### Specify CPU options for your instance

You can specify CPU options during instance launch.

The following examples describe how to specify the CPU options when using the launch instance wizard in the EC2 console and the `run-instances` AWS CLI command, and the create launch template page in the EC2 console and the `create-launch-template` AWS CLI command. For EC2 Fleet or Spot Fleet, you must specify the CPU options in a launch template.

The following examples are for an `r5.4xlarge` instance type, which has the following default values:

- Default CPU cores: 8
- Default threads per core: 2
- Default vCPUs: 16 (8 * 2)
- Valid number of CPU cores: 2, 4, 6, 8
- Valid number of threads per core: 1, 2
Disable multithreading

To disable multithreading, specify 1 thread per core.

New console

To disable multithreading during instance launch

1. Follow the Quickly launch an instance procedure and configure your instance as needed.
2. Expand Advanced details, and select the Specify CPU options check box.
3. For Core count, choose the number of required CPU cores. In this example, to specify the default CPU core count for an r5.4xlarge instance, choose 8.
4. To disable multithreading, for Threads per core, choose 1.
5. In the Summary panel, review your instance configuration, and then choose Launch instance. For more information, see Launch an instance using the new launch instance wizard.

Old console

To disable multithreading during instance launch

1. Follow the Launch an instance using the old launch instance wizard procedure.
2. On the Configure Instance Details page, for CPU options, choose Specify CPU options.
3. For Core count, choose the number of required CPU cores. In this example, to specify the default CPU core count for an r5.4xlarge instance, choose 8.
4. To disable multithreading, for Threads per core, choose 1.
5. Continue as prompted by the wizard. When you've finished reviewing your options on the Review Instance Launch page, choose Launch. For more information, see Launch an instance using the old launch instance wizard.

AWS CLI

To disable multithreading during instance launch

Use the run-instances AWS CLI command and specify a value of 1 for ThreadsPerCore for the --cpu-options parameter. For CoreCount, specify the number of CPU cores. In this example, to specify the default CPU core count for an r5.4xlarge instance, specify a value of 8.
Specify a custom number of vCPUs at launch

You can customize the number of CPU cores and threads per core for the instance.

The following example launches an `r5.4xlarge` instance with 4 vCPUs.

New console

To specify a custom number of vCPUs during instance launch

1. Follow the [Quickly launch an instance](#) procedure and configure your instance as needed.
2. Expand **Advanced details**, and select the **Specify CPU options** check box.
3. To get 4 vCPUs, specify 2 CPU cores and 2 threads per core, as follows:
   - For **Core count**, choose 2.
   - For **Threads per core**, choose 2.
4. In the **Summary** panel, review your instance configuration, and then choose **Launch instance**. For more information, see [Launch an instance using the new launch instance wizard](#).

Old console

To specify a custom number of vCPUs during instance launch

1. Follow the [Launch an instance using the old launch instance wizard](#) procedure.
2. On the **Configure Instance Details** page, for **CPU options**, choose **Specify CPU options**.
3. To get 4 vCPUs, specify 2 CPU cores and 2 threads per core, as follows:
   - For **Core count**, choose 2.
   - For **Threads per core**, choose 2.
4. Continue as prompted by the wizard. When you've finished reviewing your options on the Review Instance Launch page, choose Launch. For more information, see Launch an instance using the old launch instance wizard.

AWS CLI

**To specify a custom number of vCPUs during instance launch**

Use the run-instances AWS CLI command and specify the number of CPU cores and number of threads in the --cpu-options parameter. You can specify 2 CPU cores and 2 threads per core to get 4 vCPUs:

```bash
aws ec2 run-instances \
  --image-id ami-1a2b3c4d \
  --instance-type r5.4xlarge \
  --cpu-options "CoreCount=2,ThreadsPerCore=2" \
  --key-name MyKeyPair
```

Alternatively, specify 4 CPU cores and 1 thread per core (disable multithreading) to get 4 vCPUs:

```bash
aws ec2 run-instances \
  --image-id ami-1a2b3c4d \
  --instance-type r5.4xlarge \
  --cpu-options "CoreCount=4,ThreadsPerCore=1" \
  --key-name MyKeyPair
```

**Specify a custom number of vCPUs in a launch template**

You can customize the number of CPU cores and threads per core for the instance in a launch template.

The following example creates a launch template that specifies the configuration for an r5.4xlarge instance with 4 vCPUs.

**Console**

**To specify a custom number of vCPUs in a launch template**

1. Follow the Create a launch template from parameters procedure and configure your launch template as needed.
2. Expand **Advanced details**, and select the **Specify CPU options** check box.

3. To get 4 vCPUs, specify 2 CPU cores and 2 threads per core, as follows:

   - For **Core count**, choose 2.
   - For **Threads per core**, choose 2.

4. In the **Summary** panel, review your instance configuration, and then choose **Create launch template**. For more information, see [Launch an instance from a launch template](#).

**AWS CLI**

**To specify a custom number of vCPUs in a launch template**

Use the `create-launch-template` AWS CLI command and specify the number of CPU cores and number of threads in the `CpuOptions` parameter. You can specify 2 CPU cores and 2 threads per core to get 4 vCPUs.

```bash
aws ec2 create-launch-template \
--launch-template-name TemplateForCPUOptions \
--version-description CPUOptionsVersion1 \
--launch-template-data file://template-data.json
```

The following is an example JSON file that contains the launch template data, which includes the CPU options, for the instance configuration for this example.

```json
{
    "NetworkInterfaces": [
        {
            "AssociatePublicIpAddress": true,
            "DeviceIndex": 0,
            "Ipv6AddressCount": 1,
            "SubnetId": "subnet-7b16de0c"
        }
    ],
    "ImageId": "ami-8c1be5f6",
    "InstanceType": "r5.4xlarge",
    "TagSpecifications": [
        {
            "ResourceType": "instance",
            "Tags": [
                {
                    "Key": "Name",
                    "Value": "webserver"
                }
            ]
        }
    ]
}
```
"CpuOptions": {
    "CoreCount": 2,
    "ThreadsPerCore": 2
}

Alternatively, specify 4 CPU cores and 1 thread per core (disable multithreading) to get 4 vCPUs:

{
    "NetworkInterfaces": [{
        "AssociatePublicIpAddress": true,
        "DeviceIndex": 0,
        "Ipv6AddressCount": 1,
        "SubnetId": "subnet-7b16de0c"
    }],
    "ImageId": "ami-8c1be5f6",
    "InstanceType": "r5.4xlarge",
    "TagSpecifications": [{
        "ResourceType": "instance",
        "Tags": [{
            "Key": "Name",
            "Value": "webserver"
        }]
    }],
    "CpuOptions": {
        "CoreCount": 4,
        "ThreadsPerCore": 1
    }
}

View the CPU options for your instance

You can view the CPU options for an existing instance in the Amazon EC2 console or by describing the instance using the AWS CLI.

Console

To view the CPU options for an instance using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the left navigation pane, choose Instances and select the instance.
3. On the **Details** tab, under **Host and placement group**, find **Number of vCPUs**.

### AWS CLI

**To view the CPU options for an instance (AWS CLI)**

Use the `describe-instances` command.

```bash
aws ec2 describe-instances --instance-ids i-123456789abcde123
```

```json
...
"Instances": [
  {
    "Monitoring": {
      "State": "disabled"
    },
    "PublicDnsName": "ec2-198-51-100-5.eu-central-1.compute.amazonaws.com",
    "State": {
      "Code": 16,
      "Name": "running"
    },
    "EbsOptimized": false,
    "LaunchTime": "2018-05-08T13:40:33.000Z",
    "PublicIpAddress": "198.51.100.5",
    "PrivateIpAddress": "172.31.2.206",
    "ProductCodes": [],
    "VpcId": "vpc-1a2b3c4d",
    "CpuOptions": {
      "CoreCount": 34,
      "ThreadsPerCore": 1
    },
    "StateTransitionReason": "",
    ...
  }
]
...
```

In the output that's returned, the **CoreCount** field indicates the number of cores for the instance. The **ThreadsPerCore** field indicates the number of threads per core.
Alternatively, to view CPU information, you can connect to your instance and use one of the following system tools:

- Windows Task Manager on your Windows instance
- The `lscpu` command on your Linux instance

You can use AWS Config to record, assess, audit, and evaluate configuration changes for instances, including terminated instances. For more information, see Getting Started with AWS Config in the AWS Config Developer Guide.

**AMD SEV-SNP for Amazon EC2 instances**

AMD Secure Encrypted Virtualization-Secure Nested Paging (AMD SEV-SNP) is a CPU feature that provides the following properties:

- **Attestation** – AMD SEV-SNP enables you to retrieve a signed attestation report that contains a cryptographic measure that can be used to validate the instance's state and identity, and that it is running on genuine AMD hardware. For more information, see Attest an Amazon EC2 instance with AMD SEV-SNP.
- **Memory encryption** – Starting with AMD EPYC (Milan), AWS Graviton2, and Intel Xeon Scalable (Ice Lake) processors, instance memory is always encrypted. Instances that are enabled for AMD SEV-SNP use an instance-specific key for their memory encryption.

**Topics**

- Concepts and terminology
- Requirements
- Considerations
- Pricing
- Check AMD SEV-SNP support on Amazon EC2 instances
- Attest an Amazon EC2 instance with AMD SEV-SNP

**Concepts and terminology**

Before you begin using AMD SEV-SNP, ensure that you are familiar with the following concepts and terminology.
AMD SEV-SNP attestation report

The AMD SEV-SNP attestation report is a document that an instance can request from the CPU. The AMD SEV-SNP attestation report can be used to validate the state and identity of an instance, and to verify that it is running in a sanctioned AMD environment. The report includes a launch measurement, which is a cryptographic hash of the initial boot state of an instance, including its initial instance memory contents and initial state of the vCPUs. The AMD SEV-SNP attestation report is signed with a VLEK signature that chains back to an AMD root of trust.

VLEK

The Versioned Loaded Endorsement Key (VLEK) is a versioned signing key that is certified by AMD and used by the AMD CPU to sign the AMD SEV-SNP attestation reports. VLEK signatures can be validated using certificates provided by AMD.

OVMF binary

The Open Virtual Machine Firmware (OVMF) is the early-boot code that is used to provide a UEFI environment for the instance. The early-boot code is run before the code in the AMI is booted. The OVMF also finds and runs the boot loader provided in the AMI. For more information, see the OVMF repository.

Requirements

To use AMD SEV-SNP, you must do the following:

- Use one of the following supported instance types:
  - General purpose: m6a.large | m6a.xlarge | m6a.2xlarge | m6a.4xlarge | m6a.8xlarge
  - Compute optimized: c6a.large | c6a.xlarge | c6a.2xlarge | c6a.4xlarge |
    c6a.8xlarge | c6a.12xlarge | c6a.16xlarge
  - Memory optimized: r6a.large | r6a.xlarge | r6a.2xlarge | r6a.4xlarge
- Launch your instance in a supported AWS Region. Currently, only US East (Ohio) and Europe (Ireland) are supported.
- Use an AMI with uefi or uefi-preferred boot mode and an operating system that supports AMD SEV-SNP. For more information about AMD SEV-SNP support on your operating system, refer to the respective operating system's documentation. For AWS, AMD SEV-SNP is supported on AL2023, RHEL 9.3, SLES 15 SP4, and Ubuntu 23.04 and later.
Considerations

You can only enable AMD SEV-SNP when you launch an instance. When AMD SEV-SNP is enabled for your instance launch, the following rules apply.

- Once it is enabled, AMD SEV-SNP can't be disabled. It remains enabled throughout the instance lifecycle.
- You can only change the instance type to another instance type that supports AMD SEV-SNP.
- Hibernation and Nitro Enclaves aren't supported.
- Dedicated Hosts aren't supported.
- If the underlying host for your instance is scheduled for maintenance, you'll receive a scheduled event notification 14 days before the event. You must manually stop or restart your instance to move it to a new host.

Pricing

When you launch an Amazon EC2 instance with AMD SEV-SNP enabled, you are charged an additional hourly usage fee that is equivalent to 10 percent of the On-Demand hourly rate of the selected instance type.

This AMD SEV-SNP usage fee is a separate charge to your Amazon EC2 instance usage. Reserved Instances, Savings Plans, and operating system usage don't impact this fee.

If you configure a Spot Instance to launch with AMD SEV-SNP enabled, you are charged an additional hourly usage fee that is equivalent to 10 percent of the On-Demand hourly rate of the selected instance type. If the allocation strategy uses price as an input, Spot Fleet does not include this additional fee; only the Spot price is used.

Check AMD SEV-SNP support on Amazon EC2 instances

Topics

- Find Amazon EC2 instance types that support AMD SEV-SNP
- Check if an Amazon EC2 instance is enabled for AMD SEV-SNP

Find Amazon EC2 instance types that support AMD SEV-SNP

You can use the AWS CLI to find instance types that support AMD SEV-SNP.
To find the instance types that support AMD SEV-SNP using the AWS CLI, use the following `describe-instance-types` command.

```bash
$ aws ec2 describe-instance-types
   --filters Name=processor-info.supported-features,Values=amd-sev-snp
   --query 'InstanceTypes[*].InstanceType'
```

Example output.

```
[
   "r6a.2xlarge",
   "m6a.large",
   "m6a.2xlarge",
   "r6a.xlarge",
   "c6a.16xlarge",
   "c6a.8xlarge",
   "m6a.4xlarge",
   "c6a.12xlarge",
   "r6a.4xlarge",
   "c6a.xlarge",
   ...
]
```

**Check if an Amazon EC2 instance is enabled for AMD SEV-SNP**

You can use one of the following methods to check the status of AMD SEV-SNP.

