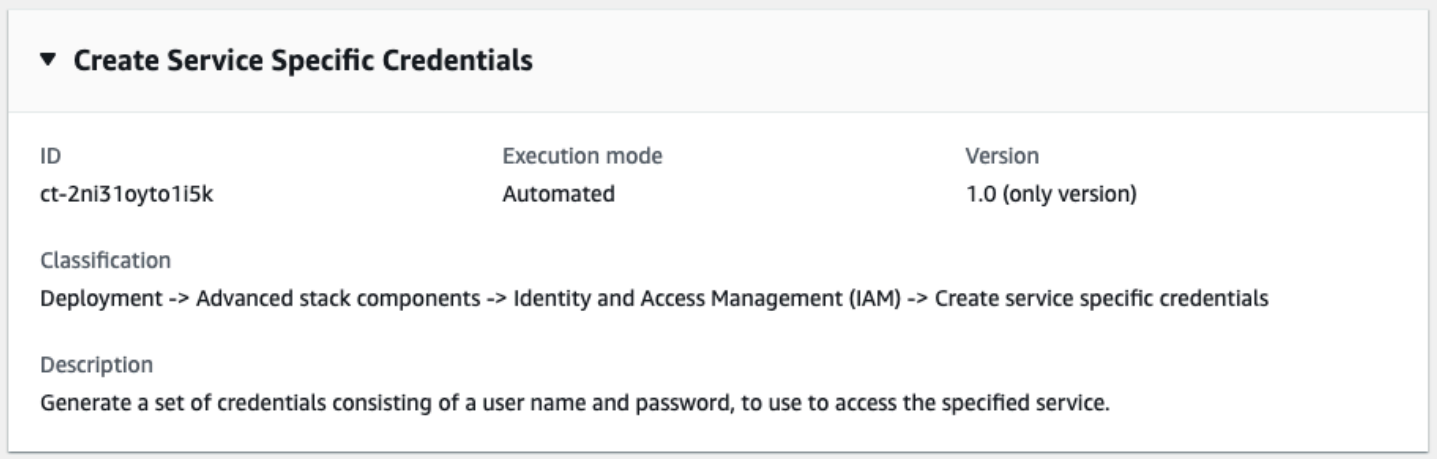
Change Type Details

Change type ID	ct-2ni31oyto1i5k
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create service specific credentials

Creating IAM service specific credentials with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM service specific credentials with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-2ni31oyto1i5k" \
--change-type-version "1.0" --title "Create service specific credentials for IAM User"
 \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
CreateServiceSpecificCredentials\",\"Region\":\"us-east-1\",\"Parameters\":{\"Username
\":[\"testuser\"],\"Service\":[\"CodeCommit\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it CreateServSpecCredsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2ni31oyto1i5k"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateServSpecCredsParams.json
   ```

2. Modify and save the CreateServSpecCredsParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName" : "AWSManagedServices-CreateServiceSpecificCredentials",
     "Region" : "us-east-1",
     "Parameters" : {
       "Username" : [
         "testuser"
       ],
       "Service" : [
         "CodeCommit"
       ]
     }
   }
   ```

3. Output the RFC template JSON file to a file named CreateServSpecCredsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateServSpecCredsRfc.json
```

4. Modify and save the CreateServSpecCredsRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-2ni31oyto1i5k",
  "ChangeTypeVersion": "1.0",
  "Title": "Testing ct-2ni31oyto1i5k CreateServiceSpecificCredentials in region us-east-1 for an IAM User"
}
```

5. Create the RFC, specifying the CreateServSpecCredsRfc file and the CreateServSpecCredsParams file:

```
aws amscm create-rfc --cli-input-json file://CreateServSpecCredsRfc.json  --
execution-parameters file://CreateServSpecCredsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2ni31oyto1i5k.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateServiceSpecificCredentials",
  "Region" : "us-east-1",
  "Parameters" : {
    "Username" : [
      "testuser"
    ],
```

```
    "Service" : [
      "CodeCommit"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateServiceSpecificCredentials",
  "Region" : "us-east-1",
  "Parameters" : {
    "Username" : [
      "testuser"
    ],
    "Service" : [
      "CodeCommit"
    ]
  }
}
```

KMS Alias | Create

Create an alias for an AWS Key Management Service (KMS) customer master key (CMK).

Full classification: Deployment | Advanced stack components | KMS alias | Create

Change Type Details

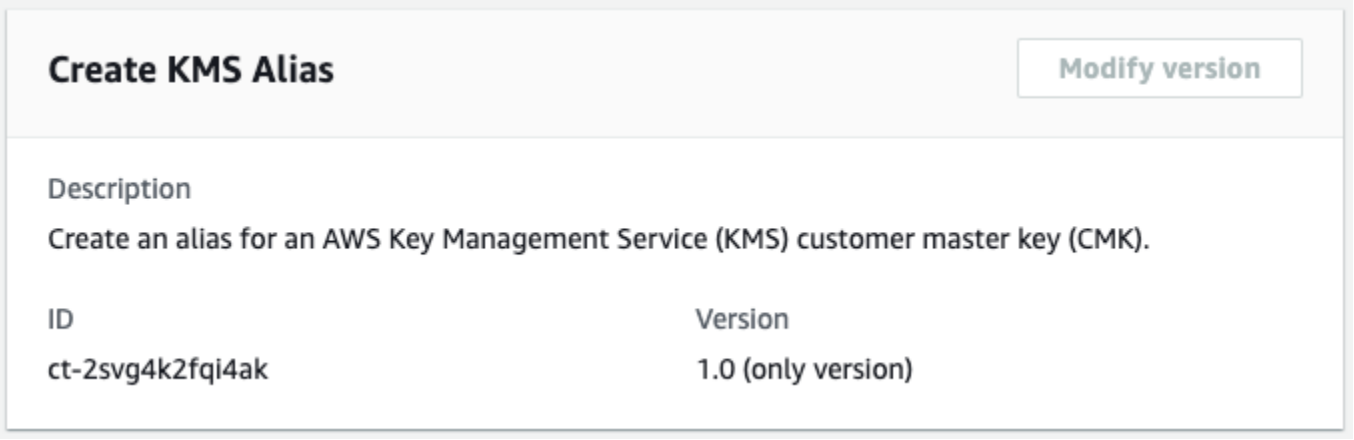
Change type ID	ct-2svg4k2fqi4ak
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create an AWS KMS alias

Creating an AWS KMS alias with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an AWS KMS alias with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title create-kms-alias --change-type-id ct-2svg4k2fqi4ak --
change-type-version 1.0 --execution-parameters '{"DocumentName": "AWSManagedServices-
CreateKMSAlias", "Region": "us-east-1", "Parameters": {"TargetKeyId": ["12345678-90ab-
cdef-1234-567890abcdef"], "AliasName": ["my-test-key"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateKmsAliasParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2svg4k2fqi4ak" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateKmsAliasParams.json
   ```

2. Modify and save the CreateKmsAliasParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateKMSAlias",
     "Region": "us-east-1",
     "Parameters": {
       "TargetKeyId": ["12345678-90ab-cdef-1234-567890abcdef"]
       "AliasName": ["my-test-key"]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it CreateKmsAliasRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateKmsAliasRfc.json
   ```

4. Modify and save the CreateKmsAliasRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-2svg4k2fqi4ak",
   ```

```
"Title":                "create-kms-alias"
}
```

5. Create the RFC, specifying the CreateKmsAlias Rfc file and the CreateKmsAliasParams file:

```
aws amscm create-rfc --cli-input-json file://CreateKmsAliasRfc.json  --execution-
parameters file://CreateKmsAliasParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2svg4k2fqi4ak.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateKMSAlias",
  "Region" : "us-east-1",
  "Parameters" : {
    "TargetKeyId" : [
      "58c399bf-1662-4d55-8bbe-fb6d26bd72b9"
    ],
    "AliasName" : [
      "test-alias"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateKMSAlias",
  "Region" : "us-east-1",
  "Parameters" : {
    "TargetKeyId" : [
      "arn:aws:kms:us-east-1:123456789012:key/58c399bf-1662-4d55-8bbe-fb6d26bd72b9"
```

```
    ],
    "AliasName" : [
      "test-alias"
    ]
  }
}
```

KMS Key | Create

Request a KMS key with a predefined key policy.

Full classification: Deployment | Advanced stack components | KMS key | Create

Change Type Details

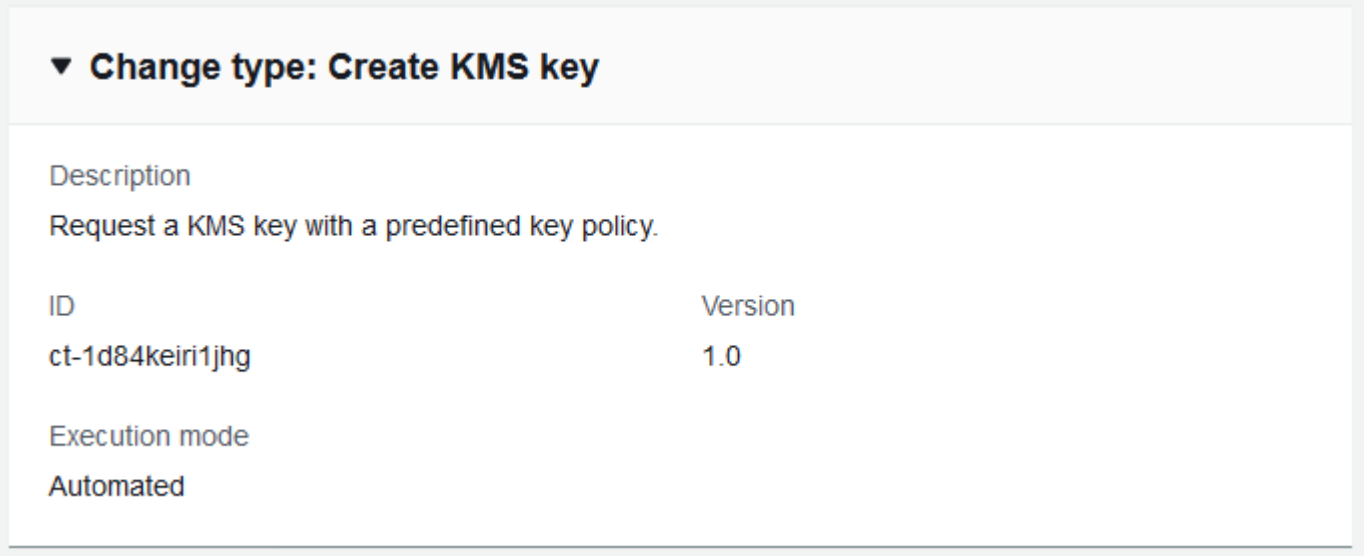
Change type ID	ct-1d84keiri1jhg
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create KMS key

Creating an AWS KMS Key with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an AWS KMS Key with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Required parameters only:

```
aws amscm create-rfc --title my-app-key --change-type-id ct-1d84keiri1jhg
 --change-type-version 1.0 --execution-parameters '{"Description":"KMS key
 for my-app","VpcId":"VPC_ID","Name":"my-app-key","StackTemplateId":"stm-
enf1j068fhg34vugt","TimeoutInMinutes":60,"Parameters":{"Description":"KMS key for my-
app"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateKmsKeyAutoParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1d84keiri1jhg"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateKmsKeyAutoParams.json
   ```

2. Modify and save the CreateKmsKeyAutoParams file. Examples follow.

   Grant a user or a role, permission to decrypt the created CMK. Example execution parameters:

   ```
   {
     "Description": "KMS key for my-app",
     "VpcId": "VPC_ID”,
     "Name": "my-app-key-decrypt",
     "StackTemplateId": "stm-enf1j068fhg34vugt",
     "TimeoutInMinutes": 60,
     "Parameters": {
       "IAMPrincipalsRequiringDecryptPermissions": [
         "ARN:role/roleA",
         "ARN:user/userB",
         "ARN:role/instanceProfileA"
       ],
       "Description": "KMS key for my-app"
     }
   }
   ```

For the resulting policy, see Grants Permissions to Decrypt with the CML for an IAM User or a Role.

Grant a user or role, permission to encrypt using the created CMK. Example execution parameters:

```
{
  "Description": "KMS key for my-app",
  "VpcId": "VPC_ID",
  "Name": "my-app-key-encrypt",
  "Tags": [
    {
      "Key": "Name",
      "Value": "my-app-key"
    }
  ],
  "StackTemplateId": "stm-enf1j068fhg34vugt",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "IAMPrincipalsRequiringEncryptPermissions": [
      "ARN:role/roleA",
      "ARN:user/userB",
      "ARN:role/instanceProfileA"
    ],
    "Description": "KMS key for my-app"
  }
}
```

For the resulting policy, see Grants Permissions to Encrypt with the CML for an IAM User or a Role.

Grant a user, role, or account, permission to create grants using the created CMK. Example execution parameters:

```
{
  "Description": "KMS key for my-app",
  "VpcId": "VPC_ID",
  "Name": "my-app-key-create-grants",
  "StackTemplateId": "stm-enf1j068fhg34vugt",
  "TimeoutInMinutes": 60,
  "Parameters": {
```

```
    "IAMPrincipalsRequiringGrantsPermissions": [
      "arn:aws:iam::999999999999:role/roleA",
      "888888888888"
    ],
    "Description": "KMS key for my-app"
  }
}
```

For the resulting policy, see Grants Permissions to Create Grants with the CMK for an IAM User, Role, or Account.

Allow only AWS services that are integrated with AWS KMS to perform the GRANT operation. Example execution parameters:

```
{
  "Description": "KMS key for my-app",
  "VpcId": "VPC_ID",
  "Name": "my-app-key-limit-to-services",
  "StackTemplateId": "stm-enf1j068fhg34vugt",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "IAMPrincipalsRequiringGrantsPermissions": [
      "arn:aws:iam::999999999999:role/roleA"
    ],
    "LimitGrantsToAWSResources": "true",
    "Description": "KMS key for my-app"
  }
}
```

For the resulting policy, see Allow only AWS services that are Integrated with AWS KMS to Perform the GRANT Operation.

Enforce use of encryption context keys in cryptographic operations. Example execution parameters:

```
{
  "Description": "KMS key for my-app",
  "VpcId": "VPC_ID",
  "Name": "my-app-key-encryption-keys",
  "StackTemplateId": "stm-enf1j068fhg34vugt",
  "TimeoutInMinutes": 60,
  "Parameters": {
```

```
    "EnforceEncryptionContextKeys": "true",
    "Description": "KMS key for my-app"
  }
}
```

For the resulting policy, see Enforce use of Encryption Context Keys in Cryptographic Operations.

Enforce a specific list of encryption context keys in cryptographic operations. Example execution parameters:

```
{
  "Description": "KMS key for my-app",
  "VpcId": "VPC_ID",
  "Name": "my-app-key-encryption-list",
  "StackTemplateId": "stm-enf1j068fhg34vugt",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "AllowedEncryptionContextKeys": [
      "Name",
      "Application"
    ],
    "Description": "KMS key for my-app"
  }
}
```

For the resulting policy, see Enforce a Specific List of Encryption Context Keys in Cryptographic Operations.

Allow AWS services to access the created CMK. Example execution parameters:

```
{
  "Description" : "KMS key for my-app",
  "VpcId" : "VPC_ID",
  "Name" : "my-app-key-allow-aws-service-access",
  "StackTemplateId" : "stm-enf1j068fhg34vugt",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
      "AllowServiceRolesAccessKMSKeys": [
          "ec2.us-east-1.amazonaws.com",
          "ecr.us-east-1.amazonaws.com"
    ],
```

```
    "Description": "KMS key for my-app"
  }
}
```

For the resulting policy, see Allow AWS services to access created CMK.

3. Output the RFC template JSON file to a file; this example names it CreateKmsKeyAutoRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateKmsKeyAutoRfc.json
```

4. Modify and save the CreateKmsKeyAutoRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-1d84keiri1jhg",
    "ChangeTypeVersion": "1.0",
    "Title": "Create KMS Key"
}
```

5. Create the RFC, specifying the CreateKmsKeyAuto Rfc file and the CreateKmsKeyAutoParams file:

```
aws amscm create-rfc --cli-input-json file://CreateKmsKeyAutoRfc.json  --execution-
parameters file://CreateKmsKeyAutoParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- This CT creates a CloudFormation stack which creates a KMS key with `DeletionPolicy: Retain`. By design, the created KMS key will persist even after you delete the stack. If you are sure you want to delete the KMS key, create an RFC with Change Type ct-2zxya20wmf5bf, Management | Advanced stack components | KMS key | Delete (review required).
- This change type is ExecutionMode=Automated, so this change type does not require manual review by AMS operations and should execute more rapidly than KMS Key: Create (review required); however, if you have an unusual situation, the manual version might work better for you. See KMS Key | Create (Review Required).

- This CT has a new parameter, AllowServiceRolesAccessKMSKeys, that provides the specified AWS services access to the KMS key. The change was made because the Autoscaling group service role was unable to start the EC2 instances with encrypted EBS volumes due to lack of permissions to the KMS key.
- To learn more about AWS KMS keys, see AWS Key Management Service (KMS), AWS Key Management Service FAQs, and AWS Key Management Service Concepts.

KMS Key Create resulting policies

Depending on how you created your KMS key, you created policies. These example policies match various KMS key create scenarios provided in Create KMS key.

Grants Permissions to Decrypt with the CML for an IAM User or a Role

Resulting example policy grants IAM users, roles or instance profiles, permission to decrypt using the CMK:

```
{
          "Sid": "Allow decrypt using the key",
          "Effect": "Allow",
          "Principal": {
              "AWS": [
                "arn:aws:iam::999999999999:role/roleA",
                "arn:aws:iam::999999999999:user/userB",
                "arn:aws:iam::999999999999:role/instanceProfileA"
              ]
          },
          "Action": [
              "kms:DescribeKey",
              "kms:Decrypt"
          ],
          "Resource": "*"
}
```

For the execution parameters to create this policy with the KMS key Create change type, see Create KMS key

Grants Permissions to Encrypt with the CML for an IAM User or a Role

Resulting example policy grants IAM users, roles or instance profiles, permission to encrypt using the CMK:

```
{
          "Sid": "Allow encrypt using the key",
          "Effect": "Allow",
          "Principal": {
              "AWS": [
                "arn:aws:iam::999999999999:role/roleA",
                "arn:aws:iam::999999999999:user/userB",
                "arn:aws:iam::999999999999:role/instanceProfileA"
              ]
          },
          "Action": [
              "kms:DescribeKey",
              "kms:Encrypt",
              "kms:ReEncrypt*",
              "kms:GenerateDataKey",
              "kms:GenerateDataKeyWithoutPlaintext"
          ],
          "Resource": "*"
}
```

For the execution parameters to create this policy with the KMS key Create change type, see Create KMS key

Grants Permissions to Create Grants with the CMK for an IAM User, Role, or Account

Resulting example policy:

```
{
          "Sid": "Allow grants",
          "Effect": "Allow",
          "Principal": {
              "AWS": [
                  "arn:aws:iam::999999999999:role/roleA",
                  "arn:aws:iam::888888888888:root"
              ]
          },
          "Action": [
              "kms:CreateGrant",
              "kms:ListGrants",
              "kms:RevokeGrant"
          ],
          "Resource": "*"
```

```
}
```

For the execution parameters to create this policy with the KMS key Create change type, see Create KMS key

Allow only AWS services that are Integrated with AWS KMS to Perform the GRANT Operation

Resulting example policy:

```
{
          "Sid": "Allow grants",
          "Effect": "Allow",
          "Principal": {
              "AWS": "arn:aws:iam::999999999999:role/roleA"
          },
          "Action": [
              "kms:CreateGrant",
              "kms:ListGrants",
              "kms:RevokeGrant"
          ],
          "Resource": "*"
      },
      {
          "Sid": "Deny if grant is not for AWS resource",
          "Effect": "Deny",
          "Principal": {
              "AWS": "*"
          },
          "Action": [
              "kms:CreateGrant",
              "kms:ListGrants",
              "kms:RevokeGrant"
          ],
          "Resource": "*",
          "Condition": {
              "Bool": {
                  "kms:GrantIsForAWSResource": "false"
              }
          }
      } }
}
```

For the execution parameters to create this policy with the KMS key Create change type, see Create KMS key

Enforce use of Encryption Context Keys in Cryptographic Operations

Resulting example policy:

```
{
          "Effect": "Deny",
          "Principal": {
              "AWS": "*"
          },
          "Action": [
              "kms:CreateGrant",
              "kms:Decrypt",
              "kms:Encrypt",
              "kms:GenerateDataKey*",
              "kms:ReEncrypt"
          ],
          "Resource": "*",
          "Condition": {
              "Null": {
                  "kms:EncryptionContextKeys": "true"
              }
          }
}
```

For the execution parameters to create this policy with the KMS key Create change type, see Create KMS key

Enforce a Specific List of Encryption Context Keys in Cryptographic Operations

Resulting example policy:

```
{
          "Effect": "Deny",
          "Principal": {
              "AWS": "*"
          },
          "Action": [
              "kms:CreateGrant",
              "kms:Decrypt",
```

```
            "kms:Encrypt",
            "kms:GenerateDataKey*",
            "kms:ReEncrypt"
        ],
        "Resource": "*",
        "Condition": {
            "StringEquals": {
                "kms:EncryptionContextKeys": [
                  "Name",
                  "Application"
                ]
            }
        }
    }
```

For the execution parameters to create this policy with the KMS key Create change type, see Create KMS key

Allow AWS services to access created CMK

Resulting example policy:

```
{
    "Effect": "Allow",
    "Principal": {
        "AWS": "*"
    },
    "Action": [
        "kms:ListGrants",
        "kms:CreateGrant",
        "kms:DescribeKey",
        "kms:Encrypt",
        "kms:Decrypt",
        "kms:ReEncrypt*",
        "kms:GenerateDataKey*"
    ],
    "Resource": "*",
    "Condition": {
        "StringEquals": {
            "kms:ViaService":  [
              "ec2.us-west-2.amazonaws.com",
              "ecr.us-east-1.amazonaws.com"
            ],
```

```
            "kms:CallerAccount": "111122223333"
        }
    }
}
```

For the execution parameters to create this policy with the KMS key Create change type, see Create KMS key

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1d84keiri1jhg.

Example: Required Parameters

```
{
  "Description" : "Test description",
  "VpcId" : "vpc-12345678901234567",
  "Name" : "TestStack",
  "StackTemplateId" : "stm-enf1j068fhg34vugt",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
    "Description" : "Test key"
  }
}
```

Example: All Parameters

```
{
  "Description" : "Test description",
  "VpcId" : "vpc-12345678",
  "Name" : "TestStack",
  "Tags" : [
    {
      "Key" : "foo",
      "Value" : "bar"
    }
  ],
  "StackTemplateId" : "stm-enf1j068fhg34vugt",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
    "Alias" : "testkey",
```

```
    "EnableKeyRotation" : "true",
    "Description" : "Test key",
    "PendingWindow" : 30,
    "IAMPrincipalsRequiringDecryptPermissions" : [
      "arn:aws:iam::123456789012:user/myuser",
      "arn:aws:iam::123456789012:role/myrole"
    ],
    "IAMPrincipalsRequiringEncryptPermissions" : [
      "arn:aws:iam::123456789012:user/myuser",
      "arn:aws:iam::123456789012:role/myrole"
    ],
    "IAMPrincipalsRequiringGrantsPermissions" : [
      "arn:aws:iam::123456789012:user/myuser",
      "arn:aws:iam::123456789012:role/myrole",
      "987654321098"
    ],
    "LimitGrantsToAWSResources" : "true",
    "EnforceEncryptionContextKeys" : "true",
    "AllowedEncryptionContextKeys" : [
      "App"
    ],
    "AllowServiceRolesAccessKMSKeys": [
      "ec2.us-east-1.amazonaws.com"
    ]
  }
}
```

KMS Key | Create (Review Required)

Request a KMS key by describing key permissions or submitting a key policy document.

Full classification: Deployment | Advanced stack components | KMS key | Create (review required)

Change Type Details

Change type ID	ct-2epp05svrlwod
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required

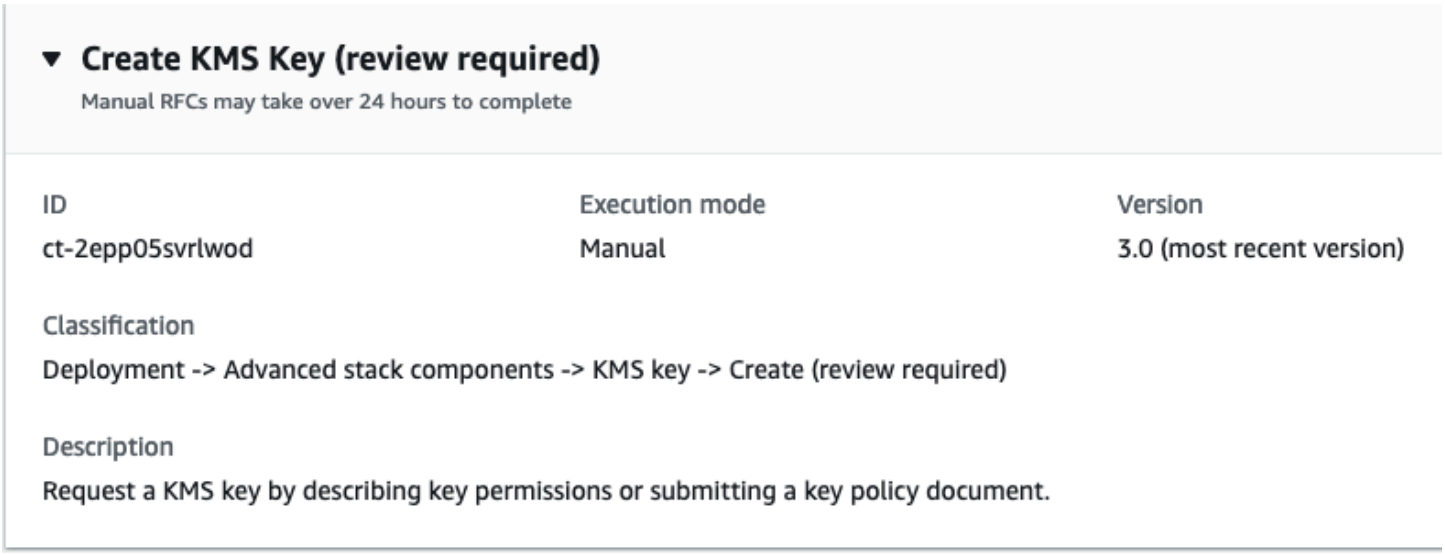
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create KMS Key (review required)

Creating an AWS KMS Key (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an AWS KMS Key (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2epp05svrlwod" --change-type-version "3.0"
 --title "TITLE" --execution-parameters "{\"KeyDescription\": \"Example description\",
 \"KeyPermissions\": \"key permissions\", \"Operation\": \"Create\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateKmsKeyParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2epp05svrlwod" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateKmsKeyParams.json
   ```

2. Modify and save the CreateKmsKeyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "KMS key request",
     "KeyPermissions": "{\"Id\":\"key-consolepolicy-3\",\"Version\":\"2012-10-17\",
   \"Statement\":[{\"Sid\":\"Allow use of the key\",\"Effect\":\"Allow\",\"Principal
   \":{\"AWS\":[\"arn:aws:iam::111122223333:role/KMSRole\"]},\"Action\":[\"kms:Encrypt
   \",\"kms:Decrypt\",\"kms:ReEncrypt*\",\"kms:GenerateDataKey*\",\"kms:DescribeKey
   \"],\"Resource\":\"*\"}]}",
     "Operation": "Create"
   }
   ```

3. Output the RFC template JSON file to a file; this example names it CreateKmsKeyRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateKmsKeyRfc.json
   ```

4. Modify and save the CreateKmsKeyRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-2epp05svrlwod",
"Title":                "KmsKey-Create-RFC"
}
```

5. Create the RFC, specifying the CreateKmsKey Rfc file and the CreateKmsKeyParams file:

```
aws amscm create-rfc --cli-input-json file://CreateKmsKeyRfc.json  --execution-
parameters file://CreateKmsKeyParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is at v3.0. The required **KeyName** parameter has been replaced by an optional **AliasName** parameter; KMS keys use aliases.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

To learn more about AWS KMS keys, see AWS Key Management Service (KMS), AWS Key Management Service FAQs, and AWS Key Management Service Concepts.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2epp05svrlwod.

Example: Required Parameters

```
{
  "KeyDescription": "Exmample description of the key to be created.",
  "KeyPermissions": "KMS Key permissions to add: kms:Get",
  "Operation": "Create"
}
```

Example: All Parameters

```
{
  "KeyDescription": "Exmample description of the key to be created.",
  "AliasName": "testkmskey",
  "KeyRotation": true,
  "KeyPermissions": "KMS Key permissions to add: kms:Get",
  "MultiRegion": false,
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "Operation": "Create",
  "Priority": "Medium"
}
```

Listener | Create (For ALB or NLB)

Create a listener for an Application Load Balancer (ALB) or Network Load Balancer (NLB). A listener is a process that checks for connection requests, the rules that you define for a listener determine how the load balancer routes requests to its registered targets.

Full classification: Deployment | Advanced stack components | Listener | Create (for ALB or NLB)

Change Type Details

Change type ID	ct-14yjom3kvpinu

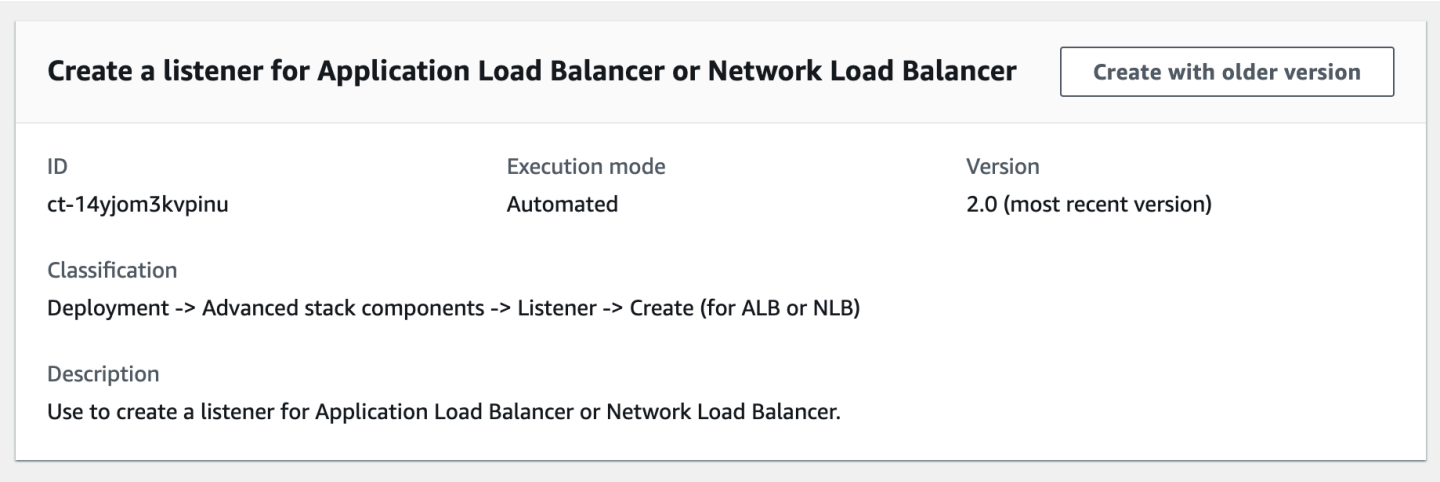
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create listener

Creating a Listener for an ALB or NLB with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Listener for an ALB or NLB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-14yjom3kvpinu" --change-type-version "2.0" --title "TITLE" --execution-parameters
 "{\"Description\":\"DESCRIPTION\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\": \"stm-
u5n0r6aacdvdwthhm\", \"Name\":\"NAME\", \"TimeoutInMinutes\":60, \"Parameters\":
 {\"LoadBalancerArn\":\"LB-ARN\",\"DefaultActionTargetGroupArn\":\"TARGET-GROUP-ARN",
\"Port\":\"80\",\"Protocol\":\"HTTP\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateListenerParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-14yjom3kvpinu" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateListenerParams.json
   ```

2. Modify and save the CreateListenerParams file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":      "Listener-Create",
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-u5n0r6aacdvdwthhm",
   "Name":             "My-Listener",
   ```

```
"Parameters":   {
    "LoadBalancerArn":              ARN,
    "DefaultActionTargetGroupArn":  ARN,
    "Port":                         PORT,
    "Protocol":                    Protocol"
    }
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateListenerRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateListenerRfc.json
```

4. Modify and save the CreateListenerRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-14yjom3kvpinu",
"Title":                "Listener-Create-RFC"
}
```

5. Create the RFC, specifying the CreateListenerRfc file and the CreateListenerParams file:

```
aws amscm create-rfc --cli-input-json file://CreateListenerRfc.json --execution-
parameters file://CreateListenerParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Next Steps: Submit a Management | Other | Other | Update change type to open ports and associate security groups, see Other | Other requests.

Tips

> **Note**
>
> You can specify up to four Target IDs, Ports, and Availability Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-14yjom3kvpinu.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "Parameters": {
    "DefaultActionTargetGroupArn": "arn:aws:elasticloadbalancing:eu-
west-1:123456789012:targetgroup/target-group-name/123456789012",
    "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-app-load-balancer/abcdefghij",
    "Port": "80",
    "Protocol": "HTTP"
  },
  "StackTemplateId": "stm-u5n0r6aacdvdwthhm",
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567890abcdef"
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "Parameters": {
    "CertificateArn": "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012",
    "DefaultActionTargetGroupArn": "arn:aws:elasticloadbalancing:eu-
west-1:123456789012:targetgroup/target-group-name/123456789012",
    "LoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-app-load-balancer/abcdefghij",
    "Port": "443",
    "Protocol": "HTTP",
    "ALBSslPolicy": "ELBSecurityPolicy-2016-08",
    "AlpnPolicy": "HTTP2Only"
  },
  "StackTemplateId": "stm-u5n0r6aacdvdwthhm",
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567890abcdef"
```

```
}
```

Load Balancer (ELB) Stack | Create

Use to create an Amazon ELB Classic Load Balancer. Use alternate change types to create an Application Load Balancer (ct-111r1yayblnw4) or Network Load Balancer (ct-2qldv4h9osmau).

Full classification: Deployment | Advanced stack components | Load balancer (ELB) stack | Create

Change Type Details

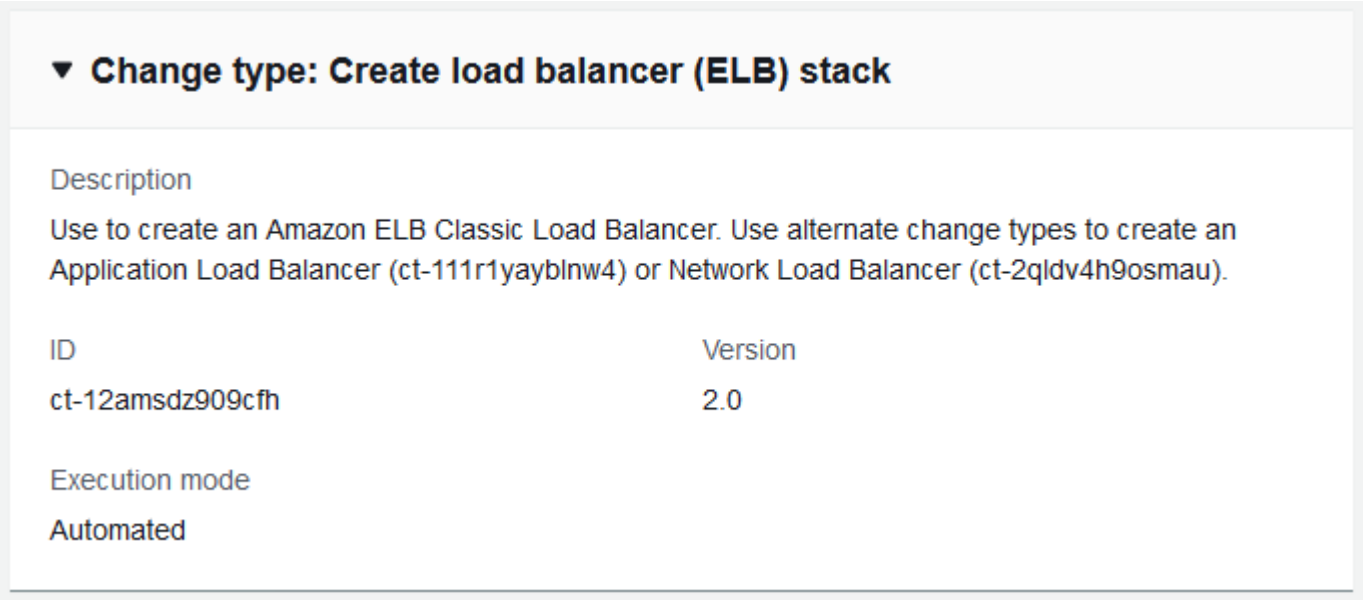
Change type ID	ct-12amsdz909cfh
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create ELB load balancer

Creating an Elastic Load Balancer with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an Elastic Load Balancer with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id ct-12amsdz909cfh --
change-type-version 3.0 --title "my-elb" --execution-parameters
 '{"Description":"My ELB","VpcId":"VPC_ID","StackTemplateId":"stm-
sdhopv30000000000","Name":"myElb","TimeoutInMinutes":60,"Parameters":{"ELBSubnetIds":
["SUBNET_ID","SUBNET_ID"],"ELBLoadBalancerPort":"80","ELBLoadBalancerProtocol":"HTTP","ELBInsta
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateElbParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-12amsdz909cfh" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateElbParams.json
   ```

2. Modify and save the CreateElbParams file. The values given in the example reflect a deployment of a Public ELB, with the health check thresholds relaxed and the ELBScheme set to `true` (for a public ELB). Note that the `Name` you set here is not the actual ELB name, you can find that name in the console as the ELB instance name. Not all optional parameters are shown in the example.

   ```
   {
   "Description":      "ELB-Create",
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-sdhopv00000000000",
   "Name":             "My-ELB",

   "Parameters":   {
       "ELBSubnetIds":  ["PUBLIC_AZ1", "PUBLIC_AZ2"],
       "ELBHealthCheckHealthyThreshold":   2,
       "ELBHealthCheckInterval":           30,
       "ELBHealthCheckTarget":             "HTTP:80/status",
       "ELBHealthCheckTimeout":            10,
       "ELBHealthCheckUnhealthyThreshold": 3,
       "ELBScheme":                        true
       }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it CreateElbRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateElbRfc.json
```

4. Modify and save the CreateElbRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-12amsdz909cfh",
"Title":                "ELB-Create-RFC"
}
```

5. Create the RFC, specifying the CreateElbRfc file and the CreateElbParams file:

```
aws amscm create-rfc --cli-input-json file://CreateElbRfc.json --execution-
parameters file://CreateElbParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the load balancer, look in the execution output: Use the `stack_id` to view the ELB in the Cloud Formation console or to create a Delete Stack RFC, use the ELBCName value to programmatically access the ELB.

   You might need to submit a Management | Other | Other | Update change type to open ports and associate security groups, see Other | Other requests.

Tips

To learn more about AWS Classic Load Balancers, see What Is a Classic Load Balancer?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-12amsdz909cfh.

Example: Required Parameters

```
{
```

```
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "StackTemplateId": "stm-sdhopv30000000000",
  "Name": "Test Stack",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ELBSubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"],
    "ELBInstancePort": "80",
    "ELBInstanceProtocol": "HTTP",
    "ELBLoadBalancerPort": "80",
    "ELBLoadBalancerProtocol": "HTTP"
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678",
  "StackTemplateId": "stm-sdhopv30000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ELBSubnetIds": ["subnet-a0b1c2d3", "subnet-a0b2c9d8"],
    "ELBHealthCheckHealthyThreshold": 2,
    "ELBHealthCheckInterval": 10,
    "ELBHealthCheckTarget": "HTTP:80/index.html",
    "ELBHealthCheckTimeout": 10,
    "ELBHealthCheckUnhealthyThreshold": 3,
    "ELBIdleTimeout": 30,
    "ELBInstancePort": "80",
    "ELBInstanceProtocol": "HTTPS",
    "ELBCookieExpirationPeriod": "60",
```

```
    "ELBCookieStickinessPolicyName": "MyPolicy",
    "ELBLoadBalancerName": "MyLoadBalancer",
    "ELBLoadBalancerPort": "443",
    "ELBLoadBalancerProtocol": "HTTP",
    "ELBSSLCertificateId": "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012",
    "ELBScheme": false,
    "ELBCrossZone": true,
    "ELBBackendInstances": ["i-12345678", "i-01234567"],
    "ELBInstancePort2": "80",
    "ELBInstanceProtocol2": "HTTPS",
    "ELBCookieExpirationPeriod2": "60",
    "ELBCookieStickinessPolicyName2": "MyPolicy2",
    "ELBLoadBalancerPort2": "445",
    "ELBLoadBalancerProtocol2": "HTTP",
    "ELBSSLCertificateId2": "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  }
}
```

Load Balancer (ELB) Stack | Create (With Additional Listeners)

Create an Elastic ("Classic") load balancer (ELB).

Full classification: Deployment | Advanced stack components | Load balancer (ELB) stack | Create (with additional listeners)

Change Type Details

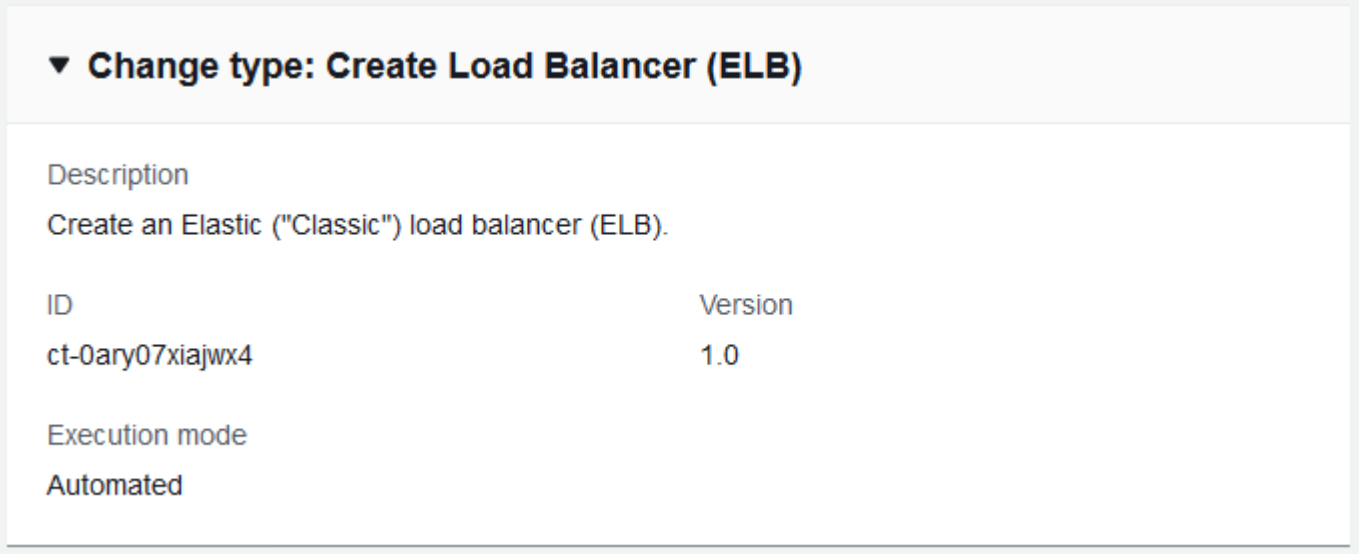
Change type ID	ct-0ary07xiajwx4
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create ELB load balancer with additional listeners

Creating an Elastic Load Balancer (with additional listeners) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an Elastic Load Balancer (with additional listeners) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  --profile saml --region us-east-1 create-rfc --change-type-
id "ct-0ary07xiajwx4" --change-type-version "1.0" --title 'My-ELB-AL-
Create-RFC' --description "Test"  --execution-parameters "{\"Description\":
\"Test\",\"VpcId\":\"VPC_ID\",\"Name\":\"TestStack\",\"StackTemplateId\":
\"stm-3tdleig07sbhstgnf\",\"TimeoutInMinutes\":60,\"LoadBalancer\":{\"SecurityGroups\":
[\"sg-12345678901234567\"],\"SubnetIds\":[\"subnet-12345678901234567\"]},\"Listener1\":
{\"InstancePort\":\"80\",\"Port\":\"80\",\"Protocol\":\"HTTP\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateElbAlParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0ary07xiajwx4" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateElbAlParams.json
   ```

2. Modify and save the CreateElbAlParams file. The values given in the example reflect a deployment of a Public ELB, with the health check thresholds relaxed and the ELBScheme set to `true` (for a public ELB). Note that the `Name` you set here is not the actual ELB name, you can find that name in the console as the ELB instance name. Not all optional parameters are shown in the example.

   ```
   {
     "Description" : "Test",
     "VpcId" : "VPC_ID",
     "Name" : "TestStack",
     "StackTemplateId" : "stm-3tdleig07sbhstgnf",
     "TimeoutInMinutes" : 60,
     "LoadBalancer" : {
       "SecurityGroups" : ["SG_ID, SG_ID"],
       "SubnetIds" : ["SUBNET_ID, SUBNET_ID"]
   ```

```
  },
  "Listener1" : {
    "InstancePort" : "80",
    "Port" : "80",
    "Protocol" : "HTTP"
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateElbAlRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateElbAlRfc.json
```

4. Modify and save the CreateElbAlRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0ary07xiajwx4",
"Title":                "My-ELB-Create-RFC"
}
```

5. Create the RFC, specifying the CreateElbAlRfc file and the CreateElbAlParams file:

```
aws amscm create-rfc --cli-input-json file://CreateElbAlRfc.json --execution-
parameters file://CreateElbAlParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the load balancer, look in the execution output: Use the `stack_id` to view the ELB in the Cloud Formation console or to create a Delete Stack RFC, use the ELBCName value to programmatically access the ELB.

Tips

To learn more about AWS Classic Load Balancers, see What Is a Classic Load Balancer?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0ary07xiajwx4.

Example: Required Parameters

```
{
  "Description" : "Test description",
  "VpcId" : "vpc-12345678901234567",
  "Name" : "TestStack",
  "StackTemplateId" : "stm-3tdleig07sbhstgnf",
  "TimeoutInMinutes" : 60,
  "LoadBalancer" : {
    "SecurityGroups" : ["sg-12345678901234567"],
    "SubnetIds" : ["subnet-12345678901234567"]
  },
  "Listener1" : {
    "InstancePort" : "80",
    "Port" : "80",
    "Protocol" : "HTTP"
  }
}
```

Example: All Parameters

```
{
  "Description" : "Test description",
  "VpcId" : "vpc-12345678",
  "Name" : "TestStack",
  "Tags" : [
    {
      "Key" : "foo",
      "Value" : "bar"
    }
  ],
  "StackTemplateId" : "stm-3tdleig07sbhstgnf",
  "TimeoutInMinutes" : 60,
  "LoadBalancer" : {
    "Name" : "testLoadBalancer",
    "Scheme" : "false",
    "SecurityGroups" : ["sg-12345678"],
    "SubnetIds" : ["subnet-12345678"],
    "AccessLogInterval" : "60",
    "ConnectionDrainingTimeout" : 60,
    "IdleTimeout" : 60,
    "CrossZone" : "true",
    "HealthCheckHealthyThreshold" : "2",
```

```
    "HealthCheckInterval" : "10",
    "HealthCheckTarget" : "TCP:80",
    "HealthCheckTimeout" : "5",
    "HealthCheckUnhealthyThreshold" : "10",
    "BackendInstances" : ["i-12345678"],
    "LBCookieExpirationPeriod" : "2",
    "LBCookieStickinessPolicyName" : "LBCOOKIE",
    "AppCookieName" : "APPCOOKIE",
    "AppCookiePolicyName" : "app-cookie"
  },
  "Listener1" : {
    "InstancePort" : "80",
    "InstanceProtocol" : "HTTP",
    "Port" : "80",
    "Protocol" : "HTTP",
    "PolicyNames" : ["cookie4"],
    "SSLCertificateId" : "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  },
  "Listener2" : {
    "InstancePort" : "80",
    "InstanceProtocol" : "HTTP",
    "Port" : "80",
    "Protocol" : "HTTP",
    "PolicyNames" : ["cookie4", "sslPolicy"],
    "SSLCertificateId" : "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  },
  "Listener3" : {
    "InstancePort" : "80",
    "InstanceProtocol" : "HTTP",
    "Port" : "80",
    "Protocol" : "HTTP",
    "PolicyNames" : ["cookie4", "sslPolicy", "two"],
    "SSLCertificateId" : "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  },
  "Listener4" : {
    "InstancePort" : "80",
    "InstanceProtocol" : "HTTP",
    "Port" : "80",
    "Protocol" : "HTTP",
    "PolicyNames" : ["cookie4", "sslPolicy"],
```

```
    "SSLCertificateId" : "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  },
  "Listener5" : {
    "InstancePort" : "80",
    "InstanceProtocol" : "HTTP",
    "Port" : "80",
    "Protocol" : "HTTP",
    "PolicyNames" : ["cookie4", "sslPolicy"],
    "SSLCertificateId" : "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  }
}
```

Network Load Balancer | Create

Use to create a Network Load Balancer.

Full classification: Deployment | Advanced stack components | Network Load Balancer | Create

Change Type Details

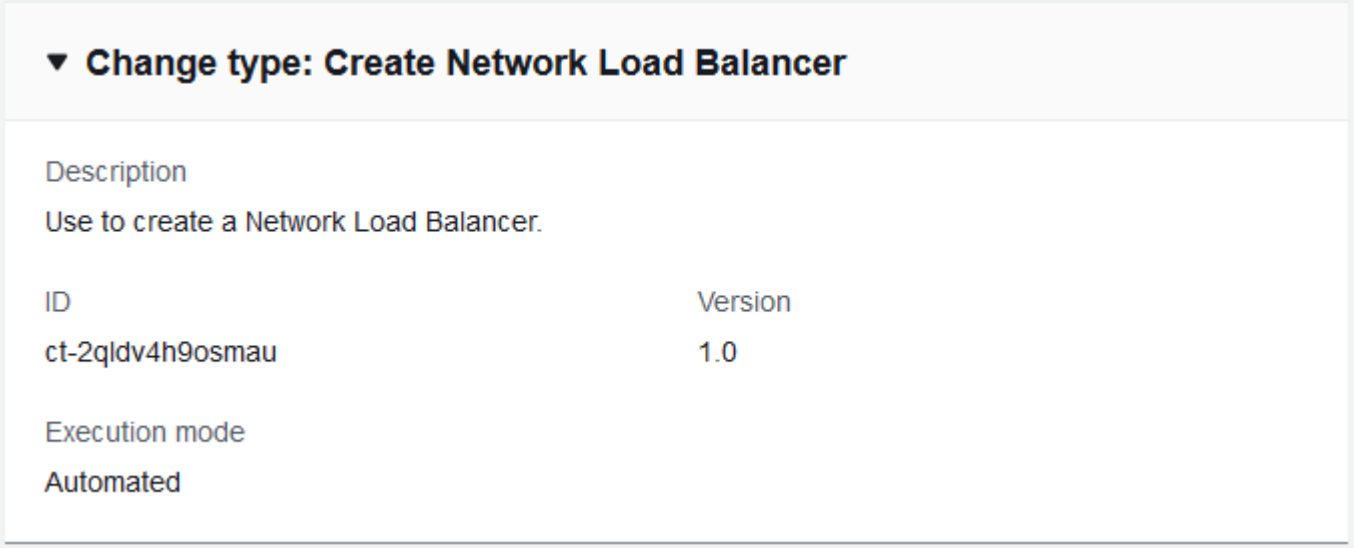
Change type ID	ct-2qldv4h9osmau
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create NLB load balancer

Creating an NLB with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an NLB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc  --change-type-id
 "ct-2qldv4h9osmau" --change-type-version "1.0" --title "Test-NLB-QC" --execution-
parameters "{\"Description\":\"QCNLB\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\":
\"stm-l70qr9itukvqssg8d\", \"Name\":\"QCNLB\", \"TimeoutInMinutes\":60, \"Parameters\":
{\"SubnetIds\":[\"SUBNET_ID\",\"SUBNET_ID\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateNlbParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2qldv4h9osmau" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateNlbParams.json
   ```

2. Modify and save the CreateNlbParams file. The values given in the example reflect a deployment of a public Network Load Balancer, with the health check thresholds relaxed and the `Public` parameters set to true (for a public NLB). Note that the `Name` you set here is not the actual NLB name, you can find that name in the console as the NLB instance name.

   ```
   {
   "Description":      "NLB-Create",
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-l70qr9itukvqssg8d",
   "Name":             "My-NLB",

   "Parameters":   {
       "SubnetIds":  ["PUBLIC_AZ1", "PUBLIC_AZ2"],
       "HealthCheckHealthyThreshold":   2,
       "HealthCheckInterval":           30,
       "HealthCheckTargetPath":         traffic-port",
       "DeregistrationDelayTimeout":                10,
       "Public":                        true
       }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it CreateNlbRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateNlbRfc.json
```

4. Modify and save the CreateNlbRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2qldv4h9osmau",
"Title":                "NLB-Create-RFC"
}
```

5. Create the RFC, specifying the CreateNlbRfc file and the CreateNlbParams file:

```
aws amscm create-rfc --cli-input-json file://CreateNlbRfc.json --execution-
parameters file://CreateNlbParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the load balancer, look in the execution output: Use the stack_id to view the NLB in the CloudFormation console or to create a Delete Stack RFC, and use the NLB CName value to programmatically access the NLB.

Tips

> **Note**
>
> You can specify up to four Target IDs, Ports, and Availability Zones.

To learn more about AWS Network Load Balancers, see Create a Network Load Balancer.

To create a network load balancer listener, see Target Group | Create (For NLB).

To create a network load balancer target group, see Create NLB target group.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2qldv4h9osmau.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "Name": "Test Stack",
  "Parameters": {
    "CrossZoneEnabled": "false",
    "DeregistrationDelayTimeoutSeconds": "300",
    "HealthCheckHealthyThreshold": "3",
    "HealthCheckIntervalSeconds": "30",
    "HealthCheckTargetPath": "/",
    "HealthCheckTargetPort": "80",
    "HealthCheckTargetProtocol": "TCP",
    "InstancePort": "80",
    "LoadBalancerName": "my-load-balancer",
    "LoadBalancerPort": "80",
    "ProxyProtocolV2": "false",
    "Public": "false",
    "SubnetIds": ["subnet-01234567890abcdef", "subnet-01234567891abcdef"],
    "Target1AvailabilityZone": "us-east-1a",
    "Target1ID": "i-01234567890abcdef",
    "Target1Port": "80",
    "Target2AvailabilityZone":  "us-east-1a",
    "Target2ID": "i-11234567890abcdef",
    "Target2Port": "80",
    "Target3AvailabilityZone": "us-east-1a",
    "Target3ID": "i-21234567890abcdef",
    "Target3Port": "80",
    "Target4AvailabilityZone": "us-east-1a",
    "Target4ID": "i-31234567890abcdef",
    "Target4Port": "80",
    "TargetType": "instance"
  },
  "StackTemplateId": "stm-l70qr9itukvqssg8d",
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567890abcdef"
}
```

OpenSearch | Create Domain

Create an Amazon OpenSearch Service domain. An OpenSearch domain encapsulates OpenSearch engine instances that process OpenSearch requests. Amazon OpenSearch Service supports OpenSearch and legacy Elasticsearch OSS (up to 7.10, the final open source version of the software).

Full classification: Deployment | Advanced stack components | OpenSearch | Create domain

Change Type Details

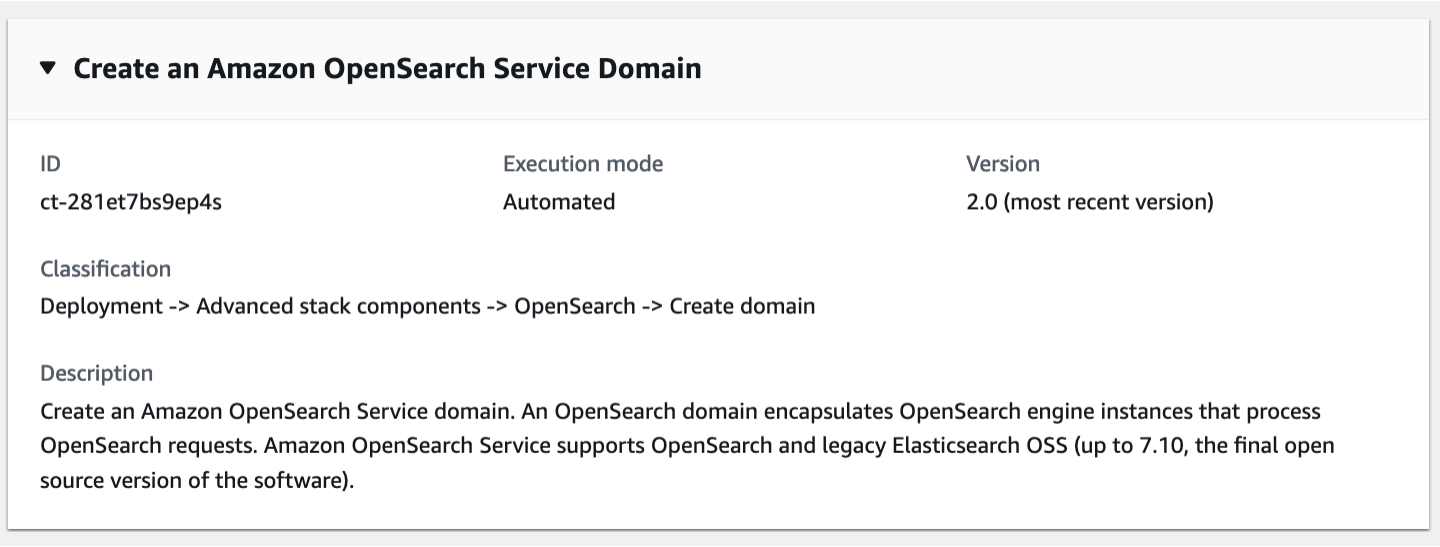
Change type ID	ct-281et7bs9ep4s
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create OpenSearch Service Domain

Creating an OpenSearch domain with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an OpenSearch domain with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-281et7bs9ep4s" \
--change-type-version "2.0" --title "Create OpenSearch domain" \
--execution-parameters "{\"Description\":\"Create OS domain\",\"VpcId\":
\"vpc-317a9856\",\"Name\": \"OpenSearchDomain\",\"StackTemplateId\": \"stm-
szccoe01000000000\",\"TimeoutInMinutes\": 60,\"Parameters\":{\"DomainName\":
\"opensearchdomain\",\"EngineVersion\":\"OpenSearch_7.10\",\"DedicatedMasterCount
\": \"3\",\"DedicatedMasterType\": \"r5.xlarge.search\",\"InstanceType\":
 \"r5.xlarge.search\",\"InstanceCount\": 2\"EBSIops\": \"0\",\"EBSVolumeSize
\": 100\"EBSVolumeType\": \"gp2\",\"SubnetIds\":[\"subnet-d3cf52f9\"]}}" \
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateOpenSearchDomainParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-281et7bs9ep4s"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateOpenSearchDomainParams.json
   ```

2. Modify and save the CreateOpenSearchDomainParams file. See examples below; make sure to modify these parameters to meet your specific needs.

   ```
   {
     "Description": "OpenSearch Service Domain",
     "VpcId": "vpc-317a9856",
     "Name": "open_search",
     "StackTemplateId": "stm-szccoe02000000000",
     "TimeoutInMinutes": 60,
     "Parameters": {
         "DomainName": "my-opensearch-domain",
         "EngineVersion": "OpenSearch_2.3",
         "DedicatedMasterCount": "3",
         "DedicatedMasterType": "r6g.large.search",
         "InstanceType": "r6g.large.search",
         "InstanceCount": "2",
           "EBSVolumeSize": "35",
           "EBSVolumeType": "gp3",
   ```

```
        "SubnetIds": [
            "subnet-0123456789abcdefg"
        ]
     }
    }
```

3. Output the RFC template to a file in your current folder; this example names it CreateOpenSearchDomainRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateOpenSearchDomainRfc.json
```

4. Modify and save the CreateOpenSearchDomainRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-281et7bs9ep4s",
    "ChangeTypeVersion": "1.0",
    "Title": "Create OpenSearch domain"
}
```

5. Create the RFC, specifying the CreateOpenSearchDomainRfc file and the CreateOpenSearchDomainParams file:

```
aws amscm create-rfc --cli-input-json file://CreateOpenSearchDomainRfc.json --
execution-parameters file://CreateOpenSearchDomainParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This change type replaces the former change type, ct-0azen3a9anxzj.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-281et7bs9ep4s.

Example: Required Parameters

```
{
```

```
  "Description": "Test description",
  "VpcId": "vpc-12345678",
  "Name": "teststak",
  "StackTemplateId": "stm-szccoe02000000000",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "DomainName": "testdomain",
    "EngineVersion": "Elasticsearch_7.10",
    "DedicatedMasterCount": "0",
    "DedicatedMasterType": "r6g.large.search",
    "InstanceType": "r6g.large.search",
    "InstanceCount": 1,
    "EBSIops": "1000",
    "EBSThroughput": "125",
    "EBSVolumeSize": 100,
    "EBSVolumeType": "gp2",
    "SubnetIds": [
      "subnet-12345678",
      "subnet-13456789"
    ]
  }
}
```

Example: All Parameters

```
{
  "Description": "Test description",
  "VpcId": "vpc-12345678",
  "Name": "teststak",
  "StackTemplateId": "stm-szccoe02000000000",
  "TimeoutInMinutes": 60,
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "Parameters": {
    "DomainName": "testdomain",
```

```
    "EngineVersion": "Elasticsearch_7.10",
    "DedicatedMasterCount": "0",
    "DedicatedMasterType": "r6g.large.search",
    "InstanceType": "r6g.large.search",
    "InstanceCount": 1,
    "ZoneAwarenessEnabled": "false",
    "EBSIops": "1000",
    "EBSThroughput": "125",
    "EBSVolumeSize": 100,
    "EBSVolumeType": "gp2",
    "EncryptionKey": "default",
    "AutomatedSnapshotStartHour": "",
    "AllowExplicitIndex": "true",
    "IndicesFieldDataCacheSize": "20",
    "MaxClauseCount": "512",
    "SubnetIds": [
      "subnet-12345678"
    ]
  }
}
```

RDS Database Stack | Create

Create an Amazon Relational Database Service (RDS) DB instance. To provision an Aurora single instance or multi-AZ instances, use CT ct-2jvzjwunghrhy.

Full classification: Deployment | Advanced stack components | RDS database stack | Create

Change Type Details

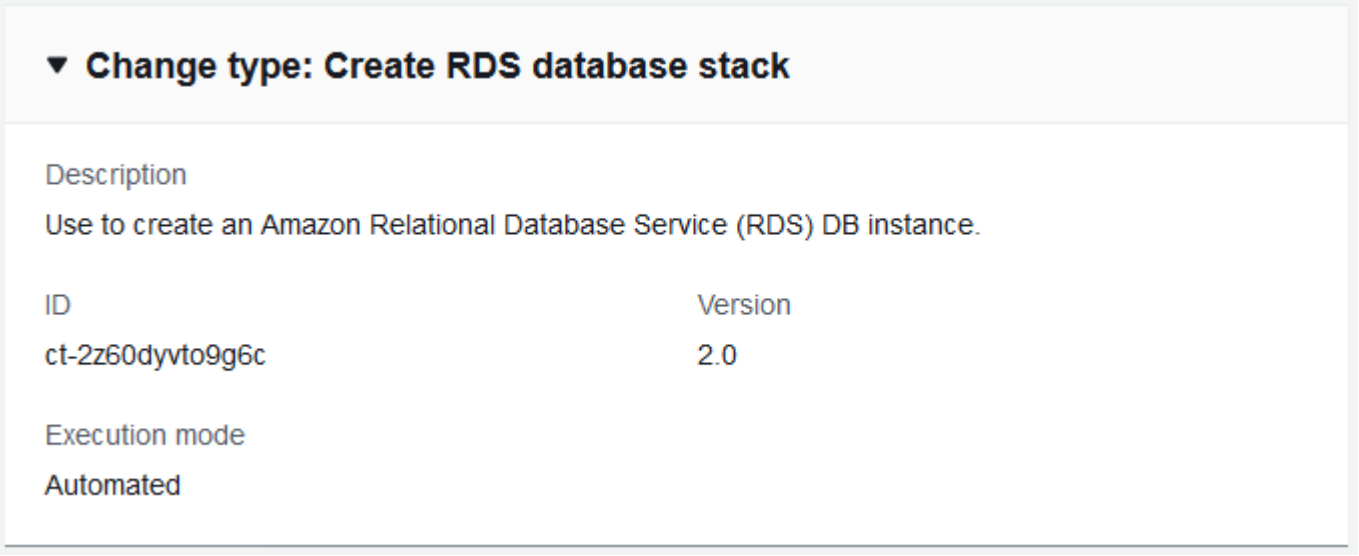
Change type ID	ct-2z60dyvto9g6c
Current version	3.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create DB stack

Creating an RDS Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an RDS Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
create-rfc --change-type-id "ct-2z60dyvto9g6c" --change-type-version "3.0" --
title "RDS-Create-QC-RFC" --execution-parameters "{\"Description\":\"My RDS DB\",
```

```
 \"VpcId\":\"VPC_ID\", \"StackTemplateId\":\"stm-sl81ze00000000000\", \"Name\":
\"RDS-Create-QC\", \"TimeoutInMinutes\":60, \"Parameters\":{\"RDSAllocatedStorage
\":100, \"RDSDBEngine\":\"MySQL\", \"RDSDBName\":\"MyDB\", \"RDSEngineVersion\":
\"8.0.20\", \"RDSLicenseModel\":\"bring-your-own-license\", \"RDSMasterUsername\":
\"myUser\", \"RDSMasterUserPassword\":\"myPassWord\", \"RDSSubnetIds\":[\"SUBNET_ID\",
\"SUBNET_ID\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateRdsParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2z60dyvto9g6c" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateRdsParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   Oracle example:

   ```
   {
   "Description":          "Create-RDS-DB",
   "VpcId":                "VPC_ID",
   "StackTemplateId":      "stm-sl81ze00000000000",
   "Name":                 "My-RDS-DB",
   "TimeoutInMinutes":     60,
   "Parameters":   {
       "RDSAllocatedStorage":      50,
       "RDSDBEngine":              "oracle-se1",
       "RDSDBName":                "MyRds",
       "RDSEngineVersion":         "11.2.0.4.v13",
       "RDSInstanceType":          "db.m1.small",
       "RDSLicenseModel":          "license-included",
       "RDSMasterUsername":        "dbadmin",
       "RDSMasterUserPassword":    "p4ssw0rd",
       "RDSSubnetIds":             ["PRIVATE_AZ1_SUBNET", "PRIVATE_AZ2_SUBNET"]
       }
   }
   ```

   MySQL example:

   ```
   {
   ```

```
"Description":          "Create-RDS-DB",
"VpcId":                "VPC_ID",
"StackTemplateId":      "stm-sl81ze00000000000",
"Name":                 "My-RDS-DB",
"TimeoutInMinutes":     60,
"Parameters":   {
    "RDSAllocatedStorage":      50,
    "RDSDBEngine":              "MySQL",
    "RDSDBName":                "MyRds",
    "RDSEngineVersion":         "8.0.20",
    "RDSInstanceType":          "db.m1.small",
    "RDSLicenseModel":          "general-public-license",
    "RDSMasterUsername":        "dbadmin",
    "RDSMasterUserPassword":    "p4ssw0rd",
    "RDSSubnetIds":             ["PRIVATE_AZ1_SUBNET", "PRIVATE_AZ2_SUBNET"]
    }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateRdsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRdsRfc.json
```

4. Modify and save the CreateRdsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-2z60dyvto9g6c",
"Title":                "RDS-Create-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRdsRfc.json --execution-
parameters file://CreateRdsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the RDS, look in the execution output: Use the "stack_id" to view the RDS in the Cloud Formation Console. To create a Delete Stack or Update RDS RFC, use the first part

of the DatabaseEndpoint (the DB instance ID) to create a Reboot RDS RFC, use the entire DatabaseEndpoint to programmatically access the RDS DB.

7. You are now able to manage the database via a database management tool such as SQL server management studio. You do not have to request access from AMS.

Tips

> **Note**
>
> The **RDSDBEngine** parameter has a new value available: **mariadb**.

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

To create an Aurora RDS stack, see Create DB stack (for Aurora).

To create an RDS stack from a snapshot, see Create DB from snapshot.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2z60dyvto9g6c.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "StackTemplateId": "stm-sl81ze20000000000",
  "Name": "Test Stack",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "RDSAllocatedStorage": 50,
```

```
    "RDSDBEngine": "mysql",
    "RDSDBName": "my_db",
    "RDSEngineVersion": "5.6.27",
    "RDSInstanceType": "db.m3.medium",
    "RDSMasterUsername": "myadminuser",
    "RDSMasterUserPassword": "MySecurePassword",
    "RDSSubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678",
  "StackTemplateId": "stm-sl81ze20000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "RDSAllocatedStorage": 100,
    "RDSBackupRetentionPeriod": 7,
    "RDSAutoMinorVersionUpgrade": true,
    "RDSCharacterSetName": "",
    "RDSDBEngine": "sqlserver-ex",
    "RDSDBName": "my_db",
    "RDSDBParameterGroupName": "default.sqlserver-ex-13.0",
    "RDSDeletionProtection": true,
    "RDSEngineVersion": "13.00.4522.0.v1",
    "RDSInstanceType": "db.t2.micro",
    "RDSIOPS": 0,
    "RDSLicenseModel": "license-included",
    "RDSMasterUsername": "myadminuser",
    "RDSMasterUserPassword": "MySecurePassword",
```

```
    "RDSMultiAZ": false,
    "RDSOptionGroupName": "default:sqlserver-ex-13-00",
    "RDSPerformanceInsights" : "true",
    "RDSPerformanceInsightsKMSKey":"arn:aws:kms:us-east-1:123456789012:key/2590cd3a-
f979-49db-adec-d213775385af",

    "RDSTimezone": "Eastern Standard Time"
  }
}
```

RDS Database Stack | Create (For Aurora)

Create an AWS Relational Database Service (RDS) Aurora stack using either multi-availability zone (MultiAZ) or a single instance.

Full classification: Deployment | Advanced stack components | RDS database stack | Create (for Aurora)

Change Type Details

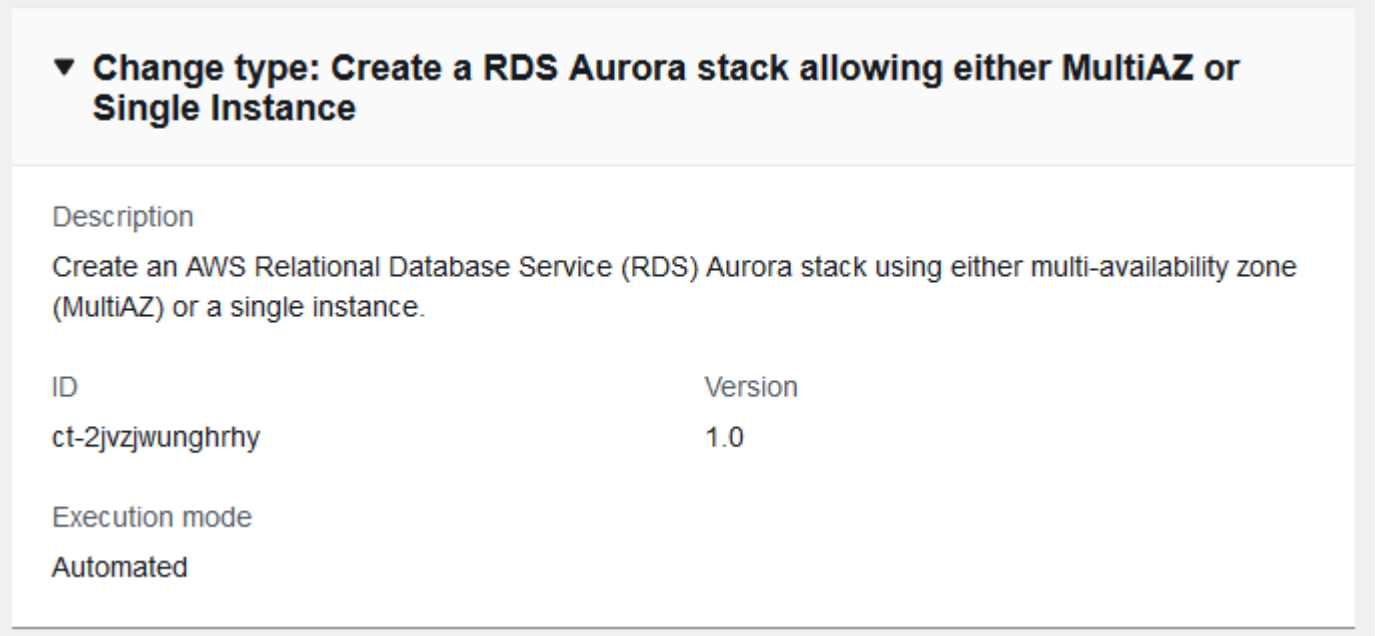
Change type ID	ct-2jvzjwunghrhy
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create DB stack (for Aurora)

Creating an Aurora RDS Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an Aurora RDS Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-2jvzjwunghrhy" --change-type-version "1.0" --title "Test Create (for Aurora)" --
execution-parameters "{\"Description\":\"Aurora_RDS_TEST\",\"VpcId\":\"VPC_ID\",\"Name
\":\"Aurora-TEST\",\"StackTemplateId\":\"stm-j24cifrdi0untnsn6\",\"TimeoutInMinutes
\":60,\"Parameters\":{\"AutoMinorVersionUpgrade\":\"true\",\"BackupRetentionPeriod\":7,
\"ClusterName\":\"\",\"DBEngine\":\"aurora\",\"DBName\":\"DB_NAME\",\"DBSubnetGroupName
\":\"DB_SUBNET_GROUP_NAME\",\"EngineVersion\":\"\",\"InstanceType\":\"db.r4.large\",
\"MasterUsername\":\"DB_USER\",\"MasterUserPassword\":\"DB_PW\",\"MultiAZ\":
\"true\",\"PerformanceInsights\":\"true\",\"PerformanceInsightsKMSKey\":\"\",
\"PerformanceInsightsRetentionPeriod\":\"7\",\"Port\":\"0\",\"PreferredBackupWindow
\":\"22:00-23:00\",\"PreferredMaintenanceWindow\":\"wed:03:32-wed:04:02\",
\"StorageEncryptionKey\":\"\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateRdsArParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2jvzjwunghrhy" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateRdsArParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   Oracle example:

   ```
   {
     "Description": "Aurora_RDS_TEST",
     "VpcId": "VPC_ID",
     "Name": "Aurora-TEST",
     "StackTemplateId": "stm-j24cifrdi0untnsn6",
   ```

```
  "TimeoutInMinutes": 60,
  "Parameters": {
    "AutoMinorVersionUpgrade": "true",
    "BackupRetentionPeriod": 7,
    "ClusterName": "",
    "DBEngine": "aurora",
    "DBName": "DB_NAME",
    "DBSubnetGroupName": "DB_SUBNET_GROUP_NAME",
    "EngineVersion": "",
    "InstanceType": "db.r4.large",
    "MasterUsername": "DB_USER",
    "MasterUserPassword": "DB_PW",
    "MultiAZ": "true",
    "PerformanceInsights": "true",
    "PerformanceInsightsKMSKey": "",
    "PerformanceInsightsRetentionPeriod": "7",
    "Port": "0",
    "PreferredBackupWindow": "22:00-23:00",
    "PreferredMaintenanceWindow": "wed:03:32-wed:04:02",
    "StorageEncryptionKey": ""
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateRdsArRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRdsArRfc.json
```

4. Modify and save the CreateRdsArRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2jvzjwunghrhy",
"Title":                "RDS-Create-Aurora-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdsArRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRdsArRfc.json --execution-
parameters file://CreateRdsArParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the RDS, look in the execution output: Use the "stack_id" to view the RDS in the Cloud Formation Console. To create a Delete Stack or Update RDS RFC, use the first part of the DatabaseEndpoint (the DB instance ID) to create a Reboot RDS RFC, use the entire DatabaseEndpoint to programmatically access the RDS DB.
7. You are now able to manage the database via a database management tool such as SQL server management studio. You do not have to request access from AMS.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

For more information, see Amazon Aurora – Relational Database Built for the Cloud - AWS.

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

To create an Aurora RDS stack from a backup, see Create DB stack from backup (for Aurora).

To create a non-Aurora RDS stack, see Update DB stack.

To create an non-Aurora RDS stack from a snapshot, see Create DB from snapshot.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2jvzjwunghrhy.

Example: Required Parameters

```
{
  "Description": "Create an RDS stack for an Aurora database (DB) with multiple
 availability zones (MultiAZ) or as a single instance DB. Also creates an Aurora DB
 cluster consisting of a DB instance, compatible with either MySQL or PostgreSQL, and
```

```
 a cluster volume that represents the data for the DB cluster, copied across three
 Availability Zones as a single, virtual volume. The DB cluster contains a primary
 instance and, optionally, up to 15 Aurora Replicas.",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-j24cifrdi0untnsn6",
  "Name": "Stack Name",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "DBEngine": "aurora",
    "EngineVersion": "",
    "DBName": "dbname",
    "DBSubnetGroupName": "db-subnet-group",
    "MasterUsername": "dbusername",
    "MasterUserPassword": "dbpassword"
  }
}
```

Example: All Parameters

```
{
  "Description": "Create an RDS stack for an Aurora database (DB) with multiple
 availability zones (MultiAZ) or as a single instance DB. Also creates an Aurora DB
 cluster consisting of a DB instance, compatible with either MySQL or PostgreSQL, and
 a cluster volume that represents the data for the DB cluster, copied across three
 Availability Zones as a single, virtual volume. The DB cluster contains a primary
 instance and, optionally, up to 15 Aurora Replicas.",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-j24cifrdi0untnsn6",
  "Name": "Stack Name",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
```

```
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "AutoMinorVersionUpgrade": "true",
    "BackupRetentionPeriod": 7,
    "ClusterName": "dbcluster",
    "DBEngine": "aurora-postgresql",
    "EngineVersion": "10.4",
    "DBName": "dbname",

    "Port": "1150",
    "PreferredBackupWindow": "22:00-23:00",
    "PreferredMaintenanceWindow": "wed:03:32-wed:04:02",
    "StorageEncryptionKey": "default"
  }
}
```

RDS Database Stack | Create DB Subnet Group

Create a Relational Database Service (RDS) database (DB) subnet group to be used with a specified RDS DB.

Full classification: Deployment | Advanced stack components | RDS database stack | Create DB subnet group

Change Type Details

Change type ID	ct-17w6f6kzf6w51

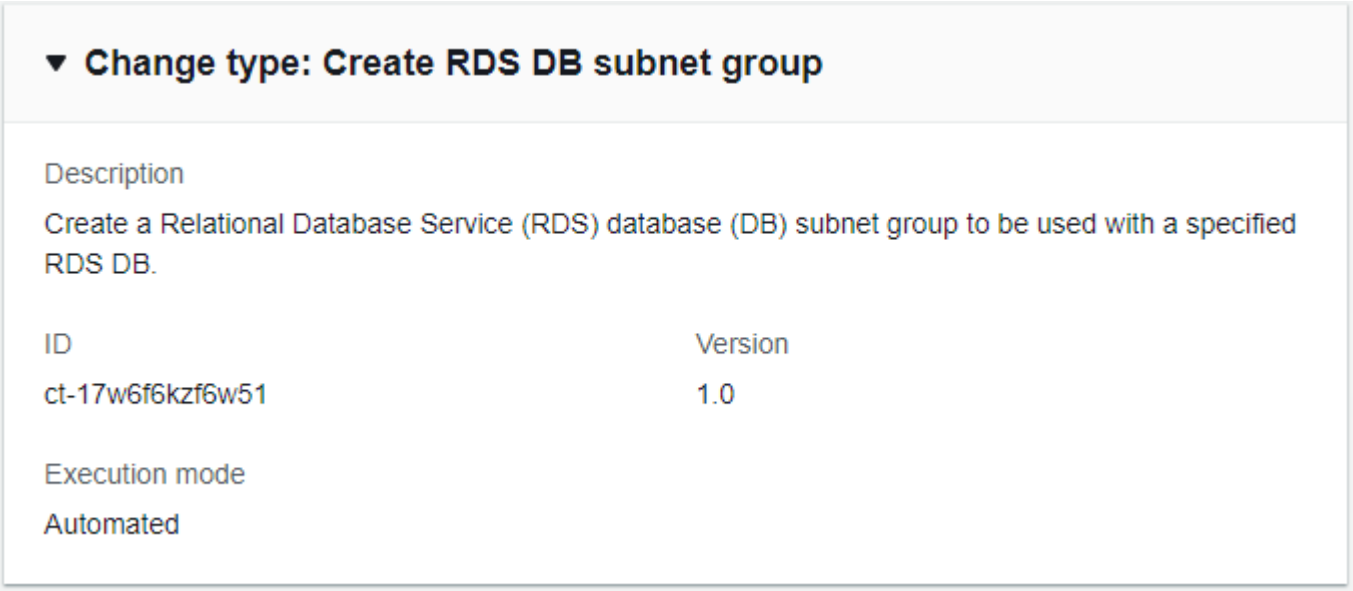
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create DB subnet groups

Creating an RDS DB Subnet Group with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an RDS DB Subnet Group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
create-rfc --change-type-id "ct-17w6f6kzf6w51" --change-type-version "1.0" --title
 "RDS-subnet-group" --execution-parameters "{\"Description\":\"RDS DB subnet group\",
 \"VpcId\":\"VPC_ID\", \"StackTemplateId\":\"stm-iutsfv5ci7suupr86\", \"Name\":\"RDS
 subnet group\", \"TimeoutInMinutes\":60, \"Parameters\": {\"DBSubnetGroupName\":
 \"mydbsubnetgroup\", \"DBSubnetGroupDescription\": \"DbSubnetGroupDescription\",
 \"SubnetIds\": [\"SUBNET_ID_1\",\"SUBNET_ID_2\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateRdsParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2z60dyvto9g6c" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateRdsParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "RDS DB subnet group",
     "VpcId": "VPC_ID",
   ```

```
  "Name": "RDS DB subnet group",
  "StackTemplateId": "stm-iutsfv5ci7suupr86",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "DBSubnetGroupName": "mydbsubnetgroup",
    "DBSubnetGroupDescription": "Example RDS db subnet group description",
    "SubnetIds": [
      "SUBNET_ID_1",
      "SUBNET_ID_2"
    ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateRdsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRdsRfc.json
```

4. Modify and save the CreateRdsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-17w6f6kzf6w51",
"Title":                "RDS-Create-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRdsRfc.json --execution-
parameters file://CreateRdsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Advanced** view.

To learn more about Amazon RDS DB subnet groups, see Working with an Amazon RDS DB Instance in a VPC.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-17w6f6kzf6w51.

Example: Required Parameters

```
{
  "Description": "Create RDS db subnet group",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-iutsfv5ci7suupr86",
  "Name": "Stack Name",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "DBSubnetGroupName": "dbsubnetgroupname",
    "SubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
  }
}
```

Example: All Parameters

```
{
  "Description": "Create RDS db subnet group",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-iutsfv5ci7suupr86",
  "Name": "Stack Name",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "DBSubnetGroupName": "dbsubnetgroupname",
```

```
    "DBSubnetGroupDescription": "Test description",
    "SubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
  }
}
```

RDS Database Stack | Create from Backup

Create an Amazon Relational Database Service (RDS) from a backup. When you restore a backup this way, the service-specific restore parameters are presented automatically.

Full classification: Deployment | Advanced stack components | RDS database stack | Create from backup

Change Type Details

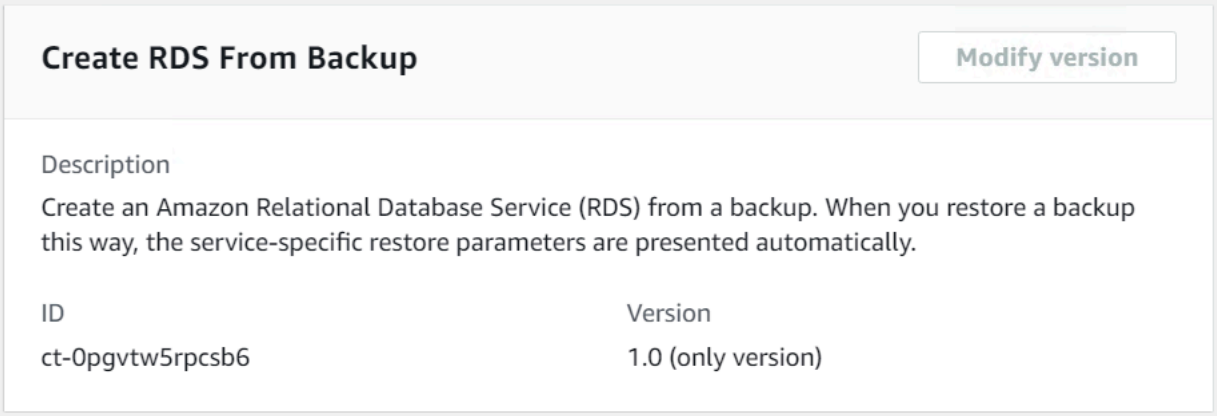
Change type ID	ct-0pgvtw5rpcsb6
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create DB stack from backup

Creating an RDS stack from backup with the Console

Screenshot of this change type, in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an RDS stack from backup with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
```

```
--change-type-id "ct-0pgvtw5rpcsb6" \
--change-type-version "1.0" --title "Create RDS From Backup" \
--execution-parameters "{\"Description\":\"Create RDS Instance Stack from
 Backup: awsbackup:job-00000000-0000-0000-0000-000000000.\",\"VpcId\":
\"vpc-00000000\",\"StackTemplateId\":\"stm-siqajx00000000000\",\"Name\":
\"restoredb\",\"TimeoutInMinutes\":360,\"Parameters\":{\"DBSnapshotIdentifier
\":\"awsbackup:job-00000000-0000-0000-0000-000000000\",\"DBSubnetIds\":
[\"subnet-79663144\", \"subnet-d0cf52fa\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateRdsFromBackupParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0g690ekkyfm79"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRdsFromBackupParams.json
   ```

2. Modify and save the CreateRdsFromBackupParams file.

   ```
   {
     "Description": "Create RDS Instance Stack from Backup:
    awsbackup:job-00000000-0000-0000-0000-000000000.",
     "VpcId": "vpc-00000000",
     "StackTemplateId": "stm-siqajx00000000000",
     "Name": "Stack Name",
     "TimeoutInMinutes": 360,
     "Parameters": {
       "DBSnapshotIdentifier": "awsbackup:job-00000000-0000-0000-0000-000000000",
       "DBSubnetIds": ["subnet-79663144", "subnet-d0cf52fa"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it CreateRdsFromBackupRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateRdsFromBackupRfc.json
   ```

4. Modify and save the CreateRdsFromBackupRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
    "ChangeTypeId": "ct-0pgvtw5rpcsb6",
    "ChangeTypeVersion": "1.0",
    "Title": "Create RDS Instance Stack from Backup"
}
```

5. Create the RFC, specifying the CreateRdsFromBackupRfc file and the CreateRdsFromBackupParams file:

```
aws amscm create-rfc --cli-input-json file://CreateRdsFromBackupRfc.json --
execution-parameters file://CreateRdsFromBackupParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0pgvtw5rpcsb6.

Example: Required Parameters

```
{
  "Description": "Create RDS Instance Stack from snapshot:
 awsbackup:job-00000000-0000-0000-0000-000000000000.",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-siqajx00000000000",
  "Name": "Stack Name",
  "Parameters": {
    "DBSnapshotIdentifier": "awsbackup:job-00000000-0000-0000-0000-000000000000",
    "DBSubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
  }
}
```

Example: All Parameters

```
{
```

```
  "Description": "Create RDS Instance Stack from snapshot:
 rds:sr341e8q8bofsd-2017-04-19-22-13.",
  "VpcId": "vpc-12345678",
  "StackTemplateId": "stm-siqajx00000000000",
  "Name": "Stack Name",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "DBInstanceClass": "db.m3.medium",
    "DBInstanceIdentifier": "my-rds-id",
    "DBSnapshotIdentifier": "customizedSnapshotId",
    "DBSubnetIds": ["subnet-a0b1c2d3", "subnet-a0b2c9d8"]
  }
}
```

RDS Database Stack | Create from Backup (For Aurora)

Create an AWS Relational Database Service (RDS) Aurora stack from AWS Backup.

Full classification: Deployment | Advanced stack components | RDS database stack | Create from backup (for Aurora)

Change Type Details

Change type ID	ct-2wllq61djysxz
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required

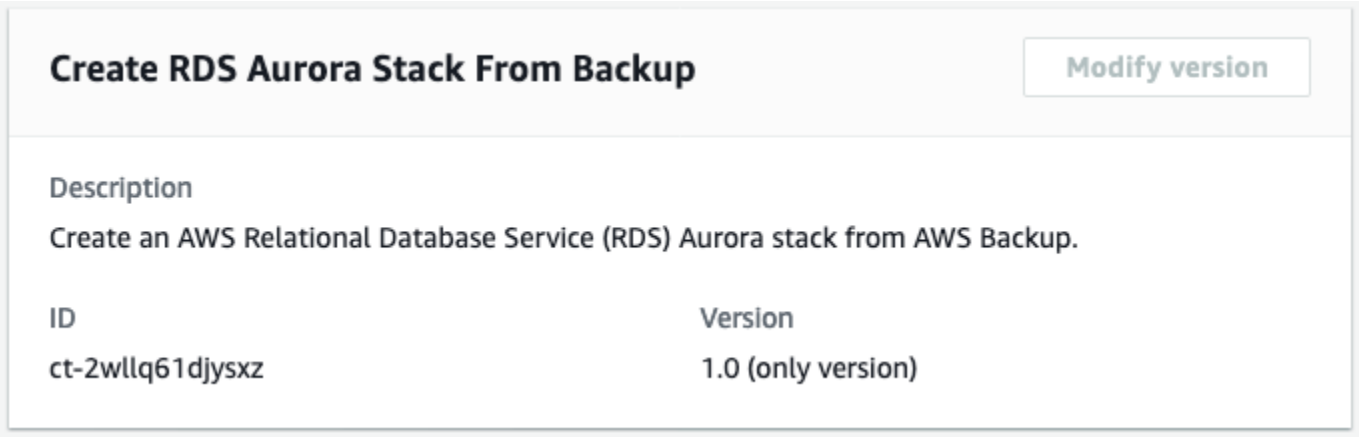
Execution mode	Automated

Additional Information

Create DB stack from backup (for Aurora)

Creating an Aurora RDS Stack From Backup with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an Aurora RDS Stack From Backup with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-
type-id "ct-2wllq61djysxz" --change-type-version "1.0" --title
 "TestCreateAuroraStackFromBackup" --execution-parameters "{\"Description\":
\"TestCreateAuroraStackFromBackup\",\"VpcId\":\"VPC_ID\",\"Name\":\"Test Aurora
 Stack From Backup\",\"Parameters\":{\"SnapshotIdentifier\":\"SNAPSHOT_IDENTIFIER\",
\"AutoMinorVersionUpgrade\":\"true\",\"BackupRetentionPeriod\":7,\"ClusterName\":
\"\",\"DBEngine\":\"aurora\",\"DBName\":\"\",\"EngineVersion\":\"\",\"InstanceType
\":\"db.r4.large\",\"MultiAZ\":\"true\",\"Port\":\"0\",\"PreferredBackupWindow
\":\"22:00-23:00\",\"PreferredMaintenanceWindow\":\"\",\"DBSubnetGroupName
\":\"DB_SUBNET_GROUP_NAME\"},\"StackTemplateId\":\"stm-j24cifrdi0untnsn6\",
\"TimeoutInMinutes\":60}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateRdsArFrmBkupParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2wllq61djysxz"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRdsArFrmBkupParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "TestCreateAuroraStackFromBackup",
     "VpcId": "VPC_ID",
     "Name": "Test Aurora Stack From Backup",
     "Parameters": {
       "SnapshotIdentifier": "SNAPSHOT_IDENTIFIER",
       "AutoMinorVersionUpgrade": "true",
   ```

```
    "BackupRetentionPeriod": 7,
    "ClusterName": "",
    "DBEngine": "aurora",
    "DBName": "",
    "EngineVersion": "",
    "InstanceType": "db.r4.large",
    "MultiAZ": "true",
    "Port": "0",
    "PreferredBackupWindow": "22:00-23:00",
    "PreferredMaintenanceWindow": "",
    "DBSubnetGroupName": "DB_SUBNET_GROUP_NAME"
  },
  "StackTemplateId": "stm-j24cifrdi0untnsn6",
  "TimeoutInMinutes": 60
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateRdsArFrmBkupRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRdsArFrmBkupRfc.json
```

4. Modify and save the CreateRdsArFrmBkupRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2wllq61djysxz",
"Title":                "RDS-Create-Aurora-From-Backup-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdsArFrmBkupRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRdsArFrmBkupRfc.json --
execution-parameters file://CreateRdsArFrmBkupParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the RDS, look in the execution output: Use the "stack_id" to view the RDS in the Cloud Formation Console. To create a Delete Stack or Update RDS RFC, use the first part of the DatabaseEndpoint (the DB instance ID); to create a Reboot RDS RFC, use the entire DatabaseEndpoint -> ClusterEndpoint to programmatically access the RDS DB.

7. You are now able to manage the database via a database management tool such as SQL server management studio. You do not have to request access from AMS.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

For more information, see Amazon Aurora – Relational Database Built for the Cloud - AWS.

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

To create an Aurora RDS stack (not using backup), see Create DB stack (for Aurora).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2wllq61djysxz.

Example: Required Parameters

```
{
  "Description": "Create an AWS Relational Database Service (RDS) Aurora stack from AWS
 Backup.",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-j24cifrdi0untnsn6",
  "Name": "Stack Name",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
```

```
  "TimeoutInMinutes": 60,
  "Parameters": {
    "SnapshotIdentifier": "arn:aws:rds:xx-xxxx-x:000000000000:cluster-
snapshot:awsbackup:job-00000000-0000-0000-0000-000000000000",
    "DBEngine": "aurora",
    "EngineVersion": "",
    "DBSubnetGroupName": "db-subnet-group"
  }
}
```

Example: All Parameters

```
{
  "Description": "Create an AWS Relational Database Service (RDS) Aurora stack from AWS
 Backup.",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-j24cifrdi0untnsn6",
  "Name": "Stack Name",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "SnapshotIdentifier": "arn:aws:rds:xx-xxxx-x:000000000000:cluster-
snapshot:awsbackup:job-00000000-0000-0000-0000-000000000000",
    "AutoMinorVersionUpgrade": "true",
    "BackupRetentionPeriod": 7,
    "ClusterName": "dbcluster",
    "DBEngine": "aurora-postgresql",
    "EngineVersion": "10.4",
    "DBName": "dbname",
    "DBSubnetGroupName": "db-subnet-group",
    "InstanceType": "db.r4.large",
    "MultiAZ": "true",
    "Port": "1150",
    "PreferredBackupWindow": "22:00-23:00",
```

```
    "PreferredMaintenanceWindow": "wed:03:32-wed:04:02"
  }
}
```

RDS Database Stack | Create from Snapshot

Create an Amazon Relational Database Service (RDS) DB instance from an RDS snapshot.

Full classification: Deployment | Advanced stack components | RDS database stack | Create from snapshot

Change Type Details

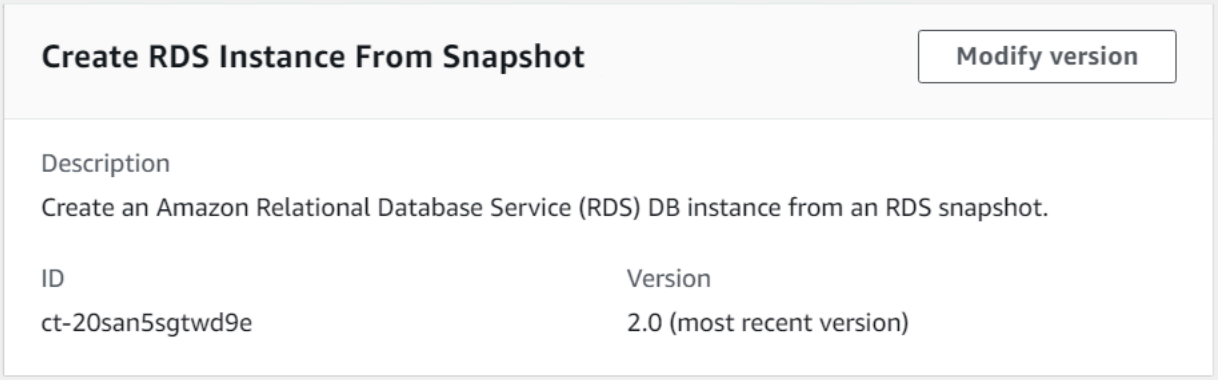
Change type ID	ct-20san5sgtwd9e
Current version	2.0
Expected execution duration	720 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create DB from snapshot

Creating an RDS Stack From a Snapshot with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an RDS Stack From a Snapshot with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Backup is enabled on RDS instances with a default backup retention period of 7 days (`RDSBackups` and `RDSBackupRetentionPeriod`).

RDS stacks do not require a grant access RFC to access them, and are instead accessed using the username and password you provided when you created the stack.

> **Note**
>
> You can add up to 50 tags.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
create-rfc --change-type-id "ct-20san5sgtwd9e" --change-type-version "2.0" --title
 "RDS-Create-FrmSS-QC-RFC" --execution-parameters "{\"Description\":\"My RDS DB
 From SS\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\":\"stm-siqajx00000000000\",
 \"Name\":\"RDS-Create-FrmSS-QC\", \"TimeoutInMinutes\":60, \"Parameters\":
{ \"DBSnapshotIdentifier\":\"DB_ID\",  \"DBSubnetIds\":[\"SUBNET_ID\",\"SUBNET_ID\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type (ct-20san5sgtwd9e) to a JSON file named CreateRdsFSParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-20san5sgtwd9e" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateRdsFSParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   Oracle example:

   ```
   {
   "Description":          "Create-RDS-DB",
   "VpcId":                "VPC_ID",
   "StackTemplateId":      "stm-siqajx00000000000",
   "Name":                 "My-RDS-DB",
   "TimeoutInMinutes":     60,
   "Parameters":   {
       "DBSnapshotIdentifier":      rds:memzlbcde0abcd-2018-05-21-11-58,
       "DBInstanceIdentifer":      "MyRds",
       "DBSubnetIds":             ["PRIVATE_AZ1_SUBNET", "PRIVATE_AZ2_SUBNET"]
       }
   ```

```
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateRdsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRdsRfc.json
```

4. Modify and save the CreateRdsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-20san5sgtwd9e",
"Title":                "RDS-Create-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRdsRfc.json --execution-
parameters file://CreateRdsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the RDS, look in the execution output: Use the "stack_id" to view the RDS in the Cloud Formation Console. To create a Delete Stack or Update RDS RFC, use the first part of the DatabaseEndpoint (the DB instance ID) to create a Reboot RDS RFC, use the entire DatabaseEndpoint to programmatically access the RDS DB.

7. You are now able to manage the database via a database management tool such as SQL server management studio. You do not have to request access from AMS.

Tips

> **Note**
>
> You can't restore a DB instance from a DB snapshot that is both shared and encrypted. Instead, you can make a copy of the DB snapshot and restore the DB instance from the copy. To copy the shared snapshot, use the RDS Snapshot | Copy CT.

This CT is now at version 2, with new parameters, **DBDomain**, **DBDomainIAMRoleName**, and **DBEngine**. Additionally, The v1 of the CT would initiate the stack launch and return the stackId immediately, but not wait for the stack to finish launching. The v2 of the CT waits for the stack to finish launching before marking the RFC as successful or failed.

You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

To learn more about Amazon RDS, see Amazon Relational Database Service Documentation.

To create a non-Aurora RDS stack, see RDS database stack | Create.

To create an Aurora RDS stack, see RDS database stack | Create (For Aurora).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-20san5sgtwd9e.

Example: Required Parameters

```
{
  "Description": "Create RDS Instance Stack from snapshot:
 rds:sr341e8q8bofsd-2017-04-19-22-13.",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-siqajx20000000000",
  "Name": "Stack Name",
  "TimeoutInMinutes": 360,
  "Parameters": {
    "DBSnapshotIdentifier": "rds:lr1jnp6dfxk6mha-2017-04-13-22-14",
    "DBSubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
  }
}
```

Example: All Parameters

```
{
  "Description": "Create RDS Instance Stack from snapshot:
 rds:sr341e8q8bofsd-2017-04-19-22-13.",
  "VpcId": "vpc-12345678",
  "StackTemplateId": "stm-siqajx20000000000",
  "Name": "Stack Name",
  "Tags": [
```

```
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 360,
  "Parameters": {
    "DBInstanceClass": "db.m3.medium",
    "DBInstanceIdentifier": "my-rds-id",
    "DBSnapshotIdentifier": "customizedSnapshotId",
    "DBSubnetIds": ["subnet-a0b1c2d3", "subnet-a0b2c9d8"],
    "DBDomain": "d-1234567890",
    "DBDomainIAMRoleName": "customer_amazon_rds_directory_service_access_role",
    "DBEngine": "sqlserver-se"
  }
}
```

RDS Snapshot | Copy

Create a KMS key encrypted copy of an Amazon Relational Database Service (Amazon RDS) DB snapshot. If you are copying a snapshot shared from another AWS account, it must be located in the same region in which the document is executed.

Full classification: Deployment | Advanced stack components | RDS snapshot | Copy

Change Type Details

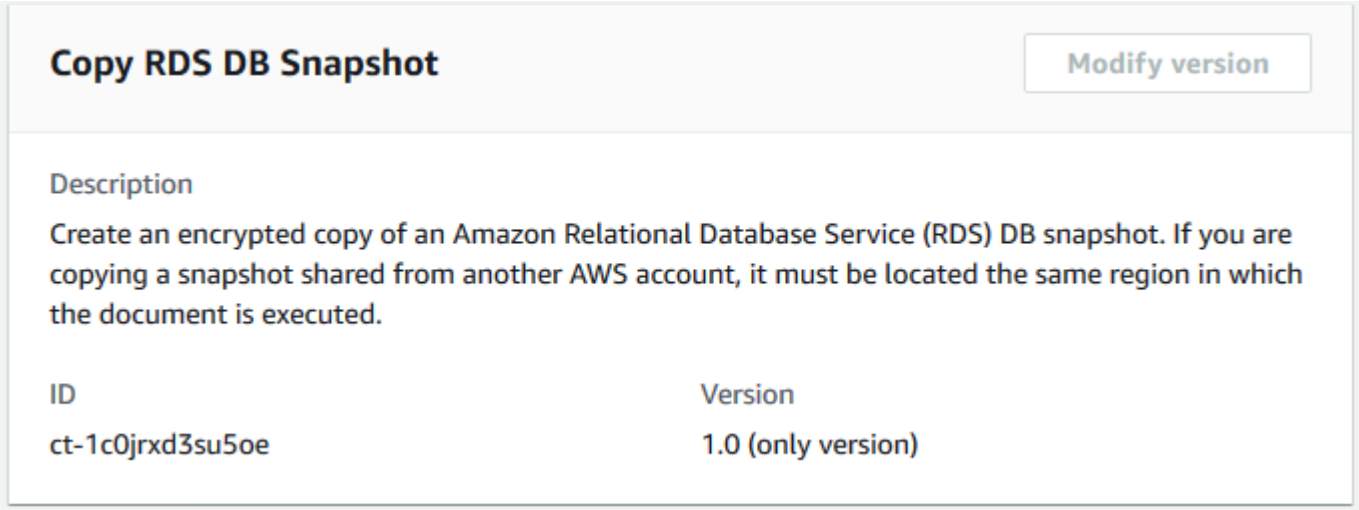
Change type ID	ct-1c0jrxd3su5oe
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Copy RDS snapshot

Copying an RDS DB Snapshot with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Copying an RDS DB Snapshot with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1c0jrxd3su5oe" --change-type-version
 "1.0" --title "Copy RDS DB snapshot" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-CopyDbSnapshot\",\"Region\":\"us-east-1\",\"Parameters\":
{\"SourceDbSnapshotArn\":[\"arn:aws:rds:us-east-2:012345678901:snapshot:my-db-
snapshot\"],\"TargetDbSnapshotIdentifier\":[\"new-db-snapshot\"],\"KmsKeyId\":
[\"arn:aws:kms:us-east-1:012345678901:key/01234567-abcd-abcd-abcd-0123456789ab\"],
\"SourceRegion\":[\"us-east-2\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CopyRdsDbSnapshotParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1c0jrxd3su5oe"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CopyRdsDbSnapshotParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CopyDbSnapshot",
     "Region": "us-east-1",
     "Parameters": {
       "SourceDbSnapshotArn": [
         "arn:aws:rds:us-east-2:012345678901:snapshot:my-db-snapshot"
       ],
       "TargetDbSnapshotIdentifier": [
         "new-db-snapshot"
       ],
       "KmsKeyId": [
         "arn:aws:kms:us-east-1:012345678901:key/01234567-abcd-abcd-abcd-0123456789ab"
       ],
       "SourceRegion": [
         "us-east-2"
       ]
   ```

```
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it CopyRdsDbSnapshotRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CopyRdsDbSnapshotRfc.json
```

4. Modify and save the CopyRdsDbSnapshotRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1c0jrxd3su5oe",
  "Title": "Copy RDS DB Snapshot"
}
```

5. Create the RFC, specifying the execution parameters file and the CopyRdsDbSnapshotRfc file:

```
aws amscm create-rfc --cli-input-json file://CopyRdsDbSnapshotRfc.json --execution-
parameters file://CopyRdsDbSnapshotParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> For more information on RDS snapshots, see Copying a DB snapshot.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1c0jrxd3su5oe.

Example: Required Parameters

```
{
```

```
  "DocumentName": "AWSManagedServices-CopyDbSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SourceDbSnapshotArn": ["arn:aws:rds:us-east-1:012345678901:snapshot:test-
snapshot"],
    "TargetDbSnapshotIdentifier": ["new-snapshot"],
    "KmsKeyId": ["01234567-abcd-abcd-abcd-0123456789ab"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CopyDbSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SourceDbSnapshotArn": ["arn:aws:rds:us-east-1:012345678901:snapshot:test-
snapshot"],
    "TargetDbSnapshotIdentifier": ["new-snapshot"],
    "KmsKeyId": ["01234567-abcd-abcd-abcd-0123456789ab"],
    "SourceRegion": ["us-east-1"],
    "OptionGroupName": ["my-option-group-name"]
  }
}
```

RDS Snapshot | Copy (For Aurora)

Create a copy of an Amazon Relational Database Service (Amazon RDS) DB Cluster snapshot. If you are copying a snapshot shared from another AWS account, it must be located in the same AWS Region as the specified DocumentName.

Full classification: Deployment | Advanced stack components | RDS snapshot | Copy (for Aurora)

Change Type Details

Change type ID	ct-19fdy7np55xiu
Current version	1.0
Expected execution duration	60 minutes

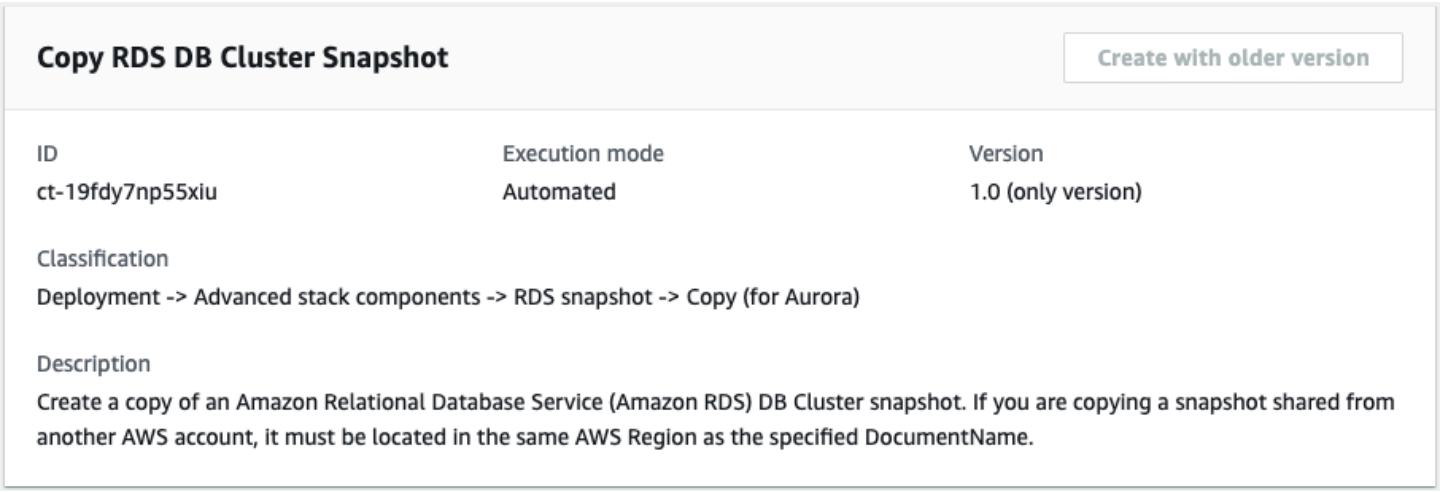
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Copy RDS Aurora snapshot

Copying an RDS Aurora snapshot with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Copying an RDS Aurora snapshot with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc  --change-type-id="ct-19fdy7np55xiu" --change-type-version="1.0"
 --title="Copy Amazon RDS Aurora snapshot" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-CopyDBClusterSnapshot\",\"Region\":\"us-east-1\",\"Parameters
\":{\"SourceDBClusterSnapshotARN\":[\"arn:aws:rds:us-east-1:111122223333:cluster-
snapshot:myauroradbcluster-snapshot\"],\"TargetDBClusterSnapshotIdentifier
\":[\"myauroradbcluster-target-snapshot\"],\"KmsKeyId\":[\"arn:aws:kms:us-
east-1:111122223333:key/01234567-abcd-abcd-abcd-0123456789ab\"],\"SourceRegion\":[\"us-
east-1\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CopyRdsAuroraSnapshotParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-19fdy7np55xiu"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CopyRdsAuroraSnapshotParams.json
   ```

2. Modify and save the execution parameters in the CopyRdsAuroraSnapshotParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName":"AWSManagedServices-CopyDBClusterSnapshot",
     "Region":"us-east-1",
     "Parameters": {
       "SourceDBClusterSnapshotARN":"arn:aws:rds:us-east-1:111122223333:cluster-
   snapshot:myauroradbcluster-snapshot",
       "TargetDBClusterSnapshotIdentifier":"myauroradbcluster-target-snapshot",
   ```

```
    "KmsKeyId": "arn:aws:kms:us-east-1:111122223333:key/01234567-abcd-abcd-
abcd-0123456789ab",
    "SourceRegion":"us-east-1"
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it CopyRdsAuroraSnapshotRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CopyRDSAuroraSnapshotRfc.json
```

4. Modify and save the CopyRdsAuroraSnapshotRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-19fdy7np55xiu",
  "Title": "Copy Aurora snapshot"
}
```

5. Copy the RFC, specifying the input CopyDBClusterSnapshotRfc.json file and the execution parameters file CopyDBClusterSnapshotParams.json:

```
aws amscm create-rfc --cli-input-json file://CopyRdsAuroraSnapshotRfc.json --
execution-parameters file://CopyRdsAuroraSnapshotParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For an overview of backing up and restoring Aurora clusters, see Backing up and restoring an Amazon Aurora DB cluster.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-19fdy7np55xiu.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CopyDBClusterSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SourceDBClusterSnapshotARN": ["arn:aws:rds:us-east-1:111122223333:cluster-
snapshot:source-snapshot"],
    "TargetDBClusterSnapshotIdentifier": ["target-snapshot"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CopyDBClusterSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SourceDBClusterSnapshotARN": ["arn:aws:rds:us-east-1:111122223333:cluster-
snapshot:source-snapshot"],
    "TargetDBClusterSnapshotIdentifier": ["target-snapshot"],
    "KmsKeyId": ["01234567-abcd-abcd-abcd-0123456789ab"],
    "SourceRegion": ["us-east-1"]
  }
}
```

RDS Snapshot | Create

Create a snapshot of an Amazon Relational Database Service (RDS) database (DB) instance. The snapshot will be encrypted with the same KMS key as the DB instance, or unencrypted if DB instance is unencrypted.

Full classification: Deployment | Advanced stack components | RDS snapshot | Create

Change Type Details

Change type ID	ct-393q3yaq9ewlm
Current version	1.0
Expected execution duration	60 minutes

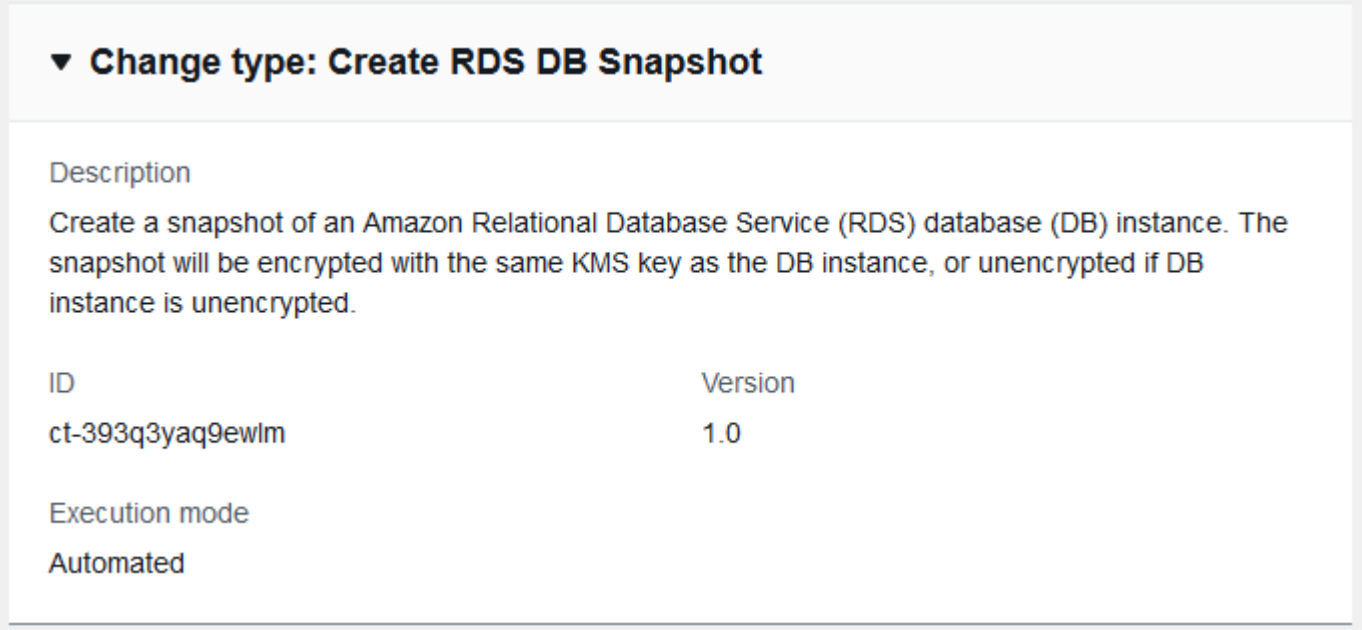
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create RDS snapshot

Creating an RDS DB Snapshot with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an RDS DB Snapshot with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-393q3yaq9ewlm" --change-type-version
 "1.0" --title "Create DB snapshot" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-CreateDBSnapshot\",\"Region\":\"us-east-1\",\"Parameters
\":{\"DBInstanceIdentifier\":[\"rds-db-instance\"],\"DBSnapshotName\":[\"my-db-
snapshot\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateRdsDbSnapshotParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-393q3yaq9ewlm"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRdsDbSnapshotParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateDBSnapshot",
     "Region": "us-east-1",
     "Parameters": {
       "DBInstanceIdentifier": [
         "rds-db-instance"
   ```

```
    ],
    "DBSnapshotName": [
      "my-db-snapshot"
    ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateRdsDbSnapshotRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRdsDbSnapshotRfc.json
```

4. Modify and save the CreateRdsDbSnapshotRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-393q3yaq9ewlm",
  "Title": "Create DB snapshot"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdsDbSnapshotRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRdsDbSnapshotRfc.json --
execution-parameters file://CreateRdsDbSnapshotParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-393q3yaq9ewlm.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateDBSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "DBInstanceIdentifier": ["dbinstance"],
    "DBSnapshotName": ["test-snapshot"]
  }
}
```

RDS Snapshot | Create (For Cluster)

Create a snapshot of Amazon Aurora or Multi-AZ DB (Amazon RDS) cluster in available state. The snapshot will be encrypted with the same KMS key as the DB cluster, or unencrypted if the DB cluster is unencrypted.

Full classification: Deployment | Advanced stack components | RDS snapshot | Create (for cluster)

Change Type Details

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an RDS DB cluster snapshot with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2zqwr34epwzx1" --change-type-version
 "1.0" --title "Create a snapshot of a RDS DB Cluster" --execution-parameters
 "{\"DocumentName\": \"AWSManagedServices-CreateDBClusterSnapshot\",\"Region\":
 \"us-east-1\",\"Parameters\": {\"DBClusterIdentifier\": [\"testdbcluster\"],
\"DBClusterSnapshotIdentifier\": [\"testdbcluster-snapshot\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateRdsDbClusterSnapshotParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2zqwr34epwzx1"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRdsDbClusterSnapshotParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
  "DocumentName": "AWSManagedServices-CreateDBClusterSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "DBClusterIdentifier" : [ "testdbcluster" ],
    "DBClusterSnapshotIdentifier" : [ "testdbcluster-snapshot" ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it CreateRdsDbClusterSnapshotRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRdsDbClusterSnapshotRfc.json
```

4. Modify and save the CreateRdsDbClusterSnapshotRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-2zqwr34epwzx1",
  "Title": "Create DB cluster snapshot"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdsDbClusterSnapshotRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRdsDbClusterSnapshotRfc.json --
execution-parameters file://CreateRdsDbClusterSnapshotParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2zqwr34epwzx1.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateDBClusterSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "DBClusterIdentifier": ["dbcluster"],
    "DBClusterSnapshotIdentifier": ["dbclustersnapshotname"]
  }
}
```

Redshift | Create (Cluster from Snapshot)

Create a Redshift cluster with the same configration as the source snapshot.

Full classification: Deployment | Advanced stack components | Redshift | Create (cluster from snapshot)

Change Type Details

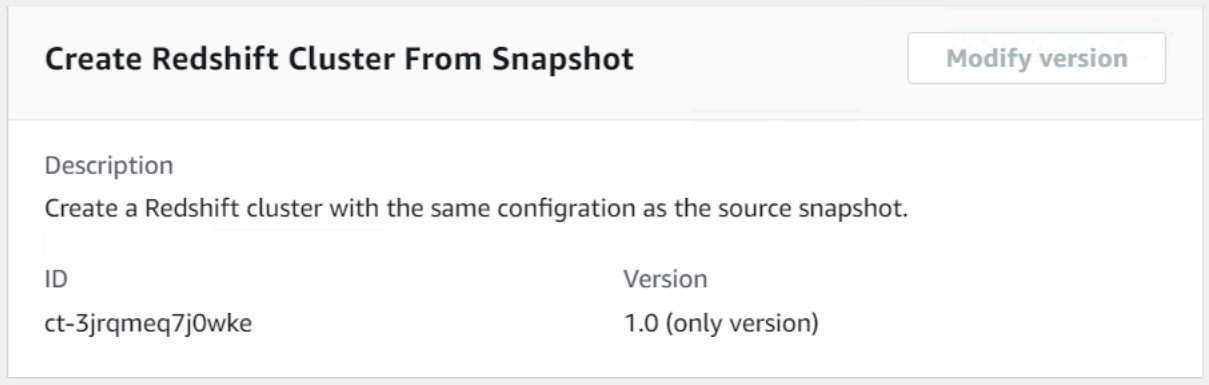
Change type ID	ct-3jrqmeq7j0wke
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create cluster from snapshot

Creating a Redshift Cluster from a snapshot with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Redshift Cluster from a snapshot with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
amscm create-rfc --change-type-id "ct-3jrqmeq7j0wke” --change-type-version
 "1.0" --title "Create redshift cluster from snapshot"  --execution-parameters
 "{\"Description\": \"DESCRIPTION\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\":
 \"stm-szovkq00000000000\", \"Name\":\"loremipsum\",\"TimeoutInMinutes\": 60,
 \"Parameters\": {\"AllowVersionUpgrade\": \"false\",\"DatabasePortNumber\": 5439,
\"AutomatedSnapshotRetentionPeriod\": 7,\"PreferredMaintenanceWindow\": \"\",
\"ClusterSnapshot\": \"mysnapshot\",\"ClusterSubnetGroup\": \"mysubnetgroup\"}
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named CreateRdshftClusterFromSnapshotParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3jrqmeq7j0wke"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRdshftClusterFromSnapshotParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   Oracle example:

   ```
   {
         "Description" : "Create a Redshift cluster from a snapshot",
         "VpcId" : "vpc-12345678901234567",
         "Name" : "TestStack",
         "StackTemplateId" : "stm-szovkq00000000000",
         "TimeoutInMinutes" : 60,
         "Parameters" : {
           "ClusterSnapshot" : "mysnapshot",
           "ClusterSubnetGroup" : "mysubnetgroup"
         }
       }
   ```

3. Output the JSON template to a file in your current folder; this example names it CreateRdshftClusterFromSnapshotRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton >
 CreateRdshftClusterFromSnapshotRfc.json
```

4. Modify and save the CreateRdshftClusterFromSnapshotRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3jrqmeq7j0wke",
"Title":                "Redshift-Cluster-Create-From-Snapshot-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdshftClusterFromSnapshotRfc file:

```
aws amscm create-rfc --cli-input-json file://
CreateRdshftClusterFromSnapshotRfc.json --execution-parameters file://
CreateRdshftClusterFromSnapshotParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

To learn more about AWS Redshift snapshots, see Amazon Redshift snapshots.

To create an AWS Redshift cluster subnet group, see Create cluster subnet group.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3jrqmeq7j0wke.

Example: Required Parameters

```
{
  "Description" : "Create a Redshift cluster from a snapshot",
  "VpcId" : "vpc-12345678901234567",
  "Name": "Teststack",
  "StackTemplateId" : "stm-szovkq00000000000",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
    "ClusterSnapshot" : "mysnapshot",
    "ClusterSubnetGroup": "mysubnetgroup",
    "NodeType": "ds2.xlarge"
  }
}
```

Example: All Parameters

```
{
  "Description" : "Create a Redshift cluster from a snapshot",
  "VpcId" : "vpc-12345678901234567",
  "Name": "Teststack",
  "Tags" : [
    {
      "Key" : "foo",
      "Value" : "bar"
    }
  ],
  "StackTemplateId" : "stm-szovkq00000000000",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
    "ClusterIdentifier" : "test1223",
    "ClusterSnapshot" : "mysnapshot",
    "SnapshotAccountOwner" : "123456789101",
    "SnapshotClusterIdentifier" : "mycluster",
    "NodeType": "ds2.xlarge",
    "IamRoles" : "arn:aws:iam::123456789012:role/customer_redshift_role",
    "ParameterGroupName" : "myparamgroup",
    "ClusterSubnetGroup" : "mysubnetgroup",
    "AllowVersionUpgrade" : "false",
    "SecurityGroups" : ["sg-12345678"],
    "DatabasePortNumber" : 5439,
    "AutomatedSnapshotRetentionPeriod" : 7,
    "PreferredMaintenanceWindow" : "sat:00:00-sat:01:00"
```

```
  }
}
```

Redshift | Create (Cluster Subnet Group)

Use to create a Redshift cluster subnet group.

Full classification: Deployment | Advanced stack components | Redshift | Create (cluster subnet group)

Change Type Details

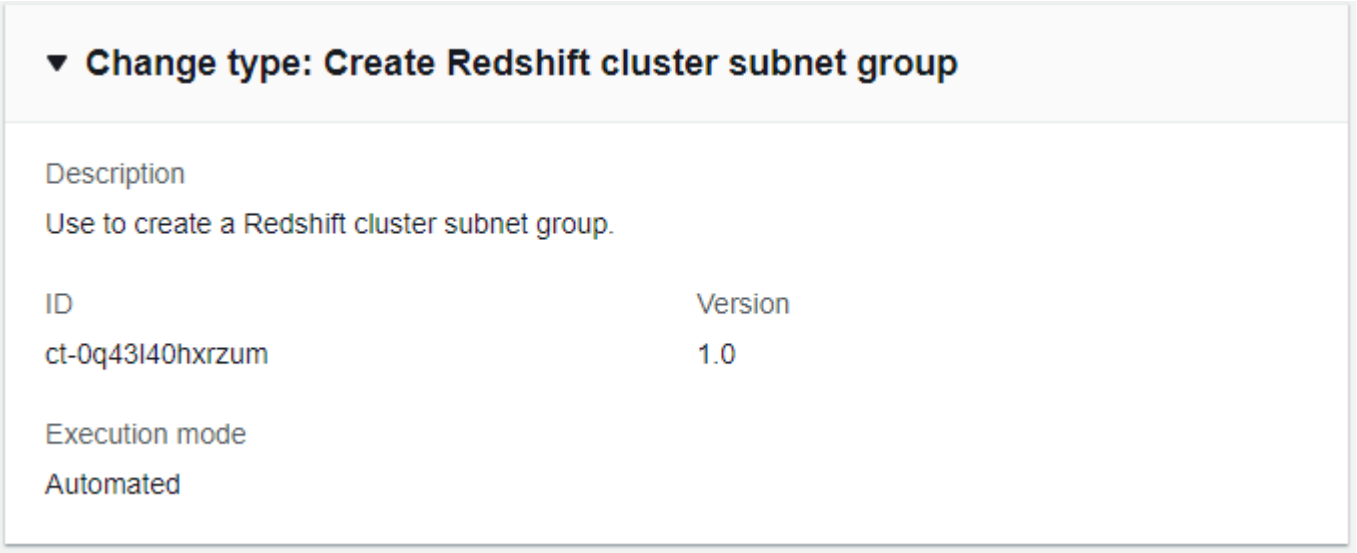
Change type ID	ct-0q43l40hxrzum
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create cluster subnet group

Creating a Redshift Cluster Subnet Group with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Redshift Cluster Subnet Group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-0q43l40hxrzum" --change-type-version "1.0" --title "RedshiftClusterSubnetGroup"
 --execution-parameters "{\"Description\": \"DESCRIPTION\", \"VpcId\":\"VPC_ID\",
 \"StackTemplateId\": \"stm-5rsvv3l4760usboci\", \"Name\":\"loremipsum\",
\"TimeoutInMinutes\": 60, \"Parameters\": { \"SubnetGroupDescription\":
\"mysubnetgroup\", \"SubnetIds\": [ \"SUBNET_ID\", \"SUBNET_ID\" ] } }"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type (ct-0q43l40hxrzum) to a JSON file named CreateRedshftClusterSGParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0q43l40hxrzum"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRedshftClusterSGParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "Create a Redshift cluster subnet group",
     "VpcId": "VPC_ID",
     "StackTemplateId": "stm-5rsvv3l4760usboci",
     "Name": "Stack_Name",
     "TimeoutInMinutes": 60,
     "Parameters":  {
      "SubnetGroupDescription": "My Redshift Subnet Group",
      "SubnetIds": [ "SUBNET_ID", "SUBNET_ID" ]
    }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it CreateRedshftClusterSGRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateRedshftClusterSGRfc.json
   ```

4. Modify and save the CreateRedshftClusterSGRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0q43l40hxrzum",
"Title":                "Redshift-Cluster-Create-SG-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRedshftClusterSGRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRedshftClusterSGRfc.json --
execution-parameters file://CreateRedshftClusterSGParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

To learn more about AWS Redshift, see Amazon Redshift Cluster Subnet Groups.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0q43l40hxrzum.

Example: Required Parameters

```
{
  "Description": "Create a Redshift cluster subnet group",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-5rsvv3l4760usboci",
  "Name": "Stack Name",
  "TimeoutInMinutes": 60,
```

```
  "Parameters": {
    "SubnetGroupDescription": "Test subnet group description",
    "SubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
  }
}
```

Example: All Parameters

```
{
  "Description": "Create a Redshift cluster subnet group",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-5rsvv3l4760usboci",
  "Name": "Stack Name",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "SubnetGroupDescription": "Test subnet group description",
    "SubnetIds": ["subnet-1234567890abcdef0", "subnet-1234567890abcdef1"]
  }
}
```

Redshift | Create (Cluster)

Create an Amazon Redshift cluster that is a fully managed data warehouse that consists of a set of compute nodes.

Full classification: Deployment | Advanced stack components | Redshift | Create (cluster)

Change Type Details

Change type ID	ct-1malj7snzxrkr
Current version	1.0

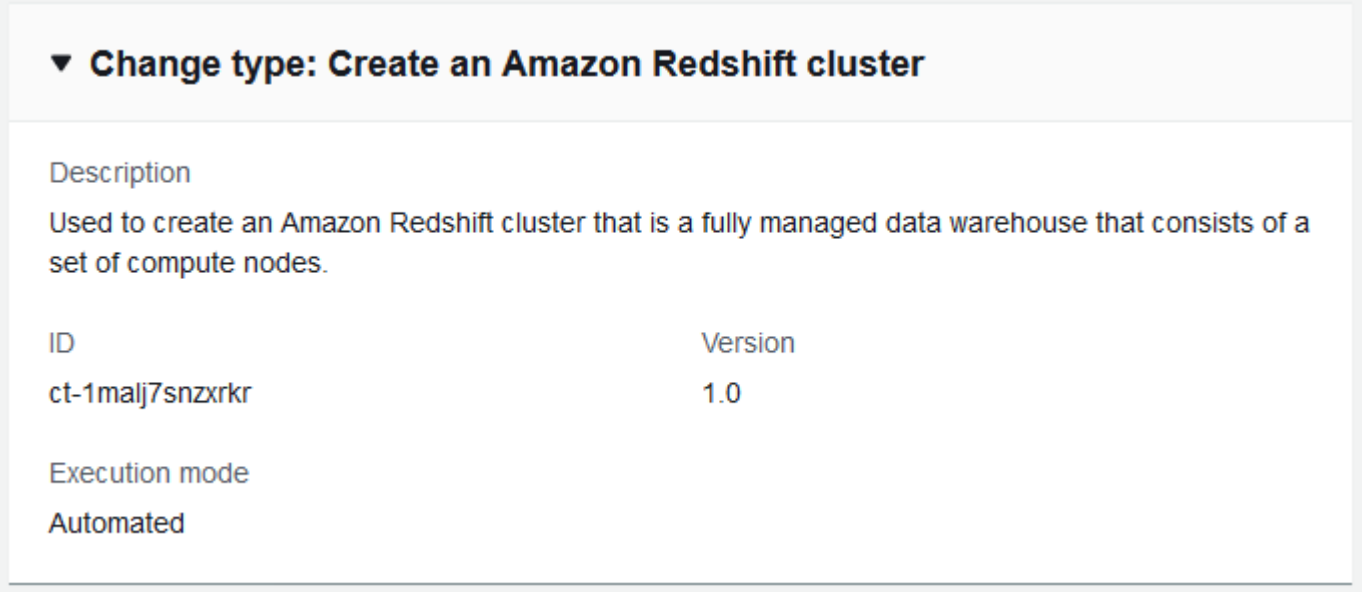
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create cluster

Creating a Redshift Cluster with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Redshift Cluster with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-1malj7snzxrkr" --change-type-version "1.0" --title "RedshiftClusterRfc"
 --execution-parameters "{\"Description\":\"DESCRIPTION\", \"VpcId\":
\"VPC_ID\", \"StackTemplateId\": \"stm-n8kpln6rtg1eiq83b\", \"Name\":
\"My_Redshift_Cluster\", \"TimeoutInMinutes\":60, \"Parameters\": {\"ClusterSubnetGroup
\":\"CLUSTER_SUBNET_GROUP\",\"DatabaseName\":\"DB_NAME\",\"MasterUsername\":\"USER\",
\"MasterUserPassword\":\"PASSWORD\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type (ct-1malj7snzxrkr) to a JSON file named CreateRdshftClusterParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1malj7snzxrkr"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRdshftClusterParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   Oracle example:

   ```
   {
     "Description": "Create a Redshift cluster",
     "VpcId": "VPC_ID",
     "StackTemplateId": "stm-n8kpln6rtg1eiq83b",
     "Name": "Stack_Name",
     "TimeoutInMinutes": 60,
     "Parameters": {
       "ClusterSubnetGroup": "mysubnetgroup",
       "DatabaseName": "myfirstdb",
       "MasterUsername": "myusername",
       "MasterUserPassword": "Mypassword1234"
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it CreateRdshftClusterRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRdshftClusterRfc.json
```

4. Modify and save the CreateRdshftClusterRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1malj7snzxrkr",
"Title":                "Redshift-Cluster-Create-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the CreateRdshftClusterRfc file:

```
aws amscm create-rfc --cli-input-json file://CreateRdshftClusterRfc.json --
execution-parameters file://CreateRdshftClusterParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

To learn more about AWS Redshift, see Amazon Redshift.

To create an AWS Redshift cluster subnet group, see Create cluster subnet group.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1malj7snzxrkr.

Example: Required Parameters

```
{
  "Description": "Create a Redshift cluster",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-n8kpln6rtg1eiq83b",
  "Name": "Stack Name",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ClusterSubnetGroup": "mysubnetgroup",
    "DatabaseName": "myfirstdb",
    "MasterUsername": "loremipsum",
    "MasterUserPassword": "Mypassword1234"
  }
}
```

Example: All Parameters

```
{
  "Description": "Create a Redshift cluster",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-n8kpln6rtg1eiq83b",
  "Name": "Stack Name",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ClusterIdentifier": "mycluster",
    "DatabaseName": "myfirstdb",
    "DatabasePortNumber": 14231,
    "MasterUsername": "loremipsum",
    "MasterUserPassword": "Mypassword1234",
    "NodeType": "ds2.xlarge",
    "ClusterType": "multi-node",
    "NumberOfNodes": "5",
    "ParameterGroupName": "myparamgroupname",
    "ClusterSubnetGroup": "mysubnetgroup",
    "SecurityGroups": ["sg-1a2b3c4d","sg-1a2b3c4d5e6f7g8h9"],
    "AllowVersionUpgrade": "true",
    "AutomatedSnapshotRetentionPeriod": 30,
    "PreferredMaintenanceWindow": "sat:00:00-sat:01:00",
    "IamRoles": "arn:aws:iam::123456789012:role/customer_redshift_role",
    "KmsKeyId": "arn:aws:kms:us-
east-1:123456789012:key/503f4b06-3507-452a-9812-7772ddc72af7"
  }
```

```
}
```

S3 Storage | Create

Create an Amazon S3 bucket for cloud storage.