**AWS CLI**

To check whether AMD SEV-SNP is enabled for an instance using the AWS CLI, use the `describe-instances` command. For `--instance-ids`, specify the ID of the instance to check.

```bash
$ aws ec2 describe-instances --instance-ids instance_id
```

In the command output, the value for AmdSevSnp in CpuOptions indicates whether AMD SEV-SNP is enabled or disabled.

**AWS CloudTrail**

In the AWS CloudTrail event for the instance launch request, a value of "cpuOptions": {"AmdSevSnp": enabled} indicates that AMD SEV-SNP is enabled for the instance.
Attest an Amazon EC2 instance with AMD SEV-SNP

Attestation is a process that allows your instance to prove its state and identity. When you enable AMD SEV-SNP for your instance, you can request an AMD SEV-SNP attestation report from the underlying processor. The AMD SEV-SNP attestation report contains a cryptographic hash, called the launch measurement, of the initial guest memory contents and initial vCPU state. The attestation report is signed with a VLEK signature that chains back to an AMD root of trust. You can use the launch measurement included in the attestation report to validate that the instance is running in a genuine AMD environment and to validate the initial boot code that was used to launch the instance.

To perform attestation with AMD SEV-SNP, complete the following steps.

Topics

• Step 1: Enable AMD SEV-SNP during instance launch
• Step 2: Get the attestation report
• Step 3: Validate the attestation report signature

Step 1: Enable AMD SEV-SNP during instance launch

You can use the AWS CLI to launch an instance with AMD SEV-SNP enabled.

To launch an instance with AMD SEV-SNP enabled, you must use the AWS CLI. Use the `run-instances` command and include the `--cpu-options AmdSevSnp=enabled` option. For `--image-id`, specify an AMI with the `uefi` or `uefi-preferred` boot mode and an operating system that supports AMD SEV-SNP. For `--instance-type`, specify a supported instance type.

```
$ aws ec2 run-instances \
--image-id supported_ami_id \
--instance-type supported_instance_type \
--key-name key_pair_name \
--subnet-id subnet_id \
--cpu-options AmdSevSnp=enabled
```

Step 2: Get the attestation report

In this step, you install and build the `snpguest` utility, and then use it to request the AMD SEV-SNP attestation report and certificates.
1. Run the following commands to build the `snpguest` utility from the [snpguest repository](https://github.com/virtee/snpguest.git).

   ```
   $ git clone https://github.com/virtee/snpguest.git
   $ cd snpguest
   $ cargo build -r
   $ cd target/release
   ```

2. Generate a request for the attestation report. The utility requests the attestation report from the host, and writes it to a binary file with the provided request data.

   The following example creates a random request string, and uses it as the request file (`request-file.txt`). When the command returns the attestation report it's stored in the file path that you specify (`report.bin`). In this case, the utility stores the report in the current directory.

   ```
   $ ./snpguest report report.bin request-file.txt --random
   ```

3. Request the certificates from host memory, and store them as PEM files. The following example stores the files in the same directory as the `snpguest` utility. If certificates already exist in the specified directory, those certificates are overwritten.

   ```
   $ ./snpguest certificates PEM ./
   ```

**Step 3: Validate the attestation report signature**

The attestation report is signed with a certificate, called the Versioned Loaded Endorsement Key (VLEK), which is issued by AMD for AWS. In this step, you can validate that the VLEK certificate is issued by AMD, and that the attestation report is signed by that VLEK certificate.

1. Download the VLEK root of trust certificates from the official AMD website to the current directory.

   ```
   $ sudo curl --proto '=https' --tlsv1.2 -sSf https://kdsintf.amd.com/vlek/v1/Milan/cert_chain -o ./cert_chain.pem
   ```

2. Use OpenSSL to validate that the VLEK certificate is signed by the AMD root of trust certificates.

   ```
   $ sudo openssl verify --CAfile ./cert_chain.pem vlek.pem
   ```
Add Windows system components using installation media

Windows Server operating systems include many optional components. Including all optional components in each Amazon EC2 Windows Server AMI is not practical. Instead, we provide you with installation media EBS snapshots that have the necessary files to configure or install components on your Windows instance.

To access and install the optional components, you must find the correct EBS snapshot for your version of Windows Server, create a volume from the snapshot, and attach the volume to your instance.

Before you begin

Use the AWS Management Console or a command line tool to get the instance ID and Availability Zone of your instance. You must create your EBS volume in the same Availability Zone as your instance.

Add Windows components using the console

Use the following procedure to use the AWS Management Console to add Windows components to your instance.

Expected output:

certs/vcek.pem: OK

3. Use the snpguest utility to validate that the attestation report is signed by the VLEK certificate.

$ ./snpguest verify attestation ./ report.bin

Expected output.

Reported TCB Boot Loader from certificate matches the attestation report.
Reported TCB TEE from certificate matches the attestation report.
Reported TCB SNP from certificate matches the attestation report.
Reported TCB Microcode from certificate matches the attestation report.
VEK signed the Attestation Report!
To add Windows components to your instance using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.

2. In the navigation pane, choose Snapshots.

3. From the Filter bar, choose Public snapshots.

4. Add the Owner Alias filter and choose amazon.

5. Add the Description filter and enter Windows.

6. Press Enter

7. Select the snapshot that matches your system architecture and language preference. For example, select Windows 2019 English Installation Media if your instance is running Windows Server 2019.

8. Choose Actions, Create volume from snapshot.

9. For Availability Zone, select the Availability Zone that matches your Windows instance. Choose Add tag and enter Name for the tag key and a descriptive name for the tag value. Choose Create volume.

10. In the Successfully created volume message (green banner), choose the volume that you just created.

11. Choose Actions, Attach volume.

12. From Instance, select the instance ID.

13. For Device name, enter the name of the device for the attachment. If you need help with the device name, see Device names for Amazon EBS and instance store volumes on Amazon EC2 instances.

15. Connect to your instance and make the volume available. For more information, see Make an Amazon EBS volume available for use in the Amazon EBS User Guide.

⚠️ Important

Do not initialize the volume.

16. Open Control Panel, Programs and Features. Choose Turn Windows features on or off. If you are prompted for installation media, specify the EBS volume with the installation media.

17. (Optional) When you are finished with the installation media, you can detach the volume. After you detach the volume, you can delete it.
Add Windows components using the Tools for Windows PowerShell

Use the following procedure to use the Tools for Windows PowerShell to add Windows components to your instance.

Add Windows components to your instance using the Tools for Windows PowerShell

1. Use the `Get-EC2Snapshot` cmdlet with the `Owner` and `description` filters to get a list of the available installation media snapshots.

   ```powershell
   PS C:\> Get-EC2Snapshot -Owner amazon -Filter @{ Name="description"; Values="Windows*" }
   ```

2. In the output, note the ID of the snapshot that matches your system architecture and language preference. For example:

   ```
   ...
   DataEncryptionKeyId : 
   Description : Windows 2019 English Installation Media
   Encrypted : False
   KmsKeyId : 
   OwnerAlias : amazon
   OwnerId : 123456789012
   Progress : 100%
   SnapshotId : snap-22da283e
   StartTime : 10/25/2019 8:00:47 PM
   State : completed
   StateMessage : 
   Tags : {}
   VolumeId : vol-be5eafcb
   VolumeSize : 6
   ...
   ```

3. Use the `New-EC2Volume` cmdlet to create a volume from the snapshot. Specify the same Availability Zone as your instance.

   ```powershell
   PS C:\> New-EC2Volume -AvailabilityZone us-east-1a -VolumeType gp2 -SnapshotId snap-22da283e
   ```

4. In the output, note the volume ID.

   ```
   Attachments : {}
   ```
5. Use the `Add-EC2Volume` cmdlet to attach the volume to your instance.

```
PS C:\> Add-EC2Volume -InstanceId i-087711ddaf98f9489 -VolumeId vol-06aa9e1fbf8b82ed1 -Device xvdh
```

6. Connect to your instance and make the volume available. For more information, see Make an Amazon EBS volume available for use in the Amazon EBS User Guide.

⚠️ **Important**

Do not initialize the volume.

7. Open Control Panel, Programs and Features. Choose Turn Windows features on or off. If you are prompted for installation media, specify the EBS volume with the installation media.

8. (Optional) When you are finished with the installation media, use the `Dismount-EC2Volume` cmdlet to detach the volume from your instance. After you detach the volume, you can use the `Remove-EC2Volume` cmdlet to delete the volume.

### Add Windows components using the AWS CLI

Use the following procedure to use the AWS CLI to add Windows components to your instance.

**To add Windows components to your instance using the AWS CLI**

1. Use the `describe-snapshots` command with the `owner-ids` parameter and `description` filter to get a list of the available installation media snapshots.
aws ec2 describe-snapshots --owner-ids amazon --filters
         Name=description,Values=Windows*

2. In the output, note the ID of the snapshot that matches your system architecture and language preference. For example:

```
{
   "Snapshots": [ ...
      {
         "OwnerAlias": "amazon",
         "Description": "Windows 2019 English Installation Media",
         "Encrypted": false,
         "VolumeId": "vol-be5eafcb",
         "State": "completed",
         "VolumeSize": 6,
         "Progress": "100%",
         "StartTime": "2019-10-25T20:00:47.000Z",
         "SnapshotId": "snap-22da283e",
         "OwnerId": "123456789012"
      }, ...
   ]
}
```

3. Use the `create-volume` command to create a volume from the snapshot. Specify the same Availability Zone as your instance.

```
aws ec2 create-volume --snapshot-id snap-22da283e --volume-type gp2 --availability-zone us-east-1a
```

4. In the output, note the volume ID.

```
{
   "AvailabilityZone": "us-east-1a",
   "Encrypted": false,
   "VolumeType": "gp2",
   "VolumeId": "vol-0c98b37f30bc5bc90",
   "State": "creating",
   "Iops": 100,
   "SnapshotId": "snap-22da283e",
   "CreateTime": "2017-04-18T10:33:10.940Z",
```
5. Use the `attach-volume` command to attach the volume to your instance.

```
aws ec2 attach-volume --volume-id vol-0c98b37f30bc8c290 --instance-id i-01474ef662b89480 --device xvdg
```

6. Connect to your instance and make the volume available. For more information, see Make an Amazon EBS volume available for use in the Amazon EBS User Guide.

⚠️ **Important**

Do not initialize the volume.

7. Open Control Panel, Programs and Features. Choose Turn Windows features on or off. If you are prompted for installation media, specify the EBS volume with the installation media.

8. (Optional) When you are finished with the installation media, use the `detach-volume` command to detach the volume from your instance. After you detach the volume, you can use the `delete-volume` command to delete the volume.

### Manage system users on your Linux instance

Each Linux instance launches with a default Linux system user. You can add users to your instance and delete users.

For the default user, the **default user name** is determined by the AMI that was specified when you launched the instance.

⚠️ **Note**

By default, password authentication and root login are disabled, and sudo is enabled. To log in to your instance, you must use a key pair. For more information about logging in, see Connect to your Linux instance.

You can allow password authentication and root login for your instance. For more information, see the documentation for your operating system.
Linux system users should not be confused with IAM users. For more information, see IAM users in the IAM User Guide.

Contents

• Default user names
• Considerations
• Create a user
• Remove a user

Default user names

The default user name for your EC2 instance is determined by the AMI that was specified when you launched the instance.

The default user names are:

• For AL2023, Amazon Linux 2, or the Amazon Linux AMI, the user name is ec2-user.
• For a CentOS AMI, the user name is centos or ec2-user.
• For a Debian AMI, the user name is admin.
• For a Fedora AMI, the user name is fedora or ec2-user.
• For a RHEL AMI, the user name is ec2-user or root.
• For a SUSE AMI, the user name is ec2-user or root.
• For an Ubuntu AMI, the user name is ubuntu.
• For an Oracle AMI, the user name is ec2-user.
• For a Bitnami AMI, the user name is bitnami.

Note

To find the default user name for other Linux distributions, check with the AMI provider.
Considerations

Using the default user is adequate for many applications. However, you may choose to add users so that individuals can have their own files and workspaces. Furthermore, creating users for new users is much more secure than granting multiple (possibly inexperienced) users access to the default user, because the default user can cause a lot of damage to a system when used improperly. For more information, see Tips for Securing Your EC2 Instance.

To enable users SSH access to your EC2 instance using a Linux system user, you must share the SSH key with the user. Alternatively, you can use EC2 Instance Connect to provide access to users without the need to share and manage SSH keys. For more information, see Connect to your Linux instance with EC2 Instance Connect.

Create a user

First create the user, and then add the SSH public key that allows the user to connect to and log into the instance.

To create a user

1. Create a new key pair. You must provide the .pem file to the user for whom you are creating the user. They must use this file to connect to the instance.

2. Retrieve the public key from the key pair that you created in the previous step.

   ```bash
   $ C:\> ssh-keygen -y -f /path_to_key_pair/key-pair-name.pem
   ```

   The command returns the public key, as shown in the following example.

   ```plaintext
   ssh-isa
   AAAAB3NzaC1yc2EAAAADAQABAAABAAGIa0D5Sfr3xOw6LR6kFwFqS1a+F2WzKQ7m5jJ0fA+eVo+
   +u41KqJ4kQgQc7gDmRfPZn/hznd6w+cLQVvq4+X83f2+ddo9ynam+4906Wbb+McKf8aQZU59
   0r2REo2Vc5QXf/8JZUmb+V1hp4GueH+71Yq+OcDh8zcRnYXaXGp/35I11G2+WiZc4OCF
   z1qZ/GZr/a1P7+9a4dLZ3/0v+iFmEzyuq8g+k7kkqLZ6y1y58T8o0S2IRlZ+eeFh+
   8vQaE2MAT/a5Zi1WQcMvKVBx/h4JzU7/nG+L8c2/1aJm5K+j5nJm/aMz5/15Gk2HJ
   +2mT35a0O1VS/4G/Ig+VZq+S2Jk7Eqg+yfu8v5IYI3WgHsvoK4fCv9Hr7A5zJ/G9
   9WR1svT18dF+aY/NSNf1r7+cO0FOjOZ7wvFF/Ap5Z3f6lZ+ZMnh5n0/l76WNwGU52/
   6Og8+b1l3H76Ft+yiM9/x5y6nW2x/KHvYDJWgj82PhG6j+XQ+w+8j5/nWq10aJHN
   3k9o8S35YrX/1d6z6jR6Y9wJ7guUwz+6t/5oXvAitkV/g+cNnT48S6Q0s+bBTVz9
   3u9CZb611G+X258+5iG44+e7EJy15kNeV2S5aHcYFjJ7FvXJMYLvH7jyDUi8MTjYtwB+
   +QhYXUM0zce5Pjz5/1i8SeJtnVC3iAoG/cQk+0FzZqaeJAAHco
   ```

3. Connect to the instance.

4. Use the adduser command to create the user and add it to the system (with an entry in the /etc/passwd file). The command also creates a group and a home directory for the user. In this example, the user is named `newuser`.
• Amazon Linux and Amazon Linux 2

With Amazon Linux and Amazon Linux 2, the user is created with password authentication disabled by default.

```
[ec2-user ~]$ sudo adduser newuser
```

• Ubuntu

Include the `--disabled-password` parameter to create the user with password authentication disabled.

```
[ubuntu ~]$ sudo adduser newuser --disabled-password
```

5. Switch to the new user so that the directory and file that you create will have the proper ownership.

```
[ec2-user ~]$ sudo su - newuser
```

The prompt changes from `ec2-user` to `newuser` to indicate that you have switched the shell session to the new user.

6. Add the SSH public key to the user. First create a directory in the user's home directory for the SSH key file, then create the key file, and finally paste the public key into the key file, as described in the following sub-steps.

a. Create a `.ssh` directory in the `newuser` home directory and change its file permissions to 700 (only the owner can read, write, or open the directory).

```
[newuser ~]$ mkdir .ssh
[newuser ~]$ chmod 700 .ssh
```

⚠️ **Important**

Without these exact file permissions, the user will not be able to log in.
b. Create a file named authorized_keys in the .ssh directory and change its file permissions to 600 (only the owner can read or write to the file).

```
[newuser ~]$ touch .ssh/authorized_keys
[newuser ~]$ chmod 600 .ssh/authorized_keys
```

⚠️ **Important**

Without these exact file permissions, the user will not be able to log in.

c. Open the authorized_keys file using your favorite text editor (such as `vim` or `nano`).

```
[newuser ~]$ nano .ssh/authorized_keys
```

Paste the public key that you retrieved in **Step 2** into the file and save the changes.

⚠️ **Important**

Ensure that you paste the public key in one continuous line. The public key must not be split over multiple lines.

The user should now be able to log into the `newuser` user on your instance, using the private key that corresponds to the public key that you added to the authorized_keys file. For more information about the different methods of connecting to a Linux instance, see [Connect to your Linux instance](#).

---

**Remove a user**

If a user is no longer needed, you can remove that user so that it can no longer be used.

Use the `userdel` command to remove the user from the system. When you specify the `-r` parameter, the user's home directory and mail spool are deleted. To keep the user's home directory and mail spool, omit the `-r` parameter.

```
[ec2-user ~]$ sudo userdel -r olduser
```
Set the Windows Administrator password for your instance

When you connect to a Windows instance, you must specify a user account and password that has permission to access the instance. The first time that you connect to an instance, you are prompted to specify the Administrator account and the default password.

With AWS Windows AMIs for Windows Server 2012 R2 and earlier, the Configure a Windows instance using the EC2Config service (legacy) generates the default password. With AWS Windows AMIs for Windows Server 2016 and 2019, Configure a Windows instance using EC2Launch generates the default password. With AWS Windows AMIs for Windows Server 2022 and later, Configure a Windows instance using EC2Launch v2 generates the default password.

Note

With Windows Server 2016 and later, Password never expires is disabled for the local administrator. With Windows Server 2012 R2 and earlier, Password never expires is enabled for the local administrator.

Change the Administrator password after connecting

When you connect to an instance the first time, we recommend that you change the Administrator password from its default value. Use the following procedure to change the Administrator password for a Windows instance.

Important

Store the new password in a safe place. You won't be able to retrieve the new password using the Amazon EC2 console. The console can only retrieve the default password. If you attempt to connect to the instance using the default password after changing it, you'll get a "Your credentials did not work" error.

To change the local Administrator password

1. Connect to the instance and open a command prompt.
2. Run the following command. If your new password includes special characters, enclose the password in double quotes.
net user Administrator "new_password"

3. Store the new password in a safe place.

**Change a lost or expired password**

If you lose your password or it expires, you can generate a new password. For password reset procedures, see [Reset the administrator password for an Amazon EC2 Windows instance](#).

**Manage device drivers for your EC2 instance**

Device drivers are software components that communicate with the virtualized hardware for your Amazon EC2 instance. To prevent system errors, performance issues, and other unexpected behavior, it's important to keep your drivers up-to-date. That's especially true for drivers that can have a strong impact on system performance depending on your usage, such as networking, graphics, and storage device drivers. New driver releases can include defect fixes or introduce expanded functionality that you might want to take advantage of for instances that are currently running.

**Network drivers**

Linux distributions can incorporate networking features like Elastic Network Adapter (ENA) or Elastic Fabric Adapter (EFA) within the kernel. However, the timing may vary for implementation of kernel driver features within the different distributions.

ENA and EFA Linux kernel drivers are available from the Amazon Drivers GitHub repository. For more information and links to the available drivers, see [Amazon Drivers](#) on GitHub.

For more information about ENA drivers, see [Enable enhanced networking with ENA on your EC2 instances](#). For more information about EFA drivers, see [Getting started](#) topics in the Elastic Fabric Adapter section of this guide.

To install or update networking drivers on Windows instances, see the following topics:

- [Install the ENA driver on Windows](#)
- [Install the latest AWS PV drivers](#)

For more information, see [Paravirtual drivers for Windows instances](#).
Note
EFA is not supported on Windows instances.

Graphics drivers

To install or update graphics drivers, see the following topics:

- [AMD drivers for your EC2 instance](#)
- [NVIDIA drivers for your Amazon EC2 instance](#)

Storage device drivers

To install or update storage drivers, see the following topics:

- For Linux instances, see [Install or upgrade the NVMe driver](#) in the Amazon EBS User Guide.
- For Windows instances, see [AWS NVMe drivers for Windows instances](#).

Install the ENA driver on EC2 Windows instances

If your instance isn't based on one of the latest Windows Amazon Machine Images (AMIs) that Amazon provides, use the following procedure to install the current ENA driver on your instance. You should perform this update at a time when it's convenient to reboot your instance. If the install script doesn’t automatically reboot your instance, we recommend that you reboot the instance as the final step.

If you use an instance store volume to store data while the instance is running, that data is erased when you stop the instance. Before you stop your instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

Prerequisites

To install or upgrade the ENA driver, your Windows instance must meet the following prerequisites:

- Have PowerShell version 3.0 or later installed
Step 1: Back up your data

We recommend that you create a backup AMI, in case you're not able to roll back your changes through the Device Manager. To create a backup AMI with the AWS Management Console, follow these steps:

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance that requires the driver upgrade, and choose Stop instance from the Instance state menu.
4. After the instance is stopped, select the instance again. To create your backup, choose Image and templates from the Actions menu, then choose Create image.
5. To restart your instance, choose Start instance from the Instance state menu.

Step 2: Install or upgrade your ENA driver

You can install or upgrade your ENA driver with AWS Systems Manager Distributor, or with PowerShell cmdlets. For further instructions, select the tab that matches the method that you want to use.

Systems Manager Distributor

You can use the Systems Manager Distributor feature to deploy packages to your Systems Manager managed nodes. With Systems Manager Distributor, you can install the ENA driver package once, or with scheduled updates. For more information about how to install the ENA driver package (AwsEnaNetworkDriver) with Systems Manager Distributor, see Install or update packages in the AWS Systems Manager User Guide.

PowerShell

This section covers how to download and install ENA driver packages on your instance with PowerShell cmdlets.

Option 1: Download and extract the latest version

1. Connect to your instance and log in as the local administrator.
2. Use the invoke-webrequest cmdlet to download the latest driver package:
$env:USERPROFILE\AwsEnaNetworkDriver.zip

Note

If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

```
```

Alternatively, you can download the latest driver package from a browser window on your instance.

3. Use the `expand-archive` cmdlet to extract the zip archive that you downloaded to your instance:

```
PS C:\> expand-archive $env:userprofile\AwsEnaNetworkDriver.zip -DestinationPath $env:userprofile\AwsEnaNetworkDriver
```

Option 2: Download and extract a specific version

1. Connect to your instance and log in as the local administrator.
2. Download the ENA driver package for the specific version you want from the version link in the ENA Windows driver version history table.
3. Extract the zip archive to your instance.

Install the ENA driver with PowerShell

The install steps are the same whether you've downloaded the latest driver or a specific version. To install the ENA driver, follow these steps.
1. To install the driver, run the `install.ps1` PowerShell script from the `AwsEnaNetworkDriver` directory on your instance. If you get an error, make sure that you’re using PowerShell 3.0 or later.

2. If the installer doesn’t automatically reboot your instance, run the `Restart-Computer` PowerShell cmdlet.

```bash
PS C:\> Restart-Computer
```

### Step 3 (optional): Verify the ENA driver version after installation

To ensure that the ENA driver package was successfully installed on your instance, you can verify the new version as follows:

1. Connect to your instance and log in as the local administrator.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the Run box.
3. Choose OK. This opens the Device Manager window.
4. Select the arrow to the left of Network adapters to expand the list.
5. Choose the name, or open the context menu for the Amazon Elastic Network Adapter, and then choose Properties. This opens the Amazon Elastic Network Adapter Properties dialog.

**Note**

ENA adapters all use the same driver. If you have multiple ENA adapters, you can select any one of them to update the driver for all of the ENA adapters.

6. To verify the current version that’s installed, open the Driver tab and check the Driver Version. If the current version doesn’t match your target version, see [Troubleshoot the Elastic Network Adapter Windows driver](#).

### Roll back an ENA driver installation

If anything goes wrong with the installation, you might need to roll back the driver. Follow these steps to roll back to the previous version of the ENA driver that was installed on your instance.

1. Connect to your instance and log in as the local administrator.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the Run box.
3. Choose OK. This opens the Device Manager window.

4. Select the arrow to the left of **Network adapters** to expand the list.

5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.

   **Note**

   ENA adapters all use the same driver. If you have multiple ENA adapters, you can select any one of them to update the driver for all of the ENA adapters.

6. To roll back the driver, open the **Driver** tab and choose **Roll Back Driver**. This opens the **Driver Package rollback** window.

   **Note**

   If the **Driver** tab doesn't show the **Roll Back Driver** action, or if the action is unavailable, it means that the **Driver Store** on your instance doesn't contain the previously installed driver package. To troubleshoot this issue, see [Troubleshooting scenarios](#), and expand the **Unexpected ENA driver version installed** section. For more information about the device driver package selection process, see [How Windows selects a driver package for a device](#) on the Microsoft documentation website.

### Track ENA Windows driver version releases

Windows AMIs include the ENA Windows driver to enable enhanced networking.

The following table shows the corresponding ENA driver version to download for each Windows Server version.

<table>
<thead>
<tr>
<th>Windows Server version</th>
<th>ENA driver version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows Server 2022</td>
<td>2.4.0 and later</td>
</tr>
<tr>
<td>Windows Server 2019</td>
<td>latest</td>
</tr>
<tr>
<td>Windows Server 2016</td>
<td>latest</td>
</tr>
</tbody>
</table>
ENA Windows driver release notifications with Amazon SNS

Amazon SNS can notify you when new versions of EC2 Windows Drivers are released. Use the following procedure to subscribe to these notifications.