Full classification: Deployment | Advanced stack components | S3 storage | Create

Change Type Details

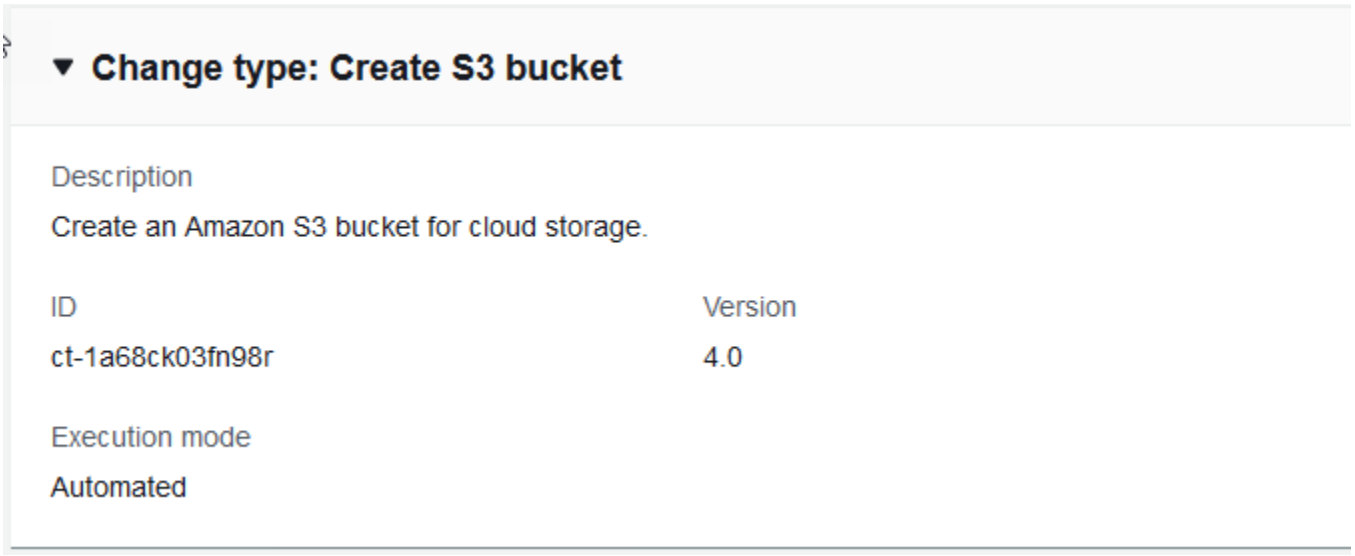
Change type ID	ct-1a68ck03fn98r
Current version	4.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create S3 storage

Creating an S3 Bucket with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an S3 Bucket with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Example with only required parameters, version 4.0 (AccessControl parameter is replaced with specific access parameters):

```
aws amscm create-rfc --title "my-s3-bucket" --change-type-id "ct-1a68ck03fn98r" --
change-type-version "4.0" --execution-parameters "{\"Description\":\"S3 bucket for
 application A.\",\"VpcId\":\"VPC_ID\",\"StackTemplateId\":\"stm-s2b72beb200000000\",
\"Name\":\"my-s3-bucket\",\"TimeoutInMinutes\":60,\"Parameters\":{\"BucketName\":\"my-
s3-bucket\"}}"
```

Example with version 3.0 parameters including AccessControl parameter:

```
aws --profile saml amscm create-rfc --change-type-id "ct-1a68ck03fn98r" --
change-type-version "2.0" --title "TITLE" --execution-parameters "{\"Description
\":\"YOUR_S3_DESCRIPTION\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\":\"stm-
s2b72beb000000000\", \"Name\":\"AMS-STACK-NAME\", \"TimeoutInMinutes\":60,\"Parameters
\": {\"AccessControl\":\"PublicRead\", \"BucketName\":\"UNIQUE-S3-BUCKET-NAME\"}}"
```

Example with all parameters, version 4.0 (AccessControl parameter is replaced with specific access parameters):

```
aws amscm create-rfc --title "my-s3-bucket" --change-type-id "ct-1a68ck03fn98r"
 --change-type-version "4.0" --execution-parameters "{\"Description\":\"S3
 bucket for application A\",\"VpcId\":\"VPC_ID\",\"StackTemplateId\":\"stm-
s2b72beb200000000\",\"Name\":\"my-s3-bucket\",\"TimeoutInMinutes\":60,\"Parameters
\":{\"BucketName\":\"my-s3-bucket\",\"ServerSideEncryption\":\"KmsManagedKeys\",
\"KMSKeyId\":\"arn:aws:kms:us-east-1:123456789012:key/fc69dcab-d3c7-4d36-
b204-9da582ae760b\",\"Versioning\":\"Enabled\",\"IAMPrincipalsRequiringReadObjectAccess
\":[\"arn:aws:iam::123456789012:role/roleA\"],\"IAMPrincipalsRequiringWriteObjectAccess
\":[\"arn:aws:iam::123456789012:role/roleA\"],\"ServicesRequiringReadObjectAccess\":
[\"logs.us-east-1.amazonaws.com\"],\"ServicesRequiringWriteObjectAccess\":[\"logs.us-
east-1.amazonaws.com\"],\"EnforceSecureTransport\":true,\"AccessAllowedIpRanges\":
[\"1.2.3.0/24\",\"2.3.4.0/24\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateBucketParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1a68ck03fn98r" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateBucketParams.json
   ```

2. Modify and save the CreateBucketParams file. Note that you do not need to use your account ID in the `BucketName`, but it can make finding the bucket easier (remember that bucket names must be unique in the account across all regions and cannot have uppercase letters). If using this to create a tier-and-tie WordPress site, you may want to indicate that purpose when setting the `BucketName`.

   Example with version 3.0 parameters including `AccessControl`:

   ```
   {
   "Description":      "S3-Bucket-Create",
   "VpcId":            "VPC-ID",
   ```

```
"StackTemplateId":  "stm-s2b72beb000000000",
"Name":             "My-S3-Bucket",
"TimeoutInMinutes": 60,
"Parameters":   {
    "AccessControl":    "Private",
    "BucketName":       "ACCOUNT_ID.BUCKET_NAME"
    }
}
```

Example with version 4.0 new access parameters (example grants READ access to the objects in the bucket for an IAM user or a role):

```
{
    "Description": "S3-Bucket-Create",
    "VpcId": "VPC-ID",
    "StackTemplateId": "stm-s2b72beb200000000",
    "Name": "My-S3-Bucket",
    "TimeoutInMinutes": 60,
    "Parameters": {
      "BucketName": "ACCOUNT_ID.BUCKET_NAME",
      "IAMPrincipalsWithReadObjectAccess": [
        "arn:aws:iam::123456789123:role/roleA",
        "arn:aws:iam::987654321987:role/roleB"
      ]
    }
}
```

For the resulting policy, see Grants READ access for an IAM User or a Role.

Example with version 4.0 new access parameters (example grants WRITE access to the objects in the bucket for an IAM user or a role):

```
{
    "Description": "S3-Bucket-Create",
    "VpcId": "VPC-ID",
    "StackTemplateId": "stm-s2b72beb200000000",
    "Name": "My-S3-Bucket",
    "TimeoutInMinutes": 60,
    "Parameters": {
      "BucketName": "ACCOUNT_ID.BUCKET_NAME",
      "IAMPrincipalsRequiringWriteObjectAccess": [
        "arn:aws:iam::123456789123:role/roleA",
```

```
        "arn:aws:iam::987654321987:role/roleB"
      ]
    }
}
```

For the resulting policy, see Grants WRITE access for an IAM User or a Role.

Example with version 4.0 new access parameters (example grants READ access to the objects in the bucket for an AWS service):

```
{
    "Description": "S3-Bucket-Create",
    "VpcId": "VPC-ID",
    "StackTemplateId": "stm-s2b72beb200000000",
    "Name": "My-S3-Bucket",
    "TimeoutInMinutes": 60,
    "Parameters": {
      "BucketName": "ACCOUNT_ID.BUCKET_NAME",
      "ServicesRequiringWriteObjectAccess": [
        "rds.amazonaws.com",
        "logs.ap-southeast-2.amazonaws.com",
        "ec2.amazonaws.com"
      ]
    }
}
```

For the resulting policy, see Grants READ access for an AWS Service.

Example with version 4.0 new access parameters (example grants WRITE access to the objects in the bucket for an AWS service):

```
{
    "Description": "S3-Bucket-Create",
    "VpcId": "VPC-ID",
    "StackTemplateId": "stm-s2b72beb200000000",
    "Name": "My-S3-Bucket",
    "TimeoutInMinutes": 60,
    "Parameters": {
      "BucketName": "ACCOUNT_ID.BUCKET_NAME",
      "ServicesRequiringWriteObjectAccess": [
        "rds.amazonaws.com",
        "logs.ap-southeast-2.amazonaws.com",
```

```
        "ec2.amazonaws.com"
      ]
    }
}
```

For the resulting policy, see Grants WRITE access for an AWS Service.

Example with version 4.0, (enforce secure transport):

```
{
    "Description": "S3-Bucket-Create",
    "VpcId": "VPC-ID",
    "StackTemplateId": "stm-s2b72beb200000000",
    "Name": "My-S3-Bucket",
    "TimeoutInMinutes": 60,
    "Parameters": {
      "BucketName": "ACCOUNT_ID.BUCKET_NAME",
      "EnforceSecureTransport": "true"
    }
}
```

For the resulting policy, see Uses EnforceSecureTransport.

Example with version 4.0, limits access to the bucket from a set of IP ranges use <>:

```
  {
    "Description": "S3-Bucket-Create",
    "VpcId": "VPC-ID",
    "StackTemplateId": "stm-s2b72beb200000000",
    "Name": "My-S3-Bucket",
    "TimeoutInMinutes": 60,
    "Parameters": {
      "BucketName": "ACCOUNT_ID.BUCKET_NAME",
      "AccessAllowedIpRanges": [
        "1.2.3.0/24",
        "2.3.4.0/24"
      ]
    }
  }
```

For the resulting policy, see Limits Access to IP Range.

3. Output the RFC template JSON file to a file named CreateBucketRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateBucketRfc.json
```

4. Modify and save the CreateBucketRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "4.0",
"ChangeTypeId":         "ct-1a68ck03fn98r",
"Title":                "S3-Bucket-Create-RFC",
"RequestedStartTime":   "2016-12-05T14:20:00Z",
"RequestedEndTime":     "2016-12-05T16:20:00Z"
}
```

5. Create the RFC, specifying the CreateBucketRfc file and the CreateBucketParams file:

```
aws amscm create-rfc --cli-input-json file://CreateBucketRfc.json  --execution-
parameters file://CreateBucketParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the S3 bucket or load objects to it, look in the execution output: Use the `stack_id` to view the bucket in the Cloud Formation Console, use the S3BucketName to view the bucket in the S3 Console.

> **Note**
>
> When uploading objects from a non-owner account, it is mandatory to specify the `bucket-owner-full-control` ACL, that grants the bucket owner account full control over all the objects in the bucket. Example:
>
> ```
> aws s3api put-object --acl bucket-owner-full-control --
> bucket ACCOUNT_ID.BUCKET_NAME --key data.txt --body /tmp/data.txt
> ```

Tips

> **Note**
>
> This walkthrough describes, and provides example commands for, creating an Amazon S3 storage bucket using version 4.0 of the change type (ct-1a68ck03fn98r). This version does not allow you to create a public S3 bucket, only private is allowed. To create a public S3 storage bucket, use a previous version of the change type, and specify **PublicRead** for the **AccessControl** parameter.
> Also, this walkthrough does not grant the permissions necessary for deleting versioned objects.

To learn more about Amazon S3, see Amazon Simple Storage Service Documentation.

S3 Storage Bucket Create Resulting Policies

Depending on how you created your Amazon S3 storage bucket, you created policies. These example policies match various Amazon S3 create scenarios provided in Creating an S3 Bucket with the CLI.

Grants READ access for an IAM User or a Role

Resulting example policy grants READ access to the objects in the bucket for an IAM user or a role:

```
{
          "Sid": "AllowBucketReadActionsForArns",
          "Effect": "Allow",
          "Principal": {
              "AWS": [
                  "arn:aws:iam::123456789123:role/roleA”,
                  "arn:aws:iam::987654321987:role/roleB”
              ]
          },
          "Action": [
              "s3:GetBucketAcl",
              "s3:GetBucketLocation",
              "s3:ListBucket"
          ],
          "Resource": "arn:aws:s3:::ACCOUNT-ID.BUCKET_NAME"
      },
      {
```

```
            "Sid": "AllowObjectReadActionsForArns",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::123456789123:role/roleA”,
                    "arn:aws:iam::987654321987:role/roleB”
                ]
            },
            "Action": [
                "s3:GetObject",
                "s3:ListMultipartUploadParts"
            ],
            "Resource": "arn:aws:s3:::ACCOUNT-ID.BUCKET_NAME/*"
}
```

For the execution parameters to create this policy with the S3 storage bucket Create change type, see Creating an S3 Bucket with the CLI

Grants WRITE access for an IAM User or a Role

The following resulting example policy grants WRITE access to the objects in the bucket for a IAM user or a role. This policy does not grant the permissions necessary for deleting versioned objects.

```
{
            "Sid": "AllowObjectWriteActionsForArns",
            "Effect": "Allow",
            "Principal": {
                "AWS": [
                    "arn:aws:iam::123456789123:role/roleA”,
                    "arn:aws:iam::987654321987:role/roleB”
                ]
            },
            "Action": [
                "s3:PutObject",
                "s3:DeleteObject",
                "s3:AbortMultipartUpload"
            ],
            "Resource": "arn:aws:s3:::ACCOUNT-ID.BUCKET_NAME/*"
}
```

For the execution parameters to create this policy with the S3 storage bucket Create change type, see Creating an S3 Bucket with the CLI

Grants READ access for an AWS Service

Resulting example policy grants READ access to the objects in the bucket for an AWS service:

```
{
          "Sid": "AllowBucketReadActionsForServcices",
          "Effect": "Allow",
          "Principal": {
              "Service": [
                  "rds.amazonaws.com",
                  "logs.ap-southeast-2.amazonaws.com",
                  "ec2.amazonaws.com"
              ]
          },
          "Action": [
              "s3:GetBucketAcl",
              "s3:GetBucketLocation",
              "s3:ListBucket"
          ],
          "Resource": "arn:aws:s3:::ACCOUNT-ID.BUCKET_NAME/*"
      },
      {
          "Sid": "AllowObjectReadActionsForServcices",
          "Effect": "Allow",
          "Principal": {
              "Service": [
                  "rds.amazonaws.com",
                  "logs.ap-southeast-2.amazonaws.com",
                  "ec2.amazonaws.com"
              ]
          },
          "Action": [
              "s3:GetObject",
              "s3:ListMultipartUploadParts"
          ],
          "Resource": "arn:aws:s3:::ACCOUNT-ID.BUCKET_NAME/*"
}
```

For the execution parameters to create this policy with the S3 storage bucket Create change type, see Creating an S3 Bucket with the CLI

Grants WRITE access for an AWS Service

The following resulting example policy grants WRITE access to the objects in the bucket for an AWS service. This policy does not grant the permissions necessary for deleting versioned objects.

```
{
      "Sid": "AllowObjectWriteActionsForServcices",
      "Effect": "Allow",
      "Principal": {
        "Service": [
            "rds.amazonaws.com",
            "logs.ap-southeast-2.amazonaws.com",
            "ec2.amazonaws.com"
        ]
    },
    "Action": [
          "s3:PutObject",
          "s3:DeleteObject",
          "s3:AbortMultipartUpload"
      ],
      "Resource": "arn:aws:s3:::ACCOUNT-ID.BUCKET_NAME/*"
}
```

For the execution parameters to create this policy with the S3 storage bucket Create change type, see Creating an S3 Bucket with the CLI

Uses EnforceSecureTransport

Resulting example policy enforcing secure transport:

```
{
          "Sid": "EnforceSecureTransport",
          "Effect": "Deny",
          "Principal": "*",
          "Action": "*",
          "Resource": "arn:aws:s3:::ACCOUNT-ID.BUCKET_NAME/*",
          "Condition": {
              "Bool": {
                  "aws:SecureTransport": "false"
              }
          }
}
```

For the execution parameters to create this policy with the S3 storage bucket Create change type, see Creating an S3 Bucket with the CLI

Limits Access to IP Range

Resulting example policy limiting access to the bucket from a set of IP ranges:

```
{
          "Sid": "RestrictBasedOnIPRanges",
          "Effect": "Deny",
          "Principal": "*",
          "Action": "s3:*",
          "Resource": "arn:aws:s3:::ACCOUNT-ID.BUCKET_NAME/*",
          "Condition": {
              "NotIpAddress": {
                  "aws:SourceIp": [
                      “1.2.3.0/24",
                      “2.3.4.0/24"
                  ]
              }
          }
      }
```

For the execution parameters to create this policy with the S3 storage bucket Create change type, see Creating an S3 Bucket with the CLI

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1a68ck03fn98r.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678901234567",
  "StackTemplateId": "stm-s2b72beb200000000",
  "Name": "Test Stack",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "BucketName": "mybucket"
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678",
  "StackTemplateId": "stm-s2b72beb200000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "BucketName": "mybucket",
    "ServerSideEncryption": "KmsManagedKeys",
    "KMSKeyId": "arn:aws:kms:ap-southeast-2:123456789012:key/9d5948f1-2082-4c07-a183-
eb829b8d81c4",
    "Versioning": "Enabled",
    "IAMPrincipalsRequiringReadObjectAccess": [
      "arn:aws:iam::123456789012:user/myuser",
      "arn:aws:iam::123456789012:role/myrole"
    ],
    "IAMPrincipalsRequiringWriteObjectAccess": [
      "arn:aws:iam::123456789012:user/myuser",
      "arn:aws:iam::123456789012:role/myrole"
    ],
    "ServicesRequiringReadObjectAccess": [
      "rds.amazonaws.com",
      "ec2.amazonaws.com",
      "logs.ap-southeast-2.amazonaws.com"
    ],
    "ServicesRequiringWriteObjectAccess": [
      "rds.amazonaws.com",
      "ec2.amazonaws.com",
      "logs.ap-southeast-2.amazonaws.com"
    ],
    "EnforceSecureTransport": true,
    "AccessAllowedIpRanges": [
```

```
      "1.0.0.0/24",
      "2.0.0.0/24"
    ]
  }
}
```

S3 Storage | Create Policy (Review Required)

Create an S3 bucket policy. The existing bucket policy (if any) is replaced with the new policy.

Full classification: Deployment | Advanced stack components | S3 storage | Create policy (review required)

Change Type Details

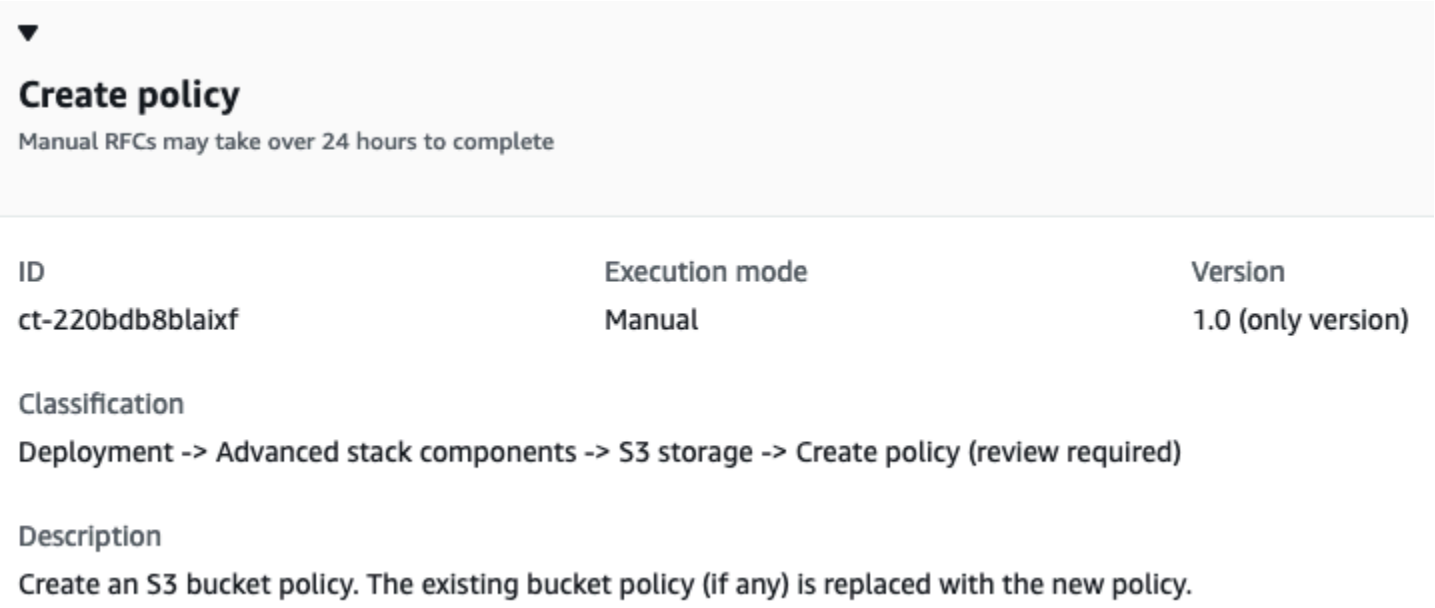
Change type ID	ct-220bdb8blaixf
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create S3 storage policy

Creating an S3 Storage Policy with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an S3 Storage Policy with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-220bdb8blaixf" --change-type-version "1.0"
 --title "TITLE" --execution-parameters "{\"BucketName\": \"example-bucket-123\",
 \"BucketPolicy\": \"Example bucket policy\", \"Operation\": \"Create policy\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateS3PolicyParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-220bdb8blaixf" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateS3PolicyParams.json
   ```

2. Modify and save the CreateS3PolicyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "BucketName": "test-bucket-01",
     "BucketPolicy": "Bucket Policy example",
     "Operation": "Create policy"
   }
   ```

3. Output the RFC template JSON file to a file named CreateS3PolicyRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateS3PolicyRfc.json
   ```

4. Modify and save the CreateS3PolicyRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-220bdb8blaixf",
   "Title":                "S3-Policy-Create-RFC"
   }
   ```

5. Create the RFC, specifying the CreateS3PolicyRfc file and the CreateS3PolicyParams file:

```
aws amscm create-rfc --cli-input-json file://CreateS3PolicyRfc.json  --execution-
parameters file://CreateS3PolicyParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon S3, see Using Bucket Policies and User Policies.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-220bdb8blaixf.

Example: Required Parameters

```
{
  "BucketName": "examplebucketname",
  "BucketPolicy": "Example bucket permissions",
  "Operation": "Create policy"
}
```

Example: All Parameters

```
{
  "BucketName": "examplebucketname",
  "BucketPolicy": "Example bucket permissions",
  "Operation": "Create policy",
  "Priority": "Medium"
}
```

Security Group | Create

Create a security group with limited scope. For complex security groups, use the manual Security group Create change type (ct-1oxx2g2d7hc90).

Full classification: Deployment | Advanced stack components | Security group | Create

Change Type Details

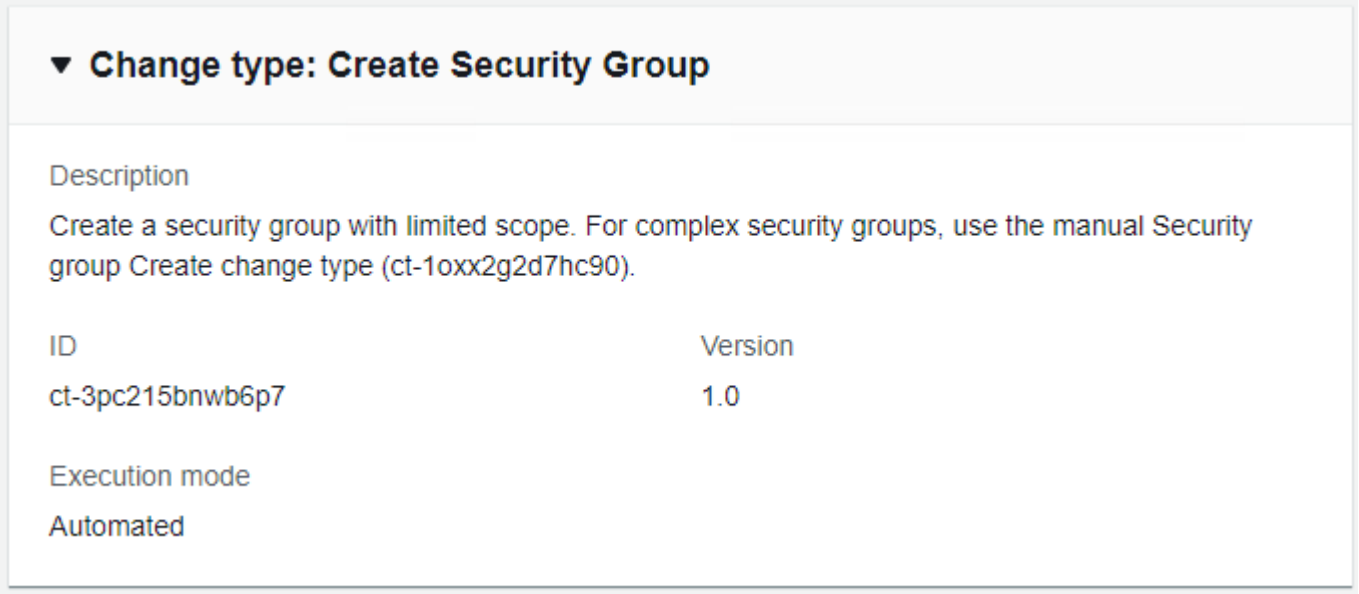
Change type ID	ct-3pc215bnwb6p7
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create security group

Creating a Security Group with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Security Group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml amscm create-rfc --change-type-id "ct-3pc215bnwb6p7" --change-
type-version "1.0" --title "Test-SG-Auto" --execution-parameters "{\"VpcId\":
\"VPC_ID\", \"Description\":\"Test-SG-Auto\", \"SecurityGroupName\":\"Test-SG-Auto\",
 \"TcpUdpIngressRules\":{\"Protocol\":\"TCP\", \"FromPort\":\"PORT\, \"ToPort\":
\"PORT\"}, \"TcpUdpEgressRules\":{\"Protocol\":\"TCP\", \"FromPort\":\"PORT\, \"ToPort
\":\"PORT\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateSGAParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3pc215bnwb6p7" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateSGAParams.json
   ```

2. Modify and save the CreateSGAParams file. For example, you can replace the contents with something like this:

   ```
   {
   "SecurityGroupName":              "My-WEB-SG",
   "SecurityGroupDescription":       "SG_DESCRIPTION",
   "TcpUdpIngressRules":   {
       "Protocol":       "PROTOCOL",
       "FromPortRange": "PORT_RANGE",
       "ToPort":         "TRAFFIC_SOURCE"
       },
   "TcpUdpEgressRules":   {
       "Protocol":      "PROTOCOL",
       "FromPort":      "PORT",
       "ToPort":        "PORT"
       }
   }
   ```

3. Output the RFC template JSON file to a file named CreateSGARfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateSGARfc.json
   ```

4. Modify and save the CreateSGARfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3pc215bnwb6p7",
"Title":                "SG-Create-Auto-RFC"
}
```

5. Create the RFC, specifying the CreateSGARfc file and the CreateSGAParams file:

```
aws amscm create-rfc --cli-input-json file://CreateSGARfc.json  --execution-
parameters file://CreateSGAParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. Once the security group is created, use Associate security group to resource to associate the security group with your AMS resources.

Tips

> **Note**
>
> Once the security group is created, use Associate security group to resource to associate the security group with your AMS resources. In order to delete a security group, it must *not* have associated resources.

To learn more about AWS security groups and creating security groups, see Security Group Rules Reference; this page can help you determine the rules you want and, importantly, how to name your security group so choosing it when creating other resources is intuitive. Also see Amazon EC2 Security Groups for Linux Instances and/or Security Groups for Your VPC.

Once the security group is created, use Associate security group to resource to associate the security group with your AMS resources. In order to delete a security group, it must *not* have associated resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3pc215bnwb6p7.

Example: Required Parameters

```
{
  "VpcId": "vpc-12345678",
  "SecurityGroupName": "app1-webserver",
  "SecurityGroupDescription": "App1 group"
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-01234567890abcdef",
  "SecurityGroupName": "app1-webserver",
  "SecurityGroupDescription": "App1 group",
  "TcpUdpIngressRules": [
    { "Protocol": "TCP", "FromPort": 80, "ToPort": 80, "AddressRanges":
 ["192.168.0.0/16"], "Description": "Client1" },
    { "Protocol": "UDP", "FromPort": 80, "ToPort": 80, "SecurityGroupIds": ["sg-
abd45678901234567"], "Description": "Client1" },
    { "Protocol": "TCP", "FromPort": 80, "ToPort": 80, "AddressRanges":
 ["192.168.0.0/16"], "SecurityGroupIds": ["sg-abc45678"], "Description": "Client1" }
  ],
  "TcpUdpEgressRules": [
    { "Protocol": "TCP", "FromPort": 100, "ToPort": 120, "AddressRanges":
 ["192.168.0.0/16"], "Description": "Client1" },
    { "Protocol": "UDP", "FromPort": 100, "ToPort": 120, "SecurityGroupIds": ["sg-
abd45678901234567"], "Description": "Client1" },
    { "Protocol": "TCP", "FromPort": 100, "ToPort": 120, "AddressRanges":
 ["192.168.0.0/16"], "SecurityGroupIds": ["sg-abc45678"], "Description": "Client1" }
  ],
  "IcmpIngressRules": [
    { "Type": -1, "Code": -1, "AddressRanges": ["192.168.0.0/16"], "Description":
 "Client1" },
    { "Type": 15, "Code": 8, "SecurityGroupIds": ["sg-abd45678901234567"],
 "Description": "Client1" }
  ],
  "IcmpEgressRules": [
```

```
    { "Type": -1, "Code": -1, "AddressRanges": ["192.168.0.0/16"], "Description":
 "Client1" },
    { "Type": 30, "Code": 15, "SecurityGroupIds": ["sg-abd45678901234567"],
 "Description": "Client1" }
  ],
  "Tags": [
    { "Key": "B", "Value": "bb" },
    { "Key": "C", "Value": "cc" },
    { "Key": "D", "Value": "dd" },
    { "Key": "E", "Value": "ee" }
  ]
}
```

Security Group | Create (Review Required)

Create a security group, and optionally associate it with AWS resources.

Full classification: Deployment | Advanced stack components | Security group | Create (review required)

Change Type Details

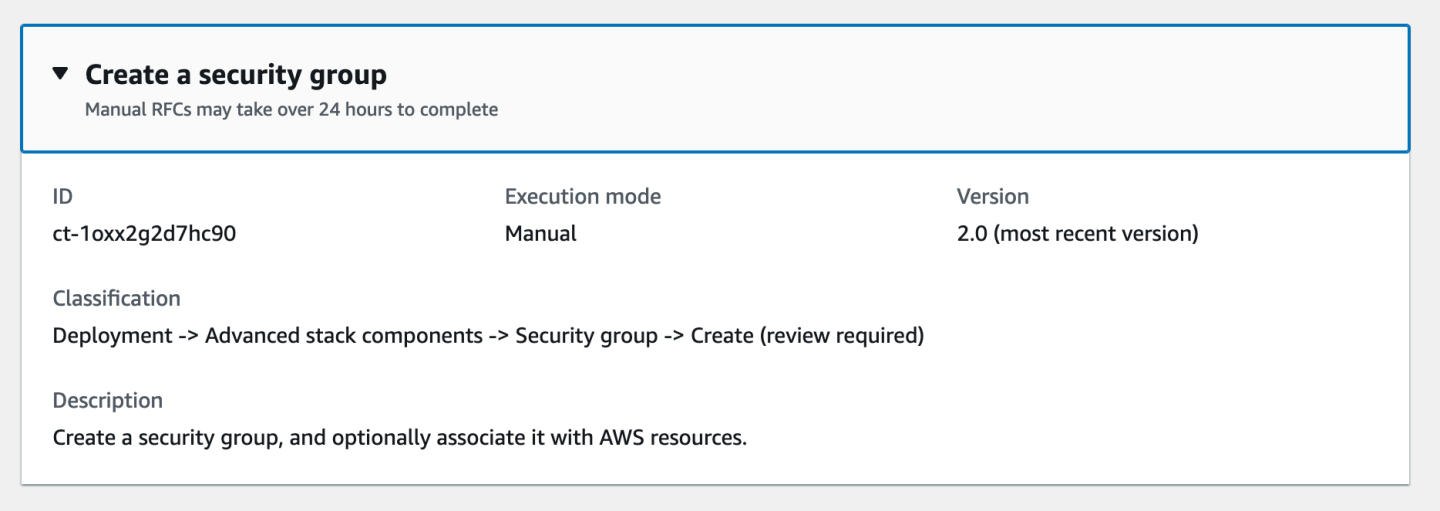
Change type ID	ct-1oxx2g2d7hc90
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create security group (review required)

Creating a Security Group (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Security Group (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml amscm create-rfc --change-type-id "ct-1oxx2g2d7hc90" --change-type-
version "2.0" --title "Test-SG-RR" --execution-parameters "{\"Description\":\"Test-
SG-RR\", \"Name\":\"Test-SG-IC\", \"InboundRules\":{\"Protocol\":\"TCP\", \"PortRange
\":\"49152-65535\, \"Source\":\"203.0.113.5/32\"}, \"OutboundRules\":{\"Protocol\":
\"TCP\", \"PortRange\":\"49152-65535\, \"Destination\":\"203.0.113.5/32\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateSgRrParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1oxx2g2d7hc90" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateSgRrParams.json
   ```

2. Modify and save the CreateSgRrParams file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":      "SG-Create-With-Review",
   "Name":             "My-SG",
   "VpcId":            "vpc-12345abc",
   "InboundRules":   {
       "Protocol":     "TRAFFIC_PROTOCOL",
       "PortRange":    "PORT_RANGE",
       "Source":       "TRAFFIC_SOURCE"
       },
   "OutboundRules":   {
       "Protocol":     "TRAFFIC_PROTOCOL",
       "PortRange":    "PORT_RANGE",
       "Destination":  "TRAFFIC_DESTINATION"
       }
   }
   ```

3. Output the RFC template JSON file to a file named CreateSgRrRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateSgRrRfc.json
   ```

4. Modify and save the CreateSgRrRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-1oxx2g2d7hc90",
"Title":                "SG-Create-RR-RFC"
}
```

5. Create the RFC, specifying the CreateSgRrRfc file and the CreateSgRrParams file:

```
aws amscm create-rfc --cli-input-json file://CreateSgRrRfc.json  --execution-
parameters file://CreateSgRrParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Note

There is an automated change type for creating a security group, Deployment | Advanced stack components | Security group | Create (no review required) (ct-3pc215bnwb6p7) that provides options for TCP and ICMP ingress and egress rules. If those rules are adequate, the Create (auto) change type will execute more quickly than this change type. For details, see Security Group | Create.

Note

Once the security group is created, use Security Group | Associate to associate the security group with your AMS resources. In order to delete a security group, it must have associated resources.

Note

Outbound rules are not required; however, if they are not specified, then a "127.0.0.1/32 Blackhole Rule" is used, meaning that the resource will only be able to communicate to itself and not with other resources. You can see this default outbound rule when using the AMS console, but not when using the AMS API/CLI.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

To learn more about AWS security groups and creating security groups, see Security Group Rules Reference; this page can help you determine the rules you want and, importantly, how to name your security group so choosing it when creating other resources is intuitive. Also see Amazon EC2 Security Groups for Linux Instances and/or Security Groups for Your VPC.

To better understand general AWS security, see Best Practices for Security, Identity, & Compliance.

Once the security group is created, use Security Group | Associate to associate the security group with your AMS resources. In order to delete a security group, it must have associated resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1oxx2g2d7hc90.

Example: Required Parameters

```
{
  "VpcId": "vpc-12345abc",
  "Name": "app1-webserver",
  "Description": "App1 group",
  "InboundRules": [],
  "OutboundRules": []
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-1234abcd",
  "Name": "app1-webserver",
  "Description": "App1 group",
  "AssociatedResources": [
    "i-1234abcd",
    "i-234abcd1",
    "i-34abcd12",
    "i-4abcd123",
```

```
    "i-abcd1234",
    "i-1234567890abcdefg",
    "i-234567890abcdefg1",
    "i-34567890abcdefg12",
    "i-4567890abcdefg123",
    "i-567890abcdefg1234"
  ],
  "InboundRules": [
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
    { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
```

```
   { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },
   { "Protocol": "TCP", "PortRange":"80", "Source": "192.168.0.0/16", "Description":
"Client1" },

"Description": "Client1" },
    { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
    { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
    { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
```

```
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },
   { "Protocol": "ALL", "PortRange": "ALL", "Destination": "192.168.0.0/16",
"Description": "Client1" },

Storage Gateway | Create from Backup

Start an AWS Backup service restore job to restore a Storage Gateway volume snapshot of the specified resource.

Full classification: Deployment | Advanced stack components | Storage Gateway | Create from Backup

Change Type Details

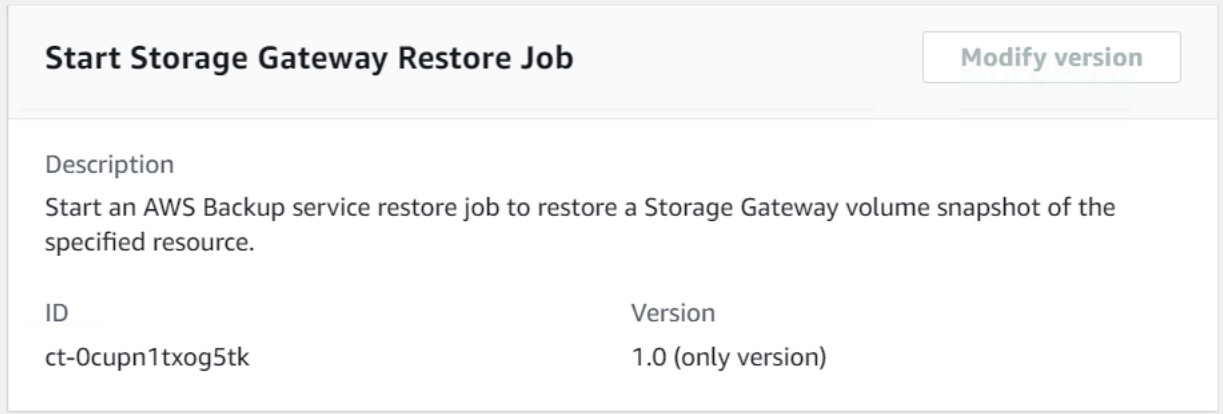
Change type ID	ct-0cupn1txog5tk
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Storage gateway, create from backup

Creating a Storage Gateway from backup with the Console

Screenshot of this change type, in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Storage Gateway from backup with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Restoring store volumes (DiskId parameter is mandatory):

```
aws amscm create-rfc \
--change-type-id "ct-0cupn1txog5tk" \
--change-type-version "1.0" --title "StartRestoreJobStorageGatewayVolume for Cached
 Volume" \
"{\"DocumentName\":\"AWSManagedServices-StartRestoreJobStorageGatewayVolume\",
\"Region\":\"us-east-1\",\"Parameters\":{\"RecoveryPointArn\":[\"arn:aws:ec2:us-
east-1::snapshot/snap-0000000000000\"],\"BackupVaultName\":[\"my-vault-name\"],
\"GatewayArn\":[\"arn:aws:storagegateway:us-east-1:000000000000:gateway/sgw-0000000\"],
\"TargetName\":[\"myTarget\"],\"GatewayType\":[\"Cached\"]}}"
```

Restoring cached volumes:

```
aws amscm create-rfc \
--change-type-id "ct-0cupn1txog5tk" \
--change-type-version "1.0" --title "StartRestoreJobStorageGatewayVolume for Stored
 Volume" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
StartRestoreJobStorageGatewayVolume\",\"Region\":\"us-east-1\",\"Parameters\":
{\"RecoveryPointArn\":[\"arn:aws:ec2:us-east-1::snapshot/snap-0000000000000\"],
\"BackupVaultName\":[\"my-vault-name\"],\"GatewayArn\":[\"arn:aws:storagegateway:us-
east-1:000000000000:gateway/sgw-0000000\"],\"TargetName\":[\"myTarget\"],\"GatewayType
\":[\"Stored\"],\"DiskId\":[\"pci-0000:00:1c.0-nvme-1\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateStoreGatewayFromBackupParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1h1tuxn2oxrtf"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateStoreGatewayFromBackupParams.json
   ```

2. Modify and save the CreateStoreGatewayFromBackupParams file.

   For restore stored volumes:

   ```
   {
   "DocumentName": "AWSManagedServices-StartRestoreJobStorageGatewayVolume",
   "Region": "us-east-1",
   "Parameters": {
     "RecoveryPointArn": [
       "arn:aws:ec2:us-east-1::snapshot/snap-00000000000000"
   ```

```
  ],
  "BackupVaultName": [
    "my-vault-name"
  ],
  "GatewayArn": [
    "arn:aws:storagegateway:us-east-1:000000000000:gateway/sgw-0000000"
  ],
  "TargetName": [
    "myTarget"
  ],
  "GatewayType": [
    "Stored"
  ],
  "DiskId": [
    "pci-0000:00:1c.0-nvme-1"
  ]
}
}
```

For restore cached volumes:

```
{
"DocumentName": "AWSManagedServices-StartRestoreJobStorageGatewayVolume",
"Region": "us-east-1",
"Parameters": {
  "RecoveryPointArn": [
    "arn:aws:ec2:us-east-1::snapshot/snap-000000000000"
  ],
  "BackupVaultName": [
    "my-vault-name"
  ],
  "GatewayArn": [
    "arn:aws:storagegateway:us-east-1:000000000000:gateway/sgw-0000000"
  ],
  "TargetName": [
    "myTarget"
  ],
  "GatewayType": [
    "Cached"
  ]
}
```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateStoreGatewayFromBackupRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateStoreGatewayFromBackupRfc.json
```

4. Modify and save the CreateStoreGatewayFromBackupRfc.json file. For example, you can replace the contents with something like this:

   For restore stored volumes:

```
{
  "ChangeTypeId": "ct-0cupn1txog5tk",
  "ChangeTypeVersion": "1.0",
  "Title": "Testing ct-0cupn1txog5tk StartRestoreJobStorageGatewayVolume in region
 us-east-1 for stored volumes"
}
```

   For restore cached volumes:

```
{
  "ChangeTypeId": "ct-0cupn1txog5tk",
  "ChangeTypeVersion": "1.0",
  "Title": "Testing ct-0cupn1txog5tk StartRestoreJobStorageGatewayVolume in region
 us-east-1 for cached volumes"
}
```

5. Create the RFC, specifying the CreateStoreGatewayFromBackupRfc file and the CreateStoreGatewayFromBackupParams file:

```
aws amscm create-rfc --cli-input-json file://CreateStoreGatewayFromBackupRfc.json
 --execution-parameters file://CreateStoreGatewayFromBackupParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0cupn1txog5tk.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-StartRestoreJobStorageGatewayVolume",
  "Region": "us-east-1",
  "Parameters": {
    "RecoveryPointArn": [
      "arn:aws:ec2:us-east-1::snapshot/snap-00000000000000000"
    ],
    "BackupVaultName": [
      "Vault01"
    ],
    "GatewayArn": [
      "arn:aws:storagegateway:us-east-1:000000000000:gateway/sgw-0000000"
    ],
    "TargetName": [
      "mytarget"
    ],
    "GatewayType": [
      "Cached"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-StartRestoreJobStorageGatewayVolume",
  "Region": "us-east-1",
  "Parameters": {
    "RecoveryPointArn": [
      "arn:aws:ec2:us-east-1::snapshot/snap-00000000000000000"
    ],
    "BackupVaultName": [
      "Vault01"
    ],
```

```
    "GatewayArn": [
      "arn:aws:storagegateway:us-east-1:000000000000:gateway/sgw-0000000"
    ],
    "TargetName": [
      "mytarget"
    ],
    "GatewayType": [
      "Cached"
    ],
    "DiskId": [
      "pci-0000:00:1c.0"
    ],
    "VolumeSize": [
      "0"
    ],
    "IamRoleArn": [
      "arn:aws:iam::123456789012:role/my_role"
    ],
    "KmsKeyArn": [
      "arn:aws:kms:us-east-1:000000000000:key/00000000-0000-0000-0000-000000000000"
    ]
  }
}
```

Tag | Create

Add tags to existing, supported resources: Autoscaling, EC2, Elastic Load Balancing, RDS, S3 buckets and Redshift clusters. Additionally, CloudWatch LogGroups that do not belong to a CloudFormation stack are supported. AMS infrastructure stacks (stacks named mc-*) cannot have tags added with this change type.

Full classification: Deployment | Advanced stack components | Tag | Create

Change Type Details

Change type ID	ct-3cx7we852p3af
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required

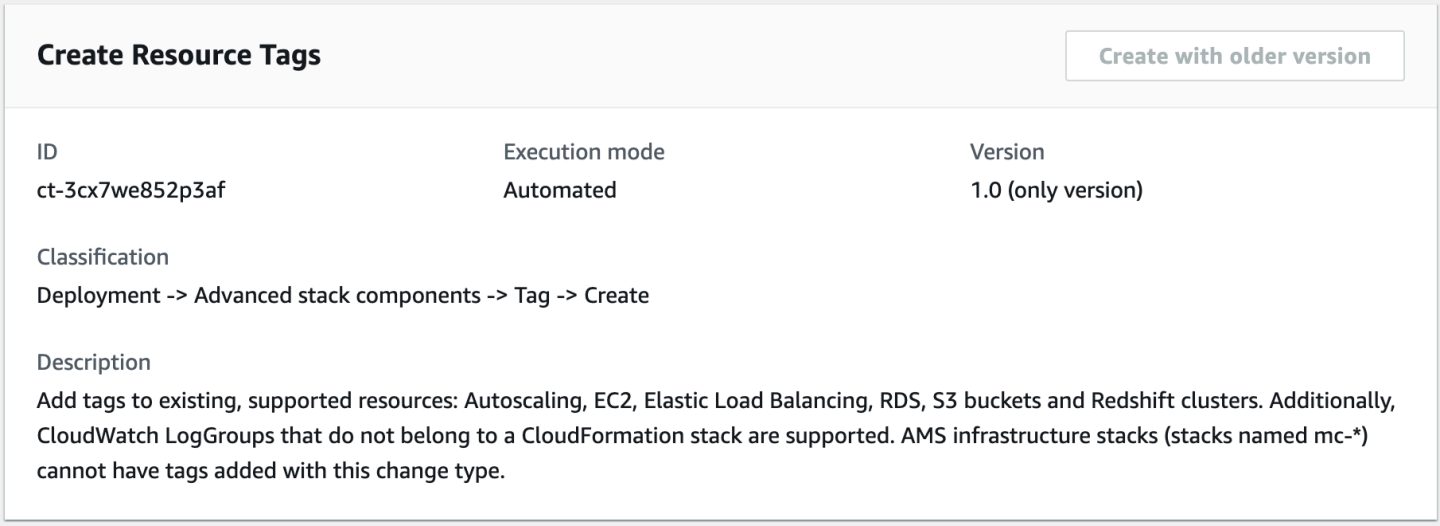
Customer approval	Not required
Execution mode	Automated

Additional Information

Create tags

Creating tags with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating tags with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3cx7we852p3af" --change-type-version
 "1.0" --title "Create Tags" --execution-parameters --execution-parameters
 '{"DocumentName":"AWSManagedServices-UpdateTags","Region":"us-east-1","Parameters":
{"ResourceArns":["i-1234567890abcdef0","vol-1234567890abcdef0","arn:aws:rds:us-
east-1:123456789012:db/my-db-instance"],"AddOrUpdateTags":["{\"Key\":\"Name\",\"Value
\":\"App1\"}","{\"Key\":\"Owner\",\"Value\":\"Dev\"}"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema to a file in your current folder. This example names it TagCreateAutoParams.json.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagCreateAutoParams.json
   ```

2. Modify and save the TagCreateAutoParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateTags",
     "Region": "us-east-1",
     "Parameters":     {
       "ResourceArns": [
         "i-1234567890abcdef0",
         "vol-1234567890abcdef0",
         "arn:aws:rds:us-east-1:123456789012:db/my-db-instance"
       ],
       "AddOrUpdateTags": [
         "{\"Key\":\"Name\",\"Value\":\"App1\"}",
         "{\"Key\":\"Owner\",\"Value\":\"Dev\"}"
   ```

```
    ]
  }
}
```

3. Output the RFC template JSON file to a file; this example names it TagCreateAutoRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > TagCreateAutoRfc.json
```

4. Modify and save the TagCreateAutoRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3cx7we852p3af",
"Title":                "TagCreateAutoRfc"
}
```

5. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://TagCreateAutoRfc.json  --execution-
parameters file://TagCreateAutoParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> AMS infrastructure stacks (stacks named `mc-*`) cannot have tags added with this change type.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3cx7we852p3af.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateTags",
  "Region": "us-east-1",
  "Parameters":     {
    "ResourceArns": [
      "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0",
      "arn:aws:ec2:us-east-1:123456789012:volume/vol-1234567890abcdef0",
      "snap-1234567890abcdef0",
      "arn:aws:rds:us-east-1:123456789012:db/my-db-instance",
      "arn:aws:redshift:us-east-1:123456789012:cluster:my-cluster",
      "arn:aws:logs:ap-southeast-2:123456789012:log-group:my-log-group:*"
    ],
    "AddOrUpdateTags": [
      "{\"Key\":\"k1\",\"Value\":\"v1\"}",
      "{\"Key\":\"k2\",\"Value\":\"v2\"}",
      "{\"Key\":\"aws-migration-project-id\",\"Value\":\"project-id\"}"
    ]
  }
}
```

Tag | Create (Review Required)

Add tags to existing, supported resources except those in AMS infrastructure stacks (stacks named mc-*). Tags simplify categorization, identification and targeting AWS resources. For Autoscaling, EC2, Elastic Load Balancing, RDS resources and S3 buckets, use the automated CT ct-3cx7we852p3af.

Full classification: Deployment | Advanced stack components | Tag | Create (review required)

Change Type Details

Change type ID	ct-0176f0n99vcps
Current version	2.0

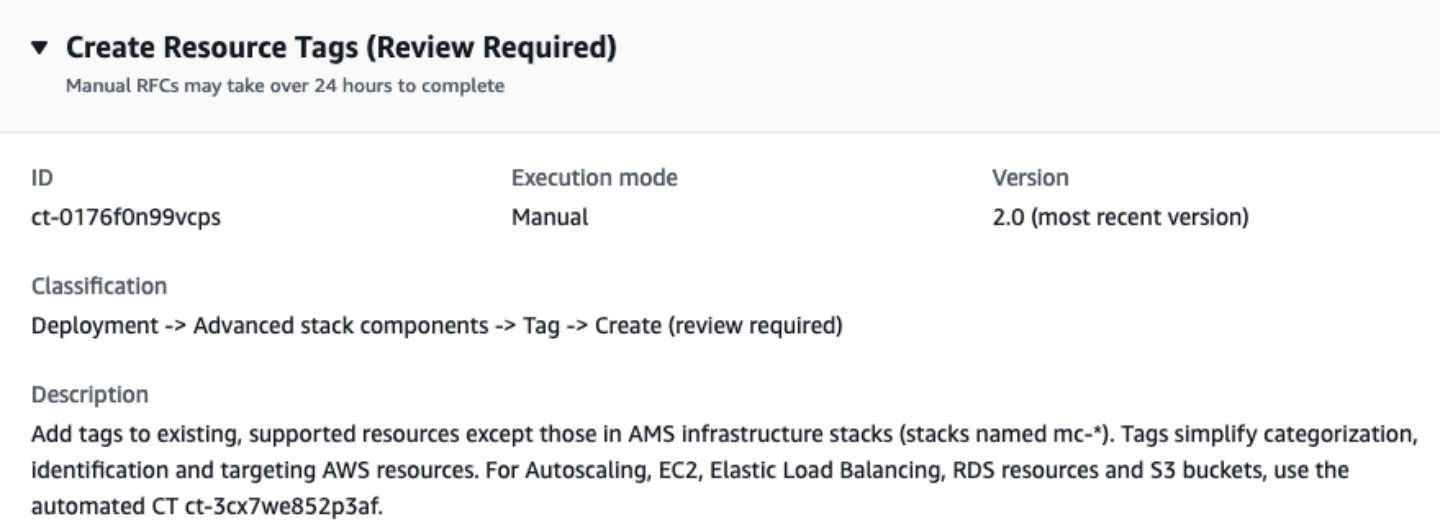
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create tags (review required)

Creating tags (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating tags (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title create-tag --change-type-id ct-0176f0n99vcps --
change-type-version 2.0 --execution-parameters '{"Resources":[{"ResourceArn":"i-
abcd1234","AddOrUpdateTags":[{"Key":"Name","Value":"app-instance-1"},
{"Key":"Owner","Value":"Dep A"}]},{"ResourceArn":"arn:aws:ec2:ap-
southeast-2:123456789012:instance/i-019714a96c22f5452","AddOrUpdateTags":
[{"Key":"Name","Value":"app-instance-2"},{"Key":"Owner","Value":"Dep A"}]}]}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema to a file in your current folder. This example names it TagCreateParams.json.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagCreateParams.json
   ```

2. Modify and save the TagCreateParams.json file. For example, you can replace the contents with something like this:

   ```
   {
      "Resources": [
       {
         "ResourceArn": "i-abcd1234",
         "AddOrUpdateTags": [
           {
             "Key": "Name",
   ```

```
          "Value": "app-instance-1"
        },
        {
          "Key": "Owner",
          "Value": "Dep A"
        }
      ]
    },
    {
      "ResourceArn": "arn:aws:ec2:ap-southeast-2:123456789012:instance/
i-1234567890abcdef1",
      "AddOrUpdateTags": [
        {
          "Key": "Name",
          "Value": "app-instance-2"
        },
        {
          "Key": "Owner",
          "Value": "Dep A"
        }
      ]
    }
  ]
}
```

3. Output the RFC template JSON file to a file; this example names it TagCreateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > TagCreateRfc.json
```

4. Modify and save the TagCreateRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-0176f0n99vcps",
"Title":                "TagCreateRfc"
}
```

5. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://TagCreateRfc.json  --execution-
parameters file://TagCreateParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0176f0n99vcps.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Resources": [
    {
      "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0",
      "AddOrUpdateTags": [
        {
          "Key": "k1",
          "Value": "v1"
        },
        {
          "Key": "k2",
          "Value": "v2"
        },
        {
          "Key": "k3",
          "Value": "v3"
        }
      ]
    },
    {
      "ResourceArn": "i-0fedcba0987654321",
      "AddOrUpdateTags": [
        {
          "Key": "k1",
          "Value": "v1"
```

```
        },
        {
          "Key": "k2",
          "Value": "v2"
        },
        {
          "Key": "k3",
          "Value": "v3"
        }
      ]
    }
  ],
  "Priority": "Medium"
}
```

Target Group | Create (For ALB)

Use to create a target group for an Application Load Balancer.

Full classification: Deployment | Advanced stack components | Target Group | Create (for ALB)

Change Type Details

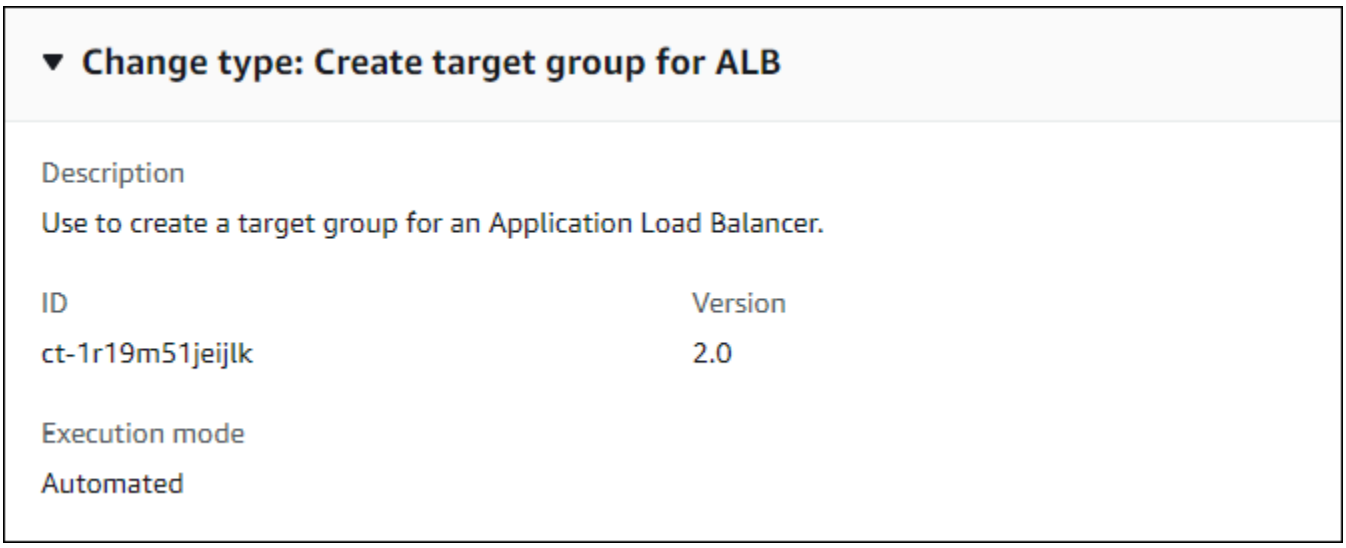
Change type ID	ct-1r19m51jeijlk
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create ALB target group

Creating a Target Group for an Application Load Balancer with the Console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Target Group for an Application Load Balancer with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Version 1.0:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-1r19m51jeijlk" --change-type-version "1.0" --title "TITLE" --execution-parameters
 "{\"Description\":\"TargetGroup-ALB\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\":
 \"stm-9c1t8maqho0os5k21\", \"Name\":\"TG-ALB\", \"TimeoutInMinutes\":60, \"Parameters
\": {\"InstancePort\":\"80\",\"InstanceProtocol\":\"HTTP\"}}"
```

Version 2.0:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-1r19m51jeijlk" --change-type-version "2.0" --title "TITLE" --execution-parameters
 "{\"Description\":\"TargetGroup-ALB\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\":
 \"stm-9c1t8maqho0os5k22\", \"Name\":\"TG-ALB\", \"TimeoutInMinutes\":60, \"Parameters
\": {\"ApplicationLoadBalancerArn\":\"ARN\",\"InstancePort\":\"80\",\"InstanceProtocol
\":\"HTTP\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateTgAlbParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1r19m51jeijlk" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateTgAlbParams.json
   ```

2. Modify and save the CreateTgAlbParams file. For example, you can replace the contents with something like this:

   Version 1.0:

   ```
   {
   "Description":      "Target-Group-ALB-Create",
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-9c1t8maqho0os5k21",
   "Name":             "My-ALB-Target-Group",

   "Parameters":   {
       "LoadBalancerArn":              ARN,
   ```

```
    "DefaultActionTargetGroupArn":   ARN,
    "Port":                          PORT,
    "Protocol":                     Protocol"
    }
}
```

Version 2.0:

```
{
"Description":      "Target-Group-ALB-Create",
"VpcId":            "VPC_ID",
"StackTemplateId":  "stm-9c1t8maqho0os5k22",
"Name":             "My-ALB-Target-Group",

"Parameters":   {
    "ApplicationLoadBalancerArn":          ARN,
    "InstancePort":                        PORT,
    "InstanceProtocol":                    Protocol"
    }
}
```

3. Output the RFC template to a file in your current folder named CreateTgAlbRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateTgAlbRfc.json
```

4. Modify and save the CreateTgAlbRfc.json file. For example, you can replace the contents with something like this:

Version 1.0:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1r19m51jeijlk",
"Title":                "Target-Group-ALB-Create-RFC"
}
```

Version 2.0:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-1r19m51jeijlk",
"Title":                "Target-Group-ALB-Create-RFC"
```

```
}
```

5. Create the RFC, specifying the CreateTgAlbRfc file and the CreateTgAlbParams file:

```
aws amscm create-rfc --cli-input-json file://CreateTgAlbRfc.json --execution-
parameters file://CreateTgAlbParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Next, create a listener for the Application Load Balancer. For more information,see ALB listeners. To open ports and associate security groups, submit a Management | Other | Other | Update change type. For more information, see Other | Other requests.

Tips

> **Note**
>
> The 2.0 version of this change type uses a different StackTemplateId (stm-9c1t8maqho0os5k22) from the 1.0 version. This is important if you are submitting the RFC with this change type version at the command line. The new version includes a new, required, parameter: **ApplicationLoadBalancer**.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1r19m51jeijlk.

Example: Required Parameters

```
{
  "Description": "Test description.",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "MyRFCName",
  "StackTemplateId": "stm-9c1t8maqho0os5k22",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "InstancePort": "80",
    "InstanceProtocol": "HTTP",
```

```
    "ApplicationLoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-app-load-balancer/abcdefghij"
  }
}
```

Example: All Parameters

```
{
  "Description": "Test description.",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "MyRFCName",
  "StackTemplateId": "stm-9c1t8maqho0os5k22",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ApplicationLoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/app/my-app-load-balancer/abcdefghij",
    "HealthCheckHealthyThreshold": "5",
    "HealthCheckUnhealthyThreshold": "3",
    "HealthCheckInterval": 30,
    "HealthCheckTimeout": "10",
    "HealthCheckTargetPath": "/healthcheck",
    "HealthCheckTargetPort": "80",
    "HealthCheckTargetProtocol": "HTTP",
    "ValidHTTPCode": "200-259",
    "InstancePort": "80",
    "Name": "mytargetgroup",
    "InstanceProtocol": "HTTP",
    "DeregistrationDelayTimeout": "300",
    "SlowStartDuration": "60",
    "StickinessCookieExpirationPeriod": "3600",
    "TargetType": "ip",
    "Target1ID": "192.168.0.1",
    "Target1Port": "80",
    "Target1AvailabilityZone": "all",
    "Target2ID": "192.168.0.2",
    "Target2Port": "80",
    "Target2AvailabilityZone": "all",
    "Target3ID": "10.44.4.125",
    "Target3Port": "8080",
    "Target3AvailabilityZone": "",
    "Target4ID": "10.44.4.126",
    "Target4Port": "8080",
    "Target4AvailabilityZone": "",
```

```
    "Target5ID": "192.168.0.127",
    "Target5Port": "80",
    "Target5AvailabilityZone": "all",
    "Target6ID": "192.168.0.128",
    "Target6Port": "80",
    "Target6AvailabilityZone": "all",
    "Target7ID": "10.44.4.129",
    "Target7Port": "8080",
    "Target7AvailabilityZone": "",
    "Target8ID": "10.44.4.130",
    "Target8Port": "8080",
    "Target8AvailabilityZone": ""
  }
}
```

Target Group | Create (For NLB)

Use to create a target group for a Network Load Balancer.

Full classification: Deployment | Advanced stack components | Target Group | Create (for NLB)

Change Type Details

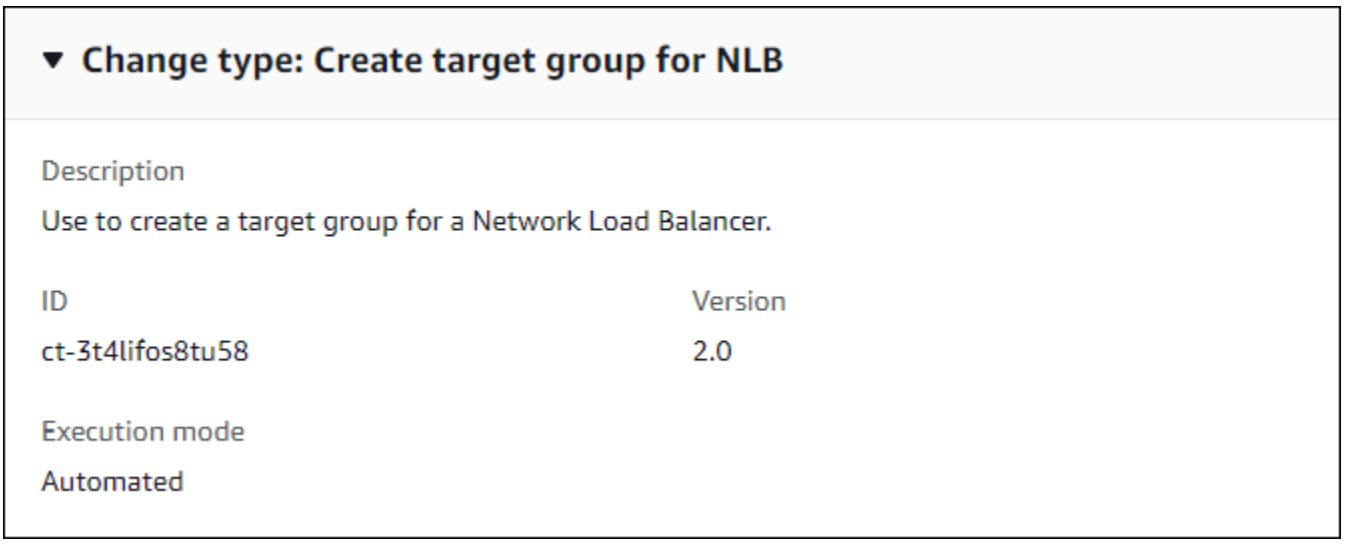
Change type ID	ct-3t4lifos8tu58
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create NLB target group

Creating a Target Group for a Network Load Balancer with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Target Group for a Network Load Balancer with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Version 1.0:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-3t4lifos8tu58" --change-type-version "1.0" --title "TITLE" --execution-parameters
 "{\"Description\":\"TargetGroup-NLB\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\":
 \"stm-6pvp2f7cp481g1r46\", \"Name\":\"TG-NLB\", \"TimeoutInMinutes\":60, \"Parameters
\": {\"InstancePort\":\"80\",\"InstanceProtocol\":\"HTTP\"}}"
```

Version 2.0:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-3t4lifos8tu58" --change-type-version "2.0" --title "TITLE" --execution-parameters
 "{\"Description\":\"TargetGroup-NLB\", \"VpcId\":\"VPC_ID\", \"StackTemplateId\":
 \"stm-6pvp2f7cp481g1r47\", \"Name\":\"TG-NLB\", \"TimeoutInMinutes\":60, \"Parameters
\": {\"NetworkLoadBalancerArn\":\"ARN\",\"InstancePort\":\"80\",\"InstanceProtocol\":
\"HTTP\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateTGNlbParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3t4lifos8tu58" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateTGNlbParams.json
   ```

2. Modify and save the CreateTGNlbParams file. For example, you can replace the contents with something like this:

   Version 1.0:

   ```
   {
   "Description":      "Target-Group-NLB-Create",
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-6pvp2f7cp481g1r46",
   "Name":             "My-NLB-Target-Group",

   "Parameters":   {
   ```

```
    "InstancePort":                          PORT
    }
}
```

Version 2.0:

```
{
"Description":      "Target-Group-NLB-Create",
"VpcId":            "VPC_ID",
"StackTemplateId":  "stm-6pvp2f7cp481g1r47",
"Name":             "My-NLB-Target-Group",

"Parameters":   {
    "NetworkLoadBalancerArn":               ARN,
    "InstancePort":                         PORT
    }
}
```

3. Output the RFC template to a file in your current folder named CreateTgNlbRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateTgNlbRfc.json
```

4. Modify and save the CreateTgNlbRfc.json file. For example, you can replace the contents with something like this:

   Version 1.0:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3t4lifos8tu58",
"Title":                "Target-Group-NLB-Create-RFC"
}
```

   Version 2.0:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-3t4lifos8tu58",
"Title":                "Target-Group-NLB-Create-RFC"
}
```

5. Create the RFC, specifying the CreateTgNlbRfc file and the CreateTgNlbParams file:

```
aws amscm create-rfc --cli-input-json file://CreateTgNlbRfc.json --execution-
parameters file://CreateTgNlbParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Next Steps: Create a listener for the NLB, see NLB listeners. To open ports and associate security groups, submit a Management | Other | Other | Update change type. For more information, see Other | Other requests.

Tips

> **Important**
>
> There is a new version of this change type, v2.0, that uses a different StackTemplateId (stm-6pvp2f7cp481g1r47). This is important if you are submitting the RFC with this change type at the command line. The new version includes a new, required, parameter: **NetworkLoadBalancer**.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3t4lifos8tu58.

Example: Required Parameters

```
{
  "Description": "Test description.",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "MyRFCName",
  "StackTemplateId": "stm-6pvp2f7cp481g1r47",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "InstancePort": "80",
    "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-
west-2:123456789012:loadbalancer/net/my-nlb/abcdefghij"
  }
}
```

Example: All Parameters

```
{
  "Description": "Test description.",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "MyRFCName",
  "StackTemplateId": "stm-6pvp2f7cp481g1r47",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "NetworkLoadBalancerArn": "arn:aws:elasticloadbalancing:us-

VPC | Add Static Route (Review Required)

Create a static route on your route table inside a VPC.

Full classification: Deployment | Advanced stack components | VPC | Add static route (review required)

Change Type Details

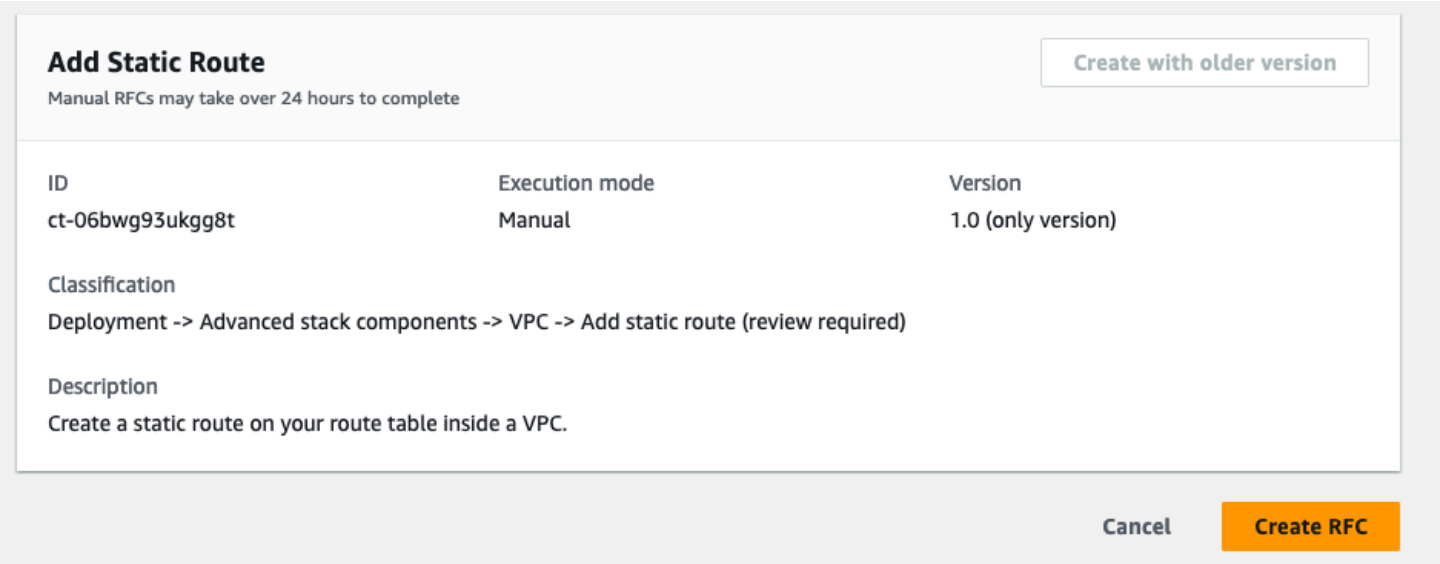
Change type ID	ct-06bwg93ukgg8t
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Add VPC static route (review required)

Add a static route with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding a static route with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title="Add Static Route" --description="Add static route"
 --ct-id="ct-06bwg93ukgg8t" --ct-version="1.0" --input-params="{\"RouteTableId
\":\"rtb-0123abcd\",\"DestinationCidrBlock\":\"172.31.0.0/16\",\"Target\":
\"pcx-0123456789abcdefg\",\"Priority\":\"High\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type; this example names it EncryptAmiParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-06bwg93ukgg8t" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AddStaticRouteParams.json
   ```

2. Modify and save the execution AddStaticRouteParams.json file. For example, you can replace the contents with something like this:

   ```
   {
       "RouteTableId": "rtb-0123abcd",
       "DestinationCidrBlock": "172.31.0.0/16",
       "Target": "pcx-0123456789abcdefg",
       "Priority": "High"
   }
   ```

3. Output the RFC template JSON file; this example names it AddStaticRouteRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > AddStaticRouteRfc.json
   ```

4. Modify and save the AddStaticRouteRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-06bwg93ukgg8t",
     "Title": "Add static route"
   }
   ```

5. Create the RFC, specifying the AddStaticRouteRfc file and the AddStaticRouteParams file:

```
aws amscm create-rfc --cli-input-json file://AddStaticRouteRfc.json  --execution-
parameters file://AddStaticRouteParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about VPCs, see Virtual private clouds (VPC).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-06bwg93ukgg8t.

Example: Required Parameters

```
{
    "RouteTableId": "rtb-01234567890abcdef",
    "Destination": "192.168.10.0/24",
    "RouteTableTarget": "igw-01234567890abcdef"
}
```

Example: All Parameters

```
{
    "RouteTableId": "rtb-01234567890abcdef",
    "Destination": "192.168.10.0/24",
    "RouteTableTarget": "igw-01234567890abcdef",
    "Priority": "High"
}
```

VPC Endpoint (Interface) | Create

Create an interface VPC endpoint, which allows you to connect to services powered by AWS PrivateLink, including many AWS services.

Full classification: Deployment | Advanced stack components | VPC endpoint (interface) | Create

Change Type Details

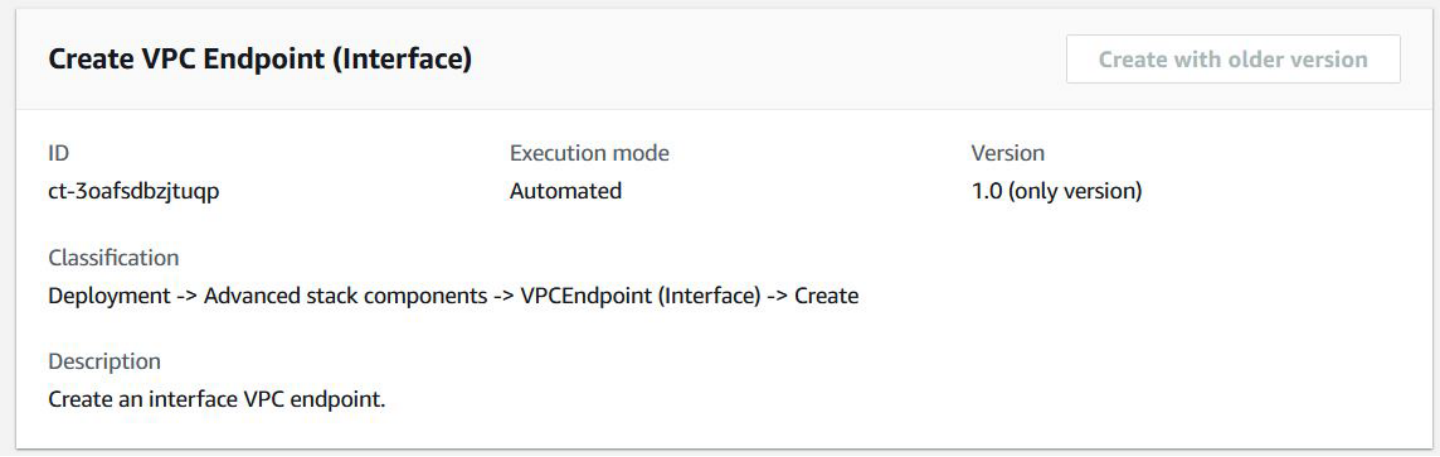
Change type ID	ct-3oafsdbzjtuqp
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create VPC endpoint

Creating a VPC endpoint with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a VPC endpoint with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3oafsdbzjtuqp" --change-type-version
 "1.0" --title "Create VPC Endpoint" --execution-parameters "{\"Description\":\"VPC
 endpoint interface\",\"VpcId\":\"vpc-1234567890abcdef0\",\"Name\":\"VPC endpoint
 interface\",\"StackTemplateId\":\"stm-f0cumpt1rfc1p1739\",\"TimeoutInMinutes
\":60,\"Parameters\":{\"VpcId\":\"vpc-1234567890abcdef0\",\"ServiceName\":
\"com.amazonaws.us-east-1.codedeploy\",\"SecurityGroups\":[\"sg-1234567890abcdef0\",
\"sg-1234567890abcdef1\"],\"SubnetIds\":[\"subnet-1234567890abcdef0\",
\"subnet-1234567890abcdef1\"],\"EnablePrivateDns\":\"false\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type; this example names it VPCEndpointCreateParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3oafsdbzjtuqp"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    VPCEndpointCreateParams.json
   ```

2. Modify and save the execution parameters as VPCEndpointCreateParams.json. For example, you can replace the contents with something like this:

```
{
  "Description": "VPC endpoint interface",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "VPC endpoint interface",
  "StackTemplateId": "stm-f0cumpt1rfc1p1739",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "VpcId": "vpc-1234567890abcdef0",
    "ServiceName": "com.amazonaws.us-east-1.codedeploy",
    "SecurityGroups": [
      "sg-1234567890abcdef0",
      "sg-1234567890abcdef1"
    ],
    "SubnetIds": [
      "subnet-1234567890abcdef0",
      "subnet-1234567890abcdef1"
    ],
    "EnablePrivateDns": "false"
  }
}
```

3. Output the RFC template JSON file; this example names it VPCEndpointCreateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > VPCEndpointCreateRfc.json
```

4. Modify and save the VPNGatewayCreateRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion" : "1.0",
  "ChangeTypeId" : "ct-3oafsdbzjtuqp",
  "Title" : "Create VPC Endpoint "
}
```

5. Create the RFC, specifying the VPCEndpointCreateRfc file and the VPCEndpointCreateParams file:

```
aws amscm create-rfc --cli-input-json file://VPCEndpointCreateRfc.json  --
execution-parameters file://VPCEndpointCreateParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3oafsdbzjtuqp.

Example: Required Parameters

```
{
  "Description": "Test description",
  "VpcId": "vpc-12345678901234567",
  "Name": "TestStack",
  "StackTemplateId": "stm-f0cumpt1rfc1p1739",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "VpcId": "vpc-a388bbc4",
    "ServiceName": "com.amazonaws.ap-southeast-2.execute-api",
    "SecurityGroups": [
      "sg-94bdebea",
      "sg-007442bef5c5badff"
    ],
    "SubnetIds": [
      "subnet-5b706a3c",
      "subnet-c9809480"
    ]
  }
}
```

Example: All Parameters

```
{
  "Description": "Test description",
  "VpcId": "vpc-12345678",
  "Name": "TestStack",
  "Tags": [
    {
      "Key": "foo",
```

```
      "Value": "bar"
    }
  ],
  "StackTemplateId": "stm-f0cumpt1rfc1p1739",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "VpcId": "vpc-a388bbc4",
    "ServiceName": "com.amazonaws.ap-southeast-2.execute-api",
    "SecurityGroups": [
      "sg-94bdebea",
      "sg-007442be"
    ],
    "SubnetIds": [
      "subnet-5b706a3c",
      "subnet-c9809480"
    ],
    "EnablePrivateDns": "true"
  }
}
```

VPN Gateway | Create

Create a virtual private network (VPN) gateway (the endpoint on the VPC side of your VPN connection), and associate it to an existing virtual private cloud (VPC) in your account.

Full classification: Deployment | Advanced stack components | VPN Gateway | Create

Change Type Details

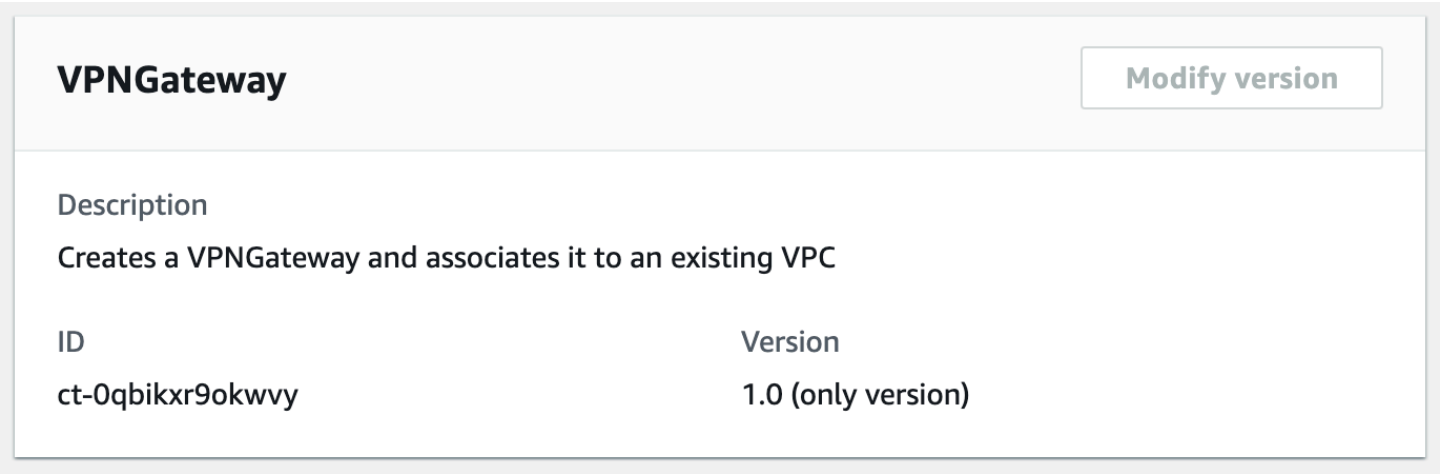
Change type ID	ct-0qbikxr9okwvy
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create VPN gateway

Creating a VPN gateway with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a VPN gateway with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title create-rds-db-instance-point-in-time-
restore --change-type-id ct-0qbikxr9okwvy --change-type-version
 1.0 --execution-parameters '{"Description": "test","VpcId":
 "vpc-317a9856","Name": "newvpngateway","StackTemplateId": "stm-
mcti3bha1vhon1sie","TimeoutInMinutes": 60,"Parameters": {"VpcId":
 "vpc-317a9856","AmazonSideAsn": 64512,"Name": "test"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type; this example names it EncryptAmiParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0qbikxr9okwvy"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    VPNGatewayCreateParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "test",
     "VpcId": "vpc-317a9856",
     "Name": "newvpngateway",
     "StackTemplateId": "stm-mcti3bha1vhon1sie",
     "TimeoutInMinutes": 60,
     "Parameters": {
       "VpcId": "vpc-317a9856",
       "AmazonSideAsn": 64512,
       "Name": "test"
     }
   }
   ```

3. Output the RFC template JSON file; this example names it VPNGatewayCreateRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > VPNGatewayCreateRfc.json
   ```

4. Modify and save the VPNGatewayCreateRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion" : "1.0",
  "ChangeTypeId" : "ct-0qbikxr9okwvy",
  "Title" : "VPNGateway Create"
}
```

5. Create the RFC, specifying the VPNGatewayCreateRfc file and the VPNGatewayCreateParams file:

```
aws amscm create-rfc --cli-input-json file://VPNGatewayCreateRfc.json  --execution-
parameters file://VPNGatewayCreateParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0qbikxr9okwvy.

Example: Required Parameters

```
{
  "Description" : "Test description",
  "VpcId" : "vpc-12345678901234567",
  "Name" : "TestStack",
  "StackTemplateId" : "stm-mcti3bha1vhon1sie",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
    "VpcId" : "vpc-12345678901234567"
  }
}
```

Example: All Parameters

```
{
```

```
  "Description" : "Test description",
  "VpcId" : "vpc-12345678",
  "Name" : "TestStack",
  "Tags" : [
    {
      "Key" : "foo",
      "Value" : "bar"
    }
  ],
  "StackTemplateId" : "stm-mcti3bha1vhon1sie",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
    "VpcId" : "vpc-12345678",
    "AmazonSideAsn" : 64512,
    "Name" : "Test-VPNGateway"
  }
}
```

AMS Patterns Subcategory

Change Type Items and Operations in the AMS Patterns Subcategory

- Solution | Deploy (Review Required)

Solution | Deploy (Review Required)

Deploy an AMS pattern to the current account. Patterns provide tools, architectures, and step-by-step guidance for implementing the methodologies for the migration strategy. Multi-account landing zone accounts can also specify OrganizationalUnit to deploy the pattern to all the accounts in that OU.

Full classification: Deployment | AMS patterns | Solution | Deploy (review required)

Change Type Details

Change type ID	ct-2jndrh7uit8uf
Current version	1.0
Expected execution duration	60 minutes

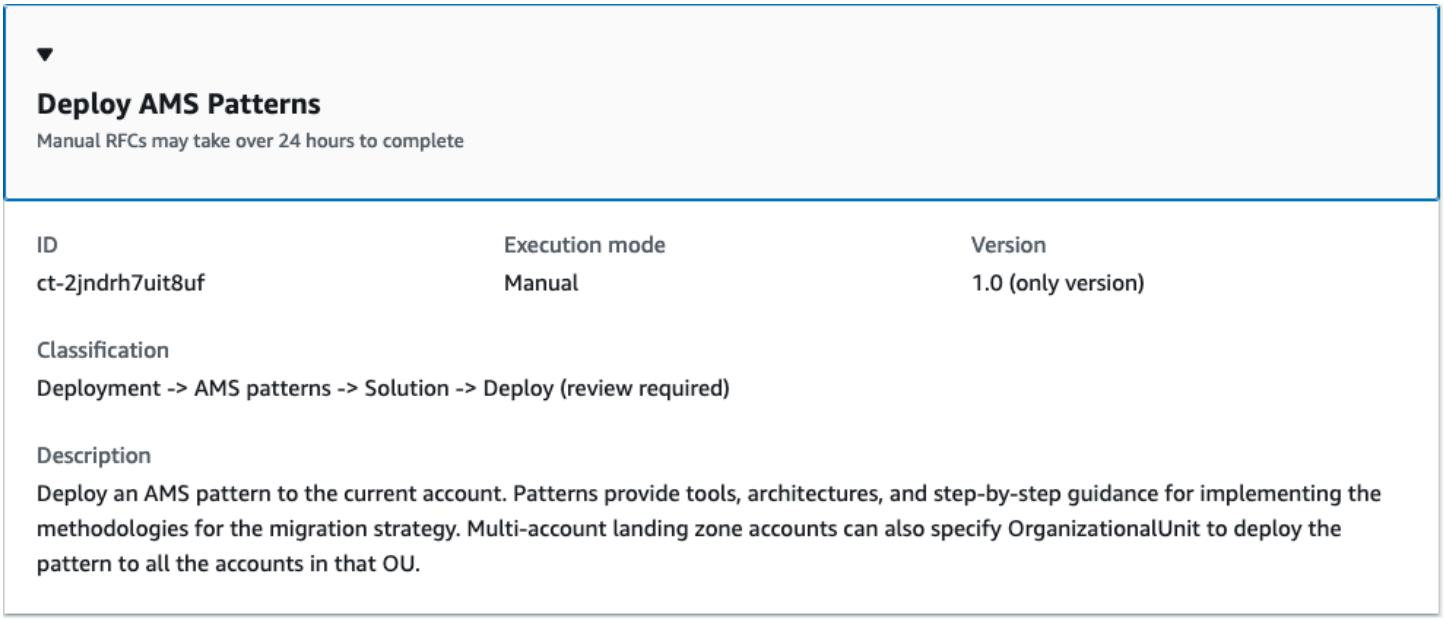
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Deploy AMS Pattern (review required)

Creating an AWS KMS Key (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an AWS KMS Key (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2jndrh7uit8uf" --change-type-version
 "1.0" --title "Deploy AMS Patterns" --execution-parameters "{\"PatternName
\": \"amsEbsVolumeSnapshotTagger\",\"PatternParameters\": "{\"ExcludedTags\":
\"BackupProd,Backup\",\"ASMGuardRail\":\"enabled\"}", \"OrganizationalUnit\":
 \"ou-9dyd-s2vptest\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type; this example names it DeployAMSPatternsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2jndrh7uit8uf"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeployAMSPatternsParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
       "PatternName": "amsEbsVolumeSnapshotTagger",
       "Parameters": {
           "ExcludedTags": "BackupProd,Backup",
           "ASMGuardRail": "enabled"
       },
   ```

```
    "OrganizationalUnit": "ou-9dyd-s2vptest"
}
```

3. Output the RFC template JSON file; this example names it DeployAMSPatternsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeployAMSPatternsRfc.json
```

4. Modify and save the DeployAMSPatternsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2jndrh7uit8uf",
"Title":                "Deploy AMS Patterns"
}
```

5. Create the RFC, specifying the DeployAMSPatternsRfc file and the DeployAMSPatternsParams file:

```
aws amscm create-rfc --cli-input-json file://DeployAMSPatternsRfc.json --execution-
parameters file://DeployAMSPatternsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2jndrh7uit8uf.

Example: Required Parameters

```
{
  "PatternName": "amsEbsVolumeSnapshotTagger"
}
```

Example: All Parameters

```
{
  "PatternName": "amsEbsVolumeSnapshotTagger",
```

```
  "OrganizationalUnitIds": ["ou-9dyd-jvsei4yg"],
  "Priority": "Medium",
  "PatternParameters": [
    {
      "Name": "Foo",
      "Value": "Bar"
    }
  ]
}
```

AMS Resource Scheduler Subcategory

Change Type Items and Operations in the AMS Resource Scheduler Subcategory

- Solution | Deploy

Solution | Deploy

Deploy the AMS Resource Scheduler solution in the account. The AMS Resource Scheduler lets you schedule automatic start and/or stop for Auto Scaling groups, EC2s, and RDS instances. Note that the Resource Scheduler deploys in an enabled state, by default; you can manage that with the AMS Resource Scheduler Disable and Enable change types.

Full classification: Deployment | AMS Resource Scheduler | Solution | Deploy

Change Type Details

Change type ID	ct-0ywnhc8e5k9z5
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Deploy AMS Resource Scheduler Solution

Deploying AMS Resource Scheduler solution with the console

The following shows this change type in the AMS console.

Deploy AMS Resource Scheduler

ID	Execution mode	Version
ct-0ywnhc8e5k9z5	Automated	2.0 (most recent version)

Classification

Deployment -> AMS Resource Scheduler -> Solution -> Deploy

Description

Deploy the AMS Resource Scheduler solution in the account. The AMS Resource Scheduler lets you schedule automatic start and/or stop for Auto Scaling groups, EC2s, and RDS instances. Note that the Resource Scheduler deploys in an enabled state, by default; you can manage that with the AMS Resource Scheduler Disable and Enable change types.

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deploying AMS Resource Scheduler solution with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id ct-0ywnhc8e5k9z5 --change-type-
version "2.0" --title "Deploy Resource Scheduler" --execution-parameters
 '{"DocumentName":"AWSManagedServices-HandleAMSResourceSchedulerStack-
Admin","Region":"us-east-1","Parameters":{"SchedulingActive":
["Yes"],"ScheduledServices":["ec2,rds,autoscaling"],"TagName":
["Schedule"],"DefaultTimezone":["America/New_York"],"Action":["Deploy"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it DeployResSchedulerParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0ywnhc8e5k9z5"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeployResSchedulerParams.json
   ```

2. Modify and save the DeployResSchedulerParams file.

   ```
   {
     "DocumentName": "AWSManagedServices-HandleAMSResourceSchedulerStack-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "SchedulingActive": [
         "Yes"
       ],
       "ScheduledServices": [
         "ec2,rds,autoscaling"
       ],
       "TagName": [
         "Schedule"
       ],
       "DefaultTimezone": [
         "America/New_York"
       ],
       "Action": [
         "Deploy"
   ```

```
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it DeployResSchedulerRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeployResSchedulerRfc.json
```

4. Modify and save the DeployResSchedulerRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-0ywnhc8e5k9z5",
"Title":                "Deploy AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the DeployResSchedulerRfc file and the DeployResSchedulerParams file:

```
aws amscm create-rfc --cli-input-json file://DeployResSchedulerRfc.json --
execution-parameters file://DeployResSchedulerParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For background information, see How the AMS Resource Scheduler works. For a quick-start tutorial, see AMS Resource Scheduler quick start.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0ywnhc8e5k9z5.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAMSResourceSchedulerStack-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["Deploy"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAMSResourceSchedulerStack-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "SchedulingActive" : [
      "Yes"
    ],
    "ScheduledServices" : [
      "ec2,rds,autoscaling"
    ],
    "TagName" : [
      "MySchedule"
    ],
    "DefaultTimezone" : [
      "Australia/Sydney"
    ],
    "UseCMK" : [
      "arn:aws:kms:ap-southeast-1:830123456789:key/07aaab3c-50d3-4cd8-
ab61-3de57127dab9"
    ],
    "UseLicenseManager" : [
      "arn:aws:license-manager:ap-southeast-1:830123456789:license-
configuration:lic-78c1e0cfc1233a4eac7197d7ee57f92c"
    ],
    "Action": [
      "Deploy"
    ]
  }
}
```

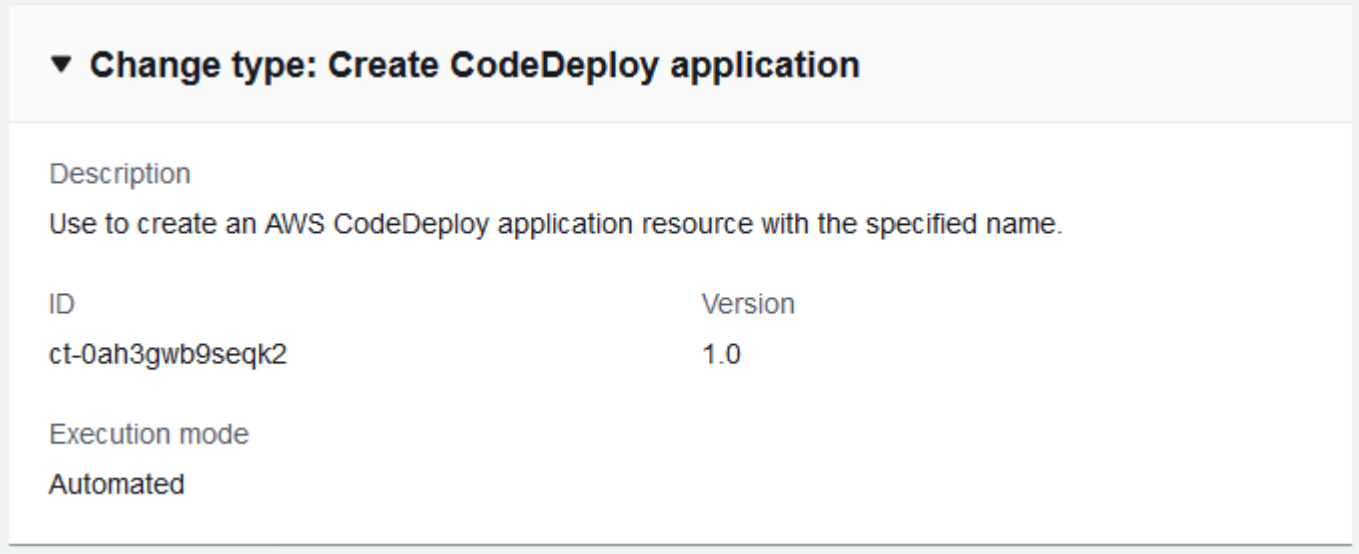
Change Type Details

Change type ID	ct-0ah3gwb9seqk2
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create CodeDeploy application

Creating a CodeDeploy application with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a CodeDeploy application with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0ah3gwb9seqk2" --change-type-version "1.0"
 --title "Stack-Create-CD-App" --execution-parameters "{\"Description\":\"TestCdApp\",
\"VpcId\":\"VPC_ID\",\"StackTemplateId\":\"stm-sft6rv00000000000\",\"Name\":\"Test\",
\"TimeoutInMinutes\":60,\"Parameters\":{\"CodeDeployApplicationName\":\"Test\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for the CodeDeploy application CT to a file in your current folder; this example names it CreateCDAppParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0ah3gwb9seqk2" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateCDAppParams.json
   ```

2. Modify and save the JSON file as follows. For example, you can replace the contents with something like this:

   ```
   {
   "Description":                    "Create WP CodeDeploy App",
   "VpcId":                          "VPC_ID",
   "StackTemplateId":                "stm-sft6rv00000000000",
   "Name":                           "WpCDApp",
   "TimeoutInMinutes":               60,
   "Parameters":   {
       "CodeDeployApplicationName":    "WordPressCDApp"
       }
   }
   ```

3. Output the JSON template for CreateRfc to a file in your current folder; this example names it CreateCDAppRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateCDAppRfc.json
   ```

4. Modify and save the JSON file as follows. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0ah3gwb9seqk2",
"Title":                "CD-App-Stack-RFC"
}
```

5. Create the RFC, specifying the CreateCDAppRfc file and the execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CreateCDAppRfc.json --execution-
parameters file://CreateCDAppParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS CodeDeploy, see Create an Application with AWS CodeDeploy.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0ah3gwb9seqk2.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "Stack Description.",
  "VpcId": "vpc-12345678",
  "StackTemplateId": "stm-sft6rv00000000000",
  "Name": "Name your stack",
  "Tags": [{"Key":"foo","Value":"bar"}],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "CodeDeployApplicationName": "foobarapp"
  }
```

```
}
```

CodeDeploy Application | Deploy

Deploy a revision of an existing AWS CodeDeploy application, which are source files CodeDeploy will deploy to your instances or scripts CodeDeploy will run on your instances.

Full classification: Deployment | Applications | CodeDeploy application | Deploy

Change Type Details

Change type ID	ct-2edc3sd1sqmrb
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required

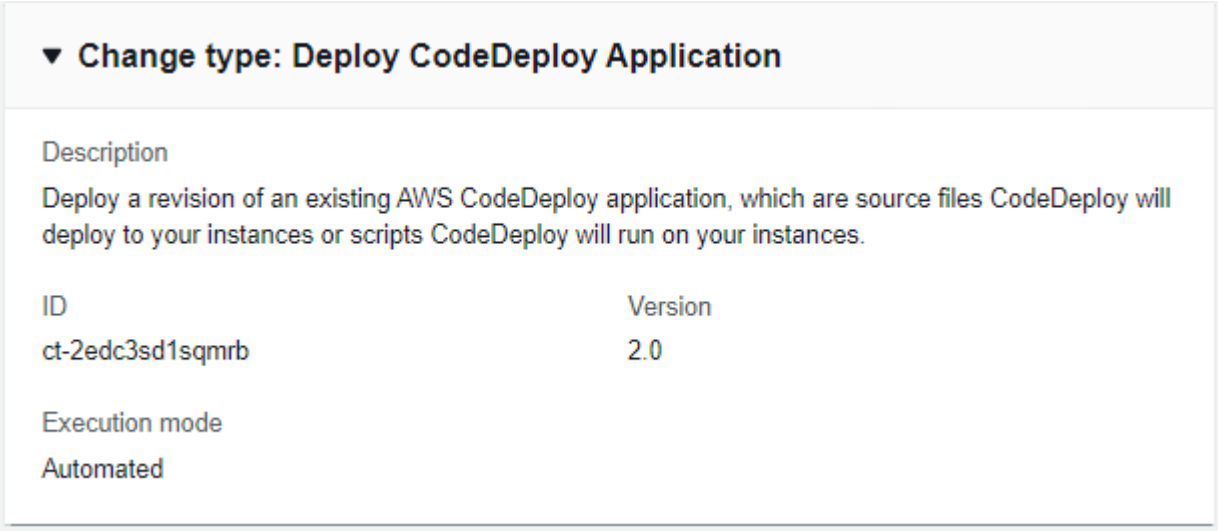
Additional Information

Deploy CodeDeploy application

Deploying a CodeDeploy application with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deploying a CodeDeploy application with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2edc3sd1sqmrb" --change-
type-version "2.0" --title "Stack-Deploy-CD-App" --execution-
parameters "{\"Description\":\"MyCDAppDeployTest\",\"VpcId\":
\"VPC_ID\",\"Name\":\"Test\",\"TimeoutInMinutes\":60,\"Parameters\":
{\"CodeDeployApplicationName\":\"TestCDApp\",\"CodeDeployDeploymentConfigName\":
\"CodeDeployDefault.OneAtATime\",\"CodeDeployDeploymentGroupName\":\"TestCDDepGroup\",
\"CodeDeployIgnoreApplicationStopFailures\":false,\"CodeDeployRevision\":
{\"RevisionType\":\"S3\",\"S3Location\":{\"S3Bucket\":\"TestBucket\",\"S3BundleType\":
\"tar\",\"S3Key\":\"TestKey\"}}}}"Test\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for the CodeDeploy application deployment CT; this example names it DeployCDAppParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-2edc3sd1sqmrb" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > DeployCDAppParams.json
```

2. Modify the JSON file as follows. For example, you can replace the contents with something like this:

```
{
"Description":                      "Deploy WordPress CodeDeploy Application",
"VpcId":                            "VPC_ID",
"Name":                             "WP CodeDeploy Deployment Group",
"TimeoutInMinutes":                 360,
"Parameters":   {
    "CodeDeployApplicationName":        "WordPressCDApp",
    "CodeDeployDeploymentGroupName":    "WordPressCDDepGroup",
    "CodeDeployIgnoreApplicationStopFailures": false,
    "CodeDeployRevision": {
      "RevisionType": "S3",
      "S3Location": {
        "S3Bucket": "ACCOUNT_ID.BUCKET_NAME",
        "S3BundleType": "zip",
        "S3Key": "wordpress.zip" }
        }
    }
}
```

3. Output the JSON template for CreateRfc to a file in your current folder; this example names it DeployCDAppRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeployCDAppRfc.json
```

4. Modify and save the DeployCDAppRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-2edc3sd1sqmrb",
"Title":                "CD-Deploy-For-CD-APP-Stack-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the DeployCDAppRfc file:

```
aws amscm create-rfc --cli-input-json file://DeployCDAppRfc.json  --execution-
parameters file://DeployCDAppParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see Create a deployment with CodeDeploy.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2edc3sd1sqmrb.

Example: Required Parameters

```
{
  "Description": "Stack Description.",
  "VpcId": "vpc-01234567890abcdef",
  "Name": "Name your stack",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "CodeDeployApplicationName": "foobarapp",
    "CodeDeployDeploymentGroupName": "myfoogroup",
    "CodeDeployRevision": {
      "RevisionType": "S3",
      "S3Location": {
        "S3Bucket": "mybucket",
        "S3BundleType": "zip",
        "S3Key": "mykey"
      }
    }
  }
}
```

Example: All Parameters

```
{
  "Description": "Stack Description.",
```

```
  "VpcId": "vpc-12345678",
  "Name": "Name your stack",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "CodeDeployApplicationName": "foobarapp",
    "CodeDeployDeploymentConfigName": "CodeDeployDefault.HalfAtATime",
    "CodeDeployDeploymentGroupName": "myfoogroup",
    "CodeDeployIgnoreApplicationStopFailures": false,
    "CodeDeployRevision": {
      "RevisionType": "S3",
      "S3Location": {
        "S3Bucket": "mybucket",
        "S3BundleType": "zip",
        "S3ETag": "1234567",
        "S3Key": "mykey",
        "S3Version": "versionfoo"
      }
    }
  }
}
```

CodeDeploy Deployment Group | Create

Use to create an AWS CodeDeploy application deployment group, an entity that describes what instances to deploy a given application to.

Full classification: Deployment | Applications | CodeDeploy deployment group | Create

Create CodeDeploy deployment group

Creating a CodeDeploy deployment group with the console

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a CodeDeploy deployment group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2gd0u847qd9d2" --change-type-version
 "1.0" --title "Stack-Create-CD-Dep-Group" --execution-parameters "{\"Description
\":\"TestCdDepGroupRfc\",\"VpcId\":\"VPC_ID\",\"StackTemplateId\":\"stm-
sp9lrk00000000000\",\"Name\":\"MyTestCDDepGroup\",\"TimeoutInMinutes\":60,\"Parameters
\":{\"CodeDeployApplicationName\":\"TestCDApp\",\"CodeDeployAutoScalingGroups\":
[\"TestASG\"],\"CodeDeployDeploymentConfigName\":\"CodeDeployDefault.OneAtATime\",
\"CodeDeployDeploymentGroupName\":\"Test\",\"CodeDeployServiceRoleArn\":
\"arn:aws:iam::000000000:role/aws-codedeploy-role\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema to a file in your current folder; this example names it CreateCDDepGroupParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2gd0u847qd9d2"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateCDDepGroupParams.json
   ```

2. Modify and save the JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":                    "CreateCDDeploymentGroup",
   "VpcId":                          "VPC_ID",
   "StackTemplateId":                "stm-sp9lrk00000000000",
   "Name":                           "WordPressCDAppGroup",
   "TimeoutInMinutes":               60,
   "Parameters":   {
       "CodeDeployApplicationName":        "WordPressCDApp",
       "CodeDeployAutoScalingGroups":      ["ASG_NAME"],
       "CodeDeployDeploymentConfigName":   "CodeDeployDefault.HalfAtATime",
       "CodeDeployDeploymentGroupName":    "UNIQUE_CDDepGroupNAME",
       "CodeDeployServiceRoleArn":         "arn:aws:iam::ACCOUNT_ID:role/aws-
   codedeploy-role"
       }
   }
   ```

3. Output the JSON template for CreateRfc to a file in your current folder; this example names it CreateCDDepGroupRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateCDDepGroupRfc.json
```

4. Modify and save the JSON file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2gd0u847qd9d2",
"Title":                "CD-Dep-Group-RFC"
}
```

5. Create the RFC, specifying the CreateCDDepGroupRfc file and the execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CreateCDDepGroupRfc.json --execution-
parameters file://CreateCDDepGroupParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS CodeDeploy deployment groups, see Create a Deployment Group with AWS CodeDeploy.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2gd0u847qd9d2.

Example: Required Parameters

```
{
  "Description": "Stack Description.",
  "VpcId": "vpc-01234567890abcdef",
  "StackTemplateId": "stm-sp9lrk00000000000",
  "Name": "Name your stack",
  "TimeoutInMinutes": 60,
  "Parameters": {
```

```
    "CodeDeployApplicationName": "foobarapp",
    "CodeDeployAutoScalingGroups": ["myfooasg"],
    "CodeDeployDeploymentGroupName": "mydeploymentgroup",
    "CodeDeployServiceRoleArn": "foo::arn::bar"
  }
}
```

Example: All Parameters

```
{
  "Description": "Stack Description.",
  "VpcId": "vpc-01234567890abcdef",
  "StackTemplateId": "stm-sp9lrk00000000000",
  "Name": "Name your stack",
  "Tags": [{"Key":"foo","Value":"bar"}],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "CodeDeployApplicationName": "foobarapp",
    "CodeDeployAutoScalingGroups": ["myfooasg"],
    "CodeDeployDeploymentConfigName": "CodeDeployDefault.HalfAtATime",
    "CodeDeployDeploymentGroupName": "mydeploymentgroup",
    "CodeDeployServiceRoleArn": "foo::arn::bar"
  }
}
```

CodeDeploy Deployment Group | Create (For EC2 Instance)

Create an AWS CodeDeploy application deployment group specifically for an EC2 instance as target. Tags you create in the EC2 instances, and specify here (EC2FilterTag1, 2, and 3), mark the instances as targets for the deployment group. A name for the deployment group is automatically generated.

Full classification: Deployment | Applications | CodeDeploy deployment group | Create (for EC2 instance)

Change Type Details

Change type ID	ct-00tlkda4242x7
Current version	1.0

Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create CodeDeploy deployment group for EC2

Creating a CodeDeploy deployment group for EC2 with the console

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a CodeDeploy deployment group for EC2 with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-00tlkda4242x7" --change-type-
version "1.0" --title "Stack-Create-CD-Ec2-Dep-Group" --execution-parameters
 "{\"Description\":\"MyTestCdDepEc2DepGroup\",\"VpcId\":\"VPC_ID\",\"Name\":
\"TestCDDepEc2Group\",\"StackTemplateId\":\"stm-n3hsoirgqeqqdbpk2\",\"TimeoutInMinutes
\":60,\"Parameters\":{\"ApplicationName\":\"TestCDApp\",\"DeploymentConfigName\":
\"CodeDeployDefault.OneAtATime\",\"AutoRollbackEnabled\":\"False\",\"EC2FilterTag\":
\"Name=Test\",\"EC2FilterTag2\":\"\",\"EC2FilterTag3\":\"\",\"ServiceRoleArn\":\"\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema to a file; this example names it CreateCDDepGroupEc2Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-00tlkda4242x7"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateCDDepGroupEc2Params.json
   ```

2. Modify and save the JSON file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"Description":                          "CreateCDDepGroupEc2",
"VpcId":                                "VPC_ID",
"StackTemplateId":                      "stm-n3hsoirgqeqqdbpk2",
"Name":                                 "CDAppGroupEc2",
"TimeoutInMinutes":                     60,
"Parameters":   {
    "ApplicationName":          "CDAppEc2",
    "DeploymentConfigName":     "CodeDeployDefault.OneAtATime",
    "CodeDeployDeploymentGroupName":    "UNIQUE_CDDepGroupNAME",
    "CodeDeployServiceRoleArn":         "arn:aws:iam::ACCOUNT_ID:role/aws-
codedeploy-role"
    }
}
```

3. Output the JSON template for CreateRfc to a file in your current folder; this example names it CreateCDDepGroupEc2Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateCDDepGroupEc2Rfc.json
```

4. Modify and save the JSON file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-00tlkda4242x7",
"Title":                "CD-Dep-Group-For-Ec2-Stack-RFC"
}
```

5. Create the RFC, specifying the CreateCDDepGroupEc2Rfc file and the execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CreateCDDepGroupEc2Rfc.json --
execution-parameters file://CreateCDDepGroupEc2Params.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS CodeDeploy deployment groups, see Create a Deployment Group with AWS CodeDeploy.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-00tlkda4242x7.

Example: Required Parameters

```
{
  "Description": "Stack Description.",
  "VpcId": "vpc-01234567890abcdef",
  "StackTemplateId": "stm-n3hsoirgqeqqdbpk2",
  "Name": "Name your stack",
  "Tags": [{"Key":"foo","Value":"bar"}],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ApplicationName": "foobarapp",
    "EC2FilterTag": "Key1=Value1"
  }
}
```

Example: All Parameters

```
{
  "Description": "Stack Description.",
  "VpcId": "vpc-01234567890abcdef",
  "StackTemplateId": "stm-n3hsoirgqeqqdbpk2",
  "Name": "Name your stack",
  "Tags": [{"Key":"foo","Value":"bar"}],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "ApplicationName": "foobarapp",
    "DeploymentConfigName": "CodeDeployDefault.HalfAtATime",
    "AutoRollbackEnabled": "True",
    "EC2FilterTag": "Key1=Value1",
    "EC2FilterTag2": "Key2=Value2",
    "EC2FilterTag3": "Key3=Value3",
    "ServiceRoleArn": "arn:aws:iam::123456789012:role/test02"
  }
}
```

AWS Backup Subcategory

Change Type Items and Operations in the AWS Backup Subcategory

- Backup Plan | Create

Backup Plan | Create

Create an AWS Backup plan, a policy expression that defines when and how you want to back up your AWS resources.

Full classification: Deployment | AWS Backup | Backup plan | Create

Change Type Details

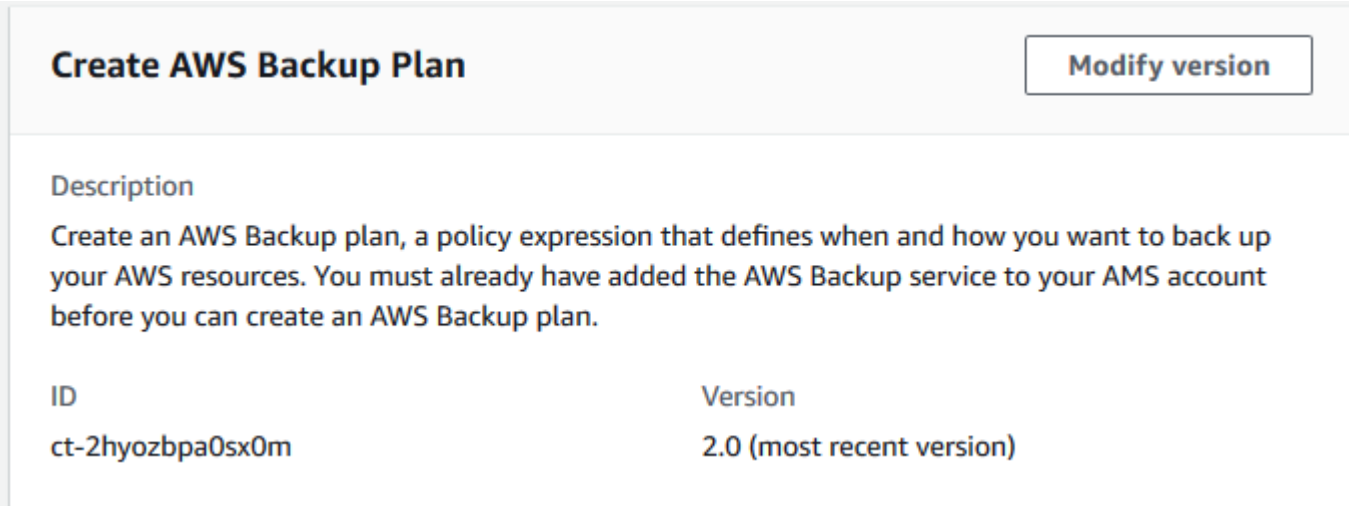
Change type ID	ct-2hyozbpa0sx0m
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create AWS Backup plan

Creating an AWS Backup plan with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an AWS Backup plan with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

With all parameters for one rule:

```
aws amscm create-rfc --change-type-id "ct-2hyozbpa0sx0m" --change-type-version "2.0" --
title "AWS Backup custom backup plan for AMS" \
  --description "RFC_DESCRIPTION" \
  --execution-parameters "{\"VpcId\":\"VPC_ID\",\"Description\":\"PLAN_DESCRIPTION\",
\"Parameters\":{\"BackupPlanName\":\"PLAN_NAME\",\"ResourceTagKey\":\"TAG_KEY\",
\"ResourceTagValue\":\"TAG_VALUE\",\"BackupRule1Name\":\"RULE_NAME\",
\"BackupRule1Vault\":\"VAULT\",\"BackupRule1CompletionWindowMinutes
\":120,\"BackupRule1ScheduleExpression\":\"cron(0 1 ? * * *)\",
\"BackupRule1DeleteAfterDays\":90,\"BackupRule1MoveToColdStorageAfterDays\":365,
\"BackupRule1StartWindowMinutes\":60,\"BackupRule1RecoveryPointTagKey\":\"TAG_KEY\",
\"BackupRule1RecoveryPointTagValue\":\"TAG_VALUE\,\"BackupRule1EnableContinuousBackup
\":\"false\",\"BackupRule1CopyActionsDestVaultArn\":\"VAULT\",
\"BackupRule1CAMoveToColdStorageAfterDays\":0,\"BackupRule1CopyActionsDeleteAfterDays
\":90},\"StackTemplateId\":\"stm-sc68a620000000000\",\"TimeoutInMinutes\":60,\"Name\":
\"TEST_STACK\"}"
```

With only required parameters for one rule:

```
aws amscm create-rfc --change-type-id "ct-2hyozbpa0sx0m" --change-type-version "2.0" --
title "AWS Backup custom backup plan for AMS" \
  --description "RFC_DESCRIPTION" \
  --execution-parameters "{\"VpcId\":\"VPC_ID\",\"Description\":\"PLAN_DESCRIPTION\",
\"Parameters\":{\"BackupPlanName\":\"PLAN_NAME\",\"ResourceTagKey\":\"TAG_KEY\",
\"ResourceTagValue\":\"TAG_VALUE\",\"BackupRule1Name\":\"RULE_NAME\",\"BackupRule1Vault
\":\"VAULT\",\"BackupRule1ScheduleExpression\":\"cron(0 1 ? * * *)\"},\"StackTemplateId
\":\"stm-sc68a620000000000\",\"TimeoutInMinutes\":60,\"Name\":\"TEST_STACK\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateBackupPlanParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2hyozbpa0sx0m"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateBackupPlanParams.json
   ```

2. Modify and save the CreateBackupPlanParams file. Note that the **BackupRule1EnableContinuousBackup** parameter set to **true** causes AWS Backup to create continuous backups capable of point-in-time restore (PITR); the default for this parameter is **false**.

```
{
    "VpcId": "VPC_ID",
    "Description": "PLAN_DESCRIPTION",
    "Parameters": {
      "BackupPlanName" : "PLAN_NAME",
      "ResourceTagKey" : "TAG_KEY",
      "ResourceTagValue" : "TAG_VALUE",
      "BackupRule1Name" : "RULE_NAME",
      "BackupRule1Vault" : "VAULT",
      "BackupRule1EnableContinuousBackup" : "true",
      "BackupRule1ScheduleExpression" : "cron(0 1 ? * * *)"
    },
    "StackTemplateId": "stm-sc68a620000000000",
    "TimeoutInMinutes": 60,
    "Name": "TEST_STACK"
}
```

3. Output the RFC template to a file in your current folder; this example names it CreateBackupPlanRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateBackupPlanRfc.json
```

4. Modify and save the CreateBackupPlanRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId" : "ct-2hyozbpa0sx0m",
  "Version" : "2.0",
   "Title": "AWS Backup create backup plan"
}
```

5. Create the RFC, specifying the CreateBackupPlanRfc file and the CreateBackupPlanParams file:

```
aws amscm create-rfc --cli-input-json file://CreateBackupPlanRfc.json --execution-
parameters file://CreateBackupPlanParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- The continuous backup configuration requires some additional knowledge. With continuous backups, you can restore your AWS Backup-supported resource by rewinding it back to a specific time that you choose, within 1 second of precision (going back a maximum of 35 days). In AMS Advanced, you configure this with the **BackupRule1EnableContinuousBackup** parameter set to **true**, which causes AWS Backup to create continuous backups capable of point-in-time restore (PITR). To learn more, see Restoring to a specified time using Point-In-Time Recovery (PITR).
- Not all resource types supported by AWS Backup are enabled by default. Review the enabled resource types in your account using Getting Started 1: Service Opt-In.
- If you need to change your backup plan, open an RFC using the Other | Create (Review Required) CT (ct-1e1xtak34nx76).
- To learn more about AWS Backup, see AWS Backup: How It Works.
- Before creating backup plans, confirm supported resources at Feature availability by resource.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2hyozbpa0sx0m.

Example: Required Parameters

```
{
  "Description": "This is a test description.",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "Test Stack",
  "Parameters": {
    "BackupPlanName": "MyCustomBackupPlan",
    "ResourceTagKey": "custom_backup_test",
    "ResourceTagValue": "true",
    "BackupRule1Name": "BackupRule1",
    "BackupRule1Vault": "ams-custom-backups",
    "BackupRule1CompletionWindowMinutes": 1440,
    "BackupRule1ScheduleExpression": "cron(0 2 ? * * *)",
    "BackupRule1DeleteAfterDays": 0,
    "BackupRule1MoveToColdStorageAfterDays": 0,
    "BackupRule1StartWindowMinutes": 180,
    "BackupRule1RecoveryPointTagKey": "test",
    "BackupRule1RecoveryPointTagValue": "test"
  },
```

```
  "TimeoutInMinutes": 60,
  "StackTemplateId": "stm-sc68a620000000000"
}
```

Example: All Parameters

```
{
  "Description": "This is a test description.",
  "VpcId": "vpc-1234567890abcdef0",
  "Name": "Test Stack",
  "Parameters": {
    "BackupPlanName": "MyCustomBackupPlan",
    "ResourceTagKey": "custom_backup_test",
    "ResourceTagValue": "true",
    "WindowsVSS" : "disabled",

    "BackupRule1Name": "BackupRule1",
    "BackupRule1Vault": "ams-custom-backups",
    "BackupRule1CompletionWindowMinutes": 1440,
    "BackupRule1ScheduleExpression": "cron(0 2 ? * * *)",
    "BackupRule1DeleteAfterDays": 0,
    "BackupRule1MoveToColdStorageAfterDays": 0,
    "BackupRule1StartWindowMinutes": 180,
    "BackupRule1RecoveryPointTagKey": "test",
    "BackupRule1RecoveryPointTagValue": "test",
    "BackupRule1EnableContinuousBackup": "false",

    "BackupRule2Name": "BackupRule2",
    "BackupRule2Vault": "ams-custom-backups",
    "BackupRule2CompletionWindowMinutes": 1440,
    "BackupRule2ScheduleExpression": "cron(0 2 ? * * *)",
    "BackupRule2DeleteAfterDays": 0,
    "BackupRule2MoveToColdStorageAfterDays": 0,
    "BackupRule2StartWindowMinutes": 180,
    "BackupRule2RecoveryPointTagKey": "test",
    "BackupRule2RecoveryPointTagValue": "test",
    "BackupRule2EnableContinuousBackup": "false",

    "BackupRule3Name": "BackupRule3",
    "BackupRule3Vault": "ams-custom-backups",
    "BackupRule3CompletionWindowMinutes": 1440,
    "BackupRule3ScheduleExpression": "cron(0 2 ? * * *)",
    "BackupRule3DeleteAfterDays": 0,
```

```

Directory Service Subcategory

Change Type Items and Operations in the Directory Service Subcategory

DNS | Create Conditional Forwarder

Create AD DNS conditional forwarder with up to five DNS servers associated with a remote domain name. For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Deployment | Directory Service | DNS | Create conditional forwarder

Change Type Details

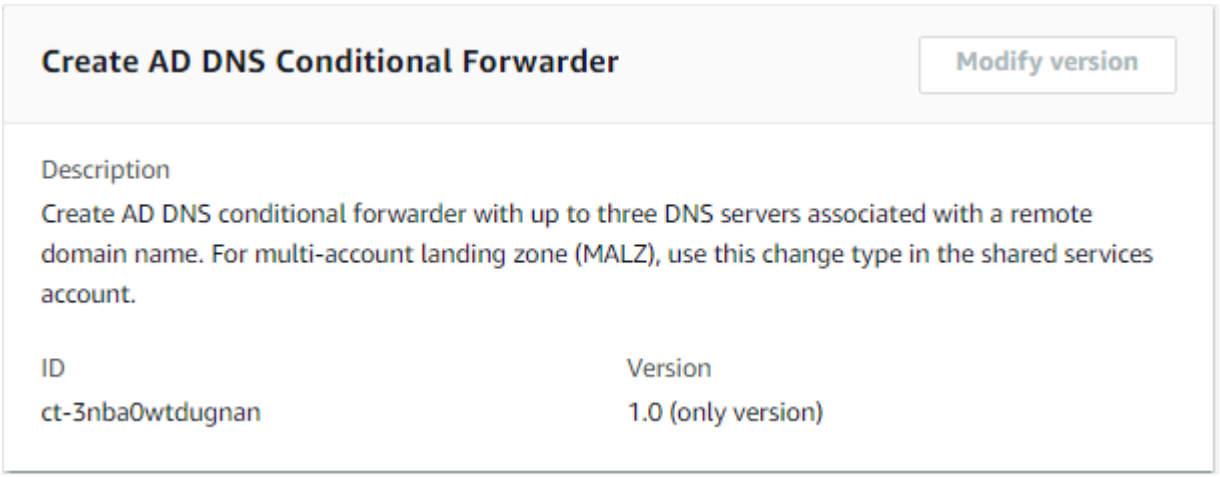
Change type ID	ct-3nba0wtdugnan
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create DNS conditional forwards

Creating DNS conditional forwards with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating DNS conditional forwards with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3nba0wtdugnan" --change-type-version "1.0"
 --title "Create conditional forwarders" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-CreateADDNSConditionalForwarder-Admin\",\"Region\": \"us-
east-1\",\"Parameters\": {\"RemoteDomainName\": [\"Domain_Name\"], \"IPAddresses\":
 [\"132.133.134.135\", \"135.134.133.132\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CondForwardCreateParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3nba0wtdugnan"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CondForwardCreateParams.json
   ```

   Modify and save the CondForwardCreateParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateADDNSConditionalForwarder-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "RemoteDomainName": [
         "Domain_Name"
       ],
       "IPAddresses": [
         "132.133.134.135", "135.134.133.132"
       ]
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it CondForwardCreateRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CondForwardCreateRfc.json
   ```

3. Modify and save the CondForwardCreateRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":         "ct-3nba0wtdugnan",
   ```

```
"ChangeTypeVersion":    "1.0",
"Title":                "Create conditional forwarders"
}
```

4. Create the RFC, specifying the CondForwardCreateRfc file and the CondForwardCreateParams file:

```
aws amscm create-rfc --cli-input-json file://CondForwardCreateRfc.json --execution-
parameters file://CondForwardCreateParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3nba0wtdugnan.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateADDNSConditionalForwarder-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "RemoteDomainName": ["test.test1.com"],
    "IPAddresses": ["10.0.0.1", "10.0.0.2"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateADDNSConditionalForwarder-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "RemoteDomainName": ["test.test1.com"],
    "IPAddresses": ["10.0.0.1", "10.0.0.2"]
  }
}
```

DNS | Create Group Managed Service Account

Create a new Active Directory (AD) Group Managed Service Account (gMSA). For multi-account landing zone (MALZ), use this change type in the shared services account.

Full classification: Deployment | Directory Service | DNS | Create group managed service account

Change Type Details

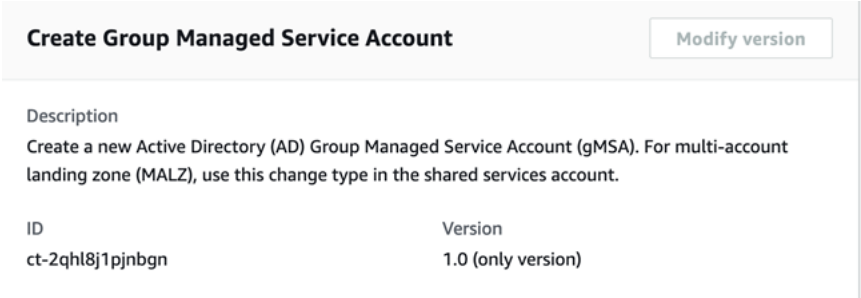
Change type ID	ct-2qhl8j1pjnbgn
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create group managed service account

Creating a group managed service account with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a group managed service account with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2qhl8j1pjnbgn" --change-type-version
 "1.0" --title "Create Group Managed Service Account" --execution-parameters
 "{\"DocumentName\": \"AWSManagedServices-CreateADGroupManagedServiceAccount-Admin
\",\"Region\": \"us-east-1\",\"Parameters\": {\"AccountName\": [\"Test-Sample\"],
\"ManagedPasswordIntervalInDays\": [\"30\"],\"PrincipalAllowedToRetrievePassword
\": [\"Test-admin\"],\"ComputerName\": [\"TestComputer\"],\"DNSHostName\":
 [\"test.domain.com\"],\"KerberosEncryptionType\": [\"RC4\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it GroupManServAcctCreateParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2qhl8j1pjnbgn"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    GroupManServAcctCreateParams.json
   ```

Modify and save the GroupManServAcctCreateParams file. For example, you can replace the contents with something like this:

```
{
  "DocumentName": "AWSManagedServices-CreateADGroupManagedServiceAccount-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "AccountName": [
      "Test-Sample"
    ],
    "ManagedPasswordIntervalInDays": [
      "30"
    ],
    "PrincipalAllowedToRetrievePassword": [
      "Test-admin"
    ],
    "ComputerName": [
      "Test-Computer"
    ],
    "DNSHostName": [
      "test.domain.com"
    ],
    "KerberosEncryptionType": [
      "RC4"
    ]
  }
}
```

2. Output the RFC template to a file in your current folder; this example names it GroupManServAcctCreateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > GroupManServAcctCreateRfc.json
```

3. Modify and save the GroupManServAcctCreateRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-2qhl8j1pjnbgn",
  "Title": "Create Group Managed Service Account"
}}
```

4. Create the RFC, specifying the GroupManServAcctCreateRfc file and the GroupManServAcctCreateParams file:

```
aws amscm create-rfc --cli-input-json file://GroupManServAcctCreateRfc.json --
execution-parameters file://GroupManServAcctCreateParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2qhl8j1pjnbgn.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateADGroupManagedServiceAccount-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "AccountName": ["Sample-account"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateADGroupManagedServiceAccount-Admin",
  "Region": "us-east-1",
  "Parameters": {
    "AccountName": ["Sample-account"],
    "ManagedPasswordIntervalInDays": ["30"],
    "PrincipalAllowedToRetrievePassword": ["Sample_Principal"],
    "ComputerName": ["Sample-Computer"],
    "DNSHostName": ["test.domain.com"],
    "KerberosEncryptionType": ["RC4,AES128,AES256"]
  }
}
```

Ingestion Subcategory

Change Type Items and Operations in the Ingestion Subcategory

- Stack from CloudFormation Template | Create
- Stack from Migration Partner Migrated Instance | Create

Stack from CloudFormation Template | Create

Create a stack by pointing to a customized CloudFormation (CFN) template in an S3 bucket, or by pasting the contents of that template as input to this change type.

Full classification: Deployment | Ingestion | Stack from CloudFormation Template | Create

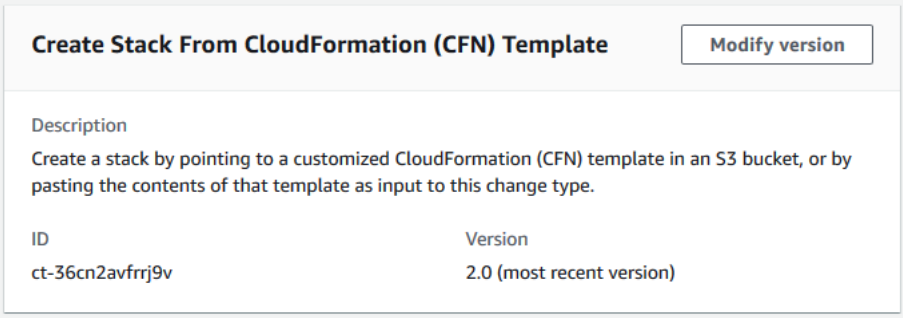
Change Type Details

Change type ID	ct-36cn2avfrrj9v
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create CloudFormation ingest stack

Creating a CloudFormation ingest stack using the console



To create a CloudFormation ingest stack using the console

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a CloudFormation ingest stack using the CLI

To create a CloudFormation ingest stack using the CLI

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

1. Prepare the CloudFormation template that you will use to create the stack, and upload it to your S3 bucket. For important details, see AWS CloudFormation Ingest Guidelines, Best Practices, and Limitations.
2. Create and submit the RFC to AMS:

- Create and save the execution parameters JSON file, include the CloudFormation template parameters that you want. The following example names it CreateCfnParams.json.