Subscribe to EC2 notifications

2. In the navigation bar, change the Region to US East (N. Virginia), if necessary. You must select this Region because the SNS notifications that you are subscribing to are in this Region.
3. In the navigation pane, choose Subscriptions.
4. Choose Create subscription.
5. In the Create subscription dialog box, do the following:
   a. For TopicARN, copy the following Amazon Resource Name (ARN):
      arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers
   b. For Protocol, choose Email.
   c. For Endpoint, enter an email address that you can use to receive the notifications.
   d. Choose Create subscription.
6. You'll receive a confirmation email. Open the email and follow the directions to complete your subscription.

Whenever new EC2 Windows drivers are released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.

Unsubscribe from Amazon EC2 Windows driver notification

---

<table>
<thead>
<tr>
<th>Windows Server version</th>
<th>ENA driver version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Windows Server 2012 R2</td>
<td>2.6.0 and earlier</td>
</tr>
<tr>
<td>Windows Server 2012</td>
<td>2.6.0 and earlier</td>

3. Select the check box for the subscription and then choose **Actions, Delete subscriptions**.
   When prompted for confirmation, choose **Delete**.

### ENA Windows driver version history

The following table summarizes the changes for each release.

<table>
<thead>
<tr>
<th>Driver version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>2.7.0</strong></td>
<td>New Features</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Removed support for Windows Server 2012 (Windows 8) and Windows Server 2012 R2 (Windows 8.1). These operating system versions have reached the end of support from AWS. Driver install will fail on Windows Server 2012 and earlier.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Added support for offloading IPv6 Tx checksum calculation to the device.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Added wide Low Latency Queuing (LLQ) support. This is dynamically enabled based on device recommendation. You can override this setting with the new &quot;WideLLQ&quot; registry key.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Added reporting for packet drops resulting from Rx overrun, which indicates insufficient space in the Rx ring for incoming packets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Added support for suboptimal configuration notifications from the device. See event ID 59000 in the Windows event viewer.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bug Fixes</td>

<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>2.2.3</td>
<td>New Feature</td>
<td>March 25, 2021</td>
</tr>
<tr>
<td></td>
<td>• Adds support for new Nitro cards with up to 400 Gbps instance networking.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bug Fix</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fixes race condition between system time change and system time query by the ENA driver, which causes false-positive detection of HW unresponsiveness.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Windows ENA driver version 2.2.3 is the final version that supports Windows Server 2008 R2. Currently available instance types that use ENA will continue to be supported on Windows Server 2008 R2, and the drivers are available by download. No future instance types will support Windows Server 2008 R2, and you cannot launch, import, or migrate Windows Server 2008 R2 images to future instance types.</td>
<td></td>
</tr>
<tr>
<td>2.2.2</td>
<td>New Feature</td>
<td>December 21, 2020</td>
</tr>
<tr>
<td></td>
<td>• Adds support to query network adapter performance metrics with CloudWatch and the Performance Counters for Windows consumers.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bug Fix</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Fixes performance issues on bare metal instances.</td>
<td></td>
</tr>
<tr>
<td>Driver version</td>
<td>Details</td>
<td>Release date</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td><strong>2.2.1</strong></td>
<td>New Feature</td>
<td>October 1, 2020</td>
</tr>
<tr>
<td></td>
<td>• Adds a method to allow the host to query the Elastic Network Adapter for network performance metrics.</td>
<td></td>
</tr>
<tr>
<td><strong>2.2.0</strong></td>
<td>New Features</td>
<td>August 12, 2020</td>
</tr>
<tr>
<td></td>
<td>• Adds support for next generation hardware types.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Improves instance start time after resuming from stop-hibernate, and eliminates false positive ENA error messages.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Performance Optimizations</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Optimizes processing of inbound traffic.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Improves shared memory management in low resource environment.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bug Fix</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Avoids system crash upon ENA device removal in rare scenario where driver fails to reset.</td>
<td></td>
</tr>
<tr>
<td><strong>2.1.5</strong></td>
<td>Bug Fix</td>
<td>June 23, 2020</td>
</tr>
<tr>
<td></td>
<td>• Fixes occasional network adapter initialization failure on bare metal instances.</td>
<td></td>
</tr>
<tr>
<td>Driver version</td>
<td>Details</td>
<td>Release date</td>
</tr>
<tr>
<td>--------------</td>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>2.1.4</td>
<td>Bug Fixes</td>
<td>November 25, 2019</td>
</tr>
<tr>
<td></td>
<td>• Prevent connectivity issues caused by corrupted LSO packet metadata arriving from the network stack.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Prevent system crash caused by a rare race condition that results in accessing an already released packet memory.</td>
<td></td>
</tr>
<tr>
<td>2.1.2</td>
<td>New Feature</td>
<td>November 4, 2019</td>
</tr>
<tr>
<td></td>
<td>• Added support for vendor ID report to allow OS to generate MAC-based UUIDs.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Bug Fixes</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Improved DHCP network configuration performance during initialization.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Properly calculate L4 checksum on inbound IPv6 traffic when the maximum transmission unit (MTU) exceeds 4K.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• General improvements to driver stability and minor bug fixes.</td>
<td></td>
</tr>

### Paravirtual drivers for Windows instances

Windows AMIs contain a set of drivers to permit access to virtualized hardware. These drivers are used by Amazon EC2 to map instance store and Amazon EBS volumes to their devices. The following table shows key differences between the different drivers.

<table>
<thead>
<tr>
<th>Driver version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1.2.3</strong></td>
<td>Includes reliability fixes and unifies support for Windows Server 2008 R2 through Windows Server 2016.</td>

<tr>
<td>Windows Server 2019</td>
<td>AWS PV latest version</td>
</tr>
<tr>
<td>Windows Server 2016</td>
<td>AWS PV latest version</td>
</tr>
</tbody>
</table>
AWS PV drivers

The AWS PV drivers are stored in the %ProgramFiles%\Amazon\Xentools directory. This directory also contains public symbols and a command line tool, xenstore_client.exe, that enables you to access entries in XenStore. For example, the following PowerShell command returns the current time from the Hypervisor:

```
PS C:\> [DateTime]::FromFileTimeUTC((gwmi -n root\wmi -cl AWSXenStoreBase).XenTime).ToString("hh:mm:ss")
11:17:00
```

The AWS PV driver components are listed in the Windows registry under HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services. These driver components are as follows: xenbus, xeniface, xennet, xenvbd, and xenvif.

AWS PV drivers also have a Windows service named LiteAgent, which runs in user-mode. It handles tasks such as shutdown and restart events from AWS APIs on Xen generation instances. You can...
access and manage services by running Services.msc from the command line. When running on Nitro generation instances, the AWS PV drivers are not used and the LiteAgent service will self-stop starting with driver version 8.2.4. Updating to the latest AWS PV driver also updates the LiteAgent and improves reliability on all instance generations.

**Install the latest AWS PV drivers**

Amazon Windows AMIs contain a set of drivers to permit access to virtualized hardware. These drivers are used by Amazon EC2 to map instance store and Amazon EBS volumes to their devices. We recommend that you install the latest drivers to improve stability and performance of your EC2 Windows instances.

**Installation options**

- You can use AWS Systems Manager to automatically update the PV drivers. For more information, see [Walkthrough: Automatically Update PV Drivers on EC2 Windows Instances (Console)](https://aws.amazon.com/systemsmanager/) in the *AWS Systems Manager User Guide*.

- You can download the driver package and run the install program manually. Be sure to check the readme.txt file for system requirements. For information about downloading and installing the AWS PV drivers, or upgrading a domain controller, see [Upgrade Windows Server instances (AWS PV upgrade)](https://aws.amazon.com/). manually.

**AWS PV driver package history**

The following table shows the changes to AWS PV drivers for each driver release.

<table>
<thead>
<tr>
<th>Package version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4.3</td>
<td>Fixed bugs in the package installer to improve the upgrade experience.</td>

</tbody>
</table>
| **8.2.5**       | Additional security enhancements.  
PowerShell installer now available in package. | 12 December 2018 |
| **8.2.4**       | Reliability improvements. | 2 October 2018 |
| **8.2.3**       | Bug fixes and performance improvements.  
Report EBS volume ID as disk serial number for EBS volumes.  
This enables cluster scenarios such as S2D. | 29 May 2018 |
| **8.2.1**       | Network and storage performance improvements plus multiple robustness fixes.  
To verify that this version has been installed, refer to the following Windows registry value: HKLM\Software\Amazon\PVDriver\Version 8.2.1. | 8 March 2018 |
| **7.4.6**       | Stability fixes to make AWS PV drivers more resilient. | 26 April 2017 |
| **7.4.3**       | Added support for Windows Server 2016.  
Stability fixes for all supported Windows OS versions.  
*AWS PV driver version 7.4.3's signature expires on March 29, 2019. We recommend updating to the latest AWS PV driver. | 18 Nov 2016 |
<p>| <strong>7.4.2</strong>       | Stability fixes for support of X1 instance type. | 2 Aug 2016 |</p>
<table>
<thead>
<tr>
<th>Package version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 7.4.1           | • Performance improvement in AWS PV Storage driver.  
• Stability fixes in AWS PV Storage driver: Fixed an issue where the instances were hitting a system crash with bug check code 0x0000DEAD.  
• Stability fixes in AWS PV Network driver.  
• Added support for Windows Server 2008R2.                                                                                                             | 12 July 2016      |
| 7.3.2           | • Improved logging and diagnostics.  
• Stability fix in AWS PV Storage driver. In some cases disks may not surface in Windows after reattaching the disk to the instance.  
• Added support for Windows Server 2012.                                                                                                                 | 24 June 2015      |
| 7.3.1           | TRIM update: Fix related to TRIM requests. This fix stabilizes instances and improves instance performance when managing large numbers of TRIM requests.                                                   |                   |
| 7.3.0           | TRIM support: The AWS PV driver now sends TRIM requests to the hypervisor. Ephemeral disks will properly process TRIM requests given the underlying storage supports TRIM (SSD). Note that EBS-based storage does not support TRIM as of March 2015. |                   |
| 7.2.5           | • Stability fix in AWS PV Storage drivers: In some cases the AWS PV driver could dereference invalid memory and cause a system failure.  
• Stability fix while generating a crash dump: In some cases the AWS PV driver could get stuck in a race condition when writing a crash dump. Before this release, the issue could only be resolved by forcing the driver to stop and restart which lost the memory dump. |                   |
<table>
<thead>
<tr>
<th>Package version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.2.4</td>
<td>Device ID persistence: This driver fix masks the platform PCI device ID and forces the system to always surface the same device ID, even if the instance is moved. More generally, the fix affects how the hypervisor surfaces virtual devices. The fix also includes modifications to the co-installer for the AWS PV drivers so the system persists mapped virtual devices.</td>
<td></td>
</tr>
</tbody>
</table>
| 7.2.2           | • Load the AWS PV drivers in Directory Services Restore Mode (DSRM) mode: Directory Services Restore Mode is a safe mode boot option for Windows Server domain controllers.  
• Persist device ID when virtual network adapter device is reattached: This fix forces the system to check the MAC address mapping and persist the device ID. This fix ensures that adapters retain their static settings if the adapters are reattached. | |
| 7.2.1           | • Run in safe mode: Fixed an issue where the driver would not load in safe mode. Previously the AWS PV Drivers would only instantiate in normal running systems.  
• Add disks to Microsoft Windows Storage Pools: Previously we synthesized page 83 queries. The fix disabled page 83 support. Note this does not affect storage pools that are used in a cluster environment because PV disks are not valid cluster disks. | |
| 7.2.0           | Base: The AWS PV base version. | |

**Citrix PV drivers**

The Citrix PV drivers are stored in the `%ProgramFiles%\Citrix\XenTools` (32-bit instances) or `%ProgramFiles(x86)%\Citrix\XenTools` (64-bit instances) directory.
The Citrix PV driver components are listed in the Windows registry under HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\services. These driver components are as follows: xenevtchn, xeniface, xennet, Xennet6, xensvc, xenvbd, and xenvif.

Citrix also has a driver component named XenGuestAgent, which runs as a Windows service. It handles tasks such as shutdown and restart events from the API. You can access and manage services by running Services.msc from the command line.

If you are encountering networking errors while performing certain workloads, you may need to disable the TCP offloading feature for the Citrix PV driver. For more information, see [TCP offloading](#).

**RedHat PV drivers**

RedHat drivers are supported for legacy instances, but are not recommended on newer instances with more than 12GB of RAM due to driver limitations. Instances with more than 12GB of RAM running RedHat drivers can fail to boot and become inaccessible. We recommend upgrading RedHat drivers to Citrix PV drivers, and then upgrade Citrix PV drivers to AWS PV drivers.

The source files for the RedHat drivers are in the %ProgramFiles%\RedHat (32-bit instances) or %ProgramFiles(x86)%\RedHat (64-bit instances) directory. The two drivers are rhelnet, the RedHat Paravirtualized network driver, and rhelscsi, the RedHat SCSI miniport driver.

**Subscribe to notifications**

Amazon SNS can notify you when new versions of EC2 Windows Drivers are released. Use one of the following methods to subscribe to these notifications.

- **Note**
  
  You must specify the Region for the SNS Topic you subscribe to.

**Subscribe to EC2 notifications from the console**

2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to are in this Region.
3. In the navigation pane, choose **Subscriptions**.
4. Choose **Create subscription**.

5. In the **Create subscription** dialog box, do the following:
   
   a. For **TopicARN**, copy the following Amazon Resource Name (ARN):
      
      \[
      \text{arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers}
      \]
      
   b. For **Protocol**, choose Email.
   
   c. For **Endpoint**, type an email address that you can use to receive the notifications.
   
   d. Choose **Create subscription**.

6. You'll receive a confirmation email. Open the email and follow the directions to complete your subscription.

### Subscribe to EC2 notifications using the AWS CLI

To subscribe to EC2 notifications with the AWS CLI, use the following command.

\[
\text{aws sns subscribe --topic-arn \textit{arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers} --region \textit{us-east-1} --protocol email --notification-endpoint YourUserName@YourDomainName.ext}
\]

### Subscribe to EC2 notifications using the AWS Tools for PowerShell

To subscribe to EC2 notifications with Tools for Windows PowerShell, use the following command.

\[
\text{Connect-SNSNotification -TopicArn \textit{arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers} -Region \textit{us-east-1} -Protocol email -Endpoint \textit{YourUserName@YourDomainName.ext}}
\]

Whenever new EC2 Windows drivers are released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.

### Unsubscribe from Amazon EC2 Windows driver notification

2. In the navigation pane, choose **Subscriptions**.

3. Select the check box for the subscription and then choose **Actions, Delete subscriptions**. When prompted for confirmation, choose **Delete**.
Upgrade PV drivers on EC2 Windows instances

We recommend that you install the latest PV drivers to improve the stability and performance of your EC2 Windows instances. The directions on this page help you download the driver package and run the install program.

To verify which driver your Windows instance uses

Open Network Connections in Control Panel and view Local Area Connection. Check whether the driver is one of the following:

- AWS PV Network Device
- Citrix PV Ethernet Adapter
- RedHat PV NIC Driver

Alternatively, you can check the output from the pnputil -e command.

System requirements

Be sure to check the readme.txt file in the download for system requirements.

Contents

- Upgrade Windows Server instances (AWS PV upgrade) with Distributor
- Upgrade Windows Server instances (AWS PV upgrade) manually
- Upgrade a domain controller (AWS PV upgrade)
- Upgrade Windows Server 2008 and 2008 R2 instances (Redhat to Citrix PV upgrade)
- Upgrade your Citrix Xen guest agent service

Upgrade Windows Server instances (AWS PV upgrade) with Distributor

You can use Distributor, a capability of AWS Systems Manager, to install or upgrade the AWS PV driver package. The installation or upgrade can be performed one time, or you can install or update it on a schedule. The In-place update option for Installation Type isn't supported for this Distributor package.
Important

If your instance is a domain controller, see Upgrade a domain controller (AWS PV upgrade). The upgrade process for domain controller instances is different than standard editions of Windows.

1. We recommend that you create a backup in case you need to roll back your changes.

   Tip

   Instead of creating the AMI from the Amazon EC2 console, you can use Systems Manager Automation to create the AMI using the AWS-CreateImage runbook. For more information, see AWS-CreateImage in the AWS Systems Manager Automation runbook reference User Guide.

   a. When you stop an instance, the data on any instance store volumes is erased. Before you stop an instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

   b. In the navigation pane, choose Instances.

   c. Select the instance that requires the driver upgrade, and choose Instance state, Stop instance.

   d. After the instance is stopped, select the instance, choose Actions, then Image and templates, and then choose Create image.

   e. Choose Instance state, Start instance.

2. Connect to the instance using Remote Desktop. For more information, see the section called “Connect to your Windows instance using an RDP client”.

3. We recommend that you take all non-system disks offline and note any drive letter mappings to the secondary disks in Disk Management before you perform this upgrade. This step is not required if you are performing an in-place update of AWS PV drivers. We also recommend setting non-essential services to Manual start-up in the Services console.

4. For the instructions for how to install or upgrade the AWS PV driver package using Distributor, see the procedures in Install or update packages in the AWS Systems Manager User Guide.

5. For Name, choose AWSPVDriver.
6. For **Installation type**, select **Uninstall and reinstall**.

7. Configure the other parameters for the package as necessary and run installation or upgrade using the referenced procedure in **Step 4**.

   After running the Distributor package, the instance automatically reboots and then upgrades the driver. The instance will not be available for up to 15 minutes.

8. After the upgrade is complete, and the instance passes both health checks in the Amazon EC2 console, verify that the new driver was installed by connecting to the instance using Remote Desktop.

9. Once you have connected, run the following PowerShell command:

   ```powershell
   Get-ItemProperty HKLM:SOFTWARE\Amazon\PVDriver
   ```

10. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see [AWS PV driver package history](#) Open Disk Management to review any offline secondary volumes and bring them online corresponding to the drive letters noted in **Step 3**.

    If you previously disabled **TCP offloading** using Netsh for Citrix PV drivers we recommend that you re-enable this feature after upgrading to AWS PV drivers. TCP Offloading issues with Citrix drivers are not present in the AWS PV drivers. As a result, TCP Offloading provides better performance with AWS PV drivers.

    If you previously applied a static IP address or DNS configuration to the network interface, you might need to reapply the static IP address or DNS configuration after upgrading AWS PV drivers.

**Upgrade Windows Server instances (AWS PV upgrade) manually**

Use the following procedure to perform an in-place upgrade of AWS PV drivers, or to upgrade from Citrix PV drivers to AWS PV drivers on Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2, Windows Server 2016, Windows Server 2019, or Windows Server 2022. This upgrade is not available for RedHat drivers, or for other versions of Windows Server.

Some older versions of Windows Server can't use the latest drivers. To verify which driver version to use for your operating system, see the driver version table in the [Paravirtual drivers for Windows instances](#) page.
Important
If your instance is a domain controller, see Upgrade a domain controller (AWS PV upgrade).
The upgrade process for domain controller instances is different than standard editions of Windows.

To upgrade AWS PV drivers manually

1. We recommend that you create a backup in case you need to roll back your changes.

Tip
Instead of creating the AMI from the Amazon EC2 console, you can use Systems Manager Automation to create the AMI using the AWS-CreateImage runbook. For more information, see AWS-CreateImage in the AWS Systems Manager Automation runbook reference User Guide.

2. When you stop an instance, the data on any instance store volumes is erased. Before you stop an instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

3. In the navigation pane, choose Instances.

4. Select the instance that requires the driver upgrade, and choose Instance state, Stop instance.

5. After the instance is stopped, select the instance, choose Actions, then Image and templates, and then choose Create image.

6. Choose Instance state, Start instance.

2. Connect to the instance using Remote Desktop.

3. We recommend that you take all non-system disks offline and note any drive letter mappings to the secondary disks in Disk Management before you perform this upgrade. This step is not required if you are performing an in-place update of AWS PV drivers. We also recommend setting non-essential services to Manual start-up in the Services console.

4. Download the latest driver package to the instance.

Or, run the following PowerShell command:
Invoke-WebRequest https://s3.amazonaws.com/ec2-windows-drivers-downloads/AWSPV/Latest/AWSPVDriver.zip -outfile $env:USERPROFILE\pv_driver.zip
Expand-Archive $env:userprofile\pv_driver.zip -DestinationPath $env:userprofile\pv_drivers

5. Extract the contents of the folder and then run AWSPVDriverSetup.msi.

After running the MSI, the instance automatically reboots and then upgrades the driver. The instance will not be available for up to 15 minutes. After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, you can verify that the new driver was installed by connecting to the instance using Remote Desktop and then running the following PowerShell command:

Get-ItemProperty HKLM:\SOFTWARE\Amazon\PVDriver

Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history Open Disk Management to review any offline secondary volumes and bring them online corresponding to the drive letters noted in Step 3.

If you previously disabled TCP offloading using Netsh for Citrix PV drivers we recommend that you re-enable this feature after upgrading to AWS PV drivers. TCP Offloading issues with Citrix drivers are not present in the AWS PV drivers. As a result, TCP Offloading provides better performance with AWS PV drivers.

If you previously applied a static IP address or DNS configuration to the network interface, you might need to reapply the static IP address or DNS configuration after upgrading AWS PV drivers.
Upgrade a domain controller (AWS PV upgrade)

Use the following procedure on a domain controller to perform either an in-place upgrade of AWS PV drivers, or to upgrade from Citrix PV drivers to AWS PV drivers.

To upgrade a domain controller

1. We recommend that you create a backup of your domain controller in case you need to roll back your changes. Using an AMI as a backup is not supported. For more information, see Backup and Restore Considerations for Virtualized Domain Controllers in the Microsoft documentation.

2. Run the following command to configure Windows to boot into Directory Services Restore Mode (DSRM).

```
bcdedit /set {default} safeboot dsrepair
```

**Warning**

Before running this command, confirm that you know the DSRM password. You'll need this information so that you can log in to your instance after the upgrade is complete and the instance automatically reboots.

The system must boot into DSRM because the upgrade utility removes Citrix PV storage drivers so it can install AWS PV drivers. Therefore we recommend noting any drive letter and folder mappings to the secondary disks in Disk Management. When Citrix PV storage drivers are not present, secondary drives are not detected. Domain controllers that use an NTDS folder on secondary drives will not boot because the secondary disk is not detected.

**Warning**

After you run this command do not manually reboot the system. The system will be unreachable because Citrix PV drivers do not support DSRM.
3. Run the following command to add **DisableDCCheck** to the registry:

   ```cmd
   reg add HKLM\SOFTWARE\Wow6432Node\Amazon\AWSPVDriverSetup /v DisableDCCheck /t REG_SZ /d true
   ```

4. **Download** the latest driver package to the instance.

5. Extract the contents of the folder and then run **AWSPVDriverSetup.msi**.

   After running the MSI, the instance automatically reboots and then upgrades the driver. The instance will not be available for up to 15 minutes.

6. After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop. Open Disk Management to review any offline secondary volumes and bring them online corresponding to the drive letters and folder mappings noted earlier.

   You must connect to the instance by specifying the user name in the following format `hostname\administrator`. For example, Win2k12TestBox\administrator.

7. Run the following command to remove the DSRM boot configuration:

   ```cmd
   bcdedit /deletevalue safeboot
   ```

8. Reboot the instance.

9. To complete the upgrade process, verify that the new driver was installed. In Device Manager, under **Storage Controllers**, locate **AWS PV Storage Host Adapter**. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see [AWS PV driver package history](#).

10. Run the following command to delete **DisableDCCheck** from the registry:

    ```cmd
    reg delete HKLM\SOFTWARE\Wow6432Node\Amazon\AWSPVDriverSetup /v DisableDCCheck
    ```

**Note**

If you previously disabled **TCP offloading** using Netsh for Citrix PV drivers we recommend that you re-enable this feature after upgrading to AWS PV Drivers. TCP Offloading issues with Citrix drivers are not present in the AWS PV drivers. As a result, TCP Offloading provides better performance with AWS PV drivers.
Upgrade Windows Server 2008 and 2008 R2 instances (Redhat to Citrix PV upgrade)

Before you start upgrading your RedHat drivers to Citrix PV drivers, make sure you do the following:

- Install the latest version of the EC2Config service. For more information, see [Install the latest version of EC2Config](#).
- Verify that you have Windows PowerShell 3.0 installed. To verify the version that you have installed, run the following command in a PowerShell window:

  ```powershell
  PS C:\> $PSVersionTable.PSVersion
  ```

  Windows PowerShell 3.0 is bundled in the Windows Management Framework (WMF) version 3.0 install package. If you need to install Windows PowerShell 3.0, see [Windows Management Framework 3.0](#) in the Microsoft Download Center.
- Back up your important information on the instance, or create an AMI from the instance. For more information about creating an AMI, see [Create an Amazon EBS-backed AMI](#).

  **Tip**

  Instead of creating the AMI from the Amazon EC2 console, you can use Systems Manager Automation to create the AMI using the AWS-CreateImage runbook. For more information, see [AWS-CreatelImage](#) in the AWS Systems Manager Automation runbook reference User Guide.

If you create an AMI, make sure that you do the following:

- Write down your password.
- Do not run the Sysprep tool manually or using the EC2Config service.
- Set your Ethernet adapter to obtain an IP address automatically using DHCP. For more information, see [Configure TCP/IP Settings](#) in the Microsoft TechNet Library.

To upgrade RedHat drivers

1. Connect to your instance and log in as the local administrator. For more information about connecting to your instance, see [Connect to your Windows instance](#).
2. In your instance, download the Citrix PV upgrade package.

3. Extract the contents of the upgrade package to a location of your choice.

4. Double-click the Upgrade.bat file. If you get a security warning, choose Run.

5. In the Upgrade Drivers dialog box, review the information and choose Yes if you are ready to start the upgrade.

6. In the Red Hat Paravirtualized Xen Drivers for Windows uninstaller dialog box, choose Yes to remove the RedHat software. Your instance will be rebooted.

   **Note**
   If you do not see the uninstaller dialog box, choose Red Hat Paravirtualize in the Windows taskbar.

7. Check that the instance has rebooted and is ready to be used.

   a. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.

   b. On the Instances page, select Actions, then Monitor and troubleshoot, and then choose Get system log.

   c. The upgrade operations should have restarted the server 3 or 4 times. You can see this in the log file by the number of times Windows is Ready to use is displayed.
8. Connect to your instance and log in as the local administrator.