  Example Web application stack CreateCfnParams.json file:

```
{
  "Name": "cfn-ingest",
  "Description": "CFNIngest Web Application Stack",
  "VpcId": "VPC_ID",
  "CloudFormationTemplateS3Endpoint": "$S3_URL",
  "TimeoutInMinutes": 120,
  "Tags": [
   {
    "Key":   "Enviroment Type"
    "Value": "Dev",
   },
   {
    "Key":   "Application"
    "Value": "PCS",
   }
  ],
  "Parameters": [
   {
    "Name": "Parameter-for-S3Bucket-Name",
    "Value":  "BUCKET-NAME"
   },
   {
    "Name": "Parameter-for-Image-Id",
    "Value":  "AMI-ID"
   }
  ],
}
```

  Example SNS topic CreateCfnParams.json file:

```
{
  "Name": "cfn-ingest",
  "Description": "CFNIngest Web Application Stack",
  "CloudFormationTemplateS3Endpoint": "$S3_URL",
  "Tags": [
    {"Key": "Enviroment Type", "Value": "Dev"}
  ],
```

```
  "Parameters": [
    {"Name": "TopicName", "Value": "MyTopic1"}
  ]
}
```

3. Create and save the RFC parameters JSON file with the following content. The following example names it CreateCfnRfc.json file:

```
{
   "ChangeTypeId": "ct-36cn2avfrrj9v",
   "ChangeTypeVersion": "2.0",
   "Title": "cfn-ingest"
}
```

4. Create the RFC, specifying the CreateCfnRfc file and the CreateCfnParams file:

```
aws amscm create-rfc --cli-input-json file://CreateCfnRfc.json  --execution-
parameters file://CreateCfnParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Note

This change type is at version 2.0 and is automated (not manually executed). This allows the CT execution to go more quickly, and, a new parameter, **CloudFormationTemplate**, allows you to paste into the RFC a custom CloudFormation template. Additionally, In this version, we do not attach the default AMS security groups if the you specify your own security groups. If you do not specify your own security groups in the request, AMS will attach the AMS default security groups. In CFN Ingest v1.0, we always appended the AMS default security groups whether or not you provided your own security groups.
AMS has enabled 17 AMS Self-Provisioned services for use in this change type. For information about supported resources, see CloudFormation Ingest Stack: Supported Resources.

Note

Version 2.0 accepts an S3 endpoint that is not a presigned URL.
If you use the previous version of this CT, the **CloudFormationTemplateS3Endpoint** parameter value must be a presigned URL.
Example command for generating a presigned S3 bucket URL (Mac/Linux):

```
export S3_PRESIGNED_URL=$(aws s3 presign DASHDASHexpires-in 86400
 s3://BUCKET_NAME/CFN_TEMPLATE.json)
```

Example command for generating a presigned S3 bucket URL (Windows):

```
for /f %i in ('aws s3 presign DASHDASHexpires-in 86400
 s3://BUCKET_NAME/CFN_TEMPLATE.json') do set S3_PRESIGNED_URL=%i
```

See also Creating Pre-Signed URLs for Amazon S3 Buckets.

Note

If the S3 bucket exists in an AMS account, you must use your AMS credentials for this command. For example, you may need to append `--profile saml` after obtaining your AMS AWS Security Token Service (AWS STS) credentials.

Related change types: Approve a CloudFormation ingest stack changeset, Update AWS CloudFormation ingest stack

To learn more about AWS CloudFormation, see AWS CloudFormation. To see CloudFormation templates, open the AWS CloudFormation Template Reference.

Validating a AWS CloudFormation ingest

The template is validated to ensure that it can be created in an AMS account. If it passes validation, it's updated to include any resources or configurations required for it to conform with AMS. This includes adding resources such as Amazon CloudWatch alarms in order to allow AMS Operations to monitor the stack.

The RFC is rejected if any of the following are true:

- RFC JSON Syntax is incorrect or does not follow the given format.
- The provided S3 bucket presigned URL is not valid.
- The template is not valid AWS CloudFormation syntax.
- The template does not have defaults set for all parameter values.
- The template fails AMS validation. For AMS validation steps, see the information later in this topic.

The RFC fails if the CloudFormation stack fails to create due to a resource creation issue.

To learn more about CFN validation and validator, see Template Validation and CloudFormation ingest stack: CFN validator examples.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-36cn2avfrrj9v.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Stack from Migration Partner Migrated Instance | Create

Migrate a running non-AMS instance into an AMS stack, in a given AMS-managed VPC and subnet. Must be an instance that was configured through a cloud migration service. Tags that exist on the instance to be migrated will be applied to the resources created in addition to tags requested in the RFC. Number of total tags between the instance to be migrated and the resources created cannot exceed fifty. Set a Name tag to give the EC2 instance, and AMI, names in the EC2 console. Please note that your RFC will be rejected if a tag on the instance to be migrated has the same key as a tag supplied in the RFC.

Full classification: Deployment | Ingestion | Stack from migration partner migrated instance | Create

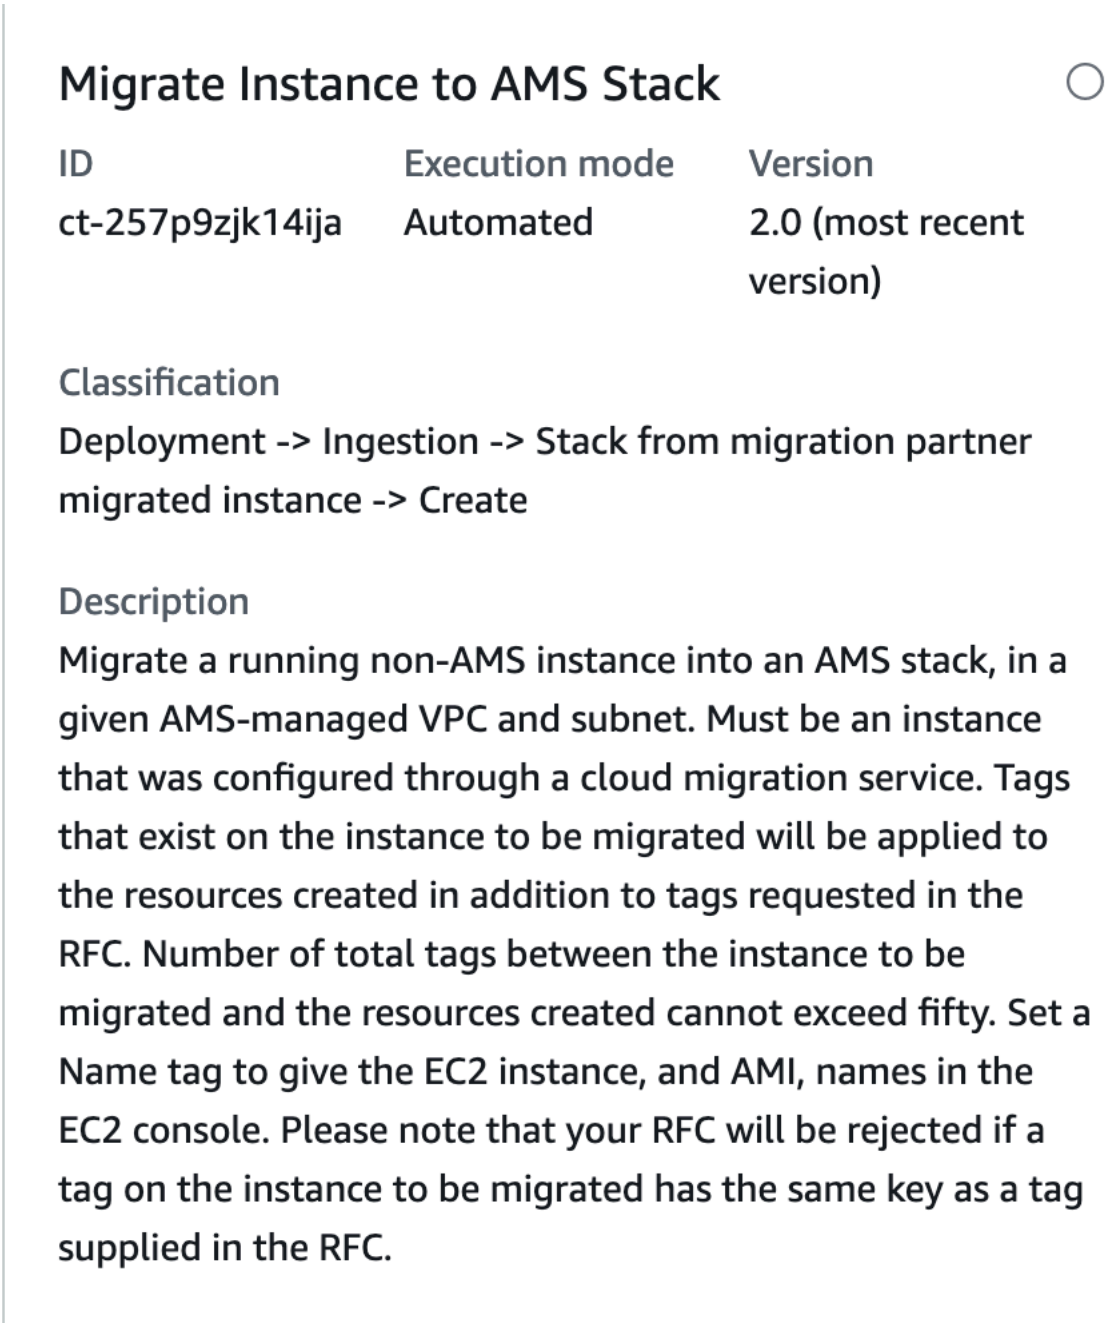
Change type ID	ct-257p9zjk14ija
Current version	3.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Workload Ingest Stack: Creating

Migrating an instance to an AMS stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

> **Note**
>
> If the RFC is rejected, the execution output includes a link to Amazon CloudWatch logs. AMS Workload Ingest (WIGS) RFCs are rejected when requirements are not met; for example, if anti-virus software is detected on the instance. The CloudWatch logs will include information about the failed requirement and the actions to take for remediation.

Migrating an instance to an AMS stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC

parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

You can use the AMS CLI to create an AMS instance from a non-AMS instance migrated to an AMS account.

Note

Be sure you have followed the prerequisites; see Migrating Workloads: Prerequisites for Linux and Windows.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-257p9zjk14ija" --change-type-version "2.0" --
title "AMS-WIG-TEST-NO-ACTION" --execution-parameters "{\"InstanceId\":\"INSTANCE_ID\",
\"TargetVpcId\":\"VPC_ID\",\"TargetSubnetId\":\"SUBNET_ID\",\"TargetInstanceType\":
\"t2.large\",\"ApplyInstanceValidation\":true,\"Name\":\"WIG-TEST\",\"Description\":
\"WIG-TEST\",\"EnforceIMDSV2\":\"false\"}"
```

TEMPLATE CREATE:

1. 0utput the execution parameters JSON schema for this change type to a file; example names it MigrateStackParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-257p9zjk14ija" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > MigrateStackParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "InstanceId":          "MIGRATED_INSTANCE_ID",
   "TargetVpcId":         "VPC_ID",
   "TargetSubnetId":      "SUBNET_ID",
   "Name":                "Migrated-Stack",
   "Description":         "Create-Migrated-Stack",
   "EnforceIMDSV2":       "false"
   }
   ```

3. Output the RFC template JSON file; example names it MigrateStackRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > MigrateStackRfc.json
   ```

4. Modify and save the MigrateStackRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":         "ct-257p9zjk14ija",
   "ChangeTypeVersion":    "2.0",
   "Title":                "Migrate-Stack-RFC"
   ```

```
}
```

5. Create the RFC, specifying the MigrateStackRfc file and the MigrateStackParams file:

```
aws amscm create-rfc --cli-input-json file://MigrateStackRfc.json  --execution-
parameters file://MigrateStackParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

   The new instance appears in the Instance list for the application owner's account for the relevant VPC.

6. Once the RFC completes successfully, notify the application owner so he or she can log into the new instance and verify that the workload is operational.

> **Note**
>
> If the RFC is rejected, the execution output includes a link to Amazon CloudWatch logs. AMS Workload Ingest (WIGS) RFCs are rejected when requirements are not met; for example, if anti-virus software is detected on the instance. The CloudWatch logs will include information about the failed requirement and the actions to take for remediation.

Tips

> **Note**
>
> Be sure you have followed the prerequisites; see Migrating Workloads: Prerequisites for Linux and Windows.

> **Note**
>
> If a tag on the instance being migrated has the same key as a tag supplied in the RFC, the RFC fails.

Note

You can specify up to four Target IDs, Ports, and Availability Zones.

Note

If the RFC is rejected, the execution output includes a link to Amazon CloudWatch logs. AMS Workload Ingest (WIGS) RFCs are rejected when requirements are not met; for example, if anti-virus software is detected on the instance. The CloudWatch logs will include information about the failed requirement and the actions to take for remediation.

Note

If the RFC is rejected, the execution output includes a link to Amazon CloudWatch logs. AMS Workload Ingest (WIGS) RFCs are rejected when requirements are not met; for example, if anti-virus software is detected on the instance. The CloudWatch logs will include information about the failed requirement and the actions to take for remediation.

If needed, see Workload ingestion (WIGS) failure.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-257p9zjk14ija.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "InstanceId" : "i-1234567890abababa",
  "TargetVpcId" : "vpc-01234567890abcdef",
  "TargetSubnetId" : "subnet-12345678901234567",
  "TargetSecurityGroupIds": ["sg-01234567890abcdef", "sg-1234567890abcdef0"],
```

```
  "Name": "My Stack",
  "Description": "This is my stack",
  "TargetInstanceType": "t2.large",
  "ApplyInstanceValidation": true,
  "KmsKeyId": "arn:aws:kms:us-east-1:012345678910:key/a3ccc020-
abcd-1234-8d69-2f060c3c1234",
  "EnforceIMDSV2": "true",

```

Managed Firewall Subcategory

Change Type Items and Operations in the Managed Firewall Subcategory

- Outbound (Palo Alto) | Create Allow List
- Outbound (Palo Alto) | Create Security Policy

Outbound (Palo Alto) | Create Allow List

Create an allow list file for AMS managed Palo Alto firewall - Outbound.

Full classification: Deployment | Managed Firewall | Outbound (Palo Alto) | Create allow list

Change Type Details

Change type ID	ct-309eozh6lpkr8
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create allow list for managed Palo Alto outbound firewall

Creating an allow list for your managed Palo Alto firewall with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an allow list for your managed Palo Alto firewall with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-309eozh6lpkr8" --change-type-version "1.0" --
title "Create Allow List" --execution-parameters "{ \"RequestType\": \"CreateAllowList
\", \"Parameters\": { "AllowListName": "CustomAllowList" } } "
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateAllowListParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-309eozh6lpkr8"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateAllowListParams.json
   ```

2. Modify and save the CreateAllowListParams file. For example, you can replace the contents with something like this:

   ```
   {
     "RequestType": "CreateAllowList",
     "Parameters": {
         "AllowListName": "CustomAllowList"
     }
   }
   ```

3. Output the RFC template JSON file to a file named CreateAllowListRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAllowListRfc.json
```

4. Modify and save the CreateAllowListRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-309eozh6lpkr8",
"Title":                "Create-Allow-List-RFC"
}
```

5. Create the RFC, specifying the CreateAllowList Rfc file and the CreateAllowListParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAllowListRfc.json  --execution-
parameters file://CreateAllowListParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Palo Alto managed firewall in AMS, see Managed Palo Alto egress firewall.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-309eozh6lpkr8.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Parameters": {
    "AllowListName": "test_file"
  },
  "RequestType": "CreateAllowList"
```

```
}
```

Outbound (Palo Alto) | Create Security Policy

Create a security policy for AMS managed Palo Alto firewall - Outbound.

Full classification: Deployment | Managed Firewall | Outbound (Palo Alto) | Create security policy

Change Type Details

Change type ID	ct-281dpwh9tqnan
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create security policy for managed Palo Alto outbound firewall

Creating a security policy for your managed Palo Alto firewall with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a security policy for your managed Palo Alto firewall with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-281dpwh9tqnan" --change-type-version
 "1.0" --title "Create Security Policy" --execution-parameters "{ \"RequestType\":
 \"CreateSecurityPolicy\", \"Parameters\": { "SecurityPolicyName": "custom-sec-name",
 "SourceAddresses": ["1.0.0.0"], "DestinationAddresses": ["2.0.0.0"], "AllowLists":
 ["CustomAllowList"], "ServicePorts": { "tcp": [20]: "udp": [30] }} } "
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateSecurityPolicyParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-281dpwh9tqnan"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateSecurityPolicyParams.json
   ```

2. Modify and save the CreateSecurityPolicyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "RequestType": "CreateSecurityPolicy",
     "Parameters": {
         "SecurityPolicyName": "custom-sec-name",
         "SourceAddresses": ["1.0.0.0"],
         "DestinationAddresses": ["2.0.0.0"],
   ```

```
      "AllowLists": [],
      "ServicePorts": {
            "tcp": [20]
            "udp": [30]
      }
  }
}
```

3. Output the RFC template JSON file to a file named CreateSecurityPolicyRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateSecurityPolicyRfc.json
```

4. Modify and save the CreateSecurityPolicyRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-281dpwh9tqnan",
"Title":                "Create-Security-Policy-RFC"
}
```

5. Create the RFC, specifying the CreateSecurityPolicy Rfc file and the CreateSecurityPolicyParams file:

```
aws amscm create-rfc --cli-input-json file://CreateSecurityPolicyRfc.json  --
execution-parameters file://CreateSecurityPolicyParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This automated change type applies only to AMS multi-account landing zone (MALZ).

To learn more about Palo Alto managed firewall in AMS, see Managed Palo Alto egress firewall.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-281dpwh9tqnan.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "Parameters": {
      "SecurityPolicyName": "custom-sec-pol",
      "SourceAddresses": ["10.0.0.1", "10.50.0.0/16"],
      "DestinationAddresses": ["1.1.1.1", "100.0.0.0/8", "amazon.com"],
      "ServicePorts": { "tcp": [1000, 1200] },
      "ActionType": "Allow",
      "EnablePolicy": false
    },
    "RequestType": "CreateSecurityPolicy"
}
```

Managed Landing Zone Subcategory

Change Type Items and Operations in the Managed Landing Zone Subcategory

- Application Account | Create VPC
- Application Account | Create VPC Additional CIDR and Subnets
- Management Account | Create Accelerate Account
- Management Account | Create Application Account (With VPC)
- Management Account | Create Custom OUs

- Networking Account | Create Transit Gateway Route Table

Application Account | Create VPC

Create a VPC with up to 10 private subnets and up to 5 optional public subnets per availability zone (AZ) for two or three AZ's.

Full classification: Deployment | Managed landing zone | Application account | Create VPC

Change Type Details

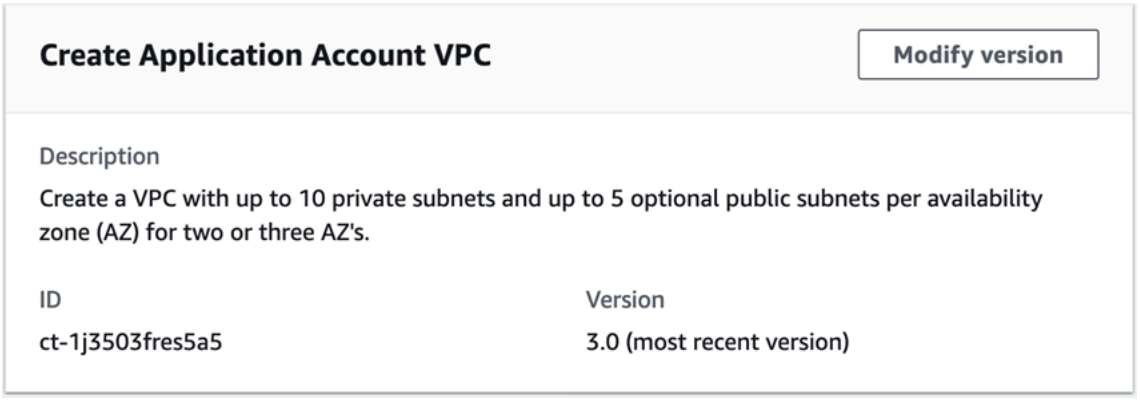
Change type ID	ct-1j3503fres5a5
Current version	3.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create VPC

Application account: Creating a VPC with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Application account: Creating a VPC with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Note

Run this change type from your Application account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1j3503fres5a5" --change-type-version "3.0"
 --title "Application account VPC onboarding" --execution-parameters "{\"VpcName\":
 \"VPC_NAME\", \"Parameters\": { \"NumberOfAZs\": \"INTEGER\", \"VPCCIDR\": \"X.X.X.X/
X\", \"PrivateSubnet1AZ1CIDR\": \"X.X.X.X/X\",\"PrivateSubnet1AZ2CIDR\": \"X.X.X.X/
X\", \"RouteType\": \"ROUTE_TYPE\", \"TransitGatewayApplicationRouteTableName\":
 \"TABLE_NAME\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateAppAcctVpcParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-1j3503fres5a5"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 CreateAppAcctVpcParams.json
```

2. Modify and save the CreateAppAcctVpcParams file. For example, you can replace the contents with something like this:

```
{
"VpcName": "TestVPC",
"Parameters": {
  "NumberOfAZs": "INTEGER",
  "VPCCIDR": "x.x.x.x/x",
  "PrivateSubnet1AZ1CIDR": "x.x.x.x/x",
  "PrivateSubnet1AZ2CIDR": "x.x.x.x/x",
  "PrivateSubnet1AZ3CIDR": "x.x.x.x/x",
  "PublicSubnetAZ1CIDR": "x.x.x.x/x",
  "PublicSubnetAZ2CIDR": "x.x.x.x/x",
  "PublicSubnetAZ3CIDR": "x.x.x.x/x",
  "RouteType": "ROUTE_TYPE",
  "TransitGatewayApplicationRouteTableName": "ROUTE_TABLE_NAME"
}
}
```

3. Output the RFC template JSON file to a file; this example names it CreateAppAcctVpcRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAppAcctVpcRfc.json
```

4. Modify and save the CreateAppAcctVpcRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-1j3503fres5a5",
"Title":                "App-Acct-Vpc-RFC"
}
```

5. Create the RFC, specifying the CreateAppAcctVpcRfc file and the CreateAppAcctVpcParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAppAcctVpcRfc.json  --execution-
parameters file://CreateAppAcctVpcParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- **Important**

  To create an additional public subnet in a new availability zone (AZ), a private subnet must already be present.

- This change type is now at version 3.0 and it has been automated (it is no longer manually run by AMS). The 2.0 version of this change type was a "review required" (manual) change type.
- To learn more about AMS multi-account landing zone, see VPC sharing: A new approach to multiple accounts and VPC management.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1j3503fres5a5.

Example: Required Parameters

```
{
  "VpcName": "TestVPC",
  "Parameters": {
    "VPCCIDR": "10.0.0.0/22",
    "NumberOfAZs": 2,
    "PrivateSubnet1AZ1CIDR": "10.0.0.0/24",
    "PrivateSubnet1AZ2CIDR": "10.0.1.0/24"
  }
}
```

Example: All Parameters

```
{
```

```
  "VpcName": "TestVPC",
  "Parameters": {
    "VPCCIDR": "10.0.0.0/22",
    "NumberOfAZs": 3,
    "RouteType": "isolated",
    "TransitGatewayApplicationRouteTableName": "applications",
    "PublicSubnetAZ1CIDR": "10.0.0.0/24",
    "PublicSubnetAZ2CIDR": "10.0.1.0/24",
    "PublicSubnetAZ3CIDR": "10.0.2.0/24",
    "PublicSubnet2AZ1CIDR": "10.0.0.0/24",
    "PublicSubnet2AZ2CIDR": "10.0.1.0/24",
    "PublicSubnet2AZ3CIDR": "10.0.2.0/24",
    "PublicSubnet3AZ1CIDR": "10.0.0.0/24",
    "PublicSubnet3AZ2CIDR": "10.0.1.0/24",
    "PublicSubnet3AZ3CIDR": "10.0.2.0/24",
    "PublicSubnet4AZ1CIDR": "10.0.0.0/24",
    "PublicSubnet4AZ2CIDR": "10.0.1.0/24",
    "PublicSubnet4AZ3CIDR": "10.0.2.0/24",
    "PublicSubnet5AZ1CIDR": "10.0.0.0/24",
    "PublicSubnet5AZ2CIDR": "10.0.1.0/24",
    "PublicSubnet5AZ3CIDR": "10.0.2.0/24",
    "PrivateSubnet1AZ1CIDR": "10.0.0.0/24",
    "PrivateSubnet1AZ2CIDR": "10.0.1.0/24",
    "PrivateSubnet1AZ3CIDR": "10.0.2.0/24",
    "PrivateSubnet2AZ1CIDR": "10.0.3.0/24",
    "PrivateSubnet2AZ2CIDR": "10.0.4.0/24",
    "PrivateSubnet2AZ3CIDR": "10.0.5.0/24",
    "PrivateSubnet3AZ1CIDR": "10.0.0.0/24",
    "PrivateSubnet3AZ2CIDR": "10.0.1.0/24",
    "PrivateSubnet3AZ3CIDR": "10.0.2.0/24",
    "PrivateSubnet4AZ1CIDR": "10.0.3.0/24",
    "PrivateSubnet4AZ2CIDR": "10.0.4.0/24",
    "PrivateSubnet4AZ3CIDR": "10.0.5.0/24",
    "PrivateSubnet5AZ1CIDR": "10.0.0.0/24",
    "PrivateSubnet5AZ2CIDR": "10.0.1.0/24",
    "PrivateSubnet5AZ3CIDR": "10.0.2.0/24",
    "PrivateSubnet6AZ1CIDR": "10.0.3.0/24",
    "PrivateSubnet6AZ2CIDR": "10.0.4.0/24",
    "PrivateSubnet6AZ3CIDR": "10.0.5.0/24",
    "PrivateSubnet7AZ1CIDR": "10.0.0.0/24",
    "PrivateSubnet7AZ2CIDR": "10.0.1.0/24",
    "PrivateSubnet7AZ3CIDR": "10.0.2.0/24",
    "PrivateSubnet8AZ1CIDR": "10.0.3.0/24",
    "PrivateSubnet8AZ2CIDR": "10.0.4.0/24",
```

```
    "PrivateSubnet8AZ3CIDR": "10.0.5.0/24",
    "PrivateSubnet9AZ1CIDR": "10.0.0.0/24",
    "PrivateSubnet9AZ2CIDR": "10.0.1.0/24",
    "PrivateSubnet9AZ3CIDR": "10.0.2.0/24",
    "PrivateSubnet10AZ1CIDR": "10.0.3.0/24",
    "PrivateSubnet10AZ2CIDR": "10.0.4.0/24",
    "PrivateSubnet10AZ3CIDR": "10.0.5.0/24"
  }
}
```

Application Account | Create VPC Additional CIDR and Subnets

Create an additional VPC CIDR, or subnets, or both, for an existing application account VPC. Add up to five public and twenty private subnet tiers to the additional CIDR, or to existing CIDRs under the VPC. A subnet tier is a set of subnets provisioned in two or three Availability Zones (AZ).

Full classification: Deployment | Managed landing zone | Application account | Create VPC Additional CIDR and Subnets

Change Type Details

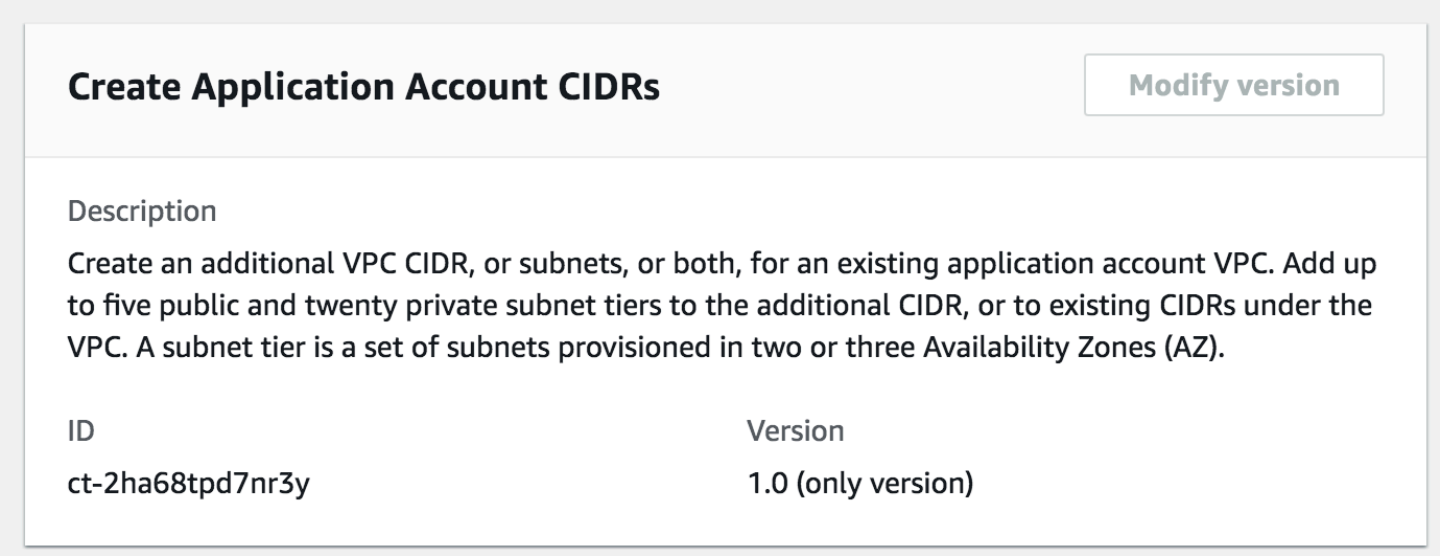
Change type ID	ct-2ha68tpd7nr3y
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create VPC CIDRs and subnets

Application account: creating VPC CIDRs or Subnets with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Application account: creating VPC CIDRs or Subnets with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Application account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

To create only additional VPC CIDRs:

```
aws amscm create-rfc --change-type-id "ct-2ha68tpd7nr3y" --change-type-version "1.0"
 --title "Additional VPC CIDR Creation" --execution-parameters "{\"VPCId\": \"VPC_ID\",
 \"Parameters\": { \"VPCCIDR\": \"X.X.X.X/X\"}}"
```

To create only additional subnets:

```
aws amscm create-rfc --change-type-id "ct-2ha68tpd7nr3y" --change-type-version
 "1.0" --title "Additional VPC Subnet Creation" --execution-parameters "{\"VPCId\":
 \"VPC_ID\", \"Parameters\": {\"PrivateRouteTableAZ1ID\": \"Transit Gateway Route Table
 AZ1 Name\", \"PrivateRouteTableAZ2ID\": \"Transit Gateway Route Table AZ2 Name\",
 \"PrivateSubnet1AZ1CIDR\": \"X.X.X.X/X\",\"PrivateSubnet1AZ2CIDR\": \"X.X.X.X/X\"}}"
```

To create additional VPC CIDR and subnets:

```
aws amscm create-rfc --change-type-id "ct-2ha68tpd7nr3y" --change-type-version "1.0"
 --title "Additional VPC CIDR and subnet Creation" --execution-parameters "{\"VPCId\":
 \"VPC_ID\", \"Parameters\": { \"VPCCIDR\": \"X.X.X.X/X\", \"PrivateRouteTableAZ1ID
\": \"Transit Gateway Route Table AZ1 Name\", \"PrivateRouteTableAZ2ID\": \"Transit
 Gateway Route Table AZ2 Name\", \"PrivateSubnet1AZ1CIDR\": \"X.X.X.X/X\",
\"PrivateSubnet1AZ2CIDR\": \"X.X.X.X/X\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateAppAcctVpcCidrSubnetParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2ha68tpd7nr3y"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateAppAcctVpcCidrSubnetParams.json
   ```

2. Modify and save the CreateAppAcctVpcCidrSubnetParams file. For example, you can replace the contents with something like this:

   To create only additional VPC CIDRs:

```
{
{
"VPCId": "VPC_ID",
 "Parameters": {
   "VPCCIDR": "x.x.x.x/x",
}
}
}
```

   To create only additional subnets:

```
{
"VPCId": "VPC_ID",
"Parameters": {
"PrivateRouteTableAZ1ID": "Transit Gateway Route Table AZ1 Name",
"PrivateRouteTableAZ2ID": "Transit Gateway Route Table AZ2 Name",
"PrivateSubnet1AZ1CIDR": "x.x.x.x/x",
"PrivateSubnet1AZ2CIDR": "x.x.x.x/x"
}
}
```

   To create additional VPC CIDR and subnets:

```
{
"VPCId": "VPC_ID",
"Parameters": {
"VPCCIDR": "x.x.x.x/x",
"PrivateRouteTableAZ1ID": "Transit Gateway Route Table AZ1 Name",
"PrivateRouteTableAZ2ID": "Transit Gateway Route Table AZ2 Name",
"PrivateSubnet1AZ1CIDR": "x.x.x.x/x",
"PrivateSubnet1AZ2CIDR": "x.x.x.x/x"
}
}
```

3. Output the RFC template JSON file to a file; this example names it CreateAppAcctVpcCidrSubnetRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAppAcctVpcCidrSubnetRfc.json
```

4. Modify and save the CreateAppAcctVpcCidrSubnetRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2ha68tpd7nr3y",
"Title":                "App-Acct-Vpc-Cidr-Subnets-RFC"
}
```

5. Create the RFC, specifying the CreateAppAcctVpcCidrSubnetRfc file and the CreateAppAcctVpcCidrSubnetParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAppAcctVpcCidrSubnetRfc.json  --
execution-parameters file://CreateAppAcctVpcCidrSubnetParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- **Important**

  To create an additional public subnet in a new availability zone (AZ), a private subnet must already be present.

- To use this CT to create additional public subnets in an already-provisioned VPC, the VPC must already have public subnets inside it. If this is not the case, contact AMS to deploy those public subnets inside the VPC first.
- To learn more about AMS multi-account landing zone, see VPC sharing: A new approach to multiple accounts and VPC management.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2ha68tpd7nr3y.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Management Account | Create Accelerate Account

Create an Accelerate account in your AMS-managed landing zone. Accelerate provides patching, backup, monitoring and reports, but no requests for change.

Full classification: Deployment | Managed landing zone | Management account | Create Accelerate account

Change Type Details

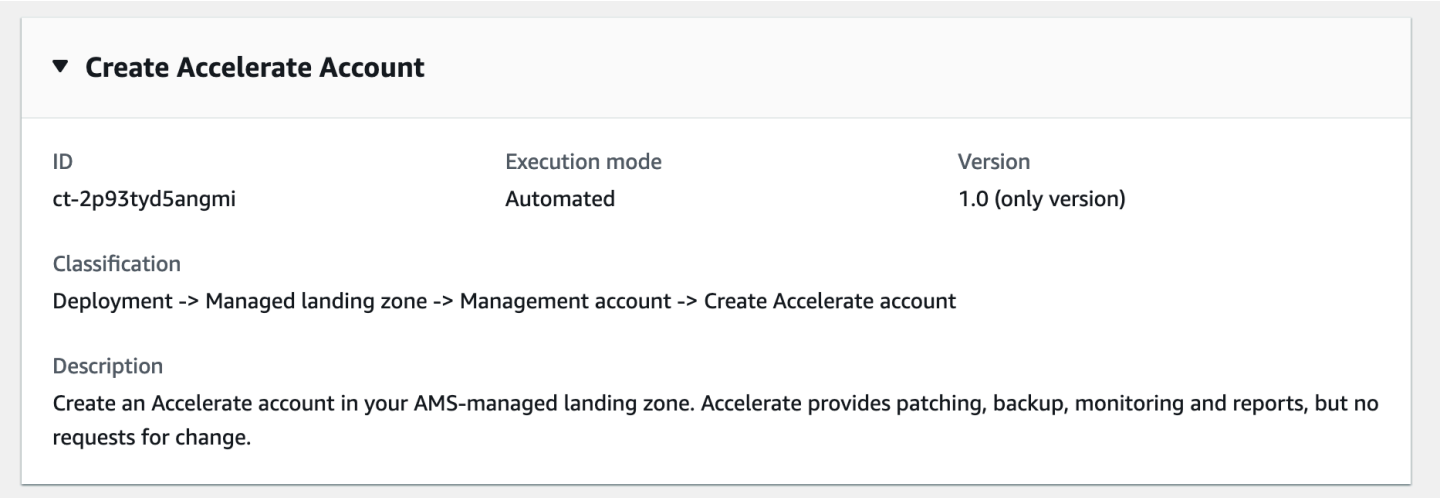
Change type ID	ct-2p93tyd5angmi
Current version	1.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create an Accelerate account

Management account: Creating an Accelerate account with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Creating an Accelerate account with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2p93tyd5angmi" --change-type-version "1.0" --
title "Create Accelerate account" --execution-parameters "{\"AccountName\": \"account-
name-1\",\"Regions\": [\"us-east-1\", \"us-east-2\"],\"AccountEmail\": \"account-
email-1@example.com\", \"AccelerateOUName\":\"accelerate\", \"SupportLevel\":\"plus\",
 \"EnablePatch\":true}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateAccAcctParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1zdasmc2ewzrs" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateAccAcctParams.json
   ```

2. Modify and save the CreateAccAcctParams file. For example, you can replace the contents with something like this:

   ```
   {
    "AccountName": "AccountName",
    "AccountEmail": "nobody@amazon.com",
    "AccelerateOUName": "accelerate",
    "Regions": [
    "ap-northeast-1",
    "ap-northeast-2"
    ],
    "SupportLevel": "plus",
    "EnablePatch": true
   }
   ```

3. Output the RFC template JSON file to a file; this example names it CreateAccAcctRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateAccAcctRfc.json
   ```

4. Modify and save the CreateAccAcctRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2p93tyd5angmi",
"Title":                "Create-Accelerate-Acct"
}
```

5. Create the RFC, specifying the CreateAccAcct Rfc file and the CreateAccAcctParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAccAcctRfc.json  --execution-
parameters file://CreateAccAcctParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AMS Accelerate, see What is AMS Accelerate?.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2p93tyd5angmi.

Example: Required Parameters

```
{
  "AccountName": "AccountName",
  "AccountEmail": "nobody@amazon.com",
  "AccelerateOUName": "accelerate",
  "Regions": [
    "ap-northeast-1",
    "ap-northeast-2"
  ],
  "SupportLevel": "plus",
  "EnablePatch": true
}
```

Example: All Parameters

```
{
  "AccountName": "AccountName",
  "AccountEmail": "nobody@amazon.com",
```

```
  "AccelerateOUName": "accelerate",
  "Regions": [
    "ap-northeast-1",
    "ap-northeast-2"
  ],
  "SupportLevel": "plus",
  "EnablePatch": true
}
```

Management Account | Create Application Account (With VPC)

Create a managed AWS landing zone application account and a VPC with up to 10 private subnets and up to 5 optional public subnets per availability zone (AZ) for two or three AZ's. Optionally, also create an AWS Backup plan with up to four different rules. Managed AWS landing zone core accounts must already be onboarded to AWS Managed Services (AMS).

Full classification: Deployment | Managed landing zone | Management account | Create application account (with VPC)

Change Type Details

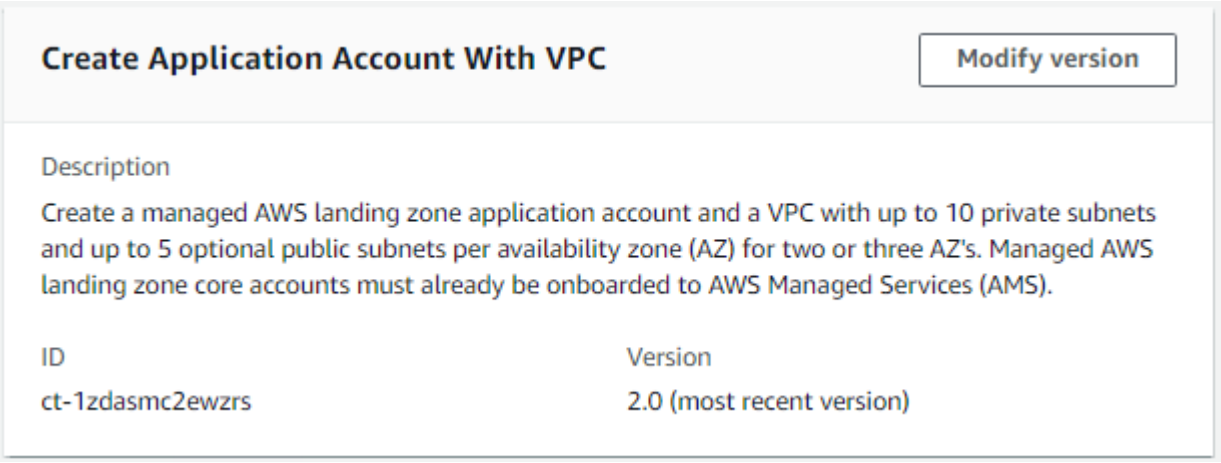
Change type ID	ct-1zdasmc2ewzrs
Current version	2.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create an Application account with VPC

Management account: Creating an application account (with VPC) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Creating an application account (with VPC) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1zdasmc2ewzrs" --change-type-version "2.0"
    --title "Application account onboarding" --execution-parameters "{\"AccountName
    \": \"ACCOUNT_NAME\",\"AccountEmail\": \"EMAIL_ADDRESS\",\"ApplicationOUName\":
    \"APP_ACCOUNT_OU_NAME:CHILD_OU_NAME\",\"SupportLevel\": \"LEVEL\",\"VpcName\":
    \"VPC_NAME\",\"NumberOfAZs\": \"INTEGER\",\"VpcCIDR\":
    \"X.X.X.X/X\", \"PrivateSubnet1AZ1CIDR\": \"X.X.X.X/X\",\"PrivateSubnet1AZ2CIDR\":
    \"X.X.X.X/X\",\"PrivateSubnet1AZ3CIDR\": \"X.X.X.X/X\",\"PublicSubnetAZ1CIDR\":
    \"X.X.X.X/X\",\"PublicSubnetAZ2CIDR\": \"X.X.X.X/X\",\"PublicSubnetAZ3CIDR\":
    \"X.X.X.X/X\", \"RouteType\": \"ROUTE_TYPE\",
 \"TransitGatewayApplicationRouteTableName\":
    \"TABLE_NAME\"}"
```

With backup parameters:

```
aws amscm create-rfc --change-type-id "ct-1zdasmc2ewzrs" --change-type-version "2.0"
    --title "Application account onboarding" --execution-parameters "{\"AccountName
    \": \"ACCOUNT_NAME\",\"AccountEmail\": \"EMAIL_ADDRESS\",\"ApplicationOUName\":
    \"APP_ACCOUNT_OU_NAME:CHILD_OU_NAME\",\"SupportLevel\": \"LEVEL\",\"VpcName\":
    \"VPC_NAME\",\"NumberOfAZs\": \"INTEGER\",\"VpcCIDR\":
    \"X.X.X.X/X\", \"PrivateSubnet1AZ1CIDR\": \"X.X.X.X/X\",\"PrivateSubnet1AZ2CIDR\":
    \"X.X.X.X/X\",\"PrivateSubnet1AZ3CIDR\": \"X.X.X.X/X\",\"PublicSubnetAZ1CIDR\":
    \"X.X.X.X/X\",\"PublicSubnetAZ2CIDR\": \"X.X.X.X/X\",\"PublicSubnetAZ3CIDR\":
    \"X.X.X.X/X\", \"RouteType\": \"ROUTE_TYPE\",
 \"TransitGatewayApplicationRouteTableName\":
    \"TABLE_NAME\", \"BackupPlanName\":\"PLAN_NAME\", \"ResourceTagKey\":
    \"TAG_KEY\", \"ResourceTagValue\":\"TAG_VALUE\", "\BackupRule1ScheduleExpression\":
    \"cron(0 2 ? * * *)\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateMgmtAcctAppAcctWithVpcParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1zdasmc2ewzrs"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateMgmtAcctAppAcctWithVpcParams.json
   ```

2. Modify and save the CreateMgmtAcctAppAcctWithVpcParams file. For example, you can replace the contents with something like this:

```
{
      "AccountName": "ACCOUNT_NAME",
      "AccountEmail": "ACCOUNT_EMAIL",
      "ApplicationOUName": "APPLICATION_OU_NAME:CHILD_OU_NAME",
      "SupportLevel": "PLUS_or_PREMIUM",
      "VpcName": "VPC_NAME",
      "NumberOfAZs": "TWO_or_THREE",
      "VpcCIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ1CIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ2CIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ3CIDR": "x.x.x.x/x",
      "PublicSubnetAZ1CIDR": "x.x.x.x/x",
      "PublicSubnetAZ2CIDR": "x.x.x.x/x",
      "PublicSubnetAZ3CIDR": "x.x.x.x/x",
      "RouteType": "ROUTABLE_or_ISOLATED",
      "TransitGatewayApplicationRouteTableName": "ROUTE_TABLE_NAME"
}
```

With backup AND patch parameters:

```
{
      "AccountName": "ACCOUNT_NAME",
      "AccountEmail": "ACCOUNT_EMAIL",
      "ApplicationOUName": "APPLICATION_OU_NAME:CHILD_OU_NAME",
      "SupportLevel": "PLUS_or_PREMIUM",
      "VpcName": "VPC_NAME",
      "NumberOfAZs": "TWO_or_THREE",
      "VpcCIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ1CIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ2CIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ3CIDR": "x.x.x.x/x",
      "PublicSubnetAZ1CIDR": "x.x.x.x/x",
      "PublicSubnetAZ2CIDR": "x.x.x.x/x",
      "PublicSubnetAZ3CIDR": "x.x.x.x/x",
      "RouteType": "ROUTABLE_or_ISOLATED",
      "TransitGatewayApplicationRouteTableName": "ROUTE_TABLE_NAME",
      "BackupPlanName": "PLAN_NAME",
      "ResourceTagKey": "TAG_KEY",
      "ResourceTagValue": "TAG_VALUE",
```

```
      "BackupRule1ScheduleExpression": "cron(0 2 ? * * *),"
      "PatchOrchestratorFirstTagKey": "TAG_KEY",
      "PatchOrchestratorDefaultMaintenanceWindowCutoff": "INTEGER",
      "PatchOrchestratorDefaultMaintenanceWindowDuration": "INTEGER",
      "PatchOrchestratorDefaultMaintenanceWindowSchedule": "cron(0 18 * * ? *),"
      "PatchOrchestratorDefaultMaintenanceWindowTimeZone": "TIME_ZONE",
      "PatchOrchestratorDefaultPatchBackupRetentionInDays": "INTEGER",
      "PatchOrchestratorNotificationEmails": "DISTRO_EMAIL"
}
```

3. Output the RFC template JSON file to a file; this example names it CreateMgmtAcctAppAcctWithVpcRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateMgmtAcctAppAcctWithVpcRfc.json
```

4. Modify and save the CreateMgmtAcctAppAcctWithVpcRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-1zdasmc2ewzrs",
"Title":                "Management-Acct-App-Acct-With-Vpc-RFC"
}
```

5. Create the RFC, specifying the CreateMgmtAcctAppAcctWithVpcRfc file and the CreateMgmtAcctAppAcctWithVpcParams file:

```
aws amscm create-rfc --cli-input-json file://CreateMgmtAcctAppAcctWithVpcRfc.json
 --execution-parameters file://CreateMgmtAcctAppAcctWithVpcParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> The minimum value for this parameter has changed from 60 to 1.

Important

This change type has been automated and you can now configure the VPC to have up to 10 private subnets and up to 5 public subnets. Additionally, you can now configure backup and patching.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

How do I create a managed AWS landing zone application account with a VPC?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1zdasmc2ewzrs.

Example: Required Parameters

```
{
  "AccountName": "AccountName",
  "AccountEmail": "nobody@amazon.com",
  "SupportLevel": "plus",
  "VpcName": "TestVPC",
  "VpcCIDR": "10.0.0.0/22",
  "NumberOfAZs": 2,
  "PrivateSubnet1AZ1CIDR": "10.0.0.0/24",
  "PrivateSubnet1AZ2CIDR": "10.0.1.0/24",
  "BackupPlanName": "default-backup-plan",
  "ResourceTagKey": "Backup",
  "ResourceTagValue": "True",
  "BackupRule1ScheduleExpression": "cron(0 2 ? * * )"
}
```

Example: All Parameters

```
{
  "AccountName": "AccountName",
  "AccountEmail": "nobody@amazon.com",
  "ApplicationOUName": "applications",
  "SupportLevel": "plus",
  "VpcName": "TestVPC",
```

```
  "VpcCIDR": "10.0.0.0/22",
  "NumberOfAZs": 3,
  "RouteType": "isolated",
  "TransitGatewayApplicationRouteTableName": "defaultAppRouteTable",
  "PublicSubnetAZ1CIDR": "10.0.0.0/24",
  "PublicSubnetAZ2CIDR": "10.0.1.0/24",
  "PublicSubnetAZ3CIDR": "10.0.2.0/24",
  "PublicSubnet2AZ1CIDR": "10.0.0.0/24",
  "PublicSubnet2AZ2CIDR": "10.0.1.0/24",
  "PublicSubnet2AZ3CIDR": "10.0.2.0/24",
  "PublicSubnet3AZ1CIDR": "10.0.0.0/24",
  "PublicSubnet3AZ2CIDR": "10.0.1.0/24",
  "PublicSubnet3AZ3CIDR": "10.0.2.0/24",
  "PublicSubnet4AZ1CIDR": "10.0.0.0/24",
  "PublicSubnet4AZ2CIDR": "10.0.1.0/24",
  "PublicSubnet4AZ3CIDR": "10.0.2.0/24",
  "PublicSubnet5AZ1CIDR": "10.0.0.0/24",
  "PublicSubnet5AZ2CIDR": "10.0.1.0/24",
  "PublicSubnet5AZ3CIDR": "10.0.2.0/24",
  "PrivateSubnet1AZ1CIDR": "10.0.0.0/24",
  "PrivateSubnet1AZ2CIDR": "10.0.1.0/24",
  "PrivateSubnet1AZ3CIDR": "10.0.2.0/24",
  "PrivateSubnet2AZ1CIDR": "10.0.3.0/24",
  "PrivateSubnet2AZ2CIDR": "10.0.4.0/24",
  "PrivateSubnet2AZ3CIDR": "10.0.5.0/24",
  "PrivateSubnet3AZ1CIDR": "10.0.0.0/24",
  "PrivateSubnet3AZ2CIDR": "10.0.1.0/24",
  "PrivateSubnet3AZ3CIDR": "10.0.2.0/24",
  "PrivateSubnet4AZ1CIDR": "10.0.3.0/24",
  "PrivateSubnet4AZ2CIDR": "10.0.4.0/24",
  "PrivateSubnet4AZ3CIDR": "10.0.5.0/24",
  "PrivateSubnet5AZ1CIDR": "10.0.0.0/24",
  "PrivateSubnet5AZ2CIDR": "10.0.1.0/24",
  "PrivateSubnet5AZ3CIDR": "10.0.2.0/24",
  "PrivateSubnet6AZ1CIDR": "10.0.3.0/24",
  "PrivateSubnet6AZ2CIDR": "10.0.4.0/24",
  "PrivateSubnet6AZ3CIDR": "10.0.5.0/24",
  "PrivateSubnet7AZ1CIDR": "10.0.0.0/24",
  "PrivateSubnet7AZ2CIDR": "10.0.1.0/24",
  "PrivateSubnet7AZ3CIDR": "10.0.2.0/24",
  "PrivateSubnet8AZ1CIDR": "10.0.3.0/24",
  "PrivateSubnet8AZ2CIDR": "10.0.4.0/24",
  "PrivateSubnet8AZ3CIDR": "10.0.5.0/24",
  "PrivateSubnet9AZ1CIDR": "10.0.0.0/24",
```

```
  "PrivateSubnet9AZ2CIDR": "10.0.1.0/24",
  "PrivateSubnet9AZ3CIDR": "10.0.2.0/24",
  "PrivateSubnet10AZ1CIDR": "10.0.3.0/24",
  "PrivateSubnet10AZ2CIDR": "10.0.4.0/24",
  "PrivateSubnet10AZ3CIDR": "10.0.5.0/24",
  "DirectAlertsEmail": "test@amazon.com",
  "SamlMetadataDocumentURL": "https://test.com",
  "BackupPlanName": "default-backup-plan",
  "ResourceTagKey": "Backup",
  "ResourceTagValue": "True",
  "BackupRule1ScheduleExpression": "cron(0 2 ? * * )",
  "PatchOrchestratorFirstTagKey": "AppId",
  "PatchOrchestratorSecondTagKey": "Environment",
  "PatchOrchestratorDefaultMaintenanceWindowCutoff": 1,
  "PatchOrchestratorDefaultMaintenanceWindowDuration": 4,
  "PatchOrchestratorDefaultMaintenanceWindowSchedule": "cron(0 18 * * ? *)",
  "PatchOrchestratorDefaultMaintenanceWindowTimeZone": "UTC",
  "PatchOrchestratorDefaultPatchBackupRetentionInDays": 60,
  "PatchOrchestratorNotificationEmails": ["user@test.com"]
}
```

Management Account | Create Custom OUs

Create multiple custom AWS organizational units (OU) under the following paths, "customer-managed", "applications:managed", "applications:tools" and "applications:development".

Full classification: Deployment | Managed landing zone | Management account | Create custom OUs

Change Type Details

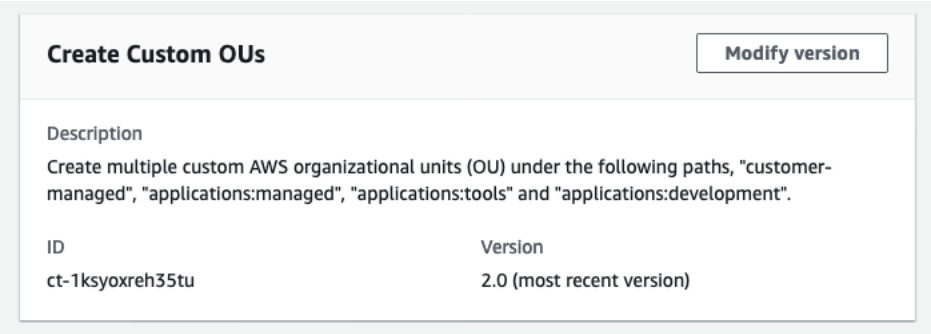
Change type ID	ct-1ksyoxreh35tu
Current version	2.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create a custom OU

Management account: Creating a Management account custom OU with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Creating a Management account custom OU with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-1ksyoxreh35tu" \
--change-type-version "2.0" --title "New OU Creation" \
--execution-parameters "{\"CustomOUPaths\": [ \"applications:managed:OU1:OU2:OU3\",
 \"applications:managed:OU1:OU2:OU3\"]}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it MgmtAcctCreateOuParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1ksyoxreh35tu"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    MgmtAcctCreateOuParams.json
   ```

2. Modify and save the MgmtAcctCreateOuParams file. For example, you can replace the contents with something like this:

   ```
   {
     "CustomOUPaths": ["applications:managed:healthcare", "customer-managed:CustomOU",
    "applications:tools:automation", "applications:development:healthcare"]
   }
   ```

3. Output the RFC template JSON file to a file; this example names it MgmtAcctCreateOuRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > MgmtAcctCreateOuRfc.json
   ```

4. Modify and save the MgmtAcctCreateOuRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-1ksyoxreh35tu",
"Title":                "Management-Acct-Create-OU-RFC"
}
```

5. Create the RFC, specifying the MgmtAcctCreateOu Rfc file and the MgmtAcctCreateOuParams file:

```
aws amscm create-rfc --cli-input-json file://MgmtAcctCreateOuRfc.json  --execution-
parameters file://MgmtAcctCreateOuParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is now at version 2.0. A new parameter, **CustomOUPath** replaces the previous **CustomOUName** parameter, and the change type is now automated and not manually executed.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

For information on creating OUs, see Managing organizational units (OUs).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1ksyoxreh35tu.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Management Account | Create Custom SCP (Review Required)

Create a custom service control policy (SCP) to manage permissions across AWS organization.

Full classification: Deployment | Managed landing zone | Management account | Create custom SCP (review required)

Change Type Details

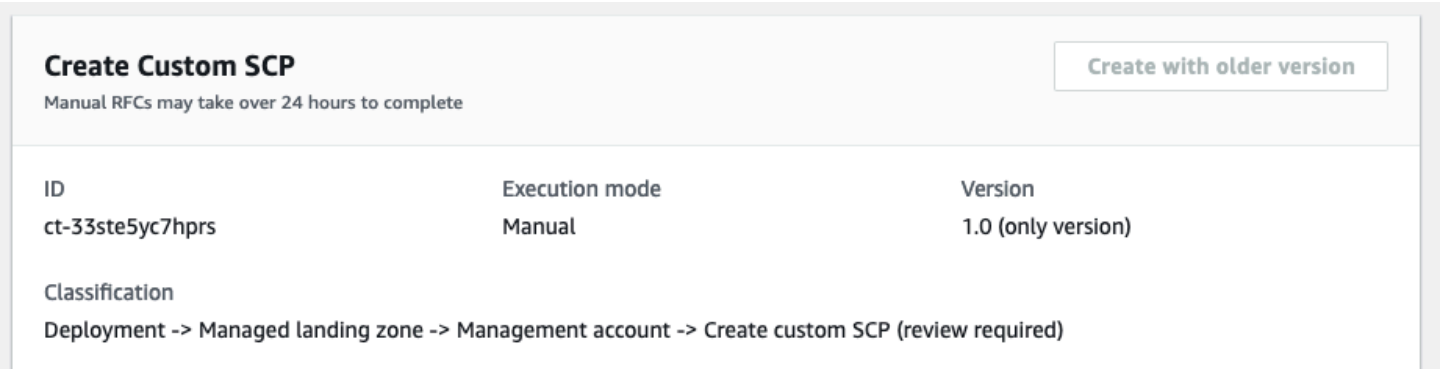
Change type ID	ct-33ste5yc7hprs
Current version	1.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create a service control policy (SCP) (review required)

Management account: Creating a Management account custom SCP with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Creating a Management account custom SCP with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id ID` command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Note

Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-33ste5yc7hprs" \
--change-type-version "1.0" --title "New SCP Creation" \
--execution-parameters "{\"TargetId\":\"ou-hlzm-8ievlm9x\",
 \"CustomServiceControlPolicy\":\"Test\", \"SCPDescription\":\"Test SCP\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateMasterAcctScpParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-33ste5yc7hprs"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 CreateMasterAcctScpParams.json
```

2. Modify and save the CreateMasterAcctScpParams file. For example, you can replace the contents with something like this:

```
{
"TargetId":"ou-hlzm-8ievlm9x",
"CustomServiceControlPolicy":"MySCP",
"SCPDescription":"Test SCP"
}
```

3. Output the RFC template JSON file to a file; this example names it CreateMasterAcctScpRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateMasterAcctScpRfc.json
```

4. Modify and save the CreateMasterAcctScpRfc file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-33ste5yc7hprs",
  "ChangeTypeVersion": "1.0",
  "Title": "New SCP Creation"
}
```

5. Create the RFC, specifying the CreateMasterAcctCreateScp Rfc file and the CreateMasterAcctScpParams.json file:

```
aws amscm create-rfc --cli-input-json file://CreateMasterAcctScpRfc.json  --
execution-parameters file://CreateMasterAcctScpParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

> **Note**
>
> Make sure that you refer to and use the curated Service Control Policies (SCPs) library that fits your business requirements. Provide the unique ID from the library in the form of `SCP-AMS-XXX` in the RFC title.
> For more information, see Curated SCPs and Config Rules.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-33ste5yc7hprs.

Example: Required Parameters

```
{
  "TargetId": "ou-96dv-e18n036l",
  "CustomServiceControlPolicy": ""
}
```

Example: All Parameters

```
{
  "TargetId": "ou-96dv-e18n036l",
  "CustomServiceControlPolicy": "",
  "SCPDescription": "Description of the custom Service Control Policy (SCP) that needs
 to be attached to the provided target.",
  "Priority": "Medium"
```

```
}
```

Management Account | Create Customer-Managed Application Account

Create a customer-managed application account in a multi-account AWS landing zone. Customer-managed accounts give you full control to operate the infrastructure within the centralized architecture managed by AMS. Multi-account AWS landing zone core accounts must already be onboarded to AWS Managed Services (AMS).

Full classification: Deployment | Managed landing zone | Management account | Create customer-managed application account

Change Type Details

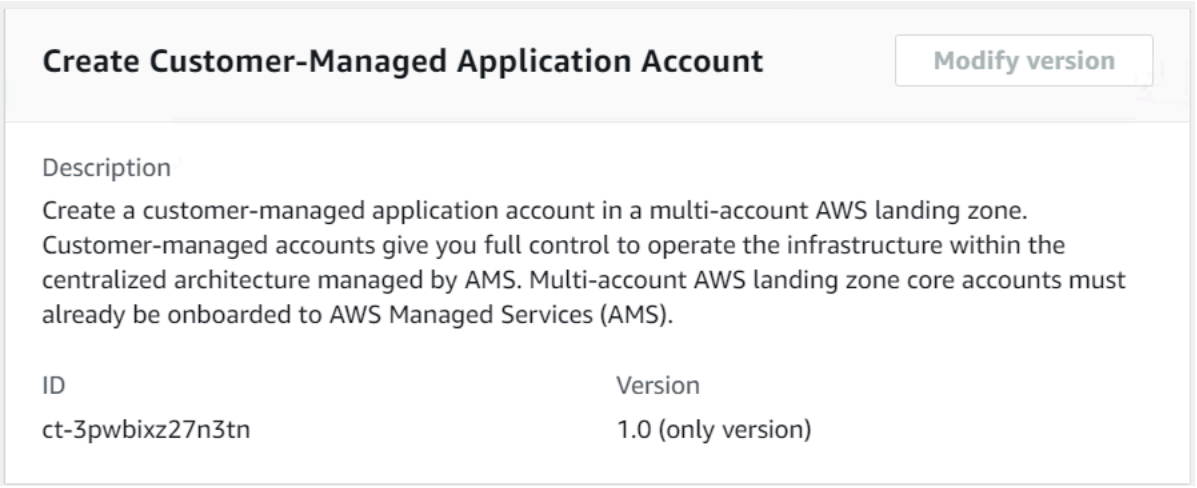
Change type ID	ct-3pwbixz27n3tn
Current version	1.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create a Customer Managed application account

Management account: Creating a Management account customer-managed application account with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Creating a Management account customer-managed application account with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-3pwbixz27n3tn" \
--change-type-version "1.0" --title "New customer-managed account creation" \
--execution-parameters "{\"AccountName\":\"test\", \"AccountEmail\":\"test@test.com\",
 \"CustomerManagedOUName\":\"customer-managed\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it NewCustomerManagedAccountParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1zdasmc2ewzrs"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    NewCustomerManagedAccountParams.json
   ```

2. Modify and save the NewCustomerManagedAccountParams file. For example, you can replace the contents with something like this:

   ```
   {
   "AccountName":"test",
   "AccountEmail":"test@test.com",
   "CustomerManagedOUName":"customer-managed"
   }
   ```

3. Output the RFC template JSON file to a file; this example names it NewCustomerManagedAccountRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > NewCustomerManagedAccountRfc.json
   ```

4. Modify and save the NewCustomerManagedAccountRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeId": "ct-3pwbixz27n3tn",
     "ChangeTypeVersion": "1.0",
     "Title": "New customer-managed account creation"
   ```

```
}
```

5. Create the RFC, specifying the NewCustomerManagedAccount Rfc file and the NewCustomerManagedAccountParams file:

```
aws amscm create-rfc --cli-input-json file://NewCustomerManagedAccountRfc.json  --
execution-parameters file://NewCustomerManagedAccountParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3pwbixz27n3tn.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Management Account | Create Developer Mode Account (With VPC)

Create a managed AWS landing zone developer mode account and a VPC with up to 10 private subnets and up to 5 optional public subnets per availability zone (AZ) for two or three AZ's. Optionally, also create an AWS Backup plan with up to four different rules. Managed AWS landing zone core accounts must already be onboarded to AWS Managed Services (AMS).

Full classification: Deployment | Managed landing zone | Management account | Create developer mode account (with VPC)

Change Type Details

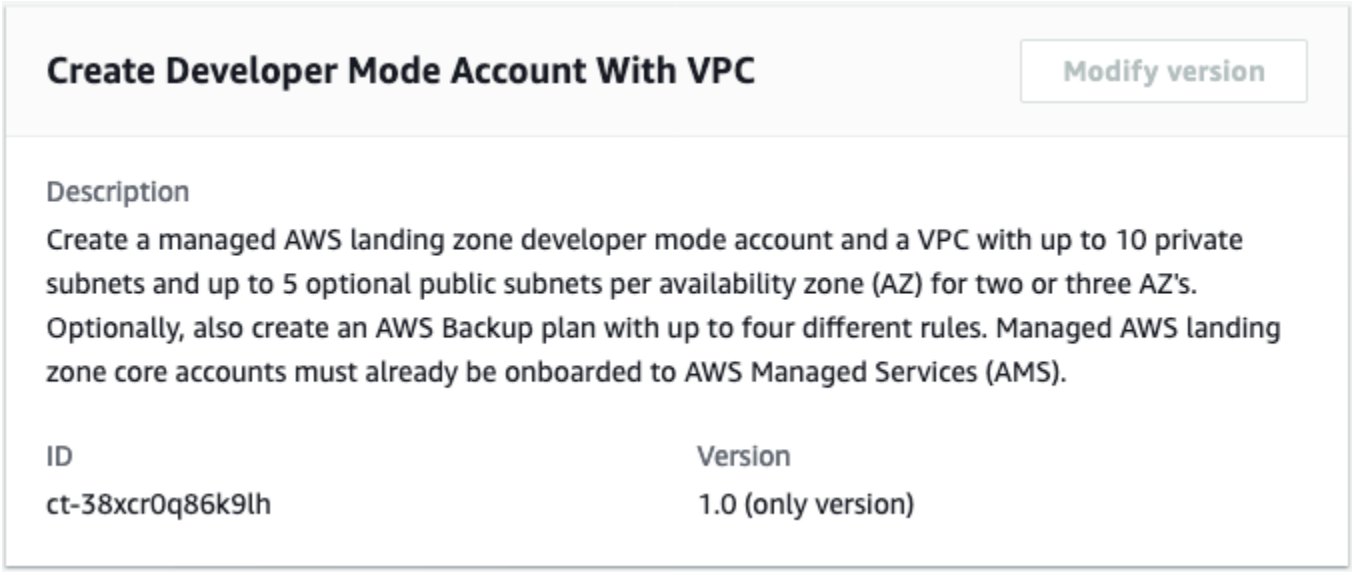
Change type ID	ct-38xcr0q86k9lh
Current version	1.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create Developer mode account with VPC

Management account: Creating a developer mode account with VPC with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Creating a developer mode account with VPC with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-38xcr0q86k9lh" --change-type-version "1.0" --
title "Dev Mode account onboarding" --execution-parameters "{\"AccountName
    \": \"ACCOUNT_NAME\",\"AccountEmail\": \"/\",\"DeveloperModeOUName\":
    \"Development_OU_NAME:CHILD_OU_NAME\",\"SupportLevel\": \"LEVEL\",\"VpcName\":
    \"VPC_NAME\",\"NumberOfAZs\": \"INTEGER\",\"VpcCIDR\":
    \"X.X.X.X/X\", \"PrivateSubnet1AZ1CIDR\": \"X.X.X.X/X\",\"PrivateSubnet1AZ2CIDR\":
    \"X.X.X.X/X\",\"PrivateSubnet1AZ3CIDR\": \"X.X.X.X/X\",\"PublicSubnetAZ1CIDR\":
    \"X.X.X.X/X\",\"PublicSubnetAZ2CIDR\": \"X.X.X.X/X\",\"PublicSubnetAZ3CIDR\":
    \"X.X.X.X/X\", \"RouteType\": \"ROUTE_TYPE\",
 \"TransitGatewayApplicationRouteTableName\":
    \"TABLE_NAME\", \"BackupPlanName\":\"PLAN_NAME\", \"ResourceTagKey\":
    \"TAG_KEY\", \"ResourceTagValue\":\"TAG_VALUE\", "\BackupRule1ScheduleExpression\":
    \"cron(0 2 ? * * *)\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateDevModeAcctWithVpcParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-38xcr0q86k9lh"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 CreateDevModeAcctWithVpcParams.json
```

2. Modify and save the CreateDevModeAcctWithVpcParams file. For example, you can replace the contents with something like this:

```
{
      "AccountName": "ACCOUNT_NAME",
      "AccountEmail": "ACCOUNT_EMAIL",
      "DeveloperModeOUName": "DEVELOPER_MODE_OU_NAME:CHILD_OU_NAME",
      "SupportLevel": "PLUS_or_PREMIUM",
      "VpcName": "VPC_NAME",
      "NumberOfAZs": "TWO_or_THREE",
      "VpcCIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ1CIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ2CIDR": "x.x.x.x/x",
      "PrivateSubnet1AZ3CIDR": "x.x.x.x/x",
      "PublicSubnetAZ1CIDR": "x.x.x.x/x",
      "PublicSubnetAZ2CIDR": "x.x.x.x/x",
      "PublicSubnetAZ3CIDR": "x.x.x.x/x",
      "RouteType": "ROUTABLE_or_ISOLATED",
      "TransitGatewayApplicationRouteTableName": "ROUTE_TABLE_NAME"
}
```

3. Output the RFC template JSON file to a file; this example names it CreateDevModeAcctWithVpcRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateDevModeAcctWithVpcRfc.json
```

4. Modify and save the CreateDevModeAcctWithVpcRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-38xcr0q86k9lh",
  "ChangeTypeVersion": "1.0",
```

```
  "Title": "Create developer mode account with VPC"
}
```

5. Create the RFC, specifying the CreateDevModeAcctWithVpcRfc file and the CreateDevModeAcctWithVpcParams file:

```
aws amscm create-rfc --cli-input-json file://CreateDevModeAcctWithVpcRfc.json  --
execution-parameters file://CreateDevModeAcctWithVpcParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about developer mode, see Developer mode.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-38xcr0q86k9lh.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Management Account | Create StackSets Stack (Review Required)

Create AWS CloudFormation (CFN) StackSets stacks and deploy the stack instances. Use the CloudFormation StackSets feature to create stacks across multiple accounts.

Full classification: Deployment | Managed landing zone | Management account | Create StackSets stack (review required)

Change Type Details

Change type ID	ct-16pknsfa8lul7

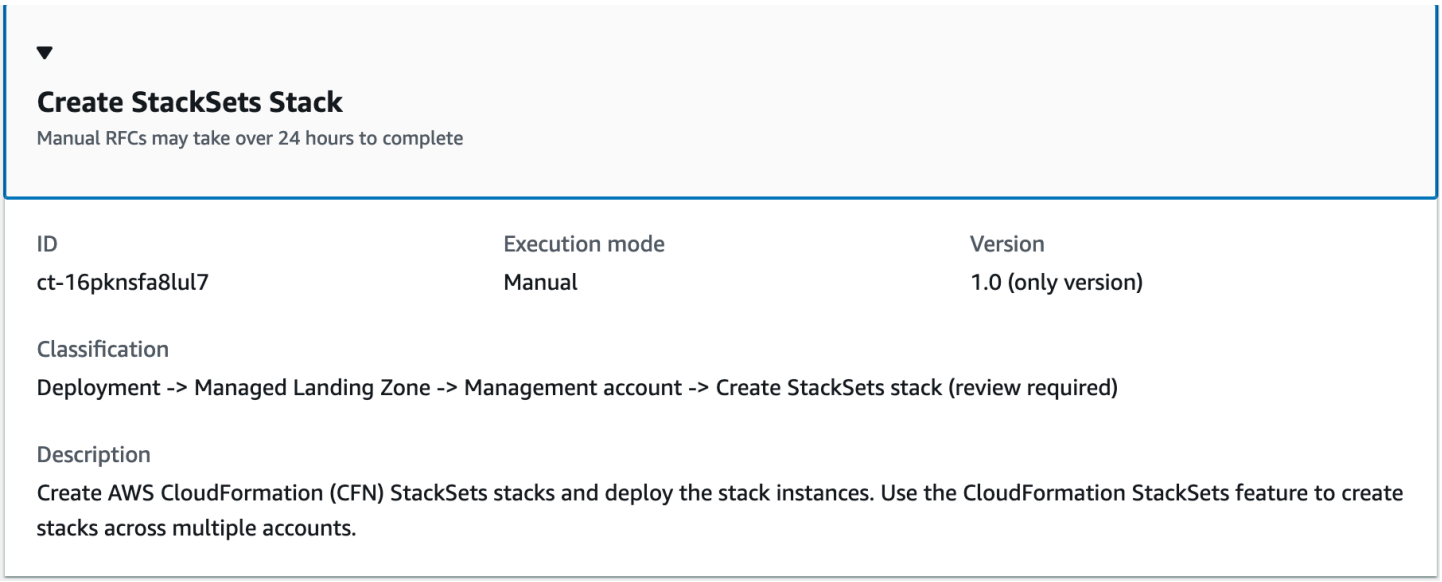
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create a Stacksets stack

Creating a Stacksets stack with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Stacksets stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Note

Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-16pknsfa8lul7" --change-type-version "1.0"
 --title "Create StackSets Stack" --execution-parameters "{\"Name\": \"Stackset name\",
 \"Region\": \"us-east-1\", \"OuId\": \"ou-cccc-00000000\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateStacksetsStackParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1v9g9n30woc8h"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateStacksetsStackParams.json
   ```

2. Modify and save the UpdateStacksetsStackParams file. For example, you can replace the contents with something like this:

```
{
   "CloudFormationTemplate": "template",
   "CloudFormationTemplateS3Endpoint": "S3 link of the template",
   "Description": "Create Stackset",
   "Name": "test-stackset",
   "OuId": ["ou-cccc-00000000"],
   "Region": "us-east-1",
   "Parameters": [
     { "Name": "test-value",
       "Value": "test-value" }
   ],
   "Tags": [
     {
       "Key": "key1",
       "Value": "value1"
     },
     {
       "Key": "key2",
       "Value": "value2"
     }
   ],
   "Priority": "High"
 }
```

3. Output the RFC template JSON file to a file; this example names it UpdateStacksetsStackRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateStacksetsStackRfc.json
```

4. Modify and save the UpdateStacksetsStackRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-16pknsfa8lul7",
  "Title": "Create StackSets Stack "
}
```

5. Create the RFC, specifying the UpdateStacksetsStack Rfc file and the UpdateStacksetsStackParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateStacksetsStackRfc.json  --
execution-parameters file://UpdateStacksetsStackParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For AWS CloudFormation details, see Create a stack set
- For general AWS CloudFormation information on stack sets, see StackSets concepts
- To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-16pknsfa8lul7.

Example: Required Parameters

```
{
  "Description": "AMSTestCT - Create a test stackset",
  "Name": "test-stackset",
  "OuId": ["ou-cccc-00000000"],
  "Region": "us-east-1"
}
```

Example: All Parameters

```
{
  "CloudFormationTemplate": "template",
  "CloudFormationTemplateS3Endpoint": "https://s3.amazonaws.com/cf-
templates-33kj7hiuwdk9-us-east-1/2017261mYA-stm-dynamic-sqs-no-params-
sept-2017.template",
  "Description": "AMSTestCT - Create a test stackset",
  "Name": "test-stackset",
  "OuId": ["ou-cccc-00000000"],
  "Region": "us-east-1",
```

```
  "Parameters": [
    { "Name": "test-value",
      "Value": "test-value" }
  ],
  "Tags": [
    {
      "Key": "key1",
      "Value": "value1"
    },
    {
      "Key": "key2",
      "Value": "value2"
    }
  ],
  "Priority": "High"
}
```

Management Account | Create Tools Account (With VPC)

Create a managed AWS landing zone tools account and a VPC with a private subnet, an isolated private subnet, and a public subnet. Optionally, also create an AWS Backup plan with up to four different rules. Managed AWS landing zone core accounts must already be onboarded to AWS Managed Services (AMS).

Full classification: Deployment | Managed landing zone | Management account | Create tools account (with VPC)

Change Type Details

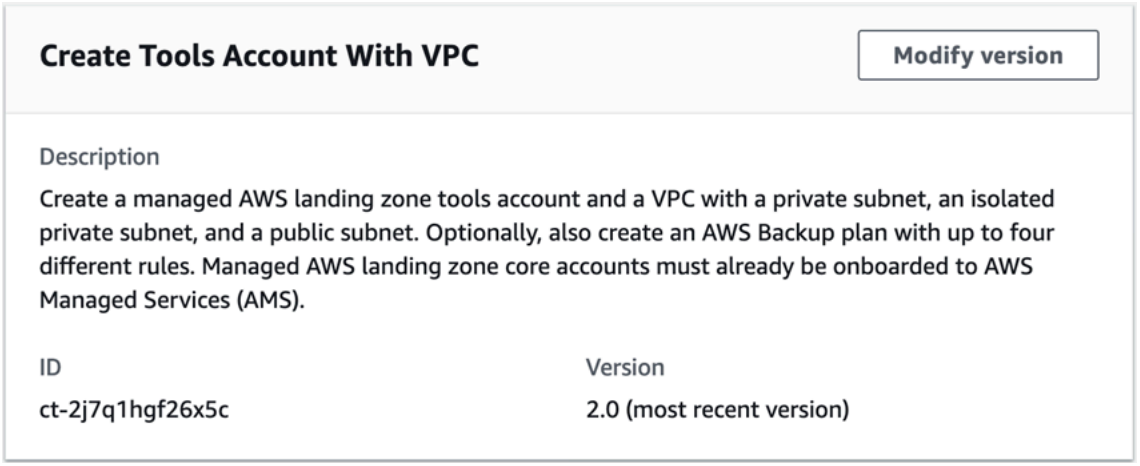
Change type ID	ct-2j7q1hgf26x5c
Current version	2.0
Expected execution duration	3600 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create Tools account with VPC

Management account: Creating a Management account Tools account with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Management account: Creating a Management account Tools account with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

> **Note**
>
> Run this change type from your Management account.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-2j7q1hgf26x5c" \
--change-type-version "1.0" --title "New tools account creation" \
--execution-parameters "{\"AccountName\": \"tools\",\"AccountEmail
\": \"test@test.com\",\"ApplicationOUName\": \"applications:tools\",
\"TransitGatewayApplicationRouteTableName\": \"defaultAppRouteDomain\",
\"SupportLevel\": \"plus\",\"VpcName\": \"testvpc4\",\"VpcCIDR\": \"10.106.0.0/24\",
 \"PrivateSubnetIsolatedCIDR\": \"10.106.0.128/26\", \"PrivateSubnetCIDR\":
\"10.106.0.192/26\",\"PublicSubnetCIDR\":\"10.106.0.192/26\",\"DirectAlertsEmail
\": \"test@test.com\",\"BackupRule1ScheduleExpression\": \"cron(0 2 ? * * )\",
\"BackupPlanName\": \"test\",\"ResourceTagKey\": \"backup\",\"ResourceTagValue\":
 \"true\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it NewToolsAccountParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2j7q1hgf26x5c"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    NewToolsAccountParams.json
   ```

2. Modify and save the NewToolsAccountParams file. For example, you can replace the contents with something like this:

   ```
   {
   "AccountName":"tools",
   "AccountEmail":"test@test.com",
   "ApplicationOUName":"applications:tools",
   "TransitGatewayApplicationRouteTableName": "defaultAppRouteDomain",
   ```

```
"SupportLevel": "plus",
"VpcName": "testvpc4",
"VpcCIDR": "10.106.0.0/24",
"PrivateSubnetIsolatedCIDR": "10.106.0.128/26",
"PrivateSubnetCIDR":"10.106.0.192/26",
"PublicSubnetCIDR":"10.106.0.192/26",
"DirectAlertsEmail": "test@test.com",
"BackupRule1ScheduleExpression": "cron(0 2 ? * * )",
"BackupPlanName": "test",
"ResourceTagKey": "backup",
"ResourceTagValue": "true"
}
```

3. Output the RFC template JSON file to a file; this example names it NewToolsAccountRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > NewToolsAccountRfc.json
```

4. Modify and save the NewToolsAccountRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-2j7q1hgf26x5c",
  "ChangeTypeVersion": "2.0",
  "Title": "New tools account with VPC creation"
}
```

5. Create the RFC, specifying the NewToolsAccount Rfc file and the NewToolsAccountParams file:

```
aws amscm create-rfc --cli-input-json file://NewToolsAccountRfc.json  --execution-
parameters file://NewToolsAccountParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is updated to version 2.0 with changes to input parameters.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2j7q1hgf26x5c.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Networking Account | Add Static Route

Create a static route on transit gateway (TGW) route table. Use this change type for multi-account landing zone (MALZ) Networking accounts only.

Full classification: Deployment | Managed landing zone | Networking account | Add static route

Change Type Details

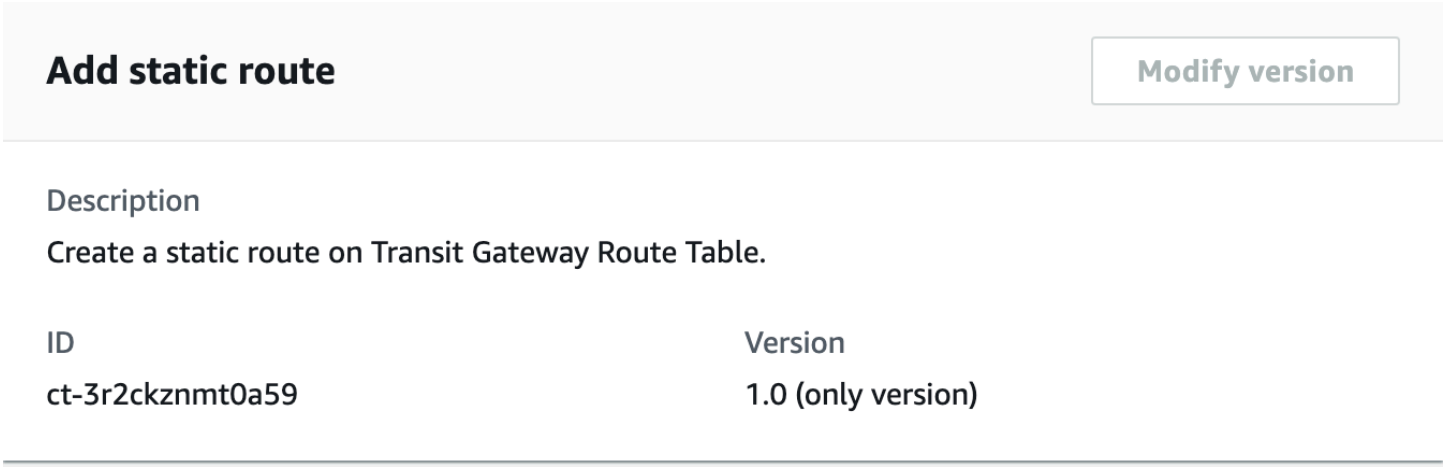
Change type ID	ct-3r2ckznmt0a59
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add a static route

Networking account: Adding a static route with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Networking account: Adding a static route with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3r2ckznmt0a59" --change-type-version
 "1.0" --title "Create a static route on Transit Gateway Route Table" --execution-
parameters "{\"DocumentName\": \"AWSManagedServices-CreateRouteInTGWRouteTable
\",\"Region\": \"us-east-1\",\"Parameters\": {\"TransitGatewayAttachmentId\":
 [\"tgw-attach-0878cf82a40721d19\"],\"TransitGatewayRouteTableId\": [\"tgw-
rtb-06ddc751c0c0c881c\"], \"Blackhole\": [\"false\"], \"DestinationCidrBlock\":
 [\"10.0.0.0/24\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AddStaticRouteParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3r2ckznmt0a59" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AddStaticRouteParams.json
   ```

2. Modify and save the AddStaticRouteParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateRouteInTGWRouteTable",
     "Region": "us-east-1",
     "Parameters": {
       "DestinationCidrBlock" : [ "10.0.0.0/24" ],
       "Blackhole" : [ "false" ],
       "TransitGatewayAttachmentId": [ "tgw-attach-0878cf82a40721d19" ],
       "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it AddStaticRouteRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > AddStaticRouteRfc.json
   ```

4. Modify and save the AddStaticRouteRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3r2ckznmt0a59",
  "Title": "Create a static route on Transit Gateway Route Table"
}
```

5. Create the RFC, specifying the AddStaticRouteRfc file and the AddStaticRouteParams file:

```
aws amscm create-rfc --cli-input-json file://AddStaticRouteRfc.json  --execution-
parameters file://AddStaticRouteParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Before you run this Change Type, confirm the following points:

- The TGW route table exists and is available.
- The TGW route table is not `DMZBastionsRouteDomain` or `EgressRouteDomain`.
- The TGW attachment exists.
- The CIDR is not default (0.0.0.0/0), invalid, or that the route already exists.

Note

If you want to add a route in the `DMZBastionsRouteDomain` or `EgressRouteDomain` route table, then use the ct-0xdawir96cy7k to open a MOO RFC.

Note

This Change Type is only valid in Multi-account Landing Zone (MALZ) Networking accounts.

To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3r2ckznmt0a59.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateRouteInTGWRouteTable",
  "Region": "us-east-1",
  "Parameters": {
    "DestinationCidrBlock": ["10.0.2.0/24"],
    "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateRouteInTGWRouteTable",
  "Region": "us-east-1",
  "Parameters": {
    "Blackhole": [false],
    "DestinationCidrBlock": ["10.0.2.0/24"],
    "TransitGatewayAttachmentId": [ "tgw-attach-0878cf82a40721d19" ],
    "TransitGatewayRouteTableId": [ "tgw-rtb-06ddc751c0c0c881c" ]
  }
}
```

Networking Account | Create Application Route Table (Review Required)

Create a custom AWS Transit Gateway (TGW) route table for the application accounts in the networking account. By default, the route table does not connect to the on-premise network, but contains preset routes. To request connections to the on-premise network, submit a Management|Other|Other|Update change type.

Full classification: Deployment | Managed landing zone | Networking account | Create application route table (review required)

Change Type Details

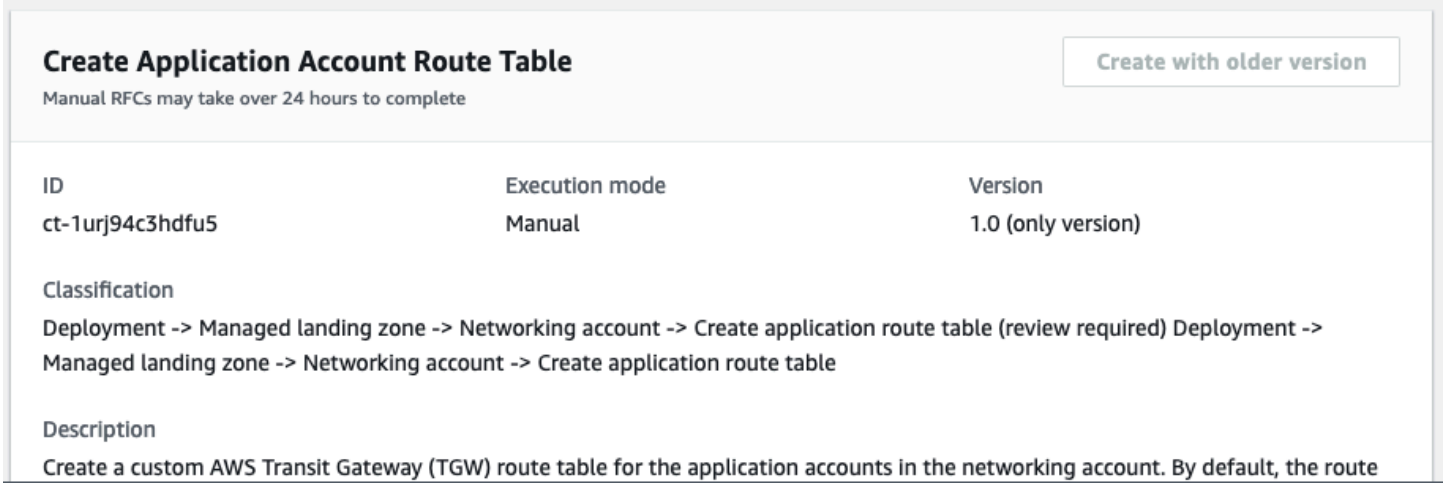
Change type ID	ct-1urj94c3hdfu5
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create application route table (review required)

Networking account: creating an application route table with the Console (review required)

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Networking account: creating an application route table with the CLI (review required)

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1urj94c3hdfu5" --change-type-version
 "1.0" --title "Create Application TGW route table" --execution-parameters
 "{\"TransitGatewayApplicationRouteTableName\":\"TABLE_NAME\", \"AddPresetStaticRoutes
\": true}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateRouteTableParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1urj94c3hdfu5"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRouteTableParams.json
   ```

2. Modify and save the CreateRouteTableParams file. For example, you can replace the contents with something like this:

   ```
   {
       "TransitGatewayApplicationRouteTableName": "ROUTE_TABLE_NAME",
           "AddPresetStaticRoutes": true
   ```

```
}
```

3. Output the RFC template JSON file to a file; this example names it CreateRouteTableRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRouteTableRfc.json
```

4. Modify and save the CreateRouteTableRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1urj94c3hdfu5",
"Title":                "Create-TG-Route-Table-RFC"
}
```

5. Create the RFC, specifying the CreateRouteTableRfc file and the CreateRouteTableParams file:

```
aws amscm create-rfc --cli-input-json file://CreateRouteTableRfc.json  --execution-
parameters file://CreateRouteTableParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

- This change type is manual. To use the automated version of this change type, see Networking Account | Create Application Route Table.
- By default, the route table does not connect to on-premise network, but contains preset routes. To request connections to the on-premise network, submit a Deployment | Managed landing zone | Networking account | Add static route change type, with the route table ID, to add routes to it.

If you set the **AddPresetStaticRoutes** parameter to False, the route table that created is empty and you must file a Deployment | Managed landing zone | Networking account | Add static route change type, with the route table ID, to add routes to it.

- To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1urj94c3hdfu5.

Example: Required Parameters

```
{
  "TransitGatewayApplicationRouteTableName": "routeTableName"
}
```

Example: All Parameters

```
{
  "TransitGatewayApplicationRouteTableName": "routeTableName",
  "AddPresetStaticRoutes": true,
  "Priority": "Medium"
}
```

Networking Account | Create Transit Gateway Route Table

Create a transit gateway (TGW) route table. Use this change type for multi-account landing zone (MALZ) Networking accounts only.

Full classification: Deployment | Managed landing zone | Networking account | Create transit gateway route table

Change Type Details

Change type ID	ct-3dscwaeyi6cup
Current version	1.0

Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Networking account: creating an application route table with the CLI (review required)

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1urj94c3hdfu5" --change-type-version
 "1.0" --title "Create Application TGW route table" --execution-parameters
 "{\"TransitGatewayApplicationRouteTableName\":\"TABLE_NAME\", \"AddPresetStaticRoutes
\": true}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateRouteTableParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1urj94c3hdfu5"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRouteTableParams.json
   ```

2. Modify and save the CreateRouteTableParams file. For example, you can replace the contents with something like this:

   ```
   {
       "TransitGatewayApplicationRouteTableName": "ROUTE_TABLE_NAME",
           "AddPresetStaticRoutes": true
   }
   ```

3. Output the RFC template JSON file to a file; this example names it CreateRouteTableRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRouteTableRfc.json
```

4. Modify and save the CreateRouteTableRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1urj94c3hdfu5",
"Title":                "Create-TG-Route-Table-RFC"
}
```

5. Create the RFC, specifying the CreateRouteTableRfc file and the CreateRouteTableParams file:

```
aws amscm create-rfc --cli-input-json file://CreateRouteTableRfc.json  --execution-
parameters file://CreateRouteTableParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

- This change type is manual. To use the automated version of this change type, see Networking Account | Create Application Route Table.
- By default, the route table does not connect to on-premise network, but contains preset routes. To request connections to the on-premise network, submit a Deployment | Managed landing zone | Networking account | Add static route change type, with the route table ID, to add routes to it.

  If you set the **AddPresetStaticRoutes** parameter to False, the route table that created is empty and you must file a Deployment | Managed landing zone | Networking account | Add static route change type, with the route table ID, to add routes to it.

- To learn more about AMS multi-account landing zone, see AWS Managed Services (AMS) Now Offers Managed Landing Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3dscwaeyi6cup.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateTGWRouteTable",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayRouteTableName": "NewApplicationRouteTable1",
    "TransitGatewayId": "tgw-0123456789abcdefg",
    "TGWRouteTableType": "createApplicationRouteDomain"
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateTGWRouteTable",
  "Region": "us-east-1",
  "Parameters": {
    "TransitGatewayRouteTableName": "NewApplicationRouteTable",
    "TransitGatewayId": "tgw-0123456789abcdefg",
    "TGWRouteTableType": "createApplicationRouteDomain"
  }
}
```

Monitoring and Notification Subcategory

Change Type Items and Operations in the Monitoring and Notification Subcategory

- CloudWatch | Create Alarms
- CloudWatch | Create LogGroup
- GuardDuty IP Set | Create (Review Required)
- GuardDuty Threat Intel Set | Create (Review Required)

- SNS | Create (Topic and Subscription)
- SQS | Create

CloudWatch | Create Alarms

Create one or more CloudWatch alarms. For detailed information on CloudWatch alarm properties, see AWS documentation "Creating CloudWatch Alarms".

Full classification: Deployment | Monitoring and notification | CloudWatch | Create alarms

Change Type Details

Change type ID	ct-361vpyun9a9dd
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create CloudWatch alarm

Creating a CloudWatch alarm with the console

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a CloudWatch alarm with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-361vpyun9a9dd" --change-type-version "1.0" --title "Test Create CloudWatch Alarms"
 --execution-parameters "{\"Alarms\": [{\"ActionsEnabled\": true,\"AlarmActions\":
 [\"arn:aws:sns:us-east-1:000000000000:SNS-Topic\"],\"AlarmDescription\": \"Test
 alarm description.\",\"AlarmName\": \"Test alarm name\",\"ComparisonOperator\":
 \"GreaterThanThreshold\",\"DatapointsToAlarm\": 1,\"Dimensions\": [{\"Name\":
 \"InstanceId\",\"Value\": \"i-12345678901234567\"}],\"EvaluateLowSampleCountPercentile
\": \"ignore\",\"EvaluationPeriods\": 2,\"InsufficientDataActions\": [\"arn:aws:sns:us-
east-1:000000000000:SNS-Topic\"],\"MetricName\": \"TestMetric\",\"Namespace\":
 \"AWS/Test\",\"OkActions\": [\"arn:aws:sns:us-east-1:000000000000:SNS-Topic\"],
\"Period\": 300,\"Statistic\": \"Average\",\"Threshold\": 85,\"TreatMissingData\":
 \"breaching\",\"Unit\": \"Percent\"}],\"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file in your current folder; this example names it CwAlarmsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-361vpyun9a9dd" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CwAlarmsParams.json
   ```

2. Modify and save the CwAlarmsParams.json file. For example, you can replace the contents with something like this:

```
{
  "Alarms": [
    {
      "ActionsEnabled": true,
      "AlarmActions": ["arn:aws:sns:us-east-1:000000000000:SNS-Topic"],
      "AlarmDescription": "Test alarm description.",
      "AlarmName": "Test alarm name",
      "ComparisonOperator": "GreaterThanThreshold",
      "DatapointsToAlarm": 1,
      "Dimensions": [
        {
          "Name": "InstanceId",
          "Value": "i-12345678901234567"
        }
      ],
      "EvaluateLowSampleCountPercentile": "ignore",
      "EvaluationPeriods": 2,
      "InsufficientDataActions": ["arn:aws:sns:us-east-1:000000000000:SNS-Topic"],
      "MetricName": "TestMetric",
      "Namespace": "AWS/Test",
      "OkActions": ["arn:aws:sns:us-east-1:000000000000:SNS-Topic"],
      "Period": 300,
      "Statistic": "Average",
      "Threshold": 85,
      "TreatMissingData": "breaching",
      "Unit": "Percent"
    }
  ],
  "Region": "us-east-1"
}
```

3. Output the JSON template for CreateRfc to a file in your current folder; this example names it CwAlarmsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CwAlarmsRfc.json
```

4. Modify and save the CwAlarmsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-361vpyun9a9dd",
```

```
"Title":                "CW-ALARMS-RFC"
}
```

5. Create the RFC, specifying the CwAlarmsRfc file and the execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CwAlarmsRfc.json --execution-
parameters file://CwAlarmsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about CloudWatch, see Creating Amazon CloudWatch Alarms.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-361vpyun9a9dd.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Alarms": [
    {
      "ActionsEnabled": true,
      "AlarmActions": ["arn:aws:sns:us-east-1:000000000000:SNS-Topic"],
      "AlarmDescription": "Test alarm description.",
      "AlarmName": "Test alarm name",
      "ComparisonOperator": "GreaterThanThreshold",
      "DatapointsToAlarm": 1,
      "Dimensions": [
        {
          "Name": "InstanceId",
          "Value": "i-12345678901234567"
        }
      ],
```

```
      "EvaluateLowSampleCountPercentile": "ignore",
      "EvaluationPeriods": 2,
      "InsufficientDataActions": ["arn:aws:sns:us-east-1:000000000000:SNS-Topic"],
      "MetricName": "TestMetric",
      "Namespace": "AWS/Test",
      "OkActions": ["arn:aws:sns:us-east-1:000000000000:SNS-Topic"],
      "Period": 300,
      "Statistic": "Average",
      "Threshold": 85,
      "TreatMissingData": "breaching",
      "Unit": "Percent"
    }
  ],
  "Region": "us-east-1"
}
```

CloudWatch | Create LogGroup

Creates a CloudWatch LogGroup with optional subscription filter, up to 5 log streams and up to 5 metric filters.

Full classification: Deployment | Monitoring and notification | CloudWatch | Create LogGroup

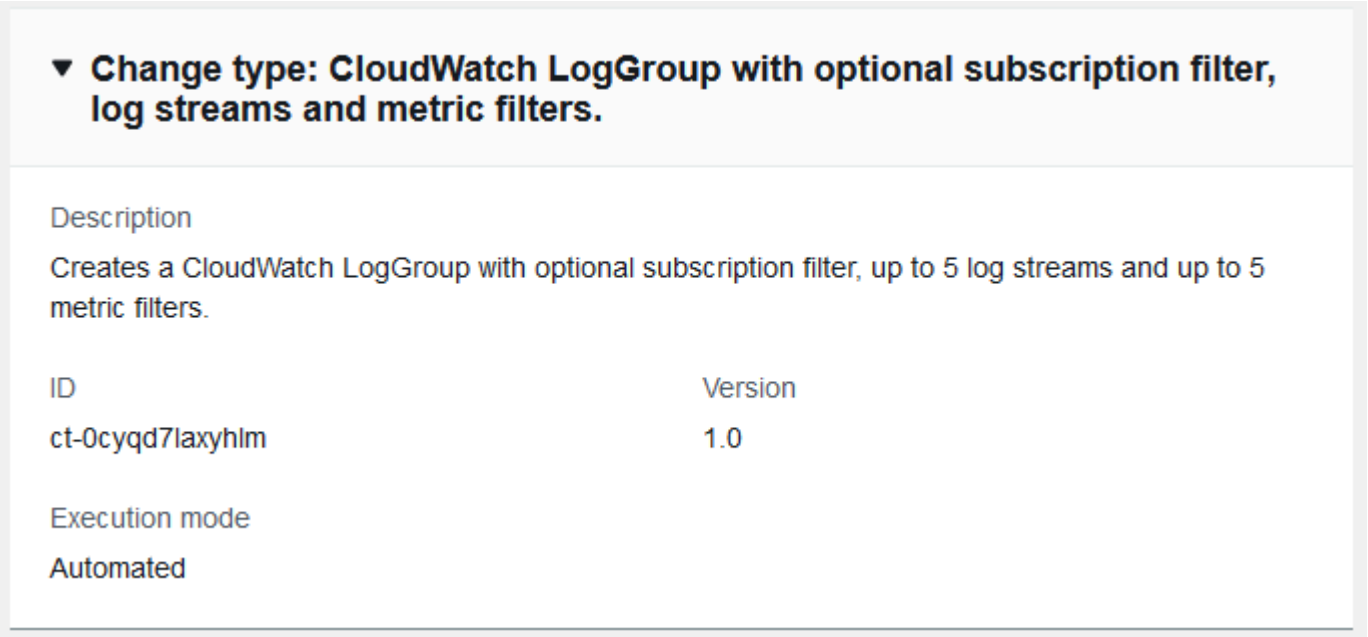
Change Type Details

Change type ID	ct-0cyqd7laxyhlm
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create CloudWatch LogGroup

Creating a CloudWatch LogGroup with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a CloudWatch LogGroup with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  --profile saml --region us-east-1 create-rfc --change-type-id
 "ct-0cyqd7laxyhlm" --change-type-version "1.0" --title 'CloudWatch LogGroup'
 --description "CloudWatch LogGroup"  --execution-parameters "{\"Description
\":\"My Test LogGroup\",\"VpcId\":\"VPC_ID\",\"Name\":\"Test LogGroup\",
\"StackTemplateId\":\"stm-8ian3plt5a6jbv7jt\",\"TimeoutInMinutes\":60,\"Parameters
\": {\"LogGroupName\":\"customer-testloggroup\",\"LogStream1Name\":\"LogStream1\",
\"SubscriptionFilterPattern\":\"test\",\"SubscriptionDestinationARN\":
\"arn:aws:lambda:us-east-1:123456789012:function:test_lambda\",\"MetricFilter1Name\":
\"test_metric_filter1\",\"MetricFilter1Namespace\":\"test_metric_filter1_namespace\",
\"MetricFilter1Pattern\":\"{$.eventType=\\\"test_event\\\"}\",\"MetricFilter1Value\":
\"10\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file in your current folder; this example names it CwLGParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-ct-0cyqd7laxyhlm" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CwLGParams.json
   ```

2. Modify and save the CwLGParams.json file. For example, you can replace the contents with something like this:

   ```
   {
       "Description": "Test CloudWatch Description",
       "VpcId": "VPC_ID",
       "StackTemplateId": "stm-8ian3plt5a6jbv7jt",
       "Name": "My_CW_Loggroup",
       "TimeoutInMinutes": 60,
       "Parameters": {
           "LogGroupName": "customer-testloggroup",
   ```

```
        "LogStream1Name": "LogStream1",
        "SubscriptionFilterPattern": "test",
        "SubscriptionDestinationARN": "arn:aws:lambda:us-
east-1:123456789012:function:test_lambda",
        "MetricFilter1Name": "test_metric_filter1",
        "MetricFilter1Namespace": "test_metric_filter1_namespace",
        "MetricFilter1Pattern": "{$.eventType=\"test_event\"}",
        "MetricFilter1Value": "10"
    }
}
```

3. Output the JSON template for CreateRfc to a file in your current folder; example names it CwLGRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CwLGRfc.json
```

4. Modify and save the CwLGRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0cyqd7laxyhlm",
"Title":                "CW-LG-RFC"
}
```

5. Create the RFC, specifying the CwLGRfc file and the execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CwLGRfc.json --execution-parameters
 file://CwLGParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about CloudWatch, see Creating Amazon CloudWatch Alarms.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0cyqd7laxyhlm.

Example: Required Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "StackTemplateId": "stm-8ian3plt5a6jbv7jt",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "LogGroupName": "customer-testloggroup"
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-1234567890abcdef0",
  "StackTemplateId": "stm-8ian3plt5a6jbv7jt",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "LogGroupName":"customer-test",
```

```
    "LogGroupRetentionInDays":"7",
    "LogStream1Name":"logstream1",
    "LogStream2Name":"logstream2",
    "LogStream3Name":"logstream3",
    "LogStream4Name":"logstream4",
    "LogStream5Name":"logstream5",
    "SubscriptionFilterIAMroleARN":"arn:aws:iam::123456789012:role/example-role",
    "SubscriptionFilterPattern":"Error",
    "SubscriptionDestinationARN":"arn:aws:kinesis:us-east-1:123456789012:stream/
example-stream-name",
    "MetricFilter1Name":"metricfilter1",
    "MetricFilter1Namespace":"metricfilter1namespace",
    "MetricFilter1Pattern":"Error",
    "MetricFilter1Value":"10",
    "MetricFilter1DefaultValue":"1",
    "MetricFilter2Name":"metricfilter2",
    "MetricFilter2Namespace":"metricfilter2namespace",
    "MetricFilter2Pattern":"Error",
    "MetricFilter2Value":"20",
    "MetricFilter2DefaultValue":"1",
    "MetricFilter3Name":"metricfilter3",
    "MetricFilter3Namespace":"metricfilter3namespace",
    "MetricFilter3Pattern":"Error",
    "MetricFilter3Value":"30",
    "MetricFilter3DefaultValue":"1",
    "MetricFilter4Name":"metricfilter4",
    "MetricFilter4Namespace":"metricfilter4namespace",
    "MetricFilter4Pattern":"40",
    "MetricFilter4Value":"2",
    "MetricFilter4DefaultValue":"1",
    "MetricFilter5Name":"metricfilter5",
    "MetricFilter5Namespace":"metricfilter5namespace",
    "MetricFilter5Pattern":"Error",
    "MetricFilter5Value":"50",
    "MetricFilter5DefaultValue":"1"
  }
}
```

GuardDuty IP Set | Create (Review Required)

Use to create an Amazon GuardDuty IPSet instance which is a list of trusted IP addresses that have been whitelisted for highly secure communication with your AWS environment.

Full classification: Deployment | Monitoring and notification | GuardDuty IP set | Create (review required)

Change Type Details

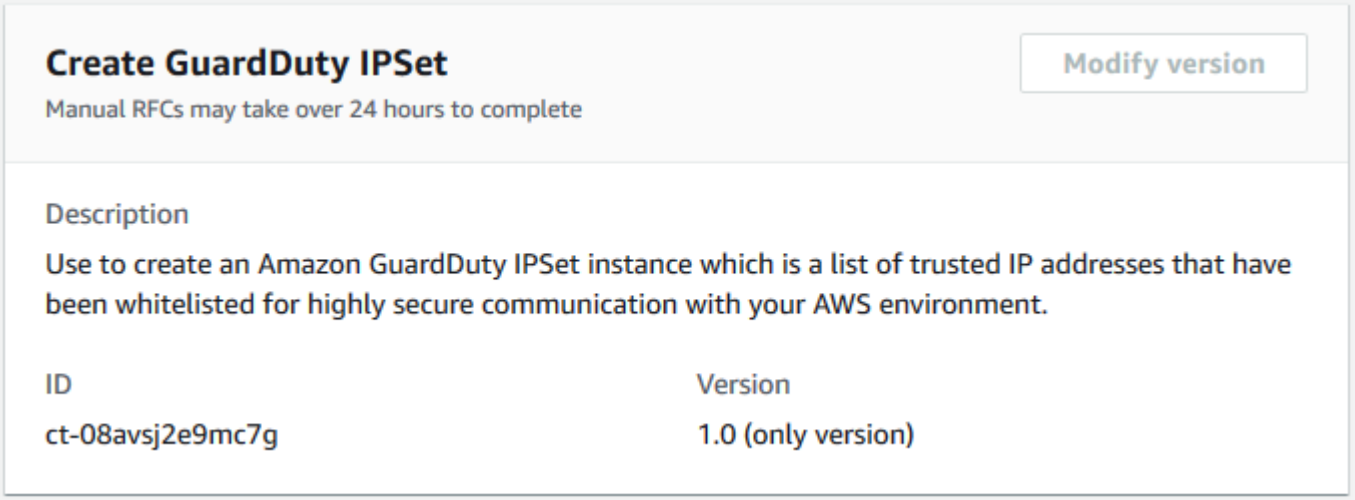
Change type ID	ct-08avsj2e9mc7g
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create GuardDuty IP set (review required)

Creating an IP set for GuardDuty (review required) with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an IP set for GuardDuty (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-08avsj2e9mc7g" --change-type-version "1.0"
 --title "Create Amazon GuardDuty IP Set" --execution-parameters "{\"Activate\": true,
 \"DetectorId\": \"00000000000000000000000000000000\", \"Format\": \"TXT\", \"Name\":
 \"trusted-ips\", \"IpSet\": \"https://s3.us-west-2.amazonaws.com/my-bucket/my-object-
key\", \"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateGdIpSetParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-08avsj2e9mc7g" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > CreateGdIpSetParams.json
   ```

2. Modify and save the CreateGdIpSetParams file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "Activate": true,
  "DetectorId": "00000000000000000000000000000000",
  "Format": "TXT",
  "Name": "trusted-ips",
  "IpSet": "https://s3.us-west-2.amazonaws.com/my-bucket/my-object-key",
  "Region": "us-east-1"
}
```

3. Output the RFC template JSON file to a file named CreateGdIpSetRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateGdIpSetRfc.json
```

4. Modify and save the CreateGdIpSetRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-08avsj2e9mc7g",
"Title":                "CREATE_GD_IP_SET"
}
```

5. Create the RFC, specifying the CreateGdIpSet Rfc file and the CreateGdIpSetParams file:

```
aws amscm create-rfc --cli-input-json file://CreateGdIpSetRfc.json  --execution-
parameters file://CreateGdIpSetParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

To learn more about Amazon GuardDuty and creating IP sets, see Amazon GuardDuty and CreateIPSet.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-08avsj2e9mc7g.

Example: Required Parameters

```
{
  "Region": "us-east-1",
  "Name": "Sample IPSet",
  "IpSet": "https://s3.amazonaws.com/guarddutylists/sample.txt"
}
```

Example: All Parameters

```
{
  "Activate": true,
  "DetectorId": "12abc34d567e8fa901bc2d34e56789f0",
  "Region": "us-east-1",
  "Name": "Sample IPSet",
  "IpSet": "https://s3.amazonaws.com/guarddutylists/sample.txt",
  "Format": "TXT",
  "Priority": "Medium"
}
```

GuardDuty Threat Intel Set | Create (Review Required)

Use to create an Amazon GuardDuty ThreatIntelSet instance, which is a list of known malicious IP addresses that have been blacklisted for communication with your AWS environment.

Full classification: Deployment | Monitoring and notification | GuardDuty threat intel set | Create (review required)

Change Type Details

Change type ID	ct-25v6r7t8gvkq5
Current version	1.0
Expected execution duration	60 minutes

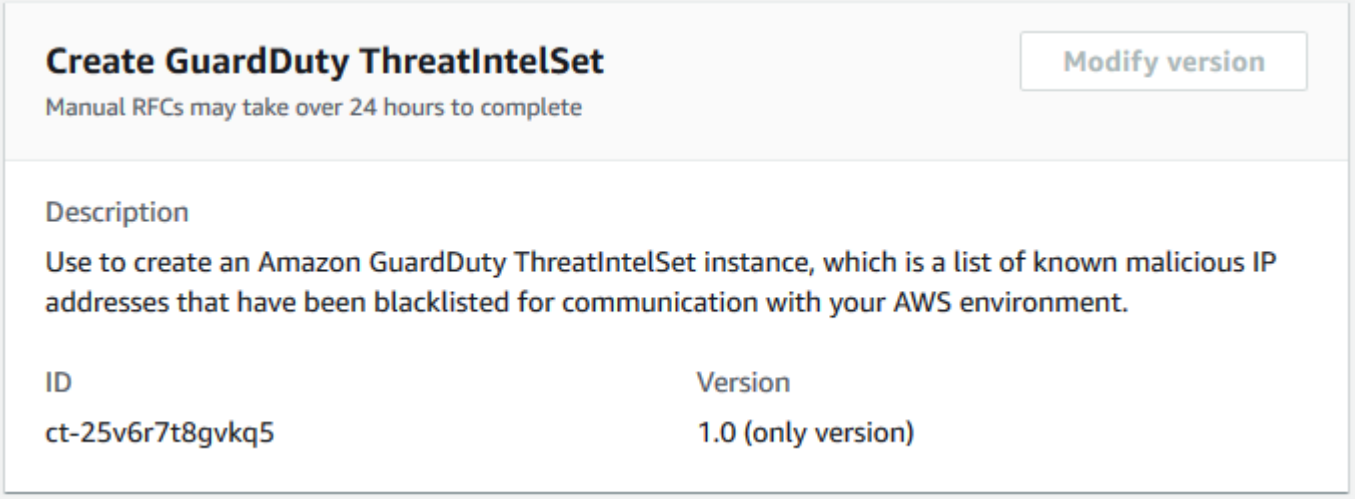
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create GuardDuty Threat intel set (review required)

Creating a Threat intel set for GuardDuty (review required) with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a Threat intel set for GuardDuty (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-25v6r7t8gvkq5" --change-type-version
 "1.0" --title "Create Amazon GuardDuty Threat Intel Set" --execution-parameters
 "{\"Activate\": true, \"DetectorId\": \"00000000000000000000000000000000\", \"Format
\": \"TXT\", \"Name\": \"blacklisted-ips\", \"ThreatIntelSet\": \"https://s3.us-
west-2.amazonaws.com/my-bucket/my-object-key\", \"Region\": \"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateGdThreatIntelSetParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-25v6r7t8gvkq5"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateGdThreatIntelSetParams.json
   ```

2. Modify and save the CreateGdThreatIntelSetParams file. For example, you can replace the contents with something like this:

   ```
   {
     "Activate": true,
     "DetectorId": "00000000000000000000000000000000",
     "Format": "TXT",
     "Name": "blacklisted-ips",
     "ThreatIntelSet": "https://s3.us-west-2.amazonaws.com/my-bucket/my-object-key",
     "Region": "us-east-1"
   }
   ```

3. Output the RFC template JSON file to a file named CreateGdThreatIntelSetRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateGdThreatIntelSetRfc.json
```

4. Modify and save the CreateGdThreatIntelSetRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-25v6r7t8gvkq5",
"Title":                "CREATE_GD_THREAT_INTEL_SET"
}
```

5. Create the RFC, specifying the CreateGdIpSet Rfc file and the CreateGdThreatIntelSetParams file:

```
aws amscm create-rfc --cli-input-json file://CreateGdThreatIntelSetRfc.json  --
execution-parameters file://CreateGdThreatIntelSetParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

For more information about Amazon GuardDuty and creating Threat Intel sets, see Amazon Guard Duty and CreateThreatIntelSet.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-25v6r7t8gvkq5.

Example: Required Parameters

```
{
```

```
  "Region": "us-east-1",
  "Name": "Sample Threat Intel Set",
  "ThreatIntelSet": "https://s3.amazonaws.com/guarddutylists/sample.txt"
}
```

Example: All Parameters

```
{
  "Activate": true,
  "DetectorId": "12abc34d567e8fa901bc2d34e56789f0",
  "Region": "us-east-1",
  "Name": "Sample Threat Intel Set",
  "ThreatIntelSet": "https://s3.amazonaws.com/guarddutylists/sample.txt",
  "Format": "TXT",
  "Priority": "Medium"
}
```

SNS | Create (Topic and Subscription)

Create an SNS topic and up to five subscriptions.

Full classification: Deployment | Monitoring and notification | SNS | Create (topic and subscription)

Change Type Details

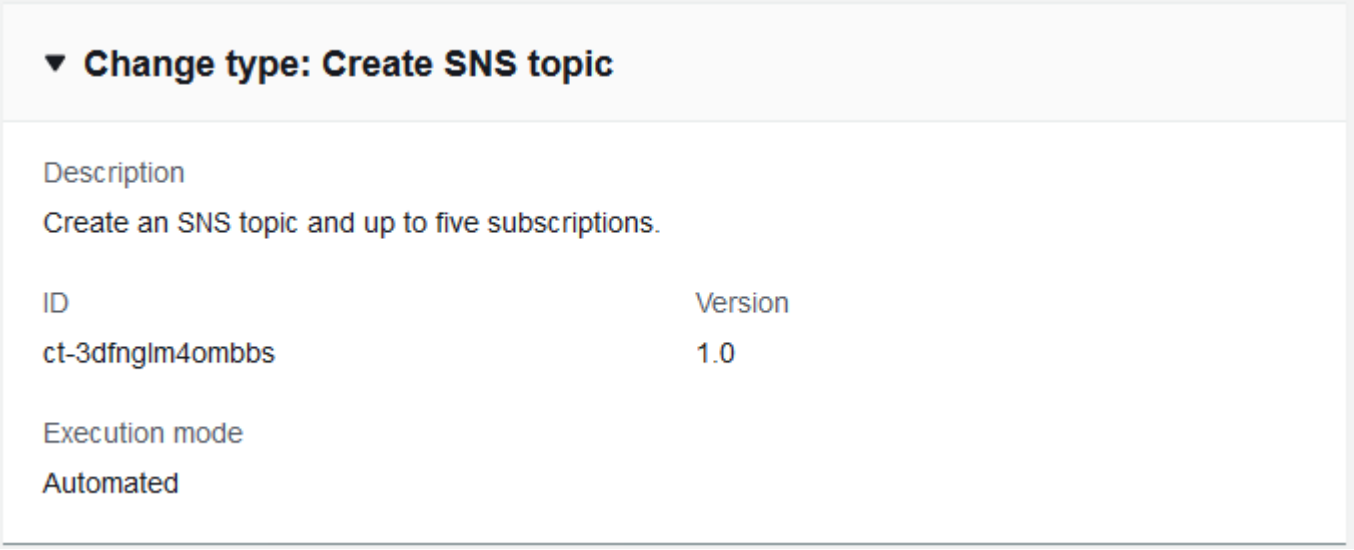
Change type ID	ct-3dfnglm4ombbs
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create SNS topic and subscription

Creating an SNS topic and subscription (up to 5) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an SNS topic and subscription (up to 5) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3dfnglm4ombbs" --change-type-version
 "1.0" --title "CREATE_SNS_TOPIC" --execution-parameters "{\"Description\":
\"SNS_TOPIC_DESCRIPTION\",\"VpcId\":\"VPC_ID\",\"Name\":\"SNS_TOPIC_NAME\",
\"StackTemplateId\":\"stm-eakrsalqo9m62tpun\",\"TimeoutInMinutes\":60,\"Parameters\":
{\"TopicName\":\"mytopic-cli\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateSnsTopicSubParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3dfnglm4ombbs"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateSnsTopicSubParams.json
   ```

2. Modify and save the CreateSnsTopicSubParams file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":      "SnsTopicSub-Create",
   "VpcId": "VPC_ID",
   "Name":             "My-SnsTopicSub",
   "Parameters":{
       "TopicName": "mytopic-cli-all-params",
       "DisplayName": "testsns",
       "Subscription1Protocol": "email",
       "Subscription1Endpoint": "abc@xyz.com",
       "Subscription1RawMessageDelivery": "false",
       "Subscription2Protocol": "sms",
       "Subscription2Endpoint": "+61500444777",
       "Subscription2RawMessageDelivery": "false",
   ```

```
    "KmsMasterKeyId": "arn:aws:kms:us-east-1:123456789101:key/
cfe0542d-3be9-4166-9eac-d0cd6af61445"
    }
}
```

3. Output the RFC template JSON file to a file named CreateSnsTopicSubRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateSnsTopicSubRfc.json
```

4. Modify and save the CreateSnsTopicSubRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3dfnglm4ombbs",
"Title":                "SnsTopicSub-Create-RFC"
}
```

5. Create the RFC, specifying the CreateSnsTopicSub Rfc file and the CreateSnsTopicSubParams file:

```
aws amscm create-rfc --cli-input-json file://CreateSnsTopicSubRfc.json  --
execution-parameters file://CreateSnsTopicSubParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Simple Notification Service (SNS) and creating SNS topics and subscriptions, see Amazon Simple Notification Service. Also see Getting Started with Amazon SNS. For pricing information, see Amazon SNS pricing.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3dfnglm4ombbs.

Example: Required Parameters

```
{
```

```
  "Description" : "Creates SNS Topic using random Topic name with no input or parameter
 given.",
  "VpcId" : "vpc-12345678901234567",
  "Name" : "TestStack",
  "StackTemplateId" : "stm-eakrsalqo9m62tpun",
  "TimeoutInMinutes" : 60,
  "Parameters" : { }
}
```

Example: All Parameters

```
{
  "Description" : "Creates just SNS Topic per the given name",
  "VpcId" : "vpc-12345678",
  "Name" : "TestStack",
  "Tags" : [
    {
      "Key" : "foo",
      "Value" : "bar"
    }
  ],
  "StackTemplateId" : "stm-eakrsalqo9m62tpun",
  "TimeoutInMinutes" : 60,
  "Parameters" : {
    "TopicName" : "MySNSTopic",
    "DisplayName" : "",
    "Subscription1Endpoint" : "",
    "Subscription1RawMessageDelivery" : "false",
    "Subscription2Endpoint" : "",
    "Subscription2RawMessageDelivery" : "false",
    "Subscription3Endpoint" : "",
    "Subscription3RawMessageDelivery" : "false",
    "Subscription4Endpoint" : "",
    "Subscription4RawMessageDelivery" : "false",
    "Subscription5Endpoint" : "",
    "Subscription5RawMessageDelivery" : "false",
    "KmsMasterKeyId" : ""
  }
}
```

SQS | Create

Use to create an Amazon Simple Queue Service instance for messages to be shared by system components.

Full classification: Deployment | Monitoring and notification | SQS | Create

Change Type Details

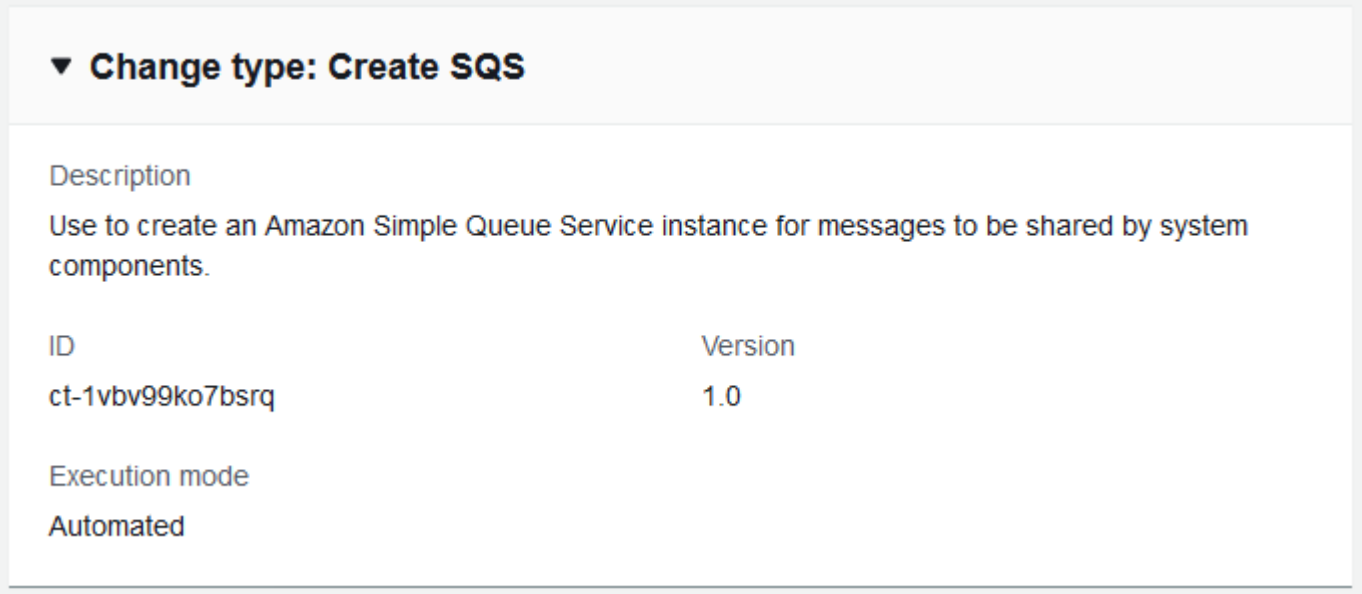
Change type ID	ct-1vbv99ko7bsrq
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create SQS queue

Creating an SQS queue with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an SQS queue with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1vbv99ko7bsrq" --change-type-version "1.0" --
title "Create Amazon SQS Queue" --execution-parameters "{\"Description\": \"SQS-Queue-
Create-RFC\", \"VpcId\": \"VPC_ID\", \"StackTemplateId\": \"stm-s1ejpr80000000000\",
 \"Name\": \"MySqsQueue\", \"Tags\": [{\"Key\": \"my-tag-1\", \"Value\": \"my-tag-
value-1\"}, {\"Key\": \"my-tag-2\", \"Value\": \"my-tag-value-2\"}], \"TimeoutInMinutes
\": 60, \"Parameters\": {\"SQSDelaySeconds\": 0, \"SQSMaximumMessageSize\": 262144,
 \"SQSMessageRetentionPeriod\": 345600, \"SQSQueueName\": \"MyQueueName\",
 \"SQSReceiveMessageWaitTimeSeconds\": 0, \"SQSVisibilityTimeout\": 60}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateSqsInstanceParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1vbv99ko7bsrq"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateSqsInstanceParams.json
   ```

2. Modify and save the CreateSqsInstanceParams file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "SQS-Queue-Create-RFC",
     "VpcId": "VPC_ID",
     "StackTemplateId": "stm-s1ejpr80000000000",
     "Name": "MySqsQueue",
     "Tags": [{
       "Key": "my-tag-1",
       "Value": "my-tag-value-1"
     }, {
       "Key": "my-tag-2",
       "Value": "my-tag-value-2"
     }],
     "TimeoutInMinutes": 60,
     "Parameters": {
       "SQSDelaySeconds": 0,
       "SQSMaximumMessageSize": 262144,
       "SQSMessageRetentionPeriod": 345600,
   ```

```
    "SQSQueueName": "MyQueueName",
    "SQSReceiveMessageWaitTimeSeconds": 0,
    "SQSVisibilityTimeout": 60
  }
}
```

3. Output the RFC template JSON file to a file named CreateSqsInstanceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateSqsInstanceRfc.json
```

4. Modify and save the CreateSqsInstanceRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1vbv99ko7bsrq",
"Title":                "Sqs-Instance-Create-RFC"
}
```

5. Create the RFC, specifying the CreateSqsInstance Rfc file and the CreateSqsInstanceParams file:

```
aws amscm create-rfc --cli-input-json file://CreateSqsInstanceRfc.json  --
execution-parameters file://CreateSqsInstanceParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon Simple Queue Service (SQS), see Amazon Simple Queue Service.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1vbv99ko7bsrq.

Example: Required Parameters

```
{
  "Description": "This is a test description",
```

```
  "VpcId": "vpc-01234567890abcdef",
  "StackTemplateId": "stm-s1ejpr80000000000",
  "Name": "Test Stack",
  "TimeoutInMinutes": 60,
  "Parameters": {
    "SQSQueueName": "mytestsqs"
  }
}
```

Example: All Parameters

```
{
  "Description": "This is a test description",
  "VpcId": "vpc-12345678",
  "StackTemplateId": "stm-s1ejpr80000000000",
  "Name": "Test Stack",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "TimeoutInMinutes": 60,
  "Parameters": {
    "SQSDelaySeconds": 0,
    "SQSMaximumMessageSize": 262144,
    "SQSMessageRetentionPeriod": 345600,
    "SQSQueueName": "mytestsqs",
    "SQSReceiveMessageWaitTimeSeconds": 0,
    "SQSVisibilityTimeout": 0
  }
}
```

Patching Subcategory

Change Type Items and Operations in the Patching Subcategory

- SSM Patch Baseline | Create (Amazon Linux 2)
- SSM Patch Baseline | Create (Amazon Linux)

- SSM Patch Baseline | Create (CentOS)
- SSM Patch Baseline | Create (Red Hat)
- SSM Patch Baseline | Create (Windows)
- SSM Patch Window | Create

SSM Patch Baseline | Create (Amazon Linux 2)

Create an AWS Systems Manager (SSM) patch baseline to define which patches are approved for installation on your instances for Amazon Linux 2 OS. Specify existing instance "Patch Group" tag values for the patch baseline. The patch baseline is an SSM resource that you can manage with the SSM console.

Full classification: Deployment | Patching | SSM patch baseline | Create (Amazon Linux 2)

Change Type Details

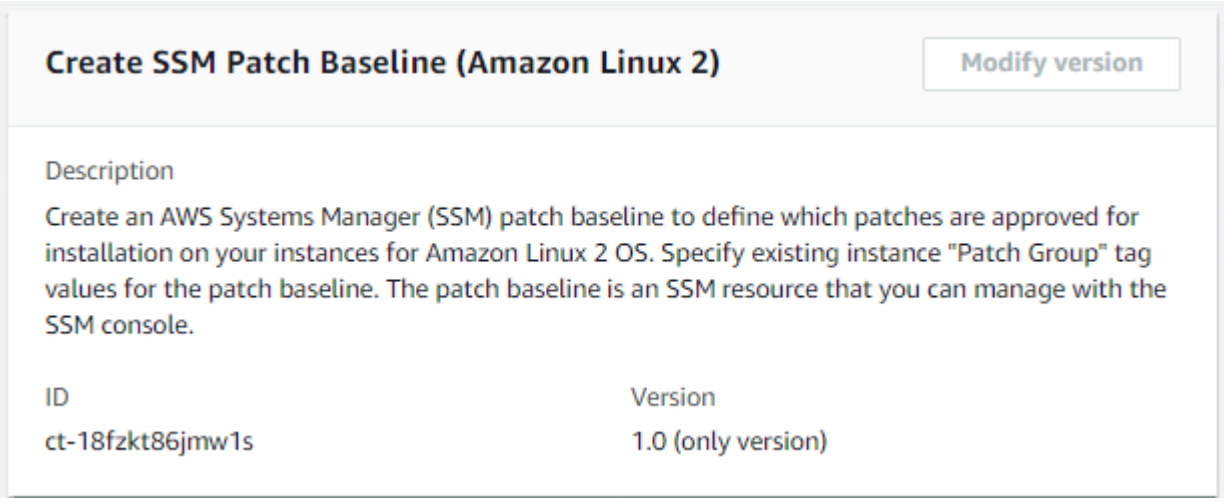
Change type ID	ct-18fzkt86jmw1s
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create for Amazon Linux 2

Creating an SSM Linux2 patch baseline with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

In the AWS Console, you can view the patch baselines you created at Systems Manager --> Patch Manager --> Patch Baselines.

Creating an SSM Linux 2 patch baseline with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title Patch-Baseline-Create-AL2-RFC --change-type-id
 ct-18fzkt86jmw1s --change-type-version 1.0 --execution-parameters ' {"ApprovalRules":
 [{"ApproveAfterDays": 7, "Classification": ["Security"], "Severity": ["All"]}],
 "OperatingSystem": "Amazon Linux 2", "Name": "TestBaselineAmazonLinux2",
 "PatchGroupTagValues": ["MyAmazonLinux2PatchGroup"]}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateAL2PatchBaselineParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2taqdgegqthjr"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateAL2PatchBaselineParams.json
   ```

2. Modify and save the CreateAL2PatchBaselineParams file, make sure to modify these parameters to meet your specific needs.

   In this example, all critical security updates are approved for installation five days after release. Patches related to vulnerability ID CVE-2017-5754 are approved immediately even if they are not a critical severity. Finally, example-pkg-0.710.10-2.7.abcd.x86_64 will not be installed, even if it matches an approval rule.

   ```
   {
   "ApprovalRules":[{
       "ApproveAfterDays": 5,
       "Severity": [
           "Critical"
           ],
       "Classification": [
           "Security"
           ]
       }],
   "ApprovedPatches":["CVE-2017-5754"],
   "Description": "Patch Baseline",
   "Name": "PatchBaseline-Unit-test",
   "OperatingSystem": "Amazon Linux 2",
   ```

```
"PatchGroupTagValues": [
    "test1"
    ],
"RejectedPatches":["example-pkg-0.710.10-2.7.abcd.x86_64"],
"Tags": [
    {
    "Key":"patchGroupAL2",
    "Value":"test1"
    }
]
```

3. Output the RFC template to a file in your current folder; this example names it CreateAL2PatchBaselineRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAL2PatchBaselineRfc.json
```

4. Modify and save the CreateAL2PatchBaselineRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-18fzkt86jmw1s",
"Title":                "Patch-Baseline-Create-AL2-RFC"
}
```

5. Create the RFC, specifying the CreateAL2PatchBaselineRfc file and the CreateAL2PatchBaselineParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAL2PatchBaselineRfc.json --
execution-parameters file://CreateAL2PatchBaselineParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the SSM patch baseline, look in the execution output: Use the stack_id to view the patch baseline in the Systems Manager console.

Tips

> **Note**
>
> There are five change types for creating an SSM patch baseline, for the various operating systems.

> **Important**
>
> At least one of **ApprovalRules** or **ApprovedPatches** is required.

If you create a patch baseline, it must have at least one approval rule and/or approved patch defined. An approval rule allows you to specify which classification (for example, SecurityUpdates) and severity (for example, Critical) patches will be installed. In your approval rules, you can define how many days after a patch is released it may be installed. A patch specified in the approved patches list will be installed irrespective of whether it is matched by an approval rule. Finally, items in the rejected patches list will exclude those patches from being installed, even if they match an approval rule and/or approved patch. For more information, see About predefined and custom patch baselines.

To create an SSM patch window, see Create SSM Patch Window.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-18fzkt86jmw1s.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

SSM Patch Baseline | Create (Amazon Linux)

Create an AWS Systems Manager (SSM) patch baseline to define which patches are approved for installation on your instances for Amazon Linux OS. Specify existing instance "Patch Group" tag values for the patch baseline. The patch baseline is an SSM resource that you can manage with the SSM console.

Full classification: Deployment | Patching | SSM patch baseline | Create (Amazon Linux)

Change Type Details

Change type ID	ct-2taqdgegqthjr
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create for Amazon Linux

Creating an SSM Amazon Linux patch baseline with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

In the AWS Console, you can view the patch baselines you created at Systems Manager --> Patch Manager --> Patch Baselines.

Creating an SSM Amazon Linux patch baseline with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Amazon Linux:

```
aws amscm create-rfc --title Patch-Baseline-Create-AL-RFC --change-type-id
 ct-2taqdgegqthjr --change-type-version 1.0 --execution-parameters '{"ApprovalRules":
 [{"ApproveAfterDays": 7, "Classification": ["Security"], "Severity": ["All"]}],
 "OperatingSystem": "Amazon Linux", "Name": "TestBaselineAmazonLinux",
 "PatchGroupTagValues": ["MyAmazonLinuxPatchGroup"]}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateALPatchBaselineParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2taqdgegqthjr"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateALPatchBaselineParams.json
   ```

2. Modify and save the CreateALPatchBaselineParams file, make sure to modify these parameters to meet your specific needs.

   In this example, all critical security updates are approved for installation five days after release. Patches related to vulnerability ID CVE-2017-5754 are approved immediately even if they are not a critical severity. Finally, example-pkg-0.710.10-2.7.abcd.x86_64 will not be installed, even if it matches an approval rule.

   ```
   {
   "ApprovalRules":[{
       "ApproveAfterDays": 5,
       "Severity": [
           "Critical"
           ],
       "Classification": [
           "Security"
           ]
       }],
   "ApprovedPatches":["CVE-2017-5754"],
   "Description": "Patch Baseline",
   ```

```
"Name": "PatchBaseline-Unit-test",
"OperatingSystem": "Amazon Linux",
"PatchGroupTagValues": [
    "test1"
    ],
"RejectedPatches":["example-pkg-0.710.10-2.7.abcd.x86_64"],
"Tags": [
    {
    "Key":"patchGroupAL",
    "Value":"test1"
    }
]
```

3. Output the RFC template to a file in your current folder; this example names it CreateALPatchBaselineRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateALPatchBaselineRfc.json
```

4. Modify and save the CreateALPatchBaselineRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2taqdgegqthjr",
"Title":                "Patch-Baseline-Create-AL-RFC"
}
```

5. Create the RFC, specifying the CreateALPatchBaselineRfc file and the CreateALPatchBaselineParams file:

```
aws amscm create-rfc --cli-input-json file://CreateALPatchBaselineRfc.json --
execution-parameters file://CreateALPatchBaselineParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the SSM patch baseline, look in the execution output: Use the stack_id to view the patch baseline in the Systems Manager console.

Tips

> **Note**
>
> There are five change types for creating an SSM patch baseline, for the various operating systems.

> **Important**
>
> At least one of **ApprovalRules** or **ApprovedPatches** is required.

If you create a patch baseline, it must have at least one approval rule and/or approved patch defined. An approval rule allows you to specify which classification (for example, SecurityUpdates) and severity (for example, Critical) patches will be installed. In your approval rules, you can define how many days after a patch is released it may be installed. A patch specified in the approved patches list will be installed irrespective of whether it is matched by an approval rule. Finally, items in the rejected patches list will exclude those patches from being installed, even if they match an approval rule and/or approved patch. For more information, see About predefined and custom patch baselines.

To create an SSM patch window, see Create SSM Patch Window.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2taqdgegqthjr.

Example: Required Parameters

```
Example not available.

SSM Patch Baseline | Create (CentOS)

Create an AWS Systems Manager (SSM) patch baseline to define which patches are approved for installation on your instances for CentOS. Specify existing instance "Patch Group" tag values for the patch baseline. The patch baseline is an SSM resource that you can manage with the SSM console.

Full classification: Deployment | Patching | SSM patch baseline | Create (CentOS)

Change Type Details

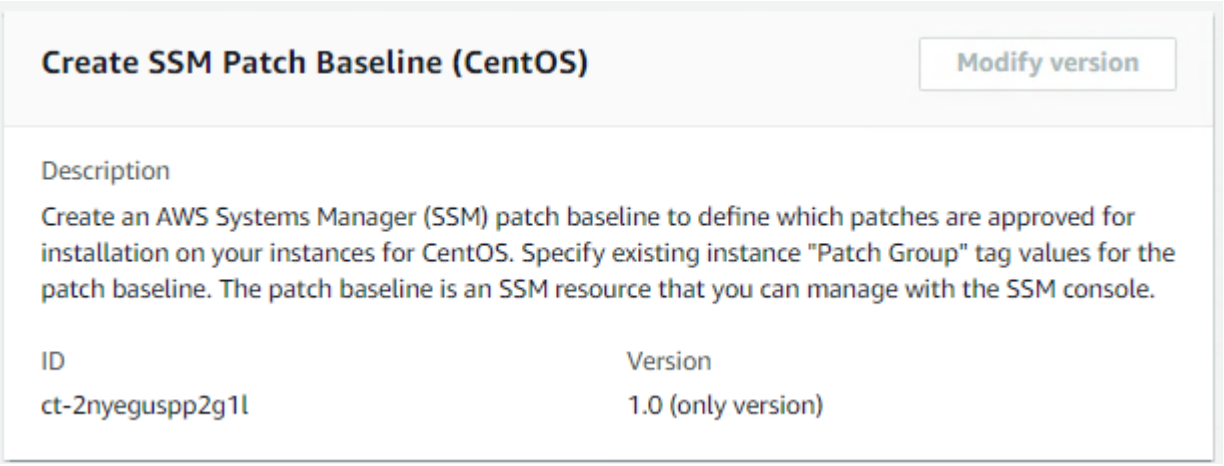
Change type ID	ct-2nyeguspp2g1l
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create for CentOS

Creating an SSM CentOS patch baseline with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

In the AWS Console, you can view the patch baselines you created at Systems Manager --> Patch Manager --> Patch Baselines.

Creating an SSM CentOS patch baseline with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

CentOS:

```
aws amscm create-rfc --title Patch-Baseline-Create-Centos-RFC --change-type-id
 ct-2nyeguspp2g1l --change-type-version 1.0 --execution-parameters '{"ApprovalRules":
 [{"ApproveAfterDays": 7, "Classification": ["All"], "Severity": ["All"]}],
 "OperatingSystem": "CentOS", "Name": "TestBaselineCentOS", "PatchGroupTagValues":
 ["MyCentOSPatchGroup"]}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateCentosPatchBaselineParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-2taqdgegqthjr"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 CreateCentosPatchBaselineParams.json
```

2. Modify and save the CreateCentosPatchBaselineParams file. See examples below; make sure to modify these parameters to meet your specific needs.