10. Confirm that the installation is complete. Navigate to the Citrix-WIN_PV folder that you extracted earlier, open the PVUpgrade.log file, and then check for the text INSTALLATION IS COMPLETE.
Upgrade your Citrix Xen guest agent service

If you are using Citrix PV drivers on Windows Server, you can upgrade the Citrix Xen guest agent service. This Windows service handles tasks such as shutdown and restart events from the API. You can run this upgrade package on any version of Windows Server, as long as the instance is running Citrix PV drivers.

⚠️ **Important**

For Windows Server 2008 R2 and later, we recommend you upgrade to AWS PV drivers that include the Guest Agent update.

Before you start upgrading your drivers, make sure you back up your important information on the instance, or create an AMI from the instance. For more information about creating an AMI, see Create an Amazon EBS-backed AMI.

⚠️ **Tip**

Instead of creating the AMI from the Amazon EC2 console, you can use Systems Manager Automation to create the AMI using the AWS-CreateImage runbook. For more information, see AWS-CreateImage in the AWS Systems Manager Automation runbook reference User Guide.

If you create an AMI, make sure you do the following:

- Do not enable the Sysprep tool in the EC2Config service.
- Write down your password.
- Set your Ethernet adapter to DHCP.

**To upgrade your Citrix Xen guest agent service**

1. Connect to your instance and log in as the local administrator. For more information about connecting to your instance, see Connect to your Windows instance.
2. On your instance, download the Citrix upgrade package.
3. Extract the contents of the upgrade package to a location of your choice.
4. Double-click the **Upgrade.bat** file. If you get a security warning, choose **Run**.

5. In the **Upgrade Drivers** dialog box, review the information and choose **Yes** if you are ready to start the upgrade.

6. When the upgrade is complete, the **PVUpgrade.log** file will open and contain the text `UPGRADE IS COMPLETE`.

7. Reboot your instance.

### Troubleshoot PV drivers on Windows instances

The following are solutions to issues that you might encounter with older Amazon EC2 images and PV drivers.

#### Contents

- **Windows Server 2012 R2 loses network and storage connectivity after an instance reboot**
- **TCP offloading**
- **Time synchronization**
- **Workloads that leverage more than 20,000 disk IOPS experience degradation due to CPU bottlenecks**

#### Windows Server 2012 R2 loses network and storage connectivity after an instance reboot

**Important**

This issue occurs only with AMIs made available before September 2014.

Windows Server 2012 R2 Amazon Machine Images (AMIs) made available before September 10, 2014 can lose network and storage connectivity after an instance reboot. The error in the AWS Management Console system log states: “Difficulty detecting PV driver details for Console Output.”

The connectivity loss is caused by the Plug and Play Cleanup feature. This feature scans for and disables inactive system devices every 30 days. The feature incorrectly identifies the EC2 network device as inactive and removes it from the system. When this happens, the instance loses network connectivity after a reboot.

For systems that you suspect could be affected by this issue, you can download and run an in-place driver upgrade. If you are unable to perform the in-place driver upgrade, you can run a helper
script. The script determines if your instance is affected. If it is affected, and the Amazon EC2 network device has not been removed, the script disables the Plug and Play Cleanup scan. If the network device was removed, the script repairs the device, disables the Plug and Play Cleanup scan, and enables your instance to reboot with network connectivity enabled.

Contents

• Choose how to fix problems
• Method 1 - Enhanced networking
• Method 2 - Registry configuration
• Run the remediation script

Choose how to fix problems

There are two methods for restoring network and storage connectivity to an instance affected by this issue. Choose one of the following methods:

<table>
<thead>
<tr>
<th>Method</th>
<th>Prerequisites</th>
<th>Procedure Overview</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method 1 - Enhanced networking</td>
<td>Enhanced networking is only available in a virtual private cloud (VPC) which requires a C3 instance type. If the server does not currently use the C3 instance type, then you must temporarily change it.</td>
<td>You change the server instance type to a C3 instance. Enhanced networking then enables you to connect to the affected instance and fix the problem. After you fix the problem, you change the instance back to the original instance type. This method is typically faster than Method 2 and less likely to result in user error. You will incur additional charges as long as the C3 instance is running.</td>
</tr>
<tr>
<td>Method 2 - Registry configuration</td>
<td>Ability to create or access a second server. Ability to change Registry settings.</td>
<td>You detach the root volume from the affected instance, attach it to a different instance, connect, and make Windows PV drivers</td>
</tr>
<tr>
<td>Method 1 - Enhanced networking</td>
<td></td>
<td></td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------</td>
<td></td>
</tr>
<tr>
<td>1. Open the Amazon EC2 console at <a href="https://console.aws.amazon.com/ec2/">https://console.aws.amazon.com/ec2/</a>.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2. In the navigation pane, choose <strong>Instances</strong>.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. Locate the affected instance. Select the instance and choose <strong>Instance state</strong>, and then choose <strong>Stop instance</strong>.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Warning</strong></td>
<td>When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.</td>
</tr>
</tbody>
</table>

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>4. After the instance is stopped, create a backup. Select the instance and choose <strong>Actions</strong>, then <strong>Image and templates</strong>, and then choose <strong>Create image</strong>.</td>
<td></td>
</tr>
<tr>
<td>5. <strong>Change</strong> the instance type to any C3 instance type.</td>
<td></td>
</tr>
<tr>
<td>6. <strong>Start</strong> the instance.</td>
<td></td>
</tr>
<tr>
<td>7. Connect to the instance using Remote Desktop and then <strong>download</strong> the AWS PV Drivers Upgrade package to the instance.</td>
<td></td>
</tr>
<tr>
<td>8. Extract the contents of the folder and run AWSPVDriverSetup.msi.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>After running the MSI, the instance automatically reboots and then upgrades the drivers. The instance will not be available for up to 15 minutes.</td>
</tr>
<tr>
<td>9. After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop and verify that the new drivers</td>
<td></td>
</tr>
</tbody>
</table>

- Method
- Prerequisites
- Procedure Overview
- changes in the Registry. You will incur additional charges as long as the additional server is running. This method is slower than Method 1, but this method has worked in situations where Method 1 failed to resolve the problem.
were installed. In Device Manager, under **Storage Controllers**, locate **AWS PV Storage Host Adapter**. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see [AWS PV driver package history](#).

10. Stop the instance and change the instance back to its original instance type.

11. Start the instance and resume normal use.

### Method 2 - Registry configuration

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the navigation pane, choose **Instances**.

3. Locate the affected instance. Select the instance, choose **Instance state**, and then choose **Stop instance**.

   **Warning**
   
   When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

   **Important**
   
   If you do not create the instance in the same Availability Zone as the affected instance you will not be able to attach the root volume of the affected instance to the new instance.

5. In the navigation pane, choose **Volumes**.

6. Locate the root volume of the affected instance. Detach the volume and then attach the volume to the temporary instance that you created earlier. Attach it with the default device name (xvdf).

7. Use Remote Desktop to connect to the temporary instance, and then use the Disk Management utility to make the volume available for use.

8. On the temporary instance, open the **Run** dialog box, type `regedit`, and press Enter.
9. In the Registry Editor navigation pane, choose **HKEY_Local_Machine**, and then from the **File** menu choose **Load Hive**.

10. In the **Load Hive** dialog box, navigate to `Affected Volume\Windows\System32\config\System` and type a temporary name in the **Key Name** dialog box. For example, enter OldSys.

11. In the navigation pane of the Registry Editor, locate the following keys:

   \[HKEY_LOCAL_MACHINE\your_temporary_key_name\ControlSet001\Control\Class \4d36e97d-e325-11ce-bfc1-08002be10318\]

   \[HKEY_LOCAL_MACHINE\your_temporary_key_name\ControlSet001\Control\Class \4d36e96a-e325-11ce-bfc1-08002be10318\]

12. For each key, double-click **UpperFilters**, enter a value of XENFILT, and then choose **OK**.

13. Locate the following key:

   \[HKEY_LOCAL_MACHINE\your_temporary_key_name\ControlSet001\Services\XENBUS \Parameters\]

14. Create a new string (REG_SZ) with the name **ActiveDevice** and the following value:

   `PCI\VEN_5853&DEV_0001&SUBSYS_00015853&REV_01`

15. Locate the following key:
16. Change the Count from 0 to 1.

17. Locate and delete the following keys:

   HKEY_LOCAL_MACHINE\your_temporary_key_name\ControlSet001\Services\XENBUS

   HKEY_LOCAL_MACHINE\your_temporary_key_name\ControlSet001\Services\xenvbd\StartOverride

   HKEY_LOCAL_MACHINE\your_temporary_key_name\ControlSet001\Services\xenfilt\StartOverride

18. In the Registry Editor navigation pane, choose the temporary key that you created when you first opened the Registry Editor.

19. From the File menu, choose Unload Hive.

20. In the Disk Management Utility, choose the drive you attached earlier, open the context (right-click) menu, and choose Offline.

21. In the Amazon EC2 console, detach the affected volume from the temporary instance and reattach it to your Windows Server 2012 R2 instance with the device name /dev/sda1. You must specify this device name to designate the volume as a root volume.

22. Start the instance.

23. Connect to the instance using Remote Desktop and then download the AWS PV Drivers Upgrade package to the instance.

24. Extract the contents of the folder and run AWSPVDriverSetup.msi.

   After running the MSI, the instance automatically reboots and then upgrades the drivers. The instance will not be available for up to 15 minutes.

25. After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop and verify that the new drivers were installed. In Device Manager, under Storage Controllers, locate AWS PV Storage Host Adapter. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history.

26. Delete or stop the temporary instance you created in this procedure.

Run the remediation script

If you are unable to perform an in-place driver upgrade or migrate to a newer instance you can run the remediation script to fix the problems caused by the Plug and Play Cleanup task.
To run the remediation script

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instance for which you want to run the remediation script. Choose **Instance state**, and then choose **Stop instance**.

   **Warning**
   
   When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

4. After the instance is stopped, create a backup. Select the instance, choose **Actions**, then **Image and templates**, and then choose **Create image**.
5. Choose **Instance state**, and then choose **Start instance**.
6. Connect to the instance by using Remote Desktop and then [download](#) the RemediateDriverIssue.zip folder to the instance.
7. Extract the contents of the folder.
8. Run the remediation script according to the instructions in the Readme.txt file. The file is located in the folder where you extracted RemediateDriverIssue.zip.

TCP offloading

**Important**

This issue does not apply to instances running AWS PV or Intel network drivers.

By default, TCP offloading is enabled for the Citrix PV drivers in Windows AMIs. If you encounter transport-level errors or packet transmission errors (as visible on the Windows Performance Monitor)—for example, when you're running certain SQL workloads—you may need to disable this feature.

**Warning**

Disabling TCP offloading may reduce the network performance of your instance.
To disable TCP offloading for Windows Server 2012 and 2008

1. Connect to your instance and log in as the local administrator.

2. If you're using Windows Server 2012, press Ctrl+Esc to access the Start screen, and then choose Control Panel. If you're using Windows Server 2008, choose Start and select Control Panel.

3. Choose Network and Internet, then Network and Sharing Center.

5. Right-click Citrix PV Ethernet Adapter #0 and select Properties.

6. In the Local Area Connection Properties dialog box, choose Configure to open the Citrix PV Ethernet Adapter #0 Properties dialog box.

7. On the Advanced tab, disable each of the properties, except for Correct TCP/UDP Checksum Value. To disable a property, select it from Property and choose Disabled from Value.

8. Choose OK.

9. Run the following commands from a Command Prompt window.

   ```
   netsh int ip set global taskoffload=disabled
   netsh int tcp set global chimney=disabled
   netsh int tcp set global rss=disabled
   netsh int tcp set global netdma=disabled
   ```

10. Reboot the instance.

**Time synchronization**

Prior to the release of the 2013.02.13 Windows AMI, the Citrix Xen guest agent could set the system time incorrectly. This can cause your DHCP lease to expire. If you have issues connecting to your instance, you might need to update the agent.
To determine whether you have the updated Citrix Xen guest agent, check whether the C:\Program Files\Citrix\XenGuestAgent.exe file is from March 2013. If the date on this file is earlier than that, update the Citrix Xen guest agent service. For more information, see Upgrade your Citrix Xen guest agent service.

**Workloads that leverage more than 20,000 disk IOPS experience degradation due to CPU bottlenecks**

You can be affected by this issue if you are using Windows instances running AWS PV drivers that leverage more than 20,000 IOPS, and you experience bug check code 0x9E: USER_MODE_HEALTH_MONITOR.

Disk reads and writes (IOs) in the AWS PV drivers occur in two phases: **IO preparation** and **IO completion**. By default, the preparation phase runs on a single arbitrary core. The completion phase runs on core 0. The amount of computation required to process an IO varies based on its size and other properties. Some IOs use more computation in the preparation phase, and others in the completion phase. When an instance drives more than 20,000 IOPS, the preparation or completion phase may result in a bottleneck, where the CPU upon which it runs is at 100% capacity. Whether or not the preparation or completion phase becomes a bottleneck depends on the properties of the IOs used by the application.

Starting with AWS PV drivers 8.4.0, the load of the preparation phase and the completion phase can be distributed across multiple cores, eliminating bottlenecks. Each application uses different IO properties. Therefore, applying one of the following configurations may raise, lower, or not impact the performance of your application. After you apply any of these configurations, monitor the application to verify that it is meeting your desired performance.

1. **Prerequisites**

   Before you begin this troubleshooting procedure, verify the following prerequisites:

   - Your instance uses AWS PV drivers version 8.4.0 or later. To upgrade, see Upgrade PV drivers on EC2 Windows instances.
   - You have RDP access to the instance. For steps to connect to your Windows instance using RDP, see Connect to your Windows instance using an RDP client.
   - You have administrator access on the instance.
2. **Observe CPU load on your instance**

You can use Windows Task Manager to view the load on each CPU to determine potential bottlenecks to disk IO.

1. Verify that your application is running and handling traffic similar to your production workload.

2. Connect to your instance using RDP.

3. Choose the **Start** menu on your instance.

4. Enter **Task Manager** in the **Start** menu to open Task Manager.

5. If Task Manager displays the Summary View, choose **More details** to expand the detailed view.

6. Choose the **Performance** tab.

7. Select **CPU** in the left pane.

8. Right-click on the graph in the main pane and select **Change graph to Logical processors** to display each individual core.

9. Depending on how many cores are on your instance, you may see lines displaying CPU load over time, or you may just see a number.
   - If you see graphs displaying load over time, look for CPUs where the box is almost entirely shaded.
   - If you see a number on each core, look for cores that consistently show 95% or greater.

10. Note whether core 0 or a different core is experiencing a heavy load.

3. **Choose which configuration to apply**

<table>
<thead>
<tr>
<th>Configuration name</th>
<th>When to apply this configuration</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default configuration</td>
<td>Workload is driving less than 20,000 IOPS, or other configurations did not improve performance or stability.</td>
<td>For this configuration, IO occurs on a few cores, which may benefit smaller workloads by increasing cache locality and reducing context switching.</td>
</tr>
</tbody>
</table>
### Configuration name

<table>
<thead>
<tr>
<th>Allow driver to choose whether to distribute completion</th>
<th>When to apply this configuration</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Workload is driving more than 20,000 IOPS and moderate or high load is observed on core 0.</td>
<td>This configuration is recommended for all Xen instances using PV 8.4.0 or later and leveraging more than 20,000 IOPS, whether or not problems are encountered.</td>
</tr>
</tbody>
</table>

| Distribute both preparation and completion | Workload is driving more than 20,000 IOPS, and either allowing the driver to choose the distribution did not improve performance, or a core other than 0 is experiencing a high load. | This configuration enables distribution of both IO preparation and IO completion. |

### Registry key values

- **NotifierDistributed**

  Value 0 or not present — The completion phase will run on core 0.

  Value 1 — The driver chooses to run the completion phase or core 0 or one additional core per attached disk.

  Value 2 — The driver runs the completion phase on one additional core per attached disk.

### Note

We recommend that you do not distribute IO preparation without also distributing IO completion (setting DpcRedirection without setting NotifierDistributed) because the completion phase is sensitive to overload by the preparation phase when the preparation phase is running in parallel.
- **DpcRedirection**

  Value 0 or not present — The preparation phase will run on a single, arbitrary core.

  Value 1 — The preparation phase is distributed across multiple cores.

**Default configuration**

Apply the default configuration with AWS PV driver versions prior to 8.4.0, or if performance or stability degradation is observed after applying one of the other configurations in this section.

1. Connect to your instance using RDP.
2. Open a new PowerShell command prompt as an administrator.
3. Run the following commands to remove the NotifierDistributed and DpcRedirection registry keys.

   ```powershell
   Remove-ItemProperty -Path HKLM:\System\CurrentControlSet\Services\xenvbd \Parameters -Name NotifierDistributed
   Remove-ItemProperty -Path HKLM:\System\CurrentControlSet\Services\xenvbd \Parameters -Name DpcRedirection
   ```
4. Reboot your instance.

**Allow driver to choose whether to distribute completion**

Set NotifierDistributed registry key to allow the PV storage driver to choose whether or not to distribute IO completion.

1. Connect to your instance using RDP.
2. Open a new PowerShell command prompt as an administrator.
3. Run the following command to set the NotifierDistributed registry key.
Set-ItemProperty -Type DWORD -Path HKLM:\System\CurrentControlSet\Services\xenvbd\Parameters -Value 0x00000001 -Name NotifierDistributed

4. Reboot your instance.

**Distribute both preparation and completion**

Set NotifierDistributed and DpcRedirection registry keys to always distribute both the preparation and completion phases.

1. Connect to your instance using RDP.
2. Open a new PowerShell command prompt as an administrator.
3. Run the following commands to set the NotifierDistributed and DpcRedirection registry keys.

```
Set-ItemProperty -Type DWORD -Path HKLM:\System\CurrentControlSet\Services\xenvbd\Parameters -Value 0x00000002 -Name NotifierDistributed
```

```
Set-ItemProperty -Type DWORD -Path HKLM:\System\CurrentControlSet\Services\xenvbd\Parameters -Value 0x00000001 -Name DpcRedirection
```

4. Reboot your instance.

**AMD drivers for your EC2 instance**

An instance with an attached AMD GPU, such as a G4ad instance, must have the appropriate AMD driver installed. Depending on your requirements, you can either use an AMI with the driver preinstalled or download a driver from Amazon S3.

To install NVIDIA drivers on an instance with an attached NVIDIA GPU, such as a G4dn instance, see [NVIDIA drivers](#) instead.

**Contents**

- [AMD Radeon Pro Software for Enterprise Driver](#)
- [AMIs with the AMD driver installed](#)
AMD Radeon Pro Software for Enterprise Driver

The AMD Radeon Pro Software for Enterprise Driver is built to deliver support for professional-grade graphics use cases. Using the driver, you can configure your instances with two 4K displays per GPU.

Supported APIs

- OpenGL, OpenCL
- Vulkan
- AMD Advanced Media Framework
- Video Acceleration API
- DirectX 9 and later
- Microsoft Hardware Media Foundation Transform

AMIs with the AMD driver installed

AWS offers different Amazon Machine Images (AMIs) that come with the AMD drivers installed. Open Marketplace offerings with the AMD driver.

AMD driver download

If you aren't using an AMI with the AMD driver installed, you can download the AMD driver and install it on your instance. Only the following operating system versions support AMD drivers:

- Amazon Linux 2 with kernel version 4.14
- Windows Server 2016
- Windows Server 2019

Note

AMD driver version `amdgpu-pro-20.20-1184451` and newer driver releases require kernel version 5.15 or higher.
These downloads are available to AWS customers only. By downloading, you agree to use the downloaded software only to develop AMIs for use with the AMD Radeon Pro V520 hardware. Upon installation of the software, you are bound by the terms of the AMD Software End User License Agreement.

Install the AMD driver on your Linux instance

1. Connect to your Linux instance.

2. Install the AWS CLI on your Linux instance and configure default credentials. For more information, see Installing the AWS CLI in the AWS Command Line Interface User Guide.

   **Important**

   Your user or role must have the permissions granted that contains the AmazonS3ReadOnlyAccess policy. For more information, see AWS managed policy: AmazonS3ReadOnlyAccess in the Amazon Simple Storage Service User Guide.

3. Install `gcc` and `make`, if they are not already installed.

   ```
   $ sudo yum install gcc make
   ```

4. Update your package cache and get the package updates for your instance.

   - For Amazon Linux 2:

     ```
     $ sudo amazon-linux-extras install epel -y
     $ sudo yum update -y
     ```

   - For Ubuntu 22.04:

     ```
     $ wget https://repo.radeon.com/.preview/a0e4ef1dffb95b4abb54e891f265e61/amdgpu-install/5.5.02.05.2/ubuntu/jammy/amdgpu-install_5.5.02.05.50502-1_all.deb
     $ sudo apt install ./amdgpu-install_5.5.02.05.50502-1_all.deb
     $ sudo sed -i 's#repo.radeon.com#&/.preview/a0e4ef1dffb95b4abb54e891f265e61#' /etc/apt/sources.list.d/{amdgpu.list,rocm.list,amdgpu-proprietary.list}
     ```

   - For other Ubuntu versions:

     ```
     $ sudo dpkg --add-architecture i386
     $ sudo apt-get update -y && sudo apt upgrade -y
     ```
• For CentOS:

```bash
$ sudo yum install epel-release -y
$ sudo yum update -y
```

5. Reboot the instance.

```bash
$ sudo reboot
```

6. Reconnect to the instance after it reboots.

7. Download the latest AMD driver.

```bash
aws s3 cp --recursive s3://ec2-amd-linux-drivers/latest/ .
```

8. Extract the file.

   • For Amazon Linux 2 and CentOS:

   ```bash
   tar -xf amdgpu-pro-*rhel*.tar.xz
   ```

   • For Ubuntu:

   ```bash
   tar -xf amdgpu-pro*ubuntu*.xz
   ```

   **Note**
   
   Skip this step for Ubuntu 22.04.

9. Change to the folder for the extracted driver.

10. Add the missing modules for the driver installation.

   • For Amazon Linux 2 and CentOS:
Skip this step.

- For Ubuntu:

  
  
  **Note**
  
  Skip this step for Ubuntu 22.04.

  
  
  $ sudo apt install linux-modules-extra-$(uname -r) -y

11. Run the self install script to install the full graphics stack.

- For Ubuntu 22.04:

  $ sudo amdgpu-install --usecase=workstation --vulkan=pro --opencl=rocr,legacy -y

- For Amazon Linux 2 and CentOS and other Ubuntu versions:

  $ ./amdgpu-pro-install -y --opencl=pal,legacy

12. Reboot the instance.

  $ sudo reboot

13. Confirm that the driver is functional.

  $ dmesg | grep amdgpu

  The response should look like the following:

  
  Initialized amdgpu

**Install the AMD driver on your Windows instance**

1. Connect to your Windows instance and open a PowerShell window.

⚠️ Important
Your user or role must have the permissions granted that contains the AmazonS3ReadOnlyAccess policy. For more information, see AWS managed policy: AmazonS3ReadOnlyAccess in the Amazon Simple Storage Service User Guide.

3. Download the drivers from Amazon S3 to your desktop using the following PowerShell commands.

```
$Bucket = "ec2-amd-windows-drivers"
$KeyPrefix = "latest" # use "archives" for Windows Server 2016
$LocalPath = "$home\Desktop\AMD"
$Objects = Get-S3Object -BucketName $Bucket -KeyPrefix $KeyPrefix -Region us-east-1
foreach ($Object in $Objects) {
    $LocalFileName = $Object.Key
    if ($LocalFileName -ne '' -and $Object.Size -ne 0) {
        $LocalFilePath = Join-Path $LocalPath $LocalFileName
        Copy-S3Object -BucketName $Bucket -Key $Object.Key -LocalFile $LocalFilePath -Region us-east-1
    }
}
```

4. Unzip the downloaded driver file and run the installer using the following PowerShell commands.

```
Expand-Archive $LocalFilePath -DestinationPath "$home\Desktop\AMD\$KeyPrefix" -Verbose
```

Now, check the content of the new directory. The directory name can be retrieved using the Get-ChildItem PowerShell command.

```
Get-ChildItem "$home\Desktop\AMD\$KeyPrefix"
```

The output should be similar to the following:

```
Directory: C:\Users\Administrator\Desktop\AMD\latest
```

AMD drivers
Install the drivers:

```
pnputil /add-driver $home\Desktop\AMD\$KeyPrefix\*.inf /install /subdirs
```

5. Follow the instructions to install the driver and reboot your instance as required.

6. To verify that the GPU is working properly, check Device Manager. You should see "AMD Radeon Pro V520 MxGPU" listed as a display adapter.

7. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol, **NICE DCV**.

**NVIDIA drivers for your Amazon EC2 instance**

An instance with an attached NVIDIA GPU, such as a P3 or G4dn instance, must have the appropriate NVIDIA driver installed. Depending on the instance type, you can either download a public NVIDIA driver, download a driver from Amazon S3 that is available only to AWS customers, or use an AMI with the driver pre-installed.

To install AMD drivers on an instance with an attached AMD GPU, such as a G4ad instance, see **AMD drivers**. To install NVIDIA drivers, see **NVIDIA drivers**.

**Contents**

- Types of NVIDIA drivers
- Available drivers by instance type
- Installation options
  - Option 1: AMIs with the NVIDIA drivers installed
  - Option 2: Public NVIDIA drivers
  - Option 3: GRID drivers (G6, Gr6, G5, G4dn, and G3 instances)
  - Option 4: NVIDIA gaming drivers (G5 and G4dn instances)
- Install an additional version of CUDA
Types of NVIDIA drivers

The following are the main types of NVIDIA drivers that can be used with GPU-based instances.

Tesla drivers

These drivers are intended primarily for compute workloads, which use GPUs for computational tasks such as parallelized floating-point calculations for machine learning and fast Fourier transforms for high performance computing applications.

GRID drivers

These drivers are certified to provide optimal performance for professional visualization applications that render content such as 3D models or high-resolution videos. You can configure GRID drivers to support two modes. Quadro Virtual Workstations provide access to four 4K displays per GPU. GRID vApps provide RDSH App hosting capabilities.