   In this example, all updates are approved for installation five days after release. The package **example-pkg-0.710.10-2.7.abcd.x86_64** will not be installed.

```
{
"ApprovalRules":[{
    "ApproveAfterDays": 5,
    "Severity": [
        "All"
        ],
    "Classification": [
        "All"
        ]
    }],
"Description": "Patch Baseline",
"Name": "PatchBaseline-Unit-test",
"OperatingSystem": "CentOS",
"PatchGroupTagValues": [
    "test1"
    ],
"RejectedPatches":["example-pkg-0.710.10-2.7.abcd.x86_64"],
"Tags": [
    {
    "Key":"patchGroupCent",
    "Value":"test1"
    }
]
```

3. Output the RFC template to a file in your current folder; this example names it CreateCentosPatchBaselineRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateCentosPatchBaselineRfc.json
```

4. Modify and save the CreateCentosPatchBaselineRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2nyeguspp2g1l",
"Title":                "Patch-Baseline-Create-Centos-RFC"
}
```

5. Create the RFC, specifying the CreateCentosPatchBaselineRfc file and the CreateCentosPatchBaselineParams file:

```
aws amscm create-rfc --cli-input-json file://CreateCentosPatchBaselineRfc.json --
execution-parameters file://CreateCentosPatchBaselineParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the SSM patch baseline, look in the execution output: Use the stack_id to view the patch baseline in the Systems Manager console.

Tips

> **Note**
>
> There are five change types for creating an SSM patch baseline, for the various operating systems.

> **Note**
>
> Because CentOS default repos do not provide update notice metadata, all updates are categorized as non-security, with no classification or severity info. As a result, you must specify **Classification:All** and **Severity:All** for any CentOS patch baseline. If you do not allow non-security updates in your CentOS baseline, no updates of any type will be installed from default repos. For more detail, see How security patches are selected.

> **Important**
>
> At least one of **ApprovalRules** or **ApprovedPatches** is required.

If you create a patch baseline, it must have at least one approval rule and/or approved patch defined. An approval rule allows you to specify which classification (for example, SecurityUpdates) and severity (for example, Critical) patches will be installed. In your approval rules, you can define how many days after a patch is released it may be installed. A patch specified in the approved patches list will be installed irrespective of whether it is matched by an approval rule. Finally, items in the rejected patches list will exclude those patches from being installed, even if they match an approval rule and/or approved patch. For more information, see About predefined and custom patch baselines.

To create an SSM patch window, see Create SSM Patch Window.

Execution Input Parameters

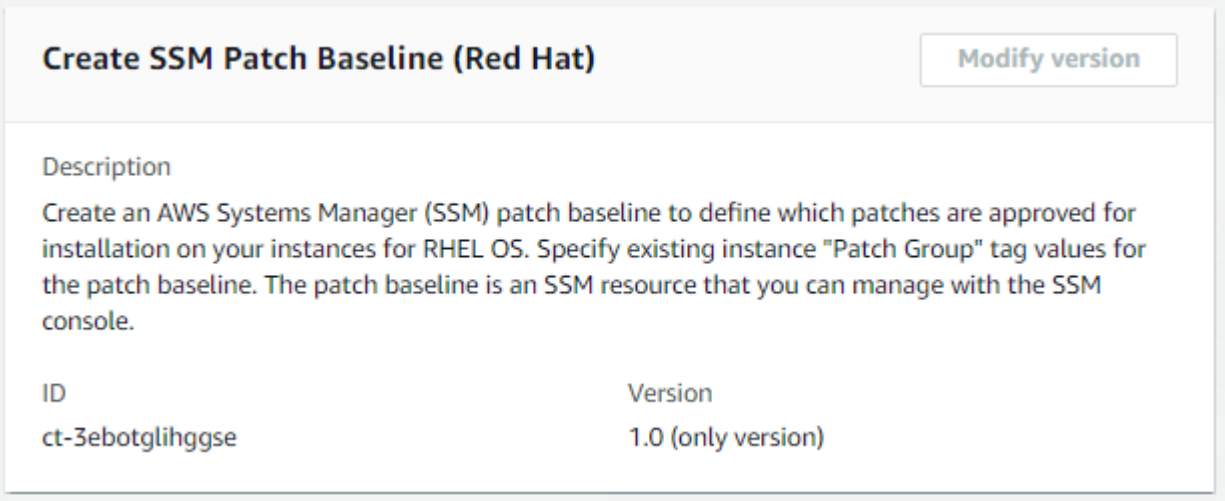
Creating an SSM RHEL patch baseline with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

In the AWS Console, you can view the patch baselines you created at Systems Manager --> Patch Manager --> Patch Baselines.

Creating an SSM RHEL patch baseline with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title Patch-Baseline-Create-Rhel-RFC --change-type-id
 ct-3ebotglihggse --change-type-version 1.0 --execution-parameters '{"ApprovalRules":
 [{"ApproveAfterDays": 7, "Classification": ["Security"], "Severity": ["All"]}],
 "OperatingSystem": "Red Hat Enterprise Linux", "Name": "TestBaselineRHEL",
 "PatchGroupTagValues": ["MyRHELPatchGroup"]}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateRhelPatchBaselineParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2taqdgegqthjr"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateRhelPatchBaselineParams.json
   ```

2. Modify and save the CreateRhelPatchBaselineParams file. See examples below; make sure to modify these parameters to meet your specific needs.

In this example, all critical security updates are approved for installation five days after release. Patches included in Red Hat Security Advisory RHSA-2018:0151 are approved immediately even if they are not a critical severity. Finally, example-pkg-0.710.10-2.7.abcd.x86_64 will not be installed, even if it matches an approval rule.

```
{
"ApprovalRules":[{
    "ApproveAfterDays": 5,
    "Severity": [
        "Critical"
        ],
    "Classification": [
        "Security"
        ]
    }],
"ApprovedPatches":["RHSA-2018:0151"],
"Description": "Patch Baseline",
"Name": "PatchBaseline-Unit-test",
"OperatingSystem": "Red Hat Enterprise Linux",
"PatchGroupTagValues": [
    "test1"
    ],
"RejectedPatches":["example-pkg-0.710.10-2.7.abcd.x86_64"],
"Tags": [
    {
    "Key":"patchGroupRhel",
    "Value":"test1"
    }
]
```

3. Output the RFC template to a file in your current folder; this example names it CreateRhelPatchBaselineRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateRhelPatchBaselineRfc.json
```

4. Modify and save the CreateRhelPatchBaselineRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3ebotglihggse",
```

```
"Title":                "Patch-Baseline-Create-Rhel-RFC"
}
```

5. Create the RFC, specifying the CreateRhelPatchBaselineRfc file and the CreateRhelPatchBaselineParams file:

```
aws amscm create-rfc --cli-input-json file://CreateRhelPatchBaselineRfc.json --
execution-parameters file://CreateRhelPatchBaselineParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the SSM patch baseline, look in the execution output: Use the stack_id to view the patch baseline in the Systems Manager console.

Tips

> **Note**
>
> There are five change types for creating an SSM patch baseline, for the various operating systems.

> **Important**
>
> At least one of **ApprovalRules** or **ApprovedPatches** is required.

If you create a patch baseline, it must have at least one approval rule and/or approved patch defined. An approval rule allows you to specify which classification (for example, SecurityUpdates) and severity (for example, Critical) patches will be installed. In your approval rules, you can define how many days after a patch is released it may be installed. A patch specified in the approved patches list will be installed irrespective of whether it is matched by an approval rule. Finally, items in the rejected patches list will exclude those patches from being installed, even if they match an approval rule and/or approved patch. For more information, see About predefined and custom patch baselines.

To create an SSM patch window, see Create SSM Patch Window.

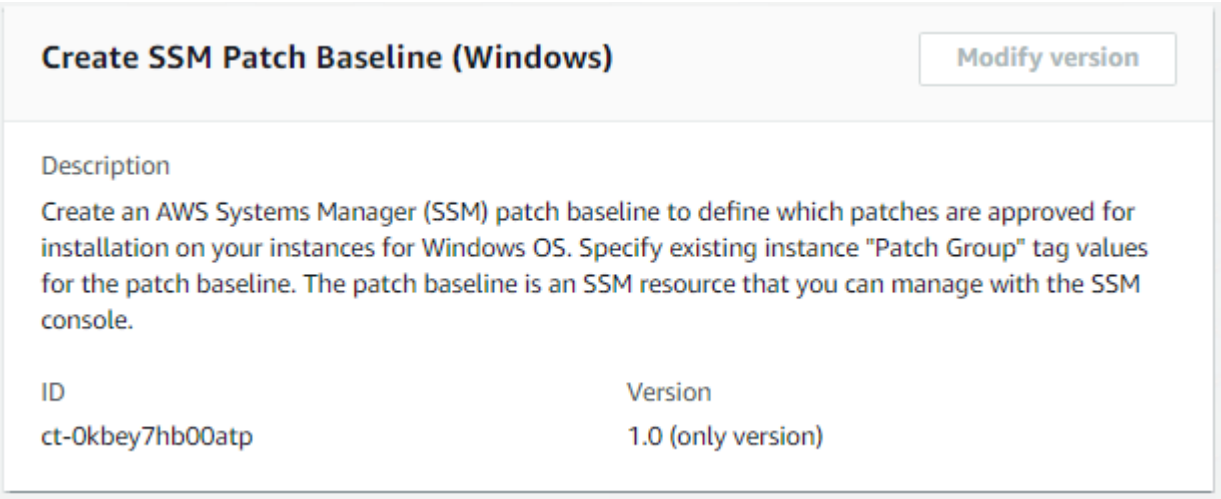
Create for Windows

Creating an SSM Windows patch baseline with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

In the AWS Console, you can view the patch baselines you created at Systems Manager --> Patch Manager --> Patch Baselines.

Creating an SSM Windows patch baseline with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title Patch-Baseline-Create-Win-RFC --change-type-id
 ct-0kbey7hb00atp --change-type-version 1.0 --execution-parameters '{"ApprovalRules":
 [{"ApproveAfterDays": 7, "Classification": ["SecurityUpdates"], "Severity": ["All"]}],
 "OperatingSystem": "Windows", "Name": "TestBaselineWindows", "PatchGroupTagValues":
 ["MyWindowsPatchGroup"]}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateWinPatchBaselineParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2taqdgegqthjr"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateWinPatchBaselineParams.json
   ```

2. Modify and save the CreateWinPatchBaselineParams file. See examples below; make sure to modify these parameters to meet your specific needs.

   In this example, all critical security updates are approved for installation five days after release. KB2032276 is approved immediately even if it is not a critical severity. Finally, KB2124261 will not be installed, even if it matches an approval rule.

   ```
   {
   "ApprovalRules":[{
       "ApproveAfterDays": 5,
       "Severity": [
           "Critical"
           ],
       "Classification": [
           "SecurityUpdates"
           ]
   ```

```
    }],
"ApprovedPatches":["KB2032276"],
"Description": "Patch Baseline",
"Name": "PatchBaseline-Unit-test",
"OperatingSystem": "Windows",
"PatchGroupTagValues": [
    "test1"
    ],
"RejectedPatches":["KB2124261"],
"Tags": [
    {
    "Key":"patchGroupWin",
    "Value":"test1"
    }
]
```

3. Output the RFC template to a file in your current folder; this example names it CreateWinPatchBaselineRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateWinPatchBaselineRfc.json
```

4. Modify and save the CreateWinPatchBaselineRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0kbey7hb00atp",
"Title":                "Patch-Baseline-Create-Win-RFC"
}
```

5. Create the RFC, specifying the CreateWinPatchBaselineRfc file and the CreateWinPatchBaselineParams file:

```
aws amscm create-rfc --cli-input-json file://CreateWinPatchBaselineRfc.json --
execution-parameters file://CreateWinPatchBaselineParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the SSM patch baseline, look in the execution output: Use the stack_id to view the patch baseline in the Systems Manager console.

Tips

> **Note**
>
> There are five change types for creating an SSM patch baseline, for the various operating systems.

> **Important**
>
> At least one of **ApprovalRules** or **ApprovedPatches** is required.

If you create a patch baseline, it must have at least one approval rule and/or approved patch defined. An approval rule allows you to specify which classification (for example, SecurityUpdates) and severity (for example, Critical) patches will be installed. In your approval rules, you can define how many days after a patch is released it may be installed. A patch specified in the approved patches list will be installed irrespective of whether it is matched by an approval rule. Finally, items in the rejected patches list will exclude those patches from being installed, even if they match an approval rule and/or approved patch. For more information, see About predefined and custom patch baselines.

To create an SSM patch window, see Create SSM Patch Window.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0kbey7hb00atp.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

SSM Patch Window | Create

Create an AWS Systems Manager (SSM) patch window for patching to take place on instances with the specified PatchGroup. The patch window is an SSM resource that you can manage with the SSM console.

Full classification: Deployment | Patching | SSM patch window | Create

Change Type Details

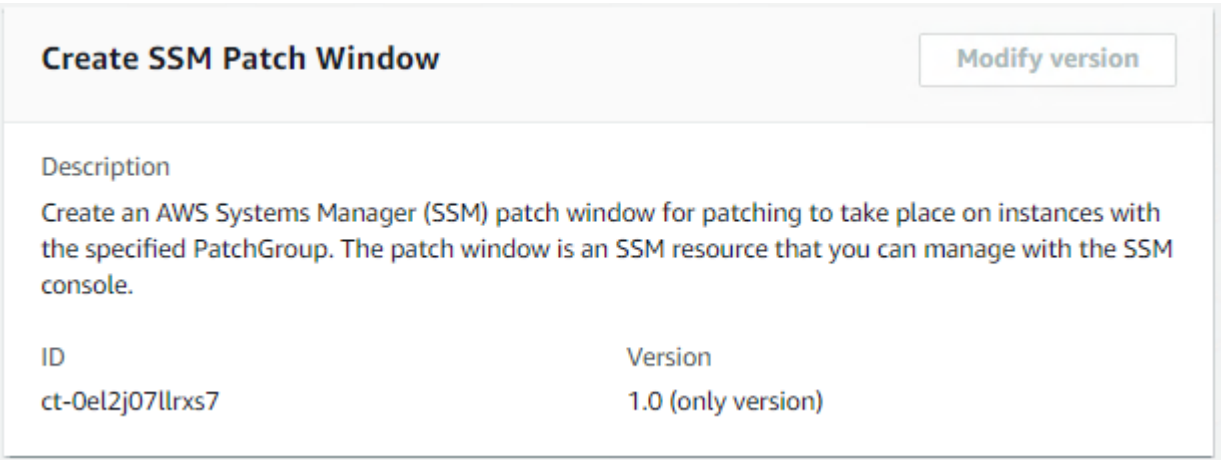
Change type ID	ct-0el2j07llrxs7
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create SSM Patch Window

Creating an SSM patch window with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an SSM patch window with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id ID` command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id ID` command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title my-test-patchwindow --changetype-id ct-0el2j07llrxs7 --
change-type-version 1.0 --execution-parameters '{"Cutoff":2, "Description":"Test",
 "Duration":24, "MaxConcurrency":"10", "MaxErrors":"12", "NotificationEmails":
["test@supertest.com"], "PatchGroup":"test-patch-group", "Schedule":"cron(0 3 ? * 6L
 *)", "ScheduleTimeZone": "Africa/Harare"}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreatePatchWindowParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0el2j07llrxs7"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreatePatchWindowParams.json
   ```

2. Modify and save the CreatePatchWindowParams file.

```
{
"Cutoff": 23,
"Description": "Required param given test",
"Duration": 24,
"EndDate": "2008-09-15T15:53:00Z",
"MaxConcurrency": "10",
"MaxErrors": "12",
"Name": "Test1",
"NotificationEmails": ["email@example.com"],
"PatchGroup": "Prod",
"Schedule": "cron(0 3 ? * 6L *)",
"ScheduleTimeZone": "Africa/Harare",
"ScheduleOffset": "0",
"StartDate": "2008-09-15T15:53:00Z"
}
```

3. Output the RFC template to a file in your current folder; this example names it CreatePatchWindowRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreatePatchWindowRfc.json
```

4. Modify and save the CreatePatchWindowRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0el2j07llrxs7",
"Title":                "Patch-Window-Create-RFC"
}
```

5. Create the RFC, specifying the CreatePatchWindowRfc file and the CreatePatchWindowParams file:

```
aws amscm create-rfc --cli-input-json file://CreatePatchWindowRfc.json --execution-
parameters file://CreatePatchWindowParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the SSM patch baseline, look in the execution output: Use the stack_id to view the patch baseline in the Systems Manager console.

Tips

- To learn more about AWS SSM patch windows, see "Maintenance Window" at Patching your Windows EC2 instances using AWS Systems Manager Patch Manager.
- To create an SSM patch baseline, see SSM Patch Window | Create.

  To update a custom Maintenance Window, see Updating an SSM Patch Window.

  To delete a custom Maintenance Window, see Delete stack.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0el2j07llrxs7.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Cutoff": 23,
  "Description": "Required param given test",
  "Duration": 24,
  "EndDate": "2008-09-15T15:53:00Z",
  "MaxConcurrency": "10",
  "MaxErrors": "12",
  "Name": "Test1",
  "NotificationEmails": ["email1@example.com"],
  "PatchGroup": "Prod",
  "Schedule": "cron(0 0 0 ? * 3#2 *)",
  "ScheduleOffset": 1,
  "ScheduleTimeZone": "Africa/Harare",
  "StartDate": "2008-09-15T15:53:00Z"
}
```

Change Type Items and Operations in the Standalone Resources Subcategory

EC2 Instance | Create For WIGS (Review Required)

Create an Amazon Elastic Compute Cloud (EC2) instance for use with Workload Ingest (WIGS) change type (ct-257p9zjk14ija). For information, see AMS documentation on WIGS in the AMS Application Developer's Guide.

Full classification: Deployment | Standalone resources | EC2 instance | Create for WIGS (review required)

Change Type Details

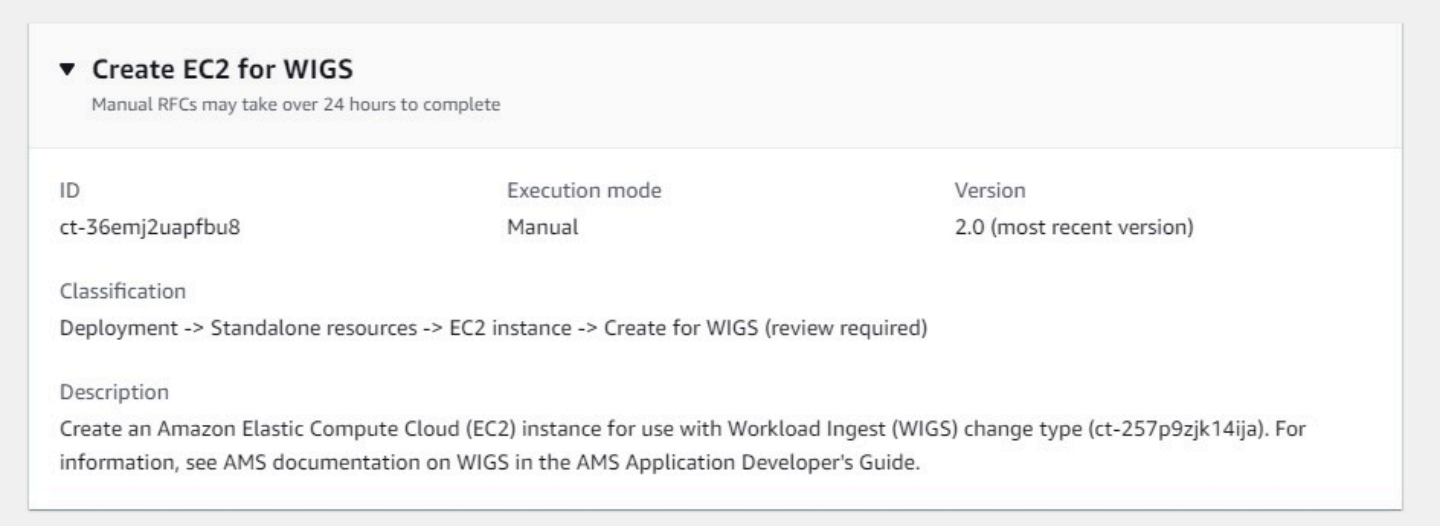
Change type ID	ct-36emj2uapfbu8
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create for WIGS (review required)

Creating an instance for WIGS with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating an instance for WIGS with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-36emj2uapfbu8" --change-type-version "2.0"
 --title "Create Pre-Ingestion Instance" --execution-parameters "{\"InstanceVpcId
\": \"vpc-1234567890abcdef0\",\"InstanceAmiId\": \"ami-1234567890abcdef0\",
\"InstanceEBSOptimized\": false,\"InstanceRootVolumeSize\": 60,\"InstanceNameTagValue
\": \"temp-wigs\",\"InstanceType\": \"t3.large\",\"InstanceSubnetId\":
 \"subnet-0bb1c79de3EXAMPLE\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it CreateEc2PreIngestParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-36emj2uapfbu8"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateEc2PreIngestParams.json
   ```

2. Modify and save the CreateEc2PreIngestParams file. For example, you can replace the contents with something like this:

   ```
   {
       "InstanceVpcId": "vpc-1234567890abcdef0",
       "InstanceAmiId": "ami-1234567890abcdef0",
       "InstanceEBSOptimized": false,
       "InstanceRootVolumeSize": 60,
       "InstanceSubnetId": "subnet-1234567890abcdef0",
       "InstanceType": "t3.large",
       "InstanceNameTagValue": "temp-wigs",
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it CreateEc2PreIngestRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateEc2PreIngestRfc.json
   ```

4. Modify and save the CreateEc2PreIngestRfc.json file. For example, you can replace the contents with something like this:.

```
{
    "ChangeTypeVersion": "2.0",
    "ChangeTypeId": "ct-36emj2uapfbu8",
    "Title": "Create Pre-Ingestion Instance"
}
```

5. Create the RFC, specifying the CreateEc2PreIngestRfc file and the CreateEc2PreIngestParams file:

```
aws amscm create-rfc --cli-input-json file://CreateEc2PreIngestRfc.json  --
execution-parameters file://CreateEc2PreIngestParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-36emj2uapfbu8.

Example: Required Parameters

```
{
    "InstanceVpcId": "vpc-1234567890abcdef0",
    "InstanceAmiId": "ami-1234567890abcdef0",
    "InstanceSubnetId": "subnet-1234567890abcdef0"
}
```

Example: All Parameters

```
{
    "InstanceVpcId": "vpc-1234567890abcdef0",
    "InstanceAmiId": "ami-1234567890abcdef0",
    "InstanceEBSOptimized": false,
    "InstanceRootVolumeSize": 60,
    "InstanceSubnetId": "subnet-1234567890abcdef0",
    "InstanceType": "t3.large",
    "InstanceNameTagValue": "temp-wigs",
    "Priority": "Medium"
}
```

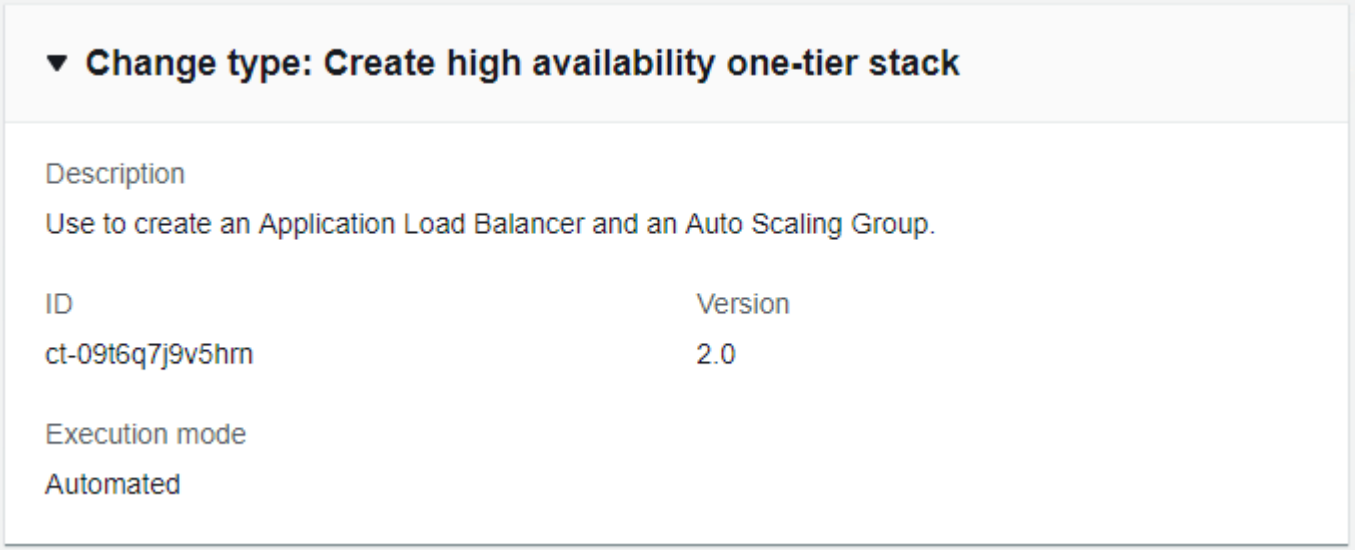
Additional Information

High availability one-tier stacks: Creating

Creating a high availability one-tier stack with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a high availability one-tier stack with the CLI

How it works:

1. Use the Template Create method (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file in your current folder; this example names it CreateOnetierStackParams.json.

```
aws amscm get-change-type-version --change-type-id "ct-09t6q7j9v5hrn"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 CreateOnetierStackParams.json
```

2. Modify the schema, replacing the *variables* as appropriate.

```
{
    "Description":          "HA-One-Tier-Stack",
    "Name":                 "One-Tier-Stack",
    "TimeoutInMinutes":     "360",
    "VpcId":                "VPC_ID",
    "ApplicationLoadBalancer": {
        "SubnetIds": [
                  "SUBNET_ID",
                  "SUBNET_ID"
        ]
    },
    "AutoScalingGroup": {
        "AmiId": "AMI-ID"
        "SubnetIds": [
                 "SUBNET_ID",
                 "SUBNET_ID"
        ]
    }
}
```

3. Output the CreateRfc JSON template to a file in your current folder; example names it CreateOnetierStackRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateOnetierStackRfc.json
```

4. Modify the RFC template as appropriate and save it. Reset the start and end times for a scheduled RFC, or leave off for an ASAP RFC.

```
{
"ChangeTypeVersion":    2.0",
"ChangeTypeId":         "ct-09t6q7j9v5hrn",
"Title":                "HA-One-Tier-RFC",
"RequestedStartTime":   "2019-04-28T22:45:00Z",
```

```
"RequestedEndTime":     "2019-04-28T22:45:00Z"
}
```

5. Create the RFC, specifying the CreateOnetierStackRfc.json file and the CreateOnetierStackParams.json execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CreateOnetierStackRfc.json --
execution-parameters file://CreateOnetierStackParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This is a large provisioning of resources, especially if you add UserData. The load balancer Amazon resource name (ARN) can be found through the Load Balancer page of the EC2 console by searching with the load balancer stack ID returned in the RFC execution output.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-09t6q7j9v5hrn.

Example: Required Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "TimeoutInMinutes": 360,
  "ApplicationLoadBalancer": {
    "SubnetIds": ["subnet-01234567890abcdef", "subnet-01234567891abcdef"]
  },
  "AutoScalingGroup": {
    "AmiId": "ami-01234567890abcdef",
    "SubnetIds": ["subnet-01234567890abcdef", "subnet-01234567891abcdef"]
  },
  "Description": "This stack contains an ALB and an ASG.",
  "Name": "High availability one-tier stack"
```

```
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-12345678",
  "TimeoutInMinutes": 360,
  "DatabaseStackId": "stack-0123456789abcdefg",
  "Description": "This stack contains an ALB and an ASG.",
  "Name": "High availability one-tier stack",
  "Tags": [
    {
      "Key": "Foo",
      "Value": "Bar"
    }
  ],
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567",

```

High Availability One-Tier Stack | Create (With ELB)

Create a stack with an Auto Scaling Group, and an Elastic Load Balancer (ELB) with up to two listeners, integrated with an existing security group that you specify.

Full classification: Deployment | Standard stacks | High availability one-tier stack | Create (with ELB)

Change Type Details

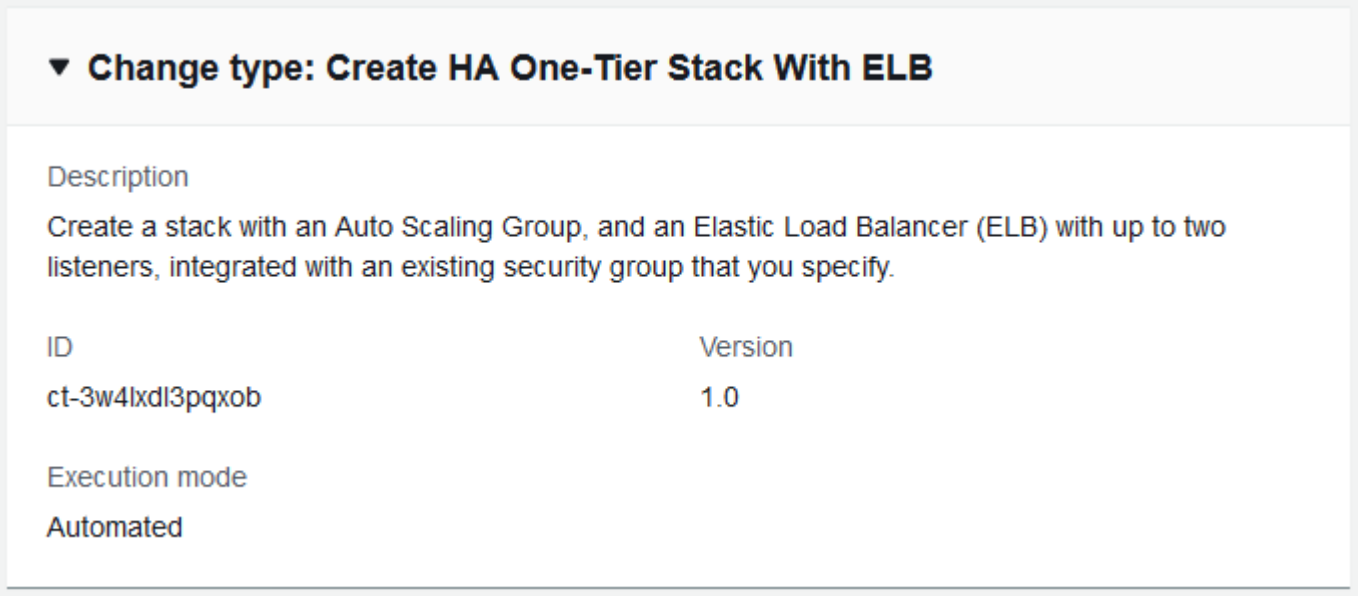
Change type ID	ct-3w4lxdl3pqxob

Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

High availability one-tier Stacks: Creating (with ELB)

Creating a high availability one-tier stack with an ELB with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a high availability one-tier stack with an ELB with the CLI

How it works:

1. Use the Template Create method (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  --profile saml --region us-east-1 create-rfc --change-type-id
 "ct-3w4lxdl3pqxob" --change-type-version "1.0" --title 'Test - HA' --description
 "Test Stack"  --execution-parameters "{\"Description\":\"DESCRIPTION\",\"VpcId
\":\"VPC_ID\",\"Name\":\"TestStack\",\"StackTemplateId\":\"stm-g7rc538l62r4c23nb
\",\"TimeoutInMinutes\":60,\"AutoScaling\":{\"AmiId\":\"AMI_ID\",\"SubnetIds\":
[\"SUBNET_ID\"]},\"LoadBalancer\":{\"SecurityGroups\":\"SG_ID\",\"SubnetIds\":
[\"SUBNET_ID\"]},\"Listener1\":{\"Port\":\"443\",\"Protocol\":\"HTTPS\",\"InstancePort
\":\"443\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file in your current folder; this example names it CreateOnetierElbStackParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3w4lxdl3pqxob"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateOnetierElbStackParams.json
   ```

2. Modify the schema, replacing the *`variables`* as appropriate.

   ```
   {
     "Description" : "DESCRIPTION",
     "VpcId" : "VPC_ID",
     "Name" : "TestStack",
   ```

```
  "StackTemplateId" : "stm-g7rc538l62r4c23nb",
  "TimeoutInMinutes" : 60,
  "AutoScaling" : {
    "AmiId" : "AMI_ID",
    "SubnetIds": ["SUBNET_ID"]
  },
  "LoadBalancer" : {
    "SecurityGroups" : "SG_ID",
    "SubnetIds" : ["SUBNET_ID"]
  },
  "Listener1" : {
    "Port" : "443",
    "Protocol" : "HTTPS",
    "InstancePort" : "443"
  }
}
```

3. Output the CreateRfc JSON template to a file in your current folder; example names it CreateOnetierElbStackRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateOnetierElbStackRfc.json
```

4. Modify the RFC template as appropriate and save it. Reset the start and end times for a scheduled RFC, or leave off for an ASAP RFC.

```
{
"ChangeTypeVersion":    1.0",
"ChangeTypeId":         "ct-3w4lxdl3pqxob",
"Title":                "HA-One-Tier-ELB-RFC",
"RequestedStartTime":   "2019-04-28T22:45:00Z",
"RequestedEndTime":     "2019-04-28T22:45:00Z"
}
```

5. Create the RFC, specifying the CreateOnetierElbStackRfc.json file and the CreateOnetierElbStackParams.json execution parameters file:

```
aws amscm create-rfc --cli-input-json file://CreateOnetierElbStackRfc.json --
execution-parameters file://CreateOnetierElbStackParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This is a large provisioning of resources, especially if you add UserData. The load balancer Amazon Resource Name (ARN) can be found through the Load Balancer page of the EC2 console by searching with the load balancer stack ID returned in the RFC execution output.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3w4lxdl3pqxob.

Example: Required Parameters

```
{
  "Description" : "Test description",
  "VpcId" : "vpc-12345678901234567",
  "Name" : "TestStack",
  "StackTemplateId" : "stm-g7rc538l62r4c23nb",
  "TimeoutInMinutes" : 60,
  "AutoScaling" : {
    "AmiId" : "ami-12345678901234567",
    "SubnetIds": ["subnet-12345678"]
  },
  "LoadBalancer" : {
    "SecurityGroups" : "sg-12345678901234567",
    "SubnetIds" : ["subnet-12345678901234567"]
  },
  "Listener1" : {
    "Port" : "443",
    "Protocol" : "HTTPS",
    "InstancePort" : "443"
  }
}
```

Example: All Parameters

```
{
  "Description" : "Test description",
  "VpcId" : "vpc-12345678",
```

```
  "Name" : "TestStack",
  "Tags" : [
    {
      "Key" : "foo",
      "Value" : "bar"
    }
  ],
  "StackTemplateId" : "stm-g7rc538l62r4c23nb",
  "TimeoutInMinutes" : 60,
  "AutoScaling" : {
    "AmiId" : "ami-12345678",
    "InstanceType" : "m4.large",
    "RootVolumeIops" : "100",
    "RootVolumeName" : "/dev/xvda",
    "RootVolumeSize" : 100,
    "RootVolumeType" : "gp2",
    "EBSOptimized" : "false",
    "MaxInstances" : "1",
    "MinInstances" : "2",
    "IAMInstanceProfile" : "customer-mc-ec2-instance-profile",
    "SubnetIds": ["subnet-12345678"],
    "UserData": ["touch /tmp/test.out"],
    "MaxBatchSize" : 1,
    "MinInstancesInService" : 1,
    "HealthCheckType" : "EC2",
    "HealthCheckGracePeriod" : "600",
    "DetailedMonitoring" : "true",
    "Cooldown" : "300",
    "ScaleMetricName" : "CPUUtilization",
    "ScaleUpPolicyCooldown" : "60",
    "ScaleUpPolicyEvaluationPeriods" : "2",
    "ScaleUpPolicyPeriod" : "60",
    "ScaleUpPolicyScalingAdjustment" : "2",
    "ScaleUpPolicyStatistic" : "Average",
    "ScaleUpPolicyThreshold" : "75",
    "ScaleDownPolicyCooldown" : "300",
    "ScaleDownPolicyEvaluationPeriods" : "4",
    "ScaleDownPolicyPeriod" : "60",
    "ScaleDownPolicyScalingAdjustment" : "-1",
    "ScaleDownPolicyStatistic" : "Average",
    "ScaleDownPolicyThreshold" : "35"
  },
  "LoadBalancer" : {
    "Name" : "testLoadBalancer",
```

```
    "Public" : "false",
    "SecurityGroups" : "sg-12345678",
    "SubnetIds" : ["subnet-12345678"],
    "AccessLogInterval" : "60",
    "ConnectionDrainingTimeout" : 60,
    "IdleTimeout" : 60,
    "CrossZone" : "true",
    "HealthCheckHealthyThreshold" : "2",
    "HealthCheckInterval" : "10",
    "HealthCheckTarget" : "TCP:80",
    "HealthCheckTimeout" : "5",
    "HealthCheckUnhealthyThreshold" : "10",
    "LBCookieExpirationPeriod" : "2",
    "LBCookieStickinessPolicyName" : "LBCOOKIE",
    "AppCookieName": "APPCookie",
    "AppCookiePolicyName": "AppCookiePolicy"
  },
  "Listener1" : {
    "InstancePort" : "80",
    "InstanceProtocol" : "HTTP",
    "Port" : "443",
    "Protocol" : "HTTPS",
    "SSLCertificateId" : "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  },
  "Listener2" : {
    "InstancePort" : "8080",
    "InstanceProtocol" : "HTTP",
    "Port" : "8443",
    "Protocol" : "HTTPS",
    "SSLCertificateId" : "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  }
}
```

High Availability Two-Tier Stack | Create

Creates a stack consisting of an Auto Scaling group, an RDS DB instance, and a load balancer (ELB). Optionally allows for application deployment with CodeDeploy by also creating a CodeDeploy application and deployment group both named the value given for ApplicationName. All resource parameters can be configured.

Full classification: Deployment | Standard stacks | High availability two-tier stack | Create

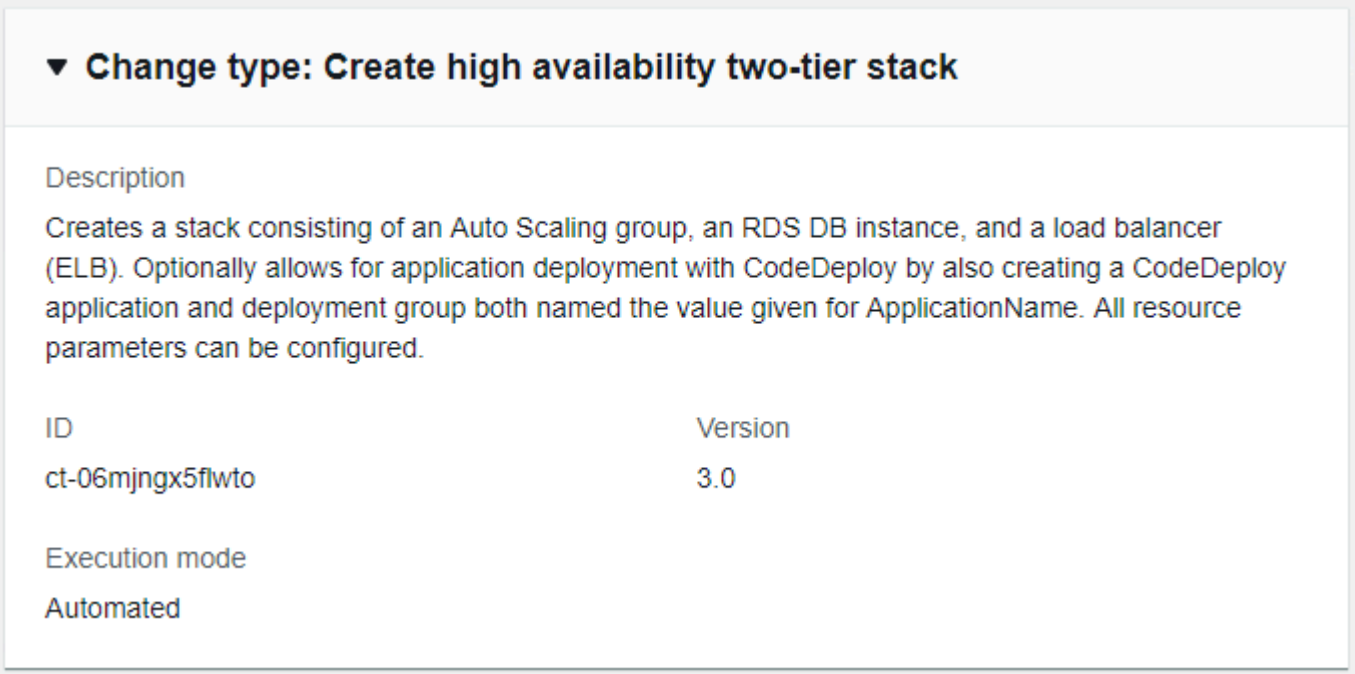
Change Type Details

Change type ID	ct-06mjngx5flwto
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Create high availability two-tier stacks

Creating a high availability two-tier stack with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a high availability two-tier stack with the CLI

How it works:

1. Use the Template Create method (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file in your current folder; this example names it Create2tierStackParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-06mjngx5flwto"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    Create2tierStackParams.json
   ```

2. Modify the schema, replacing the *`variables`* as appropriate.

   ```
   {
     "Description":        "HA two tier stack",
     "Name":               "Two-Tier-Stack",
     "TimeoutInMinutes":   360,
     "VpcId":              "VPC-ID",
     "AutoScalingGroup": {
       "AmiId":            "AMI-ID",
       "SubnetIds": [
                   "Subnet-ID",
                   "Subnet-ID"
       ]
     },
     "Database": {
       "DBName":           "DB_Name",
       "DBEngine":         "postgres",
   ```

```
    "EngineVersion":    "9.6.3",
    "LicenseModel":     "postgresql-license",
    "MasterUsername":   "masterusername",
    "SubnetIds": [
                "Subnet-ID",
                "Subnet-ID"
    ]
  },
  "LoadBalancer": {
    "SubnetIds": [
                "Subnet-ID",
                "Subnet-ID"
    ]
  }
}
```

3. Output the CreateRfc JSON template to a file in your current folder; example names it Create2tierStackRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > Create2tierStackRfc.json
```

4. Modify the RFC template as appropriate and save it. Reset the start and end times for a scheduled RFC, or leave off for an ASAP RFC.

```
{
"ChangeTypeVersion":    3.0",
"ChangeTypeId":         "ct-06mjngx5flwto",
"Title":                "HA-2-Tier-RFC",
"RequestedStartTime":   "2019-04-28T22:45:00Z",
"RequestedEndTime":     "2019-04-28T22:45:00Z"
}
```

5. Create the RFC, specifying the Create2tierStackRfc.json file and the Create2tierStackParams.json execution parameters file:

```
aws amscm create-rfc --cli-input-json file://Create2tierStackRfc.json --execution-
parameters file://Create2tierStackParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This is a large provisioning of resources, especially if you add UserData. The load balancer Amazon resource name (ARN) can be found through the Load Balancer page of the EC2 console by searching with the load balancer stack ID returned in the RFC execution output.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-06mjngx5flwto.

Example: Required Parameters

```
{
  "Description": "My stack",
  "TimeoutInMinutes": 60,
  "VpcId": "vpc-01234567890abcdef",
  "Name": "MyStack",
  "AutoScalingGroup": {
    "AmiId" : "ami-01234567890abcdef",
    "SubnetIds": ["subnet-01234567890abcdef", "subnet-01234567891abcdef"]
  },
  "LoadBalancer": {
    "SubnetIds": ["subnet-01234567890abcdef", "subnet-01234567891abcdef"]
  },
  "Database": {
    "DBName": "main",
    "DBEngine": "MySQL",
    "EngineVersion": "4.5.6",
    "LicenseModel": "general-public-license",
    "MasterUsername": "admin",
    "MasterUserPassword": "adminpass",
    "SubnetIds": ["subnet-01234567890abcdef", "subnet-01234567891abcdef"]
  }
}
```

Example: All Parameters

```
{
```

```
  "Description": "My stack",
  "VpcId": "vpc-12345678",
  "TimeoutInMinutes": 60,
  "Name": "MyStack",
  "Tags": [
    {
      "Key": "Foo",
      "Value": "Bar"
    }
  ],
  "AutoScalingGroup": {
    "AmiId": "ami-12341234",
    "Cooldown": 120,
    "DesiredCapacity": 1,
    "EBSOptimized": false,
    "HealthCheckGracePeriod": 600,
    "IAMInstanceProfile": "foo",
    "InstanceDetailedMonitoring": true,
    "InstanceRootVolumeIops": 0,
    "InstanceRootVolumeName": "/dev/xvda",
    "InstanceRootVolumeSize": 30,
    "InstanceRootVolumeType": "gp2",
    "InstanceType": "m3.medium",
    "MaxInstances": 1,
    "MinInstances": 1,
    "ScaleDownPolicyCooldown": 300,
    "ScaleDownPolicyEvaluationPeriods": 4,
    "ScaleDownPolicyPeriod": 60,
    "ScaleDownPolicyScalingAdjustment": -1,
    "ScaleDownPolicyStatistic": "Average",
    "ScaleDownPolicyThreshold": 35,
    "ScaleMetricName": "CPUUtilization",
    "ScaleUpPolicyCooldown": 60,
    "ScaleUpPolicyEvaluationPeriods": 2,
    "ScaleUpPolicyPeriod": 60,
    "ScaleUpPolicyScalingAdjustment": 2,
    "ScaleUpPolicyStatistic": "Average",
    "ScaleUpPolicyThreshold": 75,
    "SubnetIds": ["subnet-a0b1c2d3", "subnet-e4f5g6h7"],
    "UserData": ["#!/bin/bash","echo hello"]
  },
  "LoadBalancer": {
    "SubnetIds": ["subnet-a0b1c2d3", "subnet-a0b2c9d8"],
    "HealthCheckInterval": 10,
```

```
    "HealthCheckTarget": "HTTP:80/index.html",
    "HealthCheckTimeout": 10,
    "Public": false,
    "AccessCIDRRange": "1.2.3.4/0"
  },
  "Database": {
    "AllocatedStorage": 100,
    "BackupRetentionPeriod": 7,
    "Backups": true,
    "DBEngine": "postgres",
    "DBName": "my_db",
    "EngineVersion": "9.5.2",
    "InstanceType": "db.m3.medium",
    "IOPS": 0,
    "LicenseModel": "postgresql-license",
    "MasterUsername": "myadminuser",
    "MasterUserPassword": "!#$%&')*+,-.0:;=>?AZ[\\^_`a{|~",
    "MultiAZ": false,
    "Port": 5432,
    "PreferredBackupWindow": "22:00-23:00",
    "PreferredMaintenanceWindow": "wed:03:32-wed:04:02",
    "StorageEncrypted": false,
    "StorageType": "gp2",
    "SubnetIds": ["subnet-a0b1c2d3", "subnet-a0b2c9d8"]
  },
  "Application": {
    "ApplicationName": "MyApplication",
    "DeploymentConfigName": "CodeDeployDefault.OneAtATime"
  },
  "EnforceIMDSv2": "optional"
}
```

Change Type Details

Change type ID	ct-1dmlg9g1l91h6

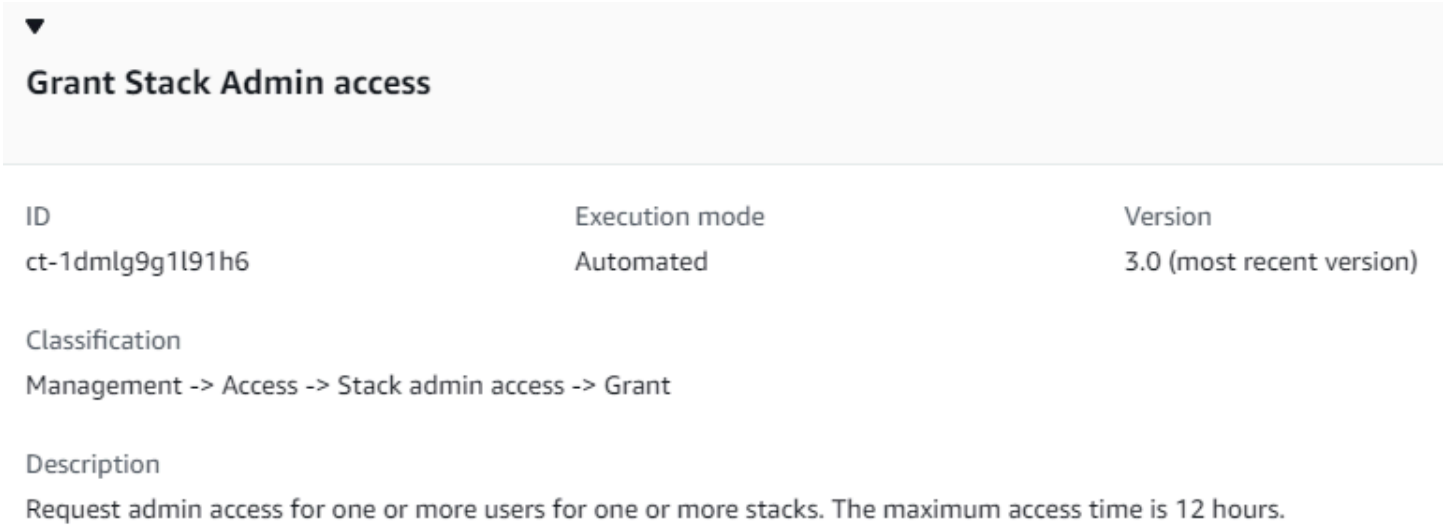
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Request administrative access

Requesting administrator access with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Requesting administrator access with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml amscm create-rfc --change-type-id "ct-1dmlg9g1l91h6" --change-type-
version "3.0" --title "Stack-Admin-Access-QC" --execution-parameters "{\"DomainFQDN
\":\"TEST.com\",\"StackIds\":[\"stack-01234567890abcdef\"],\"TimeRequestedInHours\":1,
\"Usernames\":[\"TEST\"],\"VpcId\":\"VPC_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it GrantAdminAccessParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1dmlg9g1l91h6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    GrantAdminAccessParams.json
   ```

   Modify and save the GrantAdminAccessParams file. For example, you can replace the contents with something like this:

   ```
   {
   "DomainFQDN":           "mycorpdomain.acme.com",
   "StackIds":             [STACK_ID, STACK_ID],
   "TimeRequestedInHours": 12,
   "Username":             ["USERNAME", "USERNAME"],
   "VpcId":                "VPC_ID"
   ```

```
}
```

Note that the `TimeRequestedInHours` option defaults to one hour. You can request up to twelve hours.

2. Output the RFC template to a file in your current folder; this example names it GrantAdminAccessRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > GrantAdminAccessRfc.json
```

3. Modify and save the GrantAdminAccessRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-1dmlg9g1l91h6",
"ChangeTypeVersion":     "3.0",
"Title":                 "Request-Admin-Access-to-EC2-RFC"
}
```

4. Create the RFC, specifying the GrantAdminAccessRfc file and the GrantAdminAcessParams file:

```
aws amscm create-rfc --cli-input-json file://GrantAdminAccessRfc.json --execution-
parameters file://GrantAdminAccessParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

To log in to the instance through a bastion, follow the next procedure, Instance access examples.

Tips

> **Note**
>
> You can submit an update to your access request before it expires. For information, see Stack Admin Access | Update.
> To log in to an instance that is part of an ASG, you request access to the ASG stack, which gives you access to all associated instances.

For an example about requesting ReadOnly access, see ReadOnly access: requesting.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1dmlg9g1l91h6.

Example: Required Parameters

```
{
  "DomainFQDN": "test.domain.com",
  "StackIds": ["stack-12345678901234567"],
  "Usernames": ["AD_User_Name1"],
  "VpcId": "vpc-12345678"
}
```

Example: All Parameters

```
{
  "DomainFQDN": "test.domain.com",
  "StackIds": ["stack-12345678901234567"],
  "TimeRequestedInHours": 1,
  "Usernames": ["AD_User_Name1"],
  "VpcId": "vpc-12345678"
}
```

Stack Admin Access | Update

Request admin access for one or more users for one or more stacks. The maximum access time is 12 hours.

Full classification: Management | Access | Stack admin access | Update

Change Type Details

Change type ID	ct-0ikpop8zqhkxg
Current version	3.0
Expected execution duration	60 minutes

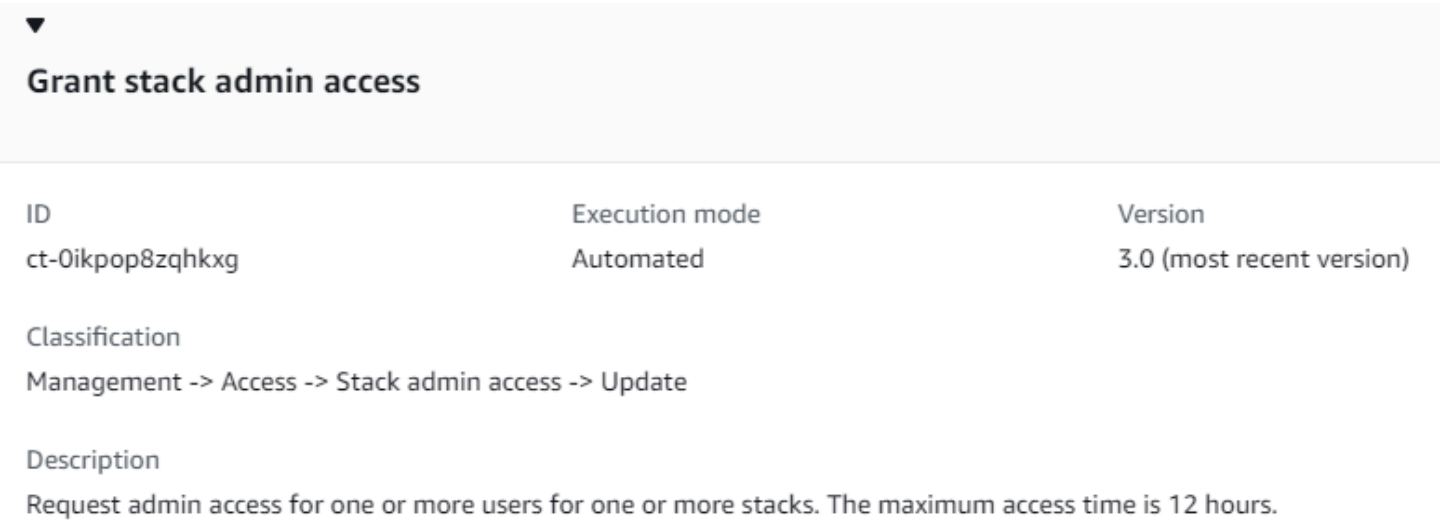
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update administrative access

Updating administrator access with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating administrator access with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml amscm create-rfc --change-type-id "ct-0ikpop8zqhkxg" --change-type-version "3.0" --title "Stack-Admin-Update-QC" --execution-parameters "{\"DomainFQDN\":\"TEST.com\",\"StackIds\":[\"stack-01234567890abcdef\"],\"TimeRequestedInHours\":1,\"Usernames\":[\"TEST\"],\"VpcId\":\"VPC_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateAdminAccessParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0ikpop8zqhkxg"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateAdminAccessParams.json
   ```

   Modify and save the UpdateAdminAccessParams file. For example, you can replace the contents with something like this:

   ```
   {
   "DomainFQDN":           "mycorpdomain.acme.com",
   "StackIds":             [STACK_ID, STACK_ID],
   "TimeRequestedInHours": 12,
   "Usernames":            ["USERNAME", "USERNAME"],
   "VpcId":                "VPC_ID"
   }
   ```

   Note that the `TimeRequestedInHours` option defaults to one hour. You can request up to twelve hours.

2. Output the RFC template to a file in your current folder; this example names it UpdateAdminAccessRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateAdminAccessRfc.json
```

3. Modify and save the UpdateAdminAccessRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-0ikpop8zqhkxg",
"ChangeTypeVersion":     "3.0",
"Title":                 "Update-Admin-Access-to-EC2-RFC"
}
```

4. Create the RFC, specifying the UpdateAdminAccessRfc file and the UpdateAdminAcessParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateAdminAccessRfc.json --execution-
parameters file://UpdateAdminAccessParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

   To log in to the instance through a bastion, follow the next procedure, Instance access examples.

Tips

> **Note**
>
> To log in to an instance that is part of an EC2 Auto Scaling group (ASG), you request access to the ASG stack, which gives you access to all associated instances.

For a walkthrough on updating ReadOnly access, see ReadOnly Access: updating.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0ikpop8zqhkxg.

Example: Required Parameters

```
{
  "DomainFQDN": "test.domain.com",
  "StackIds": ["stack-12345678901234567"],
  "Usernames": ["AD_User_Name1"],
  "VpcId": "vpc-12345678"
}
```

Example: All Parameters

```
{
  "DomainFQDN": "test.domain.com",
  "StackIds": ["stack-12345678901234567"],
  "TimeRequestedInHours": 1,
  "Usernames": ["AD_User_Name1"],
  "VpcId": "vpc-12345678"
}
```

Stack Read-Only Access | Grant

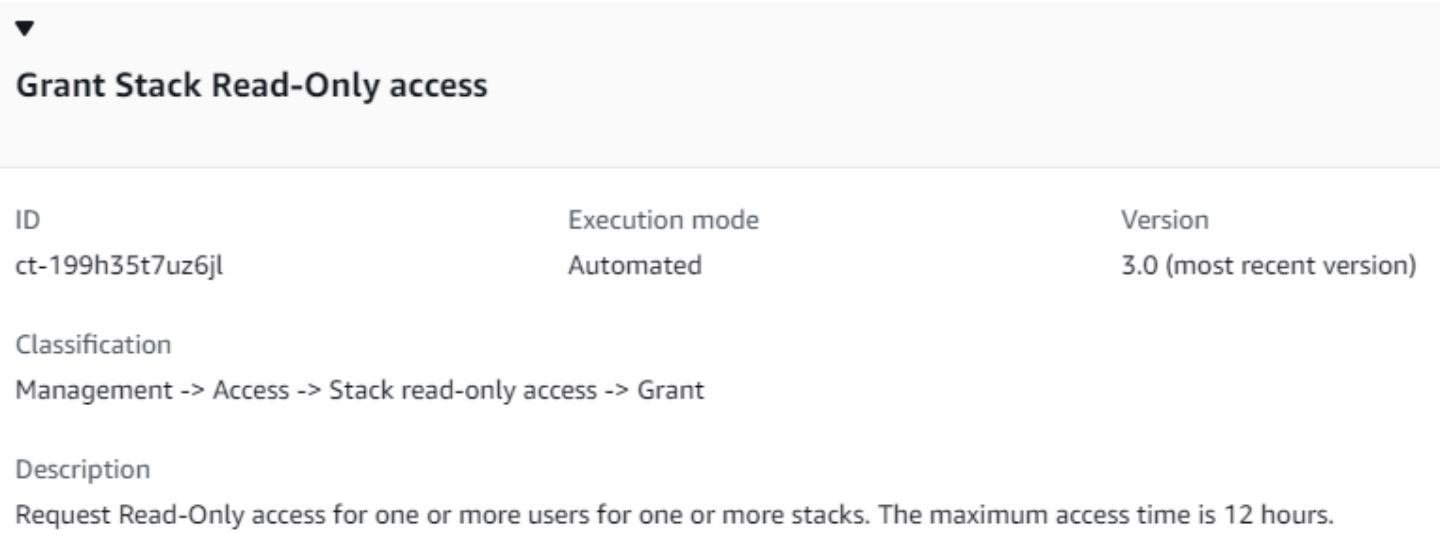
Request ReadOnly access

Requesting ReadOnly access with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Requesting ReadOnly access with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml amscm create-rfc --change-type-id "ct-199h35t7uz6jl" --change-type-
version "3.0" --title "Stack-RO-Access-QC" --execution-parameters "{\"DomainFQDN\":
\"TEST.com\",\"StackIds\":[\"stack-01234567890abcdef\"],\"TimeRequestedInHours\":1,
\"Usernames\":[\"TEST\"],\"VpcId\":\"VPC_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it GrantReadOnlyAccessParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-199h35t7uz6jl"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    GrantReadOnlyAccessParams.json
   ```

   Modify and save the GrantReadOnlyAccessParams file. For example, you can replace the contents with something like this:

   ```
   {
   "DomainFQDN":           "mycorpdomain.acme.com",
   "StackIds":             [STACK_ID, STACK_ID],
   "TimeRequestedInHours": 12,
   "Usernames":             ["USERNAME", "USERNAME"],
   "VpcId":                "VPC_ID"
   }
   ```

   Note that the `TimeRequestedInHours` option defaults to one hour. You can request up to twelve hours.

2. Output the RFC template to a file in your current folder; this example names it GrantReadOnlyAccessRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > GrantReadOnlyAccessRfc.json
```

3. Modify and save the GrantReadOnlyAccessRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-199h35t7uz6jl",
"ChangeTypeVersion":     "3.0",
"Title":                 "Request-ReadOnly-Access-to-EC2-RFC"
}
```

4. Create the RFC, specifying the GrantReadOnlyAccessRfc file and the GrantReadOnlyAcessParams file:

```
aws amscm create-rfc --cli-input-json file://GrantReadOnlyAccessRfc.json --
execution-parameters file://GrantReadOnlyAccessParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

To log in to the instance through a bastion, follow the next procedure, Instance access examples.

Tips

> **Note**
>
> You can submit an update to your access request before it expires. For details, see Stack Read-Only Access | Update.
> To log into an instance that is part of an EC2 Auto Scaling group (ASG), you request access to the ASG stack, which gives you access to all associated instances.

For a walkthrough on requesting Admin access, see Admin Access: requesting.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-199h35t7uz6jl.

Example: Required Parameters

```
{
  "DomainFQDN": "test.domain.com",
  "StackIds": ["stack-12345678901234567"],
  "Usernames": ["AD_User_Name1"],
  "VpcId": "vpc-12345678"
}
```

Example: All Parameters

```
{
  "DomainFQDN": "test.domain.com",
  "StackIds": ["stack-12345678901234567"],
  "TimeRequestedInHours": 1,
  "Usernames": ["AD_User_Name1"],
  "VpcId": "vpc-12345678"
}
```

Stack Read-Only Access | Update

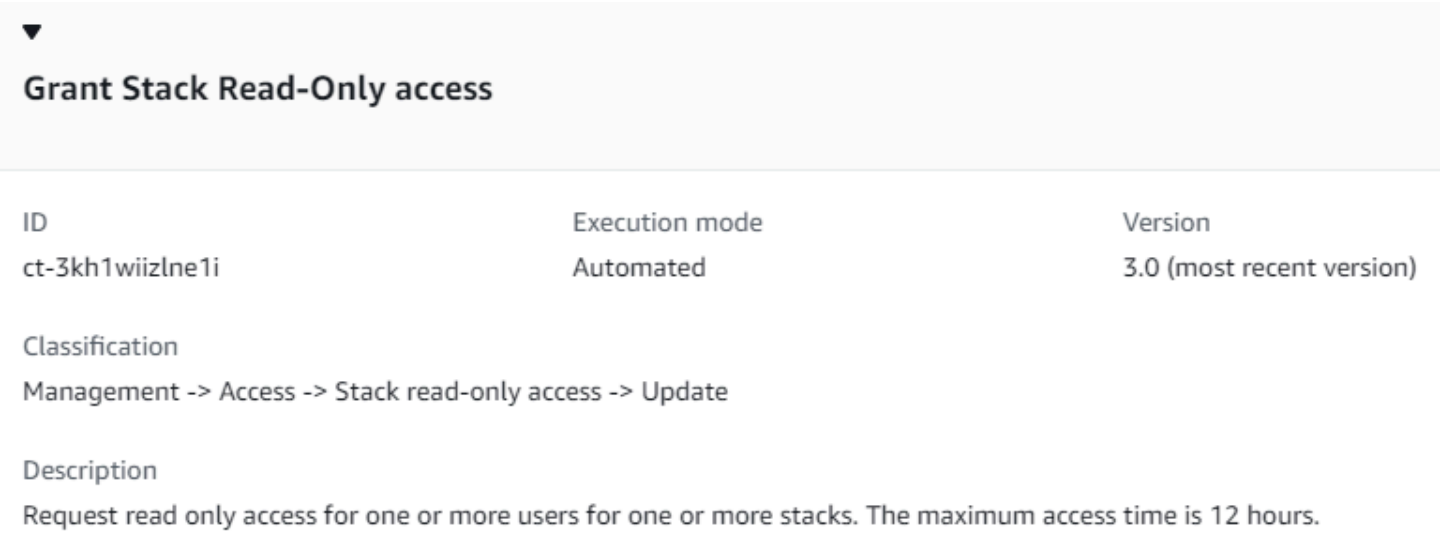
Additional Information

Update ReadOnly access

Updating ReadOnly access with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating ReadOnly access with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml amscm create-rfc --change-type-id "ct-3kh1wiizlne1i" --change-type-
version "3.0" --title "Stack-RO-Update-QC" --execution-parameters "{\"DomainFQDN\":
\"TEST.com\",\"StackIds\":[\"stack-01234567890abcdef\"],\"TimeRequestedInHours\":1,
\"Usernames\":[\"TEST\"],\"VpcId\":\"VPC_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateReadOnlyAccessParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3kh1wiizlne1i"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateReadOnlyAccessParams.json
   ```

   Modify and save the UpdateReadOnlyAccessParams.json file. For example, you can replace the contents with something like this:

   ```
   {
   "DomainFQDN":           "mycorpdomain.acme.com",
   "StackIds":             [STACK_ID, STACK_ID],
   "TimeRequestedInHours": 12,
   "Usernames":            ["USERNAME", "USERNAME"],
   "VpcId":                "VPC_ID"
   }
   ```

   Note that the `TimeRequestedInHours` option defaults to one hour. You may request up to twelve hours.

2. Output the RFC template to a file in your current folder; this example names it UpdateReadOnlyAccessRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateReadOnlyAccessRfc.json
```

3. Modify and save the UpdateReadOnlyAccessRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-3kh1wiizlne1i",
"ChangeTypeVersion":     "3.0",
"Title":                 "Update-ReadOnly-Access-to-EC2-RFC"
}
```

4. Create the RFC, specifying the UpdateReadOnlyAccessRfc file and the UpdateReadOnlyAcessParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateReadOnlyAccessRfc.json --
execution-parameters file://UpdateReadOnlyAccessParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

To log in to the instance through a bastion, follow the next procedure, Instance access examples.

Tips

For an example about updating Admin access, see Admin access: updating.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3kh1wiizlne1i.

Example: Required Parameters

```
{
  "DomainFQDN": "test.domain.com",
  "StackIds": ["stack-12345678901234567"],
  "Usernames": ["AD_User_Name1"],
  "VpcId": "vpc-12345678"
}
```

Example: All Parameters

```
{
  "DomainFQDN": "test.domain.com",
  "StackIds": ["stack-12345678901234567"],
  "TimeRequestedInHours": 1,
  "Usernames": ["AD_User_Name1"],
  "VpcId": "vpc-12345678"
}
```

ACM | Delete Certificate

Delete an AWS Certificate Manager (ACM) certificate that is currently not in use and not managed by AMS.

Full classification: Management | Advanced stack components | ACM | Delete certificate

Change Type Details

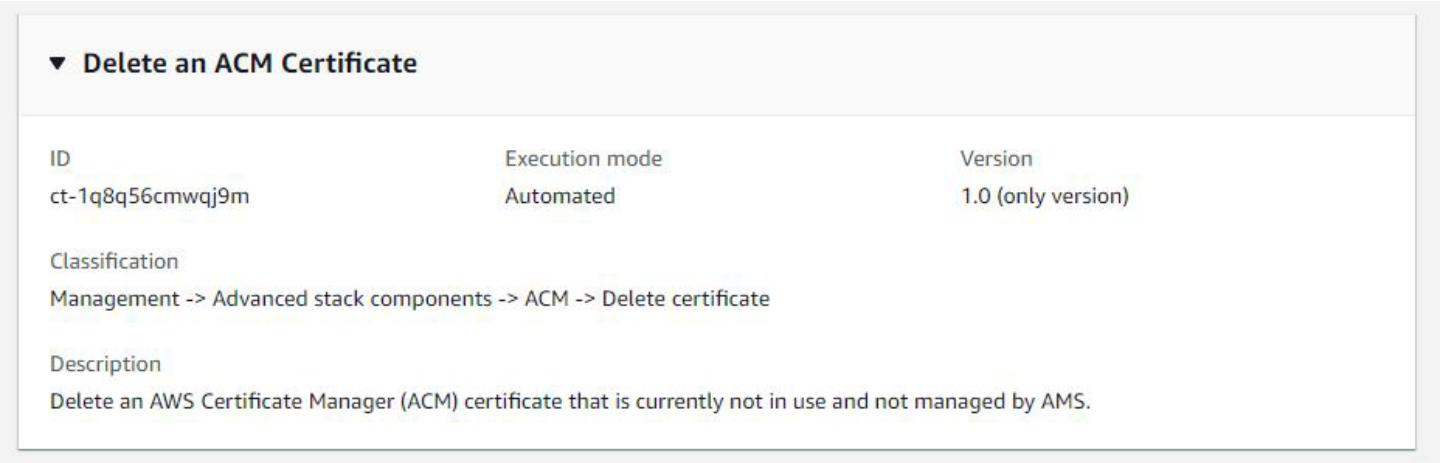
Change type ID	ct-1q8q56cmwqj9m
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete ACM certificate

Deleting an ACM with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an ACM certificate with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1q8q56cmwqj9m" --change-type-version "1.0"
 --title "Delete an ACM Certificate" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-DeleteACMCertificate\",\"Region\": \"us-east-1\",\"Parameters
\": {\"CertificateARN\": [\"arn:aws:acm:us-east-1:123456789012:certificate/c96c73cd-
d082-4fa9-bbf2-09d8600d84ad\"]}}"
```

TEMPLATE CREATE:

1. Save the execution parameters to a JSON file named DeleteCertificateParameters.json.

```
{
    "DocumentName": "AWSManagedServices-DeleteACMCertificate",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateARN": [
            "arn:aws:acm:us-east-1:123456789012:certificate/c96c73cd-d082-4fa9-
bbf2-09d8600d84ad"
        ]
    }
}
```

2. Output the RFC template to a file in your current folder; this example names it DeleteCertificateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteCertificateRfc.json
```

3. Modify and save the DeleteCertificateRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":         "ct-1q8q56cmwqj9m",
"ChangeTypeVersion":    "1.0",
"Title":                "Delete an ACM Certificate"
}
```

4. Create the RFC, specifying the CreateAcmRfc file and the CreateAcmParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteCertificateRfc.json  --
execution-parameters file://DeleteCertificateParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about ACM certificates, see What Is AWS Certificate Manager? and ACM Certificate Characteristics.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1q8q56cmwqj9m.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-DeleteACMCertificate",
  "Region" : "us-east-1",
  "Parameters": {
    "CertificateARN": ["arn:aws:acm:us-
east-1:111111111111:certificate/1111aaaa-11aa-11aa-11aa-111111aaaaaa"]
  }
}
```

AMI | Deregister

Deregister one or multiple Amazon Machine Images (AMI)s and optionally delete all associated snapshots. Once deregistered the AMI or AMIs can't be used for launching new instances.

Full classification: Management | Advanced stack components | AMI | Deregister

Change Type Details

Change type ID	ct-26vhhlj9jmlpf

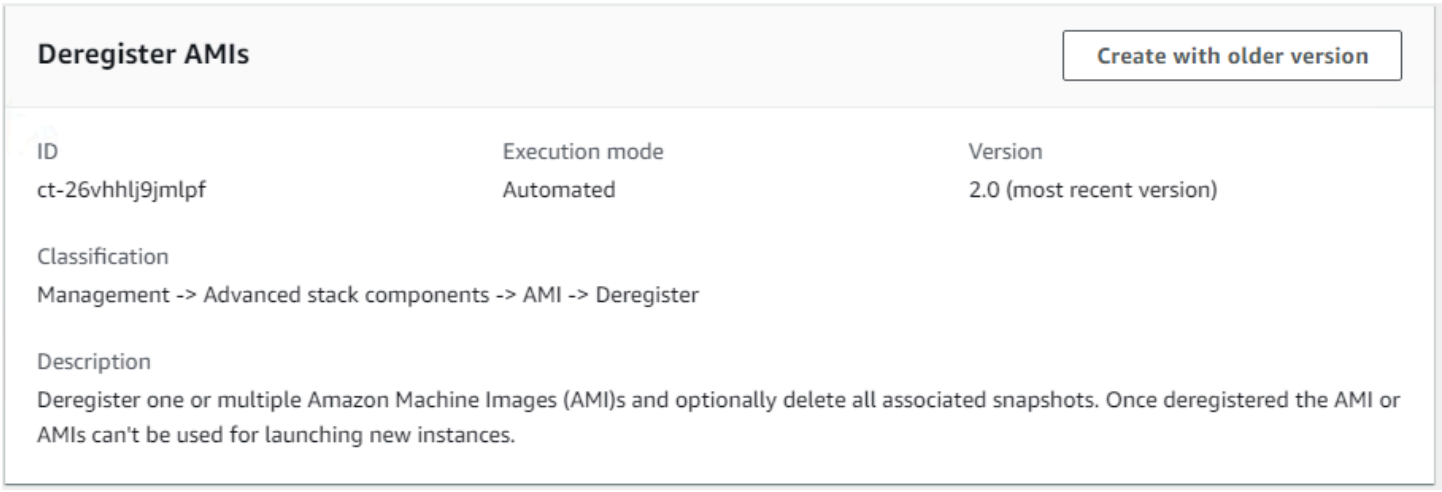
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete or deregister multiple AMIs

Deregistering AMIs with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deregistering AMIs with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \

 --change-type-id "ct-26vhhlj9jmlpf" \
 --change-type-version "2.0" --title "Deregister multiple AMIs" \
   --execution-parameters "{\"DocumentName\":\"AWSManagedServices-
BulkDeleteOrDeregisterAMI\",\"Region\":\"us-east-1\",\"Parameters\":{\"ImageIds\":
[\"ami-0acd76831a2016e19\",\"ami-08a711de1cfa05910\"],\"DeleteSnapshots\":[false]}}"
```

> **Note**
>
> To delete instead of deregister, change the value of `DeleteSnapshots` to `[true]`.

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeregisterAmiParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-26vhhlj9jmlpf" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeregisterAmiParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
    "DocumentName": "AWSManagedServices-BulkDeleteOrDeregisterAMI",
    "Region": "us-east-1",
    "Parameters":
      {
        "ImageIds":
          [
            "ami-0acd76831a2016e19",
            "ami-08a711de1cfa05910"
          ],
        "DeleteSnapshots":[false]
      }
}
```

3. Output the RFC template JSON file; this example names it DeregisterAmiRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeregisterAmiRfc.json
```

4. Modify and save the DeregisterAmiRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "2.0",
  "ChangeTypeId": "ct-26vhhlj9jmlpf",
  "Title": "Deregister multiple AMIs"
}
```

5. Create the RFC, specifying the DeregisterAmiRfc file and the DeregisterAmiParams file:

```
aws amscm create-rfc --cli-input-json file://DeregisterAmiRfc.json  --execution-
parameters file://DeregisterAmiParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about deregistering AMIs, see Deregister your Linux AMI.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-26vhhlj9jmlpf.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-BulkDeleteOrDeregisterAMI",
  "Region": "us-east-1",
  "Parameters" : {
    "ImageIds": [
      "ami-01234567891234501",
      "ami-01234567891234501",
      "ami-01234567891234501",
      "ami-01234567891234501",
      "ami-01234567891234501"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-BulkDeleteOrDeregisterAMI",
  "Region": "us-east-1",
  "Parameters" : {
    "ImageIds": [
      "ami-01234567891234501",
      "ami-01234567891234501",
      "ami-01234567891234501",
      "ami-01234567891234501",
      "ami-01234567891234501"
    ],
    "DeleteSnapshots": [
      false
    ]
  }
}
```

AMI | Encrypt

Use to create a custom AMI with an encrypted EBS snapshot, which protects data at rest. When the encrypted AMI is launched, the corresponding EBS volume is encrypted.

Full classification: Management | Advanced stack components | AMI | Encrypt

Change Type Details

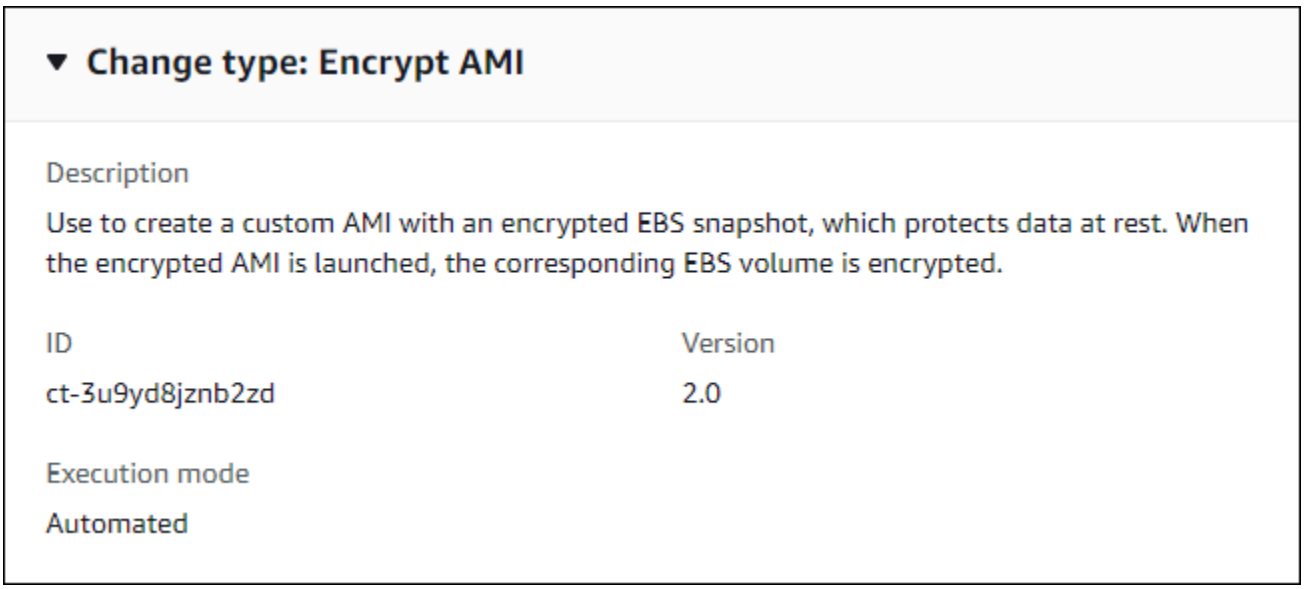
Change type ID	ct-3u9yd8jznb2zd
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Encrypt AMIs

Encrypting an AMI with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Encrypting an AMI with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc  --change-type-id
 "ct-3u9yd8jznb2zd" --change-type-version "2.0" --title "Test-AMI-Encrypt-QC" --
execution-parameters "{\"VpcId\":\"VPC_ID\", \"AmiId\":\"AMI_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type; this example names it EncryptAmiParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3u9yd8jznb2zd" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > EncryptAmiParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "VpcId":            "VPC_ID",
   "AmiId":            "AMI_ID"
   }
   ```

3. Output the RFC template JSON file; this example names it EncryptAmiRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > EncryptAmiRfc.json
   ```

4. Modify and save the EncryptAmiRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":         "ct-3u9yd8jznb2zd",
   "ChangeTypeVersion":    "2.0",
   "Title":                "AMI-Encrypt-RFC",
   "RequestedStartTime":   "2016-12-05T14:20:00Z",
   "RequestedEndTime":     "2016-12-05T16:20:00Z"
   }
   ```

5. Create the RFC, specifying the EncryptAmiRfc file and the EncryptAmiParams file:

```
aws amscm create-rfc --cli-input-json file://EncryptAmiRfc.json  --execution-
parameters file://EncryptAmiParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type does not support encrypting an AMI that is already encrypted.

To learn more about AWS AMI encryption, see AMIs with Encrypted Snapshots.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3u9yd8jznb2zd.

Example: Required Parameters

```
{
  "AmiId" : "ami-01234567890abcdef",
  "VpcId" : "vpc-01234567890abcdef"
}
```

Example: All Parameters

```
{
  "AmiId" : "ami-12345678",
  "VpcId" : "vpc-12345678",
  "KmsKeyId": "a3ccc020-abcd-1234-8d69-2f060c3c1234"
}
```

AMI | Share

Use to share an AMI with another AMS account.

Full classification: Management | Advanced stack components | AMI | Share

Change Type Details

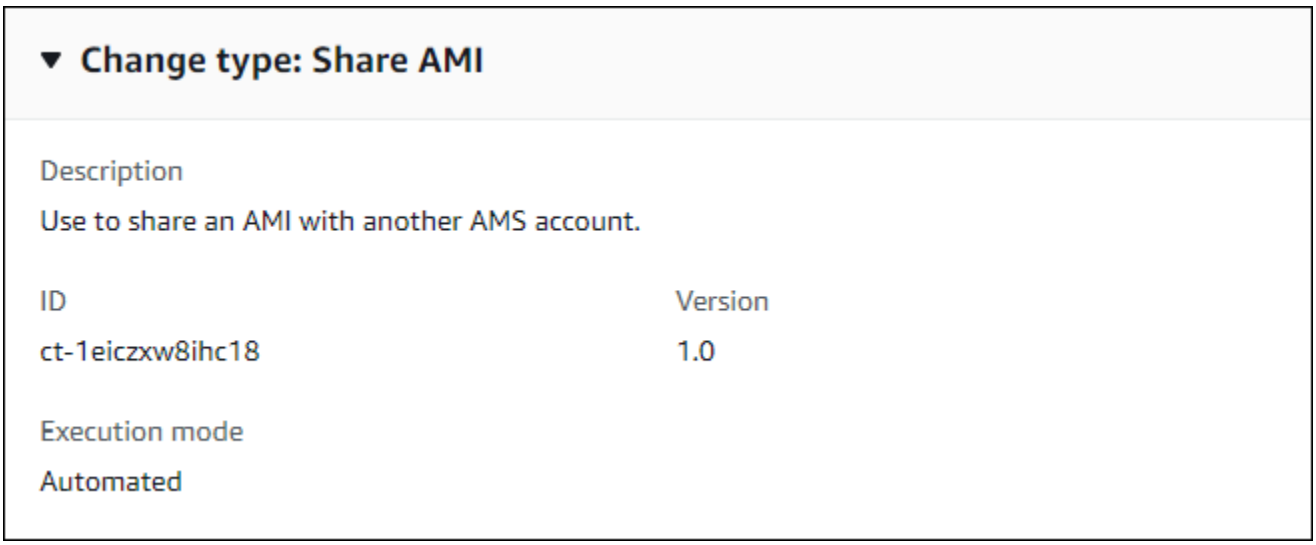
Change type ID	ct-1eiczxw8ihc18
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Share AMIs

Sharing an AMI with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Sharing an AMI with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml amscm create-rfc --change-type-id "ct-1eiczxw8ihc18" --change-type-
version "1.0" --title "AMI-Share-QC" --execution-parameters "{\"Description\":\"Share
 custom AMI\", \"AmiId\":\"AMI-ID\", \"TargetAwsAccountId\":, \"AWS-ACCOUNT-ID\":}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ShareAmiParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1eiczxw8ihc18" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > ShareAmiParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "TargetAwsAccountId":   "AMS_ACCOUNT_ID",
   "AmiId":                "AMI_ID"
   }
   ```

3. Output the RFC template JSON file; this example names it EncryptAmiRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > EncryptAmiRfc.json
```

4. Modify and save the EncryptAmiRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-1eiczxw8ihc18",
"ChangeTypeVersion":     "1.0",
"Title":                 "AMI-Share-RFC"
}
```

5. Create the RFC, specifying the ShareAmiRfc file and the ShareAmiParams file:

```
aws amscm create-rfc --cli-input-json file://ShareAmiRfc.json  --execution-
parameters file://ShareAmiParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> An AMS AMI can't be shared to a non-AMS account. This change type copies an AMI from the source AWS Region to the same Region in the destination account. You must be onboarded to AMS in the destination AWS Region of the specified TargetAwsAccountId, or the shared AMI is unusable in the target account.
> Additionally, encrypted AMIs can't be shared between accounts without the involvement of the AD administrator and an AMS Operations Engineer. If you want to do this, file a Management | Other | Other | Create (ct-1e1xtak34nx76) with AMS with the AMI ID, account information, and full details.

Important

When sharing a custom AMI that you created from an instance in your AMS account, ensure that the AMI is usable in the new account. In particular, the instance used to create the AMI must have been separated from its domain. For more information, see Create an AMI.

To learn more about sharing AMIs, see Sharing an AMI with Specific AWS Accounts.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1eiczxw8ihc18.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "AmiId": "ami-12345678",
  "TargetAwsAccountId": "123456789012"
}
```

Application Load Balancer | Add Listener Certificate

Add a certificate to the specified Application Load Balancer (ALB) listener. Use the RemediateStackDrift parameter for the automation to try to remediate drift, if it is introduced.

Full classification: Management | Advanced stack components | Application Load Balancer | Add listener certificate

Change Type Details

Change type ID	ct-3g6fq83nxg1a7
Current version	1.0
Expected execution duration	60 minutes

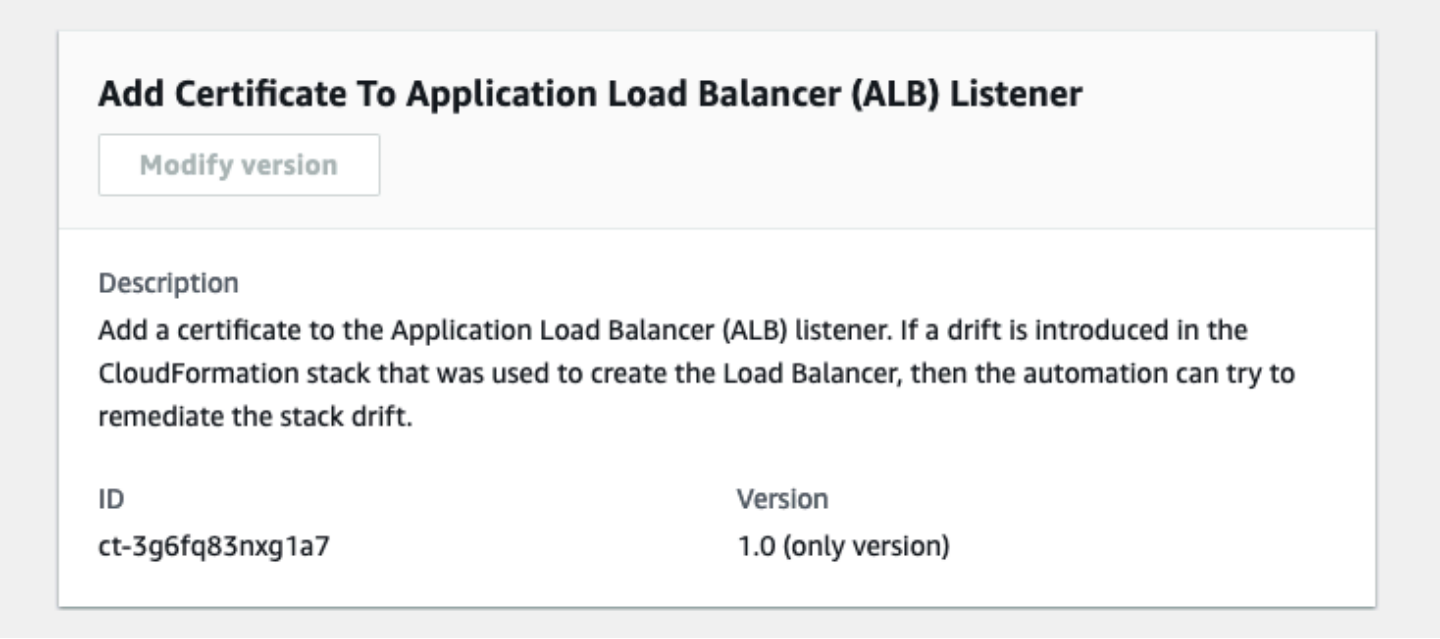
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add ALB listener certificate

Adding a listener certificate to an ALB with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding a listener certificate to an ALB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  create-rfc --change-type-id "ct-3g6fq83nxg1a7" --change-type-version
 "1.0" --title "Add listener certificate ALB" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-AddCertificateToElbv2Listener\",\"Region\": \"us-
east-1\",\"Parameters\":{\"ListenerArn\":[\"arn:aws:elasticloadbalancing:us-
east-1:123456789012:listener/app/testalb/fc656bcb5cacb3ae/a0c0da77f9b1461e\"],
\"CertificateArn\":[\"arn:aws:acm:us-east-1:123456789012:certificate/
ecb242e8-3da5-4da6-813c-17040f086fba\"],\"IsDefault\":[\"False\"],\"RemediateStackDrift
\":[\"True\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file. For example, you can replace the contents with something like this:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3g6fq83nxg1a7"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    AddAlbListenerCertParams.json
   ```

2. Modify and save the AddAlbListenerCertParams file. For example:

   ```
   {
       "DocumentName": "AWSManagedServices-AddCertificateToElbv2Listener",
       "Region": "us-east-1",
       "Parameters": {
   ```

```
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/
testalb/fc656bcb5cacb3ae/a0c0da77f9b1461e"
        ],
        "CertificateArn": [
            "arn:aws:acm:us-east-1:123456789012:certificate/
ecb242e8-3da5-4da6-813c-17040f086fba"
        ],
        "IsDefault": [
            "False"
        ],
        "RemediateStackDrift": [
            "True"
        ]
    }
}
```

3. Output the RFC template to a file in your current folder. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --generate-cli-skeleton > AddAlbListenerCertRfc.json
```

4. Modify and save the AddAlbListenerCertRfc.json file. For example:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3g6fq83nxg1a7",
"Title":                "ALB-Add-Listener-Cert-RFC"
}
```

5. Create the RFC, specifying the AddAlbListenerCertRfc file and the AddAlbListenerCertParams file:

```
aws amscm create-rfc --cli-input-json file://AddAlbListenerCertRfc.json --
execution-parameters file://AddAlbListenerCertParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Application Load Balancers, see What Is an Application Load Balancer?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3g6fq83nxg1a7.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-AddCertificateToElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ],
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/50dc6c495c0c9188"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-AddCertificateToElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ],
        "IsDefault": [
            "True"
        ],
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/50dc6c495c0c9188"
        ],
```

```
        "RemediateStackDrift": [
            "False"
        ]
    }
}
```

Application Load Balancer | Remove Listener Certificate

Remove a certificate from the specified Application Load Balancer (ALB) listener. Use the RemediateStackDrift parameter for the automation to try to remediate drift, if it is introduced.

Full classification: Management | Advanced stack components | Application Load Balancer | Remove listener certificate

Change Type Details

Change type ID	ct-0tpbr6lfa3zng
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remove ALB listener certificate

Removing a listener certificate from an ALB with the console

The following shows this change type in the AMS console.

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Removing a listener certificate from an ALB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  create-rfc --change-type-id "ct-0tpbr6lfa3zng" --change-type-version "1.0"
 --title "Remove listener certificate ALB" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-RemoveCertificateToElbv2Listener\",\"Region\": \"us-
east-1\",\"Parameters\":{\"ListenerArn\":[\"arn:aws:elasticloadbalancing:us-
east-1:123456789012:listener/app/testalb/fc656bcb5cacb3ae/a0c0da77f9b1461e\"],
\"CertificateArn\":[\"arn:aws:acm:us-east-1:123456789012:certificate/
ecb242e8-3da5-4da6-813c-17040f086fba\"],\"IsDefault\":[\"False\"],\"RemediateStackDrift
\":[\"True\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file. For example, you can replace the contents with something like this:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0tpbr6lfa3zng"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    RemoveAlbListenerCertParams.json
   ```

2. Modify and save the RemoveAlbListenerCertParams file. For example:

```
{
    "DocumentName": "AWSManagedServices-RemoveCertificateToElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/
testalb/fc656bcb5cacb3ae/a0c0da77f9b1461e"
        ],
        "CertificateArn": [
            "arn:aws:acm:us-east-1:123456789012:certificate/
ecb242e8-3da5-4da6-813c-17040f086fba"
        ],
        "IsDefault": [
            "False"
        ],
        "RemediateStackDrift": [
            "True"
        ]
    }
}
```

3. Output the RFC template to a file in your current folder. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --generate-cli-skeleton > RemoveAlbListenerCertRfc.json
```

4. Modify and save the RemoveAlbListenerCertRfc.json file. For example:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0tpbr6lfa3zng",
"Title":                "ALB-Remove-Listener-Cert-RFC"
}
```

5. Create the RFC, specifying the RemoveAlbListenerCertRfc file and the RemoveAlbListenerCertParams file:

```
aws amscm create-rfc --cli-input-json file://RemoveAlbListenerCertRfc.json --
execution-parameters file://RemoveAlbListenerCertParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Application Load Balancers, see What Is an Application Load Balancer?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0tpbr6lfa3zng.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-RemoveCertificateFromElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ],
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/50dc6c495c0c9188"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-RemoveCertificateFromElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ],
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/app/my-load-
balancer/50dc6c495c0c9188/50dc6c495c0c9188"
```

```
        ],
        "RemediateStackDrift": [
            "False"
        ]
    }
}
```

Application Load Balancer | Update

Update the properties of an existing AWS Application Load Balancer (ALB) that was created by version 3.0 CT: ct-111r1yayblnw4.

Full classification: Management | Advanced stack components | Application Load Balancer | Update

Change Type Details

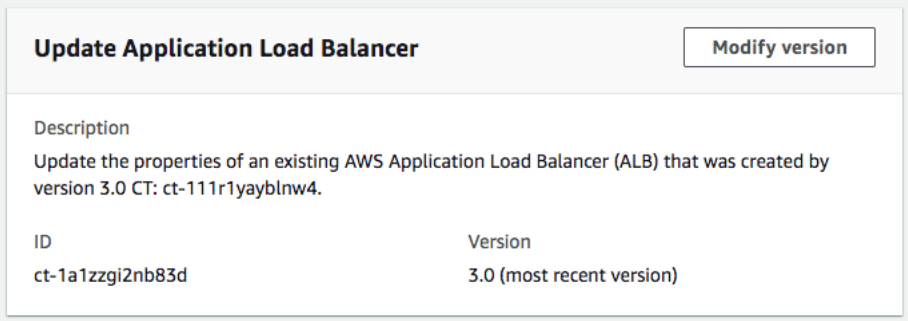
Change type ID	ct-1a1zzgi2nb83d
Current version	3.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update application load balancer (ALB)

Updating an ALB with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an ALB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title Test-Update-ALB --change-type-id ct-1a1zzgi2nb83d
 --change-type-version 3.0 --execution-parameters '{"Description":"Updating Test
 ALB","VpcId":"VPC_ID","StackTemplateId":"stm-sd7uv500000000000","Name":"Test-
Application-LoadBalancer","TimeoutInMinutes":360,"Parameters":
{"TargetGroupHealthCheckPath": "/myAppHealth"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file. For example, you can replace the contents with something like this:

```
aws amscm get-change-type-version --change-type-id "ct-111r1yayblnw4" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateAlbParams.json
```

2. Modify and save the UpdateAlbParams file. For example:

```
{
"Description":      "ALB-Update",
"VpcId":            "VPC_ID",
"Name":             "My-ALB",
"StackTemplateId":  "stm-sd7uv500000000000",
"TimeoutInMinutes" : 360,
"Parameters": {
    "LoadBalancerSecurityGroups": [
      "sg-1234567890abcdef0"
    ],
    "LoadBalancerSubnetIds": [
      "subnet-1234567890abcdef0",
      "subnet-1234567890abcdef1"
    ],
    "LoadBalancerDeletionProtection": "false",
    "LoadBalancerIdleTimeout": "60",
    "Listener1Port": "443",
    "Listener1Protocol": "HTTPS",
    "Listener1SSLCertificateArn": "arn:aws:acm:ap-
southeast-2:012345678912:certificate/e23c3545-e92d-4542-83b8-63483505b5a5",
    "Listener1SSLPolicy": "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",
    "Listener2Port": "8080",
    "Listener2Protocol": "HTTP",
    "TargetGroupHealthCheckInterval": "10",
    "TargetGroupHealthCheckPath": "/thing/index.html",
    "TargetGroupHealthCheckPort": "8080",
    "TargetGroupHealthCheckProtocol": "HTTP",
    "TargetGroupHealthCheckTimeout": "10",
    "TargetGroupHealthyThreshold": "2",
    "TargetGroupUnhealthyThreshold": "10",
    "TargetGroupValidHTTPCode": "200",
    "TargetGroupDeregistrationDelayTimeout": "300",
    "TargetGroupSlowStartDuration": "30",
```

```
    "TargetGroupCookieExpirationPeriod": "20"
  }
}
```

3. Output the RFC template to a file in your current folder. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateAlbRfc.json
```

4. Modify and save the UpdateAlbRfc.json file. For example:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-111r1yayblnw4",
"Title":                "ALB-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateAlbRfc file and the UpdateAlbParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateAlbRfc.json --execution-
parameters file://UpdateAlbParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is version 3.0, and can be used with the version 3.0 of the Create ALB change type (ct-111r1yayblnw4).

To learn more about AWS Application Load Balancers, see What Is an Application Load Balancer?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1a1zzgi2nb83d.

Example: Required Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-1234567890abcdef0",
  "Parameters": {}
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-12345678",
  "StackId": "stack-1234567890abcdef0",
  "Parameters": {
    "LoadBalancerSecurityGroups": ["sg-12345678"],
    "LoadBalancerSubnetIds": ["subnet-12345678", "subnet-12345688"],
    "LoadBalancerDeletionProtection": "false",
    "LoadBalancerIdleTimeout": "60",
    "Listener1Port": "443",
    "Listener1Protocol": "HTTPS",
    "Listener1SSLCertificateArn": "arn:aws:acm:ap-southeast-2:012345678912:certificate/
e23c3545-e92d-4542-83b8-63483505b5a5",
    "Listener1SSLPolicy": "ELBSecurityPolicy-TLS-1-2-Ext-2018-06",
    "Listener2Port": "8080",
    "Listener2Protocol": "HTTP",
    "TargetGroupHealthCheckInterval": "10",
    "TargetGroupHealthCheckPath": "/thing/index.html",
    "TargetGroupHealthCheckPort": "8080",
    "TargetGroupHealthCheckProtocol": "HTTP",
    "TargetGroupHealthCheckTimeout": "10",
    "TargetGroupHealthyThreshold": "2",
    "TargetGroupUnhealthyThreshold": "10",
    "TargetGroupValidHTTPCode": "200",
    "TargetGroupDeregistrationDelayTimeout": "300",
    "TargetGroupSlowStartDuration": "30",
    "TargetGroupCookieExpirationPeriod": "20"
  }
}
```

Auto Scaling Group | Update

Update an Auto Scaling Group and associated launch configuration created with CT ct-2tylseo8rxfsc, version 2.0.

Full classification: Management | Advanced stack components | Auto scaling group | Update

Change Type Details

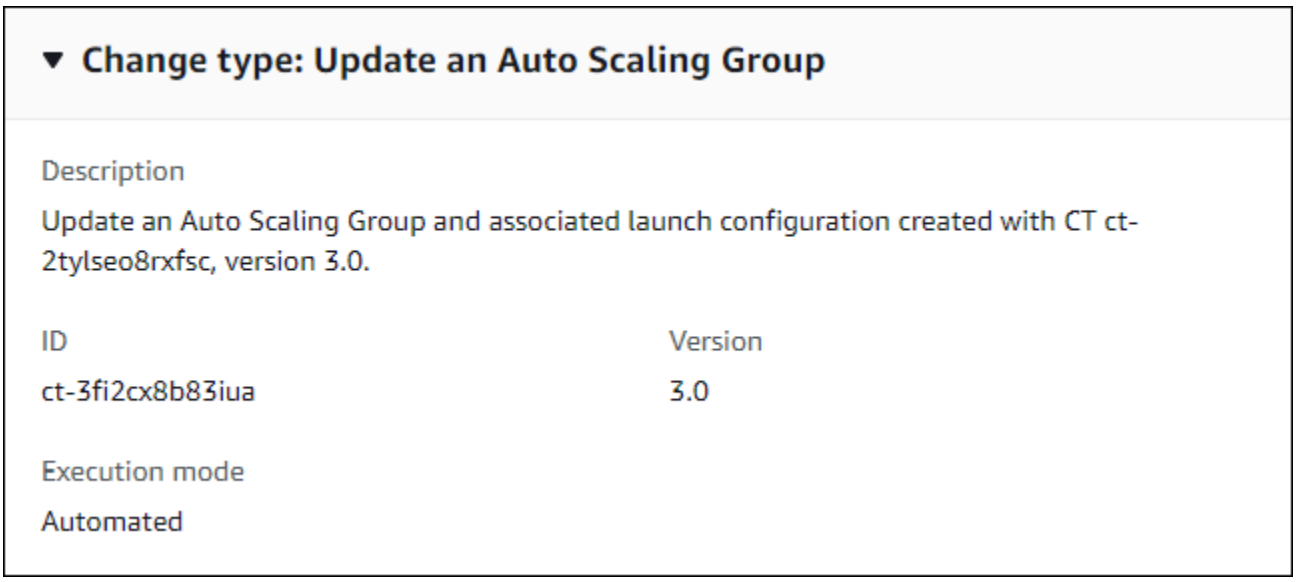
Change type ID	ct-3fi2cx8b83iua
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update Auto Scaling groups

Updating an Auto Scaling group with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an Auto Scaling group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  --profile saml --region us-east-1 create-rfc --change-type-id
 "ct-3fi2cx8b83iua" --change-type-version "2.0" --title "Test-Update ASG" --description
 "Test Update"  --execution-parameters "{\"VpcId\":\"VPC_ID\",\"StackId\":\"STACK_ID\",
\"Parameters\":{\"ASGAmiId\":\"AMI_ID\",\"ASGInstanceType\":\"m3.medium\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file in your current folder; this example names it UpdateAsgParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3fi2cx8b83iua" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateAsgParams.json
   ```

   > **Note**
   >
   > Scripts are newline-delimited (separate with literal: "\n"), also, scripts entered as UserData are executed as the "root" user and do not need to use the "sudo" command. The RFC waits up to six hours for all of the UserData script commands to execute before returning a final status of success or failure.

2. Modify and save the file. For example, you can replace the contents with something like this:

   ```
   {
     "VpcId": "VPC_ID",
     "StackId": "STACK_ID",
     "Parameters": {
       "ASGAmiId": "AMI_ID",
       "ASGInstanceType": "m3.medium"
     }
   }
   ```

3. Output the JSON template for UpdateRfc to a file in your current folder; example names it UpdateAsgRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateAsgRfc.json
   ```

4. Modify and save the JSON file as follows. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-3fi2cx8b83iua",
"Title":                "ASG-Update-Stack-RFC"
}
```

5. Create the RFC, specifying the UpdateAsgRfc file and the execution parameters file:

```
aws amscm create-rfc --cli-input-json file://UpdateAsgRfc.json --execution-
parameters file://UpdateAsgParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This is a version 2.0 change type and can be used to update Auto Scaling groups A(SG) created with the corresponding version 2.0 create change type, ct-2tylseo8rxfsc.

To learn more, see Amazon Auto Scaling.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3fi2cx8b83iua.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
```

```
  "VpcId": "vpc-12345678",
  "StackId": "stack-12345678901234567",
  "Parameters": {
    "ASGAmiId": "ami-a0b1c2d3",
    "ASGCooldown": 300,
    "ASGDesiredCapacity": 1,
    "ASGEBSOptimized": "false",
    "ASGIAMInstanceProfile": "customer-mc-ec2-instance-profile",
    "ASGInstanceDetailedMonitoring": "false",
    "ASGInstanceRootVolumeIops": 0,
    "ASGInstanceRootVolumeSize": 8,
    "ASGInstanceRootVolumeType": "standard",
    "ASGInstanceType": "m3.medium",
    "ASGLoadBalancerNames": ["elb1"],
    "ASGMaxInstances": 1,
    "ASGMinInstances": 1,
    "ASGHealthCheckGracePeriod": 600,
    "ASGHealthCheckType":"EC2",
    "ASGScaleDownMetricName": "CPUUtilization",
    "ASGScaleDownPolicyCooldown": 300,
    "ASGScaleDownPolicyEvaluationPeriods": 4,
    "ASGScaleDownPolicyPeriod": 60,
    "ASGScaleDownPolicyScalingAdjustment": -1,
    "ASGScaleDownPolicyStatistic": "Average",
    "ASGScaleDownPolicyThreshold": 35,
    "ASGScaleUpMetricName": "CPUUtilization",
    "ASGScaleUpPolicyCooldown": 60,
    "ASGScaleUpPolicyEvaluationPeriods": 2,
    "ASGScaleUpPolicyPeriod": 60,
    "ASGScaleUpPolicyScalingAdjustment": 2,
    "ASGScaleUpPolicyStatistic": "Average",
    "ASGScaleUpPolicyThreshold": 75,
    "ASGSubnetIds": ["subnet-a0b1c2d3", "subnet-e4f5g6h7"],
    "ASGUserData": "#!/bin/bash\npwd\nls -ltrh\necho \"Hello, World\""
  }
}
```

Bastions | Add CIDR Ingress (Review Required)

Add RDP or SSH bastion ingress Classless Inter-Domain Routing (CIDR) allow lists.

Full classification: Management | Advanced stack components | Bastions | Add CIDR ingress (review required)

Change Type Details

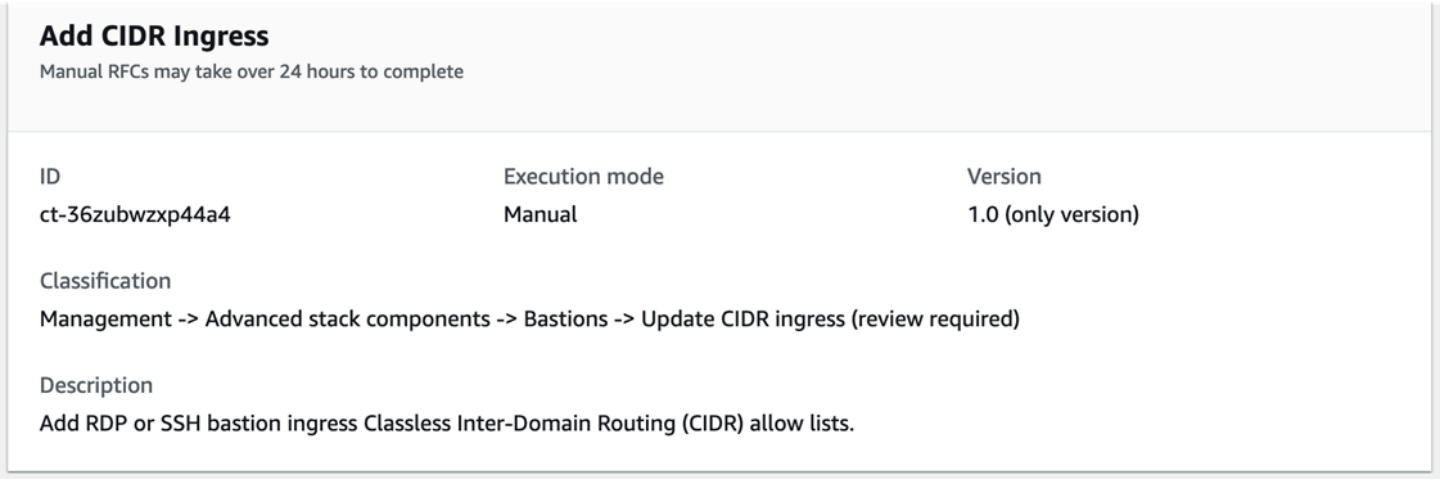
Change type ID	ct-36zubwzxp44a4
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Add CIDR ingress (review required) ct-36zubwzxp44a4

Adding bastion CIDR ingress with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding bastion CIDR ingress with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-36zubwzxp44a4" --change-type-version "1.0"
 --title "Add CIDR ingress" --execution-parameters "{\"BastionType\": \"RDP Bastion\",
 \"[\"10.0.0.1/24\",\"10.20.0.4/25\",\"10.0.0.6/25\"]\": \"10\", \"ASGMinCount\":
 \"10\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it AddBastionCidrIngressParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-36zubwzxp44a4"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    AddBastionCidrIngressParams.json
   ```

2. Modify and save the AddBastionCidrIngressParams file.

   ```
   {
      "BastionType": "RDP Bastion",
      "IngressCIDRAddresses": ["10.113.44.1/22", "10.113.56.1/22"],
      "Priority": "Medium"
   ```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it AddBastionCidrIngressRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AddBastionCidrIngressRfc.json
```

4. Modify and save the AddBastionCidrIngressRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-36zubwzxp44a4",
  "Title": "Add Bastion CIDR Ingress"
}
```

5. Create the RFC, specifying the AddBastionCidrIngressRfc file and the AddBastionCidrIngressParams file:

```
aws amscm create-rfc --cli-input-json file://AddBastionCidrIngressRfc.json --
execution-parameters file://AddBastionCidrIngressParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- To learn more, see Authorize inbound traffic for your Linux instances.
- This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-36zubwzxp44a4.

Example: Required Parameters

```
{
  "BastionType": "RDP Bastion",
  "IngressCIDRAddresses": ["10.113.44.1/22"]
}
```

Example: All Parameters

```
{
  "BastionType": "RDP Bastion",
  "IngressCIDRAddresses": ["10.113.44.1/22", "10.113.56.1/22"],
  "Priority": "Medium"
}
```

Bastions | Update Instance or Session Counts (Review Required)

Update the number of RDP and SSH Bastion instances. Optionally update the session count of RDP Bastions.

Full classification: Management | Advanced stack components | Bastions | Update instance or session counts (review required)

Change Type Details

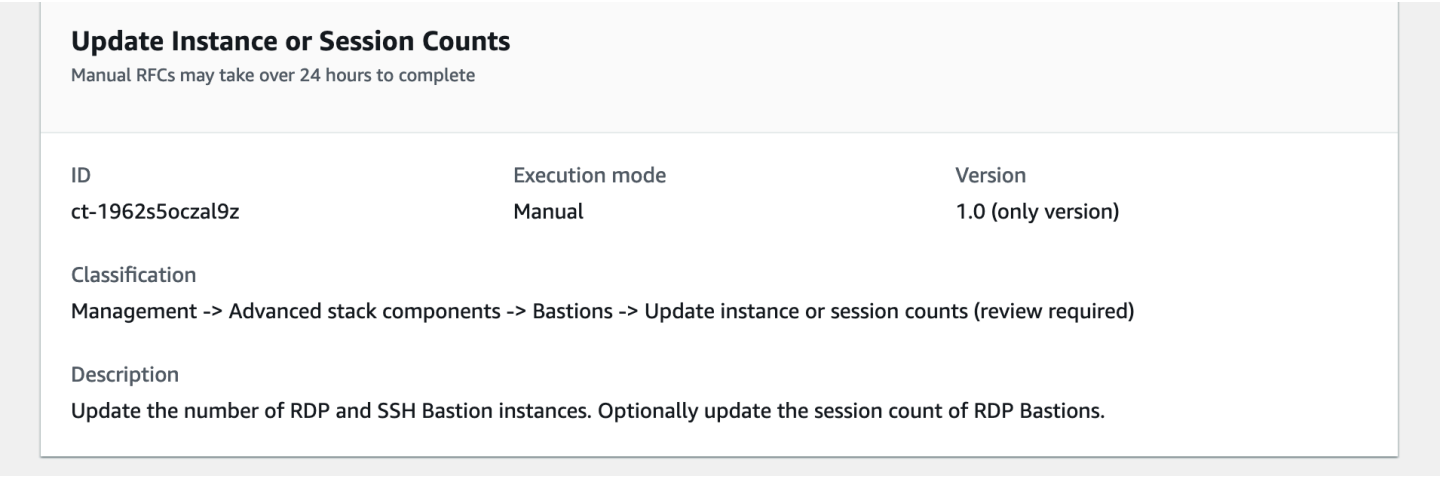
Change type ID	ct-1962s5oczal9z
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update bastion instance or session counts (review required) ct-1962s5oczal9z

Updating bastion instance or session counts with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating bastion instance or session counts with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

SSH Bastion Update Example

```
aws amscm create-rfc --change-type-id "ct-1962s5oczal9z" --change-type-version "1.0"
 --title "Update instance or session counts" --execution-parameters "{\"BastionType\":
 \"SSH Bastion\", \"ASGMaxCount\": \"10\", \"ASGMinCount\": \"10\", \"ASGDesiredCount
\": \"10\"}"
```

RDP Bastion Update Example

```
aws amscm create-rfc --change-type-id "ct-1962s5oczal9z" --change-type-version
 "1.0" --title "Update instance or session counts" --execution-parameters
 "{\"BastionType\": \"RDP Bastion\", \"RDPBastionDesiredMaximumSessions\": \"50\",
 \"RDPBastionDesiredMinimumSessions\": \"20\"}"
```

RDP Bastion Update Example with ASG

```
aws amscm create-rfc --change-type-id "ct-1962s5oczal9z" --change-type-version "1.0"
 --title "Update instance or session counts" --execution-parameters "{\"BastionType\":
 \"RDP Bastion\", \"ASGMaxCount\": \"10\", \"ASGMinCount\": \"10\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdateBastionInstSesCountsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1962s5oczal9z"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateBastionInstSesCountsParams.json
   ```

2. Modify and save the UpdateBastionInstSesCountsParams file.

   ```
   {
     "BastionType": "RDP Bastion",
     "RDPBastionDesiredMaximumSessions": 10,
   ```

```
   "RDPBastionDesiredMinimumSessions": 2,
   "ASGMaxCount": 4,
   "ASGMinCount": 0,
   "ASGDesiredCount": 2,
   "Priority": "Medium"
 }
```

3. Output the RFC template to a file in your current folder; this example names it UpdateBastionInstSesCountsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateBastionInstSesCountsRfc.json
```

4. Modify and save the UpdateBastionInstSesCountsRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1962s5oczal9z",
  "Title": "Update Bastion Instance or Session Count"
}
```

5. Create the RFC, specifying the UpdateBastionInstSesCountsRfc file and the UpdateBastionInstSesCountsParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateBastionInstSesCountsRfc.json --
execution-parameters file://UpdateBastionInstSesCountsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- To learn more about AWS bastions, see Linux Bastion Hosts on AWS.
- This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1962s5oczal9z.

Example: Required Parameters

```
{
  "BastionType": "RDP Bastion"
}
```

Example: All Parameters

```
{
  "BastionType": "RDP Bastion",
  "RDPBastionDesiredMaximumSessions": 10,
  "RDPBastionDesiredMinimumSessions": 2,
  "ASGMaxCount": 4,
  "ASGMinCount": 0,
  "ASGDesiredCount": 2,
  "Priority": "Medium"
}
```

Bastions | Update Instance Size (Review Required)

Update the instance size for an RDP or SSH customer bastion in an AMS account.

Full classification: Management | Advanced stack components | Bastions | Update instance size (review required)

Change Type Details

Change type ID	ct-2x14cv67uym46
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter

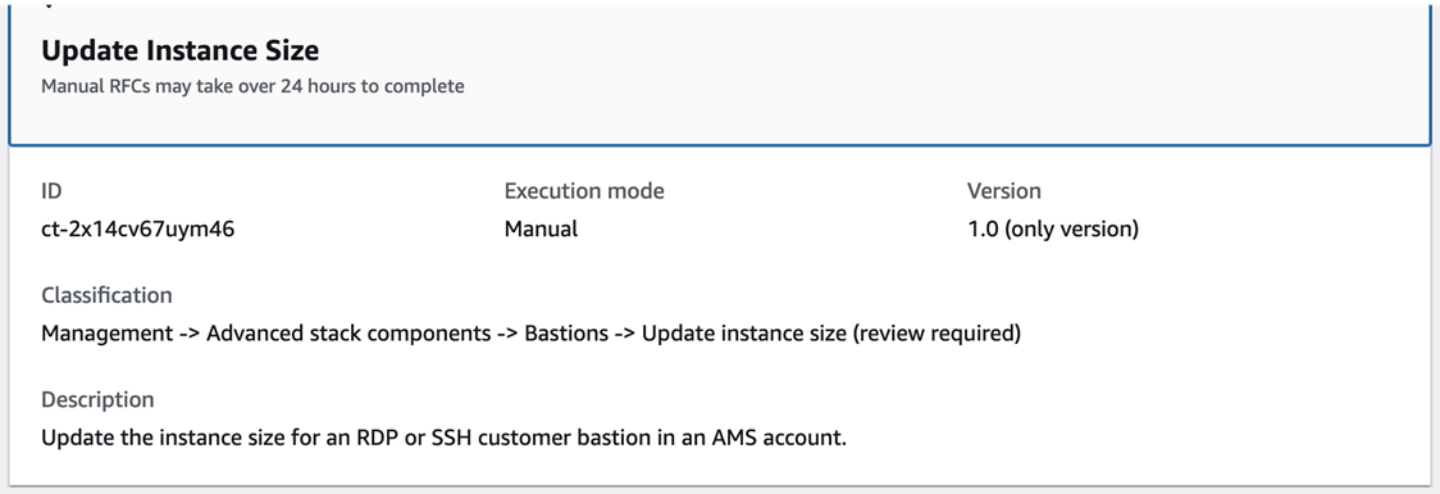
Execution mode	Manual

Additional Information

Update bastion instance size (review required) ct-2x14cv67uym46

Updating bastion instance size with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating bastion instance size with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2x14cv67uym46" --change-type-version "1.0" --
title "Update instance size" --execution-parameters "{\"InstanceType\": \"t3.medium\",
 \"BastionType\": \"RDP Bastion\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdateBastionInstSizeParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2x14cv67uym46"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateBastionInstSizeParams.json
   ```

2. Modify and save the UpdateBastionInstSizeParams file.

   ```
   {
      "BastionType": "RDP Bastion",
      "InstanceType": "t3.medium",
      "Priority": "Medium"
    }
   ```

3. Output the RFC template to a file in your current folder; this example names it UpdateBastionInstSizeRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateBastionInstSizeRfc.json
   ```

4. Modify and save the UpdateBastionInstSizeRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
   ```

```
  "ChangeTypeId": "ct-2x14cv67uym46",
  "Title": "Update Bastion Instance Size"
}
```

5. Create the RFC, specifying the UpdateBastionInstSizeRfc file and the UpdateBastionInstSizeParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateBastionInstSizeRfc.json --
execution-parameters file://UpdateBastionInstSizeParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- To learn more about AWS bastions, see Linux Bastion Hosts on AWS.
- This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2x14cv67uym46.

Example: Required Parameters

```
{
  "BastionType": "RDP Bastion",
  "InstanceType": "t3.medium"
}
```

Example: All Parameters

```
{
  "BastionType": "RDP Bastion",
  "InstanceType": "t3.medium",
```

```
  "Priority": "Medium"
}
```

Database Migration Service (DMS) | Start Replication Task

Start a new Database Migration Service (DMS) replication task, or a task in a stopped or failed state.

Full classification: Management | Advanced stack components | Database Migration Service (DMS) | Start replication task

Change Type Details

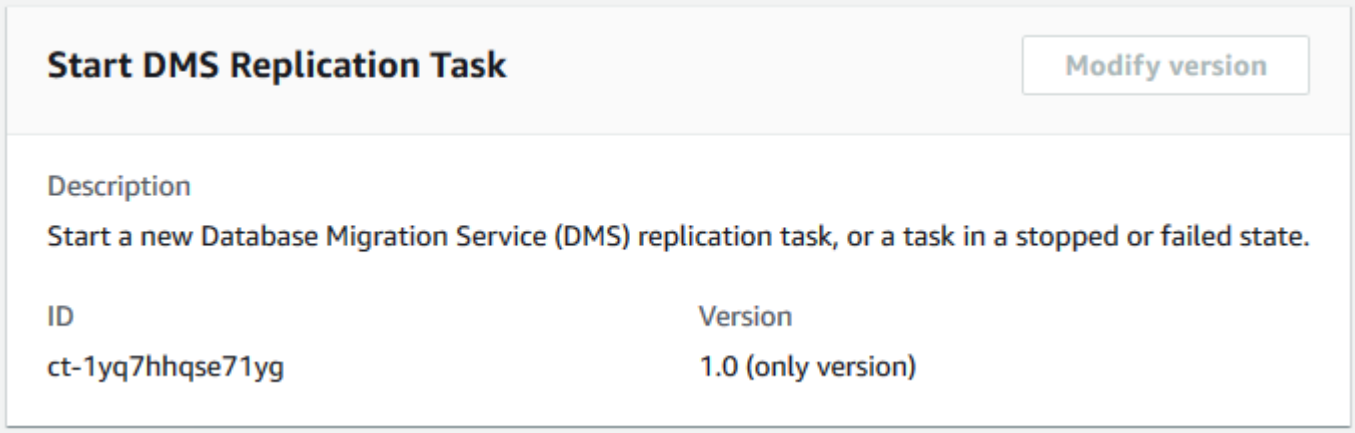
Change type ID	ct-1yq7hhqse71yg
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Start AWS DMS replication task

Starting a AWS DMS replication task with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Starting a AWS DMS replication task with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1yq7hhqse71yg" --change-type-version
 "1.0" --title "Start DMS Replication Task" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-StartDmsTask\",\"Region\":\"us-east-1\",\"Parameters\":
{\"ReplicationTaskArn\":[\"TASK_ARN\"],\"StartReplicationTaskType\":[\"start-
replication\"],\"CdcStartPosition\":[\"\"],\"CdcStopPosition\":[\"\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it StartDmsRtParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1yq7hhqse71yg" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > StartDmsRtParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-StartDmsTask",
     "Region": "us-east-1",
     "Parameters": {
         "ReplicationTaskArn": [
           "TASK_ARN"
         ],
         "StartReplicationTaskType": [
           "start-replication"
         ],
         "CdcStartPosition": [
           ""
         ],
         "CdcStopPosition": [
           ""
         ]
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it StartDmsRtRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > StartDmsRtRfc.json
   ```

4. Modify and save the StartDmsRtRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-1yq7hhqse71yg",
  "ChangeTypeVersion": "1.0",
  "Title": "Start DMS Replication Task"
}
```

5. Create the RFC, specifying the execution parameters file and the StartDmsRtRfc file:

```
aws amscm create-rfc --cli-input-json file://StartDmsRtRfc.json --execution-
parameters file://StartDmsRtParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

You can start a AWS DMS replication task, using the AMS console or the AMS API/CLI. For more information, see Working with AWS DMS Tasks.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1yq7hhqse71yg.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-StartDmsTask",
  "Region": "us-east-1",
  "Parameters": {
    "ReplicationTaskArn": ["arn:aws:dms:us-
east-1:123456789000:task:3FBZMUE4QNZNMD7DMWXXOSCCM4"],
    "StartReplicationTaskType": ["start-replication"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-StartDmsTask",
  "Region": "us-east-1",
  "Parameters": {
    "ReplicationTaskArn": ["arn:aws:dms:us-
east-1:123456789000:task:3FBZMUE4QNZNMD7DMWXXOSCCM4"],
    "StartReplicationTaskType": ["start-replication"],
    "CdcStartPosition": ["2019-01-01T01:00:00"],
    "CdcStopPosition": ["server_time:2019-01-02T01:00:00"]
  }
}
```

Database Migration Service (DMS) | Stop Replication Task

Stop a Database Migration Service (DMS) replication task. The specified task must be in the running state.

Full classification: Management | Advanced stack components | Database Migration Service (DMS) | Stop replication task

Change Type Details

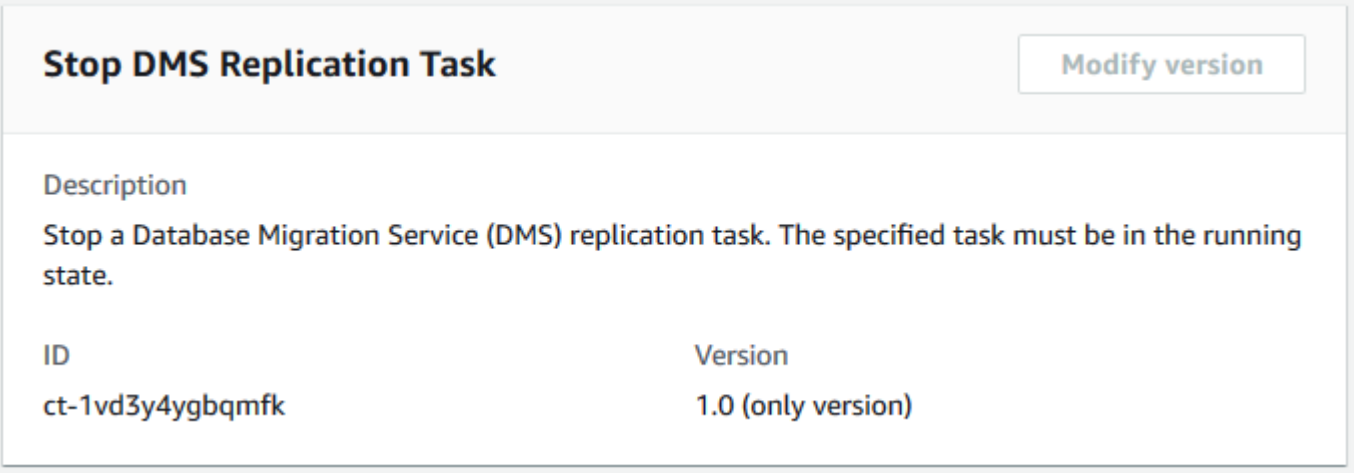
Change type ID	ct-1vd3y4ygbqmfk
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Stop AWS DMS replication task

Stopping a AWS DMS replication task with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Stopping a AWS DMS replication task with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1vd3y4ygbqmfk" --change-type-version
 "1.0" --title "Stop DMS Replication Task" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-StopDmsTask\",\"Region\":\"us-east-1\",\"Parameters\":
{\"ReplicationTaskArn\":[\"TASK_ARN\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it StopDmsRtParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1vd3y4ygbqmfk" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > StopDmsRtParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-StopDmsTask",
     "Region": "us-east-1",
     "Parameters": {
         "ReplicationTaskArn": [
           "TASK_ARN"
         ]
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it StopDmsRtRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > StopDmsRtRfc.json
   ```

4. Modify and save the StopDmsRtRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "ChangeTypeId": "ct-1vd3y4ygbqmfk",
  "ChangeTypeVersion": "1.0",
  "Title": "Stop DMS Replication Task"
}
```

5. Create the RFC, specifying the execution parameters file and the StopDmsRtRfc file:

```
aws amscm create-rfc --cli-input-json file://StopDmsRtRfc.json --execution-
parameters file://StopDmsRtParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

You can stop a DMS replication task, using the AMS console or the AMS API/CLI. For more information, see Working with AWS DMS Tasks.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1vd3y4ygbqmfk.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-StopDmsTask",
  "Region": "us-east-1",
  "Parameters": {
    "ReplicationTaskArn": ["arn:aws:dms:us-
east-1:123456789000:task:3FBZMUE4QNZNMD7DMWXXOSCCM4"]
  }
}
```

Directory Service | Accept Sharing

Accept a directory sharing request sent from the directory owner account. This is run in the directory consumer account.

Full classification: Management | Advanced stack components | Directory Service | Accept sharing

Change Type Details

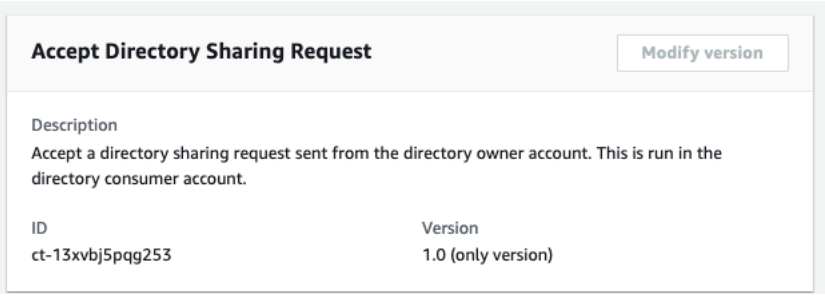
Change type ID	ct-13xvbj5pqg253
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Accept directory sharing request

Accept a directory sharing request with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Accept a directory sharing request with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \ --change-type-id "ct-13xvbj5pqg253" \ --change-type-version
 "1.0" --title "AWS Directory Service accept directory sharing" \ --execution-
parameters "{\"DocumentName\":\"AWSManagedServices-AcceptSharedDirectory\",\"Region
\":\"eu-central-1\",\"Parameters\":{\"SharedDirectoryId\":[\"d-000000000\"],
\"OwnerAccountId\":[\"000000000000\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DirectorySharingParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-13xvbj5pqg253"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DirectorySharingParams.json
   ```

   Modify and save the DirectorySharingParams file. For example, you can replace the contents with something like this:

```
{
{
  "DocumentName": "AWSManagedServices-AcceptSharedDirectory",
  "Region": "eu-central-1",
  "Parameters": {
    "SharedDirectoryId": ["d-000000000"],
    "OwnerAccountId": ["000000000000"]
  }
}
```

2. Output the RFC template to a file in your current folder; this example names it DirectorySharingRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DirectorySharingRfc.json
```

3. Modify and save the DirectorySharingRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId":          "ct-13xvbj5pqg253",
"ChangeTypeVersion":     "1.0",
"Title":                 "AWS Directory Service accept directory sharing"
}
```

4. Create the RFC, specifying the DirectorySharingRfc file and the DirectorySharingParams file:

```
aws amscm create-rfc --cli-input-json file://DirectorySharingRfc.json --execution-
parameters file://DirectorySharingParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type was originally classified as Management | Advanced stack components | Directory service | Accept sharing, and has now been moved to a more user friendly classification. The change type ID, ct-13xvbj5pqg253, has not changed.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-13xvbj5pqg253.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-AcceptSharedDirectory",
  "Region": "us-east-1",
  "Parameters": {
    "SharedDirectoryId": [
      "d-12e456789f"
    ],
    "OwnerAccountId": [
      "123456789012"
    ]
  }
}
```

DNS (Private) | Update

Update an existing Route 53 DNS Hosted Zone with the supplied resource record set.

Full classification: Management | Advanced stack components | DNS (private) | Update

Change Type Details

Change type ID	ct-1d55pi44ff21u
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required

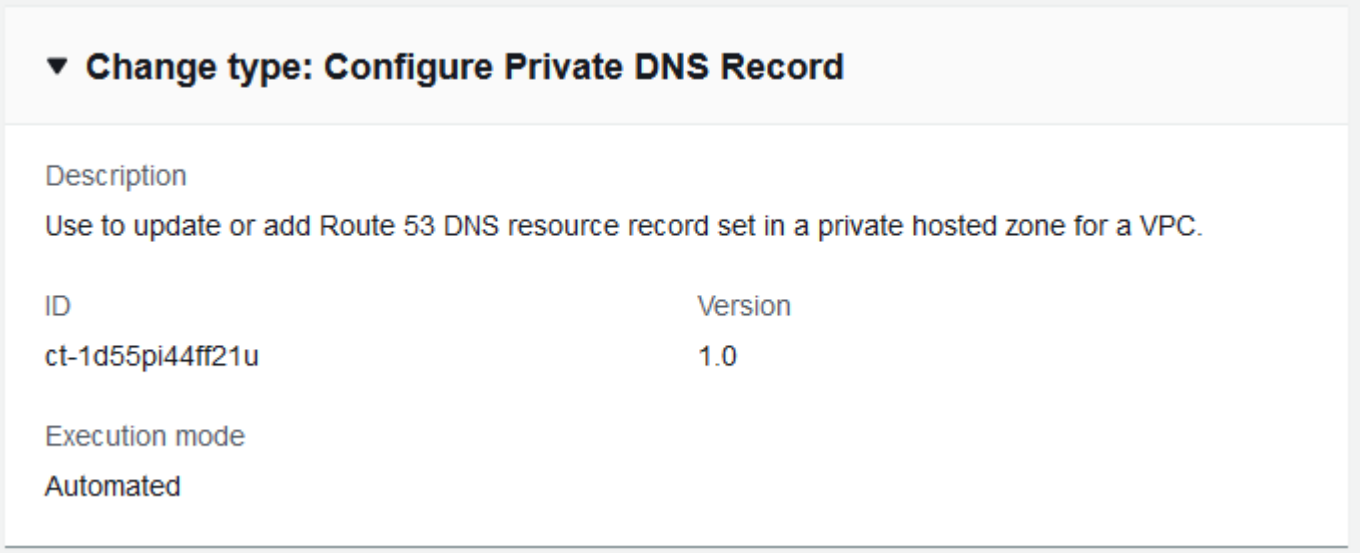
Execution mode	Automated

Additional Information

Update private DNS Route 53

Updating a private DNS Route 53 hosted zone with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a private DNS Route 53 hosted zone with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-1d55pi44ff21u" \
--change-type-version "2.0" --title "Update Private DNS Record" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
CreateAddRoute53Resources\",\"Region\":\"ap-southeast-2\",\"Parameters\":{\"StackId
\":\"stack-9iwwljjcfunnrahof\",\"RecordSet\":[\"{\\\"RecordSet\\\":[{\\\"Name\\\":\\
\"test15.domain.com\\\",\\\"Type\\\":\\\"A\\\",\\\"TTL\\\":600,\\\"ResourceRecords\\\":
[\\\"10.1.1.1\\\",\\\"10.1.2.2\\\"]},{\\\"Name\\\":\\\"test16.domain.com\\\",\\\"Type\\
\":\\\"CNAME\\\",\\\"TTL\\\":600,\\\"ResourceRecords\\\":[\\\"amazon.com\\\"]}]}\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateDnsPrivateParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1d55pi44ff21u"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateDnsPrivateParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateAddRoute53Resources",
     "Region": "ap-southeast-2",
     "Parameters": {
       "HostedZoneId": "Z0188399KN0JJOZLTEXM",
       "RecordSet": [
   ```

```
      "{\"RecordSet\":[{\"Name\":\"test20.domain.com\",\"Type\":\"A\",\"TTL\":600,
\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},{\"Name\":\"test15.domain.com\",
\"Type\":\"CNAME\",\"TTL\":600,\"ResourceRecords\":[\"amazon.com\"]}]}"
    ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it UpdateDnsPrivateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateDnsPrivateRfc.json
```

4. Modify and save the UpdateDnsPrivateRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-1d55pi44ff21u ",
  "ChangeTypeVersion": "2.0",
  "Title": "Update Private Hosted Zone"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateDnsPrivateRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateDnsPrivateRfc.json --execution-
parameters file://UpdateDnsPrivateParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- This CT fails if the specified **RecordSet** contains more than 500 resource records (RRs), or if the CloudFormation template surpasses the maximum body of 51,200 bytes.
- You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.
- To learn more, see Working with Private Hosted Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1d55pi44ff21u.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateAddRoute53Resources",
  "Region" : "us-east-1",
  "Parameters": {
    "StackId": "",
    "HostedZoneId": "Z12345678901234567890",
    "RecordSet": [
      "{\"RecordSet\":[{\"Name\":\"test1.mydomain.com\",\"Type\":\"A\",\"TTL\":\"600\",
\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},{\"Name\":\"test3.mydomain.com
\",\"Type\":\"CNAME\",\"TTL\":\"600\",\"ResourceRecords\":[\"amazon.com\"]},
{\"Name\":\"test4.mydomain.com\",\"Type\":\"A\",\"AliasTarget\":{\"DNSName\":
\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,\"HostedZoneId
\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"weighted.mydomain.com\",\"Weight\":200,
\"SetIdentifier\":\"Example-Set-Identifier-1\",\"Type\":\"A\",\"AliasTarget\":
{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"geolocationexample.mydomain.com
\",\"SetIdentifier\":\"Example-GeoLocation-Identifier-1\",\"GeoLocation\":
{\"CountryCode\":\"US\",\"SubdivisionCode\":\"WA\"},\"Type\":\"A\",\"AliasTarget
\":{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"examplelatency.mydomain.com\",
\"SetIdentifier\":\"Example-Latency-Identifier-1\",\"Region\":\"ap-southeast-2\",
\"Type\":\"A\",\"TTL\":\"600\",\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},
{\"Name\":\"examplemultivalue.mydomain.com\",\"SetIdentifier\":\"Example-
MultiValue-Identifier-1\",\"MultiValueAnswer\":true,\"Type\":\"A\",\"TTL\":\"600\",
\"ResourceRecords\":[\"10.1.1.1\"]}]}"
    ]
  }
}
```

DNS (Public) | Update

Update an existing Route 53 DNS Hosted Zone with the supplied resource record set.

Full classification: Management | Advanced stack components | DNS (public) | Update

Change Type Details

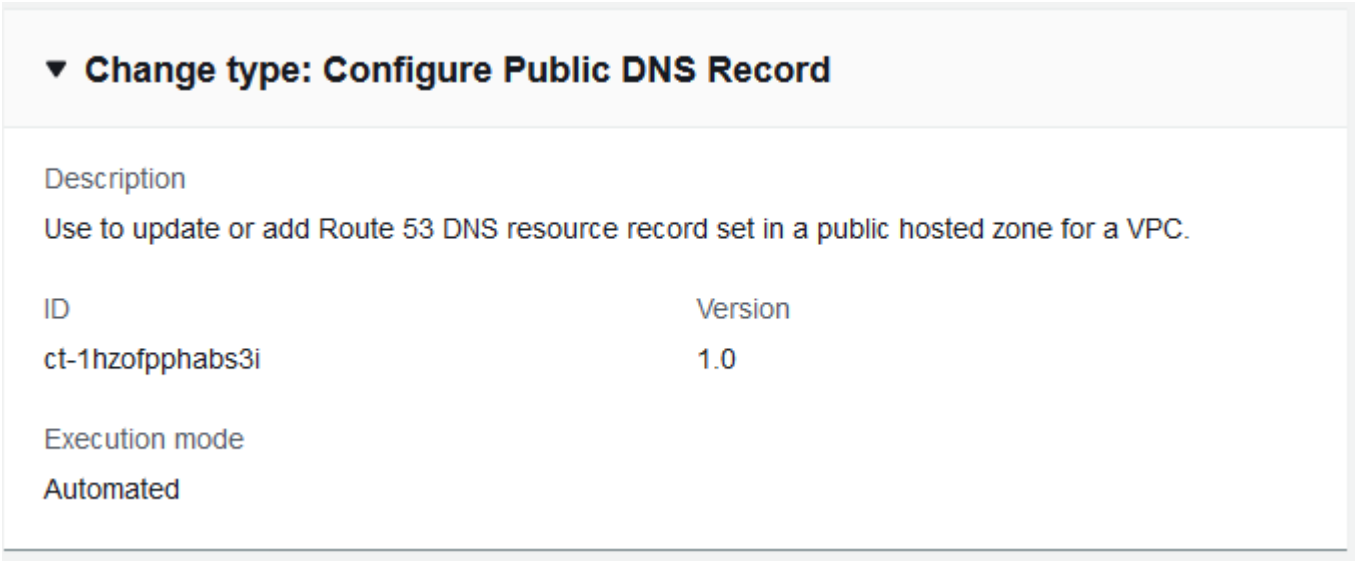
Change type ID	ct-1hzofpphabs3i
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update public DNS Route 53

Updating a Route 53 public hosted zone with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a Route 53 public hosted zone with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-1hzofpphabs3i" \
--change-type-version "2.0" --title "Update Public DNS Record" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
CreateAddRoute53Resources\",\"Region\":\"ap-southeast-2\",\"Parameters\":{\"StackId
\":\"stack-6zelfurs8yojlvn1i\",\"RecordSet\":[\"{\\\"RecordSet\\\":[{\\\"Name\\\":\\
\"test15.domain.com\\\",\\\"Type\\\":\\\"A\\\",\\\"TTL\\\":600,\\\"ResourceRecords\\\":
[\\\"10.1.1.1\\\",\\\"10.1.2.2\\\"]},{\\\"Name\\\":\\\"test16.domain.com\\\",\\\"Type\\
\":\\\"CNAME\\\",\\\"TTL\\\":600,\\\"ResourceRecords\\\":[\\\"amazon.com\\\"]}]}\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateDnsPublicParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1hzofpphabs3i"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateDnsPublicParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
  "DocumentName": "AWSManagedServices-CreateAddRoute53Resources",
  "Region": "ap-southeast-2",
  "Parameters": {
    "StackId": "stack-6zelfurs8yojlvn1i",
    "RecordSet": [
      "{\"RecordSet\":[{\"Name\":\"test15.domain.com\",\"Type\":\"A\",\"TTL\":600,
\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},{\"Name\":\"test16.domain.com\",
\"Type\":\"CNAME\",\"TTL\":600,\"ResourceRecords\":[\"amazon.com\"]}]}"
    ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it UpdateDnsPublicRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateDnsPublicRfc.json
```

4. Modify and save the UpdateDnsPublicRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-1hzofpphabs3i",
  "ChangeTypeVersion": "2.0",
  "Title": "Update Public Hosted Zone"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateDnsPublicRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateDnsPublicRfc.json --execution-
parameters file://UpdateDnsPublicParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can add up to 50 tags, but to do so you must enable the **Additional configuration** view.

To learn more, see Working with Public Hosted Zones.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1hzofpphabs3i.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-CreateAddRoute53Resources",
  "Region" : "us-east-1",
  "Parameters": {
    "StackId": "stack-k9hasbgx6eh4d5mab",
    "RecordSet": [
      "{\"RecordSet\":[{\"Name\":\"test1.mydomain.com\",\"Type\":\"A\",\"TTL\":\"600\",
\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},{\"Name\":\"test3.mydomain.com
\",\"Type\":\"CNAME\",\"TTL\":\"600\",\"ResourceRecords\":[\"amazon.com\"]},
{\"Name\":\"test4.mydomain.com\",\"Type\":\"A\",\"AliasTarget\":{\"DNSName\":
\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,\"HostedZoneId
\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"weighted.mydomain.com\",\"Weight\":200,
\"SetIdentifier\":\"Example-Set-Identifier-1\",\"Type\":\"A\",\"AliasTarget\":
{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"geolocationexample.mydomain.com
\",\"SetIdentifier\":\"Example-GeoLocation-Identifier-1\",\"GeoLocation\":
{\"CountryCode\":\"US\",\"SubdivisionCode\":\"WA\"},\"Type\":\"A\",\"AliasTarget
\":{\"DNSName\":\"d1i3674zujyzy1.cloudfront.net\",\"EvaluateTargetHealth\":true,
\"HostedZoneId\":\"Z2FDTNDATAQYW2\"}},{\"Name\":\"examplelatency.mydomain.com\",
\"SetIdentifier\":\"Example-Latency-Identifier-1\",\"Region\":\"ap-southeast-2\",
```

```
\"Type\":\"A\",\"TTL\":\"600\",\"ResourceRecords\":[\"10.1.1.1\",\"10.1.2.2\"]},
{\"Name\":\"examplemultivalue.mydomain.com\",\"SetIdentifier\":\"Example-
MultiValue-Identifier-1\",\"MultiValueAnswer\":true,\"Type\":\"A\",\"TTL\":\"600\",
\"ResourceRecords\":[\"10.1.1.1\"]}]}"
    ]
  }
}
```

EBS Snapshot | Archive

Archive Elastic Block Store (EBS) snapshots. The maximum number of EBS snapshots that can be archived concurrently depends on the 'In-progress snapshot archives per account' AWS Service Quota. Snapshots that are in the 'completed' state, storage tier is 'standard', or belonging to the current owner account, can be archived. Snapshots created by the AWS Backup service, used by AMIs, or shared with other accounts, cannot be archived. If you specify snapshots that are invalid, or the archival in-progress quota limit is reached, the RFC fails.

Full classification: Management | Advanced stack components | EBS snapshot | Archive

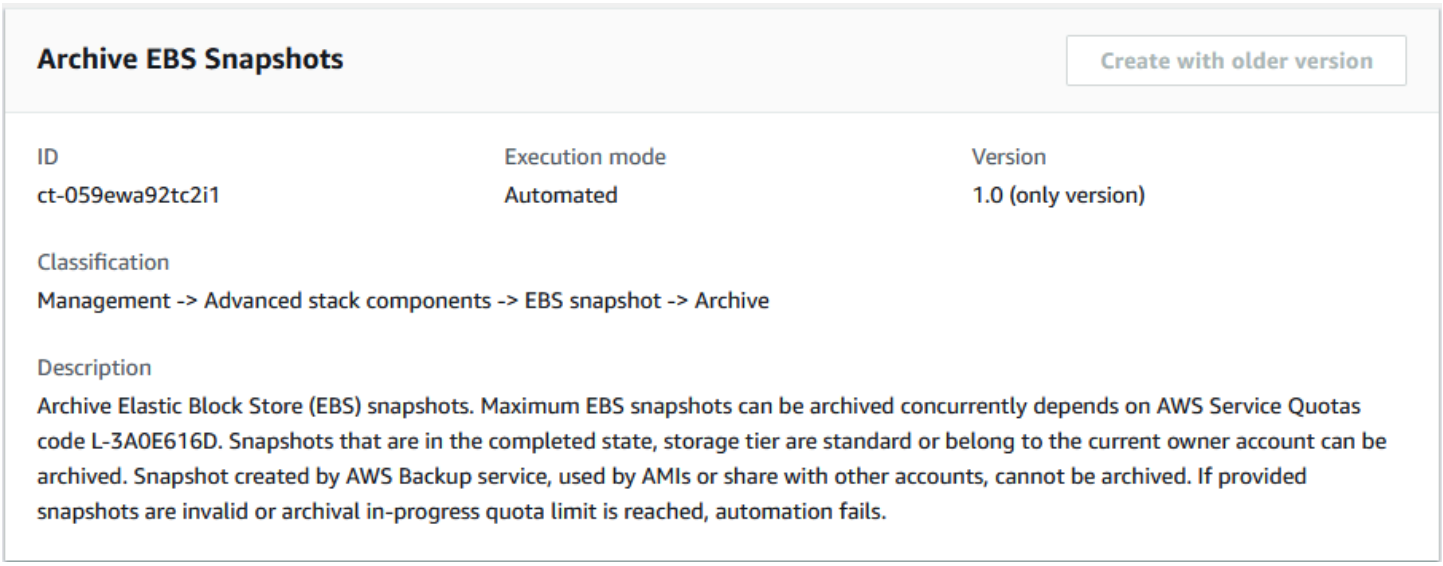
Change Type Details

Change type ID	ct-059ewa92tc2i1
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Archive EBS snapshot

Archiving EBS Snapshots with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Archiving EBS Snapshots with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-059ewa92tc2i1" --change-type-version
 "1.0" --title "Archive an EBS Snapshot" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-ArchiveEBSSnapshot\",\"Region\": \"us-east-1\",\"Parameters\":
 {\"SnapshotId\": [\"snap-1234567890abcdef0\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ArchiveEbsSnpshtParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-059ewa92tc2i1"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ArchiveEbsSnpshtParams.json
   ```

2. Modify and save the ArchiveEbsSnpshtParams file. For example, you can replace the contents with something like this:

   ```
   >{
     "DocumentName": "AWSManagedServices-ArchiveEBSSnapshot",
     "Region": "us-east-1",
     "Parameters": {
       "SnapshotId": [
         "snap-1234567890abcdef0"
       ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it ArchiveEbsSnpshtRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ArchiveEbsSnpshtRfc.json
   ```

4. Modify and save the ArchiveEbsSnpshtRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0wspy4o646g9p",
"Title":                "Archive an EBS Snapshot"
}
```

5. Create the RFC, specifying the ArchiveEbsSnpshtRfc file and the ArchiveEbsSnpshtParams file:

```
aws amscm create-rfc --cli-input-json file://ArchiveEbsSnpshtRfc.json  --execution-
parameters file://ArchiveEbsSnpshtParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS snapshots, see Amazon EBS Snapshots.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-059ewa92tc2i1.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-ArchiveEBSSnapshots",
  "Region": "us-east-1",
  "Parameters": {
    "SnapshotIds": [
      "snap-1234567890abcdef0"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-ArchiveEBSSnapshots",
  "Region": "us-east-1",
  "Parameters": {
    "SnapshotIds": [
```

```
      "snap-1234567890abcdef0"
    ]
  }
}
```

EBS Snapshot | Delete

Delete Elastic Block Store (EBS) snapshots. Because deleted snapshots cannot be restored, we recommend scheduling this RFC to provide a time period in which you could cancel the operation, if needed. At least one parameter must be specified. Note: If more than one parameter is used, only snapshots matching all used parameters are deleted. Snapshots created by AWS Backup service, used by AMIs, and snapshots created less than 60 days ago, cannot be deleted. If one or more snapshots cannot be deleted, execution fails. Up to 1000 snapshots can be deleted in one execution.

Full classification: Management | Advanced stack components | EBS snapshot | Delete

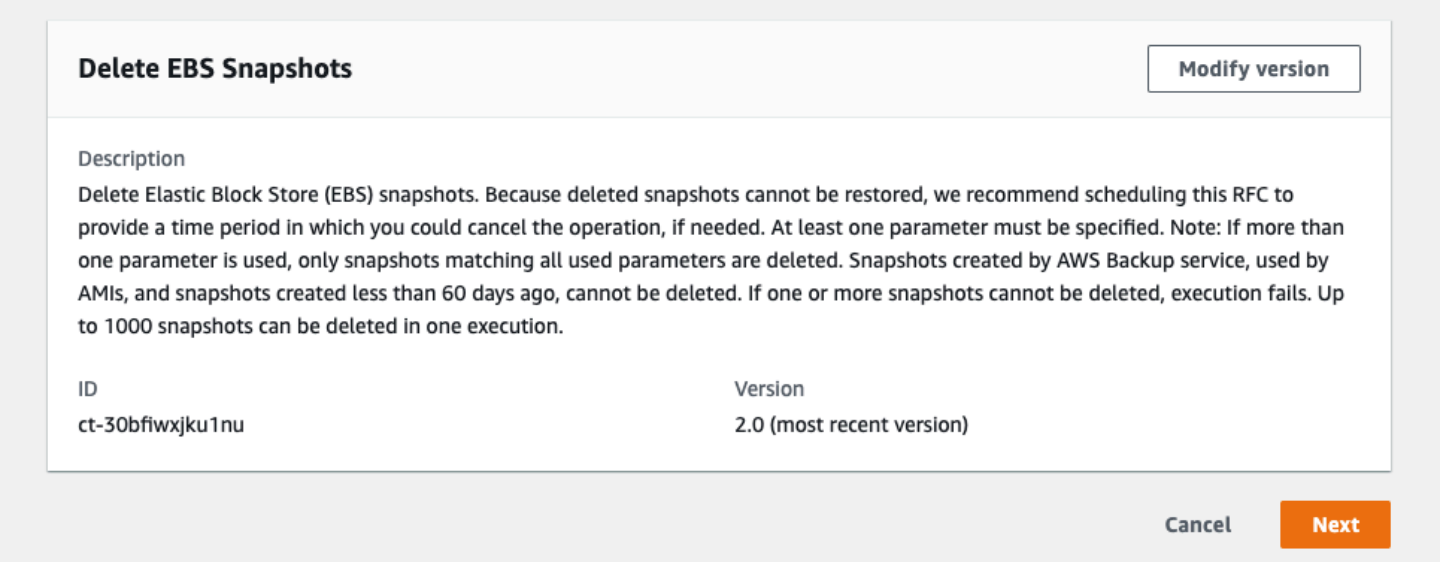
Change Type Details

Change type ID	ct-30bfiwxjku1nu
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete EBS snapshot

Deleting EBS snapshots with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting EBS snapshots with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Note that the DocumentName in version 1 is AWSManagedServices-DeleteEBSSnapshot; in version 2 it is AWSManagedServices-DeleteEBSSnapshots. These examples are for version 2.

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

With only `SnapshotIds` specified:

```
aws amscm create-rfc --change-type-id "ct-30bfiwxjku1nu" --change-type-version
 "2.0" --title "Delete EBS snapshot" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-DeleteEBSSnapshots\",\"Region\":\"us-east-1\",\"Confirmation\":
\"delete permanently\",\"Parameters\":{\"SnapshotIds\":[\"snap-0123456789abcdef0\",
\"snap-0123456789abcdef1\"]}}"
```

With up to 1000 snapshots listed in an S3 file specified:

```
aws amscm create-rfc --change-type-id "ct-30bfiwxjku1nu" --change-type-version
 "2.0" --title "Delete EBS Snapshots" --execution-parameters ""{\"DocumentName\":
\"AWSManagedServices-DeleteEBSSnapshots\",\"Region\":\"us-east-1\",\"Confirmation\":
\"delete permanently\",\"Parameters\":{\"SnapshotIdCsvUrl\":[\"PRE-SIGNED_S3_URL\"]}}"
```

Delete up to 1000 snapshots older than 2020-01-31 and tagged with Delete:True:

```
aws amscm create-rfc --change-type-id "ct-30bfiwxjku1nu" --change-type-version
 "2.0" --title "Delete EBS Snapshots" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-DeleteEBSSnapshots\",\"Region\":\"us-east-1\",\"Confirmation\":
\"delete permanently\",\"Parameters\":{\"StartDate\":[\"2020-01-31\"],\"Tag\":[{\"Key
\":\"Delete\",\"Value\":\"True\"}]}}"
```

Delete up to 1000 snapshots older than 2020-01-31 for which source volumes no longer exist:

```
aws amscm create-rfc --change-type-id "ct-30bfiwxjku1nu" --change-type-version
 "2.0" --title "Delete EBS Snapshots" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-DeleteEBSSnapshots\",\"Region\":\"us-east-1\",\"Confirmation
\":\"delete permanently\",\"Parameters\":{\"StartDate\":[\"2020-01-31\"],
\"SnapshotsWithoutVolumes\":[\"True\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteEbsSnpshtParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-30bfiwxjku1nu"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 DeleteEbsSnpshtParams.json
```

2. Modify and save the DeleteEbsSnpshtParams file. For example, you can replace the contents with something like this:

   With only `SnapshotIds` specified:

```
{
  "DocumentName": "AWSManagedServices-DeleteEBSSnapshots",
  "Region": "us-east-1",
  "Confirmation": "delete permanently",
  "Parameters" : {
    "SnapshotIds": [
      "snap-0123456789abcdef0",
      "snap-0123456789abcdef1"
    ]
  }
}
```

   With up to 1000 snapshots listed in an S3 file specified:

```
{
 "DocumentName": "AWSManagedServices-DeleteEBSSnapshots",
 "Region": "us-east-1",
 "Confirmation": "delete permanently",
 "Parameters": {
     "SnapshotIdCsvUrl": [
         "PRE-SIGNED_S3_URL"
     ]
 }
}}
```

   Delete up to 1000 snapshots older than 2020-01-31 and tagged with Delete:True:

```
{
 "DocumentName": "AWSManagedServices-DeleteEBSSnapshots",
```

```
 "Region": "us-east-1",
 "Confirmation": "delete permanently",
 "Parameters": {
      "StartDate": [
          "2020-01-31"
      ],
      "Tag": [
          {"Key":"Delete","Value":"True"}
      ]
 }
}
```

Delete up to 1000 snapshots older than 2020-01-31 for which source volumes no longer exist:

```
{
 "DocumentName": "AWSManagedServices-DeleteEBSSnapshots",
 "Region": "us-east-1",
 "Confirmation": "delete permanently",
 "Parameters": {
      "StartDate": [
          "2020-01-31"
      ],
      "SnapshotsWithoutVolumes": [
          "True"
      ]
 }
}
```

3. Output the RFC template JSON file to a file; this example names it DeleteEbsSnpshtRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteEbsSnpshtRfc.json
```

4. Modify and save the DeleteEbsSnpshtRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-30bfiwxjku1nu",
"Title":                "EBS-Snapshot-Delete-RFC"
}
```

5. Create the RFC, specifying the DeleteEbsSnpshtRfc file and the DeleteEbsSnpshtParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteEbsSnpshtRfc.json  --execution-
parameters file://DeleteEbsSnpshtParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> If more than one parameter is used, only snapshots matching all used parameters are deleted.
> Snapshots created less than 60 days ago cannot be deleted. To delete snapshots less than 60 days old, use the Management | Other | Other | Update change type (ct-0xdawir96cy7k) or a service request and an AMS engineer will assist you.
> Additionally, this CT can't delete snapshots used by AMIs or created by AWS Backup service.

> **Note**
>
> This change type is now at version 2.0 because new parameters were added to give more flexibility in determining which snapshots would be deleted. The DocumentName in version 1 is AWSManagedServices-DeleteEBSSnapshot; in version 2 it is AWSManagedServices-DeleteEBSSnapshots.

To learn more about Amazon EBS snapshots, see Amazon EBS Snapshots.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-30bfiwxjku1nu.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-DeleteEBSSnapshots",
  "Region": "us-east-1",
```

```
  "Confirmation": "delete permanently",
  "Parameters" : {}
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-DeleteEBSSnapshots",
    "Region": "us-east-1",
    "Confirmation": "delete permanently",
    "Parameters": {
        "SnapshotIds": [
            "snap-01234567891234501",
            "snap-01234567891234502",
            "snap-01234567891234503",
            "snap-01234567891234504",
            "snap-01234567891234505",
            "snap-01234567891234506",
            "snap-01234567891234507",
            "snap-01234567891234508",
            "snap-01234567891234509",
            "snap-01234567891234510"
        ],
        "SnapshotIdCsvUrl": [
            "https://s3.us-east-1.amazonaws.com/my-bucket-0123456789/snapshots.txt?

EBS Snapshot | Share

Share an Elastic Block Store (EBS) snapshot with another AMS account. If the destination account is onboarded in a different AMS Region, use change type ID ct-3lkbpansfv69k in the destination account to copy shared snapshot across regions. Only snapshots encrypted with managed KMS keys can be shared.

Full classification: Management | Advanced stack components | EBS snapshot | Share

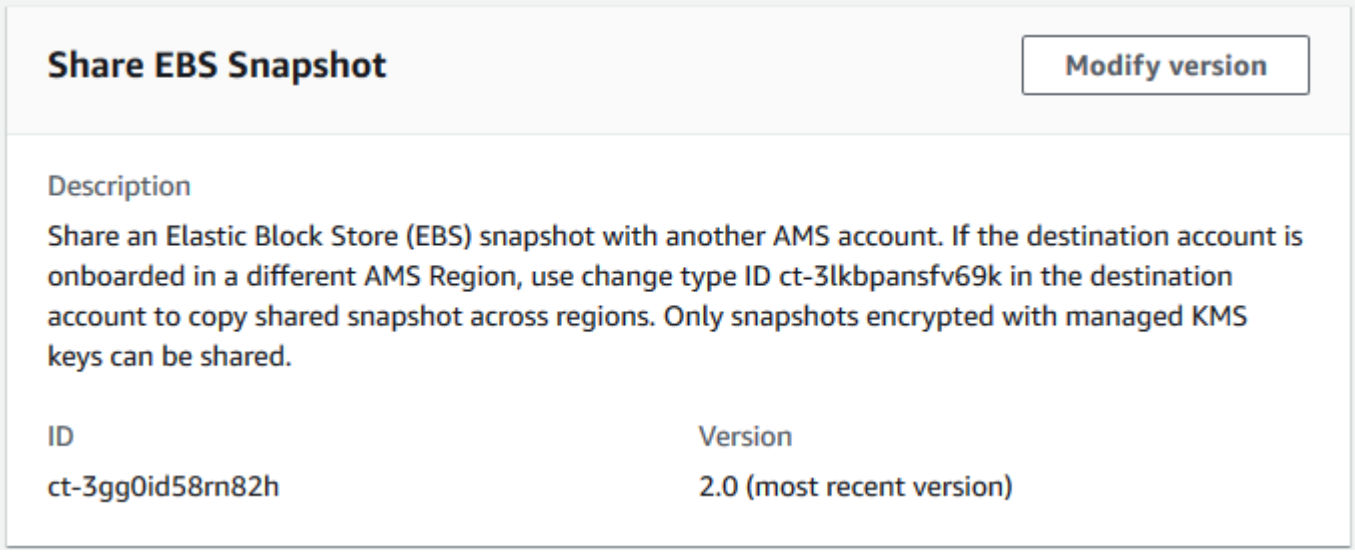
Change Type Details

Change type ID	ct-3gg0id58rn82h
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Share EBS snapshot

Sharing EBS Snapshots with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Sharing EBS Snapshots with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3gg0id58rn82h" --change-type-version
 "2.0" --title "Share EBS snapshot" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ShareEBSSnapshot\",\"Region\":\"ap-southeast-2\",\"Parameters\":
{\"AccountId\":[\"ACCOUNT_ID\"],\"SnapshotId\":[\"SNAP_ID\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ShareEbsSnpshtParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3gg0id58rn82h" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > ShareEbsSnpshtParams.json
   ```

2. Modify and save the ShareEbsSnpshtParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-ShareEBSSnapshot",
     "Region": "us-east-1",
     "Parameters": {
       "AccountId": [
         "ACCOUNT_ID"
       ],
       "SnapshotId": [
         "SNAPSHOT_ID"
       ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it ShareEbsSnpshtRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ShareEbsSnpshtRfc.json
   ```

4. Modify and save the ShareEbsSnpshtRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-3gg0id58rn82h",
"Title":                "EBS-Share-RFC"
}
```

5. Create the RFC, specifying the ShareEbsSnpshtRfc file and the ShareEbsSnpshtParams file:

```
aws amscm create-rfc --cli-input-json file://ShareEbsSnpshtRfc.json  --execution-
parameters file://ShareEbsSnpshtParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Note

A typical use for the EBS snapshot share and copy CTs would be:

1. In account A, use the EBS snapshot share CT to share the snapshot with account B.
2. In account B, use the Copy EBS snapshot CT to copy the snapshot to the AWS Region for account B.

Important

This change type version, 2.0, limits snapshot sharing to only snapshots encrypted with managed KMS keys. Additionally, several parameters were removed, **TargetParameterName**, **Targets**, **MaxConcurrency**, and **MaxErrors**; and one new parameter was introduced, **SourceSnapshotId**.

To learn more about Amazon EBS snapshots, see Amazon EBS Snapshots.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3gg0id58rn82h.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-ShareEBSSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SnapshotId": [
      "snap-1234567890abcdef0"
    ],
    "AccountId": [
      "012345678912"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-ShareEBSSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "SnapshotId": [
      "snap-1234567890abcdef0"
    ],
    "AccountId": [
      "012345678912"
    ]
  }
}
```

EBS Volume | Attach

Attach an EBS volume to an EC2 instance. This change type provides an option that attempts to remediate drift in the CloudFormation stack where the volume is being attached, but that option, RemediateStackDrift, does not work on volumes created using the CloudFormation ingest change type (ct-36cn2avfrrj9v).

Full classification: Management | Advanced stack components | EBS Volume | Attach

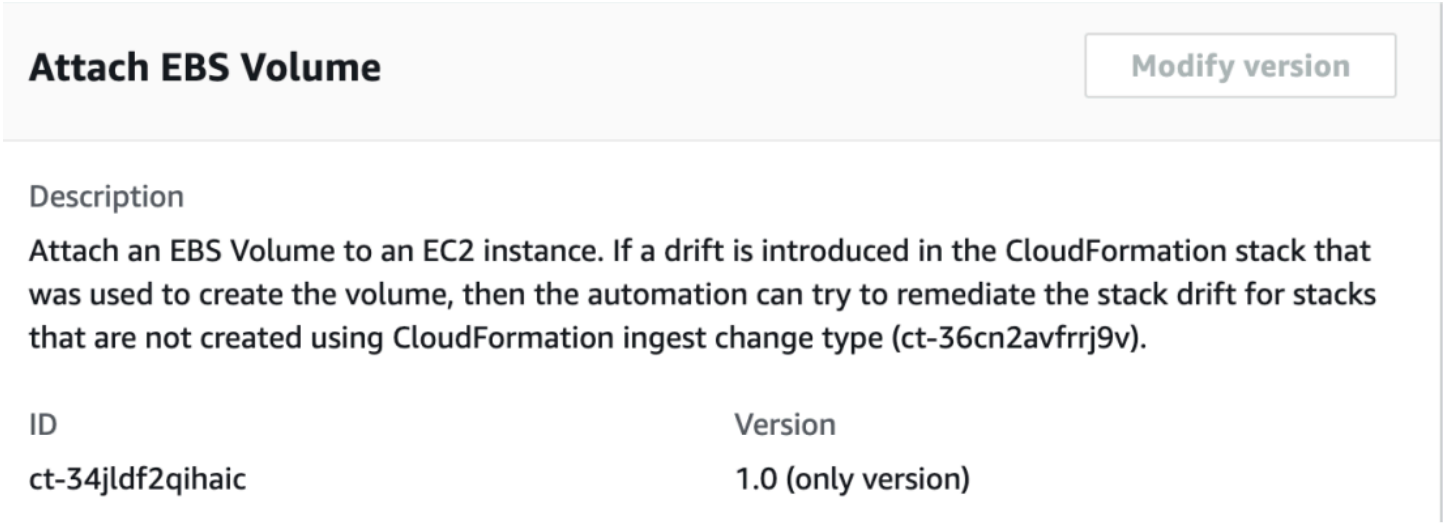
Change Type Details

Change type ID	ct-34jldf2qihaic
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Attach EBS volume

Attaching EBS Volumes with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Attaching EBS Volumes with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-34jldf2qihaic" --change-type-version
 "1.0" --title "Attach EBS Volume" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-AttachEBSVolume\",\"Region\":\"us-east-1\",\"Parameters\":
{\"VolumeId\":[\"vol-1234567890abcdef0\"],\"InstanceId\":[\"i-1234567890abcdef0\"],
\"RemediateStackDrift\":[\"False\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AttachEbsVolParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-34jldf2qihaic" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AttachEbsVolParams.json
   ```

2. Modify and save the AttachEbsVolParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName" : "AWSManagedServices-AttachEBSVolume",
     "Region" : "us-east-1",
   ```

```
  "Parameters" : {
    "VolumeId" : [
      "vol-1234567890abcdef0"
    ],
    "InstanceId" : [
      "i-1234567890abcdef0"
    ],
    "RemediateStackDrift" : [
      "False"
    ]
  }
}
```

3. Output the RFC template JSON file to a file; this example names it AttachEbsVolRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AttachEbsVolRfc.json
```

4. Modify and save the AttachEbsVolRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-34jldf2qihaic",
"Title":                "EBS-Volumes-Attach-RFC"
}
```

5. Create the RFC, specifying the AttachEbsVolRfc file and the AttachEbsVolParams file:

```
aws amscm create-rfc --cli-input-json file://AttachEbsVolRfc.json  --execution-
parameters file://AttachEbsVolParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS volumes, see Amazon Elastic Block Store.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-34jldf2qihaic.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-AttachEBSVolume",
  "Region" : "us-east-1",
  "Parameters" : {
    "VolumeId" : [
      "vol-1234567890abcdef0"
    ],
    "InstanceId" : [
      "i-1234567890abcdef0"
    ],
    "RemediateStackDrift" : [
      "False"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-AttachEBSVolume",
  "Region" : "us-east-1",
  "Parameters" : {
    "VolumeId" : [
      "vol-1234567890abcdef0"
    ],
    "InstanceId" : [
      "i-1234567890abcdef0"
    ],
    "DeviceName" : [
      "/dev/sdf"
    ],
    "RemediateStackDrift" : [
      "False"
    ]
  }
}
```

EBS Volume | Delete

Delete Elastic Block Store (EBS) volumes in an available state. Volumes that are not attached to an instance are in an available state and can be deleted.

Full classification: Management | Advanced stack components | EBS Volume | Delete

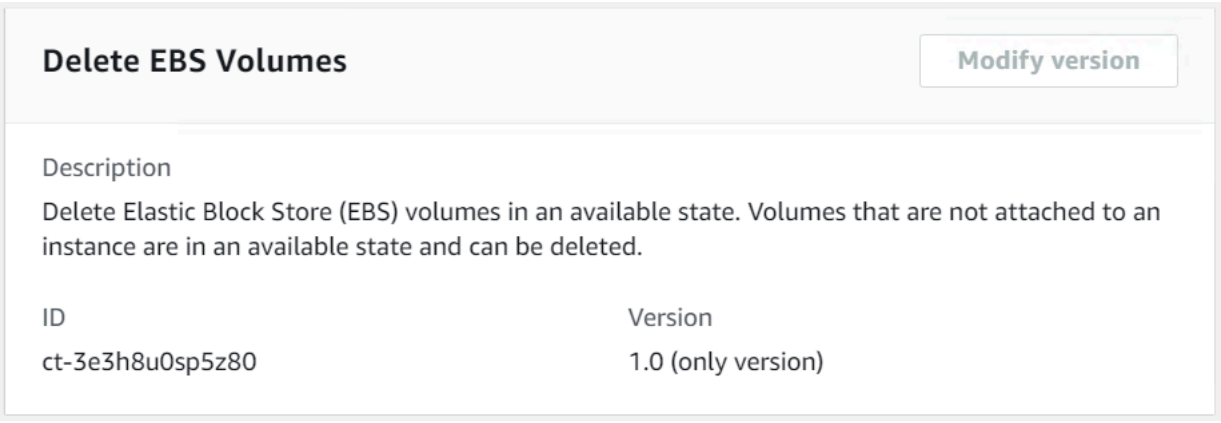
Additional Information

Delete EBS volume

Deleting EBS Volumes with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting EBS Volumes with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3e3h8u0sp5z80" --change-type-version
 "2.0" --title "Delete Ebs Volumes" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-DeleteEBSVolumesV2\",\"Region\":\"us-east-1\",\"Parameters\":
{\"VolumeIds\":[\"vol-01234567891234501\",\"vol-01234567891234502\"],\"CreateBackup\":
\"true\", \"DeleteStackVolume\":\"true\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteEbsVolParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3e3h8u0sp5z80" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeleteEbsVolParams.json
   ```

2. Modify and save the DeleteEbsVolParams file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-DeleteEBSVolumes",
  "Region": "us-east-1",
  "Parameters": {
    "VolumeIds": [
      "vol-01234567891234501",
      "vol-01234567891234502"
    ],
    "CreateBackup": [
      true
    ],
    "DeleteStackVolume": [
      true
    ]
  }
}
```

3. Output the RFC template JSON file to a file; this example names it DeleteEbsVolRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteEbsVolRfc.json
```

4. Modify and save the DeleteEbsVolRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-3e3h8u0sp5z80",
"Title":                "EBS-Volumes-Delete-RFC"
}
```

5. Create the RFC, specifying the DeleteEbsVolRfc file and the DeleteEbsVolParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteEbsVolRfc.json  --execution-
parameters file://DeleteEbsVolParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS volumes, see Amazon Elastic Block Store.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3e3h8u0sp5z80.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-DeleteEBSVolumesV2",
  "Region": "us-east-1",
  "Parameters": {
    "VolumeIds": [
      "vol-01234567891234501",
      "vol-01234567891234502",
      "vol-01234567891234503",
      "vol-01234567891234504",
      "vol-01234567891234505",
      "vol-01234567891234506",
      "vol-01234567891234507",
      "vol-01234567891234508",
      "vol-01234567891234509",
      "vol-01234567891234510"
    ],
    "CreateBackup": true,
    "DeleteStackVolume": true
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-DeleteEBSVolumesV2",
  "Region": "us-east-1",
  "Parameters": {
    "VolumeIds": [
      "vol-01234567891234501",
      "vol-01234567891234502",
      "vol-01234567891234503",
      "vol-01234567891234504",
      "vol-01234567891234505",
      "vol-01234567891234506",
      "vol-01234567891234507",
      "vol-01234567891234508",
```

```
      "vol-01234567891234509",
      "vol-01234567891234510",
      "vol-01234567891234511",
      "vol-01234567891234512",
      "vol-01234567891234513",
      "vol-01234567891234514",
      "vol-01234567891234515",
      "vol-01234567891234516",
      "vol-01234567891234517",
      "vol-01234567891234518",
      "vol-01234567891234519",
      "vol-01234567891234520"
    ],
    "CreateBackup": true,
    "DeleteStackVolume": true
  }
}
```

EBS Volume | Detach

Detach an EBS volume from an EC2 instance. This change type provides an option that attempts to remediate drift in the CloudFormation stack where the volume is being detached, but that option, RemediateStackDrift, does not work on volumes created using the CloudFormation ingest change type (ct-36cn2avfrrj9v).

Full classification: Management | Advanced stack components | EBS Volume | Detach

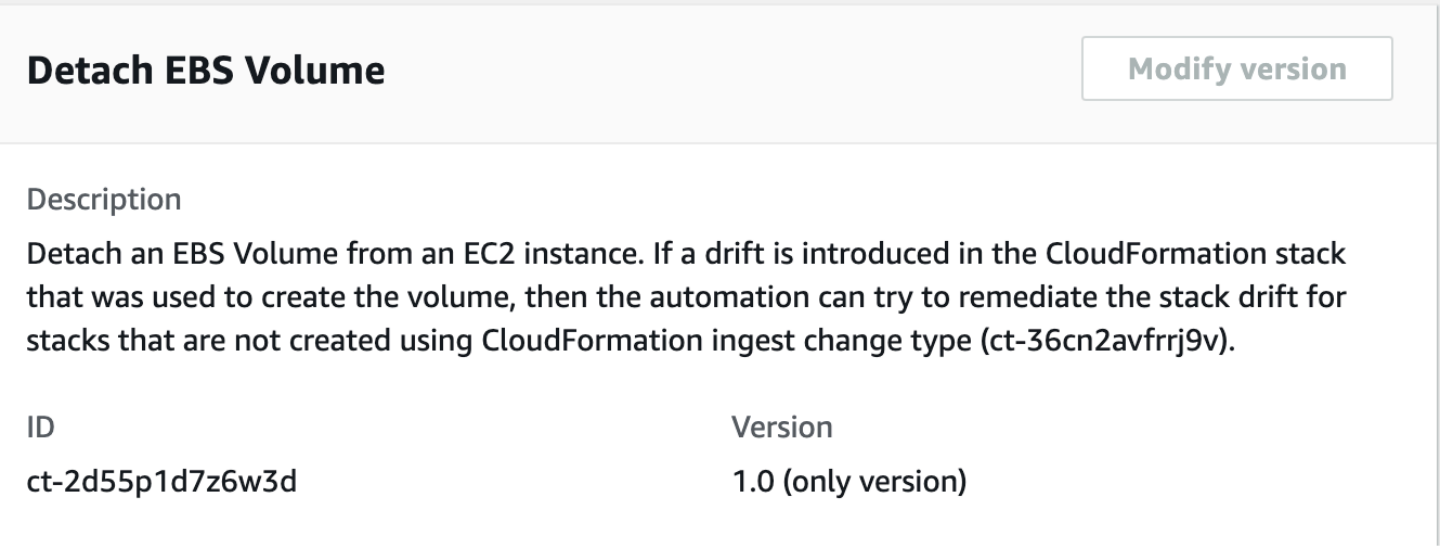
Change Type Details

Change type ID	ct-2d55p1d7z6w3d
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Detach EBS volume

Detaching EBS Volumes with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Detaching EBS Volumes with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2d55p1d7z6w3d" --change-type-version
 "1.0" --title "Detach EBS Volume" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-DetachEBSVolume\",\"Region\":\"us-east-1\",\"Parameters\":
{\"VolumeId\":[\"vol-1234567890abcdef0\"],\"RemediateStackDrift\":[\"False\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DetachEbsVolParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2d55p1d7z6w3d" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DetachEbsVolParams.json
   ```

2. Modify and save the DetachEbsVolParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName" : "AWSManagedServices-DetachEBSVolume",
     "Region" : "us-east-1",
     "Parameters" : {
       "VolumeId" : [
         "vol-1234567890abcdef0"
       ],
       "RemediateStackDrift" : [
         "False"
       ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it DetachEbsVolRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DetachEbsVolRfc.json
   ```

4. Modify and save the DetachEbsVolRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2d55p1d7z6w3d",
"Title":                "EBS-Volumes-Detach-RFC"
}
```

5. Create the RFC, specifying the DetachEbsVolRfc file and the DetachEbsVolParams file:

```
aws amscm create-rfc --cli-input-json file://DetachEbsVolRfc.json  --execution-
parameters file://DetachEbsVolParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS volumes, see Amazon Elastic Block Store.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2d55p1d7z6w3d.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-DetachEBSVolume",
  "Region" : "us-east-1",
  "Parameters" : {
    "VolumeId" : [
      "vol-1234567890abcdef0"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-DetachEBSVolume",
  "Region" : "us-east-1",
```

```
  "Parameters" : {
    "VolumeId" : [
      "vol-1234567890abcdef0"
    ],
    "RemediateStackDrift" : [
      "False"
    ]
  }
}
```

EBS Volume | Encrypt EBS By Default

Set Amazon Elastic Block Store (EBS) to enforce the encryption. After you enable encryption by default, the EBS volumes that you create and snapshot copies are always encrypted, either using the KMS key configured as default for EBS encryption or the key that you specified when you created each volume.

Full classification: Management | Advanced stack components | EBS Volume | Encrypt EBS by default

Change Type Details

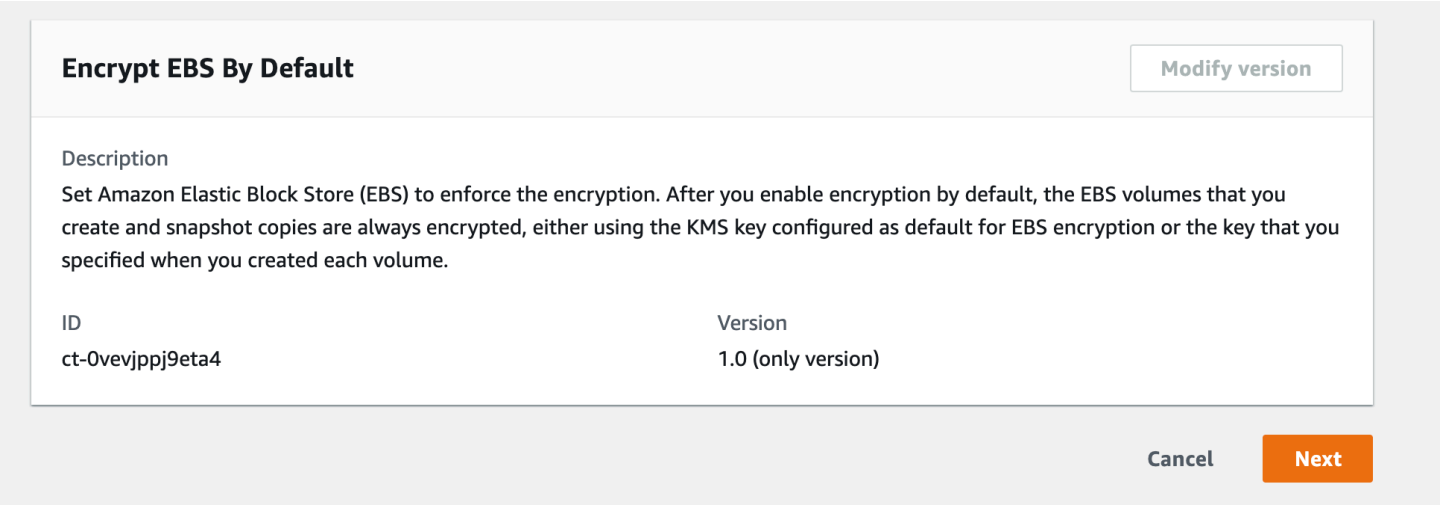
Change type ID	ct-0vevjppj9eta4
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Encrypt EBS volumes by default

Set default EBS volume encryption for EC2 instances with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Set default EBS volume encryption for EC2 instances with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0vevjppj9eta4" --change-type-version
 "1.0" --title "Encrypt EBS by default" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-EncryptEBSByDefault\",\"Region\":\"us-east-1\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it EncryptEbsByDefaultParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0vevjppj9eta4"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    EncryptEbsByDefaultParams.json
   ```

2. Modify and save the EncryptEbsByDefaultParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-EncryptEBSByDefault",
     "Region": "us-east-1"
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it EncryptEbsByDefaultRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > EncryptEbsByDefaultRfc.json
   ```

4. Modify and save the EncryptEbsByDefaultRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-0vevjppj9eta4",
     "Title": "Encrypt EBS by default"
   }
   ```

5. Create the RFC, specifying the EncryptEbsByDefaultRfc file and the EncryptEbsByDefaultParams file:

   ```
   aws amscm create-rfc --cli-input-json file://EncryptEbsByDefaultRfc.json  --
   execution-parameters file://EncryptEbsByDefaultParams.json
   ```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> After you enable encryption by default, the EBS volumes that you create are always encrypted, either using the default AWS KMS key or the KMS key that you specified when you created each volume.
> This CT can only run in Networking and Shared Services multi-account landing zone accounts.

To learn more about doing this, see enable-ebs-encryption-by-default.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0vevjppj9eta4.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-EncryptEBSByDefault",
  "Region" : "us-east-1"
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-EncryptEBSByDefault",
  "Region" : "us-east-1"
}
```

EBS Volume | Modify

Modify EBS Volumes that are not attached to an EC2 instance in an Auto Scaling group. If you resize the volume, then you may need to extend the OS file system on the volume to use any newly

allocated space. If a drift is introduced in the CloudFormation stack that was used to create the volume, then the automation can try to remediate the stack drift for stacks that are not created using CloudFormation ingest change type (ct-36cn2avfrrj9v).

Full classification: Management | Advanced stack components | EBS Volume | Modify

Change Type Details

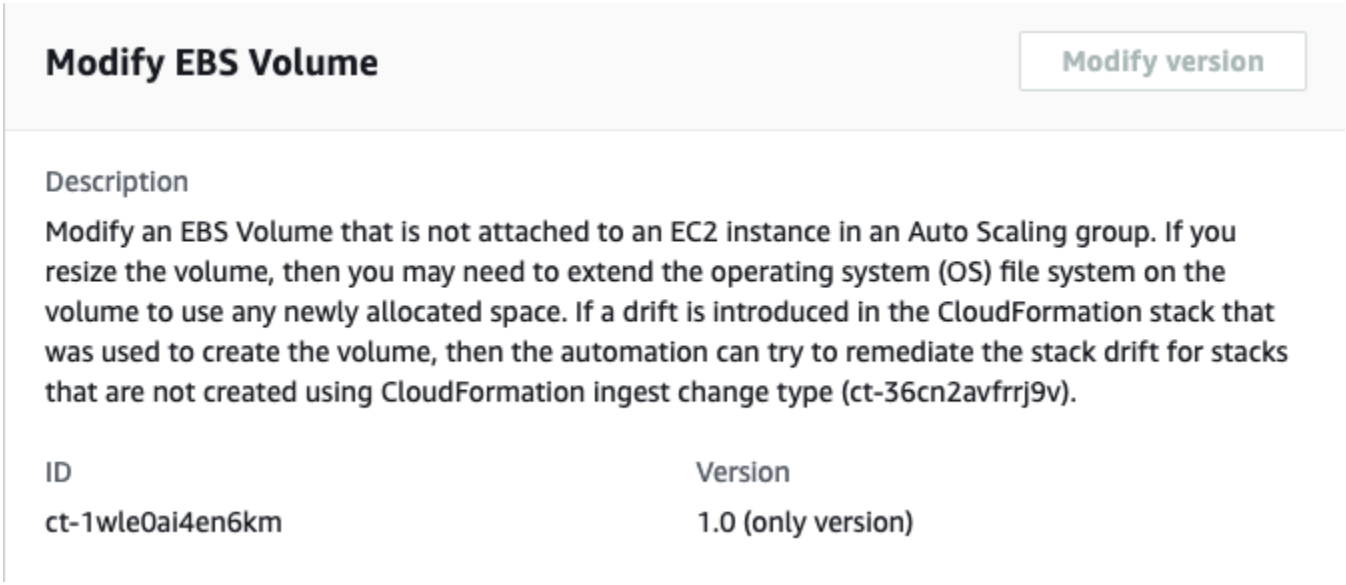
Change type ID	ct-1wle0ai4en6km
Current version	2.0
Expected execution duration	280 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Modify EBS volume

Modifying an EBS Volume with the Console

Screenshot of this change type, in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Modifying an EBS Volume with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1wle0ai4en6km" --change-type-version
 "2.0" --title "Modify EBS Volume" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ModifyEBSVolumes\",\"Region\":\"us-east-1\",\"Parameters
\":{\"VolumeIds\":[\"vol-1234567890abcdef1\",\"vol-1234567890abcdef2\",
\"vol-1234567890abcdef3\",\"vol-1234567890abcdef4\",\"vol-1234567890abcdef5\"],
\"CreateSnapshot\":[\"False\"],\"VolumeType\":[\"gp3\"],\"VolumeSize\":[\"40\"],\"Iops
\":[\"3000\"],\"Throughput\":[\"200\"],\"RemediateStackDrift\":[\"False\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it ModifyEBSVolumeParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-1wle0ai4en6km"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 ModifyEBSVolumeParams.json
```

2. Modify and save the ModifyEBSVolumeParams file.

```
    {
  "DocumentName" : "AWSManagedServices-ModifyEBSVolumes",
  "Region" : "us-east-1",
  "Parameters" : {
    "VolumeIds" : [
            "vol-1234567890abcdef1",
            "vol-1234567890abcdef2",
            "vol-1234567890abcdef3",
            "vol-1234567890abcdef4",
            "vol-1234567890abcdef5"
        ],
    "CreateSnapshot" : [
      "False"
    ],
    "VolumeType" : [
      "gp3"
    ],
    "VolumeSize" : [
      "40"
    ],
    "Iops" : [
      "3000"
    ],
    "Throughput" : [
      "200"
    ],
    "RemediateStackDrift" : [
      "False"
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it ModifyEBSVolumeRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ModifyEBSVolumeRfc.json
```

4. Modify and save the ModifyEBSVolumeRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "2.0",
  "ChangeTypeId": "ct-1wle0ai4en6km",
  "Title": "Modify EBS Volume"
}
```

5. Create the RFC, specifying the ModifyEBSVolumeRfc file and the ModifyEBSVolumeParams file:

```
aws amscm create-rfc --cli-input-json file://ModifyEBSVolumeRfc.json --execution-
parameters file://ModifyEBSVolumeParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EBS, see Amazon Elastic Block Store (EBS).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1wle0ai4en6km.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-ModifyEBSVolumes",
  "Region": "us-east-1",
  "Parameters": {
    "VolumeIds": [
      "vol-1234567890abcdef0"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-ModifyEBSVolumes",
  "Region": "us-east-1",
  "Parameters": {
    "VolumeIds": [
      "vol-01234567891234501",
      "vol-01234567891234502",
      "vol-01234567891234503",
      "vol-01234567891234504",
      "vol-01234567891234505",
      "vol-01234567891234506",
      "vol-01234567891234507",
      "vol-01234567891234508",
      "vol-01234567891234509",
      "vol-01234567891234510",
      "vol-01234567891234511",
      "vol-01234567891234512",
      "vol-01234567891234513",
      "vol-01234567891234514",
      "vol-01234567891234515",
      "vol-01234567891234516",
      "vol-01234567891234517",
      "vol-01234567891234518",
      "vol-01234567891234519",
      "vol-01234567891234520"
    ],
    "CreateSnapshot": [
      "False"
    ],
    "VolumeType": [
      "gp3"
    ],
    "VolumeSize": [
      "40"
    ],
    "Iops": [
      "3000"
    ],
    "Throughput": [
      "200"
    ],
    "RemediateStackDrift": [
```

```
      "False"
    ]
  }
}
```

EBS Volume | Update

Modify the properties of an existing Elastic Block Store (EBS) volume stack created using CT id ct-16xg8qguovg2w, version 1.0. No service interruption is expected during the update.

Full classification: Management | Advanced stack components | EBS Volume | Update

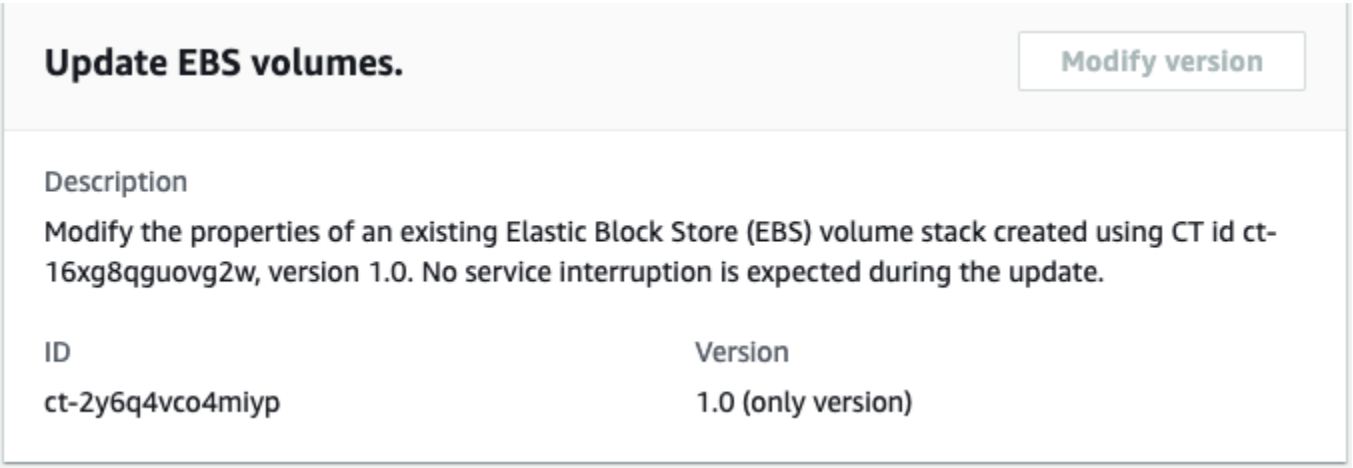
Change Type Details

Change type ID	ct-2y6q4vco4miyp
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update EBS volume

Updating EBS Volumes with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating EBS Volumes with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2y6q4vco4miyp" --change-type-
version "1.0" --title "Update EBS Volume" --execution-parameters "{\"VpcId\":
 \"vpc-0a60eb65b4EXAMPLE\",\"StackId\": \"stack-1234567890abcdef0\",\"Parameters\":
 {\"Volume1Iops\": \"3500\",\"Volume1Throughput\": \"200\",\"Volume2Type\": \"gp3\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateEbsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2y6q4vco4miyp" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateEbsParams.json
   ```

2. Modify and save the UpdateEbsParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "VpcId":   "vpc-0a60eb65b4EXAMPLE",
     "StackId": "stack-1234567890abcdef0",
     "Parameters": {
           "Volume1Iops": "3500",
            "Volume1Throughput": "200",
            "Volume2Type": "gp3"
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it UpdateEbsRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateEbsRfc.json
   ```

4. Modify and save the UpdateEbsRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   ```

```
"ChangeTypeId":         "ct-2y6q4vco4miyp",
"Title":                "Update EBS volume"
}
```

5. Create the RFC, specifying the UpdateEbsRfc file and the UpdateEbsParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateEbsRfc.json  --execution-
parameters file://UpdateEbsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For detailed information on creating RFCs, see Creating a Request for change (RFC); for an explanation of common RFC parameters, see RFC common parameters.

To learn more about Amazon EBS, see Amazon Elastic Block Store (EBS).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2y6q4vco4miyp.

Example: Required Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {}
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {
    "Volume1Iops": "3000",
    "Volume1Throughput": "125",
```

```
    "Volume1Size": "100",

EC2 Instance Stack | Associate Private IP Addresses (Review Required)

Associate one or more secondary private IP addresses to the specified network interface.

Full classification: Management | Advanced stack components | EC2 instance stack | Associate private IP addresses (review required)

Change Type Details

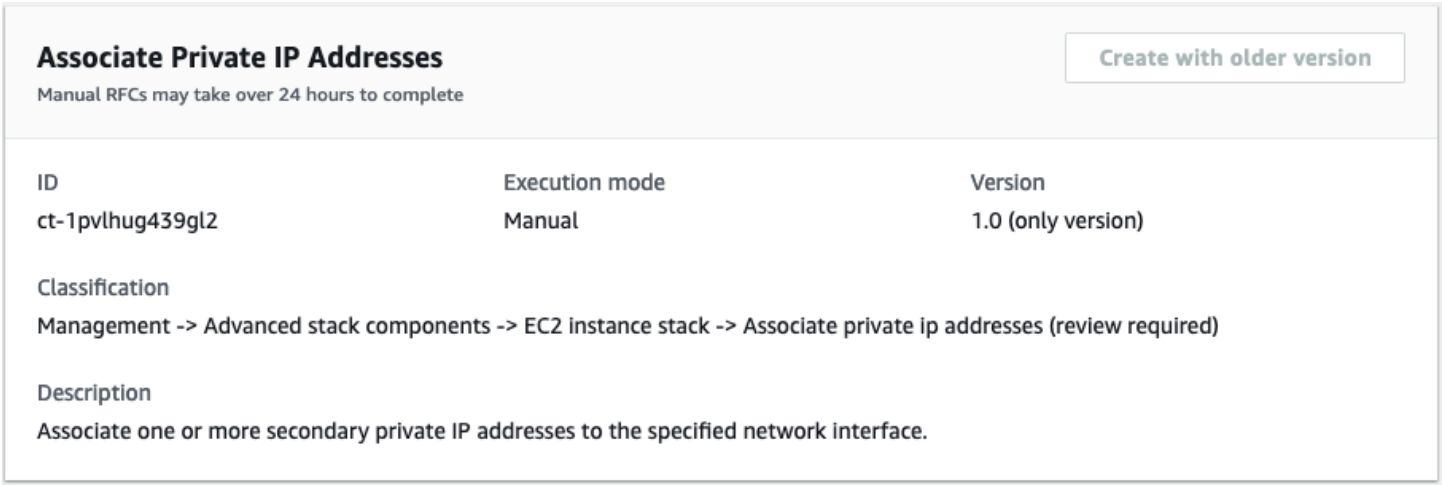
Change type ID	ct-1pvlhug439gl2
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Associate private IP addresses (review required) ct-1pvlhug439gl2

Associate private IP addresses with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating a pre-ingest instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title="Associate Private IP Addresses" --description="Associate
 Private IP Addresses" --ct-id="ct-1pvlhug439gl2" --ct-version="1.0" --input-
params="{\"NetworkInterfaceId\":\"eni-0123456789abcdef0\",\"PrivateIpAddresses\":
[\"10.0.0.82\",\"10.0.0.83\"]}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it AssociatePrivateIPAddressesParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1pvlhug439gl2"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    AssociatePrivateIPAddressesParams.json
   ```

2. Modify and save the AssociatePrivateIPAddressesParams file. For example, you can replace the contents with something like this:

   ```
   {
       "NetworkInterfaceId": "eni-0123456789abcdef0",
       "PrivateIpAddresses": ["10.0.0.82", "10.0.0.83"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it AssociatePrivateIPAddressesRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > AssociatePrivateIPAddressesRfc.json
   ```

4. Modify and save the AssociatePrivateIPAddressesRfc.json file. For example, you can replace the contents with something like this:.

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-1pvlhug439gl2",
     "Title": "Associate Private IP Addresses"
   ```

```
}
```

5. Create the RFC, specifying the AssociatePrivateIPAddressesRfc file and the AssociatePrivateIPAddressesParams file:

```
aws amscm create-rfc --cli-input-json file://AssociatePrivateIPAddressesRfc.json
 --execution-parameters file://AssociatePrivateIPAddressesParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about Amazon EC2 IP addresses, see Amazon EC2 instance IP addressing.

If needed, see EC2 instance stack create fail.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1pvlhug439gl2.

Example: Required Parameters

```
{
    "NetworkInterfaceId": "eni-0123456789abcdef0",
    "PrivateIpAddresses": ["10.0.0.82"]
}
```

Example: All Parameters

```
{
    "NetworkInterfaceId": "eni-0123456789abcdef0",
    "PrivateIpAddresses": ["10.0.0.82", "10.0.0.83"],
    "Priority": "High"
}
```

EC2 Instance Stack | Change Hostname (Linux)

Change the hostname of an EC2 Linux instance. If no hostname is provided, then the hostname is randomized.

Full classification: Management | Advanced stack components | EC2 instance stack | Change hostname (Linux)

Change Type Details

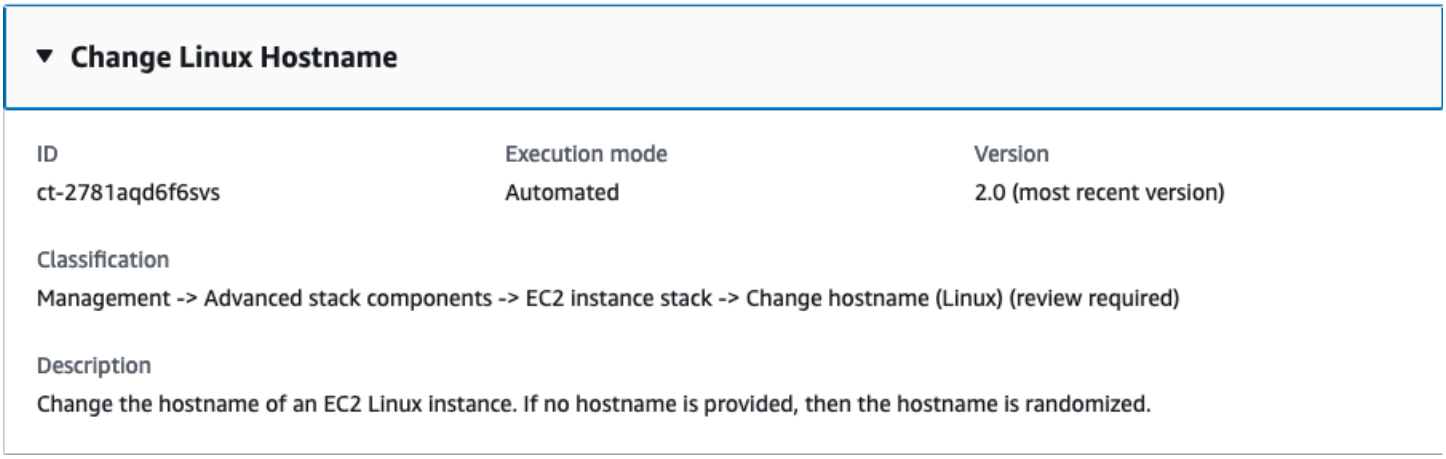
Change type ID	ct-2781aqd6f6svs
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Change hostname (Linux)

Changing the hostname for a Linux EC2 instance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Changing the hostname for a Linux EC2 instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2781aqd6f6svs" --change-type-version
 "2.0" --title "Change Linux hostname" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-ChangeHostname\",\"Region\": \"us-east-1\",\"Parameters\":
 {\"InstanceId\": [\"i-1234567890abcdef0\"],\"Hostname\": [\"01234567890abcd\"],
\"Platform\": [\"linux\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it ChangeLinuxHostnameParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2781aqd6f6svs"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ChangeLinuxHostnameParams.json
   ```

2. Modify and save the ChangeLinuxHostnameParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-ChangeHostname",
  "Region": "us-east-1",
  "Parameters": {
    "InstanceId": [ "i-1234567890abcdef0" ],
    "Hostname": [ "01234567890abcd" ],
    "Platform" : ["linux"]
  }
}}
```

3. Output the RFC template to a file in your current folder; this example names it ChangeLinuxHostnameRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ChangeLinuxHostnameRfc.json
```

4. Modify and save the ChangeLinuxHostnameRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "2.0",
  "ChangeTypeId": "ct-2781aqd6f6svs",
  "Title": "Change Linux Hostname"
}
```

5. Create the RFC, specifying the ChangeLinuxHostnameRfc file and the ChangeLinuxHostnameParams file:

```
aws amscm create-rfc --cli-input-json file://ChangeLinuxHostnameRfc.json  --
execution-parameters file://ChangeLinuxHostnameParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is at a new version, 2.0, and is now automated (version 1.0 was execution mode=manual). There are additional parameters, notably **DocumentName** and **Platform**.

To learn more about doing this, see Changing the hostname of your Amazon Linux instance.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2781aqd6f6svs.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-ChangeHostname",
  "Region" : "us-east-1",
  "Parameters" : {
    "InstanceId" : [
      "i-1234567890abcdef0"
    ],
    "Platform" : [
      "linux"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-ChangeHostname",
  "Region" : "us-east-1",
  "Parameters" : {
    "InstanceId" : [
      "i-1234567890abcdef0"
    ],
    "Hostname" : [
      "testhostname"
    ],
    "Platform" : [
      "linux"
    ]
  }
}
```

EC2 Instance Stack | Change Hostname (Windows)

Change the hostname of an EC2 Windows instance. Note that the instance will be rebooted.

Full classification: Management | Advanced stack components | EC2 instance stack | Change hostname (Windows)

Change Type Details

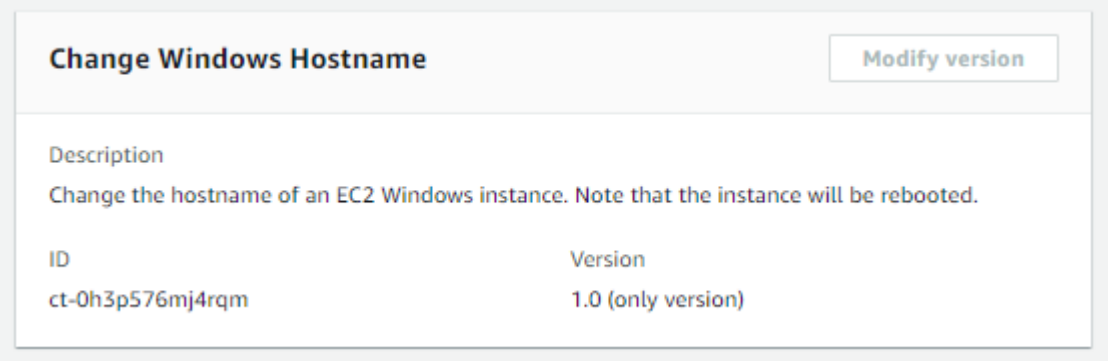
Change type ID	ct-0h3p576mj4rqm
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Change hostname (Windows)

Changing the hostname for a Windows EC2 instance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Changing the hostname for a Windows EC2 instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0h3p576mj4rqm" --change-type-version
 "1.0" --title "Change Windows Hostname" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-ChangeHostname\",\"Region\":\"us-east-1\",\"Parameters\":
{\"InstanceId\":[\"i-12345678901234567\"],\"Hostname\":[\"myhost\"],\"Platform\":
[\"windows\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it ChangeWindowsHostnameParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0h3p576mj4rqm"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ChangeWindowsHostnameParams.json
   ```

2. Modify and save the ChangeWindowsHostnameParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName" : "AWSManagedServices-ChangeHostname",
   ```

```
  "Region" : "us-east-1",
  "Parameters" : {
    "InstanceId" : [
      "i-12345678901234567"
    ],
    "Hostname" : [
      "myhost"
    ],
    "Platform" : [
      "windows"
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it ChangeWindowsHostnameRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ChangeWindowsHostnameRfc.json
```

4. Modify and save the ChangeWindowsHostnameRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-0h3p576mj4rqm",
  "Title": "Change Windows Hostname"
}
```

5. Create the RFC, specifying the ChangeWindowsHostnameRfc file and the ChangeWindowsHostnameParams file:

```
aws amscm create-rfc --cli-input-json file://ChangeWindowsHostnameRfc.json  --
execution-parameters file://ChangeWindowsHostnameParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about EC2 for Windows, see the EC2 User Guide for Windows.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0h3p576mj4rqm.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-ChangeHostname",
  "Region" : "us-east-1",
  "Parameters" : {
    "InstanceId" : [
      "i-12345678901234567"
    ],
    "Hostname" : [
      "testhostname"
    ],
    "Platform" : [
      "windows"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-ChangeHostname",
  "Region" : "us-east-1",
  "Parameters" : {
    "InstanceId" : [
      "i-12345678901234567"
    ],
    "Hostname" : [
      "testhostname"
    ],
    "Platform" : [
      "windows"
    ]
  }
}
```

EC2 Instance Stack | Change Time Zone

Change the time zone of an EC2 instance. To reboot the EC2 instance after changing the time zone, set Reboot = true.

Full classification: Management | Advanced stack components | EC2 instance stack | Change time zone

Change Type Details

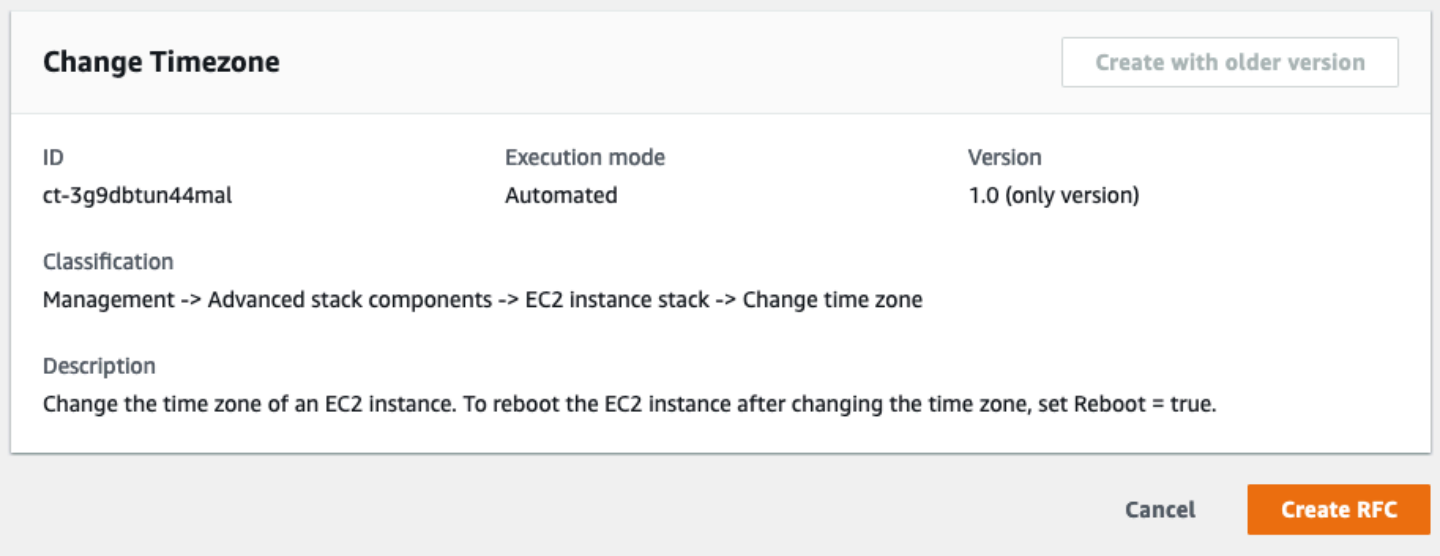
Change type ID	ct-3g9dbtun44mal
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Change time zone on instance

Changing an EC2 instance time zone with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Changing an EC2 instance time zone with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  create-rfc --change-type-id "ct-3g9dbtun44mal" --change-type-version
 "1.0" --title "Change time zone" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-SetInstanceTimeZone\",\"Region\":\"us-east-1\",\"Parameters\":
{\"InstanceId\":\"i-1234567890abcdef0\",\"Reboot\":\"True\",\"TimeZone\":\"Australia/
Sydney (AUS Eastern Standard Time)\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it ChangeEC2TimezoneParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3g9dbtun44mal"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ChangeEC2TimezoneParams.json
   ```

2. Modify and save the ChangeEC2TimezoneParams file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-SetInstanceTimeZone",
       "Region": "us-east-1",
       "Parameters": {
           "InstanceId": "i-1234567890abcdef0",
           "Reboot": "True",
           "TimeZone": "Australia/Sydney (AUS Eastern Standard Time)"
       }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it ChangeEC2TimezoneRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ChangeEC2TimezoneRfc.json
   ```

4. Modify and save the ChangeEC2TimezoneRfc.json file. For example, you can replace the contents with something like this:.

   ```
   {
   ```

```
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3g9dbtun44mal",
  "Title": "Change EC2 Instance Time Zone"
}
```

5. Create the RFC, specifying the ChangeEC2TimezoneRfc file and the ChangeEC2TimezoneParams file:

```
aws amscm create-rfc --cli-input-json file://ChangeEC2TimezoneRfc.json  --
execution-parameters file://ChangeEC2TimezoneParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about Amazon EC2, see Amazon Elastic Compute Cloud Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3g9dbtun44mal.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-SetInstanceTimeZone",
  "Region": "us-east-1",
  "Parameters": {
    "InstanceId": "i-1234567890abcdef0",
    "Reboot": "False",
    "TimeZone": "Australia/Sydney (AUS Eastern Standard Time)"
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-SetInstanceTimeZone",
  "Region": "us-east-1",
```

```
  "Parameters": {
    "InstanceId": "i-1234567890abcdef0",
    "Reboot": "True",
    "TimeZone": "Australia/Sydney (AUS Eastern Standard Time)"
  }
}
```

EC2 Instance Stack | Enable Detailed Monitoring (Review Required)

Enable detailed monitoring for the specified EC2 instance. Detailed monitoring incurs a charge. EC2 detailed monitoring provides more frequent metrics, published at one-minute intervals, instead of the five-minute intervals used in Amazon EC2 basic monitoring.

Full classification: Management | Advanced stack components | EC2 instance stack | Enable detailed monitoring (review required)

Change Type Details

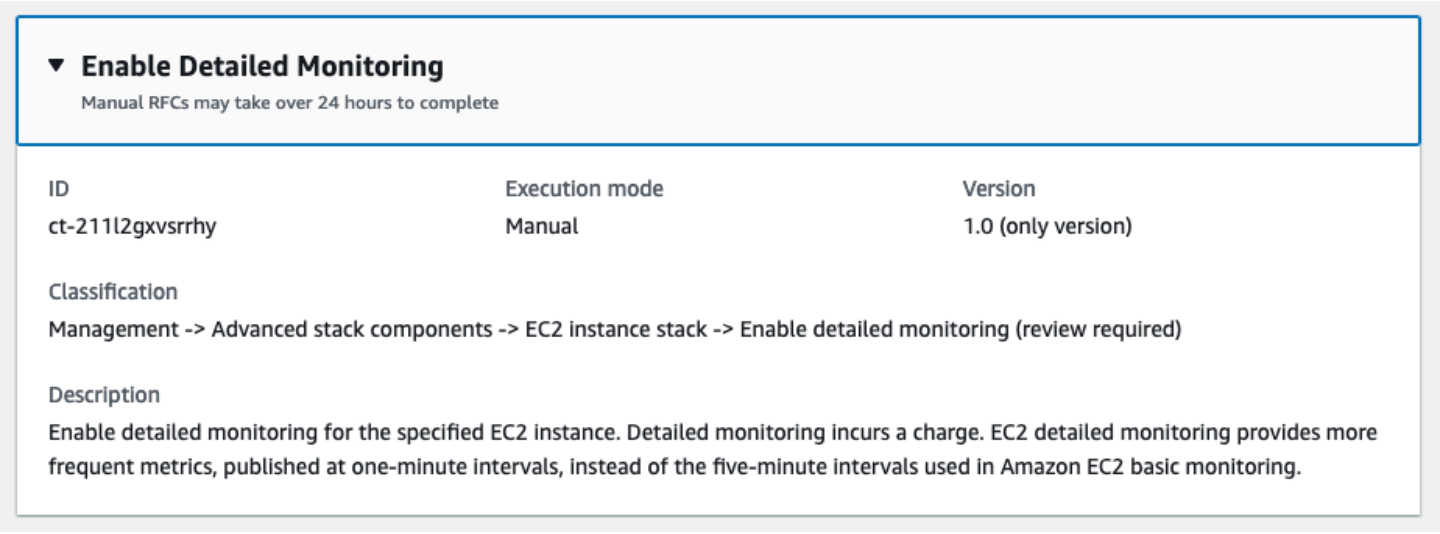
Change type ID	ct-211l2gxvsrrhy
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Enable Detailed Monitoring

Enable detailed monitoring with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Enable detailed monitoring with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-211l2gxvsrrhy" --change-type-version "1.0"
 --title "Enable Detailed Monitoring" --execution-parameters "{\"InstanceIds\":
 [\"i-1234567890abcdef0\",\"i-1234567890abcdef1\"]}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it EnableDetailedMonitoringParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-211l2gxvsrrhy"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    EnableDetailedMonitoringParams.json
   ```

2. Modify and save the EnableDetailedMonitoringParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
       "InstanceIds": ["i-0cc489fa851c31a21","i-0cc489fa851c31a22"]
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it EnableDetailedMonitoringRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > EnableDetailedMonitoringRfc.json
   ```

4. Modify and save the EnableDetailedMonitoringRfc file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-211l2gxvsrrhy",
     "Title": "Enable Detailed Monitoring"
   }
   ```

5. Create the RFC, specifying the EnableDetailedMonitoringRfc file and the EnableDetailedMonitoringParams file:

```
aws amscm create-rfc --cli-input-json file://EnableDetailedMonitoringRfc.json  --
execution-parameters file://EnableDetailedMonitoringParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about Amazon EC2, including size recommendations, see Amazon Elastic Compute Cloud Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-211l2gxvsrrhy.

Example: Required Parameters

```
{
  "InstanceIds": ["i-1234567890abcdef0","i-1234567890abceef1"]
}
```

Example: All Parameters

```
{
  "InstanceIds": ["i-1234567890abcdef0","i-1234567890abceef1"]
}
```

EC2 Instance Stack | Encrypt Instance Volumes

Encrypt Elastic Block Store (EBS) volumes attached to an EC2 instance

Full classification: Management | Advanced stack components | EC2 instance stack | Encrypt instance volumes

Change Type Details

Change type ID	ct-0hahohe17csnc

Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required

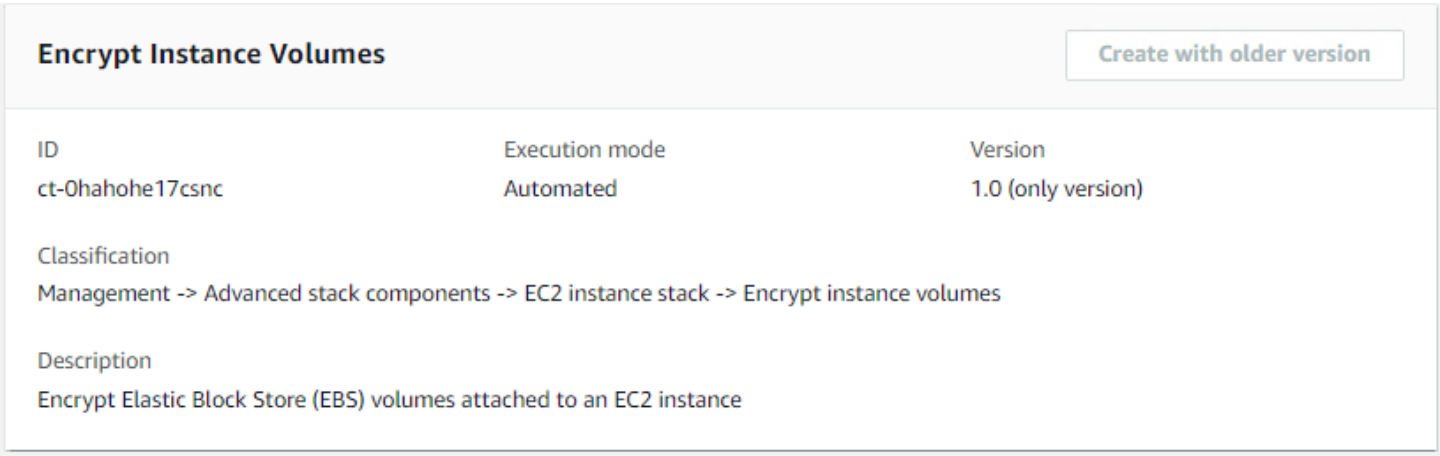
Additional Information

Encrypt instance

Encrypting EC2 instances with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Encrypting EC2 instances with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0hahohe17csnc" --change-type-version
 "1.0" --title "AWSManagedServices-EncryptInstanceVolumes" --execution-parameters
 "{\"DocumentName\": \"AWSManagedServices-EncryptInstanceVolumes\",\"Region
\": \"us-east-1\",\"Parameters\": {\"InstanceId\": [\"i-0a458848bc91a1b7b\"],
 \"VolumeIds\": [\"vol-02f576d0e8c5c51e8\", \"vol-0090e02379b9880d9\"], \"KMSKeyId\":
 [\"7103a217-2489-481e-976c-0375efc5f606\"], \"DeleteStaleNonEncryptedSnapshotBackups
\": [\"False\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it EncryptEC2sParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0hahohe17csnc" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > EncryptEC2sParams.json
   ```

2. Modify and save the EncryptEC2sParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-EncryptInstanceVolumes",
     "Region": "us-east-1",
     "Parameters": {
       "InstanceId": [
   ```

```
      "i-0a458848bc91a1b7b"
    ],
    "VolumeIds": [
      "vol-02f576d0e8c5c51e8",
      "vol-0090e02379b9880d9"
    ],
    "KMSKeyId": [
      "7103a217-2489-481e-976c-0375efc5f606"
    ],
    "DeleteStaleNonEncryptedSnapshotBackups": [
      "False"
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it EncryptEC2sRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > EncryptEC2sRfc.json
```

4. Modify and save the EncryptEC2sRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0hahohe17csnc",
"Title":                "EC2-Encrypt-RFC"
}
```

5. Create the RFC, specifying the EncryptEC2sRfc file and the EncryptEC2sParams file:

```
aws amscm create-rfc --cli-input-json file://EncryptEC2sRfc.json  --execution-
parameters file://EncryptEC2sParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about Amazon EC2, including size recommendations, see Amazon Elastic Compute Cloud Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0hahohe17csnc.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-EncryptInstanceVolumes",
  "Region" : "us-east-1",
  "Parameters": {
    "InstanceId": ["i-1234567890abcdef0"],
    "VolumeIds": ["vol-1234567890abcdef0", "vol-1234567890abcdef1"],
    "KMSKeyId": ["1234abcd-12ab-34cd-56ef-1234567890ab"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-EncryptInstanceVolumes",
  "Region" : "us-east-1",
  "Parameters": {
    "InstanceId": ["i-1234567890abcdef0"],
    "VolumeIds": ["vol-1234567890abcdef0", "vol-1234567890abcdef1"],
    "KMSKeyId": ["mrk-c280f426a06049f0bd3f998242ae2f70"],
    "DeleteStaleNonEncryptedSnapshotBackups": ["False"]
  }
}
```

EC2 Instance Stack | Gather Log4j Information

Generates a report identifying Log4j2 occurrences on the specified EC2 instances. This is a best-effort report and some occurrences may go undetected from the report.

Full classification: Management | Advanced stack components | EC2 instance stack | Gather log4j information

Change Type Details

Change type ID	ct-19f40lfm5umy8

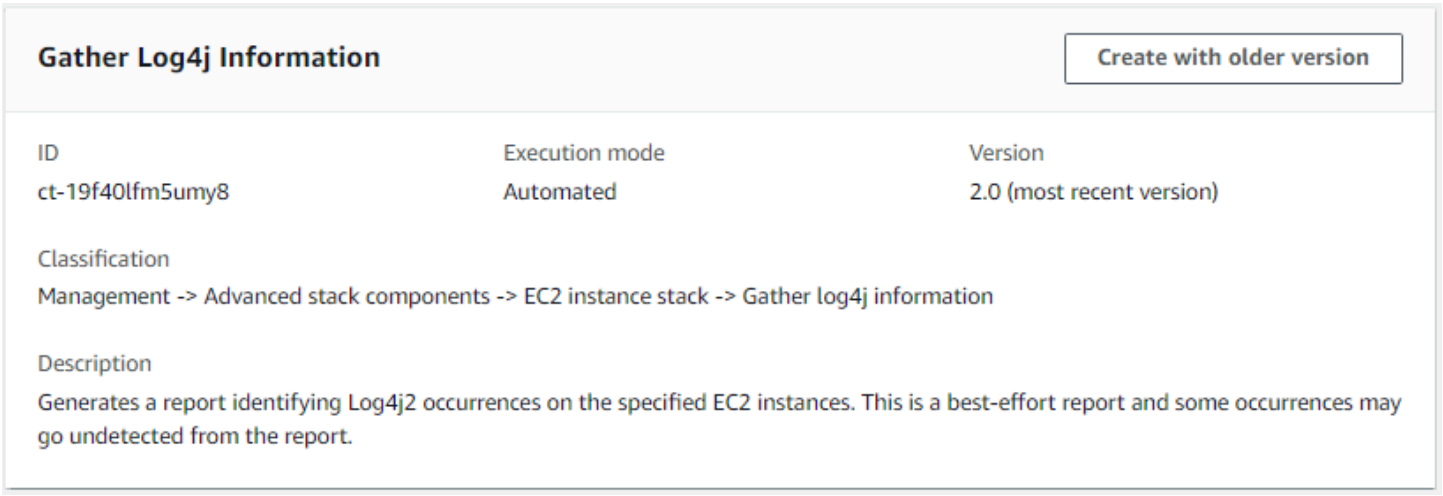
Current version	2.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update Other Other CTs

Gather Log4j Info on multiple EC2 instances with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Gather Log4j Info on multiple EC2 instances with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Version 2.0:

Scan all instances:

```
aws amscm create-rfc --change-type-id "ct-19f40lfm5umy8" --change-type-version
 "2.0" --title "Log4j Investigation" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-GatherLog4jInformation\",\"Region\":\"us-east-1\",\"Parameters\":
{\"S3Bucket\":[\"s3://BUCKET_NAME\"]},\"TargetParameterName\": \"InstanceId\",\"Targets
\": [{\"Key\": \"AWS::EC2::Instance\",\"Values\": [\"*\"]}],\"MaxConcurrency\": \"10\",
\"MaxErrors\": \"100%\"}"
```

Scan a list of instances:

```
aws amscm create-rfc --change-type-id "ct-19f40lfm5umy8" --change-type-version
 "2.0" --title "Log4j Investigation" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-GatherLog4jInformation\",\"Region\":\"us-east-1\",\"Parameters\":
{\"S3Bucket\":[\"s3://BUCKET_NAME\"]},\"TargetParameterName\": \"InstanceId\",\"Targets
\": [{\"Key\": \"ParameterValues\",\"Values\": [\"INSTANCE_ID_1\",\"INSTANCE_ID_2\",
\"INSTANCE_ID_3\",\"INSTANCE_ID_4\",\"INSTANCE_ID_5\"]}],\"MaxConcurrency\": \"10\",
\"MaxErrors\": \"100%\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it GatherLog4jInfoParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-19f40lfm5umy8"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 GatherLog4jInfoParams.json
```

2. Modify and save the GatherLog4jInfoParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   Version 2.0:

   Scan all instances:

```
{
  "DocumentName": "AWSManagedServices-GatherLog4jInformation",
  "Region": "us-east-1",
  "Parameters": {
    "S3Bucket": [
      "s3://BUCKET_NAME"
    ]
  },
  "TargetParameterName": "InstanceId",
  "Targets": [
    {
      "Key": "AWS::EC2::Instance",
      "Values": [
        "*"
      ]
    }
  ],
  "MaxConcurrency": "10",
  "MaxErrors": "100%"
}
```

   Scan a list of instances:

```
{
  "DocumentName": "AWSManagedServices-GatherLog4jInformation",
  "Region": "us-east-1",
  "Parameters": {
    "S3Bucket": [
      "s3://BUCKET_NAME"
    ]
```

```
  },
  "TargetParameterName": "InstanceId",
  "Targets": [
    {
      "Key": "ParameterValues",
      "Values": [
        "INSTANCE_ID_1",
        "INSTANCE_ID_2",
        "INSTANCE_ID_3",
        "INSTANCE_ID_4",
        "INSTANCE_ID_5"
      ]
    }
  ],
  "MaxConcurrency": "10",
  "MaxErrors": "100%"
}
```

3. Output the RFC template to a file in your current folder; this example names it GatherLog4jInfoRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > GatherLog4jInfoRfc.json
```

4. Modify and save the GatherLog4jInfoRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-19f40lfm5umy8",
"Title":                "Log4j Investigation"
}
```

5. Create the RFC, specifying the GatherLog4jInfoRfc file and the GatherLog4jInfoParams file:

```
aws amscm create-rfc --cli-input-json file://GatherLog4jInfoRfc.json  --execution-
parameters file://GatherLog4jInfoParams.json
```

Tips

This change type scans the specified EC2 instance for packages containing an impacted version of the Apache Log4j Java class. This functionality produces a best-effort report, some occurrences may go undetected or mis-identified.

AWS CloudShell is a browser-based shell that makes it easy to securely manage, explore, and interact with your AWS resources. AWS CloudShell is pre-authenticated with your console credentials when you log in. Common development and operations tools are pre-installed, so no local installation or configuration is required. With AWS CloudShell, you can quickly run scripts with the AWS Command Line Interface (AWS CLI), experiment with AWS service APIs using the AWS SDKs, or use a range of other tools to be productive. You can use AWS CloudShell right from your browser at no additional cost.

> **Note**
>
> You can use the CloudShell AWS console from any other, or the closest, AWS Region where it is available, to perform the aggregation. For example, to perform the aggregation of data stored in the Virginia region, open a CloudShell in the "US East(Virginia) us-east-1" AWS Region in the AWS Console and follow the instructions given next.

The report data includes information about Java Archives (JAR Files), found within the specified environment that contain the vulnerable JndiLookup class. AMS recommends upgrading impacted libraries to the latest available version, which can be downloaded directly from Apache at Download Apache Log4j 2. Additionally, we scan for Web Application Resource (WAR), Enterprise Archive (EAR), Jupiter Encrypted XML (JPI), Hemera Technologies (HPI), and ZIP files.

To aggregate all the generated CSV files and build a single report with AWS CloudShell:

1. From any page or AWS Region in the AWS Management Console, open the AWS CloudShell to run the script shown next. Ensure that you are logged into the AWS Management Console with the AWSManagedServicesReadOnlyRole role.

```
# Specify the S3 bucket and AWS region that contains the individual CSV files:
BUCKET_NAME="YOUR BUCKET HERE"
BUCKET_REGION="THE BUCKET REGION HERE"

# Aggregate the CSV files:
mkdir -p log4j-report
```

```
aws s3 cp s3://$BUCKET_NAME/ams/log4j-scan/ ./log4j-report --recursive --include
 "*.csv"
echo "aws_account_id,region,scan_time,instance_id,scan_type,location" > log4j-
report/report.csv
for i in `find log4j-report -type f \( -iname "*.csv" ! -iname "report.csv" \)`; do
 awk 'FNR > 1' $i >> log4j-report/report.csv; done

# Upload the report to the same S3 bucket:
file_name="report_$(date -d "today" +"%Y%m%d%H%M").csv"
aws s3 cp log4j-report/report.csv s3://$BUCKET_NAME/ams/log4j-reports/$file_name

# Open the following URL and select \"Download\" to download the report:
echo "Report uploaded to: https://s3.console.aws.amazon.com/s3/object/$BUCKET_NAME?
region=$BUCKET_REGION&prefix=ams/log4j-reports/$file_name"
```

The script outputs the S3 URL to download the report from.

2. Copy and open the URL and then choose Download

Single-Account Landing Zone: Using the report

If you are working in a single-account landing zone, the AWS CloudShell service is not available. However, you can still leverage the AWS CLI to perform the necessary steps. Follow this documentation, How do I grant my Active Directory users access to the API or AWS CLI with AD FS?, to configure CLI API Access through Active Directory Federation Services (ADFS) using IAM Roles. For Non-ADFS identity provider (IDP) implementations, visit How to Implement a General Solution for Federated API/CLI Access Using SAML 2.0. Using the above options, obtain CLI Credentials for the desired role, the default recommended role is the `Customer_ReadOnly_Role`. Then execute the script in Step 1 to generate the required CSV report.

How to read the report

The report contains the following columns:

- **scan_time**: The time at which the instance scan was performed
- **instance_id**: The EC2 instance ID
- **scan_type**: The type of scan that was performed. For example, if the scan looked at in memory information, the scan_type will be MEMORY. If the filesystem was checked, the scan_type will be FILESYSTEM
- **location**: The path to the match

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-19f40lfm5umy8.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-GatherLog4jInformation",
  "Region": "us-east-1",
  "Parameters": {
    "S3Bucket": [
      "s3://test"
    ]
  },
  "TargetParameterName": "InstanceId",
  "Targets": [
    {
      "Key": "ParameterValues",
      "Values": [
        "i-1234567890abcdef0",
        "i-1234567890abcdef1",
        "i-1234567890abcdef2",
        "i-1234567890abcdef3",
        "i-1234567890abcdef4"
      ]
    }
  ],
  "MaxConcurrency": "10",
  "MaxErrors": "100%"
}
```

EC2 Instance Stack | Reboot

Use to reboot an EC2 instance.

Full classification: Management | Advanced stack components | EC2 instance stack | Reboot

Change Type Details

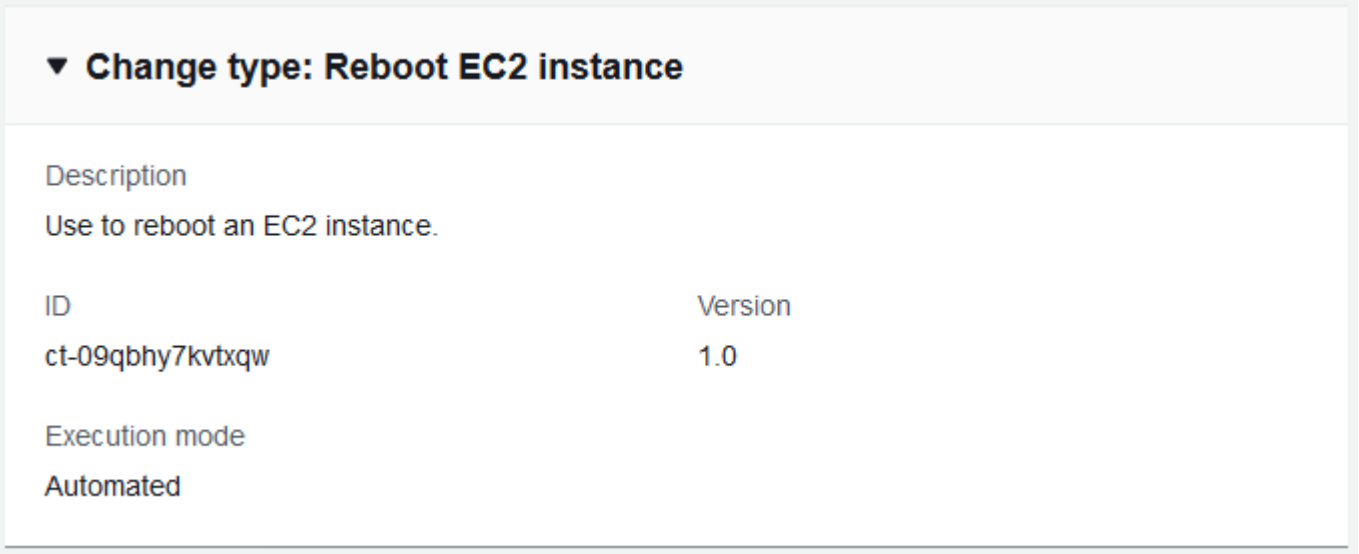
Change type ID	ct-09qbhy7kvtxqw
Current version	1.0
Expected execution duration	30 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Reboot instance

Rebooting an EC2 istance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Rebooting an EC2 instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-02u0hoaa9grat" --change-type-version "1.0" --
title "Reboot My EC2" --execution-parameters "{\"InstanceId\":\"INSTANCE_ID\"}"
```

TEMPLATE CREATE:

1. Output the RFC template to a file in your current folder. This example names it RebootEC2Rfc.json. Note that since there is only one execution parameter for stopping (rebooting, or starting) an instance, the execution parameter can be in the schema JSON file itself and there is no need to create a separate execution parameters JSON file.

   ```
   aws amscm create-rfc --generate-cli-skeleton > StopInstanceRfc.json
   ```

2. Modify and save the RebootEC2Rfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId":         "ct-09qbhy7kvtxqw",
   ```

```
"Title":                "Reboot-My-EC2-RFC",
"TimeoutInMinutes":     60,
"ExecutionParameters":  "{
        \"InstanceId\":\"INSTANCE_ID\"
    }"
}
```

3. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://RebootEC2Rfc.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about EC2, see the EC2 Documentation for your operation system.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-09qbhy7kvtxqw.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

EC2 Instance Stack | Replace Instance Profile

Replace the instance profile of an EC2 instance that is not part of an Auto Scaling group. This change may result in CloudFormation drift for any stacks that have this resource.

Full classification: Management | Advanced stack components | EC2 instance stack | Replace instance profile

Change Type Details

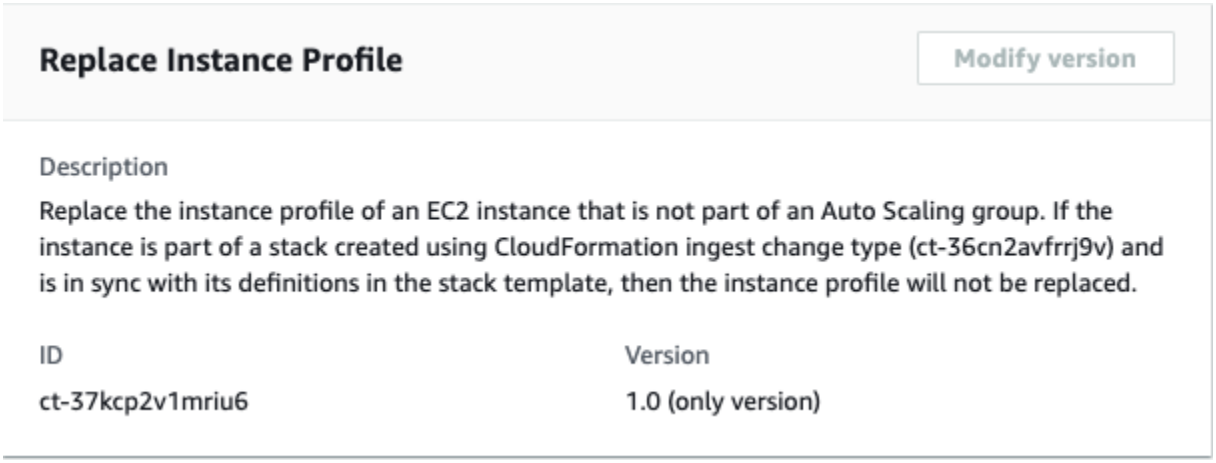
Change type ID	ct-37kcp2v1mriu6
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Replace instance profile

Replacing an EC2 instance profile using the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Replacing an EC2 instance profile using the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-37kcp2v1mriu6" --change-type-version
 "1.0" --title "Replace Instance Profile" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ReplaceInstanceProfile\",\"Region\":\"us-east-1\",\"Parameters
\":{\"InstanceId\":[\"i-12345678901234567\"],\"InstanceProfile\":[\"customer-test-
profile\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it ReplaceEC2InstanceParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-37kcp2v1mriu6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ReplaceEC2InstanceParams.json
   ```

2. Modify and save the ReplaceEC2InstanceParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-ReplaceInstanceProfile",
     "Region": "us-east-1",
   ```

```
  "Parameters": {
    "InstanceId": [
      "i-12345678901234567"
    ],
    "InstanceProfile": [
      "customer-test-profile"
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it ReplaceEC2InstanceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ReplaceEC2InstanceRfc.json
```

4. Modify and save the ReplaceEC2InstanceRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-37kcp2v1mriu6",
"Title":                "Replace Instance Profile"
}
```

5. Create the RFC, specifying the ReplaceEC2InstanceRfc file and the ReplaceEC2InstanceParams file:

```
aws amscm create-rfc --cli-input-json file://ReplaceEC2InstanceRfc.json  --
execution-parameters file://ReplaceEC2InstanceParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information on instance profiles, see Using instance profiles.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-37kcp2v1mriu6.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-ReplaceInstanceProfileV2",
  "Region" : "us-east-1",
  "Parameters" : {
    "InstanceId" : [
      "i-1234567890abcdef0"
    ],
    "InstanceProfile" : [
      "customer-test-profile"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-ReplaceInstanceProfileV2",
  "Region" : "us-east-1",
  "Parameters" : {
    "InstanceId" : [
      "i-1234567890abcdef0"
    ],
    "InstanceProfile" : [
      "customer-test-profile"
    ]
  }
}
```

EC2 Instance Stack | Resize

Resize an existing EC2 instance in your account. The state of the instance can be either 'running' or 'stopped'. If 'running', the instance is stopped during the resize operation and returned to the initial state after the resizing is complete. Before resizing the instance, ensure that the instance's root volume is not an instance store volume. We highly recommended rigorous load and performance testing before, and after, making instance type changes, and that you also consider the pricing changes that result when instances are resized. Please be aware that this change may result in CloudFormation drift for any stacks that have this resource.

Full classification: Management | Advanced stack components | EC2 instance stack | Resize

Change Type Details

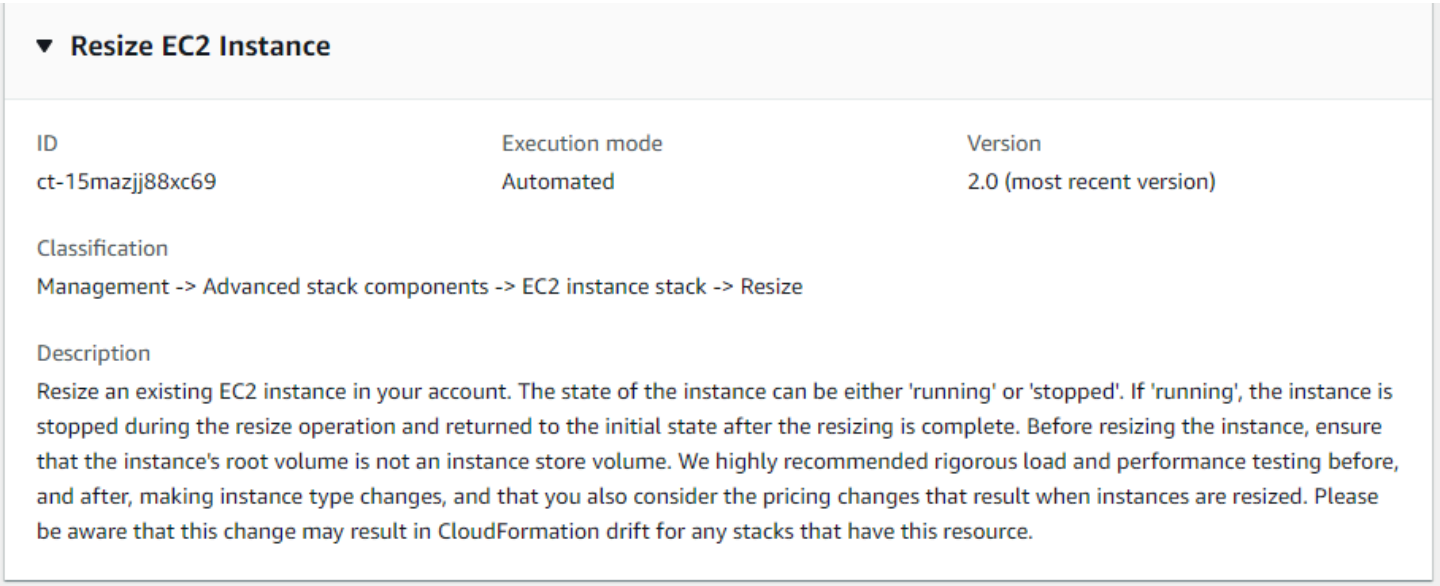
Change type ID	ct-15mazjj88xc69
Current version	2.0
Expected execution duration	30 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Resize instance

Resizing an EC2 instance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Resizing an EC2 instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-15mazjj88xc69" --change-type-version
 "2.0" --title "Resize EC2 Instance" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ResizeInstance\",\"Region\":\"ap-southeast-2\",\"Parameters
\":{\"InstanceId\":[\"i-0db3254017174df45\"],\"InstanceType\":[\"t2.xlarge\"],
\"CreateAMIBeforeResize\":[true]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it ResizeEC2Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-15mazjj88xc69" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > ResizeEC2Params.json
   ```

2. Modify and save the ResizeEC2Params file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-ChangeInstanceType",
  "Region": "ap-southeast-2",
  "Parameters": {
    "InstanceId": [
      "i-0db3254017174df45"
    ],
    "InstanceType": [
      "t2.xlarge"
    ],
    "CreateAMIBeforeResize": [
      true
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it ResizeEC2Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ResizeEC2Rfc.json
```

4. Modify and save the ResizeEC2Rfc.json file. For example, you can replace the contents with something like this:.

```
{
  "ChangeTypeVersion": "2.0",
  "ChangeTypeId": "ct-15mazjj88xc69",
  "Title": "Resize EC2 Instance"
}
```

5. Create the RFC, specifying the ResizeEC2Rfc file and the ResizeEC2Params file:

```
aws amscm create-rfc --cli-input-json file://ResizeEC2Rfc.json  --execution-
parameters file://ResizeEC2Params.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> Changing instance size can result in CloudFormation drift for any stacks that reference the changed instances.

For more information about Amazon EC2, including size recommendations, see Amazon Elastic Compute Cloud Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-15mazjj88xc69.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-ChangeInstanceType",
    "Region": "us-east-1",
    "Parameters": {
      "InstanceId": ["i-1234567890abababa"],
      "InstanceType": ["t3.xlarge"],
      "CreateAMIBeforeResize": [false]
    }
}
```

EC2 Instance Stack | Restore Volumes

Replace the instance volumes from an existing backup image of the instance.

Full classification: Management | Advanced stack components | EC2 instance stack | Restore volumes

Change Type Details

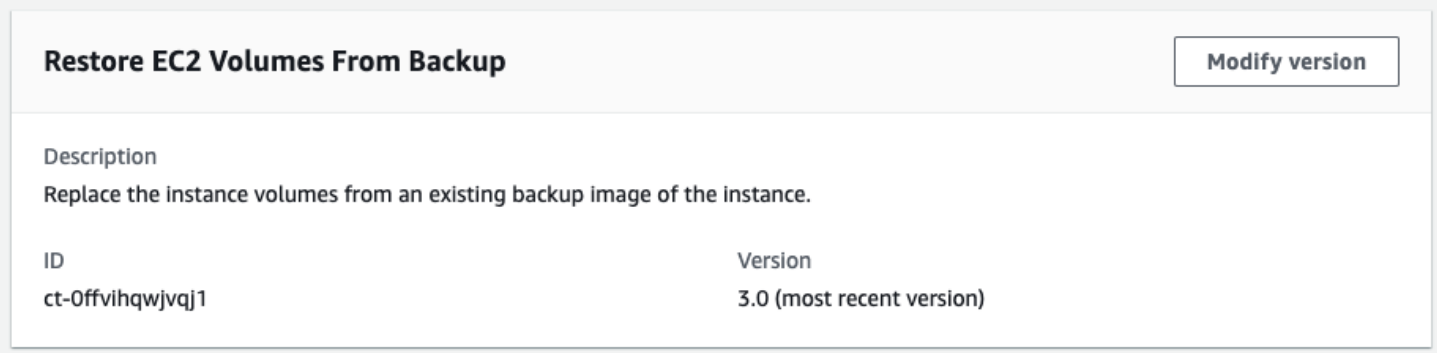
Change type ID	ct-0ffvihqwjvqj1
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Restore stack volumes

Restoring EC2 instance volumes with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Restoring EC2 instance volumes with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0ffvihqwjvqj1" --change-type-version "3.0"
 --title "Restore EC2 Volumes From Backup" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ReplaceInstanceVolumesFromSnapshotsWithContext\",\"Region\":\"us-
east-1\",\"Parameters\":{\"InstanceId\":[\"INSTANCE_ID\"],\"Backup\":[\"BACKUP\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it RestoreEC2VolsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0ffvihqwjvqj1" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > RestoreEC2VolsParams.json
   ```

2. Modify and save the RestoreEC2VolsParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-
   ReplaceInstanceVolumesFromSnapshotsWithContext",
     "Region": "us-east-1",
     "Parameters": {
       "InstanceId": [
         "INSTANCE_ID"
       ],
   ```

```
    "Backup": [
      "EC2_BACKUP_ARN"
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it RestoreEC2VolsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > RestoreEC2VolsRfc.json
```

4. Modify and save the RestoreEC2VolsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-0ffvihqwjvqj1",
"Title":                "EC2-Restore-Volume-RFC"
}
```

5. Create the RFC, specifying the RestoreEC2VolsRfc file and the RestoreEC2VolsParams file:

```
aws amscm create-rfc --cli-input-json file://RestoreEC2VolsRfc.json  --execution-
parameters file://RestoreEC2VolsParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> If the snapshot ID of the instance volumes matches the snapshot ID associated with the provided AMI, then the volumes aren't restored.

For more information about Amazon EC2, including size recommendations, see Amazon Elastic Compute Cloud Documentation.

For information on the automatic troubleshooting RFC created if this RFC fails, see EC2 instance volume restore fail

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0ffvihqwjvqj1.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-
ReplaceInstanceVolumesFromSnapshotsWithContext",
    "Region": "us-east-1",
    "Parameters": {
        "InstanceId": [
            "i-12345678"
        ],
        "Backup": [
            "ami-0ecdf967356c809c7"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-
ReplaceInstanceVolumesFromSnapshotsWithContext",
    "Region": "us-east-1",
    "Parameters": {
        "InstanceId": [
            "i-12345678"
        ],
        "Backup": [
            "ami-0ecdf967356c809c7"
        ],
        "KMSKeyId": [
            "arn:aws:kms:us-east-1:123456789012:key/6f0a9efd-e1b7-41a2-
b04c-75fd89d9dc17"
        ],
        "ChangeHostname" : ["False"],
        "SleepTime": [
```

```
            "PT5M"
        ]
    }
}
```

EC2 Instance Stack | Start

Start up to 50 stopped EC2 instances.

Full classification: Management | Advanced stack components | EC2 instance stack | Start

Change Type Details

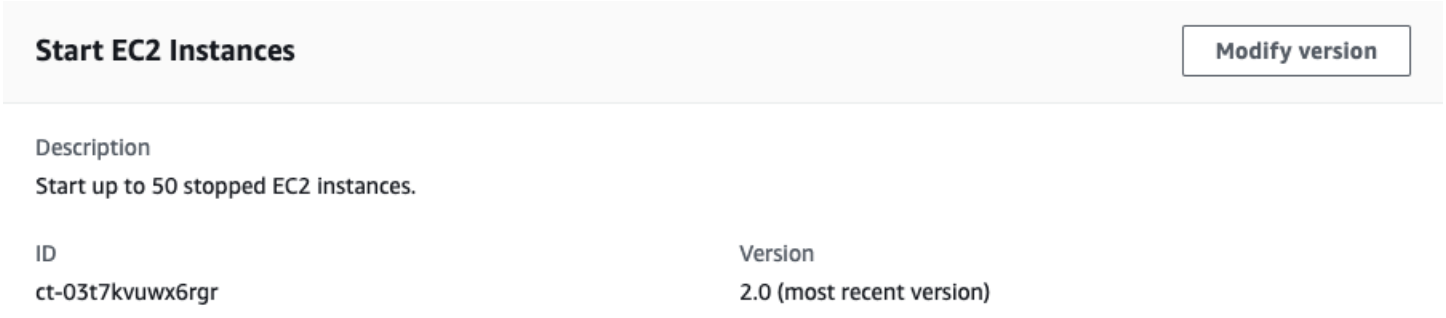
Change type ID	ct-03t7kvuwx6rgr
Current version	2.0
Expected execution duration	150 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Start stack

Starting EC2 instances with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Starting EC2 instances with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-03t7kvuwx6rgr" --change-type-version
 "2.0" --title "Start EC2 Instances" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-StartInstances\",\"Region\":\"us-east-1\",\"Parameters\":
{\"InstanceIds\":[\"i-1234567890abcdef0\", \"i-1234567890abcdef1\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it StartEC2Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-03t7kvuwx6rgr" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > StartEC2Params.json
   ```

2. Modify and save the StartEC2Params file.

```
{
"DocumentName" : "AWSManagedServices-StartInstances",
"Region" : "us-east-1",
"Parameters" : {
    "InstanceIds" : [
    "i-1234567890abcdef0",
    "i-1234567890abcdef1"
    ]
}
}
```

3. Output the RFC template to a file in your current folder; this example names it StartEC2Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > StartEC2Rfc.json
```

4. Modify and save the StartEC2Rfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "2.0",
"ChangeTypeId": "ct-03t7kvuwx6rgr",
"Title": "Start EC2 Instances"
}
```

5. Create the RFC, specifying the StartEC2Rfc file and the StartEC2Params file:

```
aws amscm create-rfc --cli-input-json file://StartEC2Rfc.json --execution-
parameters file://StartEC2Params.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is now at version 2.0. The schema has been changed so you can start up to fifty EC2 instances.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-03t7kvuwx6rgr.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-StartInstances",
    "Region": "us-east-1",
    "Parameters": {
        "InstanceIds": [
            "i-1234567890abcdef0"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-StartInstances",
    "Region": "us-east-1",
    "Parameters": {
        "InstanceIds": ["i-1234567890abcdef0"]
    }
}
```

EC2 Instance Stack | Stop

Stop up to 50 running EC2 instances. If you specify an EC2 instance that is part of an Auto Scaling group (ASG), the instance is terminated and replaced by the ASG. If not part of an ASG, the instance remains stopped, in the account, until started or deleted.

Full classification: Management | Advanced stack components | EC2 instance stack | Stop

Change Type Details

Change type ID	ct-3mvvt2zkyveqj
Current version	3.0
Expected execution duration	150 minutes

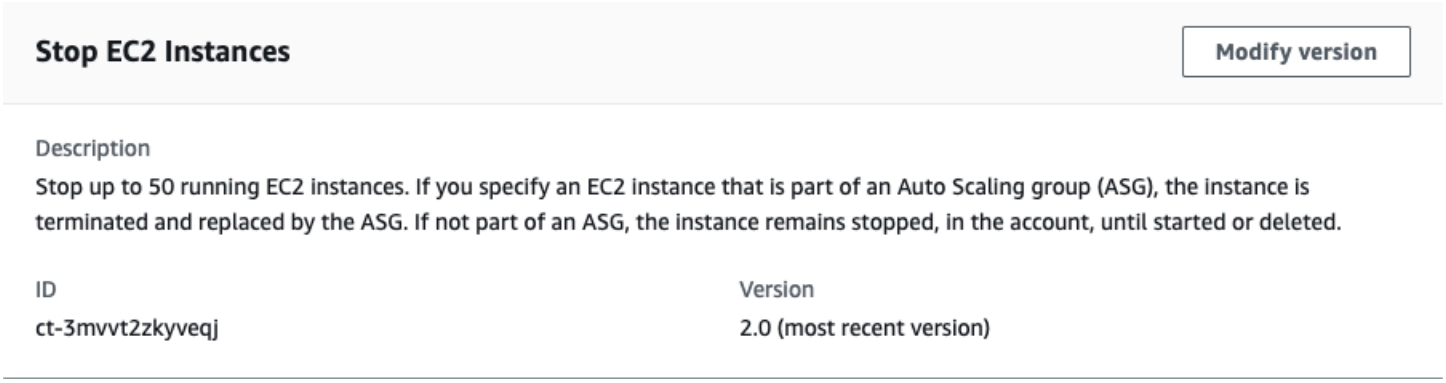
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Stop stack

Stopping an EC2 instance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Stopping an EC2 instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3mvvt2zkyveqj" --change-type-version
 "3.0" --title "Stop EC2 Instances" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-StopInstances\",\"Region\":\"us-east-1\",\"Parameters\":
{\"InstanceIds\":[\"i-1234567890abcdef0\", \"i-1234567890abcdef1\"],\"ForceStop\":
[\"false\"],\"StopASGInServiceInstances\":[\"false\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it StopEC2Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3mvvt2zkyveqj" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > StopEC2Params.json
   ```

2. Modify and save the StopEC2Params file.

   ```
   {
   "DocumentName" : "AWSManagedServices-StopInstances",
   "Region" : "us-east-1",
   "Parameters" : {
       "InstanceIds" : [
       "i-1234567890abcdef0",
       "i-1234567890abcdef1"
       ],
       "ForceStop": [
       "false"
       ],
       "StopASGInServiceInstances": [
       "false"
       ]
   }
   ```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it StopEC2Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > StopEC2Rfc.json
```

4. Modify and save the StopEC2Rfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "3.0",
"ChangeTypeId": "ct-3mvvt2zkyveqj",
"Title": "Stop EC2 Instances"
}
```

5. Create the RFC, specifying the StopEC2Rfc file and the StopEC2Params file:

```
aws amscm create-rfc --cli-input-json file://StopEC2Rfc.json --execution-parameters
 file://StopEC2Params.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is now at version 3.0. The schema has been changed so you can stop up to fifty instances.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3mvvt2zkyveqj.

Example: Required Parameters

```
{
```

```
    "DocumentName": "AWSManagedServices-StopInstances",
    "Region": "us-east-1",
    "Parameters": {
        "InstanceIds": [
            "i-1234567890abcdef0"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-StopInstances",
    "Region": "us-east-1",
    "Parameters": {
        "InstanceIds": [
            "i-1234567890abcdef0"
        ],
        "ForceStop": [
            "false"
        ],
        "StopASGInServiceInstances": [
            "false"
        ]
    }
}
```

EC2 Instance Stack | Update

Use to modify the properties of an EC2 instance created using CT id ct-14027q0sjyt1h, version 3.0.

Full classification: Management | Advanced stack components | EC2 instance stack | Update

Change Type Details

Change type ID	ct-38s4s4tm4ic4u
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required

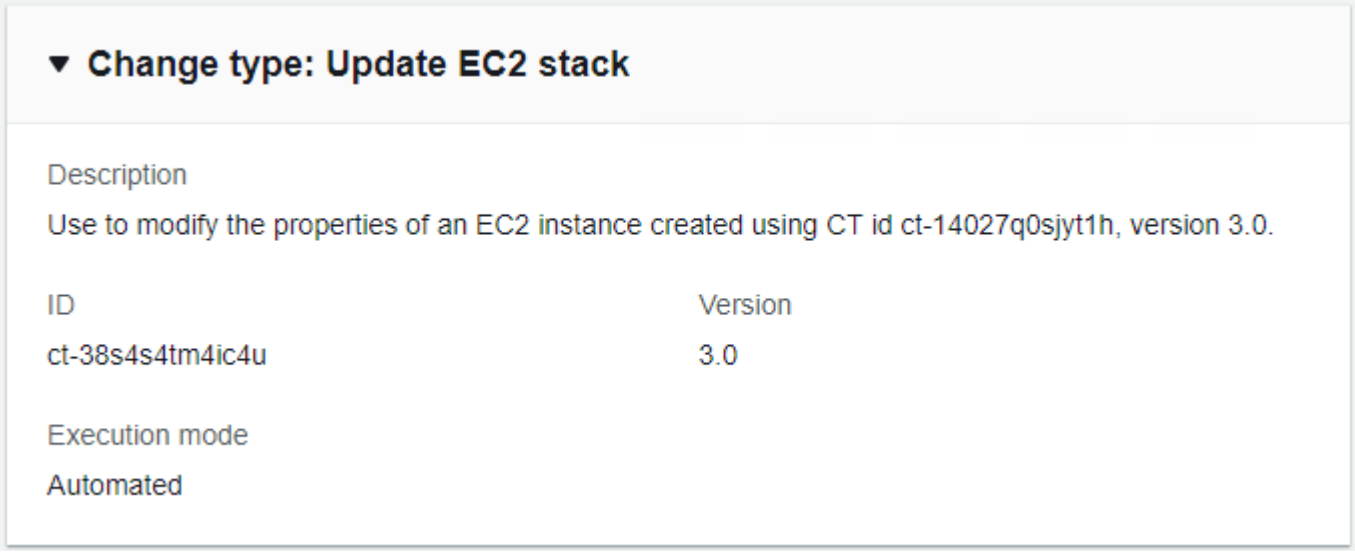
Customer approval	Not required
Execution mode	Automated

Additional Information

Update instances

Updating an EC2 instance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an EC2 instance with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Only specify the parameters you want to change. Absent parameters retain the existing values.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title test-ec2-stack-update --change-
type-id ct-38s4s4tm4ic4u --change-type-version 3.0 --execution-
parameters '{"VpcId":"VPC_ID","StackId":"STACK_ID","Parameters":
{"InstanceDetailedMonitoring":false,"InstanceEBSOptimized":false,"InstanceProfile":"customer-
mc-ec2-instance-profile","InstanceType":"t2.small","InstanceUserData":"#!/bin/bash\
\npwd\\nls -ltrh\\necho \"Hello, World\""}}'
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it UpdateEC2Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-38s4s4tm4ic4u" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateEC2Params.json
   ```

2. Modify and save the UpdateEC2Params file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "VpcId": "VPC_ID",
     "StackId": "STACK_ID",
     "Parameters": {
       "InstanceDetailedMonitoring": false,
       "InstanceEBSOptimized": false,
       "InstanceProfile": "customer-mc-ec2-instance-profile",
       "InstanceType": "t2.small",
       "InstanceUserData": "#!/bin/bash\\npwd\\nls -ltrh\\necho \"Hello, World\""
   ```

```
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it UpdateEC2Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateEC2Rfc.json
```

4. Modify and save the UpdateEC2Rfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-38s4s4tm4ic4u",
"Title":                "EC2-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateEC2Rfc file and the UpdateEC2Params file:

```
aws amscm create-rfc --cli-input-json file://UpdateEC2Rfc.json  --execution-
parameters file://UpdateEC2Params.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This is a version 3.0 change type and can be used to update EC2 instances created with the corresponding version 3.0 create change type, ct-14027q0sjyt1h.

To learn more about Amazon EC2, including size recommendations, see Amazon Elastic Compute Cloud Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-38s4s4tm4ic4u.

Example: Required Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-1234567890abcdef0",
  "Parameters": {
  }
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-12345678",
  "StackId": "stack-1234567890abcdef0",
  "Parameters": {
    "InstanceDetailedMonitoring": false,
    "InstanceEBSOptimized": false,
    "InstanceProfile": "customer-mc-ec2-instance-profile",
    "InstanceType": "t2.small",
    "InstanceUserData": "#!/bin/bash\\npwd\\nls -ltrh\\necho \"Hello, World\""
  }
}
```

EC2 Instance Stack | Update (With Additional Volumes)

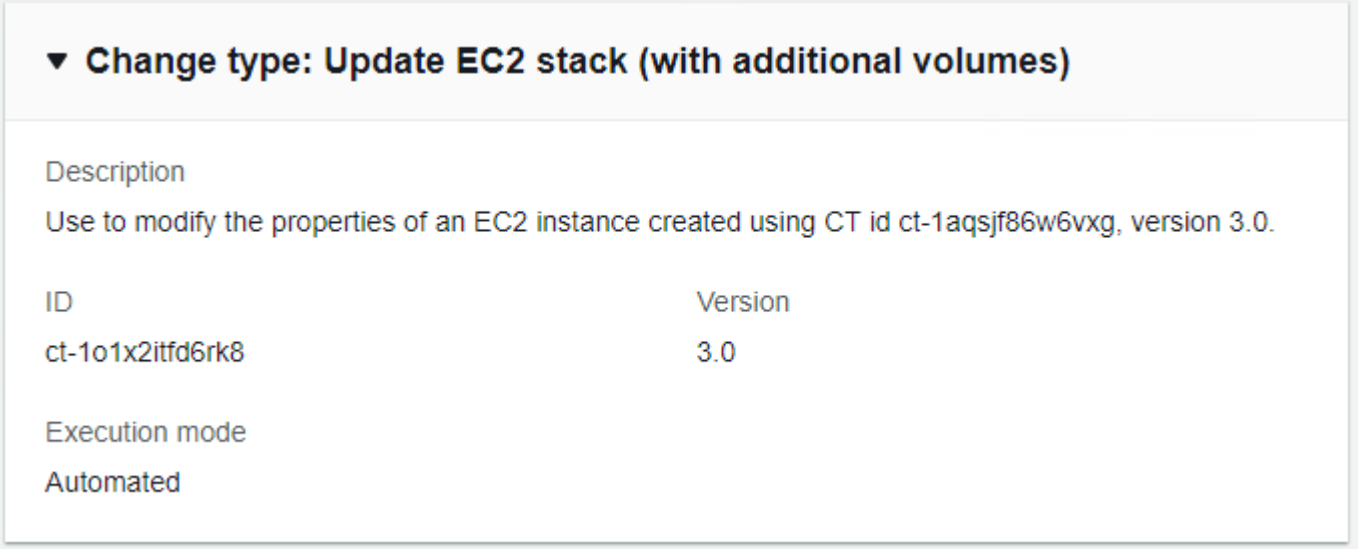
Update stack (with additional volumes)

Updating an EC2 Instance and Additional Volumes with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an EC2 Instance and Additional Volumes with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title test-ec2-stack-with-additional-volumes-
update --change-type-id ct-1o1x2itfd6rk8 --change-type-version 3.0 --
execution-parameters '{"VpcId":"VPC_ID","StackId":"STACK_ID","Parameters":
{"InstanceDetailedMonitoring":false,"InstanceEBSOptimized":false,"InstanceProfile":"customer-
mc-ec2-instance-profile","InstanceType":"t2.small","InstanceUserData":"#!/bin/bash\
\npwd\\nls -ltrh\\necho \"Hello,
 World\"","InstanceSecondaryPrivateIpAddressCount":1,"InstanceTerminationProtection":true,"Volu
dev/sdf","Volume1Size":100,"Volume1Type":"io1"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it UpdateEC2AVParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1o1x2itfd6rk8" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateEC2AVParams.json
   ```

2. Modify and save the UpdateEC2AVParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
   "Description":      "EC2-Update-1-Addl-Volumes",
   "VpcId":            "VPC_ID",
   "Name":             "My-EC2-1-Addl-Volume",
   "TimeoutInMinutes": 60,
   "Parameters":   {
       "InstanceAmiId":    "AMI_ID",
       "InstanceSubnetId": "SUBNET_ID",
       "Volume1Encrypted": "true",
   ```

```
    "Volume1Iops":      "IOPS"
    "Volume1KmsKeyId":  "KMS_MASTER_KEY_ID",
    "Volume1Name":      "xvdh"
    "Volume1Size":      "2 GiB",
    "Volume1Snapshot":  "SNAPSHOT_ID",
    "Volume1Type":      "iol"
    }
}
```

3. Output the RFC template to a file in your current folder; this example names it UpdateEC2AVRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateEC2AVRfc.json
```

4. Modify and save the UpdateEC2AVRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-1o1x2itfd6rk8",
"Title":                "EC2-Update-1-Addl-Volume-RFC"
}
```

5. Create the RFC, specifying the UpdateEC2AVRfc file and the UpdateEC2AVParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateEC2AVRfc.json  --execution-
parameters file://UpdateEC2AVParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This is a version 3.0 change type and can be used to update EC2 instances created with the corresponding version 3.0 create change type, ct-1aqsjf86w6vxg.

To learn more about Amazon EC2, including size recommendations, see Amazon Elastic Compute Cloud Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1o1x2itfd6rk8.

Example: Required Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-1234567890abcdef0",
  "Parameters": {
  }
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-1234567890abcdef0",
  "Parameters": {
    "InstanceDetailedMonitoring": false,
    "InstanceEBSOptimized": false,
    "InstanceProfile": "customer-mc-ec2-instance-profile",
    "InstanceType": "t2.small",
    "InstanceUserData": "#!/bin/bash\\npwd\\nls -ltrh\\necho \"Hello, World\"",
    "InstanceSecondaryPrivateIpAddressCount": 1,
    "InstanceTerminationProtection": true,
    "Volume1Iops": 100,
    "Volume1Name": "/dev/sdf",
    "Volume1Size": 100,
    "Volume1Snapshot": "snap-1234567890abcdef0",
    "Volume1Type": "io1",
    "Volume2Iops": 100,
    "Volume2Name": "/dev/sdg",
    "Volume2Size": 100,
    "Volume2Snapshot": "snap-1234567890abcdef0",
    "Volume2Type": "io1",
    "Volume3Iops": 100,
    "Volume3Name": "/dev/sdh",
```

```
    "Volume3Size": 100,
    "Volume3Snapshot": "snap-1234567890abcdef0",
    "Volume3Type": "io1",
    "Volume4Iops": 100,
    "Volume4Name": "/dev/sdi",
    "Volume4Size": 100,
    "Volume4Snapshot": "snap-1234567890abcdef0",
    "Volume4Type": "io1",
    "Volume5Iops": 100,
    "Volume5Name": "/dev/sdj",
    "Volume5Size": 100,
    "Volume5Snapshot": "snap-1234567890abcdef0",
    "Volume5Type": "io1"
  }
}
```

EC2 Instance Stack | Update DeleteOnTermination (Review Required)

Update the EBS volume DeleteOnTermination property of the specified EC2 instance devices.

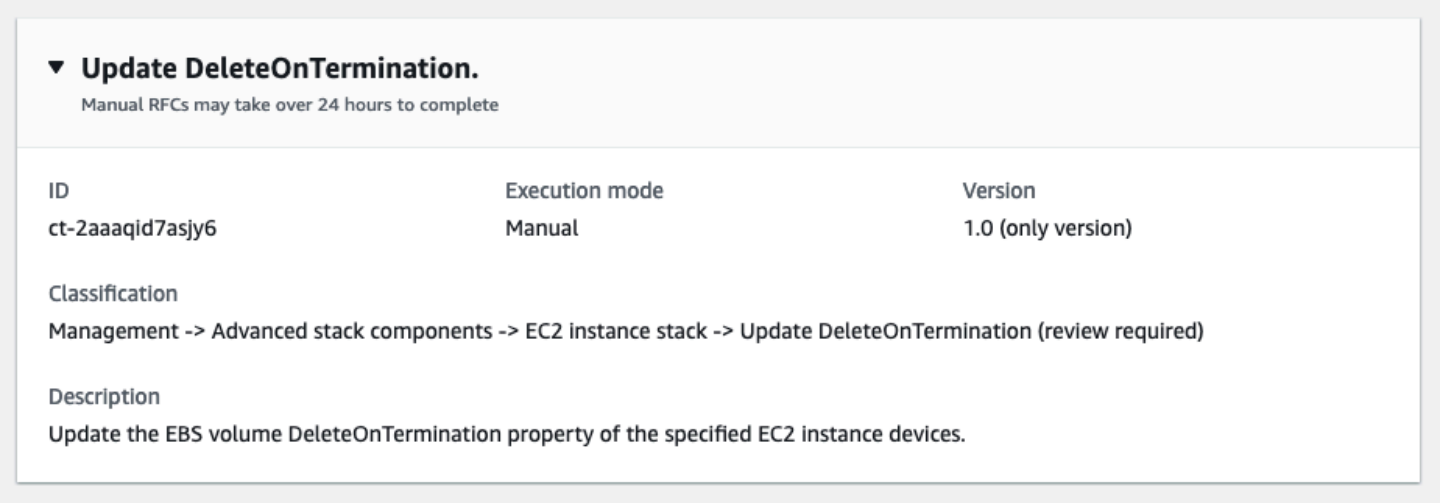
Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating the DeleteOnTermination option with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2aaaqid7asjy6" --change-type-version
 "1.0" --title "Update DeleteOnTermination" --execution-parameters "{\"InstanceId
\": \"i-1234567890abcdef0\", \"DeviceNames\": [\"/dev/sda1\", \"/dev/xvda\"],
 \"DeleteOnTermination\": \"False\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it UpdateDeleteOnTerminationParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2aaaqid7asjy6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateDeleteOnTerminationParames.json
   ```

2. Modify and save the UpdateDeleteOnTerminationParams.json file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "InstanceId": "i-0cc489fa851c31a21",
     "DeviceNames": [
       "/dev/sda1",
       "/dev/xvda"
     ],
     "DeleteOnTermination": "False"
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it UpdateDeleteOnTerminationRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateDeleteOnTerminationRfc.json
   ```

4. Modify and save the UpdateDeleteOnTerminationRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2aaaqid7asjy6",
"Title":                "Update DeleteOnTermination"
}
```

5. Create the RFC, specifying the UpdateDeleteOnTerminationRfc.json file and the UpdateDeleteOnTerminationParams.json file:

```
aws amscm create-rfc --cli-input-json file://UpdateDeleteOnTerminationRfc.json  --
execution-parameters file://UpdateDeleteOnTerminationParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EC2, including size recommendations, see Amazon Elastic Compute Cloud Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2aaaqid7asjy6.

Example: Required Parameters

```
{
  "InstanceId": "i-1234567890abcdef0",
  "DeviceNames": ["/dev/sda", "/dev/xvda"],
  "DeleteOnTermination": "True"
}
```

Example: All Parameters

```
{
```

```
  "InstanceId": "i-1234567890abcdef0",
  "DeviceNames": ["/dev/sda", "/dev/xvda"],
  "DeleteOnTermination": "True"
}
```

EC2 Instance Stack | Update Instance Detailed Monitoring

Update EC2 instances' detailed monitoring setting through direct API calls. The EC2 instances can be standalone or belong to a CloudFormation stack; in the latter case, the change might cause stack drift. To avoid causing stack drift, please use ct-38s4s4tm4ic4u instead, or ct-361tlo1k7339x if the EC2 instance was provisioned via CFN ingestion.

Full classification: Management | Advanced stack components | EC2 instance stack | Update instance detailed monitoring

Change Type Details

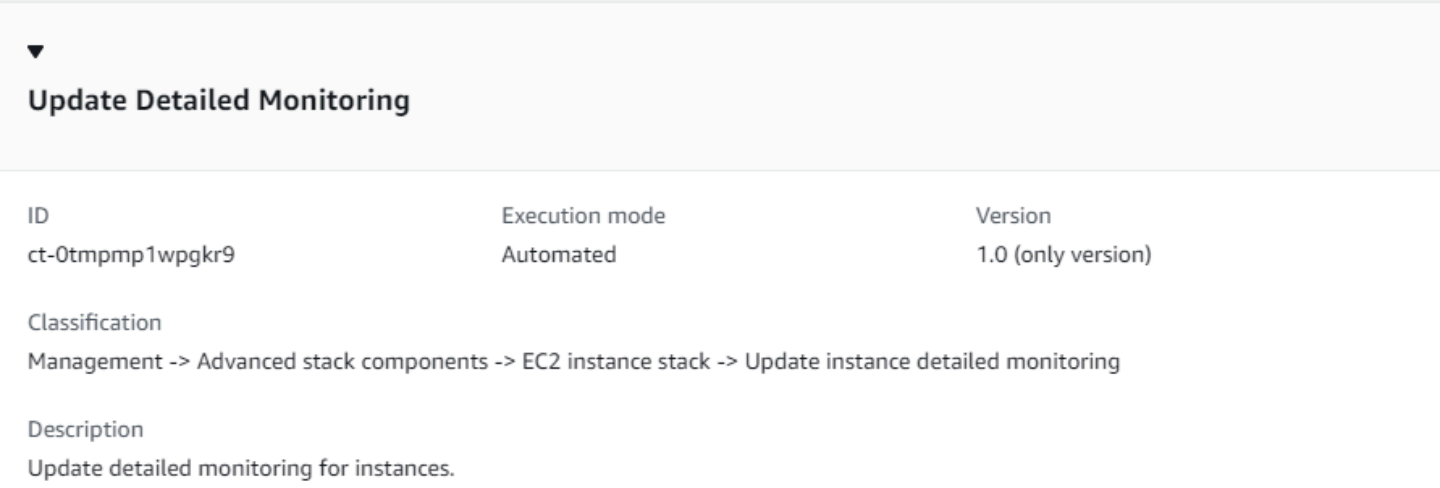
Change type ID	ct-0tmpmp1wpgkr9
Current version	1.0
Expected execution duration	10 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update detailed monitoring

Updating EC2 instances with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating EC2 instances with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title "Update EC2 detailed monitoring" -update --change-
type-id ct-0tmpmp1wpgkr9 --change-type-version 1.0 --execution-parameters
 '{"DocumentName":"AWSManagedServices-UpdateInstanceEnhancedMonitoring","Region":"us-
east-1","Parameters":{"InstanceIds":["i-09d65b13db992e8d4","i-0cdbd78ad80d2378c"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it UpdateEc2MonitoringParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0tmpmp1wpgkr9"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateEc2MonitoringParams.json
   ```

2. Modify and save the UpdateEc2MonitoringParams file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateInstanceEnhancedMonitoring",
     "Region": "us-east-1",
     "Parameters": {
       "InstanceIds": [
         "i-09d65b13db992e8d4",
         "i-0cdbd78ad80d2378c"
       ],
       "MonitoringValue": "enabled"
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it UpdateEc2MonitoringRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateEc2MonitoringRfc.json
   ```

4. Modify and save the UpdateEc2MonitoringRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-0tmpmp1wpgkr9",
   "Title":                "EC2 Update Detailed Monitoring"
   ```

```
}
```

5. Create the RFC, specifying the UpdateEc2MonitoringRfc file and the UpdateEc2MonitoringParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateEc2MonitoringRfc.json  --
execution-parameters file://UpdateEc2MonitoringParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon EC2, see Amazon Elastic Compute Cloud Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0tmpmp1wpgkr9.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateInstanceEnhancedMonitoring",
  "Region": "eu-west-1",
  "Parameters": {
    "InstanceIds": ["i-1234567890abcdef0", "i-b188560f"],
    "MonitoringValue": ["enabled"]
  }
}
```

EC2 Instance Stack | Update Termination Protection

Update existing defined termination protection for EC2 instances.

Full classification: Management | Advanced stack components | EC2 instance stack | Update termination protection

Change Type Details

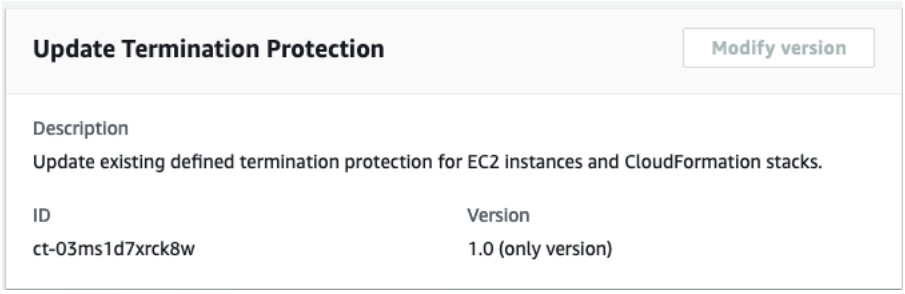
Change type ID	ct-03ms1d7xrck8w
Current version	1.0
Expected execution duration	10 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update stack termination protection

Updating an EC2 termination protection instance with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an EC2 instance termination protection with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Only specify the parameters you want to change. Absent parameters retain the existing values.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-03ms1d7xrck8w" \
--change-type-version "1.0" \
--title "Enable termination protection on EC2 instance" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
ManageResourceTerminationProtection\",\"Region\":\"us-east-1\",\"Parameters\":
{\"ResourceId\":[\"i-0d7e0c222654fc8f7\"],\"TerminationProtectionDesiredState\":
[\"enabled\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file; this example names it UpdateTermProEC2Params.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-38s4s4tm4ic4u"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateTermProEC2Params.json
   ```

2. Modify and save the UpdateTermProEC2Params file, retaining only the parameters that you want to change. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-ManageResourceTerminationProtection",
  "Region": "us-east-1",
  "Parameters": {
    "ResourceId": ["i-0d7e0c222654fc8f7"],
    "TerminationProtectionDesiredState": ["enabled"]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it UpdateTermProEC2Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateTermProEC2Rfc.json
```

4. Modify and save the UpdateTermProEC2Rfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-03ms1d7xrck8w",
    "ChangeTypeVersion": "1.0",
    "Title": "Enable termination protection on EC2 instance"
}
```

5. Create the RFC, specifying the UpdateTermProEC2Rfc file and the UpdateTermProEC2Params file:

```
aws amscm create-rfc --cli-input-json file://UpdateTermProEC2Rfc.json  --execution-
parameters file://UpdateTermProEC2Params.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> There is a related CT for AWS CloudFormation stacks, RDS Database Stack | Create.

To learn more about termination protection, see How do I protect my data against accidental EC2 instance termination?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-03ms1d7xrck8w.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-ManageResourceTerminationProtection",
  "Region": "eu-west-1",
  "Parameters": {
    "ResourceId": ["i-1234567890"],
    "TerminationProtectionDesiredState": ["enabled"]
  }
}
```

Identity and Access Management (IAM) | Delete Account Alias

Delete an existing AWS account alias. Note that if you delete the account alias, any URL containing the account alias stops working.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Delete account alias

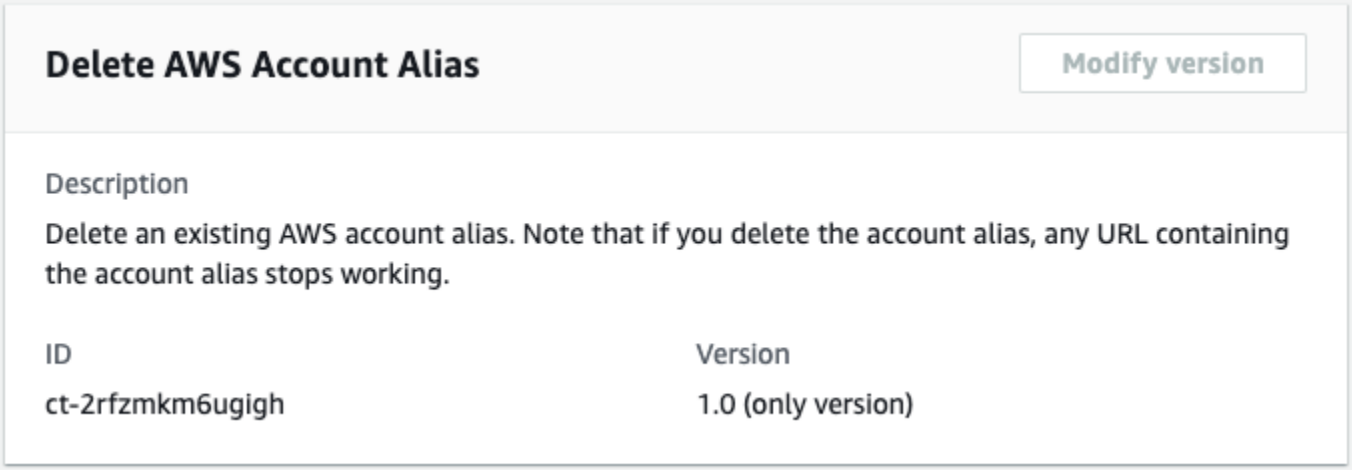
Change Type Details

Change type ID	ct-2rfzmkm6ugigh
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete IAM account alias

Deleting IAM account alias with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting IAM account alias with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2rfzmkm6ugigh" --change-type-
version "1.0" --title "Delete Account Alias" --execution-parameters
 '{"DocumentName":"AWSManagedServices-DeleteAccountAlias","Region":"us-
east-1","Parameters":{"AWSAccountAlias":["my-alias"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it DeleteIamAccountAliasParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2rfzmkm6ugigh"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteIamAccountAliasParams.json
   ```

2. Modify and save the DeleteIamAccountAliasParams file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-DeleteAccountAlias",
       "Region": "us-east-1",
       "Parameters": {
           "AWSAccountAlias": [
               "my-alias"
           ]
       }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it DeleteIamAccountAliasRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteIamAccountAliasRfc.json
   ```

4. Modify and save the DeleteIamAccountAliasRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeId": "ct-2rfzmkm6ugigh",
    "ChangeTypeVersion": "1.0",
    "Title": "Delete Account Alias"
}
```

5. Create the RFC, specifying the DeleteIamAccountAliasRfc file and the DeleteIamAccountAliasParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteIamAccountAliasRfc.json  --
execution-parameters file://DeleteIamAccountAliasParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about IAM, see the IAM User Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2rfzmkm6ugigh.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-DeleteAccountAlias",
  "Region": "us-east-1",
  "Parameters": {
    "AWSAccountAlias": ["myalias"]
  }
}
```

Identity and Access Management (IAM) | Delete Entity or Policy (Read-Write Permissions)

Delete Identity and Access Management (IAM) role or policy created with change type ct-1n9gfnog5x7fl.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Delete entity or policy (read-write permissions)

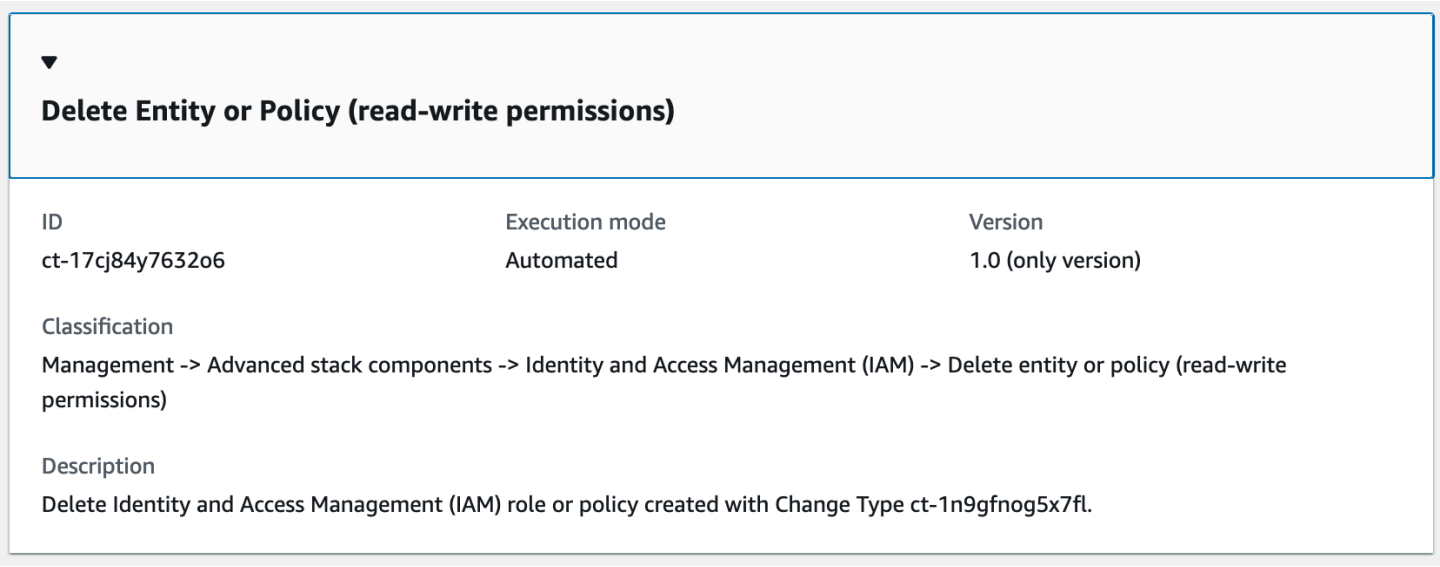
Change Type Details

Change type ID	ct-17cj84y7632o6
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Automated

Additional Information

Delete IAM entity or policy

Deleting IAM entity or policy with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting IAM entity or policy with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-17cj84y7632o6" --change-type-version
 "1.0" --title "Delete role or policy" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-HandleAutomatedIAMProvisioningDelete-Admin\",\"Region
\":\"us-east-1\",\"Parameters\":{\"RoleName\":[\"TestRole01\",\"TestRole02\"],
\"ManagedPolicyName\":[\"TestPolicy01\",\"TestPolicy02\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it DeleteIamResourceParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-17cj84y7632o6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteIamResourceParams.json
   ```

2. Modify and save the DeleteIamResourceParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName" : "AWSManagedServices-HandleAutomatedIAMProvisioningDelete-Admin",
     "Region" : "us-east-1",
     "Parameters": {
       "RoleName": ["TestRole01", "TestRole02"],
       "ManagedPolicyName": ["TestPolicy01", "TestPolicy02"]
     }
   }
   ```

3. Output the RFC template JSON file to a file named DeleteIamResourceRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteIamResourceRfc.json
   ```

4. Modify and save the DeleteIamResourceRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
       "ChangeTypeVersion": "1.0",
   ```

```
    "ChangeTypeId": "ct-17cj84y7632o6",
    "Title": "Delete entity or policy (read-write permissions)"
}
```

5. Create the RFC, specifying the DeleteIamResourceRfc file and the DeleteIamResourceParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteIamResourceRfc.json  --
execution-parameters file://DeleteIamResourceParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM) and for policy information, see Managed policies and inline policies.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-17cj84y7632o6.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAutomatedIAMProvisioningDelete-Admin",
  "Region" : "us-east-1",
  "Parameters": {}
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAutomatedIAMProvisioningDelete-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "RoleName": ["TestRole01", "TestRole02"],
    "ManagedPolicyName": ["TestPolicy01", "TestPolicy02"]
  }
```

```
}
```

Identity and Access Management (IAM) | Delete Entity or Policy (Review Required)

Delete Identity and Access Management (IAM) users, roles or policies.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Delete entity or policy (review required)

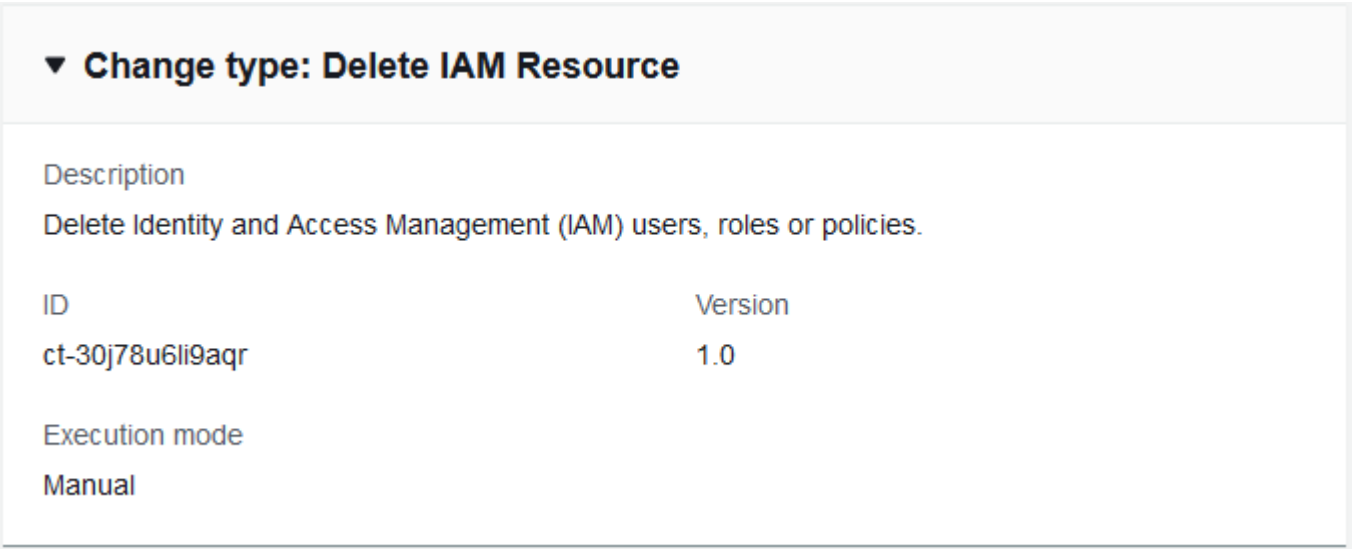
Change Type Details

Change type ID	ct-30j78u6li9aqr
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Delete IAM entity or policy

Deleting IAM Resources with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting IAM Resources with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-30j78u6li9aqr" --change-type-
version "1.0" --title "TestIamDelete" --execution-parameters "{\"IAM Roles\":
[\"arn:aws:iam::012345678901:role/test_role1\",\"arn:aws:iam::012345678901:role/
test_role2\"],\"Operation\":\"Delete\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it DeleteIamResourceParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-30j78u6li9aqr"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteIamResourceParams.json
   ```

2. Modify and save the DeleteIamResourceParams file. For example, you can replace the contents with something like this:

```
{
  "IAM Roles": [
    "arn:aws:iam::012345678901:role/test_role1",
    "arn:aws:iam::012345678901:role/test_role2"
  ],
  "Operation": "Delete"
}
```

3. Output the RFC template JSON file to a file; this example names it DeleteIamResourceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteIamResourceRfc.json
```

4. Modify and save the DeleteIamResourceRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "1.0",
"ChangeTypeId": "ct-30j78u6li9aqr",
"Title": "Delete IAM roles"
}
```

5. Create the RFC, specifying the DeleteIamResourceRfc file and the DeleteIamResourceParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteIamResourceRfc.json  --
execution-parameters file://DeleteIamResourceParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> When using manual (approval required) CTs, AMS recommends that you use the ASAP option (choose ASAP in the console, leave start and end time blank in the API/CLI) as these

CTs require an AMS operator to examine the RFC, and possibly communicate with you before it can be approved and run.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-30j78u6li9aqr.

Example: Required Parameters

```
{
  "Operation": "Delete"
}
```

Example: All Parameters

```
{
  "IAM Users": [
    "arn:aws:iam::012345678901:user/!\"#$%&'()*+,-.0123456789:;<=>?
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\\]^_`abcdefghijklmnopqrstuvwxyz{|}~/UsEr_+=,.@-"
  ],
  "IAM Roles": [
    "arn:aws:iam::012345678901:role/!\"#$%&'()*+,-.0123456789:;<=>?
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\\]^_`abcdefghijklmnopqrstuvwxyz{|}~/RoLe_+=,.@-"
  ],
  "IAM Policies": [
    "arn:aws:iam::012345678901:policy/!\"#$%&'()*+,-.0123456789:;<=>?
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\\]^_`abcdefghijklmnopqrstuvwxyz{|}~/PoLiCy_+=,.@-"
  ],
  "Operation": "Delete",
  "Priority": "Medium"
}
```

Identity and Access Management (IAM) | Delete or Deactivate Access Key

Delete or deactivate the specified AWS IAM access key ID for the specified user.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Delete or deactivate access key

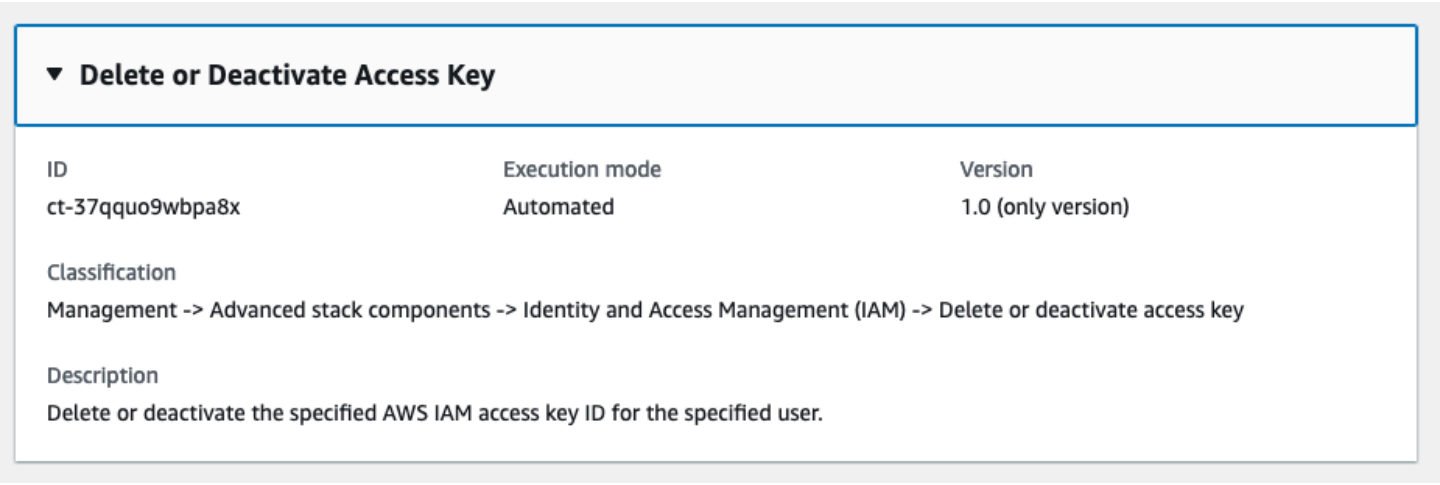
Change Type Details

Change type ID	ct-37qquo9wbpa8x
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete or deactivate access key

Deleting or deactivating access key with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting or deactivating access key with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id ID` command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

Note

When pasting in a policy document, note that the RFC only accepts policy pastes up to 5,000 characters. If your file has more than 5,000 characters, create a service request to upload the policy and then refer to that service request in the RFC that you open for IAM.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-37qquo9wbpa8x" --change-type-version "1.0"
 --title "Delete or deactivate access key" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-DeactivateIAMAccessKey\",\"Region\": \"us-east-1\",\"Parameters
\": {\"UserName\": \"test-user\", \"AccessKeyId\": \"AKIAIOSFODNN7EXAMPLE\", \"Delete
\": false}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it DeactivateIamAccessKeyParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-37qquo9wbpa8x"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 DeactivateIamAccessKeyParams.json
```

2. Modify and save the DeactivateIamAccessKey file; example creates an IAM Role with policy documents pasted inline.

```
{
  "DocumentName": "AWSManagedServices-DeactivateIAMAccessKey",
  "Region": "us-east-1",
  "Parameters": {
    "UserName": "test-user",
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "Delete": false
  }
  }
}
```

3. Output the RFC template JSON file to a file named DeactivateIamAccessKeyRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeactivateIamAccessKeyRfc.json
```

4. Modify and save the DeactivateIamAccessKeyRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeVersion": "1.0",
    "ChangeTypeId": "ct-37qquo9wbpa8x",
    "Title": "Delete or Deactivate Access Key"
}
```

5. Create the RFC, specifying the DeactivateIamAccessKeyRfc.json file and the CreateIamResourceNrrParams file:

```
aws amscm create-rfc --cli-input-json file://DeactivateIamAccessKeyRfc.json --
execution-parameters file://DeactivateIamAccessKeyParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM) and for policy information, see Managed policies and inline policies. For information about AMS permissions, see Deploying IAM resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-37qquo9wbpa8x.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-DeactivateIAMAccessKey",
  "Region": "us-east-1",
  "Parameters": {
    "UserName": "myusername",
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "Delete": true
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-DeactivateIAMAccessKey",
  "Region": "us-east-1",
  "Parameters": {
    "UserName": "myusername",
    "AccessKeyId": "AKIAIOSFODNN7EXAMPLE",
    "Delete": false
  }
}
```

Identity and Access Management (IAM) | Delete SAML Identity Provider

Delete a SAML identity provider (IdP). The given IdP must not be referenced in any IAM role and must not be the only IdP in the account.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Delete SAML identity provider

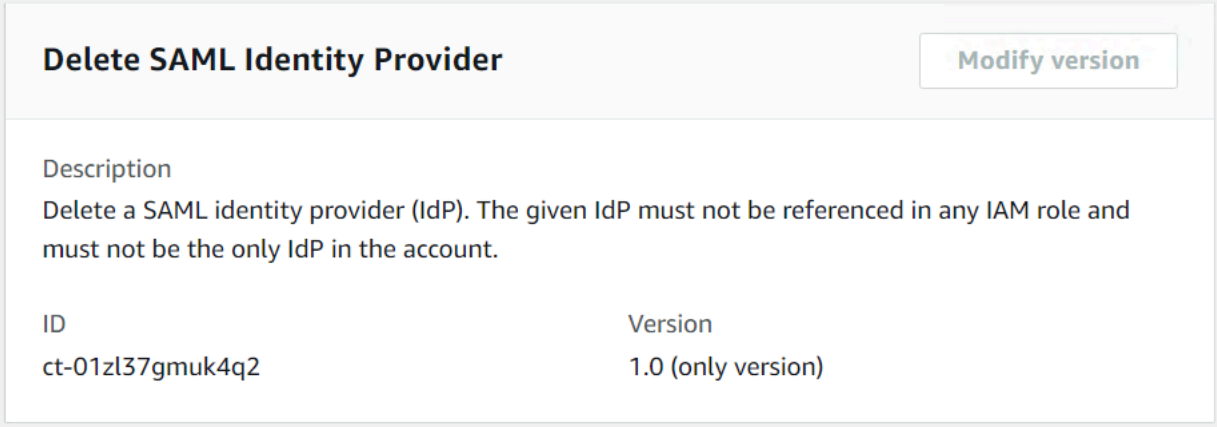
Change Type Details

Change type ID	ct-01zl37gmuk4q2
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete IAM SAML identity provider

Deleting IAM SAML IDPs with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting IAM SAML IDPs with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-01zl37gmuk4q2" --change-type-version "1.0"
 --title "Delete SAML Identity Provider" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-HandleDeleteSamlProvider-Admin\",\"Region\":\"us-east-1\",
\"Parameters\":{\"Name\":[\"customer-saml\"],\"MetadataBackup\":[\"True\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it DeleteIamSamlIdpParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-01zl37gmuk4q2"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteIamSamlIdpParams.json
   ```

2. Modify and save the DeleteIamSamlIdpParams file. For example, you can replace the contents with something like this:

```
{
  "DocumentName" : "AWSManagedServices-HandleDeleteSamlProvider-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "Name" : [
      "customer-saml"
    ],
    "MetadataBackup": [
      "True"
    ]
  }
}
```

3. Output the RFC template JSON file to a file; this example names it DeleteIamSamlIdpRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteIamSamlIdpRfc.json
```

4. Modify and save the DeleteIamSamlIdpRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "1.0",
"ChangeTypeId": "ct-01zl37gmuk4q2",
"Title": "Delete IAM SAML IDP"
}
```

5. Create the RFC, specifying the DeleteIamSamlIdpRfc file and the DeleteIamSamlIdpParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteIamSamlIdpRfc.json  --execution-
parameters file://DeleteIamSamlIdpParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about IAM, see the IAM User Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-01zl37gmuk4q2.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleDeleteSamlProvider-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "Name" : [
      "customer-saml"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleDeleteSamlProvider-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "Name" : [
      "customer-saml"
    ],
    "MetadataBackup": [
      "True"
    ]
  }
}
```

Identity and Access Management (IAM) | Reset Service-Specific Credentials

Reset the password for the specified service-specific credential.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Reset service-specific credentials

Change Type Details

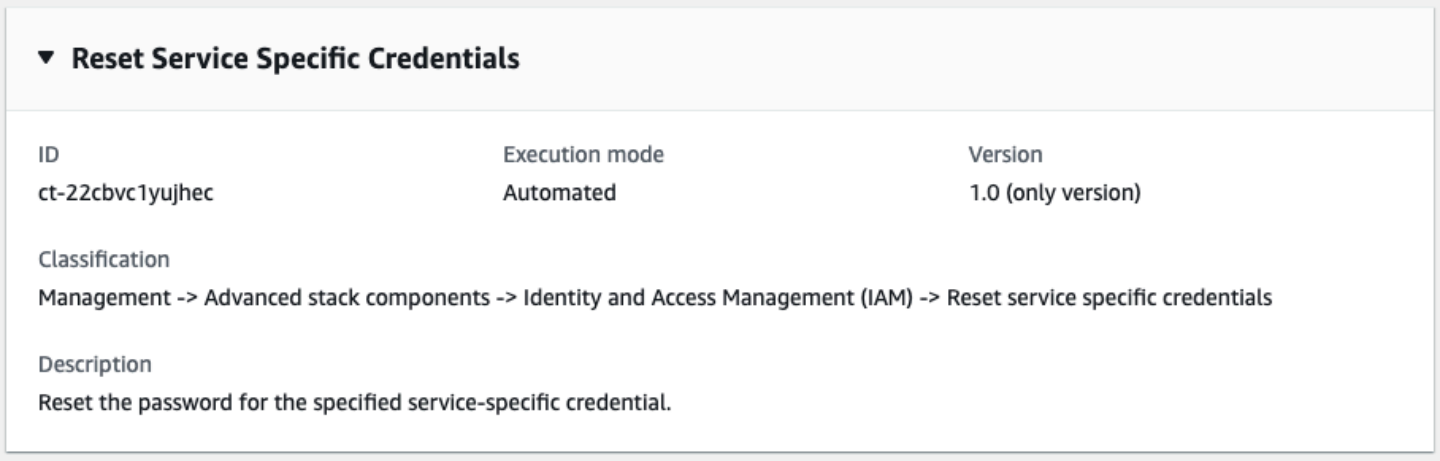
Change type ID	ct-22cbvc1yujhec

Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Reset service specific credentials

Resetting IAM service specific credentials with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Resetting IAM service specific credentials with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-22cbvc1yujhec" \
--change-type-version "1.0" --title "Reset service specific credentials for IAM User" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
ResetServiceSpecificCredentials\",\"Region\":\"us-east-1\",\"Parameters\":{\"Username
\":[\"testuser\"],\"ServiceSpecificCredentialId\":[\"ACCAR712345678EXAMPLE\"],
\"SecretArn\":[\"arn:aws:secretsmanager:us-east-1:123456789012:secret:test-secret\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it ResetServSpecCredsParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2ni31oyto1i5k"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ResetServSpecCredsParams.json
   ```

2. Modify and save the ResetServSpecCredsParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName" : "AWSManagedServices-ResetServiceSpecificCredentials",
     "Region" : "us-east-1",
     "Parameters" : {
   ```

```
    "Username" : [
      "testuser"
    ],
    "ServiceSpecificCredentialId" : [
      "ACCAR712345678EXAMPLE"
    ],
    "SecretArn" : [
      "arn:aws:secretsmanager:us-east-1:123456789012:secret:test-secret"
    ]
  }
}
```

3. Output the RFC template JSON file to a file named ResetServSpecCredsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ResetServSpecCredsRfc.json
```

4. Modify and save the ResetServSpecCredsRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-22cbvc1yujhec",
  "ChangeTypeVersion": "1.0",
  "Title": "Testing ct-22cbvc1yujhec ResetServiceSpecificCredentials in region us-
east-1 for an IAM User"
}
```

5. Create the RFC, specifying the ResetServSpecCredsRfc file and the ResetServSpecCredsParams file:

```
aws amscm create-rfc --cli-input-json file://ResetServSpecCredsRfc.json  --
execution-parameters file://ResetServSpecCredsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-22cbvc1yujhec.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-ResetServiceSpecificCredentials",
  "Region" : "us-east-1",
  "Parameters" : {
    "Username" : [
      "testuser"
    ],
    "ServiceSpecificCredentialId" : [
      "ACCAR712345678EXAMPLE"
    ],
    "SecretArn" : [
      "arn:aws:secretsmanager:us-east-1:123456789012:secret:test-secret"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-ResetServiceSpecificCredentials",
  "Region" : "us-east-1",
  "Parameters" : {
    "Username" : [
      "testuser"
    ],
    "ServiceSpecificCredentialId" : [
      "ACCAR712345678EXAMPLE"
    ],
    "SecretArn" : [
      "arn:aws:secretsmanager:us-east-1:123456789012:secret:test-secret"
    ]
  }
}
```

Identity and Access Management (IAM) | Update Account Alias

Update an existing AWS account alias. Note that an AWS account can have only one alias. If you update the account alias, the new alias overwrites the previous alias, and the URL containing the previous alias stops working.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Update account alias

Change Type Details

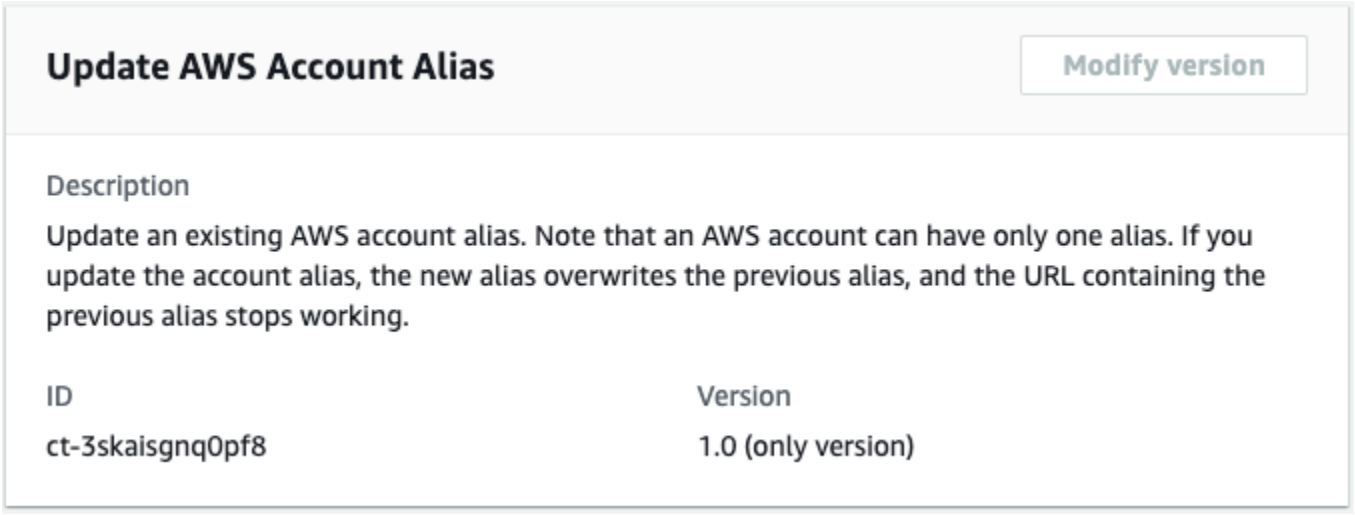
Change type ID	ct-3skaisgnq0pf8
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update IAM account alias

Updating IAM account alias with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating IAM account alias with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3skaisgnq0pf8" --change-type-
version "1.0" --title "Update Account Alias" --execution-parameters
 '{"DocumentName":"AWSManagedServices-CreateAccountAlias","Region":"us-
east-1","Parameters":{"AWSAccountAlias":["my-new-alias"], "ReplaceAliasIfExists":
["True"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateIamAccountAliasParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3skaisgnq0pf8"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateIamAccountAliasParams.json
   ```

2. Modify and save the UpdateIamAccountAliasParams file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-CreateAccountAlias",
       "Region": "us-east-1",
       "Parameters": {
           "AWSAccountAlias": [
               "my-new-alias"
           ],
           "ReplaceAliasIfExists": [
               "True"
           ]
       }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it UpdateIamAccountAliasRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateIamAccountAliasRfc.json
   ```

4. Modify and save the UpdateIamAccountAliasRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
       "ChangeTypeId": "ct-3skaisgnq0pf8",
   ```

```
    "ChangeTypeVersion": "1.0",
    "Title": "Update Account Alias"
}
```

5. Create the RFC, specifying the UpdateIamAccountAliasRfc file and the UpdateIamAccountAliasParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateIamAccountAliasRfc.json  --
execution-parameters file://UpdateIamAccountAliasParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about IAM, see the IAM User Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3skaisgnq0pf8.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-CreateAccountAlias",
  "Region": "us-east-1",
  "Parameters": {
    "AWSAccountAlias": ["myalias"],
    "ReplaceAliasIfExists": ["True"]
  }
}
```

Identity and Access Management (IAM) | Update Entity or Policy (Read-Write Permissions)

Update Identity and Access Management (IAM) role or policy with read-write permissions. You must have enabled this feature with change type ct-1706xvvk6j9hf before submitting this request. Automated IAM provisioning with read-write permissions runs over 200 validations to help ensure successful outcomes.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Update entity or policy (read-write permissions)

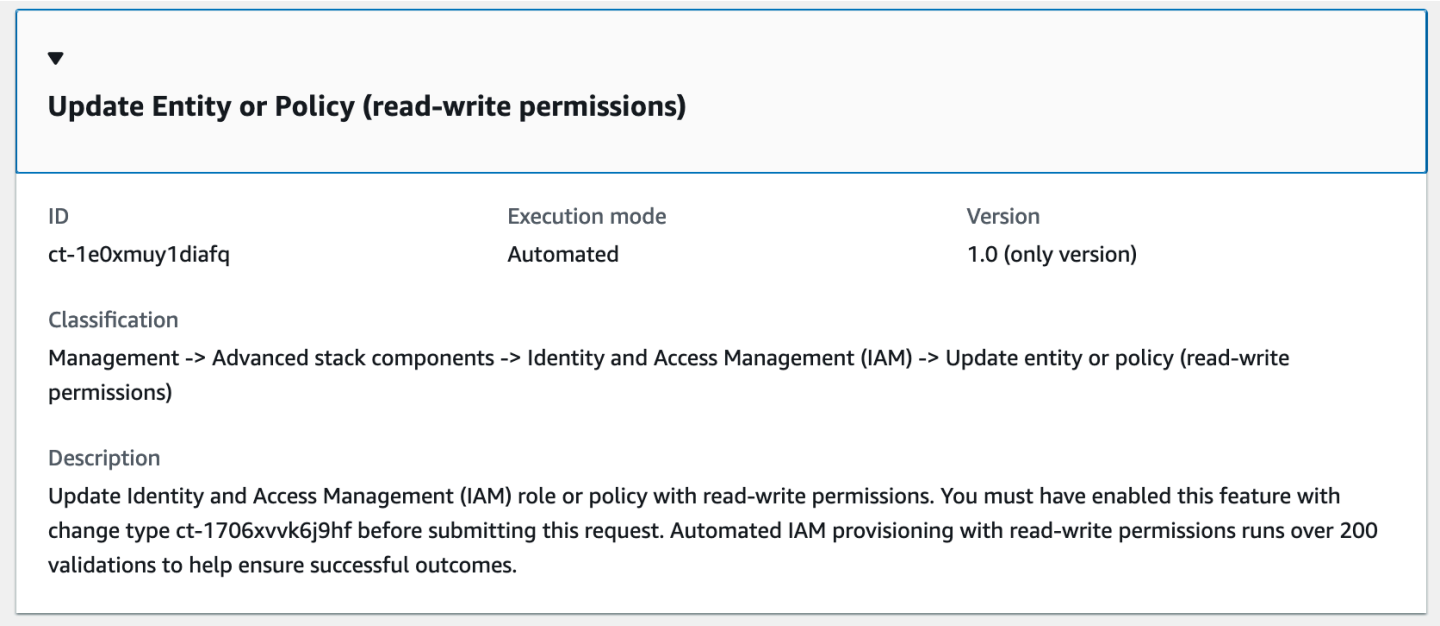
Change Type Details

Change type ID	ct-1e0xmuy1diafq
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Automated

Additional Information

Update IAM entity or policy

Updating IAM entity or policy with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating IAM entity or policy with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1e0xmuy1diafq" --change-type-version
 "1.0" --title "Update role or policy" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-HandleAutomatedIAMProvisioningUpdate-Admin\",\"Region
\":\"us-east-1\",\"Parameters\":{\"ValidateOnly\":\"No\"},\"RoleDetails
\":{\"Roles\":[{\"RoleName\":\"RoleTest01\",\"Description\":\"This is a test
 role\",\"AssumeRolePolicyDocument\":\"{\\\"Version\\\":\\\"2012-10-17\\\",\
\\"Statement\\\":[{\\\"Effect\\\":\\\"Allow\\\",\\\"Principal\\\":{\\\"AWS\\
\":\\\"arn:aws:iam::123456789012:root\\\"},\\\"Action\\\":\\\"sts:AssumeRole\
\\"}]}\",\"ManagedPolicyArns\":[\"arn:aws:iam::123456789012:policy/policy01\",
\"arn:aws:iam::123456789012:policy/policy02\"],\"MaxSessionDuration\":\"7200\",
\"PermissionsBoundary\":\"arn:aws:iam::123456789012:policy/permission_boundary01\"}]},
\"ManagedPolicyDetails\":{\"Policies\":[{\"ManagedPolicyName\":\"TestPolicy01\",
\"PolicyDocument\":\"{\\\"Version\\\":\\\"2012-10-17\\\",\\\"Statement\\\":
[{\\\"Sid\\\":\\\"AllQueueActions\\\",\\\"Effect\\\":\\\"Allow\\\",\\\"Action
\\\":\\\"sqs:ListQueues\\\",\\\"Resource\\\":\\\"*\\\",\\\"Condition\\\":{\\
\"ForAllValues:StringEquals\\\":{\\\"aws:tagKeys\\\":[\\\"temporary\\\"]}}}]}\"}]}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it UpdateIamResourceParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1e0xmuy1diafq"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateIamResourceParams.json
   ```

2. Modify and save the UpdateIamResourceParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName" : "AWSManagedServices-HandleAutomatedIAMProvisioningUpdate-Admin",
   ```

```
  "Region" : "us-east-1",
  "Parameters": {
    "ValidateOnly": "No"
  },
  "RoleDetails": {
    "Roles": [
      {
        "RoleName": "RoleTest01",
        "Description": "This is a test role",
        "AssumeRolePolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root\"},
\"Action\":\"sts:AssumeRole\"}]}",
        "ManagedPolicyArns": [
          "arn:aws:iam::123456789012:policy/policy01",
          "arn:aws:iam::123456789012:policy/policy02"
        ],
        "MaxSessionDuration": "7200",
        "PermissionsBoundary": "arn:aws:iam::123456789012:policy/
permission_boundary01"
      }
    ]
  },
  "ManagedPolicyDetails": {
    "Policies": [
      {
        "ManagedPolicyName": "TestPolicy01",
        "PolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"AllQueueActions\",\"Effect\":\"Allow\",\"Action\":\"sqs:ListQueues\",\"Resource
\":\"*\",\"Condition\":{\"ForAllValues:StringEquals\":{\"aws:tagKeys\":[\"temporary
\"]}}}]}"
      }
    ]
  }
}
```

3. Output the RFC template JSON file to a file named UpdateIamResourceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateIamResourceRfc.json
```

4. Modify and save the UpdateIamResourceRfc.json file. For example, you can replace the contents with something like this:

```
{
```

```
    "ChangeTypeVersion": "1.0",
    "ChangeTypeId": "ct-1e0xmuy1diafq",
    "Title": "Update entity or policy (read-write permissions)"
}
```

5. Create the RFC, specifying the UpdateIamResourceRfc file and the UpdateIamResourceParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateIamResourceRfc.json  --
execution-parameters file://UpdateIamResourceParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- For information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM) and for policy information, see Managed policies and inline policies. For information about AMS permissions, see Deploying IAM resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1e0xmuy1diafq.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAutomatedIAMProvisioningUpdate-Admin",
  "Region" : "us-east-1",
  "Parameters": {"ValidateOnly":  "No"}
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAutomatedIAMProvisioningUpdate-Admin",
  "Region" : "us-east-1",
  "Parameters": {
    "ValidateOnly": "No"
```

```
  },
  "RoleDetails": {
    "Roles": [
      {
        "RoleName": "RoleTest01",
        "Description": "This is a test role",
        "AssumeRolePolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":
[{\"Effect\":\"Allow\",\"Principal\":{\"AWS\":\"arn:aws:iam::123456789012:root\"},
\"Action\":\"sts:AssumeRole\"}]}",
        "ManagedPolicyArns": [
          "arn:aws:iam::123456789012:policy/policy01",
          "arn:aws:iam::123456789012:policy/policy02"
        ],
        "MaxSessionDuration": "7200",
        "PermissionsBoundary": "arn:aws:iam::123456789012:policy/permission_boundary01"
      }
    ]
  },
  "ManagedPolicyDetails": {
    "Policies": [
      {
        "ManagedPolicyName": "TestPolicy01",
        "PolicyDocument": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Sid\":
\"AllQueueActions\",\"Effect\":\"Allow\",\"Action\":\"sqs:ListQueues\",\"Resource\":\"*
\",\"Condition\":{\"ForAllValues:StringEquals\":{\"aws:tagKeys\":[\"temporary\"]}}}]}"
      }
    ]
  }
}
```

Identity and Access Management (IAM) | Update Entity or Policy (Review Required)

Update Identity and Access Management (IAM) user, role, or policy.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Update entity or policy (review required)

Change Type Details

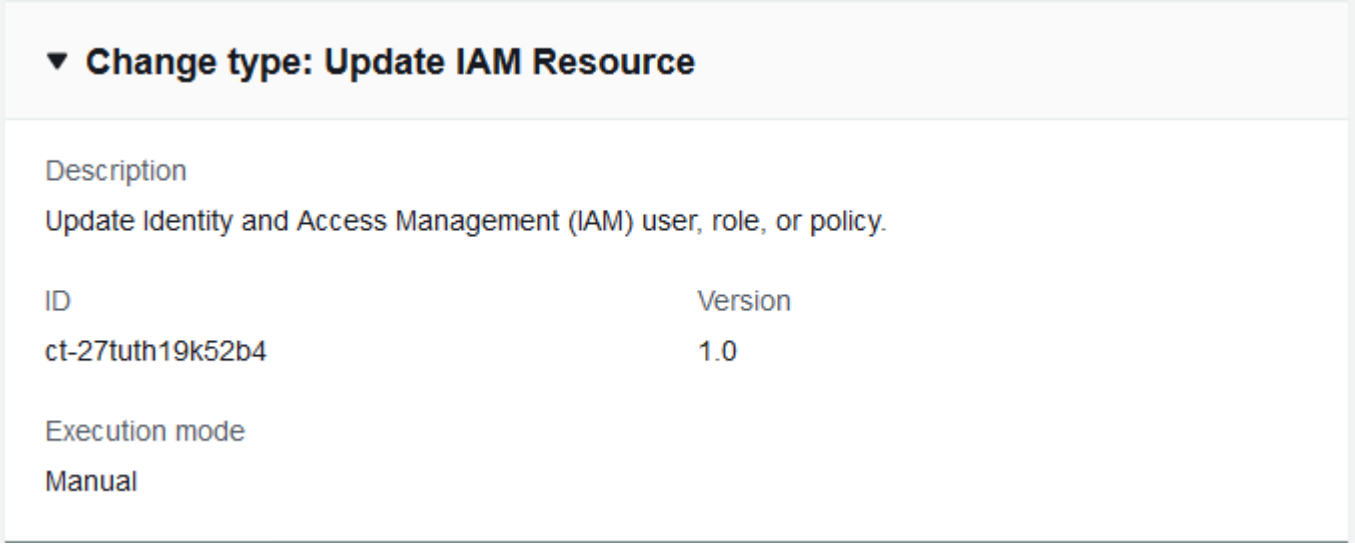
Change type ID	ct-27tuth19k52b4

Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update IAM entity or policy

Updating IAM Resources with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating IAM Resources with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-27tuth19k52b4" --change-type-version "1.0"
 --title "TestIamUpdate" --execution-parameters "{\"UseCase\":\"IAM_RESOURCE_DETAILS\",
\"IAM Role\":[{\"RoleName\":\"ROLE_NAME\",\"TrustPolicy\":\"TRUST_POLICY\",
\"RolePermissions\":\"ROLE_PERMISSIONS\"}],\"Operation\":\"Update\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateIamResourceParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-27tuth19k52b4"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateIamResourceParams.json
   ```

2. Modify and save the UpdateIamResourceParams file. For example, you can replace the contents with something like this:

   ```
   {
     "UseCase": "IAM_RESOURCE_DETAILS",
     "IAM Role": [
       {
         "RoleName": "codebuild_ec2_test_role",
   ```

```
      "TrustPolicy": "{\"Version\":\"2008-10-17\",\"Statement\":[{\"Effect\":
\"Allow\",\"Principal\":{\"Service\":\"codebuild.amazonaws.com\"},\"Action\":
\"sts:AssumeRole\"}]}",
      "RolePermissions": "{\"Version\":\"2012-10-17\",\"Statement\":[{\"Effect\":
\"Allow\",\"Action\":[\"ec2:DescribeInstanceStatus\"],\"Resource\":\"*\"}]}"
    }
  ],
  "Operation": "Update"
}
```

3. Output the RFC template JSON file to a file; this example names it UpdateIamResourceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateIamResourceRfc.json
```

4. Modify and save the UpdateIamResourceRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "1.0",
"ChangeTypeId": "ct-27tuth19k52b4",
"Title": "Update IAM Roles"
}
```

5. Create the RFC, specifying the UpdateIamResourceRfc file and the UpdateIamResourceParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateIamResourceRfc.json  --
execution-parameters file://UpdateIamResourceParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- Important. We cannot update or modify AMS default and AMS self-service provisioning service (SSPS) IAM entities as per our technical standards, with some exceptions. As an alternative we can create a clone of these entities with a custom name and required permission set to deploy in your account.

- When using manual (approval required) CTs, AMS recommends that you use the ASAP option (choose ASAP in the console, leave start and end time blank in the API/CLI) as these CTs require an AMS operator to examine the RFC, and possibly communicate with you before it can be approved and run.
- We cannot update or modify AMS default or AMS self-service provisioning service (SSPS) IAM entities. If you require similar set of permissions that are provided in the default and SSPS IAM entities, we can create a clone of the entities with a custom name that you can provide us within the RFC execution parameters (**UseCase**).

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-27tuth19k52b4.

Example: Required Parameters

```
{
  "UseCase": "Use case...",
  "Operation": "Update"
}
```

Example: All Parameters

```
{
  "UseCase": "Use case...",
  "IAM User": [
    {
      "UserName": "user-a",
      "UserPermissions": "Power User permissions",
      "Tags": [
        {
          "Key": "foo",
          "Value": "bar"
        },
```

```
        {
          "Key": "testkey",
          "Value": "testvalue"
        }
      ]
    }
  ],
  "IAM Role": [

Identity and Access Management (IAM) | Update MaxSessionDuration

Update the MaxSessionDuration property of an AWS Identity and Access Management (IAM) role. This setting determines the maximum duration that can be requested using the DurationSeconds parameter when assuming an IAM role.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Update MaxSessionDuration

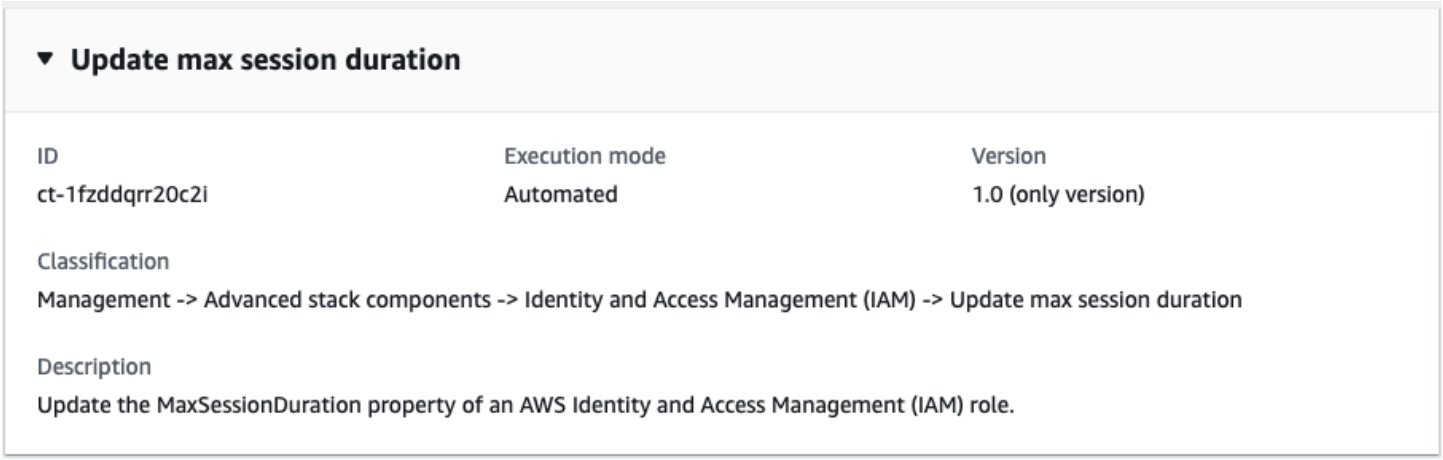
Change Type Details

Change type ID	ct-1fzddqrr20c2i
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update IAM role MaxSessionDuration

Updating an IAM Max Session Duration with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an IAM Max Session Duration with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

> **Note**
>
> When pasting in a policy document, note that the RFC only accepts policy pastes up to 5,000 characters. If your file has more than 5,000 characters, create a service request to upload the policy and then refer to that service request in the RFC that you open for IAM.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-1fzddqrr20c2i" \
--change-type-version "1.0" --title "Update max session duration" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
UpdateIAMRoleMaxSessionDuration\",\"Region\":\"us-east-1\",\"Parameters\":{\"RoleName
\":[\"role-name\"],\"MaxSessionDuration\":[3600]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; example names it UpdateMaxSessDurationParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1fzddqrr20c2i"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateMaxSessDurationParams.json
   ```

2. Modify and save the UpdateMaxSessDurationParams file; example creates an IAM Role with policy documents pasted inline.

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateIAMRoleMaxSessionDuration",
     "Region": "us-east-1",
     "Parameters": {
       "RoleName": [
         "role-name"
       ],
       "MaxSessionDuration": [
   ```

```
      3600
    ]
  }
}
```

3. Output the RFC template JSON file to a file named UpdateMaxSessDurationRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateMaxSessDurationRfc.json
```

4. Modify and save the UpdateMaxSessDurationRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-1fzddqrr20c2i",
  "Title": "Update max session duration"
}
```

5. Create the RFC, specifying the UpdateMaxSessDurationRfc file and the UpdateMaxSessDurationParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateMaxSessDurationRfc.json  --
execution-parameters file://UpdateMaxSessDurationParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1fzddqrr20c2i.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

Identity and Access Management (IAM) | Update SAML Identity Provider

Update IAM identity provider using the SAML metadata document file that you stored in your chosen S3 bucket.

Full classification: Management | Advanced stack components | Identity and Access Management (IAM) | Update SAML identity provider

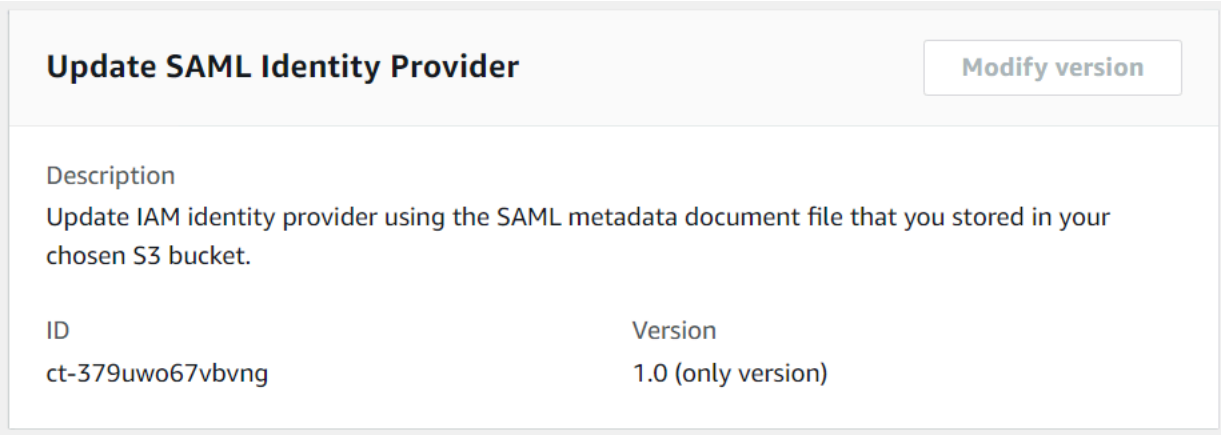
Change Type Details

Change type ID	ct-379uwo67vbvng
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update IAM SAML identity provider

Updating IAM SAML identity providers with the Console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating IAM SAML identity providers with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-379uwo67vbvng" --change-type-version "1.0"
 --title "Update SAML Identity Provider" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-HandleUpdateSamlProvider-Admin\",\"Region\":\"us-east-1\",
\"Parameters\":{\"SAMLMetadataDocumentURL\":[\"s3://bucket.name/idp-metadata.xml\"],
\"SAMLProviderArn\":[\"arn:aws:iam::123456789012:saml-provider/customer-saml\"],
\"SAMLProviderBackup\":[\"True\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateIamSamlIdpParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-379uwo67vbvng"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateIamSamlIdpParams.json
   ```

2. Modify and save the UpdateIamSamlIdpParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName" : "AWSManagedServices-HandleUpdateSamlProvider-Admin",
     "Region" : "us-east-1",
     "Parameters" : {
       "SAMLMetadataDocumentURL" : [
         "s3://bucket.name/idp-metadata.xml"
       ],
       "SAMLProviderArn" : [
         "arn:aws:iam::123456789012:saml-provider/customer-saml"
       ],
       "SAMLProviderBackup" : [
         "True"
       ]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it UpdateIamSamlIdpRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateIamSamlIdpRfc.json
```

4. Modify and save the UpdateIamSamlIdpRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "1.0",
"ChangeTypeId": "ct-379uwo67vbvng",
"Title": "Update IAM SAML IDP"
}
```

5. Create the RFC, specifying the UpdateIamSamlIdpRfc file and the UpdateIamSamlIdpParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateIamSamlIdpRfc.json  --execution-
parameters file://UpdateIamSamlIdpParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about AWS Identity and Access Management, see AWS Identity and Access Management (IAM).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-379uwo67vbvng.

Example: Required Parameters

```
{

  "DocumentName" : "AWSManagedServices-HandleUpdateSamlProvider-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "SAMLMetadataDocumentURL" : [
      "s3://bucket/path/to/metadata.xml"
    ],
```

```
    "SAMLProviderArn" : [
      "arn:aws:iam::123456789012:saml-provider/customer-saml"
    ]
  }
}
```

Example: All Parameters

```
{

  "DocumentName" : "AWSManagedServices-HandleUpdateSamlProvider-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "SAMLMetadataDocumentURL" : [
      "s3://bucket/path/to/metadata.xml"
    ],
    "SAMLProviderArn" : [
      "arn:aws:iam::123456789012:saml-provider/customer-saml"
    ],
    "SAMLProviderBackup" : [
      "True"
    ]
  }
}
```

KMS Alias | Delete

Delete an alias of an AWS Key Management Service (KMS) customer master key (CMK).

Full classification: Management | Advanced stack components | KMS alias | Delete

Change Type Details

Change type ID	ct-04gzyy008v1bg
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required

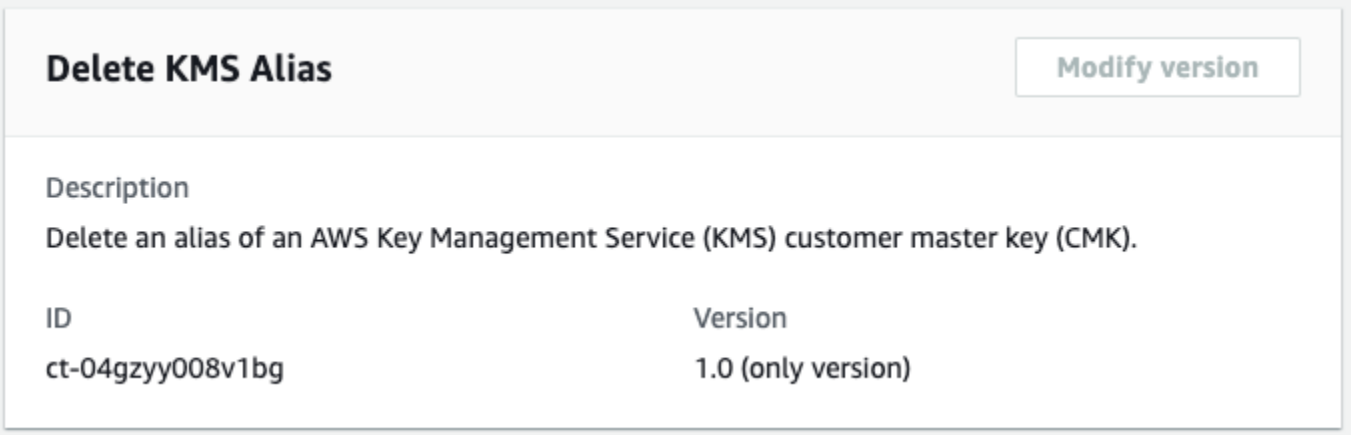
Execution mode	Automated

Additional Information

Delete an AWS KMS alias

Deleting an AWS KMS alias with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an AWS KMS alias with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title delete-kms-alias --change-type-id ct-04gzyy008v1bg --
change-type-version 1.0 --execution-parameters '{"DocumentName": "AWSManagedServices-
DeleteKMSAlias", "Region": "us-east-1", "Parameters": {"AliasName": ["my-test-key"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteKmsAliasParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-04gzyy008v1bg" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeleteKmsAliasParams.json
   ```

2. Modify and save the DeleteKmsAliasParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-DeleteKMSAlias",
     "Region": "us-east-1",
     "Parameters": {
       "AliasName": ["my-test-key"]
     }
   }
   ```

3. Output the RFC template JSON file to a file; this example names it DeleteKmsAliasRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteKmsAliasRfc.json
   ```

4. Modify and save the DeleteKmsAliasRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-04gzyy008v1bg",
"Title":                "delete-kms-alias"
}
```

5. Create the RFC, specifying the DeleteKmsAlias Rfc file and the DeleteKmsAliasParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteKmsAliasRfc.json  --execution-
parameters file://DeleteKmsAliasParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about KMS, see Key Management Service.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-04gzyy008v1bg.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-DeleteKMSAlias",
  "Region" : "us-east-1",
  "Parameters" : {
    "AliasName" : [
      "test-alias"
    ]
  }
}
```

Example: All Parameters

```
Example not available.
```

KMS Key | Delete (Review Required)

Delete an AWS Key Management Service (KMS) Key from an AMS account. By default, there is a 30 day waiting period before the key is deleted; during that period, you can restore the key using the KMS Key Update change type.

Full classification: Management | Advanced stack components | KMS key | Delete (review required)

Change Type Details

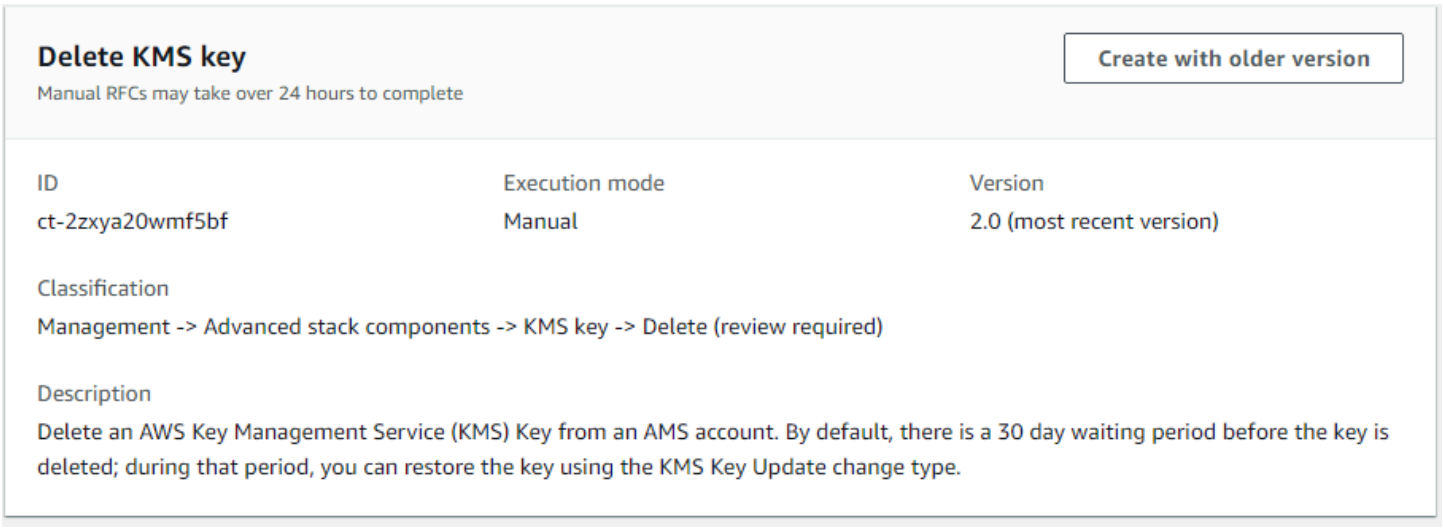
Change type ID	ct-2zxya20wmf5bf
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Delete KMS key (review required)

Deleting an AWS KMS Key (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an AWS KMS Key (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2zxya20wmf5bf" --change-type-version "2.0" --
title "TITLE" --execution-parameters "{\"KeyName\": \"example-kms-key\", \"Operation\":
 \"Delete\",\"KeyDeletionWaitPeriod\":30}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteKmsKeyParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2zxya20wmf5bf" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeleteKmsKeyParams.json
   ```

2. Modify and save the DeleteKmsKeyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "KeyName": "example-kms-key",
     "Operation": "Delete",
     "KeyDeletionWaitPeriod": 30
   }
   ```

3. Output the RFC template JSON file to a file; this example names it DeleteKmsKeyRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteKmsKeyRfc.json
   ```

4. Modify and save the DeleteKmsKeyRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "2.0",
   "ChangeTypeId":         "ct-2zxya20wmf5bf",
   "Title":                "KmsKey-Delete-RFC"
   }
   ```

5. Create the RFC, specifying the DeleteKmsKey Rfc file and the DeleteKmsKeyParams file:

   ```
   aws amscm create-rfc --cli-input-json file://DeleteKmsKeyRfc.json  --execution-
   parameters file://DeleteKmsKeyParams.json
   ```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

- To learn more about deleting KMS keys, see Deleting AWS KMS keys.
- This change type has moved to v2.0 with the addition of a new parameter, KeyDeletionWaitPeriod, that you use to set a delay in the key deletion, 7 - 30 days (30 days is the default).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2zxya20wmf5bf.

Example: Required Parameters

```
{
  "KeyName": "kms_key_name",
  "Operation": "Delete",
  "KeyDeletionWaitPeriod": 30
}
```

Example: All Parameters

```
{
  "KeyName": "kms_key_name",
  "Operation": "Delete",
  "KeyDeletionWaitPeriod": 30,
  "Priority": "Medium"
}
```

KMS Key | Enable Rotation

Enable automatic key rotation for an AWS Key Management Service (KMS) customer master key (CMK).

Full classification: Management | Advanced stack components | KMS key | Enable rotation

Change Type Details

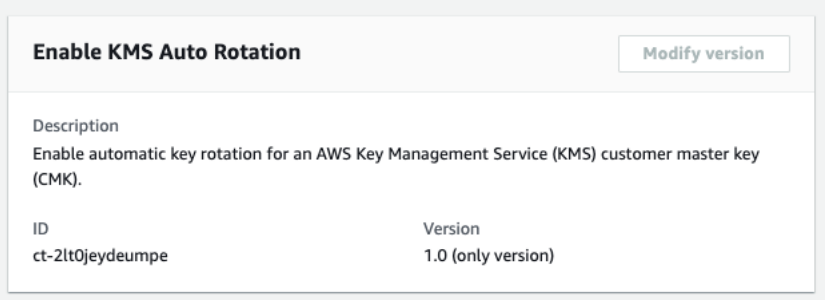
Change type ID	ct-2lt0jeydeumpe
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Enable automatic KMS key rotation

Enabling auto rotation for a AWS KMS key with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Enabling auto rotation for a AWS KMS key with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title kms-key-enable-rotation --change-type-id
 ct-2lt0jeydeumpe --change-type-version 1.0 --execution-parameters '{"DocumentName":
 "AWSManagedServices-EnableKMSKeyRotation", "Region": "us-east-1", "Parameters":
 {"KeyId": ["12345678-90ab-cdef-1234-567890abcdef"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it KmsKeyEnableRotationParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2lt0jeydeumpe"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    KmsKeyEnableRotationParams.json
   ```

2. Modify and save the KmsKeyEnableRotationParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-EnableKMSKeyRotation",
     "Region": "us-east-1",
     "Parameters": {
       "KeyId": [
         "12345678-90ab-cdef-1234-567890abcdef"
       ]
   ```

```
  }
}
```

3. Output the RFC template JSON file to a file; this example names it KmsKeyEnableRotationRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > KmsKeyEnableRotationRfc.json
```

4. Modify and save the KmsKeyEnableRotationRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-2lt0jeydeumpe",
  "Title": "enable-kms-rotation"
}
```

5. Create the RFC, specifying the KmsKeyEnableRotation Rfc file and the KmsKeyEnableRotationParams file:

```
aws amscm create-rfc --cli-input-json file://KmsKeyEnableRotationRfc.json  --
execution-parameters file://KmsKeyEnableRotationParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about KMS, see Key Management Service.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2lt0jeydeumpe.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-EnableKMSKeyRotation",
  "Region": "us-east-1",
  "Parameters": {
```

```
    "KeyId": [
      "58c399bf-1662-4d55-8bbe-fb6d26bd72b9"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-EnableKMSKeyRotation",
  "Region": "us-east-1",
  "Parameters": {
    "KeyId": [
      "arn:aws:kms:us-east-1:123456789012:key/58c399bf-1662-4d55-8bbe-fb6d26bd72b9"
    ]
  }
}
```

KMS Key | Share (Review Required)

Allow cross-account access to a KMS key by adding a statement to the key policy with encrypt and decrypt permissions.

Full classification: Management | Advanced stack components | KMS key | Share (review required)

Change Type Details

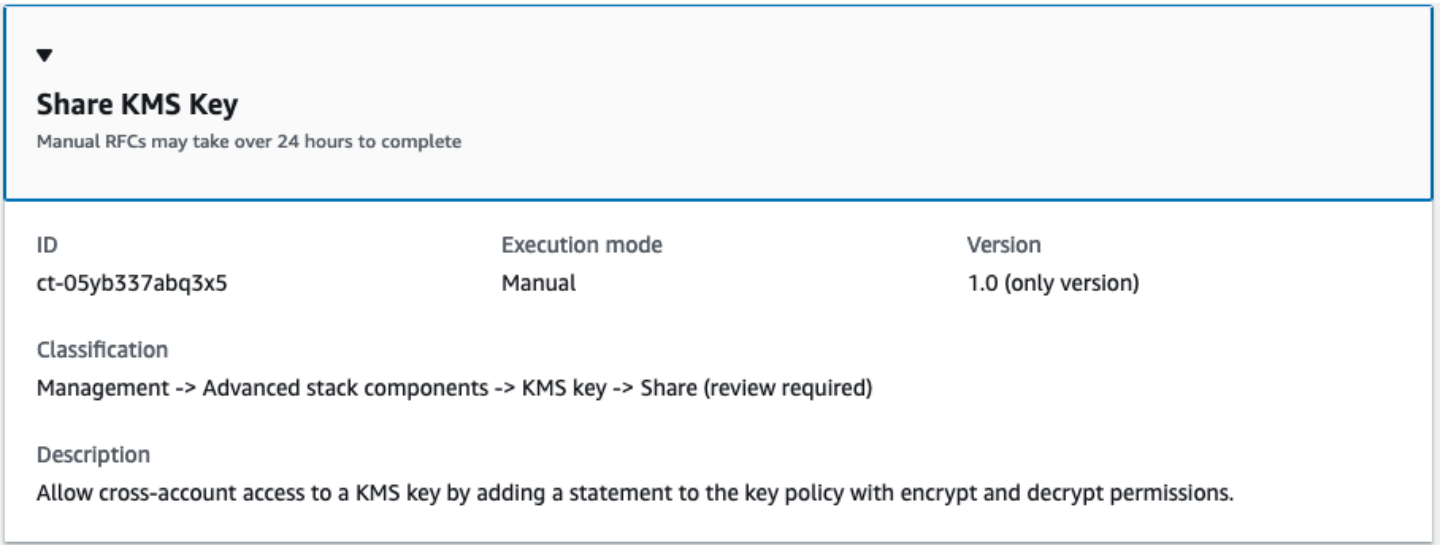
Change type ID	ct-05yb337abq3x5
Current version	1.0
Expected execution duration	30 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Share AWS KMS Key

Share an AWS KMS key with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Share an AWS KMS key with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title="Add Static Route" --description="Share KMS Key"
 --ct-id="ct-05yb337abq3x5" --ct-version="1.0" --input-params="{\"KMSKeyArn\":
\"arn:aws:kms:us-east-1:111122223333:key/06506094-64e2-47f3-94bd-f919eefa22f5\",
\"TargetAccountId\":\"000000000000\",\"IncludeKeyGrantOperations\":\"false\",
\"IAMUserOrRole\":\"arn:aws:iam::000000000000:role/role-name\", \"Priority\":\"High\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ShareKmsKeyParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-05yb337abq3x5" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > ShareKmsKeyParams.json
   ```

   Modify and save the ShareKmsKeyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "Share KMS Key",
     "Parameters": {
       "KMSKeyArn": "arn:aws:kms:us-east-1:111122223333:key/06506094-64e2-47f3-94bd-
   f919eefa22f5",
       "TargetAccountId": "000000000000",
       "IncludeKeyGrantOperations": "false"
       "IAMUserOrRole": "arn:aws:iam::000000000000:role/role-name"
     }
   }
   ```

2. Output the RFC template to a file in your current folder; this example names it ShareKmsKeyParamsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ShareKmsKeyParamsRfc.json
```

3. Modify and save the ShareKmsKeyParams.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeId": {
  "ChangeTypeVersion":    "1.0",
  "ChangeTypeId":         "ct-05yb337abq3x5",
  "Title":                "Share KMS Key"
}
```

4. Create the RFC, specifying the ShareKmsKeyParamsRfc file and the ShareKmsKeyParams file:

```
aws amscm create-rfc --cli-input-json file://ShareKmsKeyParamsRfc.json --execution-
parameters file://ShareKmsKeyParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

To log in to the instance through a bastion, follow the next procedure, Instance access examples.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-05yb337abq3x5.

Example: Required Parameters

```
{
  "KMSKeyArn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "TargetAccountId": "123456789012"
}
```

Example: All Parameters

```
{
```

```
  "KMSKeyArn": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "IncludeKeyGrantPermissions": true,
  "TargetAccountId": "111122223333",
  "IAMUserOrRoleARN": "arn:aws:iam::123456789012:role/my_role",
  "Priority": "Medium"
}
```

KMS Key | Update (Review Required)

Request an update of a KMS Key.

Full classification: Management | Advanced stack components | KMS key | Update (review required)

Change Type Details

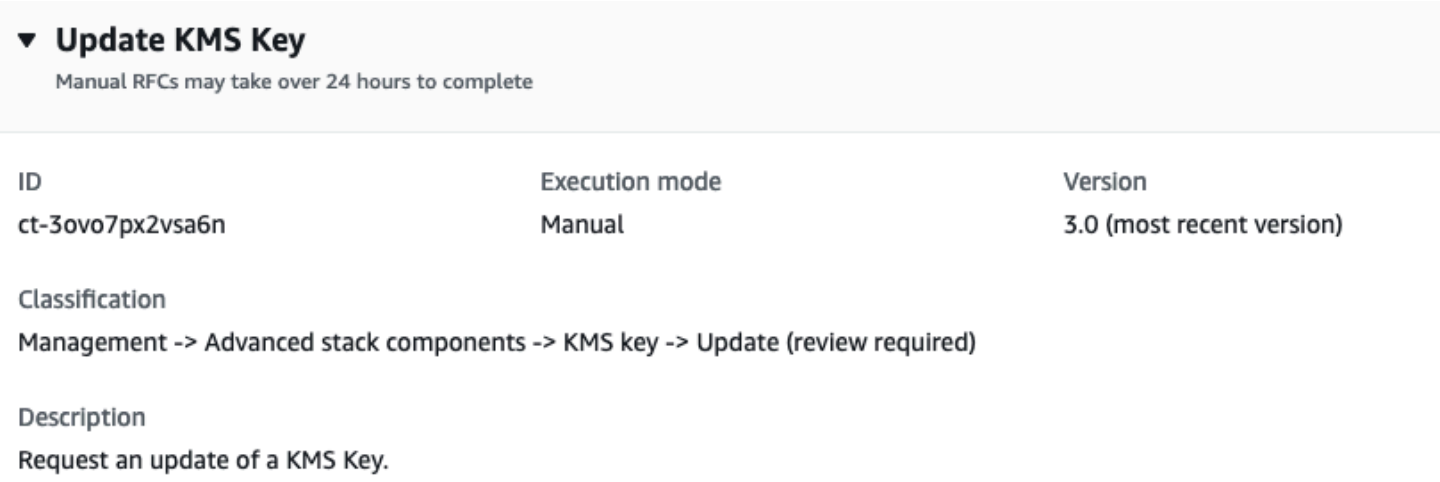
Change type ID	ct-3ovo7px2vsa6n
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update KMS key (review required)

Updating an AWS KMS Key (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an AWS KMS Key (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3ovo7px2vsa6n" --change-type-version "3.0"
 --title "TITLE" --execution-parameters "{\"KeyDescription\": \"Example description\",
 \"KeyPermissions\": \"key permissions\", \"PolicyAction\": \"Replace\", \"Operation\":
 \"Update\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateKmsKeyParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3ovo7px2vsa6n" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateKmsKeyParams.json
   ```

2. Modify and save the UpdateKmsKeyParams file. For example, you can replace the contents with something like this:

   ```
   {
   "KeyDescription": "KMS key request",
   "PolicyAction": "Replace",
   "KeyPermissions": "{\"Id\":\"key-consolepolicy-3\",\"Version\":\"2012-10-17\",
   \"Statement\":[{\"Sid\":\"Allow use of the key\",\"Effect\":\"Allow\",\"Principal
   \":{\"AWS\":[\"arn:aws:iam::111122223333:role/KMSRole\"]},\"Action\":[\"kms:Encrypt
   \",\"kms:Decrypt\",\"kms:ReEncrypt*\",\"kms:GenerateDataKey*\",\"kms:DescribeKey
   \"],\"Resource\":\"*\"}]}",
   "Operation": "Update"
   }
   ```

3. Output the RFC template JSON file to a file; this example names it UpdateKmsKeyRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateKmsKeyRfc.json
   ```

4. Modify and save the UpdateKmsKeyRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "3.0",
   "ChangeTypeId":         "ct-3ovo7px2vsa6n",
   "Title":                "KmsKey-Update-RFC"
   }
   ```

5. Create the RFC, specifying the UpdateKmsKey Rfc file and the UpdateKmsKeyParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateKmsKeyRfc.json  --execution-
parameters file://UpdateKmsKeyParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type has moved to v2.0 with the addition of new parameter options for the KeyStatus parameter. You can now choose to cancel a KMS key deletion operation and enable or disable the key.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

To learn more about AWS KMS keys, see AWS Key Management Service (KMS), AWS Key Management Service FAQs, and AWS Key Management Service Concepts.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3ovo7px2vsa6n.

Example: Required Parameters

```
{
  "TargetKeyARN": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "Operation": "Update"
}
```

Example: All Parameters

```
{
  "KeyDescription": "Exmample description of the key to be created.",
  "TargetKeyARN": "arn:aws:kms:us-
east-2:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab",
  "AliasName": "kms_key_name",
  "KeyStatus": "Enabled",
  "KeyRotation": true,
  "KeyPermissions": "KMS Key permissions to add: kms:Get",
  "Tags": [
    {
      "Key": "foo",
      "Value": "bar"
    },
    {
      "Key": "testkey",
      "Value": "testvalue"
    }
  ],
  "Operation": "Update",
  "Priority": "Medium"
}
```

Load Balancer (ELB) Stack | Replace Listener Certificate

Replace the certificate of an existing Elastic (Classic) Load Balancer (ELB) listener. Use the RemediateDrift parameter to have the automation try to remediate the stack drift, if drift is introduced in the CloudFormation stack that was used to create the load balancer.

Full classification: Management | Advanced stack components | Load balancer (ELB) stack | Replace listener certificate

Change Type Details

Change type ID	ct-0aqx5t0pgfzbg
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required

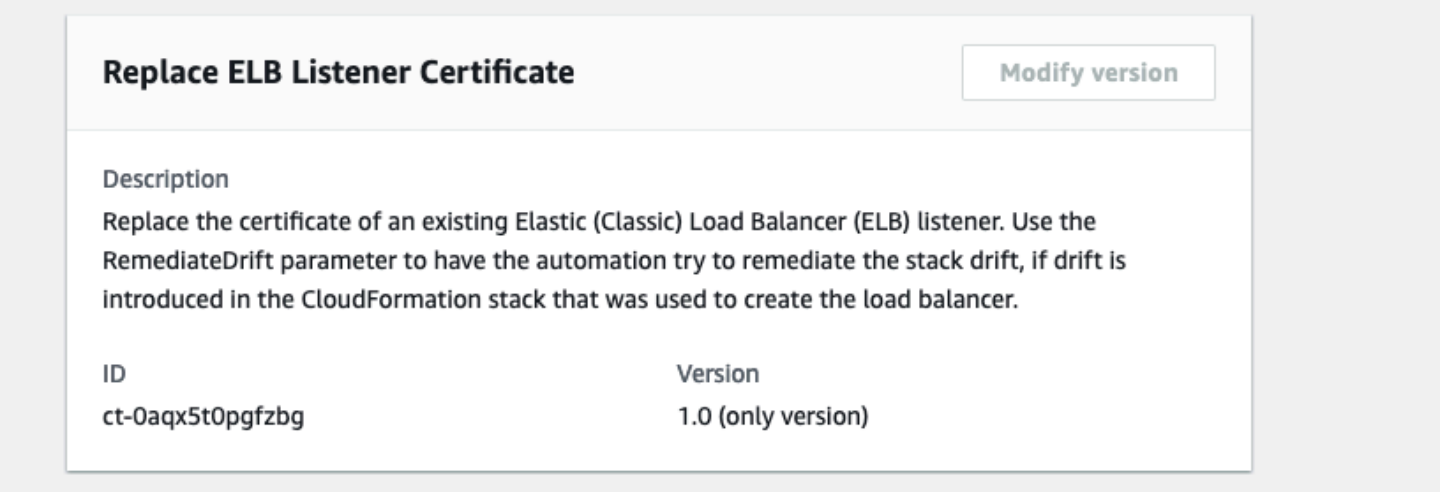
Customer approval	Not required
Execution mode	Automated

Additional Information

Replace an ELB listener certificate

Replacing an ELB listener certificate with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Replacing an ELB listener certificate with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  create-rfc --change-type-id "ct-0aqx5t0pgfzbg" --change-type-version
 "1.0" --title "Replace listener certificate" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-SetClassicLoadBalancerCertificate\",\"Region\": \"us-
east-1\",\"Parameters\":{\"LoadBalancerName\":[\"testalb\"],\"SSLCertificateArn
\":[\"arn:aws:acm:us-east-1:123456789012:certificate/c96c73cd-d082-4fa9-
bbf2-09d8600d84ad\"],"LoadBalancerPort":[\"443\"],\"RemediateStackDrift\":[\"True\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it ReplaceListCertParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0aqx5t0pgfzbg"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ReplaceListCertParams.json
   ```

2. Modify and save the ReplaceListCertParams file. The values given in the example reflect a deployment of a Public ELB, with the health check thresholds relaxed and the ELBScheme set to `true` (for a public ELB). Note that the `Name` you set here is not the actual ELB name, you can find that name in the console as the ELB instance name. Not all optional parameters are shown in the example.

   ```
   {
       "DocumentName": "AWSManagedServices-SetClassicLoadBalancerCertificate",
       "Region": "us-east-1",
       "Parameters": {
           "LoadBalancerName": [
               "testalb"
   ```

```
        ],
        "SSLCertificateArn": [
            "arn:aws:acm:us-east-1:123456789012:certificate/c96c73cd-d082-4fa9-
bbf2-09d8600d84ad"
        ],
        "LoadBalancerPort":[
             "443"
         ]
        "RemediateStackDrift": [
            "True"
        ]
    }
}
```

3. Output the RFC template to a file in your current folder; this example names it ReplaceListCertRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ReplaceListCertRfc.json
```

4. Modify and save the ReplaceListCertRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0aqx5t0pgfzbg",
"Title":                "My-ELB-Create-RFC"
}
```

5. Create the RFC, specifying the ReplaceListCertRfc file and the ReplaceListCertParams file:

```
aws amscm create-rfc --cli-input-json file://ReplaceListCertRfc.json --execution-
parameters file://ReplaceListCertParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the load balancer, look in the execution output: Use the `stack_id` to view the ELB in the Cloud Formation console or to create a Delete Stack RFC, use the ELBCName value to programmatically access the ELB.

Tips

For information about Application Load Balancers, see Application Load Balancers.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0aqx5t0pgfzbg.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-SetClassicLoadBalancerCertificate",
    "Region": "us-east-1",
    "Parameters": {
        "LoadBalancerName": [
            "testclassiclb"
        ],
        "SSLCertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-SetClassicLoadBalancerCertificate",
    "Region": "us-east-1",
    "Parameters": {
        "LoadBalancerName": [
            "testclassiclb"
        ],
        "LoadBalancerPort": [
            "443"
        ],
        "RemediateStackDrift": [
            "False"
        ],
        "SSLCertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
```

```
        ]
    }
}
```

Load Balancer (ELB) Stack | Update

Modify the properties of an existing Amazon ELB Classic Load Balancer created using CT id ct-12amsdz909cfh, version 3.0.

Full classification: Management | Advanced stack components | Load balancer (ELB) stack | Update

Change Type Details

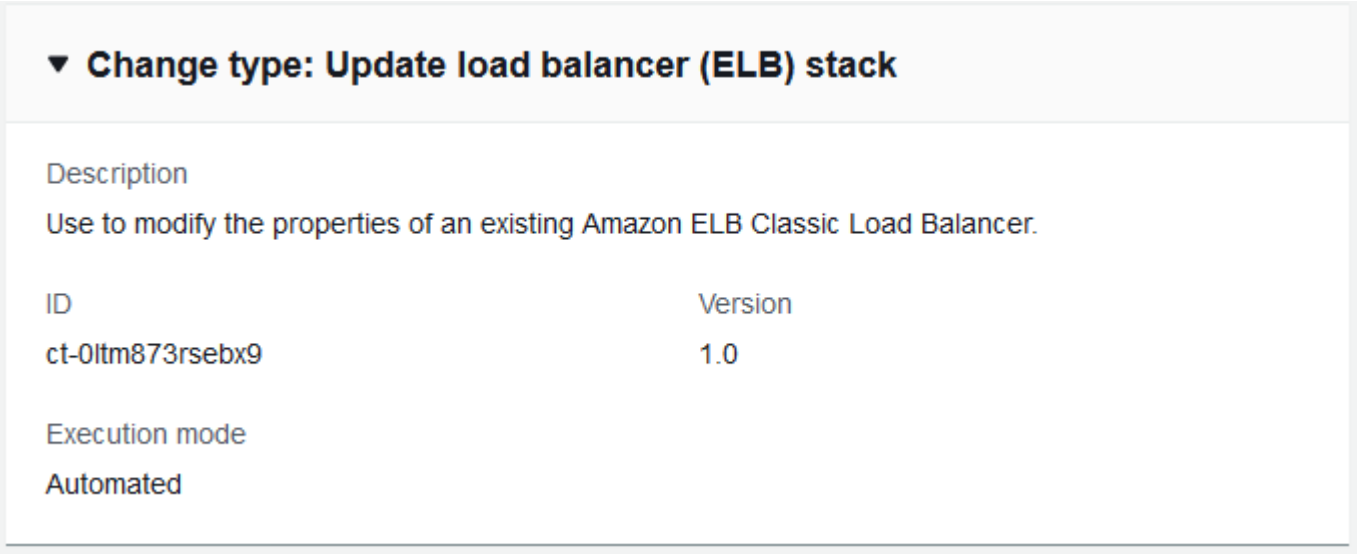
Change type ID	ct-0ltm873rsebx9
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update ELB load balancer

Updating an Elastic Load Balancer with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an Elastic Load Balancer with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title my-db-instance --change-type-id
 ct-0ltm873rsebx9 --change-type-version 3.0 --execution-parameters
 '{"VpcId":"VPC_ID","StackId":"STACK_ID","Parameters":{"ELBBackendInstances":
["INSTANCE_ID1","INSTANCE_ID2"], "ELBIdleTimeout": "600"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdateElbParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0ltm873rsebx9" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateElbParams.json
   ```

2. Modify and save the UpdateElbParams file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":      "ELB-Update",
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-sdhopv00000000000",
   "Name":             "My-ELB",

   "Parameters":   {
       "ELBSubnetIds":  ["PUBLIC_AZ1", "PUBLIC_AZ2"],
       "ELBHealthCheckHealthyThreshold":   2,
       "ELBHealthCheckInterval":           30,
       "ELBHealthCheckTarget":             "HTTP:80/status",
       "ELBHealthCheckTimeout":            10,
       "ELBHealthCheckUnhealthyThreshold": 3,
       "ELBScheme":                        true
       }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it UpdateElbRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateElbRfc.json
   ```

4. Modify and save the UpdateElbRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-0ltm873rsebx9",
"Title":                "ELB-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateElbRfc file and the UpdateElbParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateElbRfc.json --execution-
parameters file://UpdateElbParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. You might need to submit a Management | Other | Other | Update change type to open ports and associate security groups, see Other | Other requests.

Tips

To learn more about AWS Classic Load Balancers, see What Is a Classic Load Balancer?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0ltm873rsebx9.

Example: Required Parameters

```
{
  "VpcId": "vpc-01234567890abcdef",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {
  }
}
```

Example: All Parameters

```
{
```

```
  "VpcId": "vpc-01234567890abcdef",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {
    "ELBSubnetIds": ["subnet-a0b1c2d3", "subnet-a0b2c9d8"],
    "ELBHealthCheckHealthyThreshold": 2,
    "ELBHealthCheckInterval": 10,
    "ELBHealthCheckTarget": "HTTP:80/index.html",
    "ELBHealthCheckTimeout": 10,
    "ELBHealthCheckUnhealthyThreshold": 3,
    "ELBIdleTimeout": 30,
    "ELBInstancePort": "80",
    "ELBInstanceProtocol": "HTTPS",
    "ELBCookieExpirationPeriod": "60",
    "ELBCookieStickinessPolicyName": "MyPolicy",
    "ELBLoadBalancerPort": "443",
    "ELBLoadBalancerProtocol": "HTTP",
    "ELBSSLCertificateId": "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012",
    "ELBCrossZone": true,
    "ELBBackendInstances": ["i-1234567a", "i-1234567b"],
    "ELBInstancePort2": "80",
    "ELBInstanceProtocol2": "HTTPS",
    "ELBCookieExpirationPeriod2": "60",
    "ELBCookieStickinessPolicyName2": "MyPolicy2",
    "ELBLoadBalancerPort2": "445",
    "ELBLoadBalancerProtocol2": "HTTP",
    "ELBSSLCertificateId2": "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
  }
}
```

Network Load Balancer | Add Listener Certificate

Add a certificate to the specified Network Load Balancer (NLB) listener. Use the RemediateStackDrift parameter for the automation to try to remediate drift, if it is introduced.

Full classification: Management | Advanced stack components | Network Load Balancer | Add listener certificate

Change Type Details

Change type ID	ct-35p977vul06df

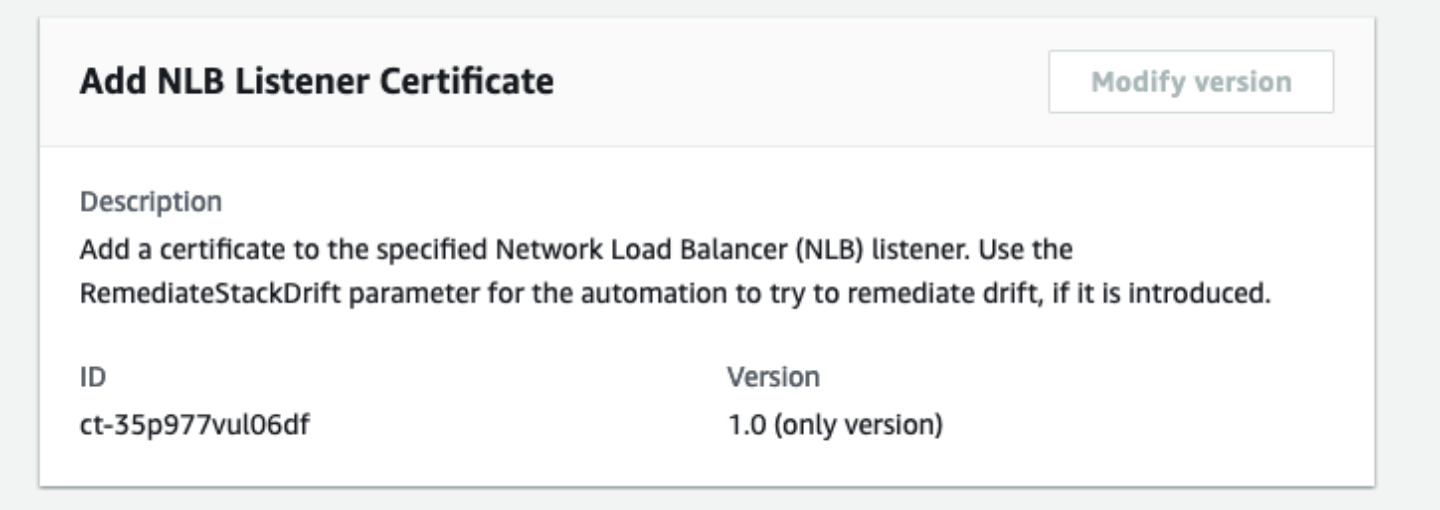
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add NLB listener certificate

Adding a listener certificate to an NLB with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding a listener certificate to an NLB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  create-rfc --change-type-id "ct-35p977vul06df" --change-type-version
 "1.0" --title "Add listener certificate NLB" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-AddCertificateToElbv2Listener\",\"Region\": \"us-
east-1\",\"Parameters\":{\"ListenerArn\":[\"arn:aws:elasticloadbalancing:us-
east-1:123456789012:listener/app/testalb/fc656bcb5cacb3ae/a0c0da77f9b1461e\"],
\"CertificateArn\":[\"arn:aws:acm:us-east-1:123456789012:certificate/
ecb242e8-3da5-4da6-813c-17040f086fba\"],\"IsDefault\":[\"False\"],\"RemediateStackDrift
\":[\"True\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file. For example, you can replace the contents with something like this:

   ```
   aws amscm get-change-type-version --change-type-id "ct-35p977vul06df"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    AddNlbListenerCertParams.json
   ```

2. Modify and save the AddNlbListenerCertParams file. For example:

   ```
   {
       "DocumentName": "AWSManagedServices-AddCertificateToElbv2Listener",
       "Region": "us-east-1",
       "Parameters": {
   ```

```
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/
testalb/fc656bcb5cacb3ae/a0c0da77f9b1461e"
        ],
        "CertificateArn": [
            "arn:aws:acm:us-east-1:123456789012:certificate/
ecb242e8-3da5-4da6-813c-17040f086fba"
        ],
        "IsDefault": [
            "False"
        ],
        "RemediateStackDrift": [
            "True"
        ]
    }
}
```

3. Output the RFC template to a file in your current folder. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --generate-cli-skeleton > AddNlbListenerCertRfc.json
```

4. Modify and save the AddNlbListenerCertRfc.json file. For example:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-35p977vul06df",
"Title":                "NLB-Add-Listener-Cert-RFC"
}
```

5. Create the RFC, specifying the AddNlbListenerCertRfc file and the AddNlbListenerCertParams file:

```
aws amscm create-rfc --cli-input-json file://AddNlbListenerCertRfc.json --
execution-parameters file://AddNlbListenerCertParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Network Load Balancers, see Create a Network Load Balancer.

To create a network load balancer listener, see Target Group | Create (For NLB).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-35p977vul06df.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-AddCertificateToElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ],
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/net/my-load-
balancer/50dc6c495c0c9188/50dc6c495c0c9188"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-AddCertificateToElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ],
        "IsDefault": [
            "True"
        ],
        "ListenerArn": [
```

```
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/net/my-load-
balancer/50dc6c495c0c9188/50dc6c495c0c9188"
        ],
        "RemediateStackDrift": [
            "False"
        ]
    }
}
```

Network Load Balancer | Remove Listener Certificate

Remove a certificate from the specified Network Load Balancer (NLB) listener. Use the RemediateStackDrift parameter for the automation to try to remediate drift, if it is introduced.

Full classification: Management | Advanced stack components | Network Load Balancer | Remove listener certificate

Change Type Details

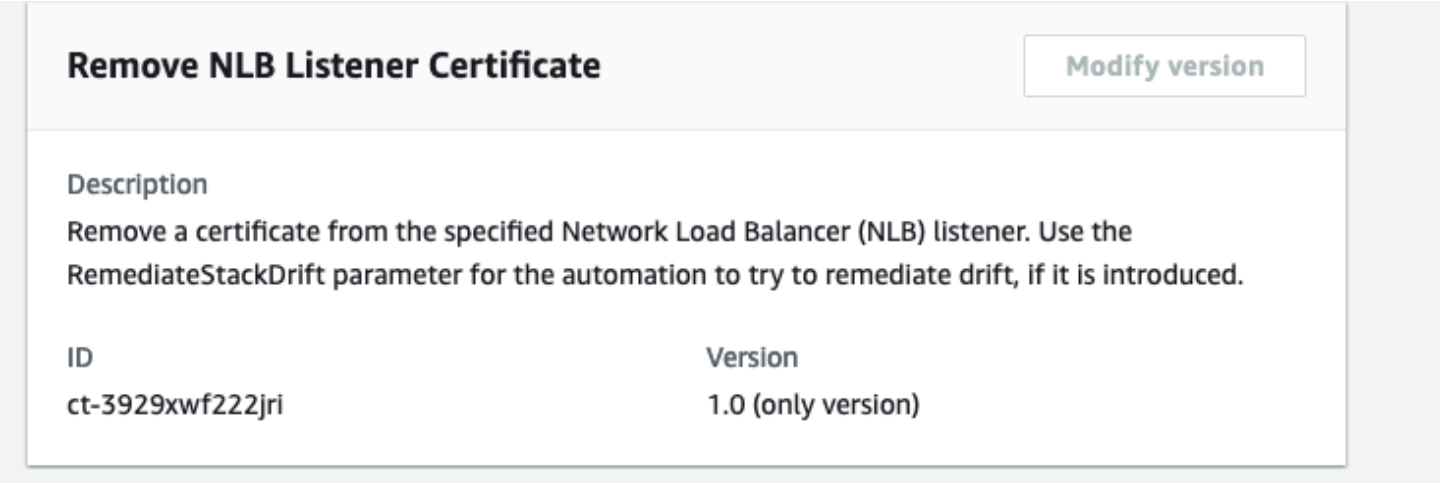
Change type ID	ct-3929xwf222jri
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Remove NLB listener certificate

Removing a listener certificate from an NLB with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Removing a listener certificate from an NLB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm  create-rfc --change-type-id "ct-3929xwf222jri" --change-type-version "1.0"
 --title "Remove listener certificate NLB" --execution-parameters "{\"DocumentName
\": \"AWSManagedServices-RemoveCertificateToElbv2Listener\",\"Region\": \"us-
east-1\",\"Parameters\":{\"ListenerArn\":[\"arn:aws:elasticloadbalancing:us-
east-1:123456789012:listener/app/testalb/fc656bcb5cacb3ae/a0c0da77f9b1461e\"],
\"CertificateArn\":[\"arn:aws:acm:us-east-1:123456789012:certificate/
ecb242e8-3da5-4da6-813c-17040f086fba\"],\"IsDefault\":[\"False\"],\"RemediateStackDrift
\":[\"True\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file. For example, you can replace the contents with something like this:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3929xwf222jri"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    RemoveNlbListenerCertParams.json
   ```

2. Modify and save the RemoveNlbListenerCertParams file. For example:

   ```
   {
       "DocumentName": "AWSManagedServices-RemoveCertificateToElbv2Listener",
       "Region": "us-east-1",
       "Parameters": {
           "ListenerArn": [
               "arn:aws:elasticloadbalancing:us-east-1:123456789012:listener/app/
   testalb/fc656bcb5cacb3ae/a0c0da77f9b1461e"
           ],
           "CertificateArn": [
               "arn:aws:acm:us-east-1:123456789012:certificate/
   ecb242e8-3da5-4da6-813c-17040f086fba"
           ],
           "IsDefault": [
               "False"
           ],
           "RemediateStackDrift": [
               "True"
           ]
       }
   }
   ```

3. Output the RFC template to a file in your current folder. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --generate-cli-skeleton > RemoveNlbListenerCertRfc.json
```

4. Modify and save the RemoveNlbListenerCertRfc.json file. For example:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3929xwf222jri",
"Title":                "NLB-Remove-Listener-Cert-RFC"
}
```

5. Create the RFC, specifying the RemoveNlbListenerCertRfc file and the RemoveNlbListenerCertParams file:

```
aws amscm create-rfc --cli-input-json file://RemoveNlbListenerCertRfc.json --
execution-parameters file://RemoveNlbListenerCertParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about listeners, see ELB Listeners.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3929xwf222jri.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-RemoveCertificateFromElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ],
```

```
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/net/my-load-
balancer/50dc6c495c0c9188/50dc6c495c0c9188"
        ]
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-RemoveCertificateFromElbv2Listener",
    "Region": "us-east-1",
    "Parameters": {
        "CertificateArn": [
            "arn:aws:acm:us-
east-1:123456789012:certificate/12345678-1234-1234-1234-123456789012"
        ],
        "ListenerArn": [
            "arn:aws:elasticloadbalancing:us-west-2:123456789012:listener/net/my-load-
balancer/50dc6c495c0c9188/50dc6c495c0c9188"
        ],
        "RemediateStackDrift": [
            "False"
        ]
    }
}
```

Network Load Balancer | Update

Update the properties of an existing Network Load Balancer.

Full classification: Management | Advanced stack components | Network Load Balancer | Update

Change Type Details

Change type ID	ct-0wglhholzo0uw
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required

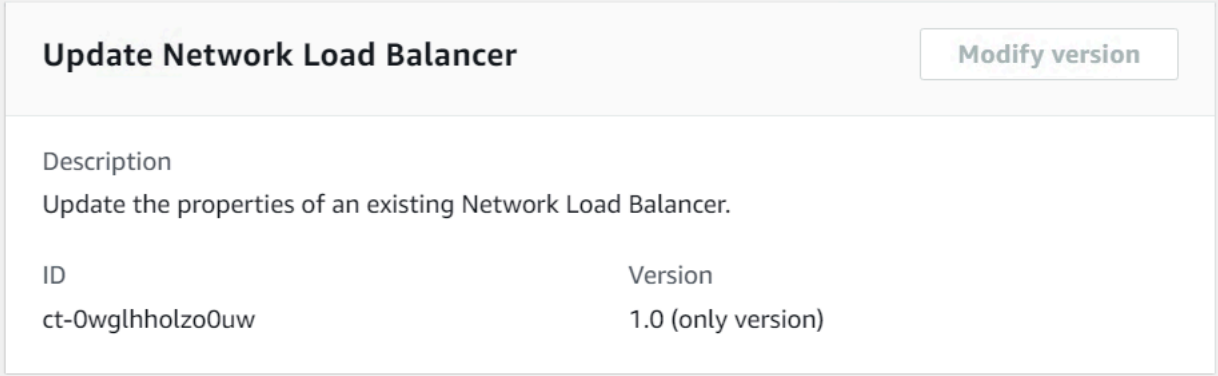
Customer approval	Not required
Execution mode	Automated

Additional Information

Update NLB load balancer

Updating an NLB with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an NLB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title test-update-nlb --change-type-id
 ct-0wglhholzo0uw --change-type-version 1.0 --execution-parameters
 '{"Description":"Update NLB","VpcId":"vpc-1234abcd","StackTemplateId":"stm-
l70qr9itukvqssg8d","Name":"test-update-nlb","TimeoutInMinutes":60,"Parameters":
{"HealthCheckHealthyThreshold": 4,"HealthCheckIntervalSeconds": 20,"HealthCheckTargetPath":
 "/","HealthCheckTargetPort": 80,"HealthCheckTargetProtocol":
 "TCP","CrossZoneEnabled": false,"ProxyProtocolV2": false,"DeregistrationDelayTimeoutSeconds":
 "i-123456789abcdefgh","Target1Port": 80, "Target1AvailabilityZone": "AZ"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdateNlbParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0wglhholzo0uw" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateNlbParams.json
   ```

2. Modify and save the UpdateNlbParams file. The values given in the example reflect a deployment of a Public NLB, with the health check thresholds relaxed and the `Public` parameters set to true (for a public NLB). Note that the `Name` you set here is not the actual NLB name, you can find that name in the console as the NLB instance name.

   ```
   {
   "Description":      "NLB-Create",
   "VpcId":            "VPC_ID",
   "StackTemplateId":  "stm-l70qr9itukvqssg8d",
   "Name":             "My-NLB",

   "Parameters":   {
       "SubnetIds":  ["PUBLIC_AZ1", "PUBLIC_AZ2"],
       "HealthCheckHealthyThreshold":   2,
   ```

```
    "HealthCheckInterval":           30,
    "HealthCheckTargetPath":         traffic-port",
    "DeregistrationDelayTimeout":                10,
    "Public":                        true
    }
}
```

3. Output the RFC template to a file in your current folder; this example names it UpdateNlbRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateNlbRfc.json
```

4. Modify and save the UpdateNlbRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0wglhholzo0uw",
"Title":                "NLB-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateNlbRfc file and the UpdateNlbParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateNlbRfc.json --execution-
parameters file://UpdateNlbParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You can specify up to four Target IDs, Ports, and Availability Zones.

To learn more about AWS Network Load Balancers, see Create a Network Load Balancer.

To create a network load balancer listener, see Target Group | Create (For NLB).

To create a network load balancer target group, see Create NLB target group.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0wglhholzo0uw.

Example: Required Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-1234567890abcdef0",
  "Parameters": {}
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-1234567890abcdef0",
  "Parameters": {
    "HealthCheckHealthyThreshold": "4",
    "HealthCheckIntervalSeconds": "10",
    "HealthCheckTargetPath": "/",
    "HealthCheckTargetPort": "80",
    "HealthCheckTargetProtocol": "TCP",
    "CrossZoneEnabled": "false",
    "ProxyProtocolV2": "false",
    "DeregistrationDelayTimeoutSeconds": "360",
    "Target1ID": "i-123456789abcdefgh",
    "Target1Port": "80",
    "Target1AvailabilityZone": "us-east-1a"
  }
}
```

RDS Database Stack | Reboot

Use to reboot an RDS DB instance.

Full classification: Management | Advanced stack components | RDS database stack | Reboot

Change Type Details

Change type ID	ct-0bpxsrtu16igp

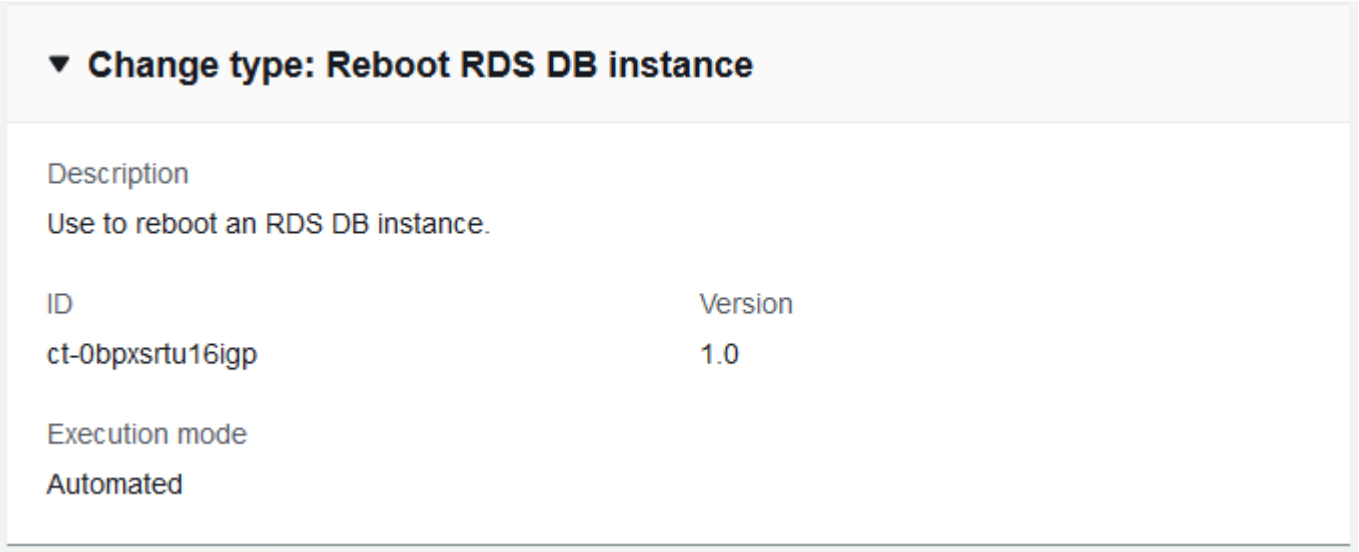
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Reboot DB stack

Rebooting an RDS Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Rebooting an RDS Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0bpxsrtu16igp" --change-type-version "1.0"
 --title "RDS-Reboot" --execution-parameters "{\"DbInstanceIdentifier\":\"DB_ID\",
\"ForceFailover\":false}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named RebootRdsParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0bpxsrtu16igp" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > RebootRdsParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DbInstanceIdentifier": "DB_ID",
     "ForceFailover": true
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it RebootRdsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > RebootRdsRfc.json
```

4. Modify and save the RebootRdsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0bpxsrtu16igp",
"Title":                "RDS-Reboot-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the RebootRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://RebootRdsRfc.json --execution-
parameters file://RebootRdsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about RDS, see the RDS User Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0bpxsrtu16igp.

Example: Required Parameters

```
{
  "DbInstanceIdentifier": "dbinstance"
}
```

Example: All Parameters

```
{
```

```
  "DbInstanceIdentifier": "db-instance1",
  "ForceFailover": true
}
```

RDS Database Stack | Restore To Point In Time

Restore an RDS DB instance to a point in time.

Full classification: Management | Advanced stack components | RDS database stack | Restore to point in time

Change Type Details

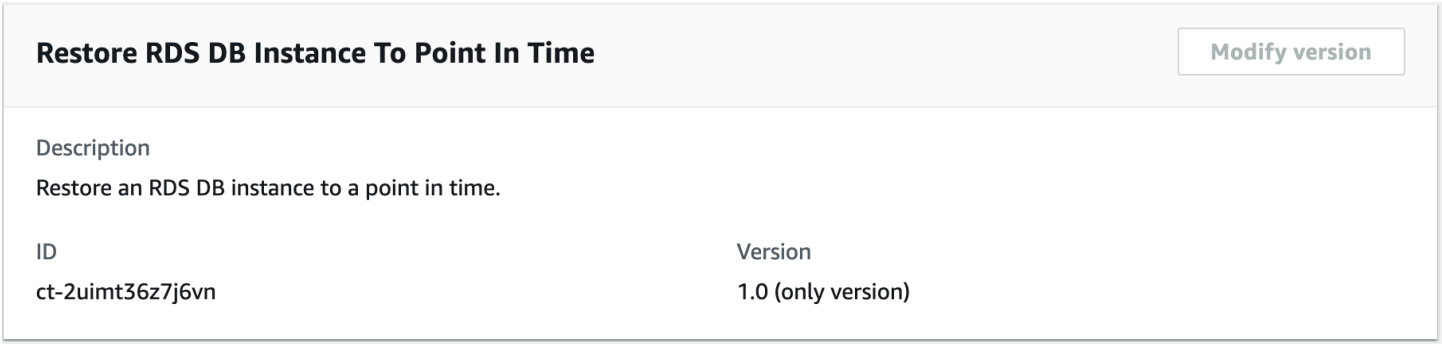
Change type ID	ct-2uimt36z7j6vn
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Restore DB to point in time

Restoring an RDS DB with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Restoring an RDS DB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title create-rds-db-instance-point-in-time-restore --
change-type-id ct-2uimt36z7j6vn --change-type-version 1.0 --execution-parameters
 '{"DocumentName": "AWSManagedServices-RestoreRDSInstanceToPointInTime","Region":
 "us-east-1","Parameters": {"SourceDBInstanceIdentifier": ["my-application-
db"],"TargetDBInstanceIdentifier": ["my-application-db-restore"],"RestoreTime":
 ["2021-03-28T00:00:00Z"],"DBInstanceClass": ["db.t3.micro"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named RestoreRdsDbParams.json.

   ```
   aws amscm create-rfc --cli-input-json file://RestoreRdsDbRFC.json --execution-
   parameters file://RestoreRdsDbParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
  "DocumentName": "AWSManagedServices-RestoreRDSInstanceToPointInTime",
  "Region": "us-east-1",
  "Parameters": {
     "SourceDBInstanceIdentifier": [
        "my-application-db"
      ],
     "TargetDBInstanceIdentifier": [
        "my-application-db-restore"
      ],
     "RestoreTime": [
        "2021-03-28T00:00:00Z"
      ],
     "DBInstanceClass": [
        "db.t3.micro"
      ]
   }
}
```

3. Output the JSON template to a file in your current folder; this example names it RestoreRdsDbRFC.json:

```
aws amscm create-rfc --generate-cli-skeleton > RestoreRdsDbRFC.json
```

4. Modify and save the RestoreRdsDbParams.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2uimt36z7j6vn",
"Title":                "Restore RDS DB instance to point in time"
}
```

5. Create the RFC, specifying the execution parameters file and the RestoreRdsDbParams file:

```
aws amscm create-rfc --cli-input-json file://RestoreRdsDbRFC.json --execution-
parameters file://RestoreRdsDbParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2uimt36z7j6vn.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-RestoreRDSInstanceToPointInTime",
  "Region" : "us-east-1",
  "Parameters" : {
    "SourceDBInstanceIdentifier" : [
      "source-db-instance"
    ],
    "TargetDBInstanceIdentifier" : [
      "restored-db-instance"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-RestoreRDSInstanceToPointInTime",
  "Region" : "us-east-1",
  "Parameters" : {
    "SourceDBInstanceIdentifier" : [
      "source-db-instance"
    ],
    "TargetDBInstanceIdentifier" : [
      "restored-db-instance"
    ],
    "RestoreTime" : [
      "2009-09-07T23:45:00Z"
    ],
    "DBInstanceClass" : [
      "db.m5.xlarge"
```

```
    ],
    "DBOptionGroupName": [
      "default-db-optiongroup"
    ],
    "DBParameterGroupName": [
      "default-db-parameters"
    ]
  }
}
```

RDS Database Stack | Rotate DB Certificate

Rotate the DB certificate on an Amazon Relational Database Service (RDS) database (DB) instance. Update any client applications that use SSL/TLS and the server certificate to connect, to use the new CA certificate beforehand. Not doing this will cause an interruption of connectivity between your applications and your database.

Full classification: Management | Advanced stack components | RDS database stack | Rotate DB certificate

Change Type Details

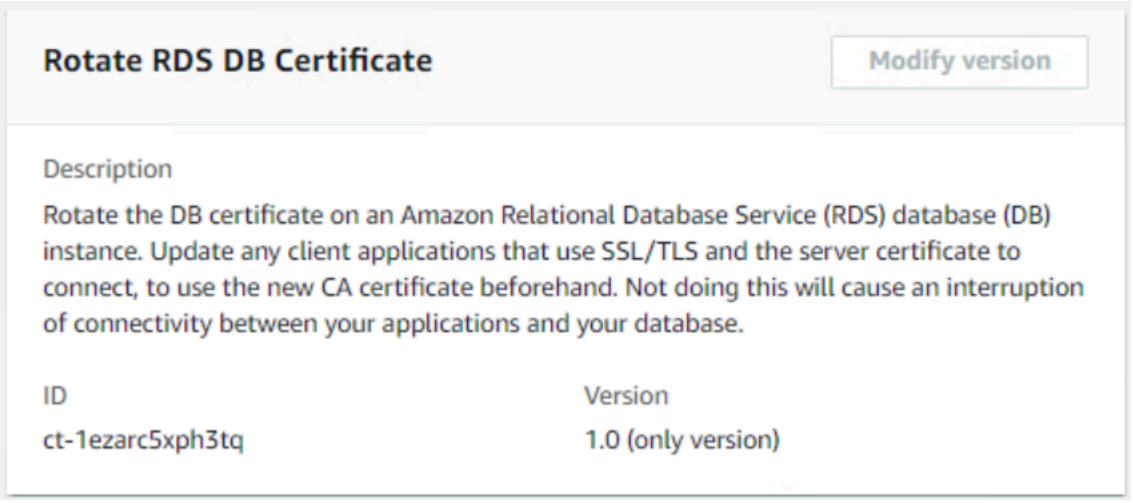
Change type ID	ct-1ezarc5xph3tq
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Rotate DB certificate

Rotating a DB Certificate on an RDS Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Rotating a DB Certificate on an RDS Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1ezarc5xph3tq" --change-type-
version "1.0" --title "Rotate DB Certificate" --execution-parameters
 '{"DocumentName":"AWSManagedServices-RotateDbCertificate","Region":"us-
east-1","Parameters":{"DBInstanceIdentifier":["database-1"],"CertificateIdentifier":
["rds-ca-rsa2048-g1"],"ApplyImmediately":["True"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named RotateRdsCertParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1ezarc5xph3tq" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > RotateRdsCertParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "DocumentName": "AWSManagedServices-RotateDbCertificate",
   "Region": "us-east-1",
   "Parameters": {
       "DBInstanceIdentifier": [
         "database-1"
       ],
       "CertificateIdentifier": [
         "rds-ca-rsa2048-g1"
       ],
       "ApplyImmediately": [
         "True"
       ]
   }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it RotateRdsCertRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RotateRdsCertRfc.json
   ```

4. Modify and save the RotateRdsCertRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1ezarc5xph3tq",
"Title":                "RDS-ROTATE-CERT-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the RotateRdsCertRfc file:

```
aws amscm create-rfc --cli-input-json file://RotateRdsCertRfc.json --execution-
parameters file://RotateRdsCertParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the RDS, look in the execution output: Use the "stack_id" to view the RDS in the Cloud Formation Console.

7. You are now able to manage the database via a database management tool such as SQL server management studio. You do not have to request access from AMS.

Tips

> **Note**
>
> Before scheduling the CA certificate rotation on your database with this change type, update any client applications that use SSL/TLS and the server certificate to connect. Not doing this will cause an interruption of connectivity between your applications and your database.

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1ezarc5xph3tq.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-RotateDbCertificate",
  "Region": "us-east-1",
  "Parameters": {
    "DBInstanceIdentifier": ["dbinstance"],
    "CertificateIdentifier": ["rds-ca-2019"],
    "ApplyImmediately": ["False"]
  }
}
```

RDS Database Stack | Start Aurora Cluster

Start an Aurora DB cluster, which is a provisioned capacity type and does not have cross-region read replicas. The cluster must be in the 'stopped' state.

Full classification: Management | Advanced stack components | RDS database stack | Start Aurora cluster

Change Type Details

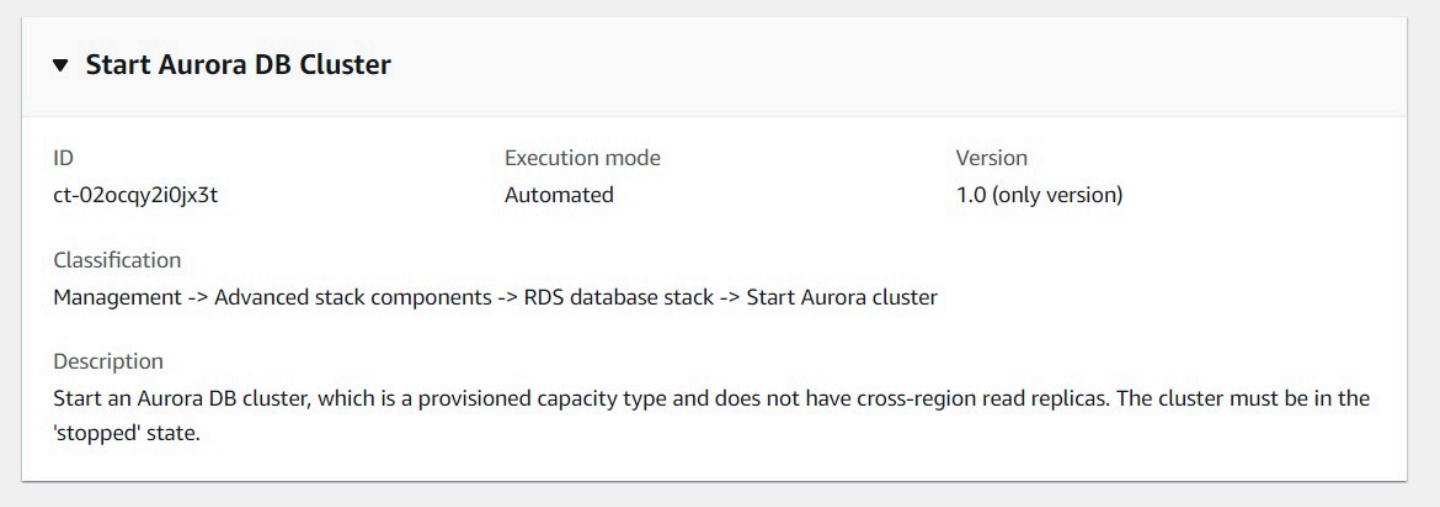
Change type ID	ct-02ocqy2i0jx3t
Current version	1.0
Expected execution duration	90 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Start DB Aurora cluster

Starting an RDS DB Aurora cluster with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Starting an RDS DB Aurora cluster with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-02ocqy2i0jx3t" --change-type-version
 "1.0" --title "Start Aurora DB Cluster" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-StartDBCluster\",\"Region\": \"us-east-1\",\"Parameters\":
 {\"DBClusterIdentifier\": \"myaurora-dbcluster\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named StartRdsDbAuroraClusterParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-02ocqy2i0jx3t"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    StartRdsDbAuroraClusterParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-StartDBCluster",
       "Region": "us-east-1",
       "Parameters": {
           "DBClusterIdentifier": "myaurora-dbcluster"
       }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it StartRdsDbAuroraClusterRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > StartRdsDbAuroraClusterRfc.json
   ```

4. Modify and save the StartRdsDbAuroraClusterRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
   ```

```
  "ChangeTypeId": "ct-02ocqy2i0jx3t",
  "Title": "Start Aurora DB Cluster"
}
```

5. Create the RFC, specifying the execution parameters file and the StartRdsDbAuroraClusterRfc file:

```
aws amscm create-rfc --cli-input-json file://StartRdsDbAuroraClusterRfc.json --
execution-parameters file://StartRdsDbAuroraClusterParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information see Amazon Aurora DB clusters.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-02ocqy2i0jx3t.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-StartDBCluster",
    "Region": "us-east-1",
    "Parameters": {
        "DBClusterIdentifier": "abcdef01234567890"
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-StartDBCluster",
    "Region": "us-east-1",
    "Parameters": {
        "DBClusterIdentifier": "abcdef01234567890"
    }
}
```

RDS Database Stack | Start DB Instance

Start an Amazon Relational Database Service (RDS) database (DB) instance.

Full classification: Management | Advanced stack components | RDS database stack | Start DB instance

Change Type Details

Change type ID	ct-3s3ik03uzw19t
Current version	1.0
Expected execution duration	60 minutes

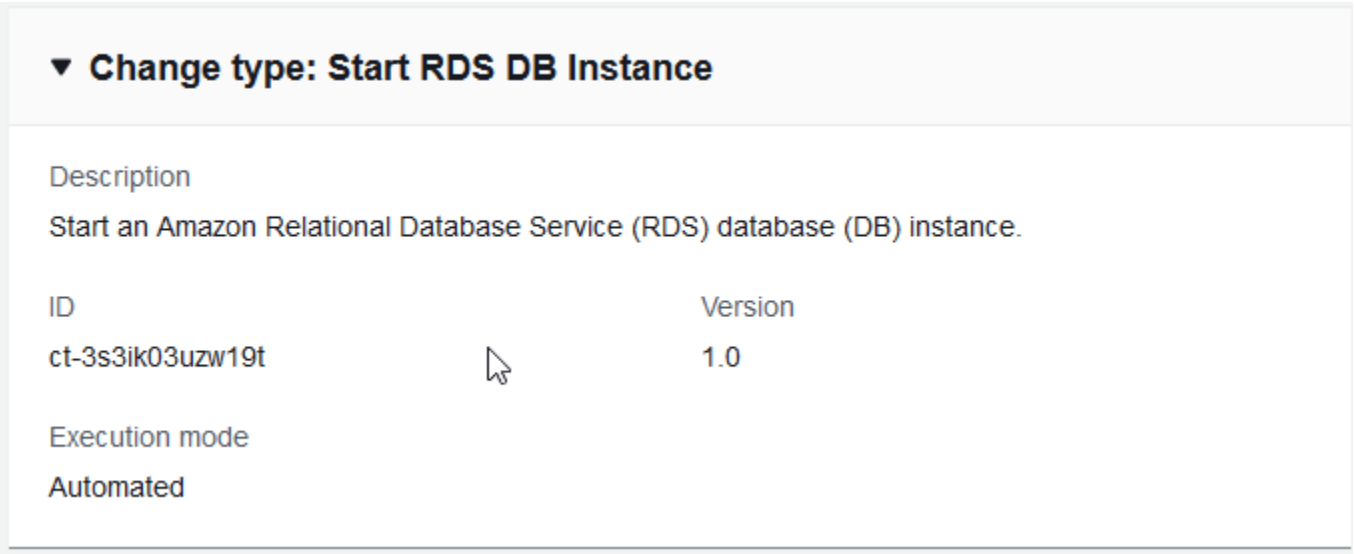
Customer approval	Not required
Execution mode	Automated

Additional Information

Start DB instance

Starting an RDS DB with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Starting an RDS DB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3s3ik03uzw19t" --change-type-version
 "1.0" --title "Start DB instance" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-StartRDSInstance\",\"Region\": \"us-east-1\",\"Parameters\":
{\"InstanceId\":[\"rds-instance\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named StartRdsDbParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3s3ik03uzw19t" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > StartRdsDbParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
"DocumentName": "AWSManagedServices-StartRDSInstance",
"Region": "us-east-1",
"Parameters": {
  "InstanceId": [ "rds-instance" ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it StartRdsDbRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > StartRdsDbRfc.json
```

4. Modify and save the StartRdsDbRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3s3ik03uzw19t",
"Title":                "RDS-Start-DB-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the StartRdsDbRfc file:

```
aws amscm create-rfc --cli-input-json file://StartRdsDbRfc.json --execution-
parameters file://StartRdsDbParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about RDS, see the RDS User Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3s3ik03uzw19t.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

RDS Database Stack | Stop Aurora Cluster

Stop an Aurora DB cluster, which is a provisioned capacity type and does not have cross-region read replicas. The cluster must be in the 'available' state.

Full classification: Management | Advanced stack components | RDS database stack | Stop Aurora cluster

Change Type Details

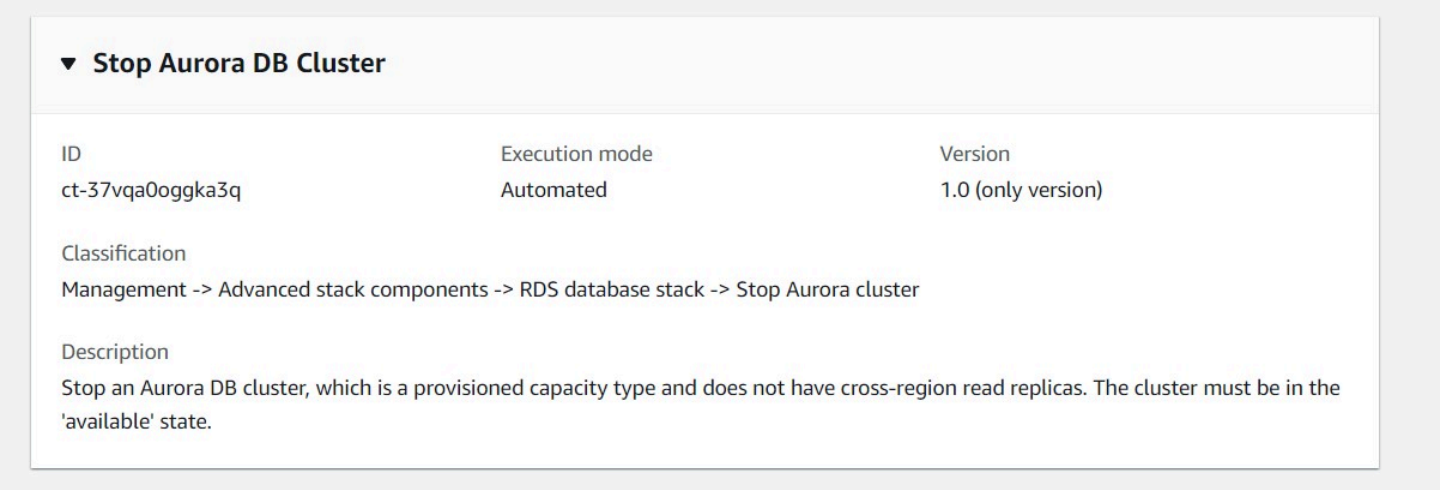
Change type ID	ct-37vqa0oggka3q
Current version	1.0
Expected execution duration	90 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Stop DB Aurora cluster

Stopping an RDS DB Aurora cluster with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Stopping an RDS DB Aurora cluster with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-37vqa0oggka3q" --change-type-version
 "1.0" --title "Stop Aurora DB Cluster" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-StopDBCluster\",\"Region\": \"us-east-1\",\"Parameters\":
 {\"DBClusterIdentifier\": \"myaurora-dbcluster\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named StopRdsDbAuroraClusterParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-37vqa0oggka3q"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    StopRdsDbAuroraClusterParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-StopDBCluster",
       "Region": "us-east-1",
       "Parameters": {
           "DBClusterIdentifier": "myaurora-dbcluster"
       }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it StopRdsDbAuroraClusterRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > StopRdsDbAuroraClusterRfc.json
   ```

4. Modify and save the StopRdsDbAuroraClusterRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-37vqa0oggka3q",
     "Title": "Stop Aurora DB Cluster"
   }
   ```

5. Create the RFC, specifying the execution parameters file and the StopRdsDbAuroraClusterRfc file:

```
aws amscm create-rfc --cli-input-json file://StopRdsDbAuroraClusterRfc.json --
execution-parameters file://StopRdsDbAuroraClusterParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information see Amazon Aurora DB clusters.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-37vqa0oggka3q.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-StopDBCluster",
    "Region": "us-east-1",
    "Parameters": {
        "DBClusterIdentifier": "abcdef01234567890"
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-StopDBCluster",
    "Region": "us-east-1",
    "Parameters": {
        "DBClusterIdentifier": "abcdef01234567890"
    }
}
```

RDS Database Stack | Stop DB Instance

Stop an Amazon Relational Database Service (RDS) database (DB) instance. After seven days, the DB instance is automatically re-started. Supported engines are: MariaDB, Microsoft SQL

Server, MySQL, Oracle, PostgreSQL. This change type doesn't apply to Aurora MySQL and Aurora PostgreSQL.

Full classification: Management | Advanced stack components | RDS database stack | Stop DB instance

Change Type Details

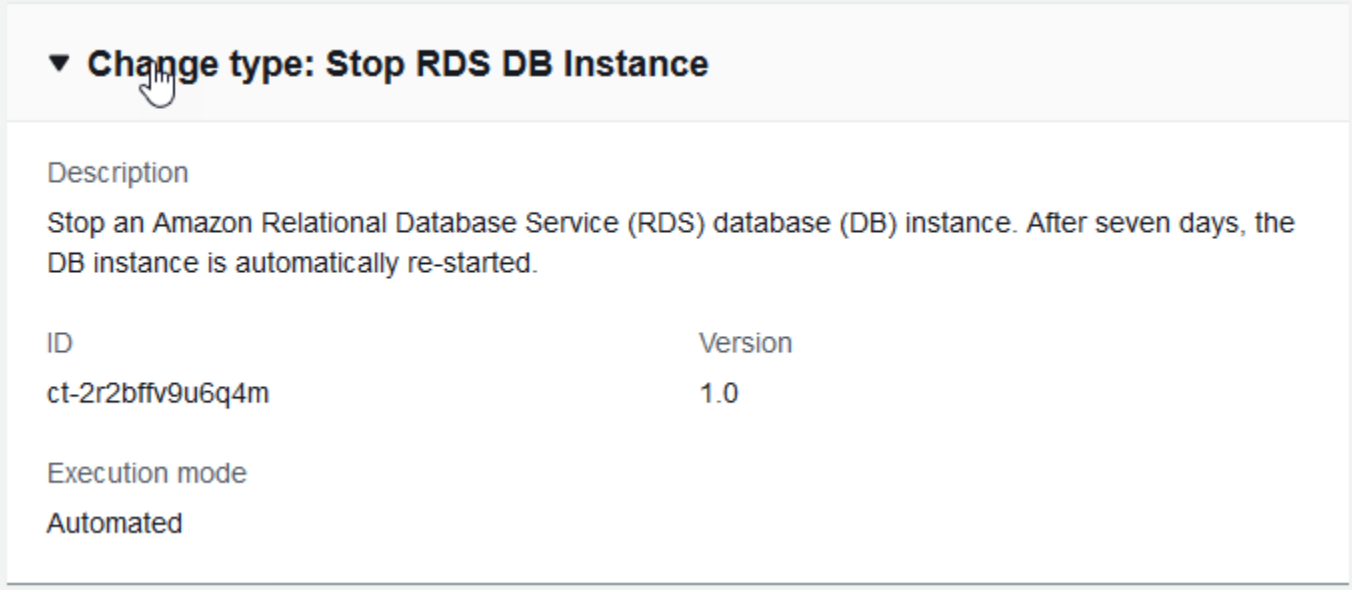
Change type ID	ct-2r2bffv9u6q4m
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Stop DB instance

Stopping an RDS DB with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Stopping an RDS DB with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2r2bffv9u6q4m" --change-type-version
 "1.0" --title "Stop DB instance" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-StopRDSInstance\",\"Region\": \"us-east-1\",\"Parameters\":
{\"InstanceId\":[\"rds-instance\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named StopRdsDbParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2r2bffv9u6q4m" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > StopRdsDbParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

```
{
"DocumentName": "AWSManagedServices-StopRDSInstance",
"Region": "us-east-1",
"Parameters": {
  "InstanceId": [ "rds-instance" ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it StopRdsDbRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > StopRdsDbRfc.json
```

4. Modify and save the StopRdsDbRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2r2bffv9u6q4m",
"Title":                "RDS-STOP-DB-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the StopRdsDbRfc file:

```
aws amscm create-rfc --cli-input-json file://StopRdsDbRfc.json --execution-
parameters file://StopRdsDbParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This command doesn't apply to Aurora MySQL and Aurora PostgreSQL. For Aurora clusters, use a Management | Other | Other |Update (ct-0xdawir96cy7k) change type and request StopDBCluster instead.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2r2bffv9u6q4m.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
Example not available.
```

RDS Database Stack | Update

Modify the properties of an Amazon Relational Database Service (RDS) DB instance created using ct-2z60dyvto9g6c, version 3.0.

Full classification: Management | Advanced stack components | RDS database stack | Update

Change Type Details

Change type ID	ct-12w49boaiwtzp
Current version	3.0
Expected execution duration	360 minutes
AWS approval	Required

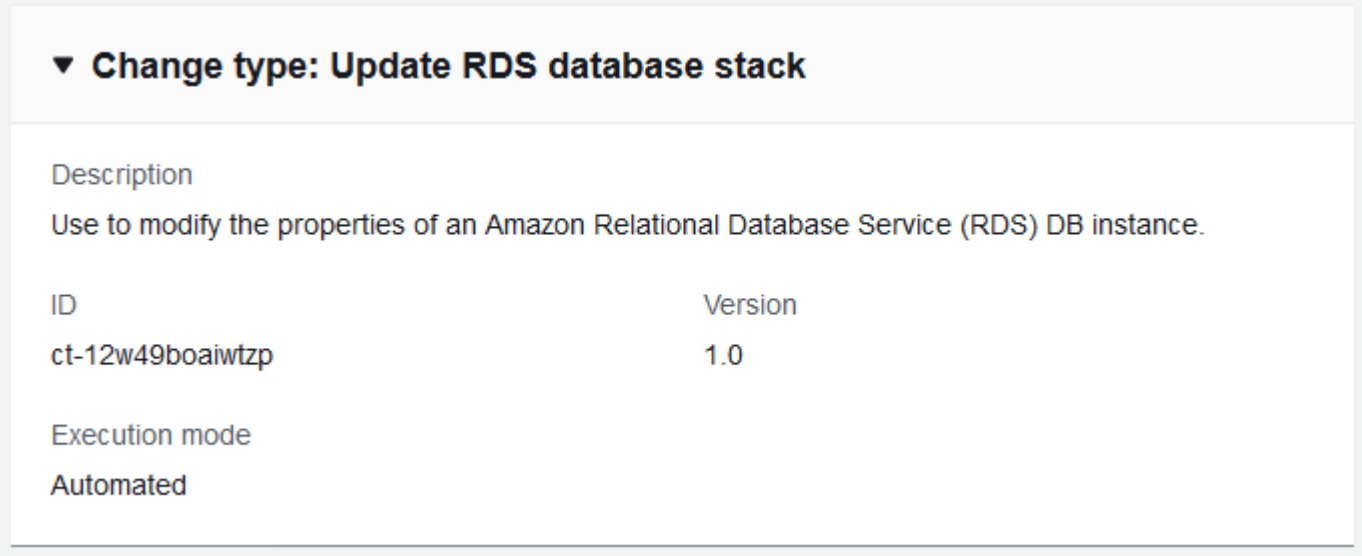
Customer approval	Not required
Execution mode	Automated

Additional Information

Update DB stack

Updating an RDS Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an RDS Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-12w49boaiwtzp" --change-type-version "1.0"
 --title "RDS_UPDATE" --execution-parameters "{\"VpcId\":\"VPC_ID\",\"StackId\":
\"STACK_ID\",\"Parameters\":{\"RDSBackups\":true,\"RDSInstanceType\":\"db.m3.medium\",
\"RDSIOPS\":0,\"RDSMultiAZ\":true,\"RDSPreferredBackupWindow\":\"22:00-23:00\",
\"RDSPreferredMaintenanceWindow\":\"wed:03:32-wed:04:02\",\"RDSStorageType\":\"gp2\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateRdsParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-12w49boaiwtzp" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateRdsParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   "Description":          "Update-RDS-DB",
   "VpcId":                "VPC_ID",
   "StackId":              "STACK_ID",
   "Parameters":   {
       "RDSAllocatedStorage":      80,
       }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdateRdsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateRdsRfc.json
```

4. Modify and save the UpdateRdsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-12w49boaiwtzp",
"Title":                "RDS-Update-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateRdsRfc.json --execution-
parameters file://UpdateRdsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the RDS, look in the execution output: Use the "stack_id" to view the RDS in the Cloud Formation Console.

7. You are now able to manage the database via a database management tool such as SQL server management studio. You do not have to request access from AMS.

Tips

> **Note**
>
> AMS employs drift detection on certain stacks, including RDS stacks, to determine if configuration changes. The AMS disallows updates to an RDS stack that has been determined to have configuration drift. The RFC will fail with the following error message: "Update cannot be performed on this stack, please contact AMS for further assistance."

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

To update an RDS stack for Aurora, see Update DB (for Aurora).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-12w49boaiwtzp.

Example: Required Parameters

```
{
  "VpcId": "vpc-01234567890abcdef",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {
    "RDSAllocatedStorage": 50
  }
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-01234567",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {
    "RDSAllocatedStorage": 50,
    "RDSAllowMajorVersionUpgrade": true,
    "RDSAutoMinorVersionUpgrade": true,
    "RDSBackupRetentionPeriod": 7,
    "RDSDBParameterGroupName": "default.sqlserver-ex-13.0",
    "RDSDeletionProtection": true,
    "RDSDomain": "d-1234567890",
    "RDSDomainIAMRoleName": "customer_amazon_rds_directory_service_access_role",
    "RDSBackups": true,
    "RDSEngineVersion": "5.6.27",
    "RDSInstanceType": "db.m3.medium",
    "RDSIOPS": 0,
    "RDSMasterUserPassword": "$tr0n9PA55w0Rd",
    "RDSMultiAZ": false,
    "RDSOptionGroupName": "default:sqlserver-ex-13-00",
    "RDSPerformanceInsights" : "true",
    "RDSPerformanceInsightsKMSKey":"arn:aws:kms:us-east-1:123456789012:key/2590cd3a-
f979-49db-adec-d213775385af",
    "RDSPerformanceInsightsRetentionPeriod":"7",
    "RDSPreferredBackupWindow": "22:00-23:00",
    "RDSPreferredMaintenanceWindow": "wed:03:32-wed:04:02",
    "RDSStorageType": "gp2"
```

```
  }
}
```

RDS Database Stack | Update (For Aurora)

Modify the properties of an existing AWS Relational Database Service (RDS) Aurora stack created using CT ID ct-2jvzjwunghrhy, version 1.0.

Full classification: Management | Advanced stack components | RDS database stack | Update (for Aurora)

Change Type Details

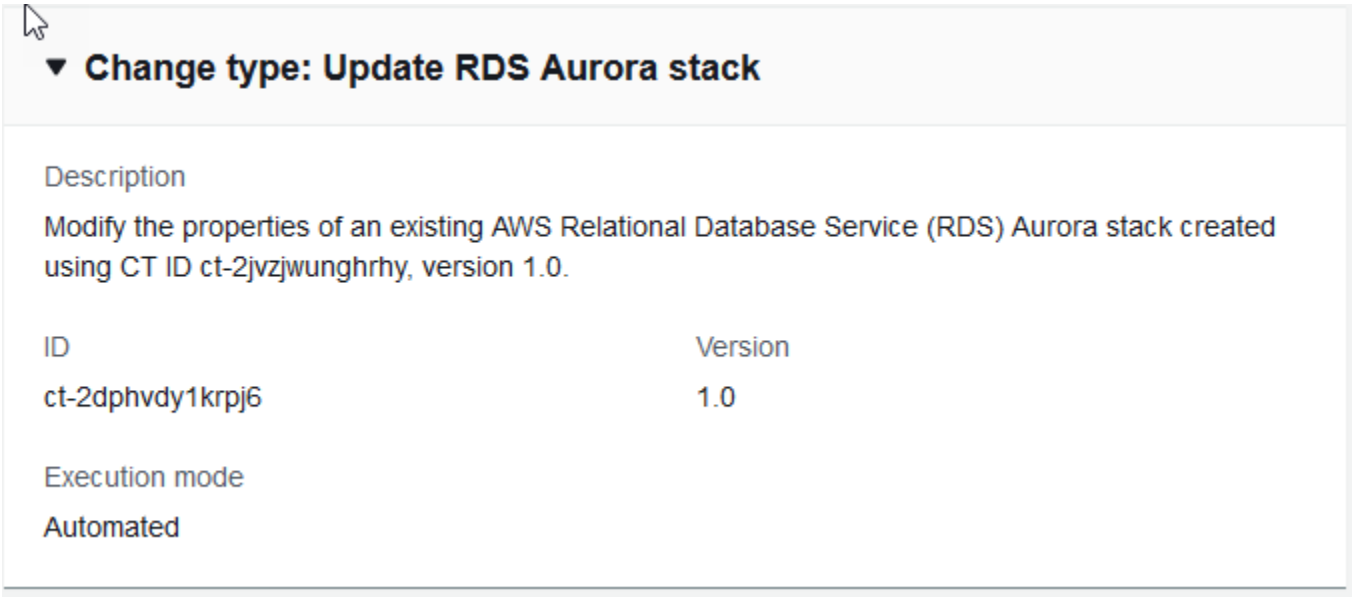
Change type ID	ct-2dphvdy1krpj6
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update DB (for Aurora)

Updating an RDS Aurora Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an RDS Aurora Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --region us-east-1 --change-type-id "ct-2dphvdy1krpj6" --change-
type-version "1.0" --title "Test - Update Aurora RDS"  --execution-parameters "{\"VpcId
\":\"VPC_ID\",\"StackId\":\"STACK_ID\",\"Parameters\":{\"AutoMinorVersionUpgrade
\":\"true\",\"BackupRetentionPeriod\":5,\"EngineVersion\":\"10.4\",\"InstanceType
\":\"db.r4.large\",\"MultiAZ\":\"true\",\"PerformanceInsights\":\"true\",
\"PerformanceInsightsKMSKey\":\"default\",\"PerformanceInsightsRetentionPeriod
\":\"7\",\"Port\":\"1151\",\"PreferredBackupWindow\":\"22:00-23:00\",
\"PreferredMaintenanceWindow\":\"wed:03:32-wed:04:02\",\"MasterUserPassword\":\"PW\"}}"
```

TEMPLATE CREATE (all parameters shown):

1. Output the execution parameters for this change type to a JSON file named UpdateAuroraRdsParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2dphvdy1krpj6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateAuroraRdsParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "VpcId": "VPC_ID",
     "StackId": "STACK_ID",
     "Parameters": {
       "AutoMinorVersionUpgrade": "true",
       "BackupRetentionPeriod": 5,
       "EngineVersion": "10.4",
       "InstanceType": "db.r4.large",
       "MultiAZ": "true",
       "PerformanceInsights": "true",
       "PerformanceInsightsKMSKey": "default",
       "PerformanceInsightsRetentionPeriod": "7",
       "Port": "1151",
       "PreferredBackupWindow": "22:00-23:00",
       "PreferredMaintenanceWindow": "wed:03:32-wed:04:02",
       "MasterUserPassword": "**********"
     }
   ```

```
}
```

3. Output the JSON template to a file in your current folder; this example names it UpdateAuroraRdsRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateAuroraRdsRfc.json
```

4. Modify and save the UpdateAuroraRdsRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2dphvdy1krpj6",
"Title":                "RDS-Aurora-Update-RFC"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateAuroraRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateAuroraRdsRfc.json --execution-
parameters file://UpdateAuroraRdsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the RDS, look in the execution output: Use the "stack_id" to view the RDS in the Cloud Formation Console.

Tips

> **Note**
>
> AMS employs drift detection on certain stacks, including RDS stacks, to determine if configuration changes. The AMS disallows updates to an RDS stack that has been determined to have configuration drift. The RFC will fail with the following error message: "Update cannot be performed on this stack, please contact AMS for further assistance."

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

To update a non-Aurora RDS stack, see Update DB stack.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2dphvdy1krpj6.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "VpcId": "vpc-12345678901234567",
  "StackId": "stack-a1b2c3d4e5f67890e",
  "Parameters": {
    "AutoMinorVersionUpgrade": "true",
    "BackupRetentionPeriod": 7,
    "InstanceType": "db.serverless",
    "MasterUserPassword": "dbpassword",
    "MultiAZ": "true",
    "PerformanceInsights": "true",
    "PerformanceInsightsKMSKey": "default",
    "PerformanceInsightsRetentionPeriod": "7",
    "Port": "1150",
    "PreferredBackupWindow": "22:00-23:00",
    "PreferredMaintenanceWindow": "wed:03:32-wed:04:02",
    "ServerlessScalingMinCapacity": 1.0,
    "ServerlessScalingMaxCapacity": 2.0
  }
}
```

RDS Database Stack | Update Deletion Protection

Update the DeletionProtection setting for the specified RDS instance or cluster. The RDS instance or cluster can be standalone or belong to a CloudFormation stack; in the latter case, the change might cause stack drift. To avoid causing stack drift, use ct-12w49boaiwtzp instead, or ct-361tlo1k7339x if the RDS was provisioned through CFN ingestion.

Full classification: Management | Advanced stack components | RDS database stack | Update deletion protection

Change Type Details

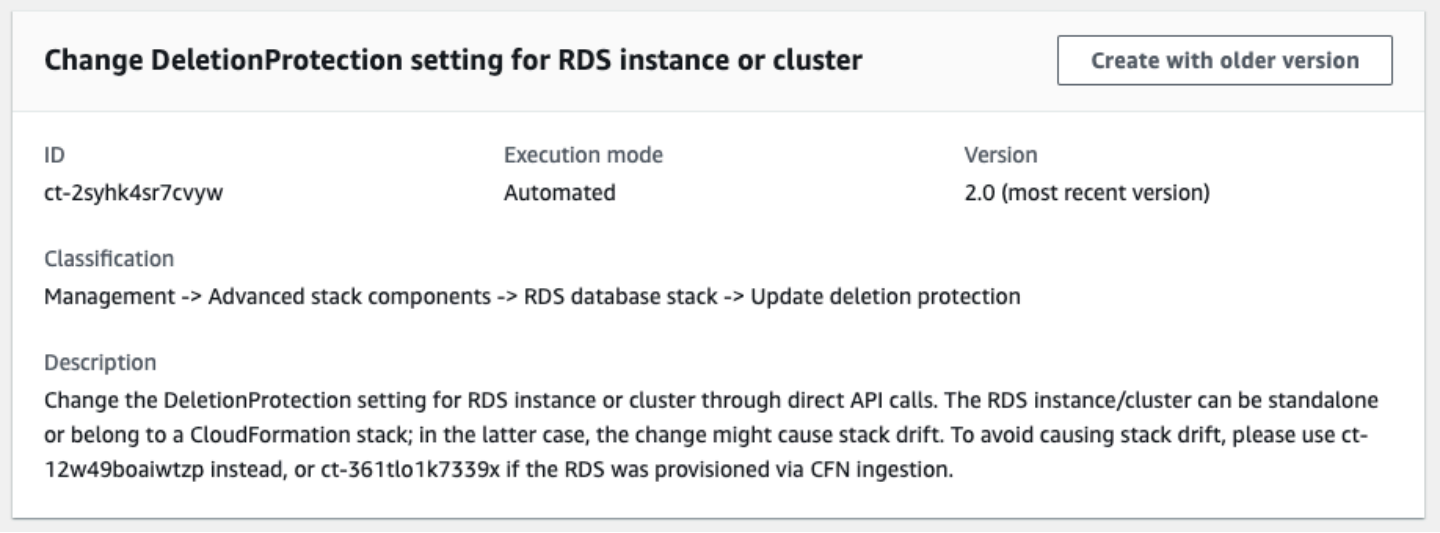
Change type ID	ct-2syhk4sr7cvyw
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update DB deletion protection

Updating an RDS stack deletion protection with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an RDS stack deletion protection with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-2syhk4sr7cvyw" \
--change-type-version "2.0" --title "Update RDS deletion protection" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
UpdateRDSDeletionProtection\",\"Region\":\"us-east-1\",\"Parameters\":
{\"DBIdentifierArn\":[\"arn:aws:rds:ap-southeast-2:012345678901:db:myrds\"],
\"DeletionProtection\":[true]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateRdsDeletionProtectionParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2syhk4sr7cvyw"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateRdsDeletionProtectionParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "DocumentName": "AWSManagedServices-UpdateRDSDeletionProtection",
  "Region": "ap-southeast-2",
  "Parameters": {
    "DBIdentifierArn": [
      "arn:aws:rds:ap-southeast-2:012345678901:db:myrds"
    ],
    "DeletionProtection": [
      true
    ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it UpdateRdsDeletionProtectionRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateRdsDeletionProtectionRfc.json
```

4. Modify and save the UpdateRdsDeletionProtectionRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-2syhk4sr7cvyw",
  "ChangeTypeVersion": "2.0",
  "Title": "Update RDS deletion protection"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateRdsDeletionProtectionRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateRdsDeletionProtectionRfc.json --
execution-parameters file://UpdateRdsDeletionProtectionParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. The execution output indicates the action taken: enabled or disabled.

Tips

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2syhk4sr7cvyw.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-UpdateRDSDeletionProtection",
  "Region" : "us-east-1",
  "Parameters" : {
    "DBIdentifierArn" : "arn:aws:rds:us-east-1:123456789012:db:testdbinstance",
    "DeletionProtection" : true
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-UpdateRDSDeletionProtection",
  "Region" : "us-east-1",
  "Parameters" : {
    "DBIdentifierArn" : "arn:aws:rds:us-east-1:123456789012:db:testdbinstance",
    "DeletionProtection" : true
  }
}
```

RDS Database Stack | Update Enhanced Monitoring

Update the Enhanced Monitoring property of an Amazon Relational Database Service (RDS) database instance or cluster. Enhanced Monitoring allows you to collect vital operating system metrics and process information, at the defined granularity.

Full classification: Management | Advanced stack components | RDS database stack | Update enhanced monitoring

Change Type Details

Change type ID	ct-3jx80fquylzhf

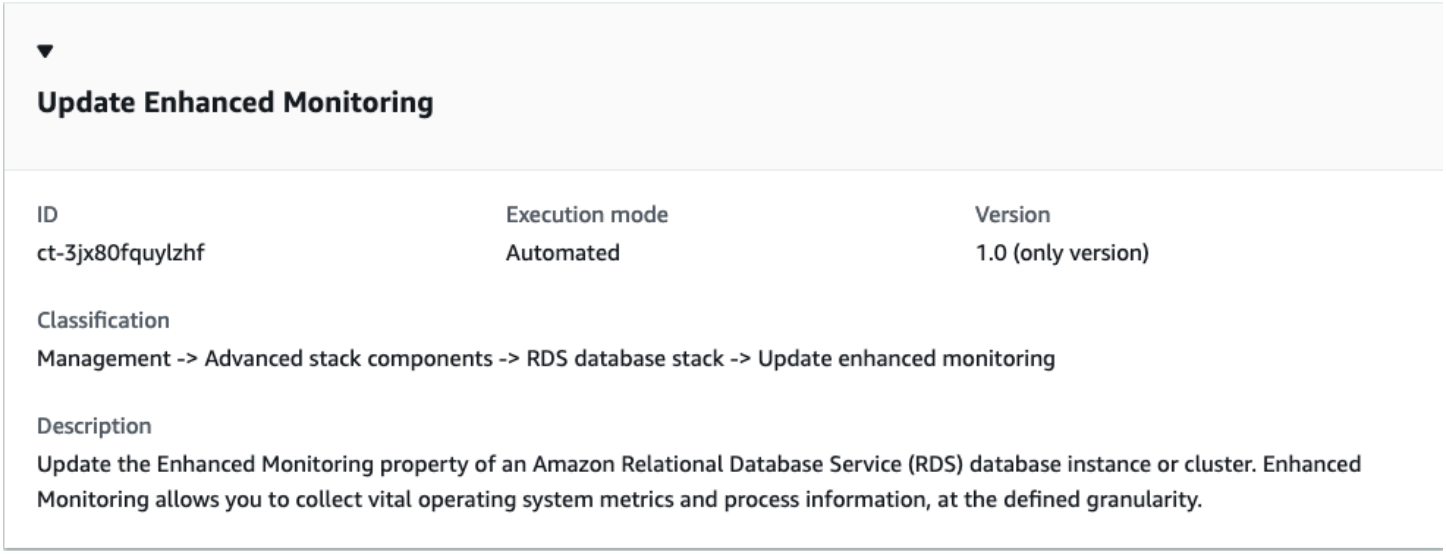
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update Enhanced Monitoring

Updating enhanced monitoring with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating enhanced monitoring with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3jx80fquylzhf" --change-type-
version "1.0" --title "Update Enhanced Monitoring" --execution-parameters
 "{\"DocumentName\":\"AWSManagedServices-UpdateRDSEnhancedMonitoring\",\"Region
\":\"us-east-1\",\"Parameters\": {\"DBIdentifierArn\":[\"arn:aws:rds:us-
east-1:000000000000:db:testdbinstance\"], \"MonitoringInterval\": [\"60\"],,
\"MonitoringRoleName\": \"ds-monitoring-role\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named RotateRdsCertParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3jx80fquylzhf"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateRDSEnhancedMonitoringParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-UpdateRDSEnhancedMonitoring",
       "Region": "us-east-1",
       "Parameters": {
           "DBIdentifierArn": "arn:aws:rds:us-east-1:000000000000:db:testdbinstance",
   ```

```
        "MonitoringInterval": "60",
        "MonitoringRoleName": [
            "rds-monitoring-role"
        ]
    }
}
```

3. Output the JSON template to a file in your current folder; this example names it UpdateRDSEnhancedMonitoringRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateRDSEnhancedMonitoringRfc.json
```

4. Modify and save the UpdateRDSEnhancedMonitoringRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3jx80fquylzhf",
"Title":                "Update Enhanced Monitoring"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateRDSEnhancedMonitoringRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateRDSEnhancedMonitoringRfc.json --
execution-parameters file://UpdateRDSEnhancedMonitoringParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3jx80fquylzhf.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateRDSEnhancedMonitoring",
  "Region": "us-east-1",
  "Parameters": {
```

```
    "DBIdentifierArn" : "arn:aws:rds:us-east-1:000000000000:db:testdbinstance",
    "MonitoringInterval" : "60"
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-UpdateRDSEnhancedMonitoring",
  "Region" : "us-east-1",
  "Parameters" : {
    "DBIdentifierArn" : "arn:aws:rds:us-east-1:000000000000:db:testdbinstance",
    "MonitoringInterval" : "60",
    "MonitoringRoleName": "rds-monitoring-role"
  }
}
```

RDS Database Stack | Update Instance Type

Change the DB instance type through direct API calls. The RDS instance can be standalone or belong to a CloudFormation stack; in the latter case, the change might cause stack drift. To avoid causing stack drift, please use ct-12w49boaiwtzp instead, or ct-361tlo1k7339x if the RDS instance was provisioned via CFN ingestion.

Full classification: Management | Advanced stack components | RDS database stack | Update instance type

Change Type Details

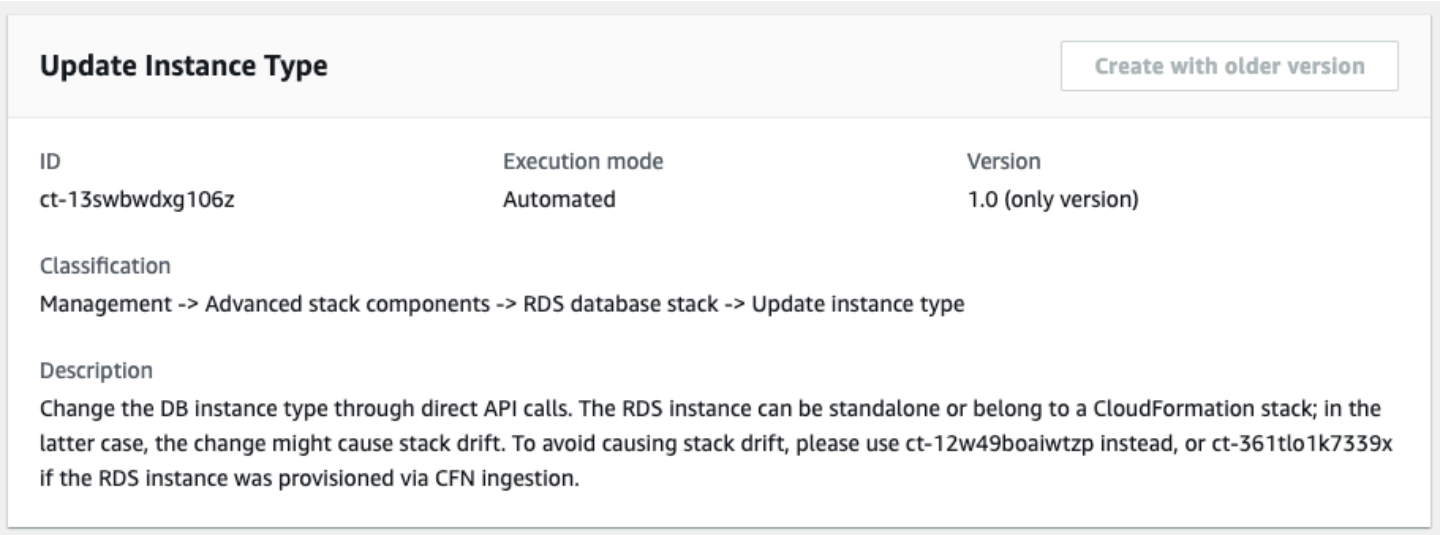
Change type ID	ct-13swbwdxg106z
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update an RDS instance type

Updating an RDS instance type with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an RDS instance type with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-13swbwdxg106z" --change-type-version
 "1.0" --title "Update rds instance type" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-UpdateRDSInstanceType\",\"Region\":\"us-east-1\",\"Parameters\":
 {\"DBInstanceIdentifier\":[\"rt123456789\"], \"DBInstanceClass\": [\"db.m4.large\"],
\"ApplyImmediately\": \"true\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateInstanceTypeParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-13swbwdxg106z"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateInstanceTypeParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateRDSInstanceType",
     "Region": "us-east-1",
     "Parameters": {
       "DBInstanceIdentifier": [
         "rt123456789"
       ],
       "DBInstanceClass": [
         "db.m4.large"
       ],
       "ApplyImmediately": "false"
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdateInstanceTypeRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateInstanceTypeRfc.json
```

4. Modify and save the UpdateInstanceTypeRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-13swbwdxg106z",
"Title":                "Update RDS instance type"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateInstanceTypeRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateInstanceTypeRfc.json --
execution-parameters file://UpdateInstanceTypeParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> AMS employs drift detection on certain stacks, including RDS stacks, to determine if configuration changes. The AMS disallows updates to an RDS stack that has been determined to have configuration drift. The RFC will fail with the following error message: "Update cannot be performed on this stack, please contact AMS for further assistance."

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

To update an RDS stack for Aurora, see RDS Database Stack | Update.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-13swbwdxg106z.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateRDSInstanceType",
  "Region": "us-east-1",
  "Parameters": {
    "DBInstanceIdentifier": [
      "rt123456789"
    ],
    "DBInstanceClass": [
      "db.m4.large"
    ],
    "ApplyImmediately": "false"
  }
}
```

RDS Database Stack | Update Maintenance Window (Review Required)

Update an existing RDS maintenance window, which is a weekly time range (in UTC) during which system maintenance can occur. Changing an RDS maintenance window doesn't result in an outage. If moving this window to the current time, there must be at least 30 minutes between the current time and the end of the current window to ensure pending changes are applied.

Full classification: Management | Advanced stack components | RDS database stack | Update maintenance window (review required)

Change Type Details

Change type ID	ct-27jjy5wnrfef2
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required

Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update RDS maintainance window (review required)

Updating an RDS maintainance window with the Console

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an RDS maintainance window with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status

changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-27jjy5wnrfef2" --change-type-version "1.0"
 --title "Update RDS Maintenance Window" --execution-parameters "{\"DBIdentifierArn\":
 \"arn:aws:rds:us-east-1:123456789101:db:database-1\", \"PreferredMaintenanceWindow\":
 \"Sun:04:00-Sun:04:30\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateRDSMaintenanceWindowParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-27jjy5wnrfef2"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateRDSMaintenanceWindowParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DBIdentifierArn": "arn:aws:rds:us-east-1:123456789101:db:database-1",
     "PreferredMaintenanceWindow": "Sun:04:00-Sun:04:30"
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdateRDSMaintenanceWindowRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateRDSMaintenanceWindowRfc.json
   ```

4. Modify and save the UpdateRDSMaintenanceWindowRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-27jjy5wnrfef2",
  "Title": "Update RDS Maintenance Window"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateRDSMaintenanceWindowRfc.json file:

```
aws amscm create-rfc --cli-input-json file://UpdateRDSMaintenanceWindowRfc.json --
execution-parameters file://UpdateRDSMaintenanceWindowParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> AMS employs drift detection on certain stacks, including RDS stacks, to determine if configuration changes. The AMS disallows updates to an RDS stack that has been determined to have configuration drift. The RFC will fail with the following error message: "Update cannot be performed on this stack, please contact AMS for further assistance."

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-27jjy5wnrfef2.

Example: Required Parameters

```
{
  "DBIdentifierArn": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
  "PreferredMaintenanceWindow": "Sun:05:00-Sun:05:30"
}
```

Example: All Parameters

```
{
  "DBIdentifierArn": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
  "PreferredMaintenanceWindow": "Sun:05:00-Sun:05:30"
}
```

RDS Database Stack | Update Master User Password

Update the MasterUserPassword property of an Amazon Relational Database Service (RDS) database instance.

Full classification: Management | Advanced stack components | RDS database stack | Update master user password

Change Type Details

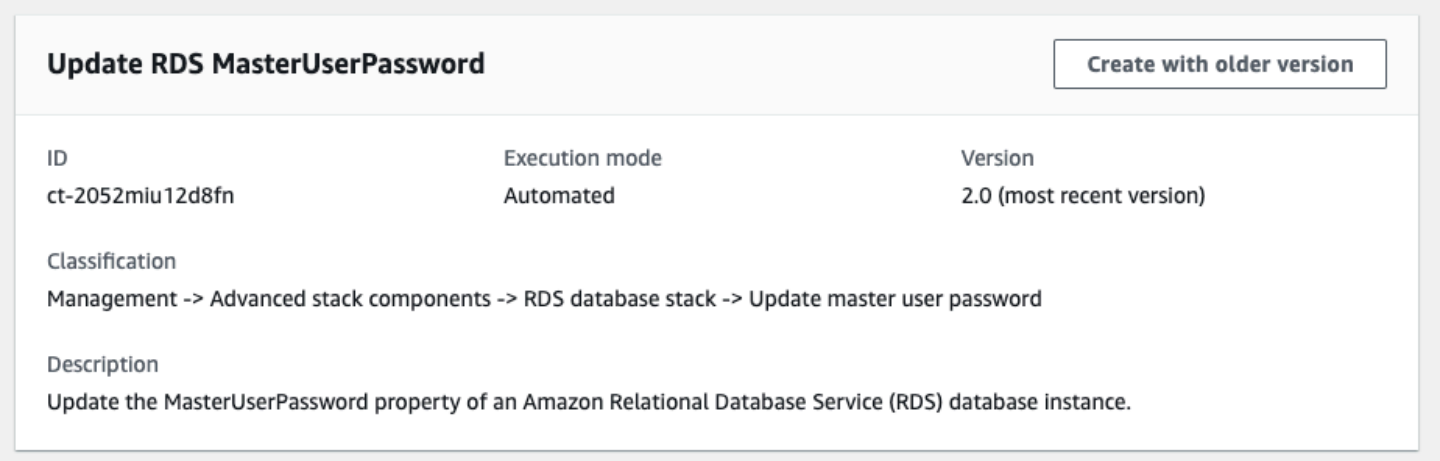
Change type ID	ct-2052miu12d8fn
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update DB master user password

Update the RDS master user password with the console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Update an RDS master user password with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2052miu12d8fn" --change-type-version "2.0"
 --title "Update RDS master user password" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-UpdateInstanceMasterUserPasswordV2\",\"Region\":\"us-east-1\",
\"Parameters\": {\"DBInstanceIdentifier\":[\"myrdsinstance\"], \"SecretName\":
 \"my_secret_name\", \"SecretKey\": \"my_secret_key\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateRdsMPParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2052miu12d8fn" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateRdsMPParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateInstanceMasterUserPasswordV2",
     "Region": "ap-southeast-2",
     "Parameters": {
       "DBInstanceIdentifier": "myrdsinstance",
       "SecretName": "my_secret_name",
       "SecretKey": "my_secret_key",
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdateRdsMPRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateRdsMPRfc.json
   ```

4. Modify and save the UpdateRdsMPRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-2052miu12d8fn",
"Title":                ""Update RDS master user password"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateRdsMPRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateRdsMPRfc.json --execution-
parameters file://UpdateRdsMPParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the RDS, look in the execution output: Use the "stack_id" to view the RDS in the Cloud Formation Console.

7. You are now able to manage the database via a database management tool such as SQL server management studio. You do not have to request access from AMS.

Tips

- Before you use this CT, you must first store your new master user password in one of the following:
  - AWS Systems Manager (SSM) Parameter Store
  - AWS Secrets Manager
- To use **SSM (AWS Systems Manager) Parameter Store**

  SSM Parameter Store

CT Parameter	Value
SSMParameter	"*my_ssm_parameter_name* "

- To use **AWS Secrets Manager**

AWS Secrets Manager

CT Parameter	Value
SecretName	"*my_secret_name* "
SecretKey	"*my_secret_key* "

- To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.
- For an informal comparison of Secrets Manager and SSM Parameter Store, see AWS — Difference between Secrets Manager and Parameter Store (Systems Manager).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2052miu12d8fn.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateInstanceMasterUserPasswordV2",
  "Region": "us-east-1",
  "Parameters": {
    "DBInstanceIdentifier": "rt123456789",
    "SecretName": "mysecret",
    "SecretKey": "mypassword"
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateInstanceMasterUserPasswordV2",
  "Region": "us-east-1",
  "Parameters": {
    "DBInstanceIdentifier": "rt123456789",
    "SecretName": "mysecret",
    "SecretKey": "mypassword"
  }
```

```
}
```

RDS Database Stack | Update MultiAZ Setting

Change the DB instance MultiAZ value through direct API calls. The MultiAZ setting determines whether or not the DB instance is deployed across multiple availability zones (AZs). The RDS instance can be standalone or belong to a CloudFormation stack; in the latter case, the change might cause stack drift. To avoid causing stack drift, please use ct-12w49boaiwtzp instead, or ct-361tlo1k7339x if the RDS instance was provisioned via CFN ingestion.

Full classification: Management | Advanced stack components | RDS database stack | Update MultiAZ setting

Change Type Details

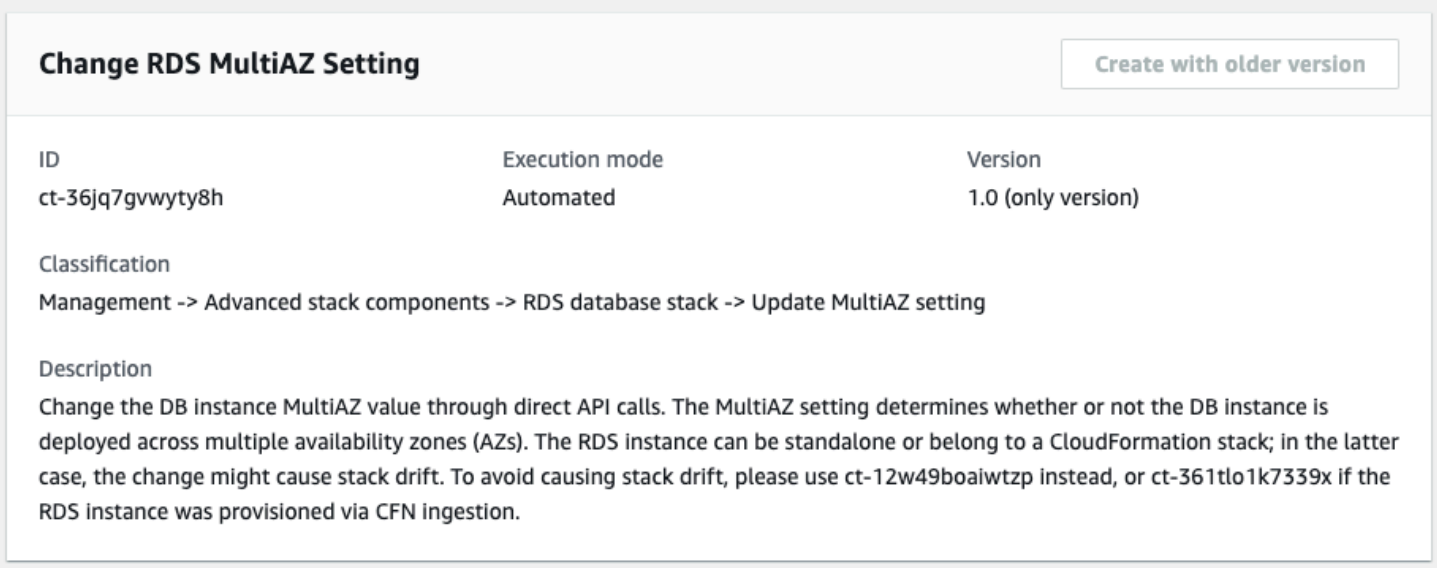
Change type ID	ct-36jq7gvwyty8h
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update an RDS multi-AZ deployment

Updating an RDS multi-AZ deployment with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an RDS multi-AZ deployment with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-36jq7gvwyty8h" --change-type-version
 "1.0" --title "Update RDS Multiple AZ" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-UpdateRDSMultiAZ\",\"Region\":\"us-east-1\",\"Parameters\":
 {\"DBInstanceIdentifier\":[\"rt123456789\"], \"MultiAZ\": \"true\",\"ApplyImmediately
\": \"true\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateMultipleAzParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-36jq7gvwyty8h"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateMultipleAzParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateRDSMultiAZ",
     "Region": "us-east-1",
     "Parameters": {
       "DBInstanceIdentifier": [
         "rt123456789"
       ],
       "MultiAZ": "true",
       "ApplyImmediately": "false"
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdateMultipleAzRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateMultipleAzRfc.json
   ```

4. Modify and save the UpdateMultipleAzRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-36jq7gvwyty8h",
"Title":                "Update RDS Multiple AZ"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateMultipleAzRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateMultipleAzRfc.json --execution-
parameters file://UpdateMultipleAzParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> AMS employs drift detection on certain stacks, including RDS stacks, to determine if configuration changes. The AMS disallows updates to an RDS stack that has been determined to have configuration drift. The RFC will fail with the following error message: "Update cannot be performed on this stack, please contact AMS for further assistance."

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

To update an RDS stack for Aurora, see RDS Database Stack | Update.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-36jq7gvwyty8h.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateRDSMultiAZ",
  "Region": "us-east-1",
  "Parameters": {
    "DBInstanceIdentifier": [
      "rt123456789"
    ],
    "MultiAZ": "true",
    "ApplyImmediately": "false"
  }
}
```

RDS Database Stack | Update Performance Insights (Review Required)

Update Performance Insights for a DB instance or Multi-AZ DB cluster. Amazon RDS Performance Insights is a database performance tuning and monitoring feature that helps you assess the load on your database. You can change settings, enable, or disable the feature.

Full classification: Management | Advanced stack components | RDS database stack | Update Performance Insights (review required)

Change Type Details

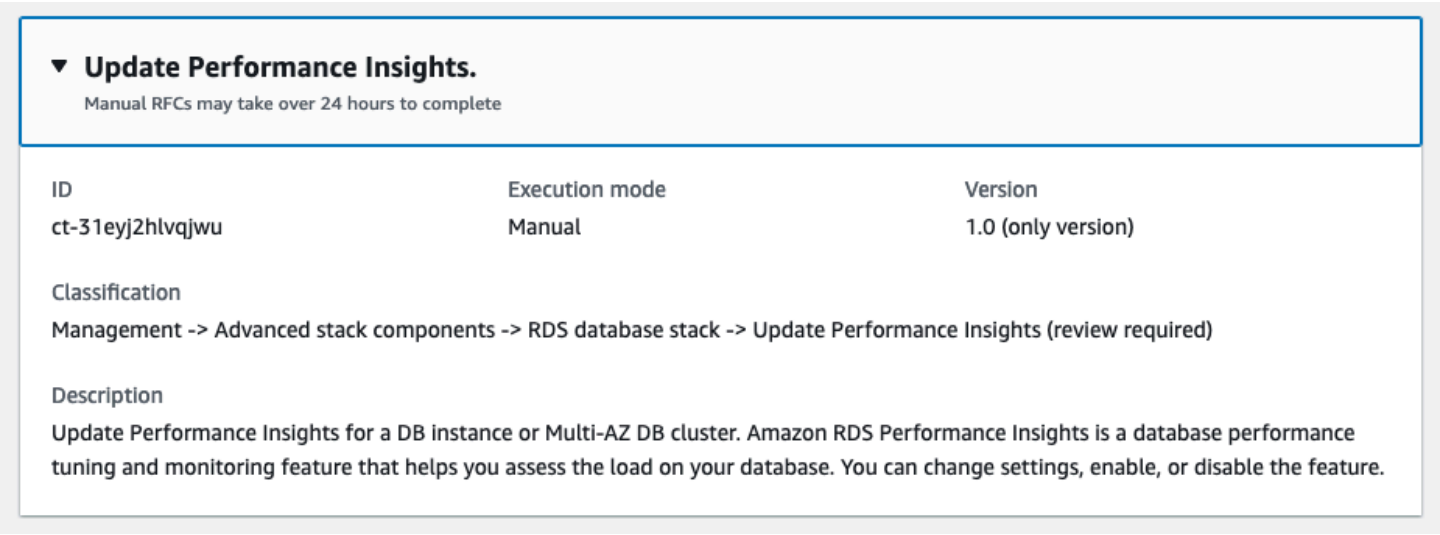
Change type ID	ct-31eyj2hlvqjwu
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Manual

Additional Information

Update RDS performance insights (review required)

Updating an RDS performance insights with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating performance insights with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-31eyj2hlvqjwu" --change-type-
version "1.0" --title "Update Performance Insights." --execution-parameters
 "{\"DBIdentifierArn\": \"arn:aws:rds:us-east-1:123456789012:cluster:database-1\",
\"PerformanceInsights\": \"true\", \"PerformanceInsightsKMSKeyId\": \"default\",
 \"PerformanceInsightsRetentionPeriod\": \"7 days\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdatePerformanceInsightsParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-31eyj2hlvqjwu"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdatePerformanceInsightsParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DBIdentifierArn": "arn:aws:rds:us-east-1:123456789101:cluster:database-1",
     "PerformanceInsights": "true",
     "PerformanceInsightsKMSKeyId": "default",
     "PerformanceInsightsRetentionPeriod": "7 days"
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdatePerformanceInsightsRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdatePerformanceInsightsRfc.json
   ```

4. Modify and save the UpdatePerformanceInsightsRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   ```

```
"ChangeTypeId":          "ct-31eyj2hlvqjwu",
"Title":                 "Update Performance Insights"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdatePerformanceInsightsRfc.json --
execution-parameters file://UpdatePerformanceInsightsParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> AMS employs drift detection on certain stacks, including RDS stacks, to determine if configuration changes. The AMS disallows updates to an RDS stack that has been determined to have configuration drift. The RFC will fail with the following error message: "Update cannot be performed on this stack, please contact AMS for further assistance."

To learn more about Amazon RDS, including size recommendations, see Amazon Relational Database Service Documentation.

To update an RDS stack for Aurora, see RDS Database Stack | Update.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-31eyj2hlvqjwu.

Example: Required Parameters

```
{
  "DBIdentifierArn": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
  "PerformanceInsights": "true"
}
```

Example: All Parameters

```
{
  "DBIdentifierArn": "arn:aws:rds:us-east-1:123456789012:db:my-db-instance",
  "PerformanceInsights": "true",
  "PerformanceInsightsKMSKeyId": "arn:aws:kms:us-
east-1:123456789012:key/58c399bf-1662-4d55-8bbe-fb6d26bd72b9",
  "PerformanceInsightsRetentionPeriod": "7 days"
}
```

RDS Database Stack | Update Storage

Change the RDS instance storage type, capacity or IOPS through direct API calls. The RDS instance can be standalone or belong to a CloudFormation stack, in the latter case, the change might cause stack drift. To avoid causing stack drift, please use ct-12w49boaiwtzp instead, or ct-361tlo1k7339x if the RDS instance was provisioned via CFN ingestion.

Full classification: Management | Advanced stack components | RDS database stack | Update Storage

Change Type Details

Change type ID	ct-0loed9dzig1ze
Current version	1.0

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating RDS storage with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0loed9dzig1ze" --change-type-version
 "1.0" --title "Update RDS storage" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-UpdateRDSStorage\",\"Region\":\"us-east-1\",\"Parameters\":
 {\"DBInstanceIdentifier\":[\"rt123456789\"], \"AllocatedStorage\": [\"100\"],,
\"ApplyImmediately\": \"true\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateStorageParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0loed9dzig1ze" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateStorageParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateRDSStorage",
     "Region": "us-east-1",
     "Parameters": {
       "DBInstanceIdentifier": [
         "rt123456789"
       ],
       "AllocatedStorage": [
         "100"
       ],
       "ApplyImmediately": "false"
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdateStorageRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateStorageRfc.json
   ```

4. Modify and save the UpdateStorageRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0loed9dzig1ze",
"Title":                "Update RDS storage"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateStorageRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateStorageRfc.json --execution-
parameters file://UpdateStorageParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> AMS employs drift detection on certain stacks, including RDS stacks, to determine if configuration changes.       "rt123456789"
    ],
    "AllocatedStorage": [
      "1000"
    ],
    "StorageType": [
      "gp3"
    ],
    "Iops": [
      "10000"
    ],
    "ApplyImmediately": "true"
  }
}
```

RDS Snapshot | Delete

Delete DB instance or cluster snapshots. This document only supports deletion of 'manual' and 'awsbackup' snapshot types. If the snapshot is being copied, the copy operation is terminated. The snapshot must be in available state to be deleted. If one or more snapshots cannot be deleted, automation fails. Up to 20 snapshots can be deleted in one execution.

Full classification: Management | Advanced stack components | RDS snapshot | Delete

Change Type Details

Change type ID	ct-0idxb0xsg1ui6
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required

Execution mode	Automated

Additional Information

Delete RDS snapshots

Deleting RDS Snapshots with the Console

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting RDS Snapshots with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0idxb0xsg1ui6" --change-type-version
 "2.0" --title "Delete RDS Snapshots" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-DeleteRDSSnapshots\",\"Region\": \"us-east-1\",\"Parameters\":
 {\"SnapshotNamesOrArns\": [\"snapshot1\", \"snapshot2\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named DeleteRdsDbSnapshotParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0idxb0xsg1ui6"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DeleteRDSSnapshotsGroupParameters.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-DeleteRDSSnapshots",
     "Region": "us-east-1",
     "SnapshotNamesOrArns": ["snapshot1","snapshot2"]
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it DeleteRdsDbSnapshotRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteRDSSnapshots.json
   ```

4. Modify and save the DeleteRdsDbSnapshotRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "2.0",
  "ChangeTypeId": "ct-0idxb0xsg1ui6",
  "Title": "Delete RDS Snapshots"
}
```

5. Create the RFC, specifying the DeleteRDSSnapshots.json file and the execution parameters file, DeleteRDSSnapshotsGroupParameters.json:

```
aws amscm create-rfc --cli-input-json file://DeleteRDSSnapshots.json --execution-
parameters file://DeleteRDSSnapshotsGroupParameters.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information about RDS snapshots, see Backing up and restoring an Amazon RDS DB instance.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0idxb0xsg1ui6.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-DeleteRDSSnapshotsV2",
  "Region": "us-east-1",
  "Parameters": {
    "SnapshotNamesOrArns": [
      "dbsnapshot",
      "arn:aws:rds:us-east-1:945533541580:snapshot:db2-snapshot",
      "arn:aws:rds:us-east-1:945533541580:cluster-snapshot:db2-snapshot"
```

```
    ]
  }
}
```

RDS Snapshot | Share

Share a snapshot of an Amazon Relational Database Service (RDS) database (DB) instance with another AMS account. Only snapshots encrypted with managed KMS keys can be shared.

Full classification: Management | Advanced stack components | RDS snapshot | Share

Change Type Details

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Sharing an RDS DB Snapshot with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2u5rcyv5h34zn" --change-type-version
 "1.0" --title "Share DB snapshot" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ShareDBSnapshot\",\"Region\":\"us-east-1\",\"Parameters\":
{\"DBSnapshotName\":[\"rds-db-snapshot\"],\"AccountId\":[\"012345678912\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named ShareRdsDbSnapshotParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2u5rcyv5h34zn"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ShareRdsDbSnapshotParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-ShareDBSnapshot",
     "Region": "us-east-1",
     "Parameters": {
       "DBSnapshotName": [
         "rds-db-snapshot"
       ],
       "AccountId": [
         "012345678912"
       ]
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it ShareRdsDbSnapshotRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ShareRdsDbSnapshotRfc.json
   ```

4. Modify and save the ShareRdsDbSnapshotRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-2u5rcyv5h34zn",
  "Title": "Share DB Snapshot"
}
```

5. Create the RFC, specifying the execution parameters file and the ShareRdsDbSnapshotRfc file:

```
aws amscm create-rfc --cli-input-json file://ShareRdsDbSnapshotRfc.json --
execution-parameters file://ShareRdsDbSnapshotParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about RDS, see the RDS User Guide.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2u5rcyv5h34zn.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-ShareDBSnapshot",
  "Region": "us-east-1",
  "Parameters": {
    "DBSnapshotName": ["dbsnapshot"],
    "AccountId": ["012345678912"]
  }
}
```

Redshift | Pause Cluster

Pause an Amazon Redshift cluster. If a recent snapshot is not available, a temporary manual snapshot is created with a retention period of one day. This snapshot is deleted towards the end of execution for both success and failure scenarios. It is safe for AMS to delete this snapshot as pausing the cluster creates an automated snapshot by default.

Full classification: Management | Advanced stack components | Redshift | Pause cluster

Change Type Details

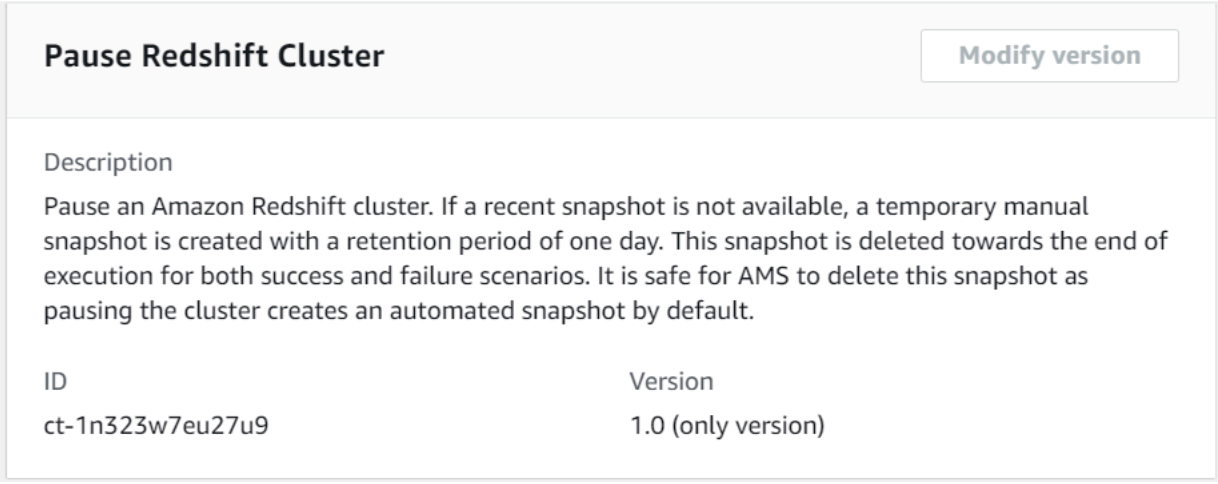
Change type ID	ct-1n323w7eu27u9
Current version	1.0
Expected execution duration	180 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Pause cluster

Pausing a Redshift cluster with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Pausing a Redshift cluster with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1n323w7eu27u9" --change-type-version "1.0"
 --title "Pause Amazon Redshift cluster" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-PauseRedshiftCluster\",\"Region\":\"us-east-1\",\"Parameters\":
{\"ClusterIdentifier\":[\"my-redshift-cluster\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type (ct-1n323w7eu27u9) to a JSON file named PauseRdshftClusterParams.json.

```
aws amscm get-change-type-version --change-type-id "ct-1n323w7eu27u9"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 PauseRdshftClusterParams.json
```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   Oracle example:

```
{
  "DocumentName" : "AWSManagedServices-PauseRedshiftCluster",
  "Region" : "us-east-1",
  "Parameters" : {
    "ClusterIdentifier" : [
      "my-redshift-cluster"
    ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it PauseRdshftClusterRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > PauseRdshftClusterRfc.json
```

4. Modify and save the PauseRdshftClusterRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1n323w7eu27u9",
"Title":                "Pause Amazon Redshift cluster"
}
```

5. Create the RFC, specifying the execution parameters file and the PauseRdshftClusterRfc file:

```
aws amscm create-rfc --cli-input-json file://PauseRdshftClusterRfc.json --
execution-parameters file://PauseRdshftClusterParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS Redshift, see Amazon Redshift.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1n323w7eu27u9.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-PauseRedshiftCluster",
    "Region": "us-east-1",
    "Parameters": {
      "ClusterIdentifier": ["myredcluster1"]
    }
}
```

Redshift | Resume Cluster

Resume a paused Amazon Redshift cluster.

Full classification: Management | Advanced stack components | Redshift | Resume cluster

Change Type Details

Change type ID	ct-39c5qiasbe4he
Current version	1.0
Expected execution duration	180 minutes
AWS approval	Required
Customer approval	Not required

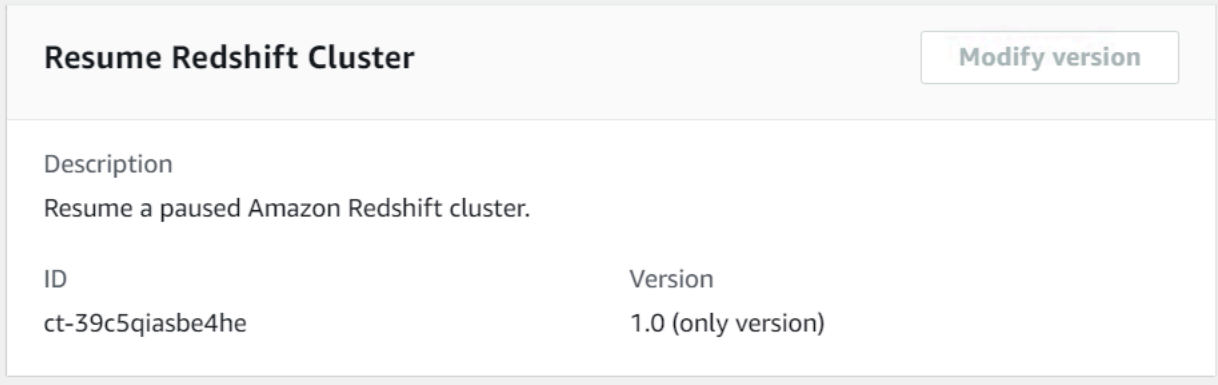
Execution mode	Automated

Additional Information

Resume cluster

Resuming a Redshift cluster with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Resuming a Redshift cluster with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-39c5qiasbe4he" --change-type-version "1.0"
 --title "Resume Amazon Redshift cluster" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-ResumeRedshiftCluster\",\"Region\":\"us-east-1\",\"Parameters\":
{\"ClusterIdentifier\":[\"my-redshift-cluster\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type (ct-39c5qiasbe4he) to a JSON file named ResumeRdshftClusterParams.json.

```
aws amscm get-change-type-version --change-type-id "ct-39c5qiasbe4he"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 ResumeRdshftClusterParams.json
```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   Oracle example:

```
{
  "DocumentName" : "AWSManagedServices-ResumeRedshiftCluster",
  "Region" : "us-east-1",
  "Parameters" : {
    "ClusterIdentifier" : [
      "my-redshift-cluster"
    ]
  }
}
```

3. Output the JSON template to a file in your current folder; this example names it ResumeRdshftClusterRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ResumeRdshftClusterRfc.json
```

4. Modify and save the ResumeRdshftClusterRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-39c5qiasbe4he",
"Title":                "Resume Amazon Redshift cluster"
}
```

5. Create the RFC, specifying the execution parameters file and the ResumeRdshftClusterRfc file:

```
aws amscm create-rfc --cli-input-json file://ResumeRdshftClusterRfc.json --
execution-parameters file://ResumeRdshftClusterParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Resume an Amazon Redshift cluster. To learn how to pause an Amazon Redshift cluster, see Pause cluster

To learn more about Amazon Redshift, see Amazon Redshift.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-39c5qiasbe4he.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-ResumeRedshiftCluster",
    "Region": "us-east-1",
    "Parameters": {
      "ClusterIdentifier": ["myredcluster1"]
    }
  }
```

Route 53 Resolver | Associate VPC With Resolver Rule

Associate a VPC with a Route 53 resolver rule, this causes the resolver to forward all DNS queries for the domain name specified in the rule, and that originate in the VPC, to the IP addresses specified in the rule.

Full classification: Management | Advanced stack components | Route 53 Resolver | Associate VPC with resolver rule

Change Type Details

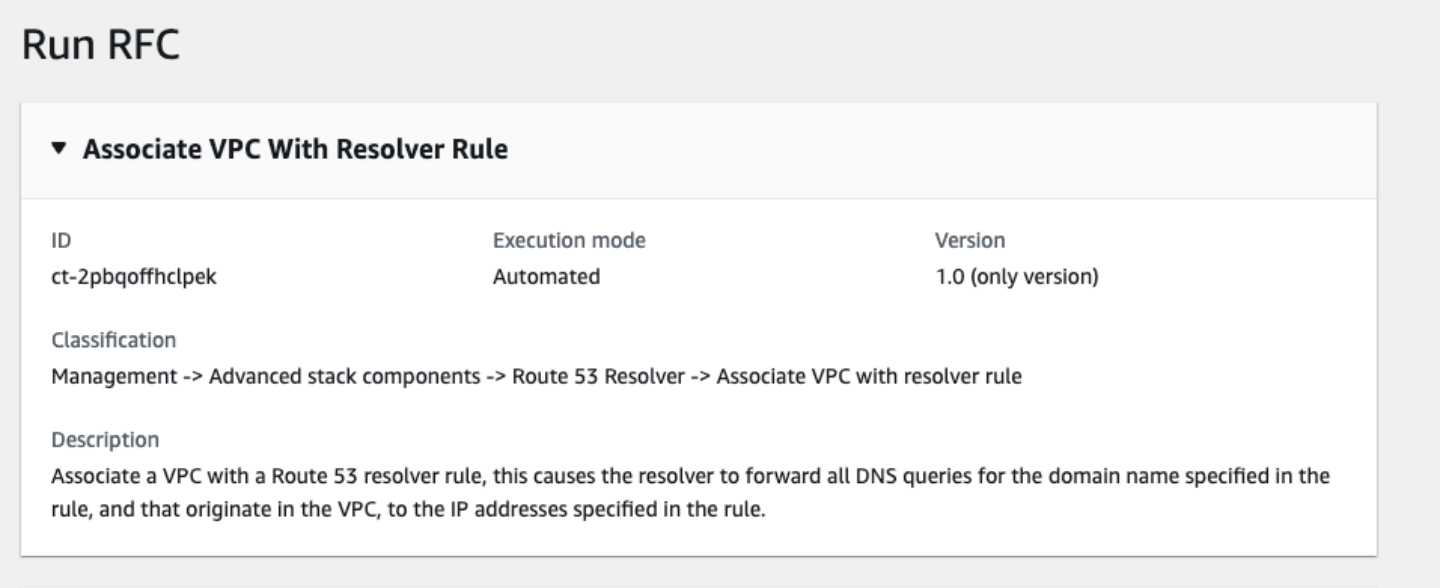
Change type ID	ct-2pbqoffhclpek
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Associate VPC with Resolver Rule

Requesting administrator access with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Requesting administrator access with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title="Associate VPC with Resolver Rule" --ct-
id="ct-2pbqoffhclpek" --ct-version="1.0" --execution-parameters "{\"Description\":
\"Associate VPC with Resolver Rule\",\"ResolverRuleId\":\"rslvr-rr-974b1666869a4d27b\",
\"VPCId\":\"vpc-02a18ed0cd3c17e71\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type; this example names it VPCAssociateResolverRule.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2pbqoffhclpek"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    VPCAssociateResolverRule.json
   ```

2. Modify and save the execution parameters as VPCAssociateResolverRuleParams.json. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-AssociateVPCWithResolverRule",
   ```

```
  "Region": "us-east-1",
  "Parameters": {
    "Name": "resolver-rule-associate-vpc-test",
    "ResolverRuleId": "rslvr-rr-1234567890abcdefg",
    "VPCId": "vpc-1a2b3c4d"
  }
}
```

3. Output the RFC template JSON file; this example names it VPCAssociateResolverRuleRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > VPCAssociateResolverRuleRfc.json
```

4. Modify and save the VPCAssociateResolverRuleRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion" : "1.0",
  "ChangeTypeId" : "ct-2pbqoffhclpek",
  "Title" : "Associate VPC with Resolver Rule "
}
```

5. Create the RFC, specifying the VPCAssociateResolverRuleRfc file and the VPCAssociateResolverRuleParams file:

```
aws amscm create-rfc --cli-input-json file://VPCAssociateResolverRuleRfc.json  --
execution-parameters file:/VPCAssociateResolverRuleParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2pbqoffhclpek.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-AssociateVPCWithResolverRule",
    "Region": "us-east-1",
    "Parameters": {
```

```
      "ResolverRuleId": "rslvr-rr-1234567890abcdefg",
      "VPCId": "vpc-1a2b3c4d"
    }
  }
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-AssociateVPCWithResolverRule",
  "Region": "us-east-1",
  "Parameters": {
    "Name": "resolver-rule-associate-vpc-test",
    "ResolverRuleId": "rslvr-rr-1234567890abcdefg",
    "VPCId": "vpc-1a2b3c4d"
  }
}
```

Route 53 Resolver | Disassociate Resolver Rules from VPC

Removes the associations between specified resolver rules (upto 20) and a specified VPC.

Full classification: Management | Advanced stack components | Route 53 Resolver | Disassociate resolver rules from VPC

Change Type Details

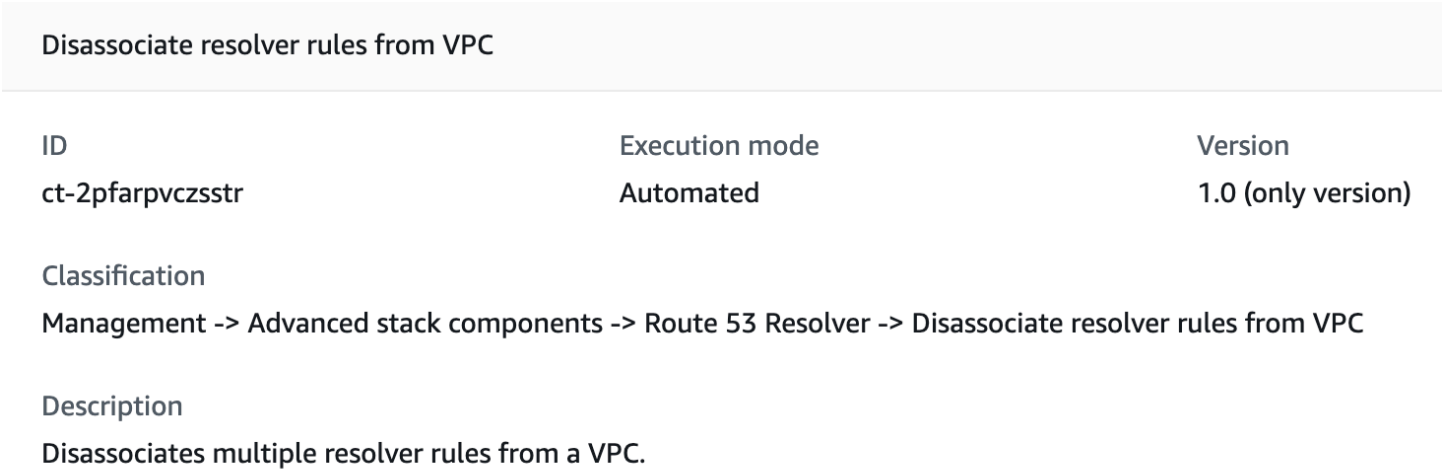
Change type ID	ct-2pfarpvczsstr
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Disassociate resolver rules from VPC

Disassociate resolver rules from a VPC with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Disassociate resolver rules from a VPC with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws --profile saml --region us-east-1 amscm create-rfc --change-type-id
 "ct-3e3prksxmdhw8" --change-type-version "2.0" --title "AMI-Create-IC" --
execution-parameters "{\"AMIName\":\"MyAmi\",\"VpcId\":\"VPC_ID\",\"EC2InstanceId\":
\"INSTANCE_ID\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateAmiFromAsgParams.json:

   ```
   aws amscm create-rfc --change-type-id "ct-3e3prksxmdhw8" --change-type-version
    "1.0" --title "Create AMI from an Auto Scaling group" --execution-parameters
    "{\"DocumentName\": \"AWSManagedServices-CreateAmiInAutoScalingGroup\",\"Region
   \": \"us-east-1\",\"Parameters\": {\"AutoScalingGroupName\": [\"stack-ab0123cdef-
   ASG-1ABC2345\"],\"Sysprep\": [\"False\"],\"StopInstance\": [\"False\"]}}"
   ```

2. Modify and save the execution parameters CreateAmiFromAsgParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-CreateAmiInAutoScalingGroup",
     "Region": "us-east-1",
     "Parameters": {
       "AutoScalingGroupName": [
         "stack-ab0123cdef-ASG-1ABC2345"
       ],
       "Sysprep": [
         "False"
       ],
       "StopInstance": [
         "False"
       ]
     }
   }
   ```

3. Output the RFC template JSON file to a file in your current folder; this example names it CreateAmiFromAsgRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > CreateAmiFromAsgRfc.json
```

4. Modify and save the CreateAmiFromAsgRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3e3prksxmdhw8",
  "Title": "Create AMI from an Auto Scaling group"
}
```

5. Create the RFC, specifying the CreateAmiFromAsgRfc file and the CreateAmiFromAsgParams file:

```
aws amscm create-rfc --cli-input-json file://CreateAmiFromAsgRfc.json  --execution-
parameters file://CreateAmiFromAsgParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2pfarpvczsstr.

Example: Required Parameters

```
{
    "DocumentName": "AWSManagedServices-DisassociateVPCResolverRules",
    "Region": "us-east-1",
    "Parameters": {
        "ResolverRuleIds": [
            "rslvr-rr-1234567890abcdefg"
        ],
        "VPCId": "vpc-1a2b3c4d"
    }
}
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-DisassociateVPCResolverRules",
    "Region": "us-east-1",
    "Parameters": {
        "ResolverRuleIds": [
            "rslvr-rr-1234567890abcdefg",
            "rslvr-rr-9876543210abcdefg"
        ],
        "VPCId": "vpc-1a2b3c4d"
    }
}
```

S3 Storage | Add Event Notification

Add an event notification to the specified S3 bucket through direct API calls. The S3 bucket can be standalone or belong to a CloudFormation stack. For buckets in CloudFormation stacks, be aware that stack drift might occur if the bucket was provisioned through CFN ingestion.

Full classification: Management | Advanced stack components | S3 storage | Add event notification

Change Type Details

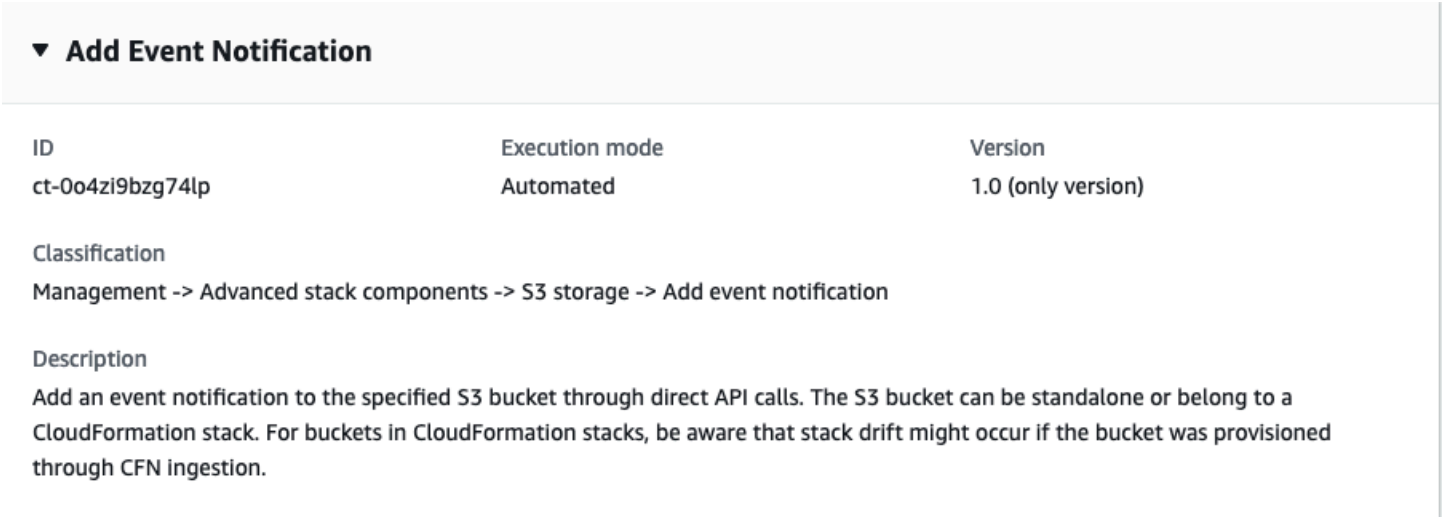
Change type ID	ct-0o4zi9bzg74lp
Current version	1.0
Expected execution duration	10 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add event notification to an Amazon S3 bucket

Add an event notification to an S3 bucket with the Amazon S3 Console

The following is a screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Add an event notification to an S3 bucket with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0o4zi9bzg74lp" --change-type-version
 "1.0" --title "Add event notification" --execution-parameters "{ \"DocumentName
\": \"AWSManagedServices-AddBucketEventNotification\", \"Region\": \"us-
east-1\", \"Parameters\": { \"BucketName\": \"bucketname\", \"EventName\":
 \"eventname\", \"Prefix\": \"foo\", \"Suffix\": \".bar\", \"EventTypes\":
 [ \"s3:ObjectCreated:Post\", \"s3:ObjectCreated:Put\" ], \"DestinationARN\":
 \"arn:aws:lambda:us-east-1:123456789012:function:functionname\" } }"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AddEventNotificationS3Params.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-220bdb8blaixf"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    AddEventNotificationS3Params.json
   ```

2. Modify and save the AddEventNotificationS3Params file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-AddBucketEventNotification",
     "Region": "us-east-1",
     "Parameters": {
       "BucketName": "bucketname",
       "EventName": "eventname",
       "Prefix": "foo",
       "Suffix": ".bar",
       "EventTypes": [
         "s3:ObjectCreated:Post",
         "s3:ObjectCreated:Put"
       ],
       "DestinationARN": "arn:aws:lambda:us-east-1:123456789012:function:functionname"
     }
   }
   ```

3. Output the RFC template JSON file to a file named AddEventNotificationS3Rfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AddEventNotificationS3Rfc.json
```

4. Modify and save the AddS3LifecycleConfigRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion": "1.0",
"ChangeTypeId": "ct-0o4zi9bzg74lp",
"Title": "Add Event Notification"
}
```

5. Create the RFC, specifying the AddEventNotificationS3Rfc file and the AddEventNotificationS3Params file:

```
aws amscm create-rfc --cli-input-json file://AddEventNotificationS3Rfc.json --
execution-parameters file://AddEventNotificationS3Params.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0o4zi9bzg74lp.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-AddBucketEventNotification",
  "Region": "us-east-1",
  "Parameters": {
    "BucketName": "s3-notification-test",
    "EventName": "TestEvent",
    "EventTypes": [
      "s3:ObjectCreated:*",
      "s3:ObjectCreated:Put"
    ],
    "DestinationARN": "arn:aws:lambda:us-east-1:123456789012:function:testfunction"
  }
```

```
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-AddBucketEventNotification",
  "Region": "us-east-1",
  "Parameters": {
    "BucketName": "s3-notification-test",
    "EventName": "TestEvent",
    "EventTypes": [
      "s3:ObjectCreated:*",
      "s3:ObjectCreated:Put",
      "s3:ObjectCreated:Post",
      "s3:ObjectCreated:Copy",
      "s3:ObjectCreated:CompleteMultipartUpload",
      "s3:ObjectRemoved:*",
      "s3:ObjectRemoved:Delete",
      "s3:ObjectRemoved:DeleteMarkerCreated",
      "s3:ObjectRestore:*",
      "s3:ObjectRestore:Post",
      "s3:ObjectRestore:Completed",
      "s3:ObjectRestore:Delete",
      "s3:ReducedRedundancyLostObject",
      "s3:Replication:*",
      "s3:Replication:OperationFailedReplication",
      "s3:Replication:OperationMissedThreshold",
      "s3:Replication:OperationReplicatedAfterThreshold",
      "s3:Replication:OperationNotTracked",
      "s3:LifecycleExpiration:*",
      "s3:LifecycleExpiration:Delete",
      "s3:LifecycleExpiration:DeleteMarkerCreated",
      "s3:LifecycleTransition",
      "s3:IntelligentTiering",
      "s3:ObjectTagging:*",
      "s3:ObjectTagging:Put",
      "s3:ObjectTagging:Delete",
      "s3:ObjectAcl:Put"
    ],
    "DestinationARN": "arn:aws:lambda:us-east-1:123456789012:function:testfunction",
    "Prefix": "testprefix",
    "Suffix": ".jpg"
  }
```

```
}
```

S3 Storage | Add Replication Rule

Add an S3 replication rule to the specified S3 bucket.

Full classification: Management | Advanced stack components | S3 storage | Add replication rule

Change Type Details

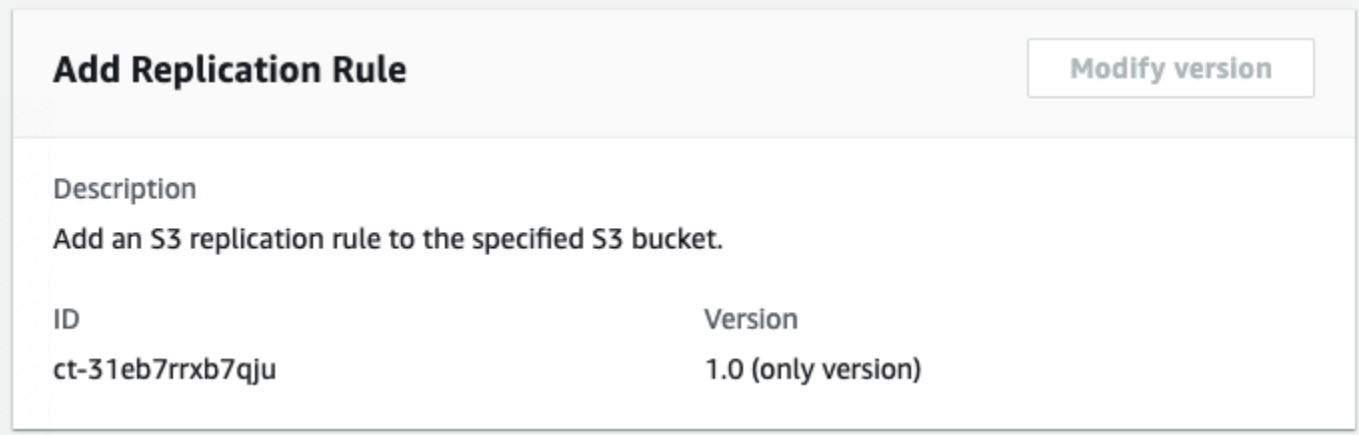
Change type ID	ct-31eb7rrxb7qju
Current version	1.0
Expected execution duration	10 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Add replication rule

Adding replication rules to a specified Amazon S3 bucket using the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding replication rules to a specified Amazon S3 bucket using the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

With all parameters for one rule:

```
aws amscm create-rfc --change-type-id "ct-31eb7rrxb7qju" --change-type-version
 "1.0" --title "Put S3 replication rule in the source bucket."--execution-
parameters"{\"DocumentName\":\"AWSManagedServices-PutReplicationRule\",\"Region
\":\"us-east-1\",\"Parameters\":{\"ReplicationRuleName\":[\"test-replication-
all-params\"],\"SourceBucketName\":[\"source-bucket-name\"],\"DestinationAccount
\":[\"123456789012\"],\"DestinationBucketName\":[\"destination-bucket-name\"],
\"ReplicationRole\":[\"arn:aws:iam::123456789012:role/customer_test_s3_replication\"],
\"OwnerTranslation\":[\"false\"],\"DecryptObjectKMSKey\":[\"arn:aws:kms:us-
east-1:123456789012:key/12345678-aaaa-bbbb-cccc-123456789012\"],\"EncryptReplicaKMSKey
\":[\"arn:aws:kms:eu-west-1:012987654321:key/87654321-aaaa-bbbb-cccc-012987654321\"],
\"Prefix\":[\"\"],\"Priority\":[\"1\"]}}"
```

TEMPLATE CREATE:

1. Create and save the PutReplicationRuleParams file.

```
aws amscm get-change-type-version --change-type-id "ct-31eb7rrxb7qju"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 PutReplicationRuleParams.json
```

2.
```
{
    "DocumentName" : "AWSManagedServices-PutReplicationRule",
    "Region": "us-east-1",
    "Parameters": {
      "ReplicationRuleName" : "test-replication-all-params",
      "SourceBucketName" : "source-bucket-name",
      "DestinationAccount" : "123456789012",
      "DestinationBucketName" : "destination-bucket-name",
      "ReplicationRole" : "arn:aws:iam::123456789012:role/
customer_test_s3_replication",
      "OwnerTranslation" : "false",
      "DecryptObjectKMSKey" : ["arn:aws:kms:us-east-1:123456789012:key/12345678-
aaaa-bbbb-cccc-123456789012"],
      "EncryptReplicaKMSKey" : "arn:aws:kms:eu-west-1:012987654321:key/87654321-
aaaa-bbbb-cccc-012987654321",
      "Prefix" : " ",
      "Priority" : "1"
    }
}
```

3. Output the RFC template to a file in your current folder; this example names it PutReplicationRuleRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > PutReplicationRuleRfc.json
```

4. Modify and save the PutReplicationRuleRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeVersion": "1.0",
    "ChangeTypeId": "ct-31eb7rrxb7qju",
    "Title": "Add S3 replication rule in the source bucket."
}
```

5. Create the RFC, specifying the PutReplicationRuleParams file and the PutReplicationRuleRfc file:

```
aws amscm create-rfc --cli-input-json file://PutReplicationRuleRfc.json --
execution-parameters file://PutReplicationRuleParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This is a new change type that allows you to add replication rules to a specified Amazon S3 bucket. If you want to receive a replication replica in your Amazon S3 bucket, use the S3 storage: Receive replication replica change type.

To learn more about Amazon S3 replication rules , see How do I add a replication rule to an S3 bucket?

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-31eb7rrxb7qju.

Example: Required Parameters

```
{
    "DocumentName" : "AWSManagedServices-PutReplicationRule",
    "Region": "us-east-1",
    "Parameters": {
      "ReplicationRuleName": ["test-replication-only-required-params"],
      "SourceBucketName": ["source-s3-test"],
      "DestinationAccount": ["555555555555"],
      "DestinationBucketName": ["destination-s3-test"],
      "ReplicationRole": ["arn:aws:iam::123456789012:role/
customer_test_s3_replication"]
    }
}
```

Example: All Parameters

```
{
    "DocumentName" : "AWSManagedServices-PutReplicationRule",
    "Region": "us-east-1",
    "Parameters": {
      "ReplicationRuleName": ["test-replication-all-params"],
      "SourceBucketName": ["s3-replication-test"],
      "DestinationAccount": ["555555555555"],
      "DestinationBucketName": ["test-replication-destination"],
      "ReplicationRole": ["arn:aws:iam::123456789012:role/
customer_test_s3_replication"],
      "OwnerTranslation": ["false"],
      "DecryptObjectKMSKey": ["arn:aws:kms:us-east-1:123456789012:key/
bfb30098-2f19-4375-91f5-12345682129a"],
      "EncryptReplicaKMSKey": ["arn:aws:kms:eu-west-1:123456789012:key/
d5e68703-8199-4265-a103-12345637bd47"],
      "Prefix":[""],
      "Priority": ["1"]
    }
}
```

S3 Storage | Delete Policy (Review Required)

Use to delete an S3 bucket policy.

Full classification: Management | Advanced stack components | S3 storage | Delete policy (review required)

Change Type Details

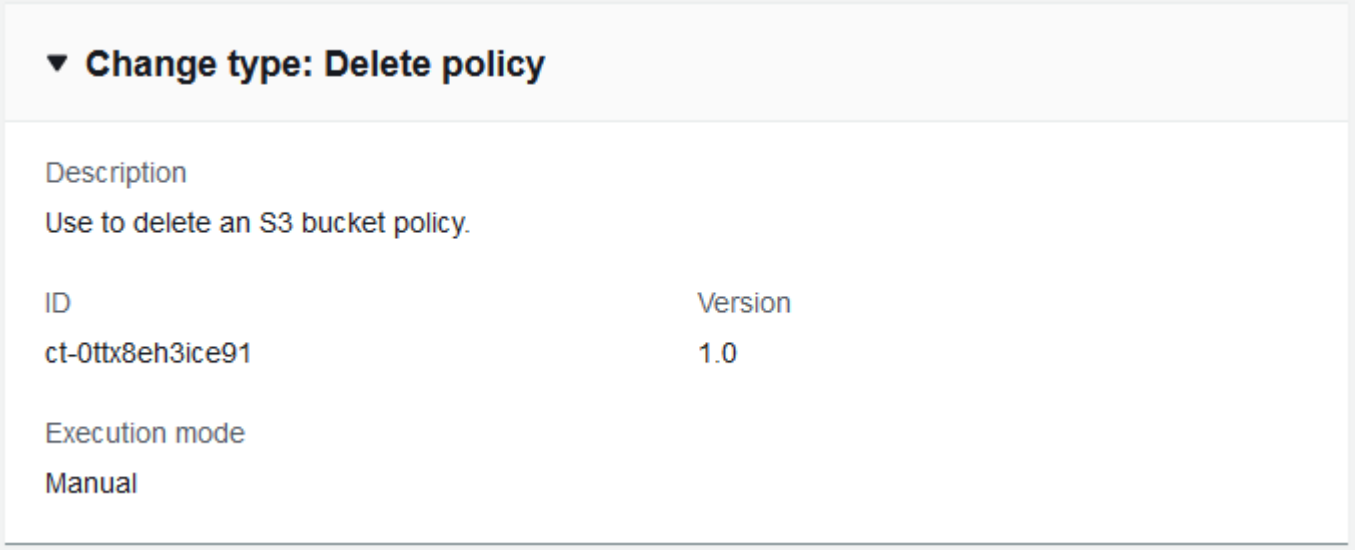
Change type ID	ct-0ttx8eh3ice91
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Delete S3 storage policy (review required)

Deleting an S3 Storage Policy (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an S3 Storage Policy (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0ttx8eh3ice91" --change-type-version "1.0"
 --title "TITLE" --execution-parameters "{\"BucketName\": \"example-bucket-123\",
 \"Operation\": \"Delete policy\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteS3PolicyParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0ttx8eh3ice91" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeleteS3PolicyParams.json
   ```

2. Modify and save the DeleteS3PolicyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "BucketName": "test-bucket-01",
     "Operation": "Delete policy"
   }
   ```

3. Output the RFC template JSON file to a file named DeleteS3PolicyRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteS3PolicyRfc.json
   ```

4. Modify and save the DeleteS3PolicyRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-0ttx8eh3ice91",
   "Title":                "S3-Policy-Delete-RFC"
   ```

```
}
```

5. Create the RFC, specifying the DeleteS3PolicyRfc file and the DeleteS3PolicyParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteS3PolicyRfc.json  --execution-
parameters file://DeleteS3PolicyParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0ttx8eh3ice91.

Example: Required Parameters

```
{
  "BucketName": "examplebucketname",
  "Operation": "Delete policy"
}
```

Example: All Parameters

```
{
  "BucketName": "examplebucketname",
  "Operation": "Delete policy",
  "Priority": "Medium"
}
```

S3 Storage | Manage Lifecycle Configuration

Add a new lifecycle configuration, or replace an existing one for an Amazon S3 bucket.

Full classification: Management | Advanced stack components | S3 storage | Manage lifecycle configuration

Change Type Details

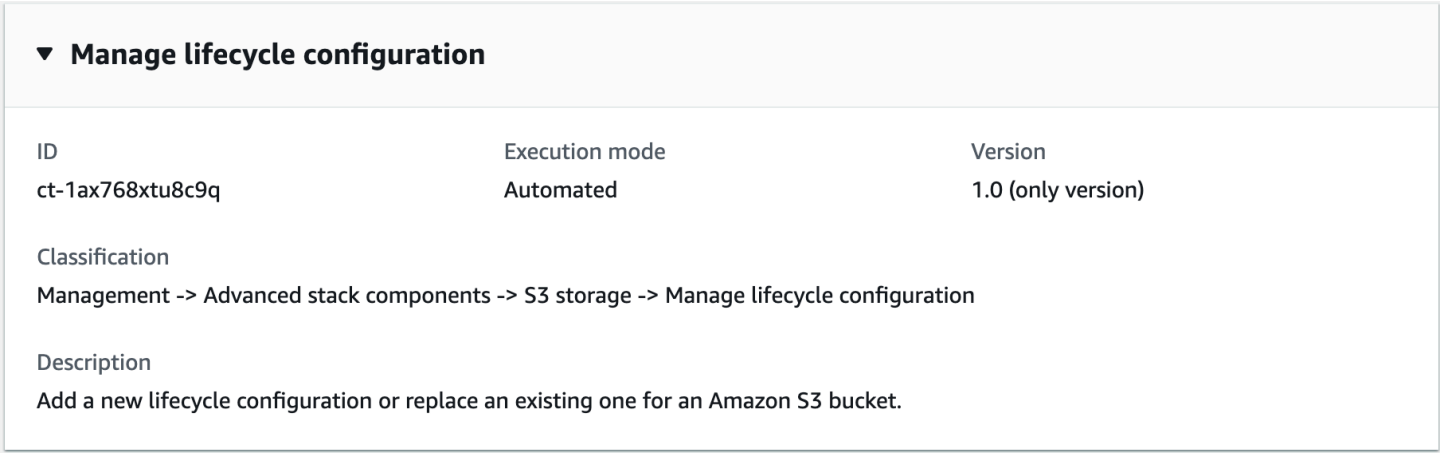
Change type ID	ct-1ax768xtu8c9q
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Manage S3 lifecycle configuration

Adding a new or replacing an existing lifecycle configuration for an S3 bucket with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

> **Note**
>
> When you add a lifecycle configuration from the console, you must provide a JSON string for the `LifecycleConfiguration` parameter similar to the following example:
> `{"Rules":[{"ID": "IDname","Filter": {"Prefix": "bucketprefix/"},"Status": "Enabled","Expiration": {"Days": 30},"NoncurrentVersionExpiration": {"NoncurrentDays": 30}}]}`

Adding a new or replacing an existing lifecycle configuration for an S3 bucket with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-1ax768xtu8c9q" \
--change-type-version "1.0" --title "Manage lifecycle configuration" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
PutBucketLifecycleConfiguration\",\"Region\":\"us-east-1\",\"Parameters\":{\"BucketName
\":[\"example-bucket-123\"],\"LifecycleConfiguration\":[\"{\\\"Rules\\\":[{\\
```

```
\"Filter\\\":{\\\"Prefix\\\":\\\"documents/\\\"},\\\"Status\\\":\\\"Enabled\\\",\\
\"Transitions\\\":[{\\\"Days\\\":365,\\\"StorageClass\\\":\\\"GLACIER\\\"}],\\\"ID
\\\":\\\"ExampleRule\\\"}]}\"], \"ReplaceExisting\": [\"True\"], \"Verification\":
 [\"confirm\"], \"MinimumNumberOfDaysBeforeExpiration\": [2]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it ManageS3LifecycleConfigParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-220bdb8blaixf"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    ManageS3LifecycleConfigParams.json
   ```

2. Modify and save the ManageS3LifecycleConfigParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-PutBucketLifecycleConfiguration",
     "Region": "us-east-1",
     "Parameters": {
       "BucketName": ["example-bucket-123"],
       "LifecycleConfiguration": ["{\"Rules\":[{\"Filter\":{\"Prefix\":\"documents/
   \"},\"Status\":\"Enabled\",\"Transitions\":[{\"Days\":365,\"StorageClass\":
   \"GLACIER\"}],\"ID\":\"ExampleRule\"}]}"],
       "ReplaceExisting": ["True"],
       "Verification": ["confirm"],
       "MinimumNumberOfDaysBeforeExpiration": [2]
     }
   }
   ```

3. Output the RFC template JSON file to a file named ManageS3LifecycleConfigRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > ManageS3LifecycleConfigRfc.json
   ```

4. Modify and save the ManageS3LifecycleConfigRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeId": "ct-1ax768xtu8c9q",
   "ChangeTypeVersion": "1.0",
   "Title": "Testing - ct-1ax768xtu8c9q Manage lifecycle configuration"
   ```

```
}
```

5. Create the RFC, specifying the ManageS3LifecycleConfigRfc file and the ManageS3LifecycleConfigParams file:

```
aws amscm create-rfc --cli-input-json file://ManageS3LifecycleConfigRfc.json  --
execution-parameters file://ManageS3LifecycleConfigParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon S3, see Amazon Simple Storage Service Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1ax768xtu8c9q.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-PutBucketLifecycleConfiguration",
  "Region" : "us-east-1",
  "Parameters" : {
    "BucketName" : [
      "test-s3-bucket"
    ],
    "LifecycleConfiguration" : [
      "{\"Rules\":[{\"Filter\":{\"Prefix\":\"documents/\"},\"Status\":\"Enabled\",
\"Transitions\":[{\"Days\":365,\"StorageClass\":\"GLACIER\"}],\"Expiration\":{\"Days
\":3650},\"ID\":\"ExampleRule\"}]}"
    ],
    "Verification" : [
      "confirm"
    ],
    "MinimumNumberOfDaysBeforeExpiration" : [
      10
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-PutBucketLifecycleConfiguration",
  "Region" : "us-east-1",
  "Parameters" : {
    "BucketName" : [
      "test-s3-bucket"
    ],
    "LifecycleConfiguration" : [
      "{\"Rules\":[{\"Filter\":{\"Prefix\":\"documents/\"},\"Status\":\"Enabled\",
\"Transitions\":[{\"Days\":365,\"StorageClass\":\"GLACIER\"}],\"Expiration\":{\"Days
\":3650},\"ID\":\"ExampleRule\"}]}"
    ],
    "ReplaceExisting" : [
      "False"
    ],
    "Verification" : [
      "confirm"
    ],
    "MinimumNumberOfDaysBeforeExpiration" : [
      10
    ]
  }
}
```

S3 Storage | Receive Replication Replica

Receive S3 object replicas in the destination bucket.

Full classification: Management | Advanced stack components | S3 storage | Receive replication replica

Change Type Details

Change type ID	ct-00zr0b0ozlcn3
Current version	1.0
Expected execution duration	10 minutes
AWS approval	Required

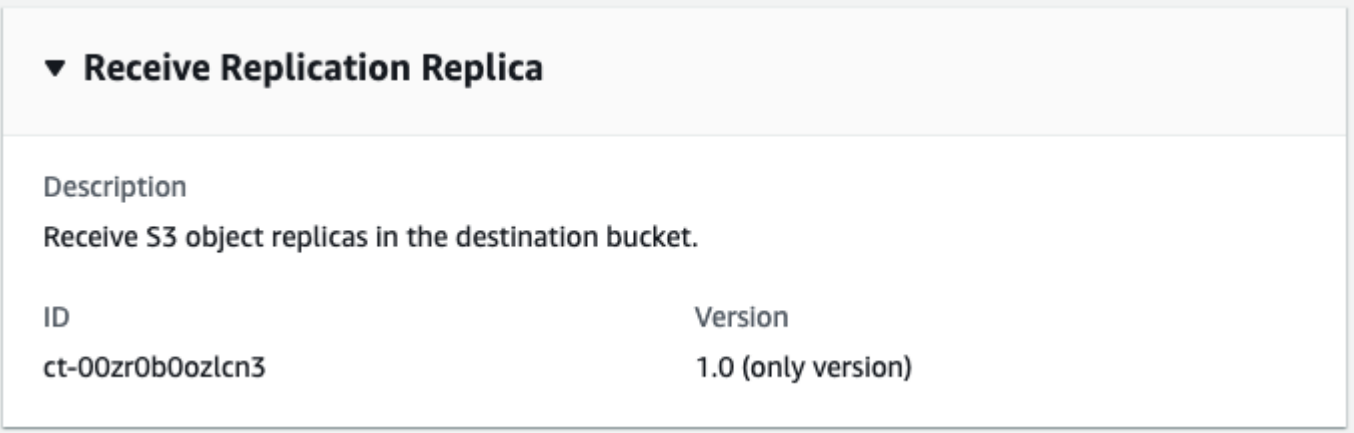
Customer approval	Not required
Execution mode	Automated

Additional Information

Receive replication replica

Receiving replication replicas in an Amazon S3 bucket using the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Receiving replication replicas in an Amazon S3 bucket using the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

With required parameters for one rule:

```
aws amscm create-rfc --change-type-id "ct-00zr0b0ozlcn3" --change-type-version
 "1.0" --title "Receive S3 object replicas in the destination bucket"--execution-
parameters"{\"DocumentName\":\"AWSManagedServices-ReceiveReplicationReplica\",
\"Region\":\"us-east-1\",\"Parameters\":{\"DestinationBucketName\":[\"destination-
bucket-name\"],\"SourceBucketName\":[\"source-bucket-name\"],\"ReplicationRole
\":[\"arn:aws:iam::123456789012:role/s3crr_role_for_test-replication\"],
\"EncryptReplicaKMSKey\":[\"arn:aws:kms:us-east-1:123456789012:key/12345678-aaaa-bbbb-
cccc-123456789012\"],\"OwnerTranslation\":[\"false\"]}}"
```

TEMPLATE CREATE:

1. Create and save the ReceiveReplicationReplicaParams.json file:

```
aws amscm get-change-type-version --change-type-id "ct-00zr0b0ozlcn3"
 --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
 ReceiveReplicationReplicaParams.json
```

2.

```
{
    "DocumentName" : "AWSManagedServices-ReceiveReplicationReplica",
    "Region": "us-east-1",
    "Parameters": {
      "DestinationBucketName" : "destination-bucket-name",
      "SourceBucketName" : "source-bucket-name",
      "ReplicationRole" : "arn:aws:iam::123456789012:role/s3crr_role_for_test-
replication",
      "EncryptReplicaKMSKey" : "arn:aws:kms:us-east-1:123456789012:key/12345678-
aaaa-bbbb-cccc-123456789012",
      "OwnerTranslation" : "false"
    }
```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it ReceiveReplicationReplicaRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > ReceiveReplicationReplicaRfc.json
```

4. Modify and save the ReceiveReplicationReplicaRfc.json file. For example, you can replace the contents with something like this:

```
{
    "ChangeTypeVersion": "1.0",
    "ChangeTypeId": "ct-00zr0b0ozlcn3",
    "Title": "Receive S3 object replicas in the destination bucket."
}
```

5. Create the RFC, specifying the ReceiveReplicationReplicaRfc file and the ReceiveReplicationReplicaParams file:

```
aws amscm create-rfc --cli-input-json file://ReceiveReplicationReplicaRfc.json --
execution-parameters file://ReceiveReplicationReplicaParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This is a new change type that enables you to receive replication replicas in your Amazon S3 bucket. If you want to add replication rules, use the S3 storage: Add replication replica change type.

To learn more about Replication, see Replication.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-00zr0b0ozlcn3.

Example: Required Parameters

```
{
    "DocumentName" : "AWSManagedServices-ReceiveReplicationReplica",
    "Region": "us-east-1",
    "Parameters": {
      "DestinationBucketName": ["s3-replication-destination"],
      "SourceBucketName": ["test-s3-replication"],
      "ReplicationRole": ["arn:aws:iam::555555555555:role/service-role/
s3_role_for_test-replication"]
    }
}
```

Example: All Parameters

```
{
    "DocumentName" : "AWSManagedServices-ReceiveReplicationReplica",
    "Region": "us-east-1",
    "Parameters": {
      "DestinationBucketName": ["s3-test-destination"],
      "SourceBucketName": ["s3-test-source"],
      "ReplicationRole": ["arn:aws:iam::555555555555:role/service-role/
s3_role_for_test-replication"],
      "EncryptReplicaKMSKey":["arn:aws:kms:us-
east-1:123456789012:key/12345678-5555-4375-91f5-1232d682129a"],
      "OwnerTranslation":["true"]
    }
}
```

S3 Storage | Update

Modify the properties of an S3 bucket created using change type ID ct-1a68ck03fn98r, version 4.0.

Full classification: Management | Advanced stack components | S3 storage | Update

Change Type Details

Change type ID	ct-1gi93jhvj28eg
Current version	4.0

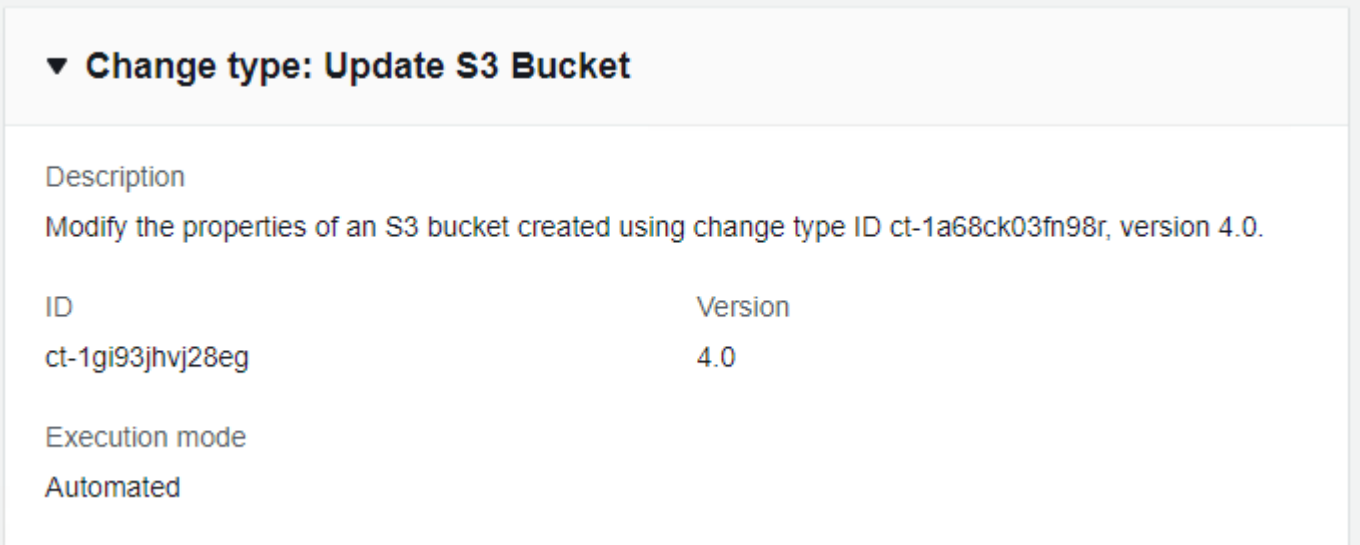
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update S3 storage

Updating an S3 with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an S3 with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

Example with only required parameters:

```
aws amscm create-rfc --title s3-bucket-update --change-type-
id ct-1gi93jhvj28eg --change-type-version 4.0 --execution-
parameters '{"VpcId":"VPC_ID","StackId":"STACK_ID","Parameters":
{"IAMPrincipalsRequiringWriteObjectAccess":["arn:aws:iam::123456789012:role/roleA"]}}'
```

Example with all parameters:

```
aws amscm create-rfc --title s3-bucket-update --change-type-
id ct-1gi93jhvj28eg --change-type-version 4.0 --execution-
parameters '{"VpcId":"VPC_ID","StackId":"STACK_ID","Parameters":
{"ServerSideEncryption":"KmsManagedKeys","KMSKeyId":"arn:aws:kms:us-
east-1:123456789012:key/a5984de7-3cde-4817-
a398-92d57a8d0880","Versioning":"Enabled","IAMPrincipalsRequiringReadObjectAccess":
["arn:aws:iam::123456789012:role/roleA"],"IAMPrincipalsRequiringWriteObjectAccess":
["arn:aws:iam::123456789012:role/roleA"],"ServicesRequiringReadObjectAccess":
["logs.us-east-1.amazonaws.com"],"ServicesRequiringWriteObjectAccess":["logs.us-
east-1.amazonaws.com"],"EnforceSecureTransport":true,"AccessAllowedIpRanges":
["1.2.3.4/24"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateBucketParams.json.

```
aws amscm get-change-type-version --change-type-id "ct-1gi93jhvj28eg" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateBucketParams.json
```

2. Modify and save the UpdateBucketParams file.

   Example with all parameters (at least one parameter must be specified):

```
{
  "VpcId": "VPC_ID",
  "StackId": "STACK_ID",
  "Parameters": {
    "ServerSideEncryption": "KmsManagedKeys",
    "KMSKeyId": "arn:aws:kms:us-east-1:123456789012:key/a5984de7-3cde-4817-
a398-92d57a8d0880",
    "Versioning": "Enabled",
    "IAMPrincipalsRequiringReadObjectAccess": [
      "arn:aws:iam::123456789012:role/roleA"
    ],
    "IAMPrincipalsRequiringWriteObjectAccess": [
      "arn:aws:iam::123456789012:role/roleA"
    ],
    "ServicesRequiringReadObjectAccess": [
      "logs.us-east-1.amazonaws.com"
    ],
    "ServicesRequiringWriteObjectAccess": [
      "logs.us-east-1.amazonaws.com"
    ],
    "EnforceSecureTransport": true,
    "AccessAllowedIpRanges": [
      "1.2.3.4/24"
    ]
  }
}
```

   Example with required parameters (at least one parameter must be specified):

```
{
  "VpcId": "VPC_ID",
  "StackId": "STACK_ID",
  "Parameters": {
    "IAMPrincipalsRequiringWriteObjectAccess": [
      "arn:aws:iam::123456789012:role/roleA"
```

```
    ]
  }
}
```

For examples of resulting policies, see S3 Storage Bucket Create Resulting Policies.

3. Output the RFC template JSON file to a file named UpdateBucketRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateBucketRfc.json
```

4. Modify and save the UpdateBucketRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "4.0",
"ChangeTypeId":         "ct-1gi93jhvj28eg",
"Title":                "S3-Bucket-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateBucketRfc file and the UpdateBucketParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateBucketRfc.json  --execution-
parameters file://UpdateBucketParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. To view the S3 bucket or load objects to it, look in the execution output: Use the `stack_id` to view the bucket in the Cloud Formation Console, use the **S3BucketName** to view the bucket in the S3 Console.

Tips

> **Note**
>
> This walkthrough describes, and provides example commands for, updating an AWS S3 storage bucket that was created with version 4.0 of the S3 storage Create change type (ct-1a68ck03fn98r). In that version of that change type, the **AccessControl** parameter was removed and replaced with specific parameters to allow specified services or IAM roles read or write access.

To learn more about Amazon S3, see Amazon Simple Storage Service Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1gi93jhvj28eg.

Example: Required Parameters

```
{
  "VpcId": "vpc-12345678901234567",
  "StackId": "stack-1234567890abcdefg",
  "Parameters": {
  }
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-12345678",
  "StackId": "stack-1234567890abcdefg",
  "Parameters": {
    "ServerSideEncryption": "KmsManagedKeys",
    "KMSKeyId": "arn:aws:kms:ap-southeast-2:123456789012:key/9d5948f1-2082-4c07-a183-
eb829b8d81c4",
    "Versioning": "Enabled",
    "IAMPrincipalsRequiringReadObjectAccess": [
      "arn:aws:iam::123456789012:user/myuser",
      "arn:aws:iam::123456789012:role/myrole"
    ],
    "IAMPrincipalsRequiringWriteObjectAccess": [
      "arn:aws:iam::123456789012:user/myuser",
      "arn:aws:iam::123456789012:role/myrole"
    ],
    "ServicesRequiringReadObjectAccess": [
      "rds.amazonaws.com",
      "ec2.amazonaws.com",
      "logs.ap-southeast-2.amazonaws.com"
    ],
    "ServicesRequiringWriteObjectAccess": [
      "rds.amazonaws.com",
      "ec2.amazonaws.com",
      "logs.ap-southeast-2.amazonaws.com"
```

```
    ],
    "EnforceSecureTransport": true,
    "AccessAllowedIpRanges": [
      "1.0.0.0/24",
      "2.0.0.0/24"
    ]
  }
}
```

S3 Storage | Update Encryption

Enable or update S3 bucket encryption setting through direct API calls. The S3 bucket can be standalone or belong to a CloudFormation stack; in the latter case, the change might cause stack drift. To avoid causing stack drift, please use ct-1gi93jhvj28eg instead, or ct-361tlo1k7339x if the S3 bucket was provisioned via CFN ingestion.

Full classification: Management | Advanced stack components | S3 storage | Update encryption

Change Type Details

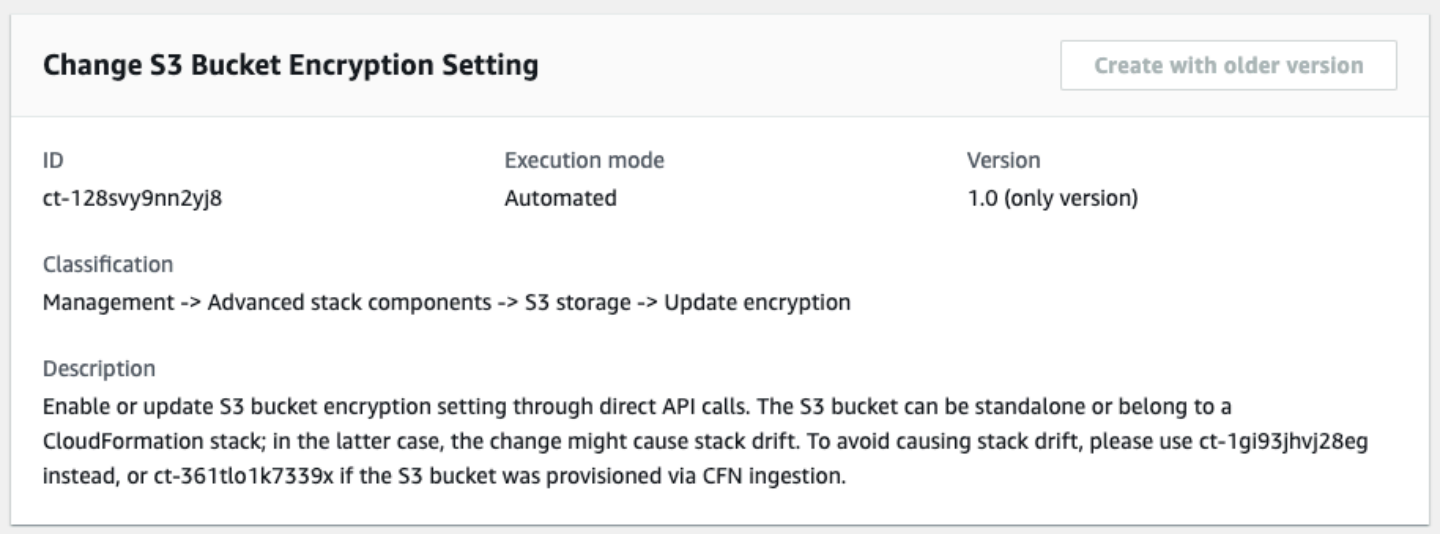
Change type ID	ct-128svy9nn2yj8
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update S3 bucket encryption

Updating S3 bucket encryption with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating S3 bucket encryption with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-128svy9nn2yj8" --change-type-version
 "1.0" --title "Update bucket encryption" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-UpdateBucketEncryption\",\"Region\":\"us-east-1\",\"Parameters
\":{\"BucketName\":[\"BucketName\"],\"ServerSideEncryption\": \"KmsManagedKeys\",
\"KMSKeyId\":[\"01234567-abcd-abcd-abcd-0123456789ab\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateBucketEncryptionParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-128svy9nn2yj8"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateBucketEncryptionParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateBucketEncryption",
     "Region": "us-east-1",
     "Parameters": {
       "BucketName": [
         "BucketName"
       ],
       "ServerSideEncryption": "KmsManagedKeys",
       "KMSKeyId": [
         "01234567-abcd-abcd-abcd-0123456789ab"
       ]
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdateBucketEncryptionRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateBucketEncryptionRfc.json
   ```

4. Modify and save the UpdateBucketEncryptionRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-128svy9nn2yj8",
"Title":                "Update bucket encryption"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateBucketEncryptionRfc.json --
execution-parameters file://UpdateBucketEncryptionParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon S3, see Amazon Simple Storage Service Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-128svy9nn2yj8.

Example: Required Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateBucketEncryption",
  "Region": "us-east-1",
  "Parameters": {
    "BucketName": [
      "rt123456789"
    ],
    "ServerSideEncryption": "S3ManagedKeys"
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateBucketEncryption",
  "Region": "us-east-1",
  "Parameters": {
    "BucketName": [
      "rt123456789"
    ],
    "ServerSideEncryption": "KmsManagedKeys",
    "KMSKeyId": [
      "1234abcd-12ab-34cd-56ef-1234567890ab"
    ]
  }
}
```

S3 Storage | Update Policy (Review Required)

Update an S3 bucket policy.

Full classification: Management | Advanced stack components | S3 storage | Update policy (review required)

Change Type Details

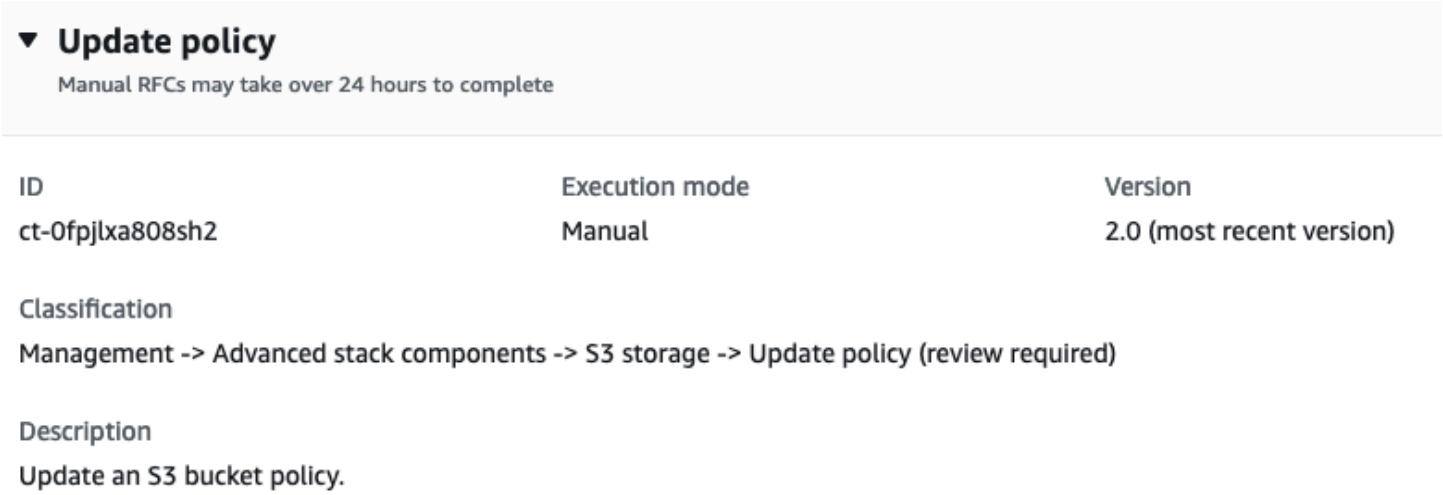
Change type ID	ct-0fpjlxa808sh2
Current version	2.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update S3 storage policy (review required)

Updating an S3 Storage Policy (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an S3 Storage Policy (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0fpjlxa808sh2" --change-type-version "2.0"
 --title "TITLE" --execution-parameters "{\"BucketName\": \"example-bucket-123\",
 \"BucketPolicy\": \"Example bucket policy\", \"Operation\": \"Update policy\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateS3PolicyParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0fpjlxa808sh2" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateS3PolicyParams.json
   ```

2. Modify and save the UpdateS3PolicyParams file. For example, you can replace the contents with something like this:

   ```
   {
     "BucketName": "examplebucketname",
     "BucketPolicy": "Example bucket permissions",
     "Operation": "Update policy",
     "PolicyAction": "Append"
   }
   ```

3. Output the RFC template JSON file to a file named UpdateS3PolicyRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateS3PolicyRfc.json
   ```

4. Modify and save the UpdateS3PolicyRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "2.0",
   "ChangeTypeId":         "ct-0fpjlxa808sh2",
   "Title":                "S3-Policy-Update-RFC"
   }
   ```

5. Create the RFC, specifying the UpdateS3PolicyRfc file and the UpdateS3PolicyParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateS3PolicyRfc.json  --execution-
parameters file://UpdateS3PolicyParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon S3, see Amazon Simple Storage Service Documentation.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0fpjlxa808sh2.

Example: Required Parameters

```
{
  "BucketName": "examplebucketname",
  "BucketPolicy": "Example bucket permissions",
  "PolicyAction": "Append",
  "Operation": "Update policy"
}
```

Example: All Parameters

```
{
  "BucketName": "examplebucketname",
  "BucketPolicy": "Example bucket permissions",
  "PolicyAction": "Append",
  "Operation": "Update policy",
  "Priority": "Medium"
}
```

S3 Storage | Update Versioning

Change S3 bucket versioning setting through direct API calls. The S3 bucket can be standalone or belong to a CloudFormation stack; in the latter case, the change might cause stack drift. To avoid causing stack drift, please use ct-1gi93jhvj28eg instead, or ct-361tlo1k7339x if the S3 bucket was provisioned via CFN ingestion.

Full classification: Management | Advanced stack components | S3 storage | Update versioning

Change Type Details

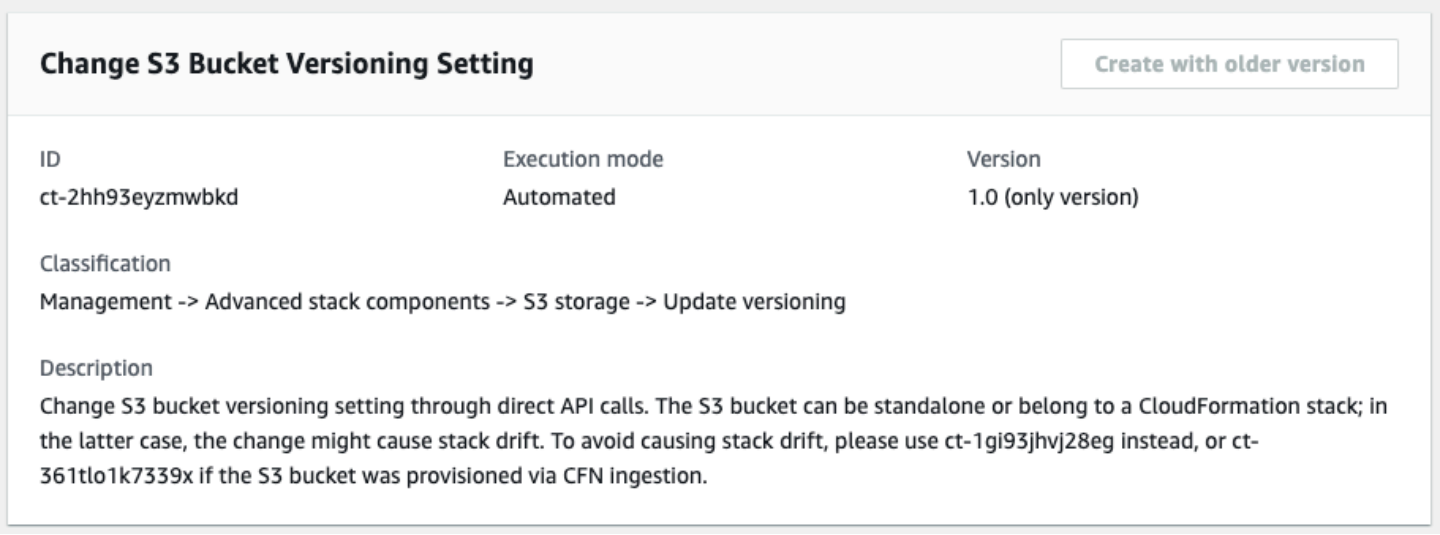
Change type ID	ct-2hh93eyzmwbkd
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update S3 bucket versioning

Updating S3 bucket versioning with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating S3 bucket versioning with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2hh93eyzmwbkd" --change-type-version
 "1.0" --title "Update bucket versioning" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-UpdateBucketVersioning\",\"Region\":\"us-east-1\",\"Parameters\":
{\"BucketName\":[\"BucketName\"],\"Versioning\": \"Enabled\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters for this change type to a JSON file named UpdateBucketVersioningParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2hh93eyzmwbkd"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateBucketVersioningParams.json
   ```

2. Modify and save the execution parameters JSON file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateBucketVersioning",
     "Region": "us-east-1",
     "Parameters": {
       "BucketName": [
         "BucketName"
       ],
       "Versioning": "Enabled"
     }
   }
   ```

3. Output the JSON template to a file in your current folder; this example names it UpdateBucketVersioningRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateBucketVersioningRfc.json
   ```

4. Modify and save the UpdateBucketVersioningRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2hh93eyzmwbkd",
"Title":                "Update bucket versioning"
}
```

5. Create the RFC, specifying the execution parameters file and the UpdateRdsRfc file:

```
aws amscm create-rfc --cli-input-json file://UpdateBucketVersioningRfc.json --
execution-parameters file://UpdateBucketVersioningParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about Amazon S3, see Amazon Simple Storage Service Documentation.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2hh93eyzmwbkd.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateBucketVersioning",
  "Region": "us-east-1",
  "Parameters": {
    "BucketName": [
      "rt123456789"
    ],
    "Versioning": "Enabled"
  }
}
```

Security Group | Associate

Associate security groups with an AWS resource.

Full classification: Management | Advanced stack components | Security group | Associate

Change Type Details

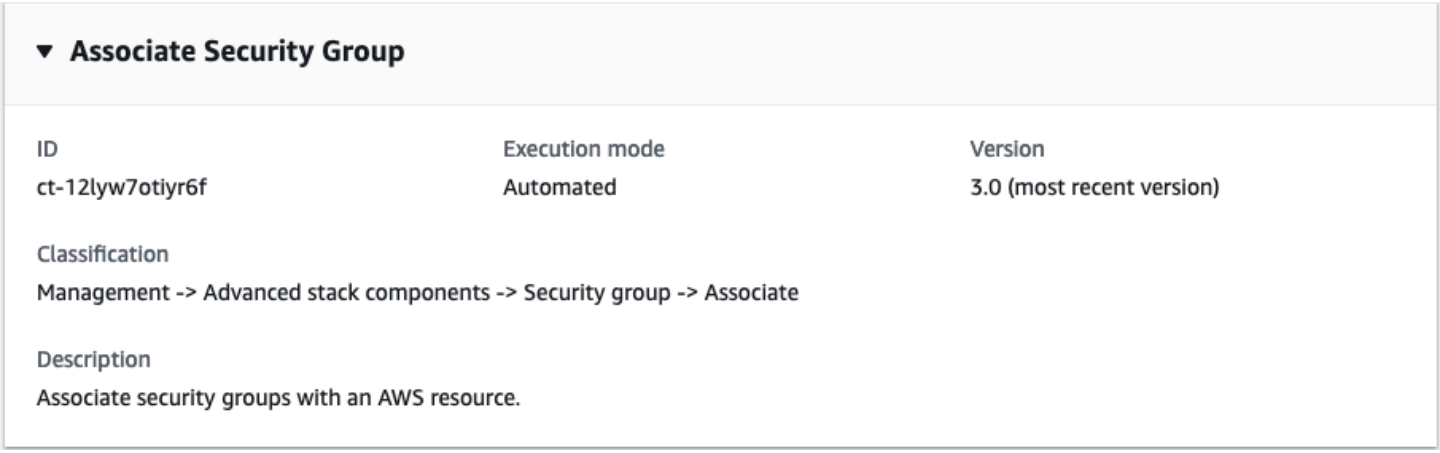
Change type ID	ct-12lyw7otiyr6f
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Associate security group to resource

Associating a Security Group to Resources with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Associating a Security Group to Resources with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-12lyw7otiyr6f" --change-type-version "3.0"
 --title "Associate Security Groups" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-AttachSecurityGroupsV2\", \"Region\": \"us-east-1\", \"Parameters
\": {\"ResourceType\": \"EC2Instance\", \"ResourceId\": \"i-xxxxxxxxxxxxxxxxx\",
 \"SecurityGroupIds\": [\"sg-xxxxxxxxxxxxxxxxx\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AssociateSGParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-12lyw7otiyr6f" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AssociateSGParams.json
   ```

2. Modify and save the AssociateSGParams file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-AttachSecurityGroupsV2",
       "Region": "us-east-1",
   ```

```
    "Parameters": {
        "ResourceType": [
            "EC2Instance"
        ],
        "ResourceId": [
            "i-xxxxxxxxxxxxxxxxx"
        ],
        "SecurityGroupIds": [
            "sg-xxxxxxxxxxxxxxxxx"
        ]
    }
}
```

3. Output the RFC template JSON file to a file named AssociateSGRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AssociateSGRfc.json
```

4. Modify and save the AssociateSGRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "3.0",
"ChangeTypeId":         "ct-12lyw7otiyr6f",
"Title":                "SG-Associate-RFC"
}
```

5. Create the RFC, specifying the AssociateSG Rfc file and the AssociateSGParams file:

```
aws amscm create-rfc --cli-input-json file://AssociateSGRfc.json  --execution-
parameters file://AssociateSGParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is now at version 3.0. The schema is changed to use an SSM document and new resource types are now supported.

Important

For AutoScalingGroupCurrentInstancesOnly, security groups are only attached to individual instances currently part of the ASG. LaunchTemplate or LaunchConfiguration are not updated. Bes sure to update LaunchTemplate / LaunchConfiguration before updating security groups to AutoScalingGroup Instances.

Important

If true, any access allowed by existing security groups is removed and only the new security groups are in effect.

To learn more about associating security groups to resources, see Amazon EC2 Security Groups for Linux Instances and/or Security Groups for Your VPC.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-12lyw7otiyr6f.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-AttachSecurityGroupsV2",
    "Region": "us-east-1",
    "Parameters": {
      "ResourceType": "RDSDBInstance",
      "ResourceId": "MyDBInstance",
      "SecurityGroupIds": ["sg-1234556eaba0a4799"],
      "OverwriteSecurityGroups": "true"
    }
}
```

Security Group | Authorize Egress Rule

Authorize the egress rule for the specified security group (SG). You must specify the configurations of the egress rule that you are authorizing. Note that this adds an egress rule to the specified SG but does not modify any existing egress rules.

Full classification: Management | Advanced stack components | Security group | Authorize egress rule

Change Type Details

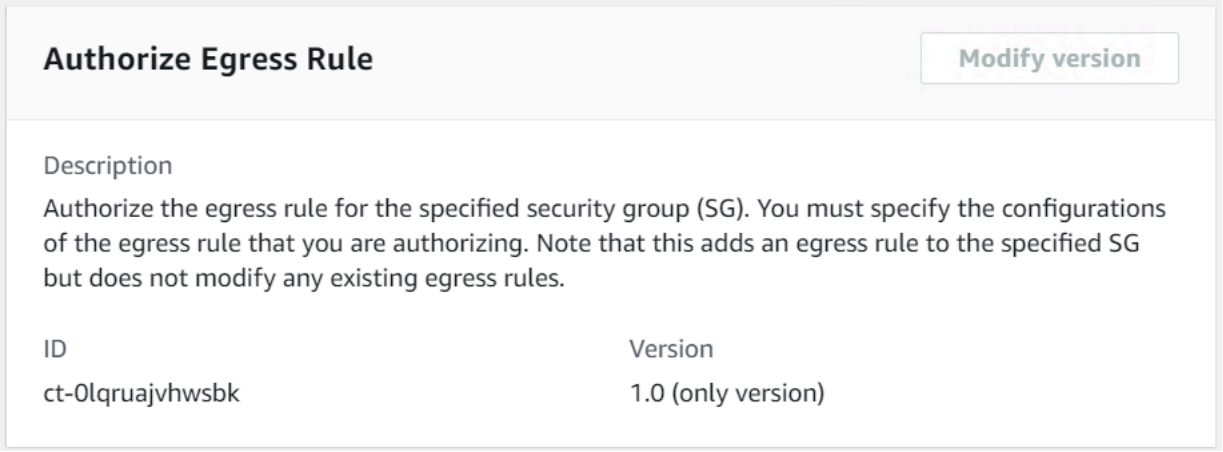
Change type ID	ct-0lqruajvhwsbk
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Authorize security group egress rule

Authorizing a security group egress rule with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Authorizing a security group egress rule with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0lqruajvhwsbk" --change-type-version
 "1.0" --title "Authorize security group egress rule" --execution-parameters
 '{"DocumentName":"AWSManagedServices-AuthorizeSecurityGroupEgressRule","Region":"us-
east-1","Parameters":{"SecurityGroupId":["SG_ID"],"IpProtocol":["tcp"],"FromPort":
[80],"ToPort":[80],"Destination":["10.0.0.1/24"],"Description":["HTTP Port for
 10.0.0.1/24"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AuthSGEgressParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-0lqruajvhwsbk" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AuthSGEgressParams.json
   ```

2. Modify and save the AuthSGEgressParams file. For example, you can replace the contents with something like this:

```
{
"DocumentName" : "AWSManagedServices-AuthorizeSecurityGroupEgressRule",
"Region" : "us-east-1",
"Parameters" : {
"SecurityGroupId" : ["SG_ID"],
"IpProtocol" : ["tcp"],
"FromPort" : [80],
"ToPort" : [80],
"Destination" : ["10.0.0.1/24"]
"Description" : ["HTTP Port for 10.0.0.1/24"]
}
}
```

3. Output the RFC template JSON file to a file named AuthSGEgressRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AuthSGEgressRfc.json
```

4. Modify and save the AuthSGEgressRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-0lqruajvhwsbk",
  "ChangeTypeVersion": "1.0",
  "Title": "Authorize security group egress rule"
}
```

5. Create the RFC, specifying the AuthSGEgressRfc file and the AuthSGEgressParams file:

```
aws amscm create-rfc --cli-input-json file://AuthSGEgressRfc.json  --execution-
parameters file://AuthSGEgressParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> There are two ways to authorize a new egress rule, one, Security Group: Update change type (ct-3memthlcmvc1b), has ExecutionMode=Manual and provides a lot of latitude for custom rules; however, being manual, it takes longer to execute as AMS Operations must review it for safety, and possibly require communications. The other egress rule authorization way, Security Group: Authorize Egress Rule change type (ct-3j2zstluz6dxq), has ExecutionMode=Automated and provides options for creating standard TCP/UDP or ICMP egress rules. It is more limited in scope; however, being automated, it executes more quickly.
> This walkthrough is for the Security Group: Authorize Egress Rule change type.

To learn more about AWS security groups and security group rules, see Security Group Rules Reference; this page can help you determine the rules you want and, importantly, how to name your security group so choosing it when creating other resources is intuitive. Also see Amazon EC2 Security Groups for Linux Instances and/or Security Groups for Your VPC.

Once the security group is created, use Associate security group to resource to associate the security group with your AMS resources. In order to delete a security group, it must have associated resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0lqruajvhwsbk.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-AuthorizeSecurityGroupEgressRule",
  "Region" : "us-east-1",
  "Parameters" : {
    "SecurityGroupId" : [
      "sg-abcd1234"
    ],
    "IpProtocol" : [
      "tcp"
```

```
    ],
    "FromPort" : [
      "80"
    ],
    "ToPort" : [
      "80"
    ],
    "Destination" : [
      "10.0.0.1/32"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-AuthorizeSecurityGroupEgressRule",
  "Region" : "us-east-1",
  "Parameters" : {
    "SecurityGroupId" : [
      "sg-abcd1234"
    ],
    "IpProtocol" : [
      "tcp"
    ],
    "FromPort" : [
      "80"
    ],
    "ToPort" : [
      "80"
    ],
    "Destination" : [
      "10.0.0.1/32"
    ],
    "Description" : [
      "New rule"
    ]
  }
}
```

Security Group | Authorize Ingress Rule

Authorize the ingress rule for the specified security group (SG). You must specify the configurations of the ingress rule that you are authorizing. Note that this adds an ingress rule to the specified SG but does not modify any existing ingress rules.

Full classification: Management | Advanced stack components | Security group | Authorize ingress rule

Change Type Details

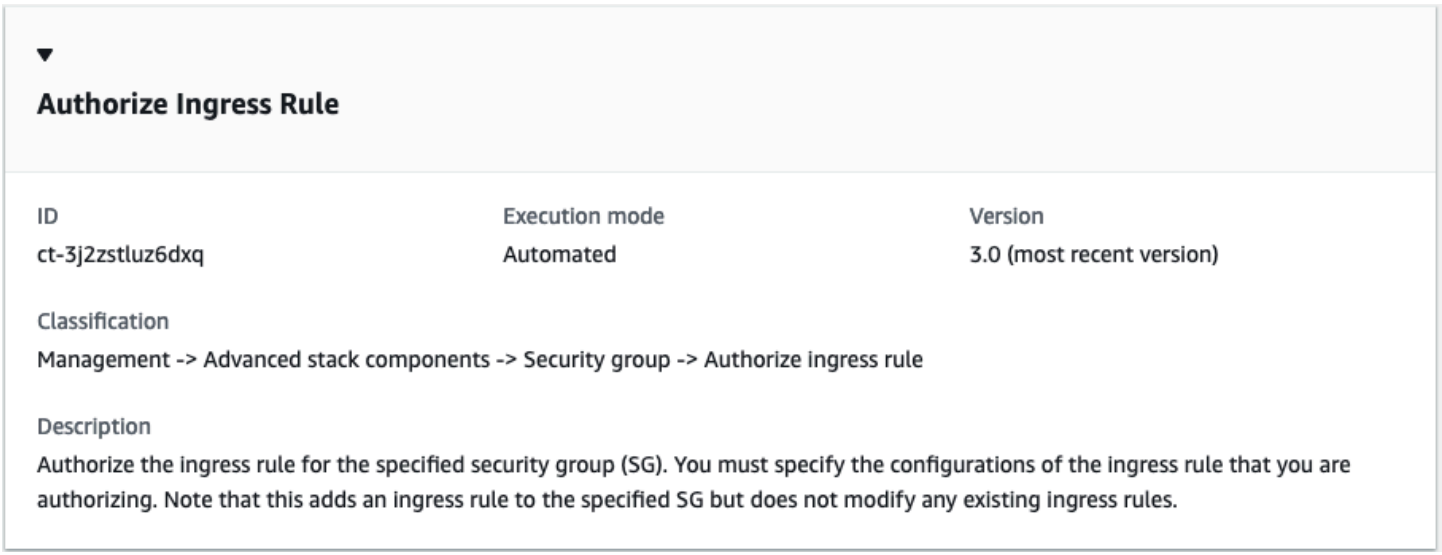
Change type ID	ct-3j2zstluz6dxq
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Authorize security group ingress rule

Authorizing a security group ingress rule with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Authorizing a security group ingress rule with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3j2zstluz6dxq" --change-
type-version "3.0" --title "Authorize security group ingress rule"
 --execution-parameters '{"DocumentName":"AWSManagedServices-
AuthorizeSecurityGroupIngressRuleV3","Region":"us-east-1","Parameters":
{"SecurityGroupId":["SG_ID"],"IpProtocol":["tcp"],"FromPort":[80],"ToPort":
[80],"Source":["10.0.0.1/24"],"Description":["HTTP Port for 10.0.0.1/24"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it AuthSGIngressParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3j2zstluz6dxq" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AuthSGIngressParams.json
   ```

2. Modify and save the AuthSGIngressParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName" : "AWSManagedServices-AuthorizeSecurityGroupIngressRuleV3",
     "Region" : "us-east-1",
     "Parameters" : {
       "SecurityGroupId" : [
         "SG_ID"
       ],
       "IpProtocol" : [
         "tcp"
       ],
       "FromPort" : [
         80
       ],
       "ToPort" : [
         80
       ],
       "Source" : [
         "10.0.0.1/24"
       ],
       "Description" : [
   ```

```
      "HTTP Port for 10.0.0.1/24"
    ]
  }
}
```

3. Output the RFC template JSON file to a file named AuthSGIngressRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AuthSGIngressRfc.json
```

4. Modify and save the AuthSGIngressRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-3j2zstluz6dxq",
  "ChangeTypeVersion": "3.0",
  "Title": "Authorize security group ingress rule"
}
```

5. Create the RFC, specifying the AuthSGIngressRfc file and the AuthSGIngressParams file:

```
aws amscm create-rfc --cli-input-json file://AuthSGIngressRfc.json  --execution-
parameters file://AuthSGIngressParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

Note

This change type is now at version 2.0. The two separate, optional source parameters, **CidrIp** and **SourceSecurityGroupId**, have been combined into one required parameter, **Source**, with two options. This was done to ensure that a source was provided; without a source, the RFC would fail.

There are two ways to authorize a new ingress rule: use Security Group: Update change type (ct-3memthlcmvc1b), which is a manual change type (and thus takes longer to implement because AMS Operations must review it for safety, and may require communications); alternatively, use this change type (ct-3j2zstluz6dxq), which is automated

(and thus implemented more quickly) and provides options for deleting standard TCP/UDP or ICMP ingress rules.

To learn more about AWS security groups and security group rules, see Security Group Rules Reference; this page can help you determine the rules you want and, importantly, how to name your security group so choosing it when creating other resources is intuitive. Also see Amazon EC2 Security Groups for Linux Instances and/or Security Groups for Your VPC.

Once the security group is created, use Associate security group to resource to associate the security group with your AMS resources. In order to delete a security group, it must have associated resources.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3j2zstluz6dxq.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-AuthorizeSecurityGroupIngressRuleV3",
  "Region" : "us-east-1",
  "Parameters" : {
    "SecurityGroupId" : [
      "sg-abcd1234"
    ],
    "IpProtocol" : [
      "tcp"
    ],
    "FromPort" : [
      "80"
    ],
    "ToPort" : [
      "80"
    ],
    "Source" : [
      "10.0.0.1/32"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-AuthorizeSecurityGroupIngressRuleV3",
  "Region" : "us-east-1",
  "Parameters" : {
    "SecurityGroupId" : [
      "sg-abcd1234"
    ],
    "IpProtocol" : [
      "tcp"
    ],
    "FromPort" : [
      "80"
    ],
    "ToPort" : [
      "80"
    ],
    "Source" : [
      "10.0.0.0"
    ],
    "Description" : [
      "New rule"
    ]
  }
}
```

Security Group | Delete

Delete up to 20 security groups. Note: Only security groups with no dependencies are deleted and security groups with dependencies are not deleted. This change type does not require a review and can be used instead of the manual, review required, change type (ct-3cp96z7r065e4).

Full classification: Management | Advanced stack components | Security group | Delete

Change Type Details

Change type ID	ct-18r16ldqil6w9
Current version	1.0
Expected execution duration	60 minutes

AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete security group

Deleting an AMS Security Group with the Console

Screenshot of this change type in the AMS console:

How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an AMS Security Group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) , and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-18r16ldqil6w9" --change-type-version
 "1.0" --title "Delete security group" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-DeleteSecurityGroups\", \"Region\": \"us-east-1\", \"Parameters
\": {\"SecurityGroupIds\": [\"sg-xxxxxxxxxxxxxxxxx\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteSGParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-18r16ldqil6w9" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeleteSGParams.json
   ```

2. Modify and save the DeleteSGParams file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-DeleteSecurityGroups",
       "Region": "us-east-1",
       "Parameters": {
           "SecurityGroupIds": [
               "sg-xxxxxxxxxxxxxxxxx"
           ]
       }
   }
   ```

3. Output the RFC template JSON file to a file named DeleteSGRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteSGRfc.json
   ```

4. Modify and save the DeleteSGRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-18r16ldqil6w9",
   "Title":                "SG-Delete-RFC"
   ```

```
}
```

5. Create the RFC, specifying the DeleteSG Rfc file and the eleteSGParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteSGRfc.json  --execution-
parameters file://DeleteSGParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> You must first separate the security group from any resources associated with it or the RFC fails. Only security groups with no dependencies are deleted and security groups with dependencies are not deleted.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-18r16ldqil6w9.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-DeleteSecurityGroups",
    "Region": "us-east-1",
    "Parameters": {
      "SecurityGroupIds": ["sg-1234556eaba0a4799"],
      "ForceDelete": ["true"]
    }
}
```

Security Group | Delete (Review Required)

Disassociate a security group from the specified AWS resources and optionally delete the security group.

Full classification: Management | Advanced stack components | Security group | Delete (review required)

Change Type Details

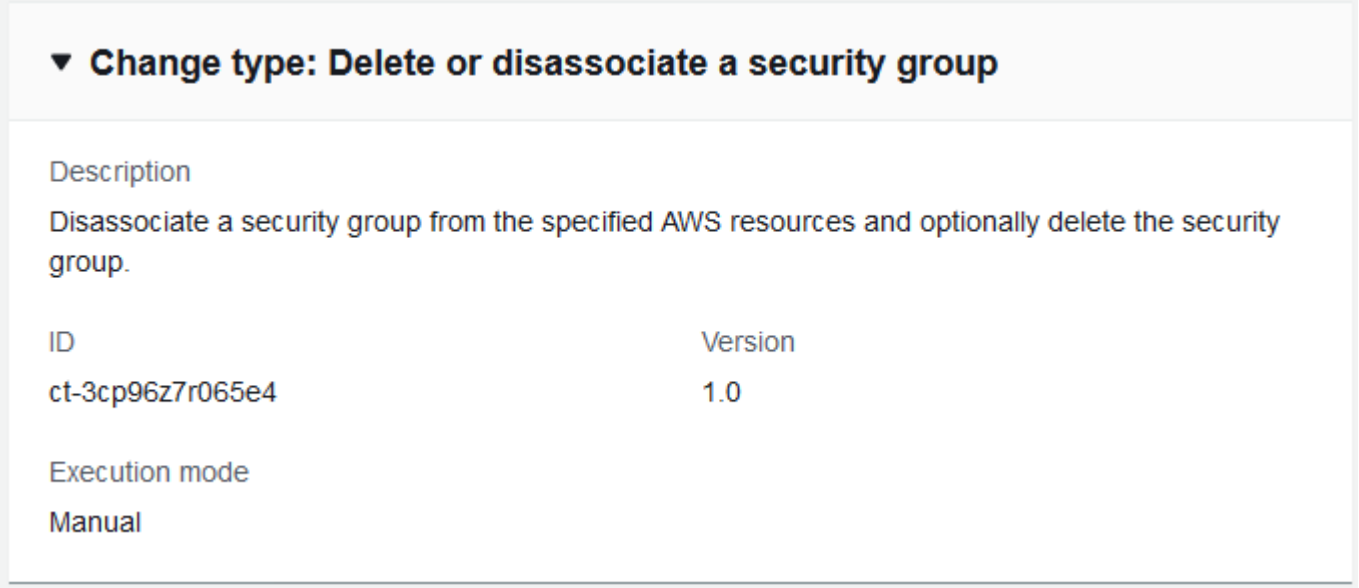
Change type ID	ct-3cp96z7r065e4
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Delete security group (review required)

Deleting an AMS Security Group with the Console (review required)

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an AMS Security Group with the CLI (review required)

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

- Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline) , and then submit the returned RFC ID. For example, you can replace the contents with something like this:

  To remove associated resources, you can issue a command similar to this that uses the Delete Security Group CT (note that `SecurityGroupID` and `DeleteSecurityGroup` are required parameters):

  ```
  aws --profile saml amscm create-rfc --change-type-id "ct-3cp96z7r065e4"
   --change-type-version "1.0" --title "Remove-SG-Resources" --execution-
  parameters "{\"SecurityGroupId\":\"SG_ID\", \"DeleteSecurityGroup\":\false,
   \"DisassociatedResources\":\"IDS_OF_RESOURCES\"}"
  ```

  (Optional) To delete the security group, you can issue a command similar to this that uses the Delete Security Group CT (note that `SecurityGroupID` and `DeleteSecurityGroup` are required parameters):

  ```
  aws --profile saml amscm create-rfc --change-type-id "ct-3cp96z7r065e4" --change-
  type-version "1.0" --title "Remove-SG" --execution-parameters "{\"SecurityGroupId
  \":\"SG_ID\", \"DeleteSecurityGroup\":\true, \"DisassociatedResources\":
  \"IDS_OF_RESOURCES\"}"
  ```

  A security group cannot be deleted until all of the associated resources have been removed; use the `DisassociatedResources` parameter in the Delete Security group CT to disassociate all of the associated resources. If all resources have been disassociated, use this `\"DisassociatedResources\":\"[]\"`.

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DeleteSGParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3cp96z7r065e4" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeleteSGParams.json
   ```

2. Modify and save the DeleteSGParams file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "SecurityGroupId": "sg-1234abcd",
  "DisassociatedResources": [
    "i-1234abcd",
    "i-234abcd1",
    "i-567890abcdefg1234"
  ],
  "DeleteSecurityGroup": true
}
```

3. Output the RFC template JSON file to a file named DeleteSGRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DeleteSGRfc.json
```

4. Modify and save the DeleteSGRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3cp96z7r065e4",
"Title":                "SG-Delete-RFC"
}
```

5. Create the RFC, specifying the DeleteSG Rfc file and the eleteSGParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteSGRfc.json  --execution-
parameters file://DeleteSGParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

6. (Optional) To add inbound or outbound rules, you can issue a command similar to this that uses the Update Security Group CT:

```
aws --profile saml amscm create-rfc --change-type-id "ct-3memthlcmvc1b"
 --change-type-version "1.0" --title "Add-SG-Rules" --execution-parameters
 "{\"SecurityGroupId\":\"SG_ID\", \"AddInboundRules\":{\"Protocol\":\"TCP\",
 \"PortRange\":\"49152-65535\, \"Source\":\"203.0.113.5/32\"}, \"AddOutboundRules
\":{\"Protocol\":\"TCP\", \"PortRange\":\"49152-65535\, \"Destination\":
\"203.0.113.5/32\"}}"
```

7. (Optional) To remove inbound or outbound rules, you can issue a command similar to this that uses the Update Security Group CT:

```
aws --profile saml amscm create-rfc --change-type-id "ct-3memthlcmvc1b" --
change-type-version "1.0" --title "Remove-SG-Rules" --execution-parameters
 "{\"SecurityGroupId\":\"SG_ID\", \"Name\":\"MA-Test-SG-QC\", \"RemoveInboundRules
\":{\"Protocol\":\"TCP\", \"PortRange\":\"49152-65535\, \"Source\":
\"203.0.113.5/32\"}, \"RemoveOutboundRules\":{\"Protocol\":\"TCP\", \"PortRange\":
\"49152-65535\, \"Destination\":\"203.0.113.5/32\"}}"
```

8. (Optional) To add associated resources, you can issue a command similar to this that uses the Update Security Group CT:

```
aws --profile saml amscm create-rfc --change-type-id "ct-3memthlcmvc1b" --
change-type-version "1.0" --title "Add-SG-Resources" --execution-parameters
 "{\"SecurityGroupId\":\"SG_ID\", \"AssociatedResources\":\"IDS_OF_RESOURCES\"}"
```

9. (Optional) To remove associated resources, you can issue a command similar to this that uses the Delete Security Group CT (note that `SecurityGroupID` and `DeleteSecurityGroup` are required parameters):

```
aws --profile saml amscm create-rfc --change-type-id "ct-3cp96z7r065e4"
 --change-type-version "1.0" --title "Remove-SG-Resources" --execution-
parameters "{\"SecurityGroupId\":\"SG_ID\", \"DeleteSecurityGroup\":\false,
 \"DisassociatedResources\":\"IDS_OF_RESOURCES\"}"
```

Tips

> **Note**
>
> There is an automated change type for deleting a security group, Deployment | Advanced stack components | Security group | Delete (no review required) (ct-18r16ldqil6w9) that may execute more quickly than this change type. For details, see Delete security group.

> **Note**
>
> You must first separate the security group from any resources associated with it or the RFC fails.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3cp96z7r065e4.

Example: Required Parameters

```
{
  "SecurityGroupId": "sg-1234abcd",
  "DisassociatedResources": [
    "i-1234abcd",
    "i-234abcd1",
    "i-34abcd12",
    "i-4abcd123",
    "i-abcd1234",
    "i-1234567890abcdefg",
    "i-234567890abcdefg1",
    "i-34567890abcdefg12",
    "i-4567890abcdefg123",
    "i-567890abcdefg1234"
  ],
  "DeleteSecurityGroup": false,
  "Priority": "Medium"
}
```

Example: All Parameters

```
{
  "SecurityGroupId": "sg-1234abcd",
  "DisassociatedResources": [
    "i-1234abcd",
    "i-234abcd1",
    "i-34abcd12",
    "i-4abcd123",

```

```
    "i-234567890abcdefg1",
    "i-34567890abcdefg12",
    "i-4567890abcdefg123",
    "i-567890abcdefg1234"
  ],
  "DeleteSecurityGroup": true,
  "Priority": "Medium"
}
```

Security Group | Disassociate

Disassociate a security group from up to 50 AWS resources and optionally delete the security group. This change type does not require a review and can be used instead of the manual, review required, change type (ct-3cp96z7r065e4).

Full classification: Management | Advanced stack components | Security group | Disassociate

Change Type Details

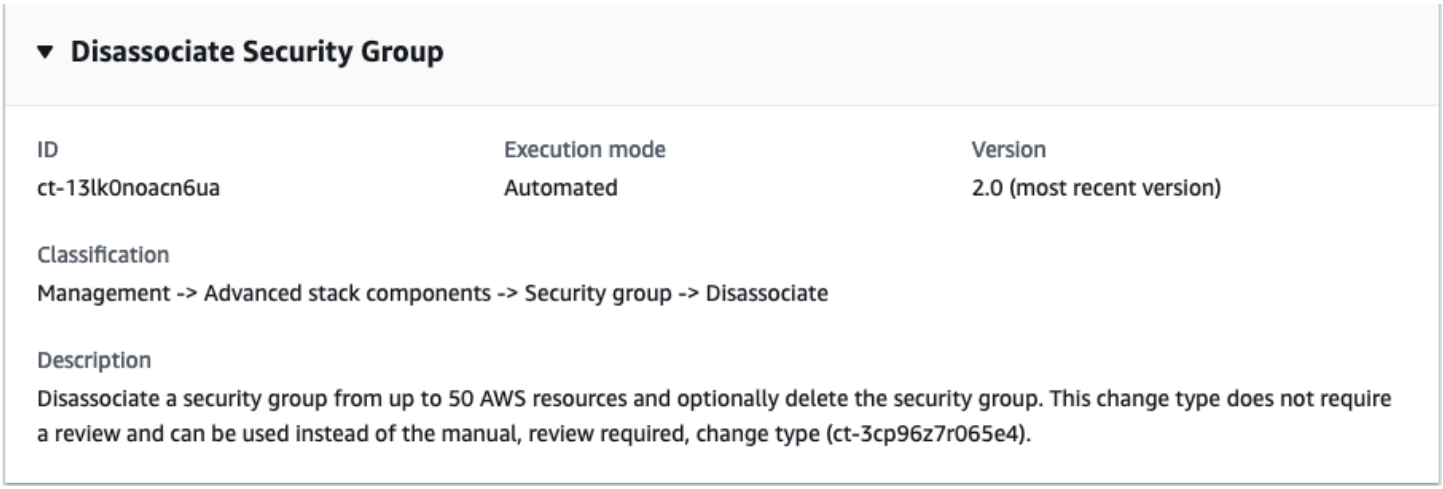
Change type ID	ct-13lk0noacn6ua
Current version	2.0
Expected execution duration	120 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Disassociate security group to resource

Disassociating a Security Group to Resources with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Disassociating a Security Group to Resources with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-13lk0noacn6ua" --change-type-version "2.0"
 --title "Disassociate security group" --execution-parameters "{\"DocumentName\":
 \"AWSManagedServices-DisassociateSecurityGroupV2\", \"Region\": \"us-east-1\",
 \"Parameters\": {\"SecurityGroupId\": \"sg-xxxxxxxxxxxxxxxxx\", \"EC2InstanceIds\":
 [\"i-xxxxxxxxxxxxxxxxx\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it DisassociateSGParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-13lk0noacn6ua" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DisassociateSGParams.json
   ```

2. Modify and save the DisassociateSGParams file. For example, you can replace the contents with something like this:

   ```
   {
       "DocumentName": "AWSManagedServices-DisassociateSecurityGroupV2",
       "Region": "us-east-1",
       "Parameters": {
           "SecurityGroupId": [
               "sg-xxxxxxxxxxxxxxxxx"
           ],
           "EC2InstanceIds": [
               "i-xxxxxxxxxxxxxxxxx"
           ]
       }
   }
   ```

3. Output the RFC template JSON file to a file named DisassociateSGRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DisassociateSGRfc.json
   ```

4. Modify and save the DisassociateSGRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "2.0",
     "ChangeTypeId": "ct-13lk0noacn6ua",
     "Title": "Disassociate security group"
   ```

```
}
```

5. Create the RFC, specifying the DisassociateSG Rfc file and the DisassociateSGParams file:

```
aws amscm create-rfc --cli-input-json file://DisassociateSGRfc.json  --execution-
parameters file://DisassociateSGParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For help deleting a security group from a VPC, see Why can't I delete a security group for my Amazon VPC?.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-13lk0noacn6ua.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-DisassociateSecurityGroupV2",
    "Region": "us-east-1",
    "Parameters": {
      "SecurityGroupId": "sg-1234556eaba0a4799",
      "EC2InstanceIds": ["i-1234567890abababa"],
      "ElasticNetworkInterfaceIds": ["eni-1234567890abababa"],
      "AutoScalingGroupNames": ["myautoscalinggroup"],
      "ElasticLoadBalancerNames": ["myloadbalancer"],
      "ApplicationLoadBalancerNames": ["myloadbalancer"],
      "RDSDBInstanceIdentifiers": ["mydbinstance"],
      "RDSDBClusterIdentifiers": ["mydbcluster"],
      "ElasticacheClusterIdentifiers": ["mycachecluster"],
      "RedshiftClusterIdentifiers": ["myredshiftcluster"],
```

```
      "ElasticFileSystemIds": ["myfilesystem"]
    }
}
```

Security Group | Revoke Egress Rule

Revoke the egress rule for the specified security group (SG). You must specify the configurations of the egress rule that you are revoking. Note that, once revoked, the egress rule is permanently deleted.

Full classification: Management | Advanced stack components | Security group | Revoke egress rule

Change Type Details

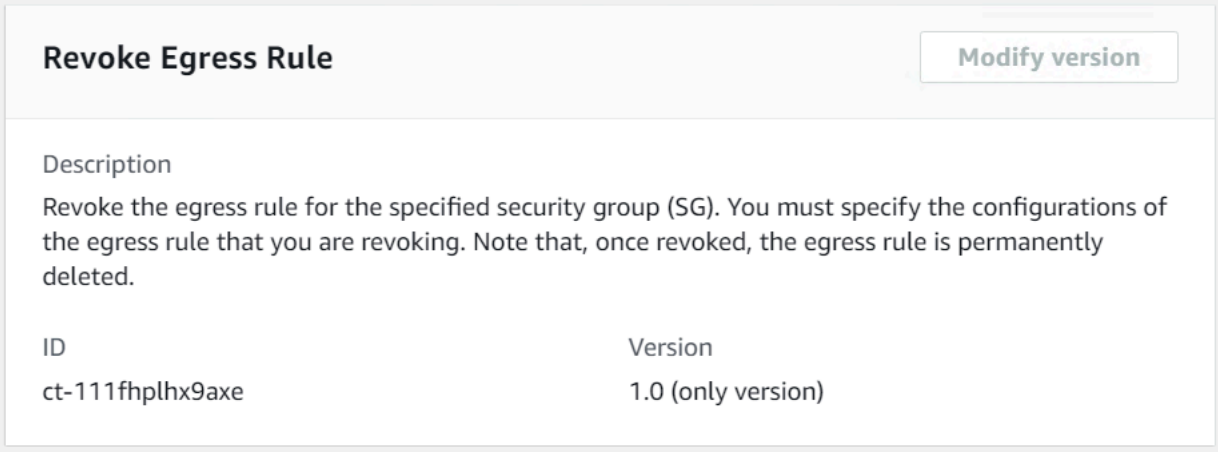
Change type ID	ct-111fhplhx9axe
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Revoke security group egress rule

Revoking a Security Group Egress Rule with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Revoking a Security Group Egress Rule with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-111fhplhx9axe" --change-type-version
 "1.0" --title "Revoke security group egress rule" --execution-parameters
 '{"DocumentName":"AWSManagedServices-RevokeSecurityGroupEgressRule","Region":"us-
east-1","Parameters":{"SecurityGroupId":["SG_ID"],"IpProtocol":["tcp"],"FromPort":
[80],"ToPort":[80],"Destination":["10.0.0.1/24"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RevokeSGEgressParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-111fhplhx9axe" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > RevokeSGEgressParams.json
   ```

2. Modify and save the RevokeSGEgressParams file. For example, you can replace the contents with something like this:

   ```
   {
   "DocumentName" : "AWSManagedServices-RevokeSecurityGroupEgressRule",
   "Region" : "us-east-1",
   "Parameters" : {
   "SecurityGroupId" : ["SG_ID"],
   "IpProtocol" : ["tcp"],
   "FromPort" : [80],
   "ToPort" : [80],
   "Destination" : ["10.0.0.1/24"]
   }
   }
   ```

3. Output the RFC template JSON file to a file named RevokeSGEgressRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > RevokeSGEgressRfc.json
   ```

4. Modify and save the RevokeSGEgressRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeId": "ct-111fhplhx9axe",
     "ChangeTypeVersion": "1.0",
     "Title": "Revokeorize security group egress rule"
   }
   ```

5. Create the RFC, specifying the RevokeSGEgressRfc file and the RevokeSGEgressParams file:

```
aws amscm create-rfc --cli-input-json file://RevokeSGEgressRfc.json  --execution-
parameters file://RevokeSGEgressParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> There are two ways to revoke an egress rule, one, Security Group: Update change type (ct-3memthlcmvc1b), has ExecutionMode=Manual; being manual, it takes longer to execute as AMS Operations must review it for safety, and possibly require communications. The other egress rule revoke way, Security Group: Revoke Egress Rule change type (ct-1vjbacfr4ufdv), has ExecutionMode=Automated and provides options for deleting standard TCP/UDP or ICMP egress rules. It is more limited in scope; however, being automated, it executes more quickly.
> This walkthrough is for the Security Group: Revoke Egress Rule change type.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-111fhplhx9axe.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-RevokeSecurityGroupEgressRule",
  "Region" : "us-east-1",
  "Parameters" : {
    "SecurityGroupId" : [
```

```
      "sg-abcd1234"
    ],
    "IpProtocol" : [
      "tcp"
    ],
    "FromPort" : [
      "80"
    ],
    "ToPort" : [
      "80"
    ],
    "Destination" : [
      "10.0.0.1/32"
    ]
  }
}
```

Security Group | Revoke Ingress Rule

Revoke the ingress rule for the specified security group (SG). You must specify the configurations of the ingress rule that you are revoking. Note that, once revoked, the ingress rule is permanently deleted.

Full classification: Management | Advanced stack components | Security group | Revoke ingress rule

Change Type Details

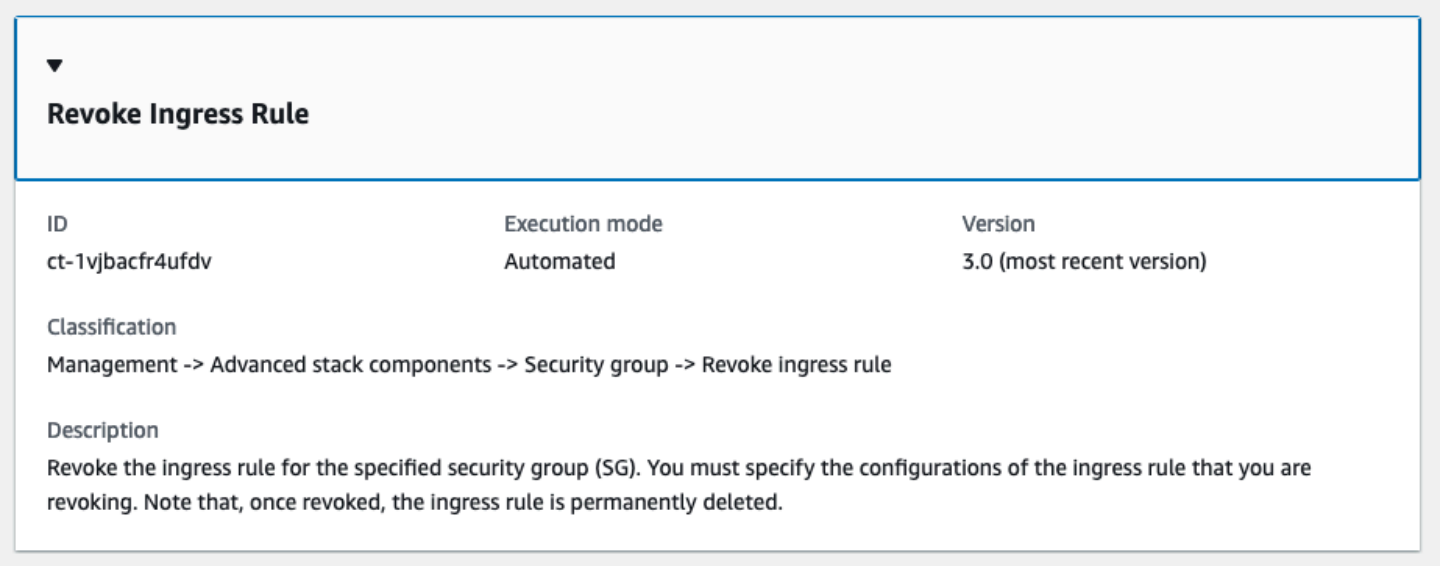
Change type ID	ct-1vjbacfr4ufdv
Current version	3.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Revoke security group ingress rule

Revoking a Security Group Ingress Rule with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Revoking a Security Group Ingress Rule with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1vjbacfr4ufdv" --change-type-version
 "3.0" --title "Revoke security group ingress rule" --execution-parameters
 '{"DocumentName":"AWSManagedServices-RevokeSecurityGroupIngressRuleV3","Region":"us-
east-1","Parameters":{"SecurityGroupId":["SG_ID"],"IpProtocol":["tcp"],"FromPort":
[80],"ToPort":[80],"Source":["10.0.0.1/24"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it RevokeSGIngressParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1vjbacfr4ufdv"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    RevokeSGIngressParams.json
   ```

2. Modify and save the RevokeSGIngressParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName" : "AWSManagedServices-RevokeSecurityGroupIngressRuleV3",
     "Region" : "us-east-1",
     "Parameters" : {
       "SecurityGroupId" : [
         "SG_ID"
       ],
       "IpProtocol" : [
         "tcp"
       ],
       "FromPort" : [
         80
       ],
   ```

```
    "ToPort" : [
      80
    ],
    "Source" : [
      "10.0.0.1/24"
    ]
  }
}
```

3. Output the RFC template JSON file to a file named RevokeSGIngressRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > RevokeSGIngressRfc.json
```

4. Modify and save the RevokeSGIngressRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeId": "ct-1vjbacfr4ufdv",
  "ChangeTypeVersion": "3.0",
  "Title": "Revoke security group ingress rule"
}
```

5. Create the RFC, specifying the RevokeSGIngressRfc file and the RevokeSGIngressParams file:

```
aws amscm create-rfc --cli-input-json file://RevokeSGIngressRfc.json  --execution-
parameters file://RevokeSGIngressParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> This change type is now at version 3.0.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1vjbacfr4ufdv.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-RevokeSecurityGroupIngressRuleV3",
  "Region" : "us-east-1",
  "Parameters" : {
    "SecurityGroupId" : [
      "sg-abcd1234"
    ],
    "IpProtocol" : [
      "tcp"
    ],
    "FromPort" : [
      "80"
    ],
    "ToPort" : [
      "80"
    ],
    "Source" : [
      "10.0.0.1/32"
    ]
  }
}
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-RevokeSecurityGroupIngressRuleV3",
  "Region": "us-east-1",
  "Parameters": {
    "SecurityGroupId": [
      "sg-abcd1234"
    ],
    "IpProtocol": [
      "tcp"
    ],
    "FromPort": [
      "80"
    ],
    "ToPort": [
      "80"
    ],
    "Source": [
```

```
      "10.0.0.0"
    ]
  }
}
```

Security Group | Update (Review Required)

Update the inbound and the outbound rules of a security group, and optionally associate it with AWS resources.

Full classification: Management | Advanced stack components | Security group | Update (review required)

Change Type Details

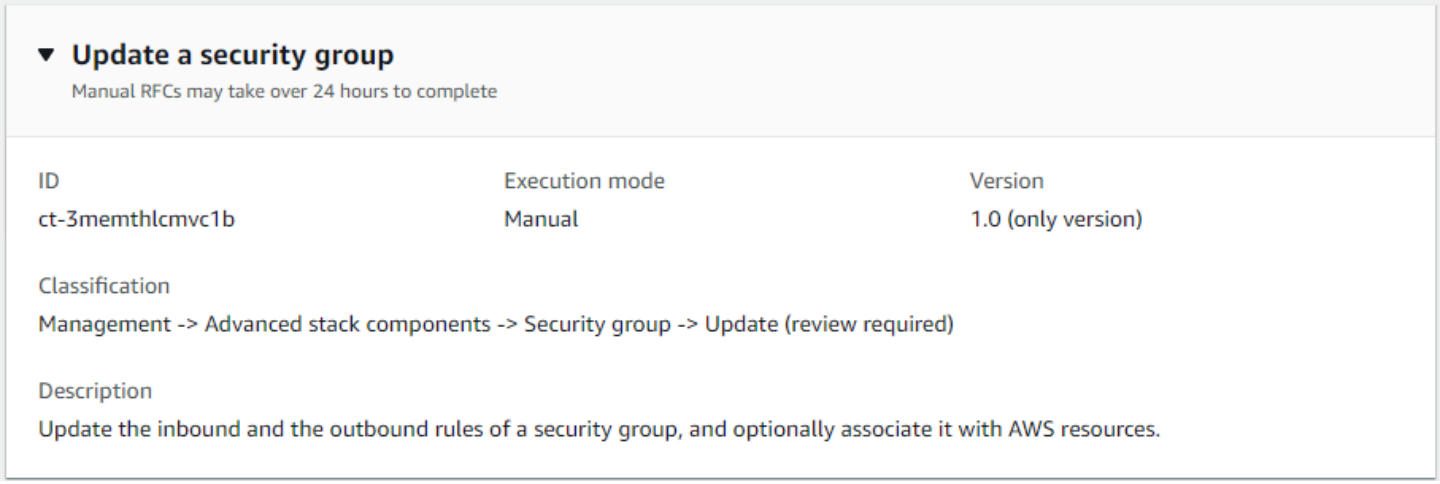
Change type ID	ct-3memthlcmvc1b
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update security group (review required)

Updating an AMS Security Group (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an AMS Security Group (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

1. Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

(Optional) To add inbound or outbound rules, you can issue a command similar to this that uses the Update Security Group CT:

```
aws --profile saml amscm create-rfc --change-type-id "ct-3memthlcmvc1b" --change-
type-version "1.0" --title "Add-SG-Rules" --execution-parameters "{\"SecurityGroupId
\":\"SG_ID\", \"AddInboundRules\":{\"Protocol\":\"TCP\", \"PortRange\":
\"49152-65535\, \"Source\":\"203.0.113.5/32\"}, \"AddOutboundRules\":{\"Protocol\":
\"TCP\", \"PortRange\":\"49152-65535\, \"Destination\":\"203.0.113.5/32\"}}"
```

(Optional) To remove inbound or outbound rules, you can issue a command similar to this that uses the Update Security Group CT:

```
aws --profile saml amscm create-rfc --change-type-id "ct-3memthlcmvc1b" --
change-type-version "1.0" --title "Remove-SG-Rules" --execution-parameters
 "{\"SecurityGroupId\":\"SG_ID\", \"Name\":\"MA-Test-SG-QC\", \"RemoveInboundRules\":
{\"Protocol\":\"TCP\", \"PortRange\":\"49152-65535\, \"Source\":\"203.0.113.5/32\"},
 \"RemoveOutboundRules\":{\"Protocol\":\"TCP\", \"PortRange\":\"49152-65535\,
 \"Destination\":\"203.0.113.5/32\"}}"
```

(Optional) To add associated resources, you can issue a command similar to this that uses the Update Security Group CT:

```
aws --profile saml amscm create-rfc --change-type-id "ct-3memthlcmvc1b" --
change-type-version "1.0" --title "Add-SG-Resources" --execution-parameters
 "{\"SecurityGroupId\":\"SG_ID\", \"AssociatedResources\":\"IDS_OF_RESOURCES\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it UpdateSGParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3memthlcmvc1b" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateSGParams.json
   ```

2. Modify and save the UpdateSGParams file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
  "SecurityGroupId": "sg-1234abcd",
  "DisassociatedResources": [
    "i-1234abcd",
    "i-234abcd1",
    "i-567890abcdefg1234"
  ]
}
```

3. Output the RFC template JSON file to a file named UpdateSGRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateSGRfc.json
```

4. Modify and save the UpdateSGRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3memthlcmvc1b",
"Title":                "SG-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateSG Rfc file and the UpdateSGParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateSGRfc.json  --execution-
parameters file://UpdateSGParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

To learn more about AWS security groups, see Amazon EC2 Security Groups for Linux Instances and/or Security Groups for Your VPC.

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3memthlcmvc1b.

Example: Required Parameters

```
{
  "SecurityGroupId": "sg-1234abcd",
  "AddAssociatedResources": [],
  "AddInboundRules": [],
  "RemoveInboundRules": [],
  "AddOutboundRules": [],
  "RemoveOutboundRules": []
}
```

Example: All Parameters

```
{
  "SecurityGroupId": "sg-1234abcd",
  "AddAssociatedResources": [
    "i-1234abcd",
    "i-234abcd1",
    "i-34abcd12",
    "i-4abcd123",
    "i-abcd1234",
    "i-1234567890abcdefg",
    "i-234567890abcdefg1",
    "i-34567890abcdefg12",
    "i-4567890abcdefg123",
    "i-567890abcdefg1234"
  ],
  "AddInboundRules": [
    { "Protocol": "TCP(6)", "PortRange":"80", "Source": "192.168.0.0/16",
 "Description": "Client1" },

Stack | Delete

Delete an existing stack and its resources from your account. The effects of deleting a resource vary. For details, see the appropriate AWS documentation for the resource. Note that termination protection on a resource in the stack causes the RFC to fail. To check for a resource's termination protection status, see the corresponding AWS console.

Full classification: Management | Advanced stack components | Stack | Delete

Change Type Details

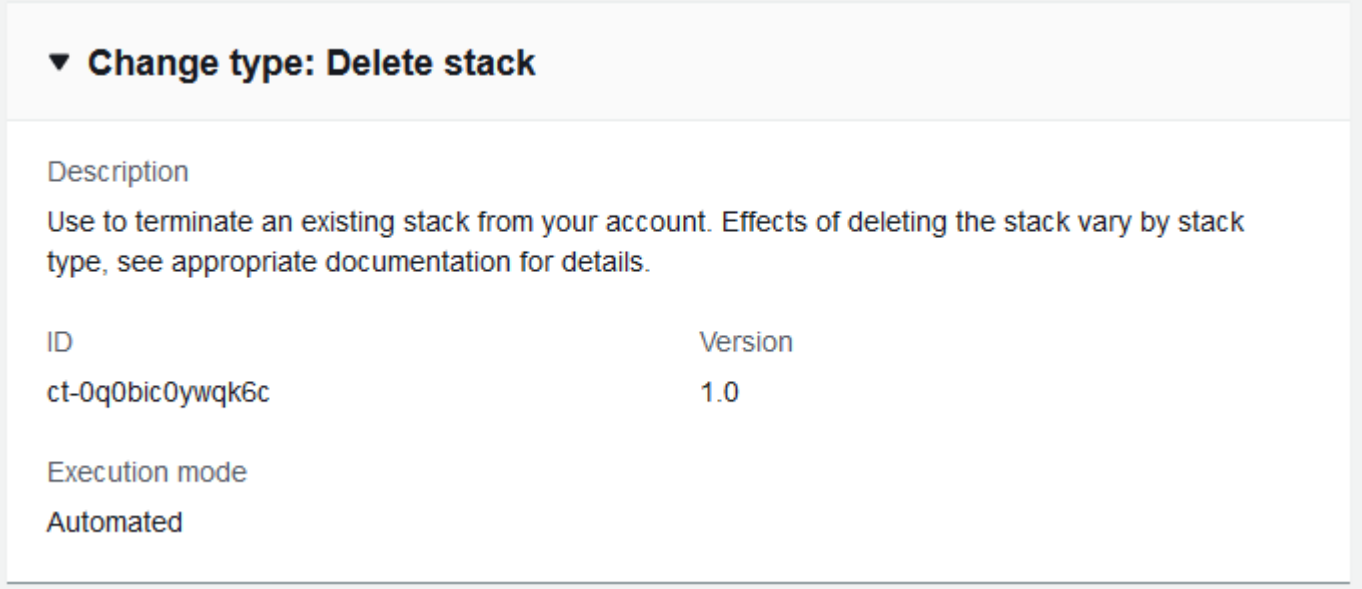
Change type ID	ct-0q0bic0ywqk6c
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete stack

Deleting a Stack with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting a Stack with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0q0bic0ywqk6c" --change-type-version "1.0" --
title "Delete My Stack" --execution-parameters "{\"StackId\":\"STACK_ID\"}"
```

TEMPLATE CREATE:

1. Output the RFC template to a file in your current folder; this example names it DeleteStackRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteStackRfc.json
   ```

2. Modify and save the DeleteStackRfc.json file.

   The internal quotation marks in the ExecutionParameters JSON extension must be escaped with a backslash (\). Example without start and end time:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-0q0bic0ywqk6c",
   "Title":                "Delete-My-Stack-RFC"
   "ExecutionParameters":  "{
           \"StackId\":\"STACK_ID\"}"
   }
   ```

3. Create the RFC:

   ```
   aws amscm create-rfc --cli-input-json file://DeleteStackRfc.json
   ```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> If deleting an S3 bucket, it must be emptied of objects first.

> **Important**
>
> Deleting stacks can have unwanted and unanticipated consequences. For important caveats, see RFC Troubleshooting section RFCs for Delete Stack.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0q0bic0ywqk6c.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "StackId": "stack-a1b2c3d4e5f67890e",
  "TimeoutInMinutes": 720
}
```

Stack Patching Configuration | Update

Use to update patch configuration.

Full classification: Management | Advanced stack components | Stack patching configuration | Update

Change Type Details

Change type ID	ct-34alumbtv2b9p
Current version	1.0
Expected execution duration	15 minutes
AWS approval	Required
Customer approval	Not required

Execution mode	Automated

Additional Information

> **Important**
>
> This change type has been deprecated and cannot be used.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-34alumbtv2b9p.

Example: Required Parameters

```
{
  "StackId": "stack-12345678901234567"
}
```

Example: All Parameters

```
{
  "StackId": "stack-12345678901234567",
  "MaintenanceWindow": {
    "DayOfWeek": 4,
    "DurationInMinutes": 240,
    "Hour": 18,
    "Minute": 0,
    "WeekOfMonth": 2
  },
  "HealthyHostThreshold": 0.8
}
```

Tag | Bulk Update

Bulk add tags to existing, supported resources: Autoscaling, EC2, Elastic Load Balancing, RDS and S3 buckets. AMS infrastructure stacks (stacks named mc-*) cannot have tags added with this change type. Use this with AWS Tag Editor when managing large numbers of tags (i.e. >50).

Full classification: Management | Advanced stack components | Tag | Bulk update

Change Type Details

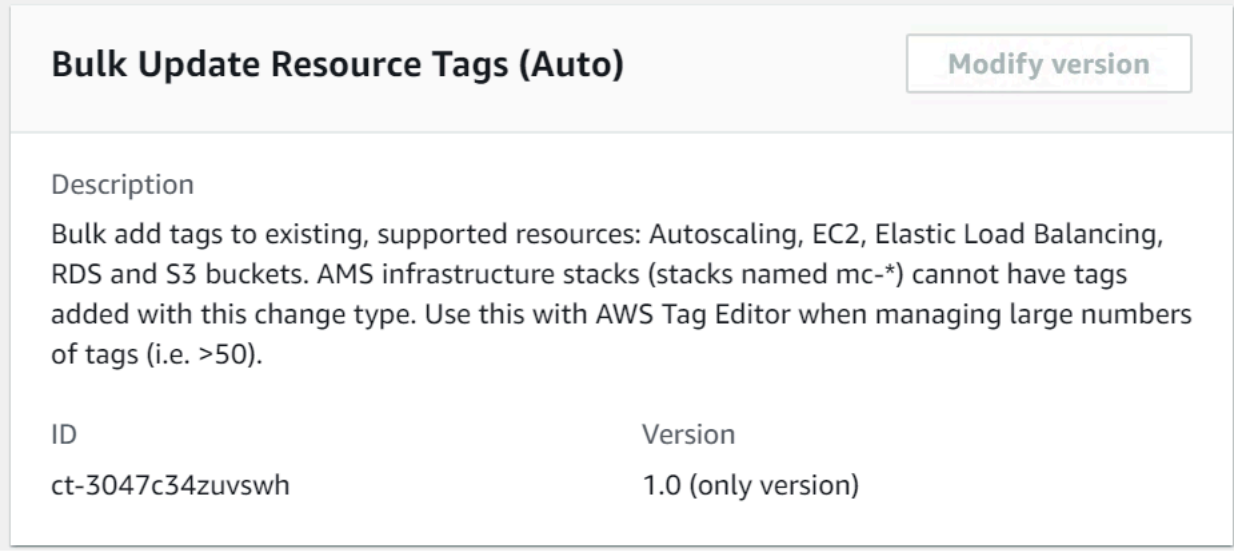
Change type ID	ct-3047c34zuvswh
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Bulk update tags

Bulk Updating Tags with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Bulk Updating Tags with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3047c34zuvswh" --change-type-version "1.0" --
title "Bulk update Tags" --execution-parameters '{"DocumentName":"AWSManagedServices-
BulkUpdateTags","Region":"us-east-1","Parameters":{"CsvS3Url":["PRESIGNED_S3_URL"]}}'
```

TEMPLATE CREATE:

1. Output the RFC template to a file in your current folder. This example names it TagBulkUpdateAutoRfc.json. Note that since there is only one execution parameter for starting a stack, the execution parameter can be in the schema JSON file itself and there is no need to create a separate execution parameters JSON file.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagBulkUpdateAutoRfc.json
   ```

2. Modify and save the TagBulkUpdateAutoRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
    "DocumentName": "AWSManagedServices-BulkUpdateTags",
    "Region": "us-east-1",
    "Parameters": {
        "CsvS3Url": [
          "PRESIGNED_S3_URL"
          ]
    }
}
```

3. Output the RFC template JSON file to a file; this example names it TagBulkUpdateAutoRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > TagBulkUpdateAutoRfc.json
```

4. Modify and save the TagBulkUpdateAutoRfc.json file. For example, you can replace the contents with something like this:

```
{
  "ChangeTypeVersion": "1.0",
  "ChangeTypeId": "ct-3047c34zuvswh",
  "Title": "Bulk update Tags"
}
```

5. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://TagBulkUpdateAutoRfc.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- The Tag Editor export populates a matrix of all tags against all resources, missing tags are populated with a value of 'not tagged'. Re-using this export CSV as input to the RFC results in all the previously missing tags being created, with literal values of 'not tagged'.
- This change type is automated, so it typically runs more quickly than a review required change type; however, if your situation is unusual, you might want to use the review required change type for additional help. See Tag | Bulk Update (Review Required).
- For supported services and other information, see Tag bulk update notes.

- Bulk add tags to existing supported resources, except those in AMS infrastructure stacks (stacks named mc-*).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3047c34zuvswh.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
    "DocumentName": "AWSManagedServices-BulkUpdateTags",
    "Region": "us-east-1",
    "Parameters": {
        "CsvS3Url": ["https://example-bucket.s3.amazonaws.com/tags.csv?
AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE"]
    }
}
```

Tag | Bulk Update (Review Required)

Bulk add tags to existing, supported resources except those in AMS infrastructure stacks (stacks named mc-*). Tags simplify categorization, identification and targeting AWS resources. Use this with AWS Tag Editor when managing large numbers of tags (i.e. >50). For Autoscaling, EC2, Elastic Load Balancing, RDS resources and S3 buckets, use automated CT ct-3047c34zuvswh.

Full classification: Management | Advanced stack components | Tag | Bulk update (review required)

Change Type Details

Change type ID	ct-0k4b96aatyqgl

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title bulk-update-tags --change-type-id ct-0k4b96aatyqgl
 --change-type-version 1.0 --execution-parameters '{"Description":"test-tag-bulk-
update","CsvS3Url":"PRE-SIGNED_S3_URL"}'
```

TEMPLATE CREATE:

1. Output the RFC template to a file in your current folder. This example names it TagBulkUpdateRfc.json. Note that since there is only one execution parameter for starting a stack, the execution parameter can be in the schema JSON file itself and there is no need to create a separate execution parameters JSON file.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagBulkUpdateRfc.json
   ```

2. Modify and save the TagBulkUpdateRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
     "ChangeTypeVersion": "1.0",
     "ChangeTypeId": "ct-0k4b96aatyqgl",
     "Title": "Bulk-Update_Tags",
     "ExecutionParameters": "{\"Description\":\"Bulk tag resources\",\"CsvS3Url\":
   \"PRESIGNED_S3_URL\"}"
   }}
   ```

3. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://TagBulkUpdateRfc.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

- The Tag Editor export populates a matrix of all tags against all resources, missing tags are populated with a value of 'not tagged'. Re-using this export CSV as input to the RFC results in all the previously missing tags being created, with literal values of 'not tagged'.
- This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

  To use the automated version of this change type, recommended except in unusual circumstances, see Tag | Bulk Update.
- For supported services and other information, see Tag bulk update notes.
- Bulk add tags to existing supported resources, except those in AMS infrastructure stacks (stacks named mc-*).

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0k4b96aatyqgl.

Example: Required Parameters

```
{
    "Description": "Tag all the instances for App A",
    "CsvS3Url": "https://example-bucket.s3.eu-central-1.amazonaws.com/tags.csv"
}
```

Example: All Parameters

```
{
  "Description": "Tag all the instances for App A",
  "CsvS3Url": "https://example-bucket.s3.amazonaws.com/tags.csv?
AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE",
  "Priority": "Medium"
}
```

Tag | Delete

Delete tags from existing, tagged resources: Autoscaling, EC2, Elastic Load Balancing, RDS, S3 buckets and Redshift clusters. Additionally, CloudWatch LogGroups that do not belong to a CloudFormation stack are supported. AMS infrastructure stacks (stacks named mc-*) cannot have tags deleted with this change type.

Full classification: Management | Advanced stack components | Tag | Delete

Change Type Details

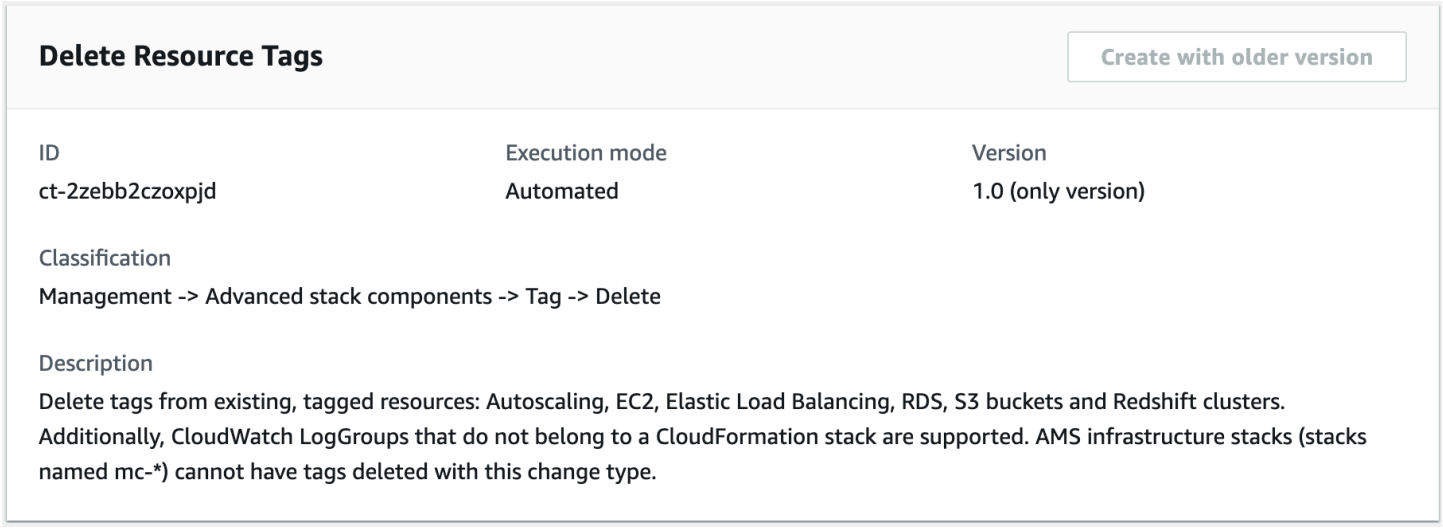
Change type ID	ct-2zebb2czoxpjd
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Delete tags

Deleting Tags with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting Tags with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2zebb2czoxpjd" --change-type-version "1.0"
 --title "Delete Tags" --execution-parameters '{"DocumentName":"AWSManagedServices-
UpdateTags","Region":"us-east-1","Parameters":{"ResourceArns":
["i-1234567890abcdef0","vol-1234567890abcdef0","arn:aws:rds:us-east-1:123456789012:db/
my-db-instance"],"RemoveTags":["Unused tag 1","Unused tag 2","Unused tag 3"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema to a file in your current folder. This example names it TagDeleteAutoParams.json.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagDeleteAutoParams.json
   ```

2. Modify and save the TagDeleteAutoParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateTags",
     "Region": "us-east-1",
     "Parameters":     {
       "ResourceArns": [
         "i-1234567890abcdef0",
         "vol-1234567890abcdef0",
         "arn:aws:rds:us-east-1:123456789012:db/my-db-instance"
       ],
       "RemoveTags": [
         "Unused tag 1",
         "Unused tag 2",
         "Unused tag 3"
       ]
     }
   }
   ```

3. Output the RFC template to a file in your current folder. This example names it TagDeleteAutoRfc.json.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagDeleteAutoRfc.json
   ```

4. Modify and save the TagDeleteAutoRfc.json file.

   The internal quotation marks in the `ExecutionParameters` JSON extension must be escaped with a backslash (\). Example:

```
{
"ChangeTypeId":         "ct-2zebb2czoxpjd",
"Title":                "Delete-Tags-Auto-RFC"
}
```

5. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://TagDeleteAutoRfc.json  --execution-
parameters file://TagDeleteAutoParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

AMS infrastructure stacks (stacks named `mc-*`) cannot have tags deleted with this change type.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2zebb2czoxpjd.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateTags",
  "Region": "us-east-1",
  "Parameters":     {
    "ResourceArns": [
      "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0",
      "arn:aws:ec2:us-east-1:123456789012:volume/vol-1234567890abcdef0",
      "snap-1234567890abcdef0",
```

```
      "arn:aws:rds:us-east-1:123456789012:db/my-db-instance",
      "arn:aws:redshift:us-east-1:123456789012:cluster:my-cluster",
      "arn:aws:logs:ap-southeast-2:123456789012:log-group:my-log-group:*"
    ],
    "RemoveTags": [
      "k4",
      "k5",
      "aws-migration-project-id"
    ]
  }
}
```

Tag | Delete (Review Required)

Delete tags from existing, supported resources except those in AMS infrastructure stacks (stacks named mc-*). For Autoscaling, EC2, Elastic Load Balancing, RDS resources and S3 buckets, use automated CT ct-2zebb2czoxpjd.

Full classification: Management | Advanced stack components | Tag | Delete (review required)

Change Type Details

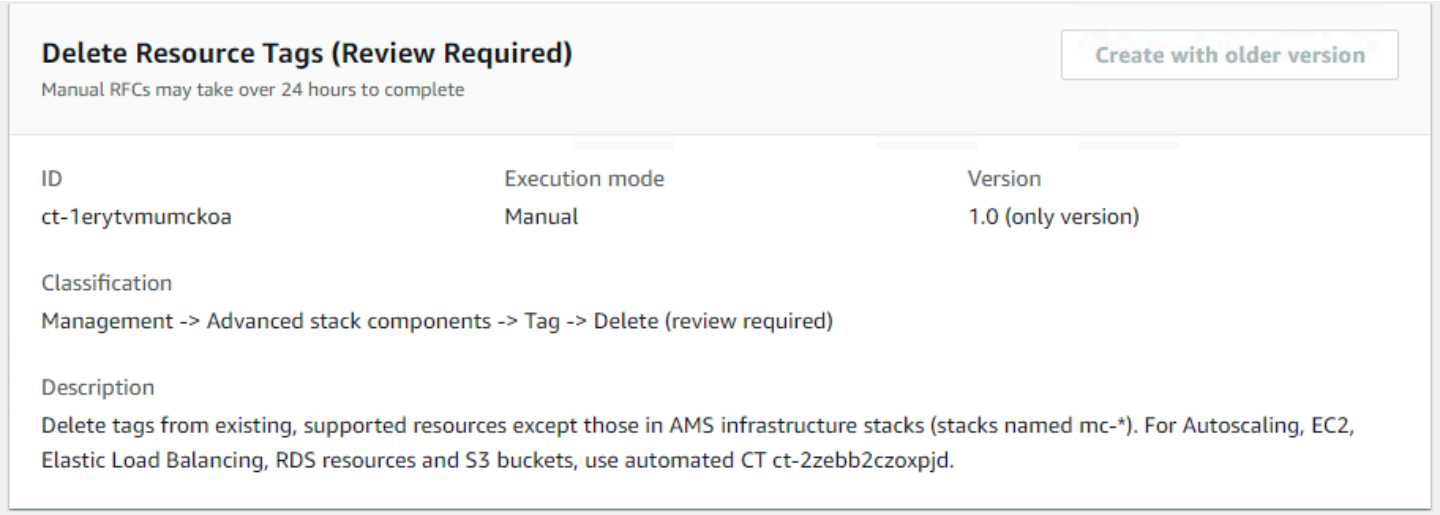
Change type ID	ct-1erytvmumckoa
Current version	1.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Delete tags (review required)

Deleting Tags (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting Tags (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title delete-tags --change-type-id ct-1erytvmumckoa --
change-type-version 1.0 --execution-parameters '{"Description":"test","Resources":
[{"ResourceArn":"i-abcd1234","RemoveTags":["Name","Owner"]},
{"ResourceArn":"arn:aws:ec2:ap-southeast-2:123456789012:instance/
i-019714a96c22f5452","RemoveTags":["Name","Owner"]}]}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema to a file in your current folder. This example names it TagDeleteParams.json.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagDeleteParams.json
   ```

2. Modify and save the TagDeleteParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "Description": "Delete tags",
     "Resources": [
       {
         "ResourceArn": "i-abcd1234",
         "RemoveTags": [
           "Unused tag 1",
           "Unused tag 2"
         ]
       },
       {
         "ResourceArn": "arn:aws:ec2:ap-southeast-2:123456789012:instance/
   i-1234567890abcdef1",
         "RemoveTags": [
           "Unused tag 1",
           "Unused tag 2"
         ]
       }
     ]
   }
   ```

3. Output the RFC template to a file in your current folder. This example names it TagDeleteRfc.json.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagDeleteRfc.json
   ```

4. Modify and save the TagDeleteRfc.json file.

   The internal quotation marks in the `ExecutionParameters` JSON extension must be escaped with a backslash (\). Example:

   ```
   {
   "ChangeTypeId":         "ct-1erytvmumckoa",
   "Title":                "Delete-Tags-RFC"
   }
   ```

5. Create the RFC:

   ```
   aws amscm create-rfc --cli-input-json file://TagDeleteRfc.json  --execution-
   parameters file://TagDeleteParams.json
   ```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1erytvmumckoa.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Description": "Remove tags from instances",
  "Resources": [
```

```
    {
      "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0",
      "RemoveTags": ["k1", "k2"]
    },
    {
      "ResourceArn": "i-0fedcba0987654321",
      "RemoveTags": ["k1", "k2"]
    }
  ],
  "Priority": "Medium"
}
```

Tag | Update

Update tags on existing, tagged resources: Autoscaling, EC2, Elastic Load Balancing, RDS, S3 buckets and Redshift clusters. Additionally, CloudWatch LogGroups that do not belong to a CloudFormation stack are supported. AMS infrastructure stacks (stacks named mc-*) cannot have tags updated with this change type.

Full classification: Management | Advanced stack components | Tag | Update

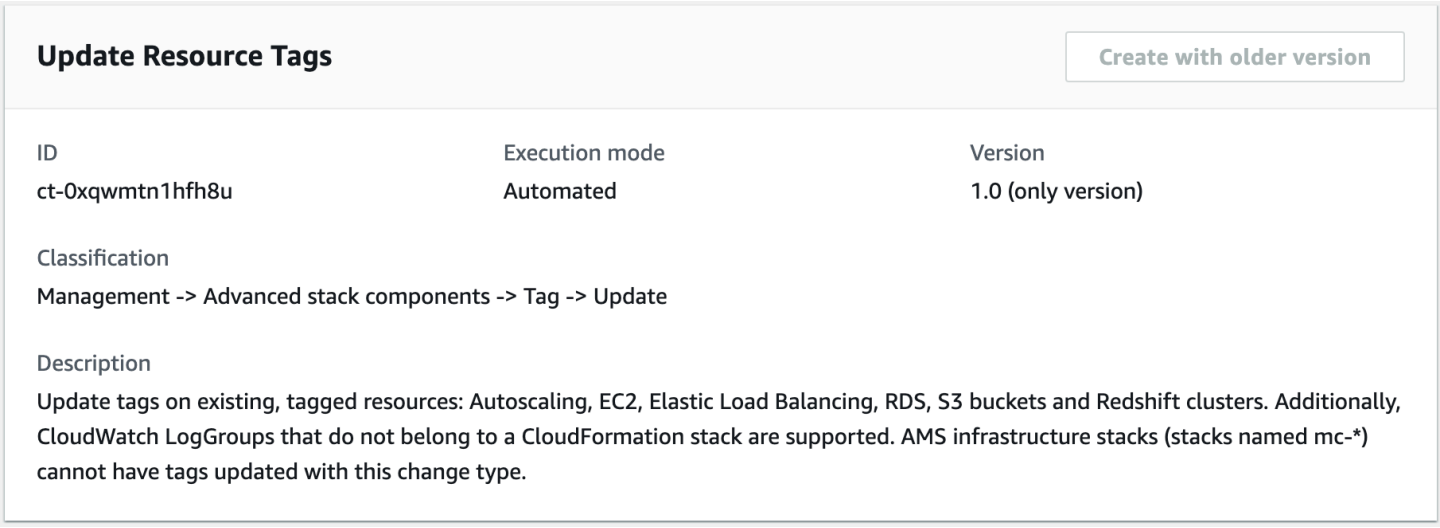
Updating tags with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating tags with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0xqwmtn1hfh8u" --change-type-version "1.0"
 --title "Update Tags" --execution-parameters '{"DocumentName":"AWSManagedServices-
UpdateTags","Region":"us-east-1","Parameters":{"ResourceArns":
["i-1234567890abcdef0","vol-1234567890abcdef0","arn:aws:rds:us-east-1:123456789012:db/
my-db-instance"],"AddOrUpdateTags":["{\"Key\":\"Name\",\"Value\":\"App1\"}","{\"Key\":
\"Owner\",\"Value\":\"Dev\"}"],"RemoveTags":["Unused tag 1","Unused tag 2","Unused tag
 3"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema to a file in your current folder. This example names it TagUpdateAutoParams.json.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagUpdateAutoParams.json
   ```

2. Modify and save the TagUpdateAutoParams.json file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-UpdateTags",
     "Region": "us-east-1",
     "Parameters":     {
       "ResourceArns": [
         "i-1234567890abcdef0",
         "vol-1234567890abcdef0",
         "arn:aws:rds:us-east-1:123456789012:db/my-db-instance"
       ],
       "AddOrUpdateTags": [
         {\"Key\":\"Name\",\"Value\":\"App1\"},
         {\"Key\":\"Owner\",\"Value\":\"Dev\"}
       ],
       "RemoveTags": [
         "Unused tag 1",
         "Unused tag 2",
         "Unused tag 3"
       ]
     }
   ```

```
}
```

3. Output the RFC template to a file in your current folder; this example names it TagUpdateAutoRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > TagUpdateAutoRfc.json
```

4. Modify and save the TagUpdateAutoRfc.json file.

   The internal quotation marks in the ExecutionParameters JSON extension must be escaped with a backslash (\). Example without start and end time:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-0xqwmtn1hfh8u",
"Title":                "Update-Tags-Auto-RFC"
}
```

5. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://TagUpdateAutoRfc.json  --execution-
parameters file://TagUpdateAutoParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

AMS infrastructure stacks (stacks named `mc-*`) can't have tags updated with this change type. Use the **Bulk update** change type (ct-3047c34zuvswh) if you have more than fifty tags to manage.

Tags can't contain the following prefixes:

- ams
- AMS
- Ams

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0xqwmtn1hfh8u.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName": "AWSManagedServices-UpdateTags",
  "Region": "us-east-1",
  "Parameters":     {
    "ResourceArns": [
      "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0",
      "arn:aws:ec2:us-east-1:123456789012:volume/vol-1234567890abcdef0",
      "snap-1234567890abcdef0",
      "arn:aws:rds:us-east-1:123456789012:db/my-db-instance",
      "arn:aws:redshift:us-east-1:123456789012:cluster:my-cluster",
      "arn:aws:logs:ap-southeast-2:123456789012:log-group:my-log-group:*"
    ],
    "AddOrUpdateTags": [
      "{\"Key\":\"k1\",\"Value\":\"v1\"}",
      "{\"Key\":\"k2\",\"Value\":\"v2\"}",
      "{\"Key\":\"aws-migration-project-id\",\"Value\":\"project-id\"}"
    ],
    "RemoveTags": [
      "k4",
      "k5",
      "k6"
    ]
  }
}
```

Tag | Update (Review Required)

Add tags to, update tags on, or remove tags from, existing, supported, resources except those in AMS infrastructure stacks (stacks named mc-*). Tags simplify categorization, identification and targeting AWS resources. Use BulkUpdate if you have >50 tags to manage. For Autoscaling, EC2, Elastic Load Balancing, RDS resources and S3 buckets, use automated CT ct-0xqwmtn1hfh8u.

Full classification: Management | Advanced stack components | Tag | Update (review required)

Change Type Details

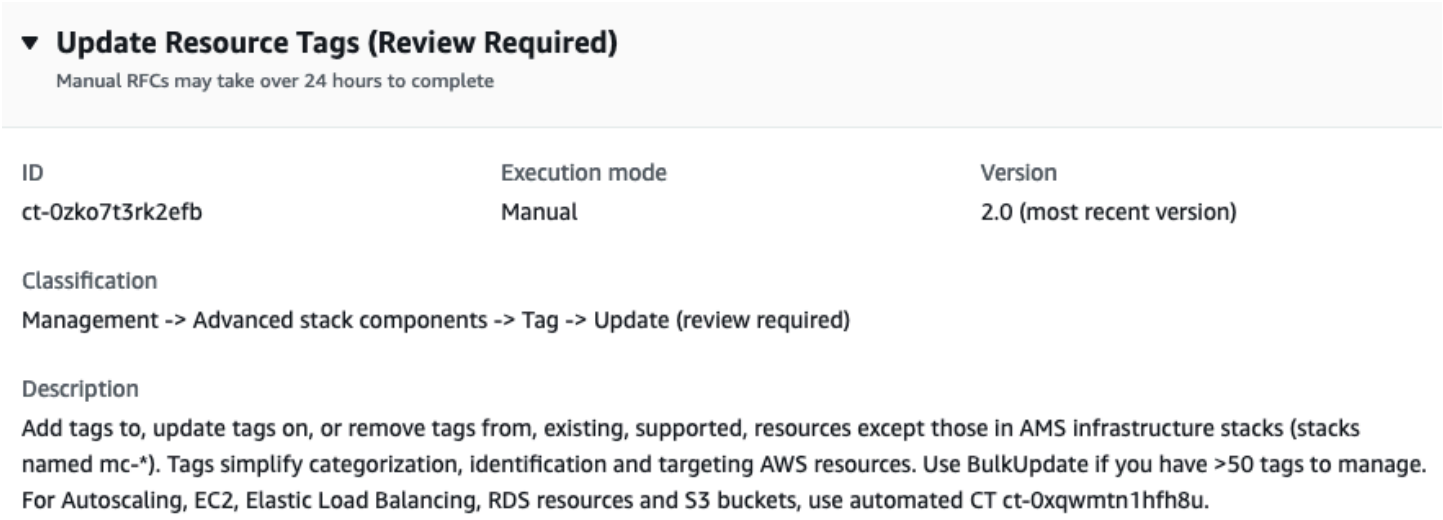
Change type ID	ct-0zko7t3rk2efb
Current version	2.0
Expected execution duration	240 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Update tags (review required)

Updating tags (review required) with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.

2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating tags (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title update-tags --change-type-id ct-0zko7t3rk2efb
 --change-type-version 2.0 --execution-parameters '{"Resources":
[{"ResourceArn":"i-abcd1234","AddOrUpdateTags":[{"Key":"Name","Value":"app-
instance-1"},{"Key":"Owner","Value":"Dep A"}],"RemoveTags":["Team","Prod"]},
{"ResourceArn":"arn:aws:ec2:ap-southeast-2:123456789012:instance/
i-019714a96c22f5452","AddOrUpdateTags":[{"Key":"Name","Value":"app-instance-1"},
{"Key":"Owner","Value":"Dep A"}],"RemoveTags":["Team","Prod"]}]}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema to a file in your current folder. This example names it TagUpdateParams.json.

   ```
   aws amscm create-rfc --generate-cli-skeleton > TagUpdateParams.json
   ```

2. Modify and save the TagUpdateParams.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
    "Resources": [
    {
      "ResourceArn": "i-abcd1234",
      "AddOrUpdateTags": [
        {
          "Key": "Name",
          "Value": "app-instance-1"
        },
        {
          "Key": "Owner",
          "Value": "Dep A"
        }
      ],
      "RemoveTags": [
        "Unused tag 1",
        "Unused tag 2"
      ]
    },
    {
      "ResourceArn": "arn:aws:ec2:ap-southeast-2:123456789012:instance/
i-1234567890abcdef1",
      "AddOrUpdateTags": [
        {
          "Key": "Name",
          "Value": "app-instance-1"
        },
        {
          "Key": "Owner",
          "Value": "Dep A"
        }
      ],
      "RemoveTags": [
        "Unused tag 1",
        "Unused tag 2"
      ]
    }
  ]
}
```

3. Output the RFC template to a file in your current folder; this example names it TagUpdateRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > TagUpdateRfc.json
```

4. Modify and save the TagUpdateRfc.json file.

   The internal quotation marks in the ExecutionParameters JSON extension must be escaped with a backslash (\). Example without start and end time:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-0zko7t3rk2efb",
"Title":                "Update-Tags-RFC"
}
```

5. Create the RFC:

```
aws amscm create-rfc --cli-input-json file://TagUpdateRfc.json  --execution-
parameters file://TagUpdateParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0zko7t3rk2efb.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "Resources": [
    {
```

```
      "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0",
      "AddOrUpdateTags": [
        {
          "Key": "k1",
          "Value": "v1"
        },
        {
          "Key": "k2",
          "Value": "v2"
        },
        {
          "Key": "k3",
          "Value": "v3"
        }
      ],
      "RemoveTags": ["k4", "k5", "k6"]
    },
    {
      "ResourceArn": "i-0fedcba0987654321",
      "AddOrUpdateTags": [
        {
          "Key": "k1",
          "Value": "v1"
        },
        {
          "Key": "k2",
          "Value": "v2"
        },
        {
          "Key": "k3",
          "Value": "v3"
        }
      ],
      "RemoveTags": ["k4", "k5", "k6"]
    }
  ],
  "Priority": "Medium"
}
```

Target Group | Attach Instances

Attach instance or instances to the target group (ALB and NLB).

Full classification: Management | Advanced stack components | Target group | Attach instances

Change Type Details

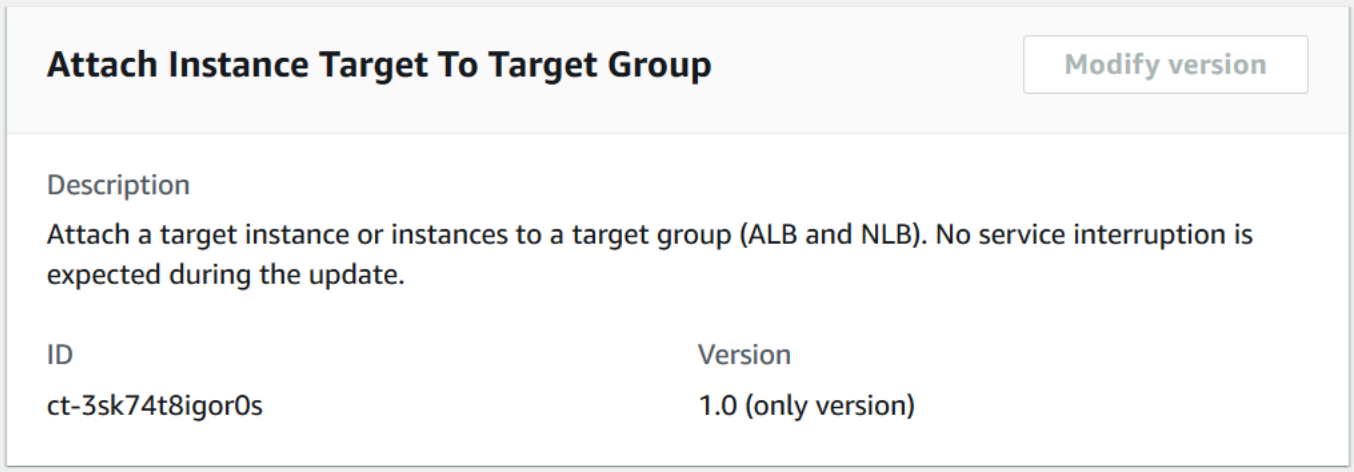
Change type ID	ct-3sk74t8igor0s
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Attach instances to a target group

Attaching Instances to a Target Group with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Attaching Instances to a Target Group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-3sk74t8igor0s" \
--change-type-version "1.0" --title "AttachInstancesToTargetGroup" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
AttachInstancesToTargetGroup\",\"Region\":\"us-east-1\",\"Parameters\":{\"InstancesIds
\":[\"i-000000000000\",\"i-111111111111\"],\"InstancesPort\":[\"80\"],\"TargetGroupArn
\":[\"arn:aws:elasticloadbalancing:us-east-1:00000000000:targetgroup/test-target-
group/0000000000\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it TgAttachInstanceParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-3sk74t8igor0s"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    TgAttachInstanceParams.json
   ```

2. Modify and save the TgAttachInstanceParams file. For example, you can replace the contents with something like this:

```
{
  "DocumentName": "AWSManagedServices-AttachInstancesToTargetGroup",
  "Region": "us-east-1",
  "Parameters": {
      "InstancesIds": [
          "i-000000000000",
          "i-111111111111"
      ],
      "InstancesPort": [
          "80"
      ],
      "TargetGroupArn": [
          "arn:aws:elasticloadbalancing:us-east-1:00000000000:targetgroup/test-
target-group/0000000000"
      ]
  }
}
```

3. Output the RFC template to a file in your current folder named TgAttachInstanceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > TgAttachInstanceRfc.json
```

4. Modify and save the TgAttachInstanceRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3sk74t8igor0s",
"Title":                "Target-Group-Attach-Instance-RFC"
}
```

5. Create the RFC, specifying the TgAttachInstanceRfc file and the TgAttachInstanceParams file:

```
aws amscm create-rfc --cli-input-json file://TgAttachInstanceRfc.json --execution-
parameters file://TgAttachInstanceParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about target groups, see ELB Target Groups.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3sk74t8igor0s.

Example: Required Parameters

```
 {
  "DocumentName": "AWSManagedServices-AttachInstancesToTargetGroup",
  "Region": "us-east-1",
  "Parameters": {
    "InstancesIds": ["i-0000000000"],
    "InstancesPort": ["80"],
    "TargetGroupArn": ["arn:aws:elasticloadbalancing:eu-
west-1:000000000000:targetgroup/target-group-name/000000000000"]
  }
}
```

Example: All Parameters

```
 {
  "DocumentName": "AWSManagedServices-AttachInstancesToTargetGroup",
  "Region": "us-east-1",
  "Parameters": {
    "InstancesIds": ["i-0000000000"],
    "InstancesPort": ["80"],
    "TargetGroupArn": ["arn:aws:elasticloadbalancing:eu-
west-1:000000000000:targetgroup/target-group-name/000000000000"]
  }
}
```

Target Group | Detach Instances

Detach an instance, or instances, from the specified port of a target group (ALB or NLB).

Full classification: Management | Advanced stack components | Target group | Detach instances

Change Type Details

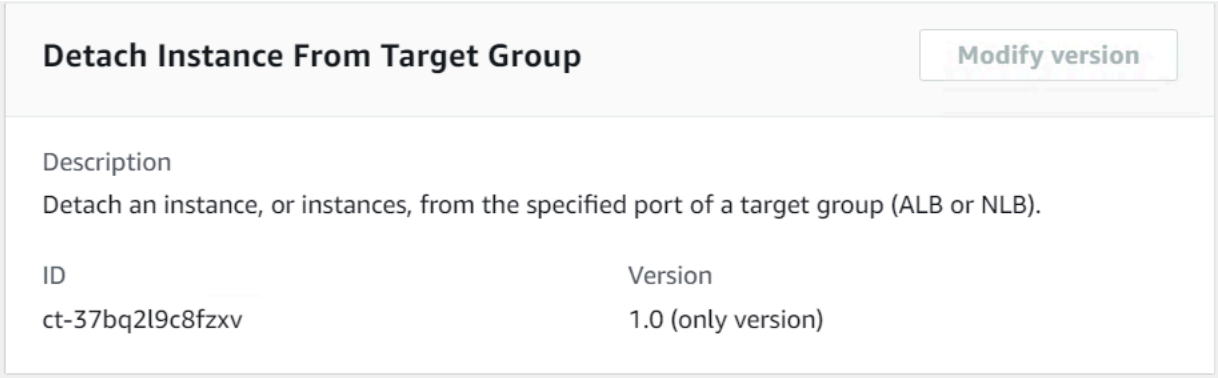
Change type ID	ct-37bq2l9c8fzxv
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Detach instances from a target group

Detaching Instances from a Target Group with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Detaching Instances from a Target Group with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc \
--change-type-id "ct-37bq2l9c8fzxv" \
--change-type-version "1.0" --title "DetachInstancesFromTargetGroup" \
--execution-parameters "{\"DocumentName\":\"AWSManagedServices-
DetachInstancesFromTargetGroup\",\"Region\":\"us-east-1\",\"Parameters\":
{\"InstancesIds\":[\"i-000000000000\",\"i-111111111111\"],\"InstancesPort\":[\"80\"],
\"TargetGroupArn\":[\"arn:aws:elasticloadbalancing:us-east-1:00000000000:targetgroup/
test-target-group/0000000000\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it TgDetachInstanceParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-37bq2l9c8fzxv"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    TgDetachInstanceParams.json
   ```

2. Modify and save the TgDetachInstanceParams file. For example, you can replace the contents with something like this:

   ```
   {
     "DocumentName": "AWSManagedServices-DetachInstancesFromTargetGroup",
     "Region": "us-east-1",
   ```

```
  "Parameters": {
      "InstancesIds": [
          "i-000000000000",
          "i-111111111111"
      ],
      "InstancesPort": [
          "80"
      ],
      "TargetGroupArn": [
          "arn:aws:elasticloadbalancing:us-east-1:00000000000:targetgroup/test-
target-group/0000000000"
      ]
  }
}
```

3. Output the RFC template to a file in your current folder named TgDetachInstanceRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > TgDetachInstanceRfc.json
```

4. Modify and save the TgDetachInstanceRfc.json file. For example, you can replace the contents with something like this:

   Version 1.0:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-37bq2l9c8fzxv",
"Title":                "Target-Group-Detach-Instance-RFC"
}
```

5. Create the RFC, specifying the TgDetachInstanceRfc file and the TgDetachInstanceParams file:

```
aws amscm create-rfc --cli-input-json file://TgDetachInstanceRfc.json --execution-
parameters file://TgDetachInstanceParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about target groups, see ELB Target Groups.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-37bq2l9c8fzxv.

Example: Required Parameters

```
 {
  "DocumentName": "AWSManagedServices-DetachInstancesFromTargetGroup",
  "Region": "us-east-1",
  "Parameters": {
    "InstancesIds": ["i-0000000000"],
    "InstancesPort": ["80"],
    "TargetGroupArn": ["arn:aws:elasticloadbalancing:eu-
west-1:000000000000:targetgroup/target-group-name/000000000000"]
  }
}
```

Example: All Parameters

```
 {
  "DocumentName": "AWSManagedServices-DetachInstancesFromTargetGroup",
  "Region": "us-east-1",
  "Parameters": {
    "InstancesIds": ["i-0000000000"],
    "InstancesPort": ["80"],
    "TargetGroupArn": ["arn:aws:elasticloadbalancing:eu-
west-1:000000000000:targetgroup/target-group-name/000000000000"]
  }
}
```

Target Group | Update (For ALB)

Use to update properties of an existing Target Group for an Application Load Balancer created by CT id ct-1r19m51jeijlk.

Full classification: Management | Advanced stack components | Target group | Update (for ALB)

Change Type Details

Change type ID	ct-2v82sp4np40ki

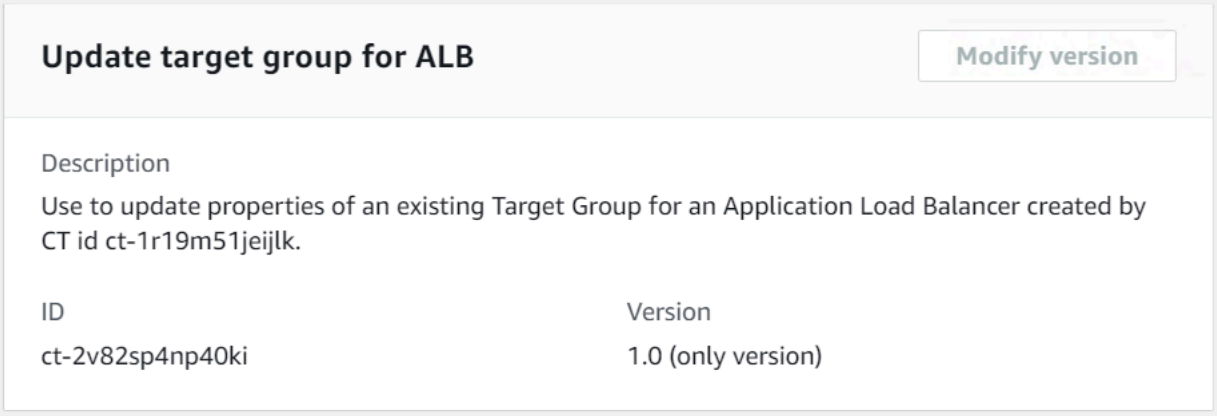
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update ALB target group

Updating a Target Group for an Application Load Balancer with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.

- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a Target Group for an Application Load Balancer with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title update-tg-alb --change-type-id ct-2v82sp4np40ki --change-
type-version 1.0 --execution-parameters '{"Description":"Update target group for
 ALB","VpcId":"vpc-1234abcd","StackTemplateId":"stm-9c1t8maqho0os5k22","Name":"update-
tg-alb","TimeoutInMinutes":60,"Parameters":{"HealthCheckHealthyThreshold":
 "5","HealthCheckUnhealthyThreshold":
 "3","HealthCheckInterval": 30,"HealthCheckTimeout": "10","HealthCheckTargetPath":
 "/healthcheck","HealthCheckTargetPort": "80","HealthCheckTargetProtocol":
 "HTTP","ValidHTTPCode": "200-259","DeregistrationDelayTimeout":
 "300","SlowStartDuration": "60","StickinessCookieExpirationPeriod":
 "3600","Target1ID": "i-abcdef01","Target1Port": "80","Target1AvailabilityZone":
 "AZ","Target2ID": "i-abcdefabcdefabcd1","Target2Port": "80","Target2AvailabilityZone":
 "AZ"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it CreateTgAlbParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-2v82sp4np40ki" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateTgAlbParams.json
   ```

2. Modify and save the UpdateTgAlbParams file. For example, you can replace the contents with something like this:

```
{
"Description":      "Target-Group-ALB-Create",
"VpcId":            "VPC_ID",
"Name":             "My-ALB-Target-Group",

"Parameters":   {
    "LoadBalancerArn":              ARN,
    "DefaultActionTargetGroupArn":  ARN,
    "Port":                         PORT,
    "Protocol":                    Protocol"
    }
}
```

3. Output the RFC template to a file in your current folder named UpdateTgAlbRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateTgAlbRfc.json
```

4. Modify and save the UpdateTgAlbRfc.json file. For example, you can replace the contents with something like this:

   Version 1.0:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2v82sp4np40ki",
"Title":                "Target-Group-ALB-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateTgAlbRfc file and the UpdateTgAlbParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateTgAlbRfc.json --execution-
parameters file://UpdateTgAlbParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

> **Note**
>
> The 2.0 version of this change type uses a different StackTemplateId (stm-9c1t8maqho0os5k22) from the 1.0 version. This is important if you are submitting the RFC with this change type version at the command line. The new version includes a new, required, parameter: **ApplicationLoadBalancer**.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2v82sp4np40ki.

Example: Required Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-123456789abcdefgh",
  "Parameters": {}
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-123456789abcdefgh",
  "Parameters": {
    "HealthCheckHealthyThreshold": "5",
    "HealthCheckUnhealthyThreshold": "3",
    "HealthCheckInterval": 30,
    "HealthCheckTimeout": "10",
    "HealthCheckTargetPath": "/healthcheck",
    "HealthCheckTargetPort": "80",
    "HealthCheckTargetProtocol": "HTTP",
    "ValidHTTPCode": "200-259",
    "DeregistrationDelayTimeout": "300",
    "SlowStartDuration": "60",
    "StickinessCookieExpirationPeriod": "3600",
    "Target1ID": "i-abcdef01",
```

```
    "Target1AvailabilityZone": "",
    "Target2ID": "i-abcdefabcdefabcd1",
    "Target2AvailabilityZone": "",
    "Target3ID": "i-abcdefabcdefabcd2",
    "Target3AvailabilityZone": "",
    "Target4ID": "i-abcdefabcdefabcd3",
    "Target4AvailabilityZone": "",
    "Target5ID": "i-abcdefabcdefabcd4",
    "Target5AvailabilityZone": "",
    "Target6ID": "i-abcdefabcdefabcd5",
    "Target6AvailabilityZone": "",
    "Target7ID": "i-abcdefabcdefabcd6",
    "Target7AvailabilityZone": "",
    "Target8ID": "i-abcdefabcdefabcd7",
    "Target8AvailabilityZone": ""
  }
}
```

Target Group | Update (For NLB)

Use to update properties of an existing Target Group for a Network Load Balancer.

Full classification: Management | Advanced stack components | Target group | Update (for NLB)

Change Type Details

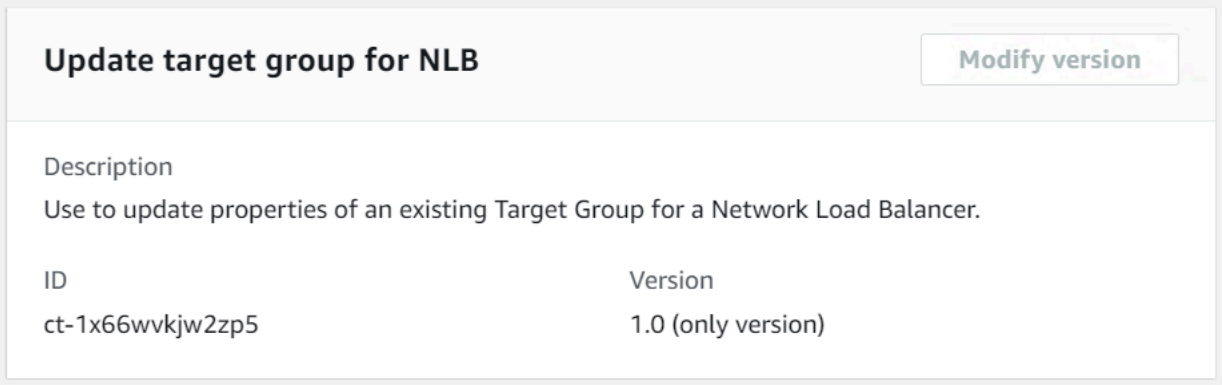
Change type ID	ct-1x66wvkjw2zp5
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Update NLB target group

Updating a Target Group for a Network Load Balancer with the Console

Screenshot of this change type in the AMS console:



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating a Target Group for a Network Load Balancer with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotation marks when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --title update-tg-nlb --change-type-id ct-1x66wvkjw2zp5 --change-
type-version 1.0 --execution-parameters '{"Description":"Update target group for
 NLB","VpcId":"vpc-1234abcd","StackTemplateId":"stm-6pvp2f7cp481g1r47","Name":"test-
update-tg-nlb","TimeoutInMinutes":60,"Parameters":{"HealthCheckHealthyThreshold":
 "5","HealthCheckInterval": 30,"HealthCheckTargetPath": "/
healthcheck","HealthCheckTargetPort": "80","HealthCheckTargetProtocol":
 "HTTP","ProxyProtocolV2": "true","DeregistrationDelayTimeout": "300","Target1ID":
 "i-abcdef01","Target1Port": "80","Target1AvailabilityZone": "AZ","Target2ID": "i-
abcdefabcdefabcd1","Target2Port": "80","Target2AvailabilityZone": "AZ"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdateTgNlbParams.json.

   ```
   aws amscm get-change-type-version --change-type-id "ct-1x66wvkjw2zp5" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateTgNlbParams.json
   ```

2. Modify and save the UpdateTgNlbParams file. For example, you can replace the contents with something like this:

   ```
   {
   "VpcId":            "VPC_ID",
   "StackId":          "STACK_ID",
   "Parameters":   {
       "DeregistrationDelayTimeout":  160
       }
   }
   ```

3. Output the RFC template to a file in your current folder named UpdateTgNlbRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateTgNlbRfc.json
   ```

4. Modify and save the UpdateTgNlbRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1x66wvkjw2zp5",
"Title":                "Target-Group-NLB-Update-RFC"
}
```

5. Create the RFC, specifying the UpdateTgNlbRfc file and the UpdateTgNlbParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateTgNlbRfc.json --execution-
parameters file://UpdateTgNlbParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For information about target groups, see ELB Target Groups.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1x66wvkjw2zp5.

Example: Required Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-123456789abcdefgh",
  "Parameters": {}
}
```

Example: All Parameters

```
{
  "VpcId": "vpc-1234567890abcdef0",
  "StackId": "stack-123456789abcdefgh",
  "Parameters": {
    "HealthCheckHealthyThreshold": "5",
    "HealthCheckInterval": 30,
    "HealthCheckTargetPath": "/healthcheck",
    "HealthCheckTargetPort": "80",
```

```
    "HealthCheckTargetProtocol": "HTTP",
    "ProxyProtocolV2": "true",
    "DeregistrationDelayTimeout": "300",
    "Target1ID": "192.168.0.1",
    "Target1Port": "80",
    "Target1AvailabilityZone": "all",
    "Target2ID": "192.168.0.2",
    "Target2Port": "80",
    "Target2AvailabilityZone": "all",
    "Target3ID": "10.44.4.125",
    "Target3Port": "8080",
    "Target3AvailabilityZone": "",
    "Target4ID": "10.44.4.126",
    "Target4Port": "8080",
    "Target4AvailabilityZone": "",
    "Target5ID": "192.168.0.127",
    "Target5Port": "80",
    "Target5AvailabilityZone": "all",
    "Target6ID": "192.168.0.128",
    "Target6Port": "80",
    "Target6AvailabilityZone": "all",
    "Target7ID": "192.168.0.129",
    "Target7Port": "8080",
    "Target7AvailabilityZone": "",
    "Target8ID": "192.168.0.130",
    "Target8Port": "8080",
    "Target8AvailabilityZone": ""
  }
}
```

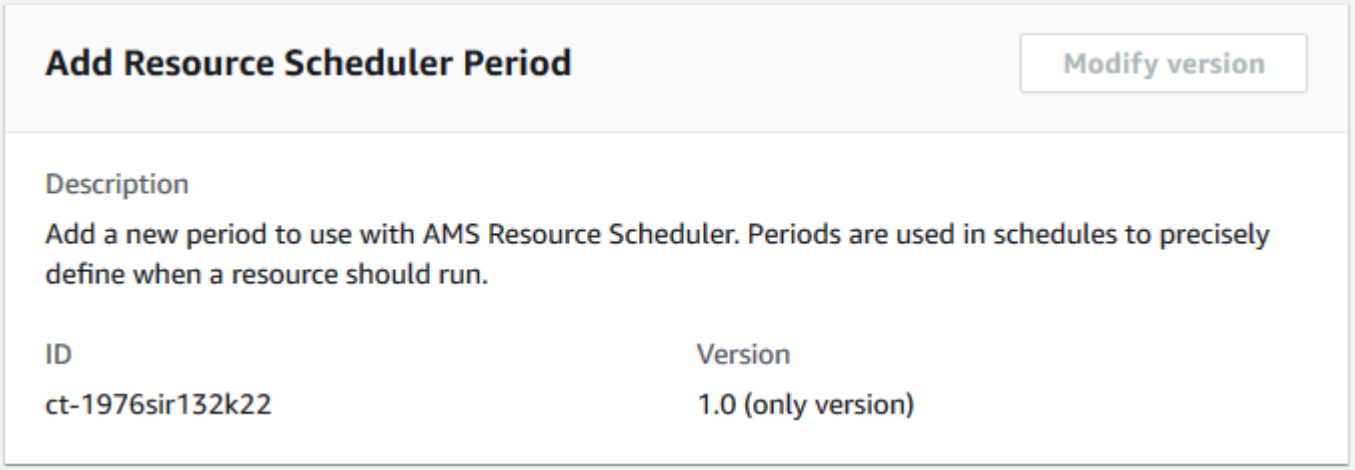
Period add

Adding an AMS Resource Scheduler period with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding an AMS Resource Scheduler period with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1976sir132k22" --change-type-version "1.0" --
title "Add period for AMS Resource Scheduler" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-AddOrUpdatePeriod\",\"Region\":\"us-east-1\",\"Parameters
\":{\"Action\":[\"add\"],\"Name\":[\"period01\"],\"Description\":[\"Test period
 definition\"],\"BeginTime\":[\"09:00\"],\"EndTime\":[\"17:00\"],\"Months\":[\"jan-
feb\"],\"MonthDays\":[\"jan/3\"],\"WeekDays\":[\"mon-fri\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it AddPeriodParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1976sir132k22" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AddPeriodParams.json
   ```

2. Modify and save the AddPeriodParams file.

   ```
   {
     "DocumentName" : "AWSManagedServices-AddOrUpdatePeriod",
     "Region" : "us-east-1",
     "Parameters" : {
       "Action" : ["add"],
       "Name" : ["period01"],
       "Description" : ["Test period definition"],
       "BeginTime" : ["09:00"],
       "EndTime" : ["17:00"],
       "Months" : ["jan-feb"],
       "MonthDays" : ["jan/3"],
       "WeekDays" : ["mon-fri"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it AddPeriodRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > AddPeriodRfc.json
   ```

4. Modify and save the AddPeriodRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   ```

```
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1976sir132k22",
"Title":                "Add period for AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the AddPeriodRfc file and the AddPeriodParams file:

```
aws amscm create-rfc --cli-input-json file://AddPeriodRfc.json --execution-
parameters file://AddPeriodParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1976sir132k22.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddOrUpdatePeriod",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["add"],
    "Name" : ["period01"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddOrUpdatePeriod",
```

```
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["add"],
    "Name" : ["period01"],
    "Description" : ["Test period definition"],
    "BeginTime" : ["09:00"],
    "EndTime" : ["17:00"],
    "Months" : ["jan-feb"],
    "MonthDays" : ["jan/3"],
    "WeekDays" : ["mon-fri"]
  }
}
```

Period | Delete

Delete an existing period used in AMS Resource Scheduler.

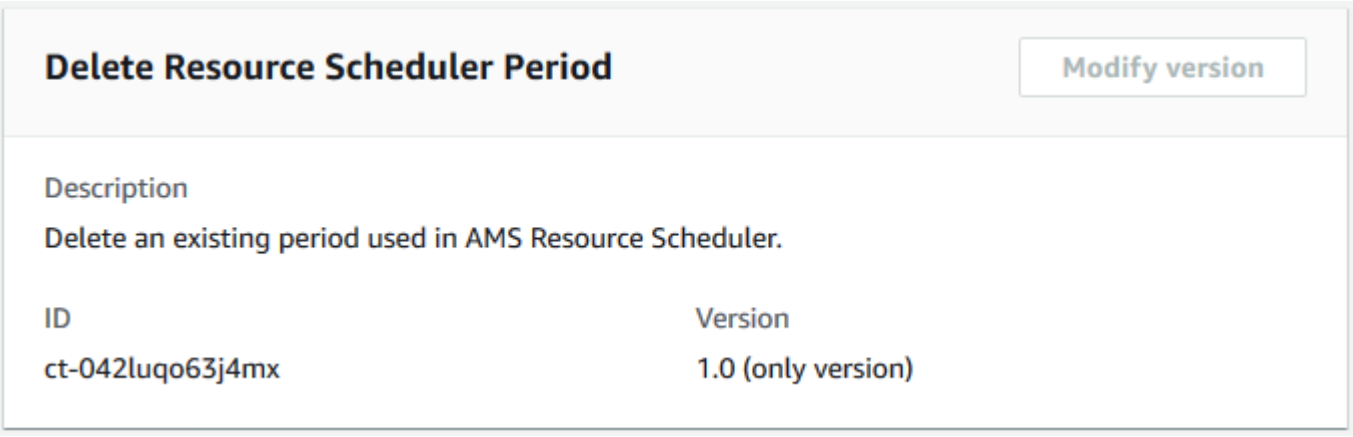
Deleting an AMS Resource Scheduler Period with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an AMS Resource Scheduler period with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-042luqo63j4mx" --change-type-version
 "1.0" --title "Delete period used in AMS Resource Scheduler" --execution-parameters
 "{\"DocumentName\":\"AWSManagedServices-DeleteScheduleOrPeriod\",\"Region\":\"us-
east-1\",\"Parameters\":{\"ConfigurationType\":[\"period\"],\"Name\":[\"period01\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it DeletePeriodParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-042luqo63j4mx" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeletePeriodParams.json
   ```

2. Modify and save the DeletePeriodParams file.

   ```
   {
     "DocumentName" : "AWSManagedServices-DeleteScheduleOrPeriod",
     "Region" : "us-east-1",
     "Parameters" : {
       "ConfigurationType" : ["period"],
       "Name" : ["period01"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it DeletePeriodRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeletePeriodRfc.json
   ```

4. Modify and save the DeletePeriodRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-042luqo63j4mx",
   "Title":                "Delete period used in AMS Resource Scheduler"
   }
   ```

5. Create the RFC, specifying the DeletePeriodRfc file and the DeletePeriodParams file:

```
aws amscm create-rfc --cli-input-json file://DeletePeriodRfc.json --execution-
parameters file://DeletePeriodParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-042luqo63j4mx.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-DeleteScheduleOrPeriod",
  "Region" : "us-east-1",
  "Parameters" : {
    "ConfigurationType" : ["period"],
    "Name" : ["period01"]
  }
}
```

Period | Describe

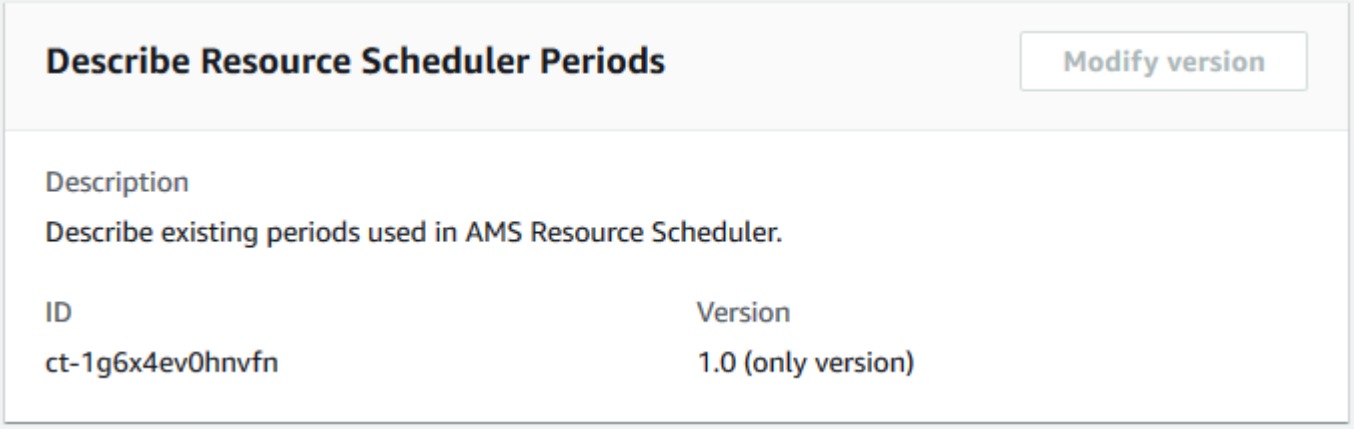
Period describe

Describing an AMS Resource Scheduler period with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.

- **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

  To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
- **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Describing an AMS Resource Scheduler period with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-1g6x4ev0hnvfn" --change-type-version "1.0"
 --title "Describe periods used in AMS Resource Scheduler" --execution-parameters
 "{\"DocumentName\":\"AWSManagedServices-DescribeScheduleOrPeriods\",\"Region\":\"us-
east-1\",\"Parameters\":{\"ConfigurationType\":[\"periods\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it DescribePeriodParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-1g6x4ev0hnvfn" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DescribePeriodParams.json
   ```

2. Modify and save the DescribePeriodParams file.

   ```
   {
     "DocumentName" : "AWSManagedServices-DescribeScheduleOrPeriods",
     "Region" : "us-east-1",
     "Parameters" : {
       "ConfigurationType" : ["periods"]
   ```

```
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it DescribePeriodRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DescribePeriodRfc.json
```

4. Modify and save the DescribePeriodRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-1g6x4ev0hnvfn",
"Title":                "Describe periods used in AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the DescribePeriodRfc file and the DescribePeriodParams file:

```
aws amscm create-rfc --cli-input-json file://DescribePeriodRfc.json --execution-
parameters file://DescribePeriodParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-1g6x4ev0hnvfn.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-DescribeScheduleOrPeriods",
  "Region" : "us-east-1",
  "Parameters" : {
    "ConfigurationType" : ["periods"]
  }
}
```

Period | Update

Update an existing period used in AMS Resource Scheduler.

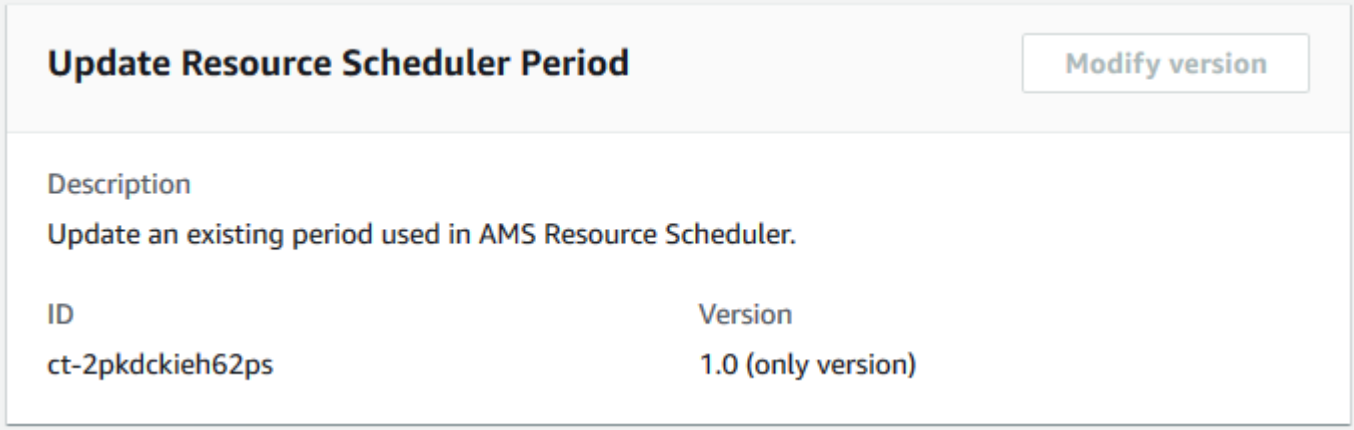
Period update

Updating an AMS Resource Scheduler period with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an AMS Resource Scheduler period with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2pkdckieh62ps" --change-type-version
 "1.0" --title "Update period used in AMS Resource Scheduler" --execution-parameters
 "{\"DocumentName\":\"AWSManagedServices-AddOrUpdatePeriod\",\"Region\":\"us-east-1\",
\"Parameters\":{\"Action\":[\"update\"],\"Name\":[\"period01\"],\"Description\":[\"Test
 period definition\"],\"BeginTime\":[\"09:00\"],\"EndTime\":[\"17:00\"],\"Months\":
[\"jan-feb\"],\"MonthDays\":[\"jan/3\"],\"WeekDays\":[\"mon-fri\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdatePeriodParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2pkdckieh62ps" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdatePeriodParams.json
   ```

2. Modify and save the UpdatePeriodParams file.

   ```
   {
     "DocumentName" : "AWSManagedServices-AddOrUpdatePeriod",
     "Region" : "us-east-1",
     "Parameters" : {
       "Action" : ["update"],
       "Name" : ["period01"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it UpdatePeriodRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdatePeriodRfc.json
   ```

4. Modify and save the UpdatePeriodRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-2pkdckieh62ps",
   "Title":                "Update period used in AMS Resource Scheduler"
   }
   ```

5. Create the RFC, specifying the UpdatePeriodRfc file and the UpdatePeriodParams file:

```
aws amscm create-rfc --cli-input-json file://UpdatePeriodRfc.json --execution-
parameters file://UpdatePeriodParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2pkdckieh62ps.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddOrUpdatePeriod",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["update"],
    "Name" : ["period01"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddOrUpdatePeriod",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["update"],
    "Name" : ["period01"],
    "Description" : ["Test period definition"],
    "BeginTime" : ["09:00"],
```

```
    "EndTime" : ["17:00"],
    "Months" : ["jan-feb"],
    "MonthDays" : ["jan/3"],
    "WeekDays" : ["mon-fri"]
  }
}
```

Schedule | Add

Add a new schedule to be used in AMS Resource Scheduler. Schedules employ defined periods to determine when the specified resource should run.

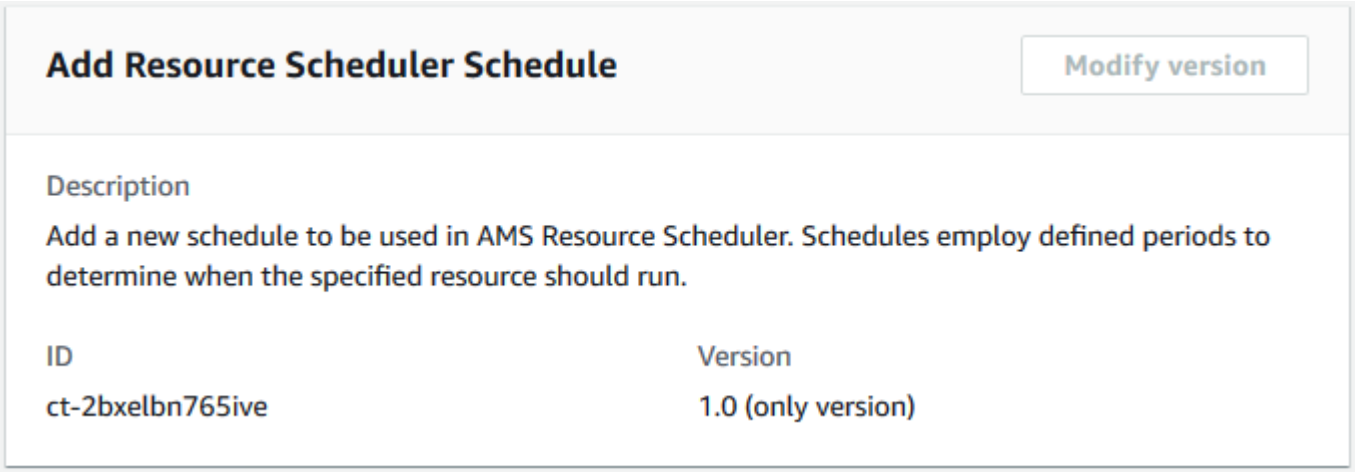
Schedule add

Adding an AMS Resource Scheduler schedule with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Adding an AMS Resource Scheduler schedule with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2bxelbn765ive" --change-type-version
 "1.0" --title "Add a schedule for AMS Resource Scheduler" --execution-parameters
 "{\"DocumentName\":\"AWSManagedServices-AddOrUpdateSchedule\",\"Region\":
\"us-east-1\",\"Parameters\":{\"Action\":[\"add\"],\"Name\":[\"Schedule01\"],
\"Description\":[\"Test schedule\"],\"Hibernate\":[\"true\"],\"Enforced\":
[\"false\"],\"OverrideStatus\":[\"running\"],\"Periods\":[\"period01\",\"period02\"],
\"RetainRunning\":[\"false\"],\"StopNewInstances\":[\"true\"],\"SSMMaintenanceWindow\":
[\"window01\"],\"TimeZone\":[\"Australia/Sydney\"],\"UseMaintenanceWindow\":[\"true\"],
\"UseMetrics\":[\"false\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it AddScheduleParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2bxelbn765ive" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > AddScheduleParams.json
   ```

2. Modify and save the AddScheduleParams file.

   ```
   {
     "DocumentName" : "AWSManagedServices-AddOrUpdateSchedule",
     "Region" : "us-east-1",
     "Parameters" : {
       "Action" : ["add"],
       "Name" : ["Schedule01"],
       "Description" : ["Test schedule"],
       "Hibernate" : ["true"],
       "Enforced" : ["false"],
       "OverrideStatus" : ["running"],
       "Periods" : [
         "period01",
         "period02"
       ],
       "RetainRunning" : ["false"],
       "StopNewInstances" : ["true"],
       "SSMMaintenanceWindow" : ["window01"],
       "TimeZone" : ["Australia/Sydney"],
       "UseMaintenanceWindow" : ["true"],
       "UseMetrics" : ["false"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it AddScheduleRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > AddScheduleRfc.json
```

4. Modify and save the AddScheduleRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2bxelbn765ive",
"Title":                "Add a schedule for AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the AddScheduleRfc file and the AddScheduleParams file:

```
aws amscm create-rfc --cli-input-json file://AddScheduleRfc.json --execution-
parameters file://AddScheduleParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2bxelbn765ive.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddOrUpdateSchedule",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["add"],
```

```
    "Name" : ["schedule01"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddOrUpdateSchedule",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["add"],
    "Name" : ["Schedule01"],
    "Description" : ["Test schedule"],
    "Hibernate" : ["true"],
    "Enforced" : ["false"],
    "OverrideStatus" : ["running"],
    "Periods" : ["period01, period02"],
    "RetainRunning" : ["false"],
    "StopNewInstances" : ["true"],
    "SSMMaintenanceWindow" : ["window01, window02"],
    "TimeZone" : ["Australia/Sydney"],
    "UseMaintenanceWindow" : ["true"],
    "UseMetrics" : ["false"]
  }
}
```

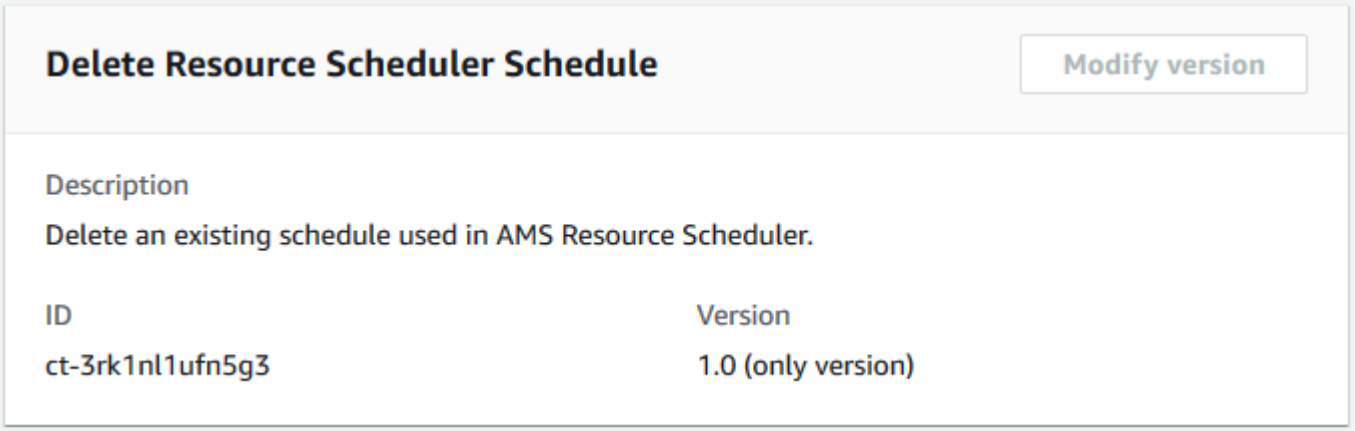
Deleting an AMS Resource Scheduler schedule with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Deleting an AMS Resource Scheduler schedule with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3rk1nl1ufn5g3" --change-type-version
 "1.0" --title "Delete schedule for AMS Resource Scheduler" --execution-parameters
 "{\"DocumentName\":\"AWSManagedServices-DeleteScheduleOrPeriod\",\"Region\":
\"us-east-1\",\"Parameters\":{\"ConfigurationType\":[\"schedule\"],\"Name\":
[\"schedule01\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it DeleteScheduleParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3rk1nl1ufn5g3" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > DeleteScheduleParams.json
   ```

2. Modify and save the DeleteScheduleParams file.

   ```
   {
     "DocumentName" : "AWSManagedServices-DeleteScheduleOrPeriod",
     "Region" : "us-east-1",
     "Parameters" : {
       "ConfigurationType" : ["schedule"],
       "Name" : ["schedule01"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it DeleteScheduleRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > DeleteScheduleRfc.json
   ```

4. Modify and save the DeleteScheduleRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-3rk1nl1ufn5g3",
"Title":                "Delete schedule for AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the DeleteScheduleRfc file and the DeleteScheduleParams file:

```
aws amscm create-rfc --cli-input-json file://DeleteScheduleRfc.json --execution-
parameters file://DeleteScheduleParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

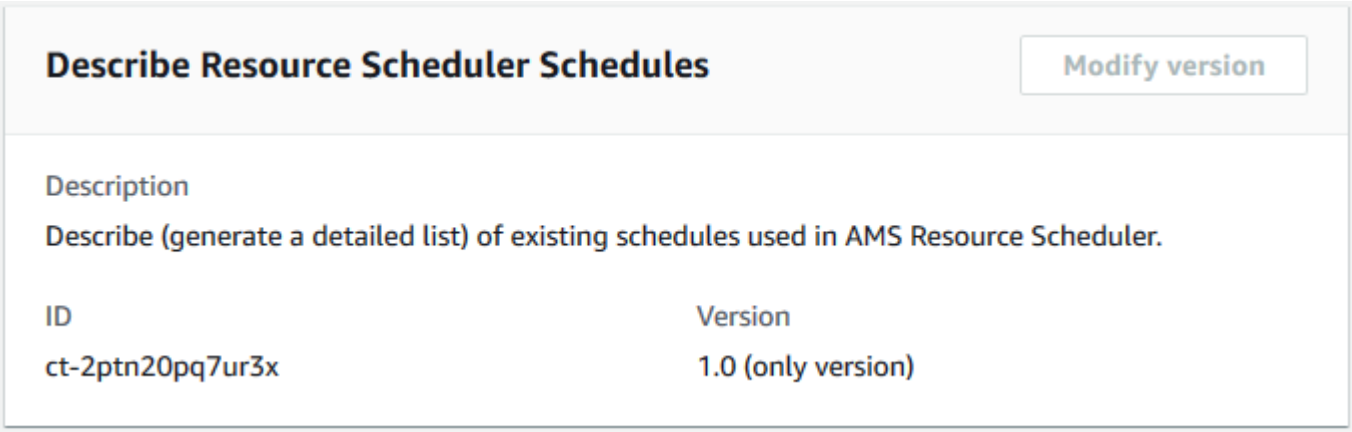
Describing an AMS Resource Scheduler schedule with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Describing an AMS Resource Scheduler schedule with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.

2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *ID* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *ID* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2ptn20pq7ur3x" --change-type-version "1.0"
 --title "Describe schedules used in AMS Resource Scheduler" --execution-parameters
 "{\"DocumentName\":\"AWSManagedServices-DescribeScheduleOrPeriods\",\"Region\":\"us-
east-1\",\"Parameters\":{\"ConfigurationType\":[\"schedules\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it DescribeScheduleParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2ptn20pq7ur3x"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DescribeScheduleParams.json
   ```

2. Modify and save the DescribeScheduleParams file.

```
{
  "DocumentName" : "AWSManagedServices-DescribeScheduleOrPeriods",
  "Region" : "us-east-1",
  "Parameters" : {
    "ConfigurationType" : ["schedules"]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it DescribeScheduleRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DescribeScheduleRfc.json
```

4. Modify and save the DescribeScheduleRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2ptn20pq7ur3x",
"Title":                "Describe schedule for AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the DescribeScheduleRfc file and the DescribeScheduleParams file:

```
aws amscm create-rfc --cli-input-json file://DescribeScheduleRfc.json --execution-
parameters file://DescribeScheduleParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2ptn20pq7ur3x.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-DescribeScheduleOrPeriods",
  "Region" : "us-east-1",
  "Parameters" : {
    "ConfigurationType" : ["schedules"]
  }
}
```

Schedule | Update

Update an existing schedule to be used in AMS Resource Scheduler.

Full classification: Management | AMS Resource Scheduler | Schedule | Update

Change Type Details

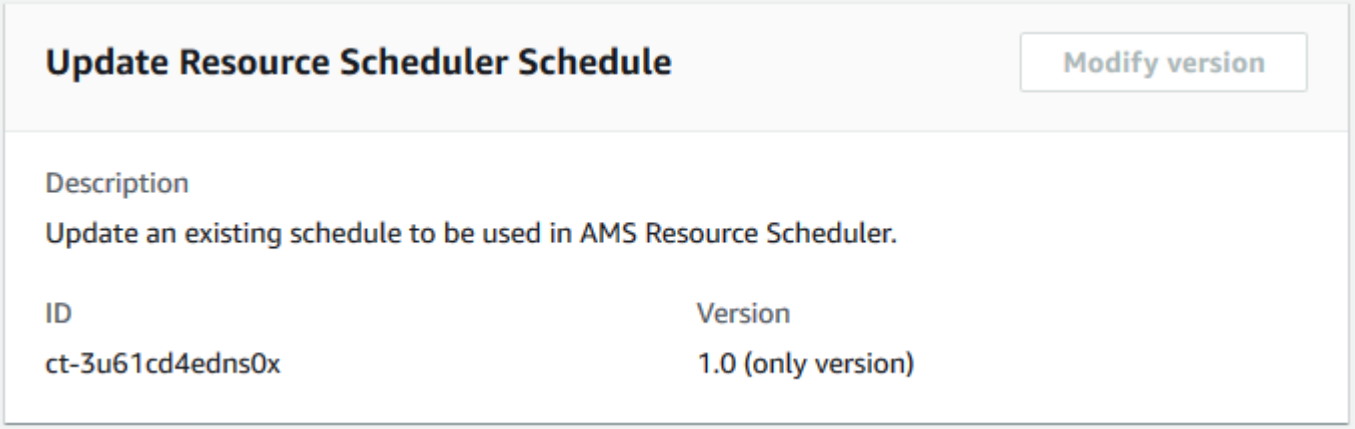
Change type ID	ct-3u61cd4edns0x
Current version	1.0
Expected execution duration	360 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Schedule update

Updating an AMS Resource Scheduler schedule with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating an AMS Resource Scheduler schedule with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-3u61cd4edns0x" --change-type-version
 "1.0" --title "Update a schedule used in AMS Resource Scheduler" --execution-
parameters "{\"DocumentName\":\"AWSManagedServices-AddOrUpdateSchedule\",\"Region
\":\"us-east-1\",\"Parameters\":{\"Action\":[\"update\"],\"Name\":[\"Schedule01\"],
\"Description\":[\"Test schedule\"],\"Hibernate\":[\"true\"],\"Enforced\":
[\"false\"],\"OverrideStatus\":[\"running\"],\"Periods\":[\"period01\",\"period02\"],
\"RetainRunning\":[\"false\"],\"StopNewInstances\":[\"true\"],\"SSMMaintenanceWindow\":
[\"window01\"],\"TimeZone\":[\"Australia/Sydney\"],\"UseMaintenanceWindow\":[\"true\"],
\"UseMetrics\":[\"false\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdateScheduleParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-3u61cd4edns0x" --query
    "ChangeTypeVersion.ExecutionInputSchema" --output text > UpdateScheduleParams.json
   ```

2. Modify and save the UpdateScheduleParams file.

   ```
   {
     "DocumentName" : "AWSManagedServices-AddOrUpdateSchedule",
     "Region" : "us-east-1",
     "Parameters" : {
       "Action" : ["update"],
       "Name" : ["Schedule01"]
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it UpdateScheduleRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > UpdateScheduleRfc.json
   ```

4. Modify and save the UpdateScheduleRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "1.0",
"ChangeTypeId":         "ct-2ptn3u61cd4edns0x20pq7ur3x",
"Title":                "Update a schedule for AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the UpdateScheduleRfc file and the UpdateScheduleParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateScheduleRfc.json --execution-
parameters file://UpdateScheduleParams.json
```

You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-3u61cd4edns0x.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-AddOrUpdateSchedule",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["update"],
    "Name" : ["Schedule01"]
  }
}
```

Example: All Parameters

```
{
```

```
  "DocumentName" : "AWSManagedServices-AddOrUpdateSchedule",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["update"],
    "Name" : ["Schedule01"],
    "Description" : ["Test schedule"],
    "Hibernate" : ["true"],
    "Enforced" : ["false"],
    "OverrideStatus" : ["running"],
    "Periods" : ["period01, period02"],
    "RetainRunning" : ["false"],
    "StopNewInstances" : ["true"],
    "SSMMaintenanceWindow" : ["window01, window02"],
    "TimeZone" : ["Australia/Sydney"],
    "UseMaintenanceWindow" : ["true"],
    "UseMetrics" : ["false"]
  }
}
```

Solution | Update

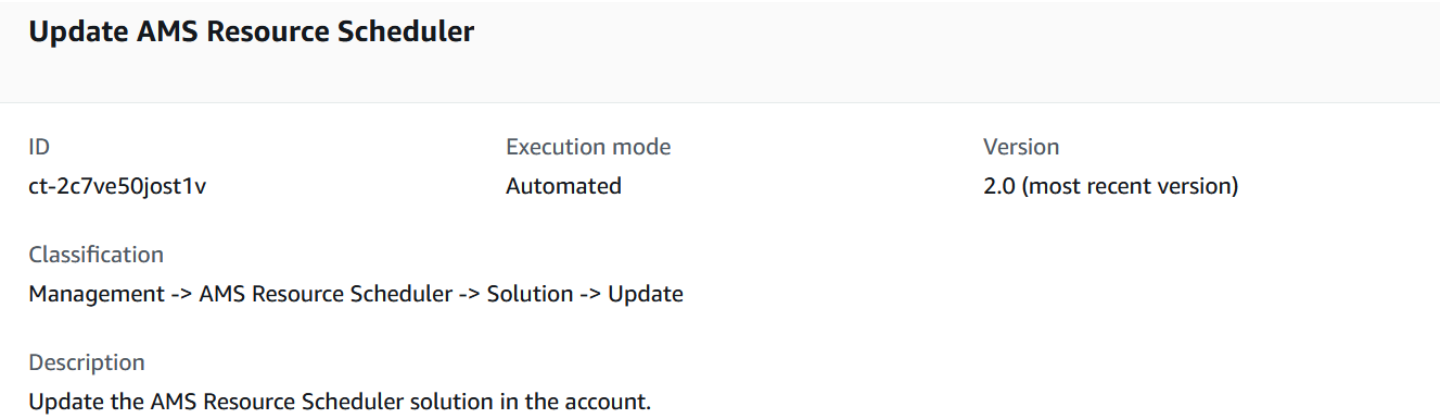
Update AMS Resource Scheduler Solution

Updating AMS Resource Scheduler solution with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Updating AMS Resource Scheduler solution with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id ct-2c7ve50jost1v --change-type-
version "2.0" --title "Update Resource Scheduler Configurations"
 --execution-parameters '{"DocumentName":"AWSManagedServices-
HandleAMSResourceSchedulerStack-Admin","Region":"us-east-1","Parameters":
{"SchedulingActive":["Yes"],"ScheduledServices":["ec2,rds,autoscaling"],"TagName":
["Schedule"],"DefaultTimezone":["America/New_York"],"Action":["Update"]}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it UpdateResSchedulerParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2c7ve50jost1v"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    UpdateResSchedulerParams.json
   ```

2. Modify and save the UpdateResSchedulerParams file.

   ```
   {
     "DocumentName": "AWSManagedServices-HandleAMSResourceSchedulerStack-Admin",
     "Region": "us-east-1",
     "Parameters": {
       "SchedulingActive": [
         "Yes"
       ],
       "ScheduledServices": [
         "ec2,rds,autoscaling"
       ],
       "TagName": [
         "Schedule"
       ],
       "DefaultTimezone": [
         "America/New_York"
       ],
       "Action": [
         "Update"
   ```

```
    ]
  }
}
```

3. Output the RFC template to a file in your current folder; this example names it UpdateResSchedulerRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > UpdateResSchedulerRfc.json
```

4. Modify and save the UpdateResSchedulerRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-2c7ve50jost1v",
"Title":                "Update Resource Scheduler Configurations"
}
```

5. Create the RFC, specifying the UpdateResSchedulerRfc file and the UpdateResSchedulerParams file:

```
aws amscm create-rfc --cli-input-json file://UpdateResSchedulerRfc.json --
execution-parameters file://UpdateResSchedulerParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For background information, see How the AMS Resource Scheduler works. For a quick-start tutorial, see AMS Resource Scheduler quick start.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2c7ve50jost1v.

Example: Required Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAMSResourceSchedulerStack-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "Action" : ["Update"]
  }
}
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAMSResourceSchedulerStack-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "SchedulingActive" : [
      ""
    ],
    "ScheduledServices" : [
      ""
    ],
    "TagName" : [
      ""
    ],
    "DefaultTimezone" : [
      ""
    ],
    "UseCMK" : [
      "arn:aws:kms:ap-southeast-1:830123456789:key/07aaab3c-50d3-4cd8-
ab61-3de57127dab9"
    ],
    "UseLicenseManager" : [
      "arn:aws:license-manager:ap-southeast-1:830123456789:license-
configuration:lic-78c1e0cfc1233a4eac7197d7ee57f92c"
    ],
    "Action" : [
      "Update"
    ]
  }
}
```

State | Disable

Disable AMS Resource Scheduler in the account. This will prevent resources from being scheduled for automatic start or stop actions even if they are configured for such actions.

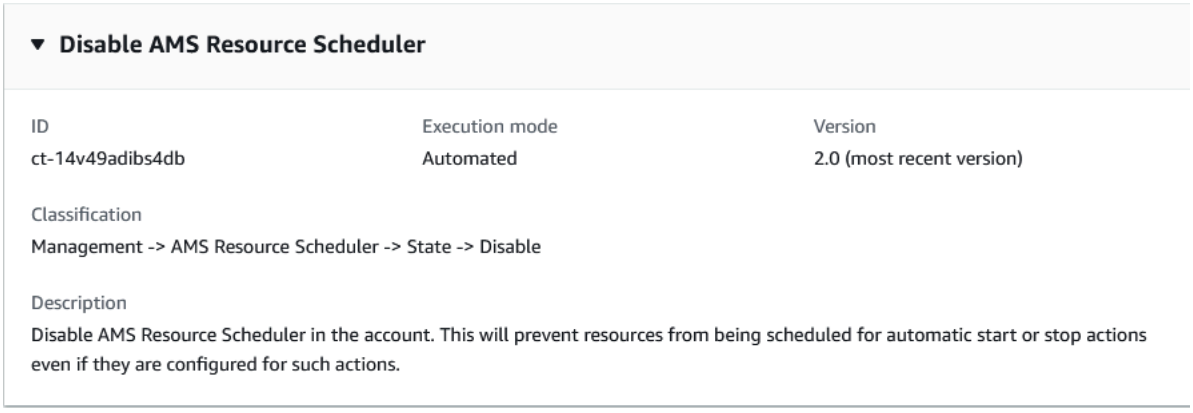
Disable

Disabling AMS Resource Scheduler with the Console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Disabling AMS Resource Scheduler with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

Note

You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-14v49adibs4db" --change-type-version "2.0"
 --title "Disable AMS Resource Scheduler" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-HandleAMSResourceSchedulerStack-Admin\",\"Region\":\"us-east-1\",
\"Parameters\":{\"SchedulingActive\":[\"No\"],\"Action\":\"Update\"}}'
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it DisableResSchedulerParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-14v49adibs4db"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    DisableResSchedulerParams.json
   ```

2. Modify and save the DisableResSchedulerParams file.

```
{
  "DocumentName" : "AWSManagedServices-EnableOrDisableAMSResourceScheduler",
  "Region" : "us-east-1",
  "Parameters" : {
  "SchedulingActive" : ["No"],
  "Action" : "Update"
}
}
```

3. Output the RFC template to a file in your current folder; this example names it DisableResSchedulerRfc.json:

```
aws amscm create-rfc --generate-cli-skeleton > DisableResSchedulerRfc.json
```

4. Modify and save the DisableResSchedulerRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-14v49adibs4db",
"Title":                "Disable AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the DisableResSchedulerRfc file and the DisableResSchedulerParams file:

```
aws amscm create-rfc --cli-input-json file://DisableResSchedulerRfc.json --
execution-parameters file://DisableResSchedulerParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-14v49adibs4db.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAMSResourceSchedulerStack-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
    "SchedulingActive" : ["No"],
    "Action" : "Update"
  }
}
```

State | Enable

Enable AMS Resource Scheduler in the account where it was previously disabled. This will re-enable scheduling of resources for automatic start or stop actions where the resources are already tagged with a valid schedule. Make sure to verify currently tagged resources and schedules before enabling the scheduler.

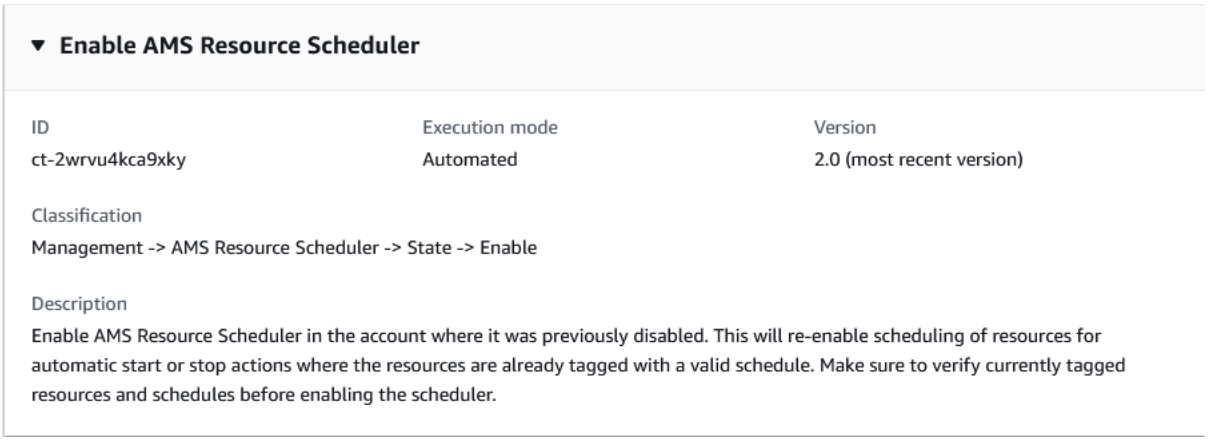
Enable

Enabling AMS Resource Scheduler with the console

The following shows this change type in the AMS console.



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.

3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.

5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Enabling AMS Resource Scheduler with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients \" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not

the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2wrvu4kca9xky" --change-type-version "2.0"
 --title "Enable AMS Resource Scheduler" --execution-parameters "{\"DocumentName\":
\"AWSManagedServices-HandleAMSResourceSchedulerStack-Admin\",\"Region\":\"us-east-1\",
\"Parameters\":{\"SchedulingActive\":[\"Yes\"],\"Action\":\"Update\"}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it EnableResSchedulerParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-2wrvu4kca9xky"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    EnableResSchedulerParams.json
   ```

2. Modify and save the EnableResSchedulerParams file.

   ```
   {
     "DocumentName" : "AWSManagedServices-EnableOrDisableAMSResourceScheduler",
     "Region" : "us-east-1",
     "Parameters" : {
       "SchedulingActive" : ["Yes"],
       "Action" : "Update"
     }
   }
   ```

3. Output the RFC template to a file in your current folder; this example names it EnableResSchedulerRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > EnableResSchedulerRfc.json
   ```

4. Modify and save the EnableResSchedulerRfc.json file. For example, you can replace the contents with something like this:

```
{
"ChangeTypeVersion":    "2.0",
"ChangeTypeId":         "ct-2wrvu4kca9xky",
"Title":                "Enable AMS Resource Scheduler"
}
```

5. Create the RFC, specifying the EnableResSchedulerRfc file and the EnableResSchedulerParams file:

```
aws amscm create-rfc --cli-input-json file://EnableResSchedulerRfc.json --
execution-parameters file://EnableResSchedulerParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

For more information, see How the AMS Resource Scheduler works.

AMS Resource Scheduler is based on the AWS Instance Scheduler; to learn more, see AWS Instance Scheduler.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-2wrvu4kca9xky.

Example: Required Parameters

```
Example not available.
```

Example: All Parameters

```
{
  "DocumentName" : "AWSManagedServices-HandleAMSResourceSchedulerStack-Admin",
  "Region" : "us-east-1",
  "Parameters" : {
```

```
    "SchedulingActive" : ["Yes"],
    "Action" : "Update"
  }
}
```

Change Type Items and Operations in the Applications Subcategory

- IAM Instance Profile | Create (Review Required)

IAM Instance Profile | Create (Review Required)

Use to create an instance profile.

Full classification: Management | Applications | IAM instance profile | Create (review required)

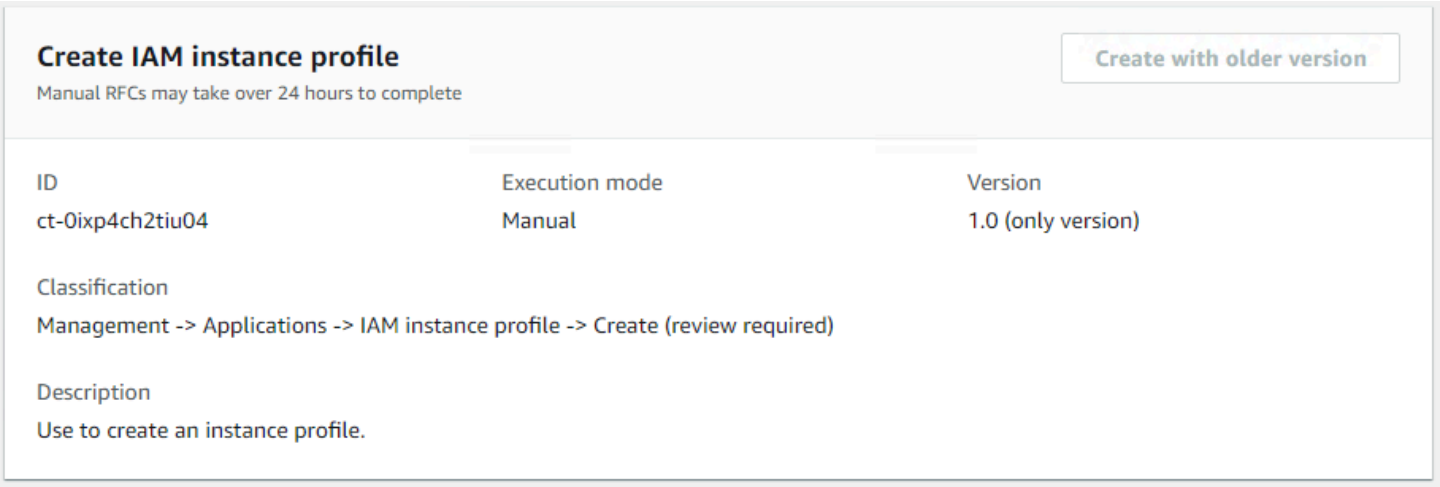
Change Type Details

Change type ID	ct-0ixp4ch2tiu04
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required if submitter
Execution mode	Manual

Additional Information

Create application IAM instance profile (review required)

Creating IAM instance profiles (review required) with the console



How it works:

1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.

4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Creating IAM instance profiles (review required) with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-0ixp4ch2tiu04" --change-type-version
 "1.0" --title "TestInstanceProfile" --execution-parameters "{\"InstanceProfileName
\":\"PROFILE_NAME\",\"RelatedIds\":[\"RESOURCE_ID\", \"RESOURCE_ID\"],
\"InstanceProfileDescription\":\"PROFILE_DESCRIPTION\"}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a file; this example names it CreateInstanceProfileParams.json:

   ```
   aws amscm get-change-type-version --change-type-id "ct-0ixp4ch2tiu04"
    --query "ChangeTypeVersion.ExecutionInputSchema" --output text >
    CreateInstanceProfileParams.json
   ```

2. Modify and save the CreateInstanceProfileParams file. For example, you can replace the contents with something like this:

   ```
   {
     "InstanceProfileDescription":    "PROFILE_DESCRIPTION.",
     "InstanceProfileName":           "PROFILE_NAME",
     "RelatedIds":[\"RESOURCE_ID\", \"RESOURCE_ID\"],
   }
   ```

3. Output the RFC template JSON to a file; this example names it CreateInstanceProfileRfc.json:

   ```
   aws amscm create-rfc --generate-cli-skeleton > CreateInstanceProfileRfc.json
   ```

4. Modify and save the CreateInstanceProfileRfc.json file. For example, you can replace the contents with something like this:

   ```
   {
   "ChangeTypeVersion":    "1.0",
   "ChangeTypeId":         "ct-0ixp4ch2tiu04",
   "Title":                "InstanceProfile-Create-RFC"
   ```

5. Create the RFC, specifying the CreateInstanceProfileRfc file and the CreateInstanceProfileParams file:

```
aws amscm create-rfc --cli-input-json file://CreateInstanceProfileRfc.json  --
execution-parameters file://CreateInstanceProfileParams.json
```

   You receive the ID of the new RFC in the response and can use it to submit and monitor the RFC. Until you submit it, the RFC remains in the editing state and does not start.

Tips

This is a "review required" change type (an AMS operator must review and run the CT), which means that the RFC can take longer to run and you might have to communicate with AMS through the RFC details page correspondance option. Additionally, if you schedule a "review required" change type RFC, be sure to allow at least 24 hours, if approval does not happen before the scheduled start time, the RFC is rejected automatically.

For more information about AWS Identity and Access Management, see Using Instance Profiles.

Execution Input Parameters

For detailed information about the execution input parameters, see Schema for Change Type ct-0ixp4ch2tiu04.

Example: Required Parameters

```
{
  "InstanceProfileDescription": "An ample description",
  "InstanceProfileName": "a_good_name"
}
```

Example: All Parameters

```
{
  "InstanceProfileDescription": "An ample description",
  "InstanceProfileName": "a_good_name",
  "RelatedIds": ["foo", "bar", "baz"],
  "Priority": "Medium"
}
```

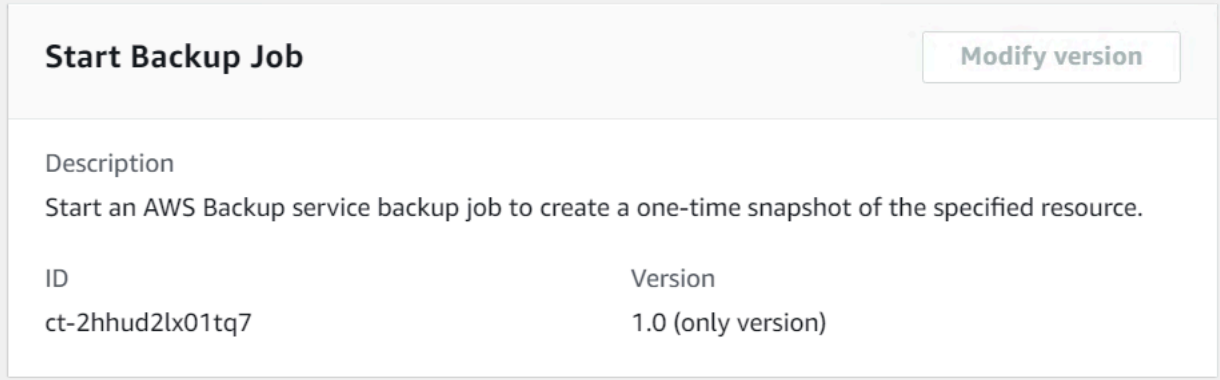
Current version	1.0
Expected execution duration	60 minutes
AWS approval	Required
Customer approval	Not required
Execution mode	Automated

Additional Information

Start AWS Backup job

Starting a backup job with the console

The following shows this change type in the AMS console.



1. Navigate to the **Create RFC** page: In the left navigation pane of the AMS console click **RFCs** to open the RFCs list page, and then click **Create RFC**.
2. Choose a popular change type (CT) in the default **Browse change types** view, or select a CT in the **Choose by category** view.
   - **Browse by change type**: You can click on a popular CT in the **Quick create** area to immediately open the **Run RFC** page. Note that you cannot choose an older CT version with quick create.

     To sort CTs, use the **All change types** area in either the **Card** or **Table** view. In either view, select a CT and then click **Create RFC** to open the **Run RFC** page. If applicable, a **Create with older version** option appears next to the **Create RFC** button.
   - **Choose by category**: Select a category, subcategory, item, and operation and the CT details box opens with an option to **Create with older version** if applicable. Click **Create RFC** to open the **Run RFC** page.
3. On the **Run RFC** page, open the CT name area to see the CT details box. A **Subject** is required (this is filled in for you if you choose your CT in the **Browse change types** view). Open the **Additional configuration** area to add information about the RFC.

   In the **Execution configuration** area, use available drop-down lists or enter values for the required parameters. To configure optional execution parameters, open the **Additional configuration** area.
4. When finished, click **Run**. If there are no errors, the **RFC successfully created** page displays with the submitted RFC details, and the initial **Run output**.
5. Open the **Run parameters** area to see the configurations you submitted. Refresh the page to update the RFC execution status. Optionally, cancel the RFC or create a copy of it with the options at the top of the page.

Starting a backup job with the CLI

How it works:

1. Use either the Inline Create (you issue a `create-rfc` command with all RFC and execution parameters included), or Template Create (you create two JSON files, one for the RFC parameters and one for the execution parameters) and issue the `create-rfc` command with the two files as input. Both methods are described here.
2. Submit the RFC: `aws amscm submit-rfc --rfc-id` *`ID`* command with the returned RFC ID.

   Monitor the RFC: `aws amscm get-rfc --rfc-id` *`ID`* command.

To check the change type version, use this command:

```
aws amscm list-change-type-version-summaries --filter
 Attribute=ChangeTypeId,Value=CT_ID
```

> **Note**
>
> You can use any `CreateRfc` parameters with any RFC whether or not they are part of the schema for the change type. For example, to get notifications when the RFC status changes, add this line, `--notification "{\"Email\": {\"EmailRecipients\" : [\"email@example.com\"]}}"` to the RFC parameters part of the request (not the execution parameters). For a list of all CreateRfc parameters, see the AMS Change Management API Reference.

INLINE CREATE:

Issue the create RFC command with execution parameters provided inline (escape quotes when providing execution parameters inline), and then submit the returned RFC ID. For example, you can replace the contents with something like this:

```
aws amscm create-rfc --change-type-id "ct-2hhud2lx01tq7" --change-type-version
 "1.0" --title "AWS Backup Start Backup Job" --execution-parameters "{\"DocumentName
\":\"AWSManagedServices-StartBackupJob\",\"Region\":\"us-east-1\",\"Parameters
\":{\"BackupVaultName\":[\"backup-vault\"],\"ResourceArn\":[\"arn:aws:ec2:us-
east-1:000000000000:volume/vol-123456789\"]}}"
```

TEMPLATE CREATE:

1. Output the execution parameters JSON schema for this change type to a JSON file; this example names it StartBackupJobParams.json:

```
aws amscm get-change-type-version --change-type-id "ct-2hhud2lx01tq7" --query
 "ChangeTypeVersion.ExecutionInputSchema" --output text > StartBackupJobParams.json
```

2. Modify and save the StartBackupJobParams file.

```
{
  "DocumentName": "AWSManagedServices-StartBackupJob",
  "Region": "us-east-1",