Gaming drivers

These drivers contain optimizations for gaming and are updated frequently to provide performance enhancements. They support a single 4K display per GPU.

Configured mode

On Windows, the Tesla drivers are configured to run in Tesla Compute Cluster (TCC) mode. The GRID and gaming drivers are configured to run in Windows Display Driver Model (WDDM) mode. In TCC mode, the card is dedicated to compute workloads. In WDDM mode, the card supports both compute and graphics workloads.

NVIDIA control panel

The NVIDIA control panel is supported with GRID and Gaming drivers. It is not supported with Tesla drivers.

Supported APIs for Tesla, GRID, and gaming drivers

- OpenCL, OpenGL, and Vulkan
- NVIDIA CUDA and related libraries (for example, cuDNN, TensorRT, nvJPEG, and cuBLAS)
- NVENC for video encoding and NVDEC for video decoding
- Windows-only APIs: DirectX, Direct2D, DirectX Video Acceleration, DirectX Raytracing
Available drivers by instance type

The following table summarizes the supported NVIDIA drivers for each GPU instance type.

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Tesla driver</th>
<th>GRID driver</th>
<th>Gaming driver</th>
</tr>
</thead>
<tbody>
<tr>
<td>G3</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>G4dn</td>

</tbody>
</table>

¹ This Tesla driver also supports optimized graphics applications specific to the ARM64 platform

² Using Marketplace AMIs only

Installation options

Use one of the following options to get the NVIDIA drivers required for your GPU instance.

Options

- **Option 1: AMIs with the NVIDIA drivers installed**
- **Option 2: Public NVIDIA drivers**
- **Option 3: GRID drivers (G6, Gr6, G5, G4dn, and G3 instances)**
- **Option 4: NVIDIA gaming drivers (G5 and G4dn instances)**
Option 1: AMIs with the NVIDIA drivers installed

AWS and NVIDIA offer different Amazon Machine Images (AMIs) that come with the NVIDIA drivers installed.

- Marketplace offerings with the Tesla driver
- Marketplace offerings with the GRID driver
- Marketplace offerings with the Gaming driver

To review considerations that are dependent on your operating system (OS) platform, choose the tab that applies to your AMI.

Linux

To update the driver version installed using one of these AMIs, you must uninstall the NVIDIA packages from your instance to avoid version conflicts. Use this command to uninstall the NVIDIA packages:

```
[ec2-user ~]$ sudo yum erase nvidia cuda
```

The CUDA toolkit package has dependencies on the NVIDIA drivers. Uninstalling the NVIDIA packages erases the CUDA toolkit. You must reinstall the CUDA toolkit after installing the NVIDIA driver.

Windows

If you create a custom Windows AMI using one of the AWS Marketplace offerings, the AMI must be a standardized image created with Windows Sysprep to ensure that the GRID driver works. For more information, see Use EC2 launch agents to create an AMI with Windows Sysprep.

Option 2: Public NVIDIA drivers

The options offered by AWS come with the necessary license for the driver. Alternatively, you can install the public drivers and bring your own license. To install a public driver, download it from the NVIDIA site as described here.

Alternatively, you can use the options offered by AWS instead of the public drivers. To use a GRID driver on a P3 instance, use the AWS Marketplace AMIs as described in Option 1. To use a GRID
driver on a G6, Gr6, G5, G4dn, or G3 instance, use the AWS Marketplace AMIs as described in Option 1 or install the NVIDIA drivers provided by AWS as described in Option 3: GRID drivers (G6, Gr6, G5, G4dn, and G3 instances).

To download a public NVIDIA driver

Log on to your instance and download the 64-bit NVIDIA driver appropriate for the instance type from [http://www.nvidia.com/Download/Find.aspx](http://www.nvidia.com/Download/Find.aspx). For **Product Type**, **Product Series**, and **Product**, use the options in the following table.

<table>
<thead>
<tr>
<th>Instance</th>
<th>Product Type</th>
<th>Product Series</th>
<th>Product</th>
</tr>
</thead>
<tbody>
<tr>
<td>G3</td>
<td>Tesla</td>
<td>M-Class</td>
<td>M60</td>
</tr>
<tr>
<td>G4dn</td>
<td>Tesla</td>
<td>T-Series</td>
<td>T4</td>
</tr>
<tr>
<td>G5</td>
<td>Tesla</td>
<td>A-Series</td>
<td>A10</td>
</tr>
<tr>
<td>G5g</td>
<td>Tesla</td>
<td>T-Series</td>
<td>NVIDIA T4G</td>
</tr>
<tr>
<td>G6</td>
<td>Tesla</td>
<td>L-Series</td>
<td>L4</td>
</tr>
<tr>
<td>Gr6</td>
<td>Tesla</td>
<td>L-Series</td>
<td>L4</td>
</tr>
<tr>
<td>P2</td>
<td>Tesla</td>
<td>K-Series</td>
<td>K80</td>
</tr>
<tr>
<td>P3</td>
<td>Tesla</td>
<td>V-Series</td>
<td>V100</td>
</tr>
<tr>
<td>P4d</td>
<td>Tesla</td>
<td>A-Series</td>
<td>A100</td>
</tr>
<tr>
<td>P4de</td>
<td>Tesla</td>
<td>A-Series</td>
<td>A100</td>
</tr>
<tr>
<td>P5</td>
<td>Tesla</td>
<td>H-Series</td>
<td>H100</td>
</tr>
</tbody>
</table>

1 G5 instances require driver version 470.00 or later

2 G5g instances require driver version 470.82.01 or later. The operating systems is Linux aarch64

3 G6 and Gr6 instances require driver version 525.0 or later.

4 P5 instances require driver version 530 or later.
To install the NVIDIA driver on Linux operating systems, see the NVIDIA Driver Installation Quickstart Guide.

To install the NVIDIA driver on Windows, follow these steps:

1. Open the folder where you downloaded the driver and launch the installation file. Follow the instructions to install the driver and reboot your instance as required.
2. Disable the display adapter named Microsoft Basic Display Adapter that is marked with a warning icon using Device Manager. Install these Windows features: Media Foundation and Quality Windows Audio Video Experience.
   
   **Important**
   
   Don't disable the display adapter named Microsoft Remote Display Adapter. If Microsoft Remote Display Adapter is disabled your connection might be interrupted and attempts to connect to the instance after it has rebooted might fail.

3. Check Device Manager to verify that the GPU is working correctly.
4. To achieve the best performance from your GPU, complete the optimization steps in Optimize GPU settings on Amazon EC2 instances.

**Option 3: GRID drivers (G6, Gr6, G5, G4dn, and G3 instances)**

These downloads are available to AWS customers only. By downloading, in order to adhere to requirements of the AWS solution referred to in the NVIDIA GRID Cloud End User License Agreement (EULA), you agree to use the downloaded software only to develop AMIs for use with the NVIDIA L4, NVIDIA A10G, NVIDIA Tesla T4, or NVIDIA Tesla M60 hardware. Upon installation of the software, you are bound by the terms of the NVIDIA GRID Cloud End User License Agreement. For information about the version of the NVIDIA GRID driver for your operating system, see the NVIDIA® Virtual GPU (vGPU) Software Documentation on the NVIDIA website.

**Considerations**

- G6 and Gr6 instances require GRID 17 or later.
- G5 instances require GRID 13.1 or later (or GRID 12.4 or later).
- G3 instances require AWS provided DNS resolution for GRID licensing to work.
- IMDSv2 is only supported with NVIDIA driver version 14.0 or greater.
• For Windows instances, if you launch your instance from a custom Windows AMI, the AMI must be a standardized image created with Windows Sysprep to ensure that the GRID driver works. For more information, see Use EC2 launch agents to create an AMI with Windows Sysprep.

• GRID 17.0 and later do not support Windows Server 2019.

• GRID 14.2 and later do not support Windows Server 2016.

• GRID 17.0 and later is not supported with G3 instances.

Amazon Linux and Amazon Linux 2

To install the NVIDIA GRID driver on your instance

1. Connect to your Linux instance.

2. Install the AWS CLI on your Linux instance and configure default credentials. For more information, see Installing the AWS CLI in the AWS Command Line Interface User Guide.

   ! Important
   
   Your user or role must have the permissions granted that contains the
   AmazonS3ReadOnlyAccess policy. For more information, see AWS managed policy:
   AmazonS3ReadOnlyAccess in the Amazon Simple Storage Service User Guide.

3. Install gcc and make, if they are not already installed.

   [ec2-user ~]$ sudo yum install gcc make

4. Update your package cache and get the package updates for your instance.

   [ec2-user ~]$ sudo yum update -y

5. Reboot your instance to load the latest kernel version.

   [ec2-user ~]$ sudo reboot

6. Reconnect to your instance after it has rebooted.

7. Install the gcc compiler and the kernel headers package for the version of the kernel you are currently running.
8. Download the GRID driver installation utility using the following command:

```
```

Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

```
[ec2-user ~]$ aws s3 ls --recursive s3://ec2-linux-nvidia-drivers/
```

9. Add permissions to run the driver installation utility using the following command.

```
[ec2-user ~]$ chmod +x NVIDIA-Linux-x86_64*.run
```

10. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

```
[ec2-user ~]$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

11. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

**Note**

If you are using Amazon Linux 2 with kernel version 5.10, use the following command to install the GRID driver.

```
[ec2-user ~]$ sudo CC=/usr/bin/gcc10-cc ./NVIDIA-Linux-x86_64*.run
```
12. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA's documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
```

13. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

14. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol NICE DCV.

b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

CentOS 7 and Red Hat Enterprise Linux 7

To install the NVIDIA GRID driver on your instance

1. Connect to your Linux instance. Install gcc and make, if they are not already installed.

2. Update your package cache and get the package updates for your instance.

```
[ec2-user ~]$ sudo yum update -y
```

3. Reboot your instance to load the latest kernel version.

```
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.
5. Install the gcc compiler and the kernel headers package for the version of the kernel you are currently running.

   [ec2-user ~]$ sudo yum install -y gcc kernel-devel-$(uname -r)

6. Disable the nouveau open source driver for NVIDIA graphics cards.

   a. Add nouveau to the /etc/modprobe.d/blacklist.conf blacklist file. Copy the following code block and paste it into a terminal.

   [ec2-user ~]$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
   blacklist vga16fb
   blacklist nouveau
   blacklist rivafb
   blacklist nvidiafb
   blacklist rivatv
   EOF

   b. Edit the /etc/default/grub file and add the following line:

   GRUB_CMDLINE_LINUX="rdblacklist=nouveau"

   c. Rebuild the Grub configuration.

   [ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg

7. Download the GRID driver installation utility using the following command:

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

   [ec2-user ~]$ aws s3 ls --recursive s3://ec2-linux-nvidia-drivers/

8. Add permissions to run the driver installation utility using the following command.

   [ec2-user ~]$ chmod +x NVIDIA-Linux-x86_64*.run

9. Run the self-install script as follows to install the GRID driver that you downloaded. For example:
When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

10. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

11. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA’s documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
```

12. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

13. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

   a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol NICE DCV.

   b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

   c. Install the GUI desktop/workstation package.

```
[ec2-user ~]$ sudo yum groupinstall -y "Server with GUI"
```
CentOS Stream 8 and Red Hat Enterprise Linux 8

To install the NVIDIA GRID driver on your instance

1. Connect to your Linux instance. Install `gcc` and `make`, if they are not already installed.

2. Update your package cache and get the package updates for your instance.

   ```bash
   [ec2-user ~]$ sudo yum update -y
   ```

3. Reboot your instance to load the latest kernel version.

   ```bash
   [ec2-user ~]$ sudo reboot
   ```

4. Reconnect to your instance after it has rebooted.

5. Install the `gcc` compiler and the kernel headers package for the version of the kernel you are currently running.

   ```bash
   [ec2-user ~]$ sudo dnf install -y make gcc elfutils-libelf-devel libglvnd-devel kernel-devel-$(uname -r)
   ```

6. Download the GRID driver installation utility using the following command:

   ```bash
   ```

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

   ```bash
   [ec2-user ~]$ aws s3 ls --recursive s3://ec2-linux-nvidia-drivers/
   ```

7. Add permissions to run the driver installation utility using the following command.

   ```bash
   [ec2-user ~]$ chmod +x NVIDIA-Linux-x86_64*.run
   ```

8. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

   ```bash
   [ec2-user ~]$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
   ```
When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

9. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

10. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA’s documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf

[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
```

11. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

12. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

   a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol NICE DCV.

   b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

   c. Install the GUI workstation package.

```
[ec2-user ~]$ sudo dnf groupinstall -y workstation
```
To install the NVIDIA GRID driver on your Linux instance

1. Connect to your Linux instance. Install gcc and make, if they are not already installed.
2. Update your package cache and get the package updates for your instance.

   ```
   [ec2-user ~] $ sudo yum update -y
   ```

3. Reboot your instance to load the latest kernel version.

   ```
   [ec2-user ~] $ sudo reboot
   ```

4. Reconnect to your instance after it has rebooted.

5. Install the gcc compiler and the kernel headers package for the version of the kernel you are currently running.

   ```
   [ec2-user ~] $ sudo dnf install -y make gcc elfutils-libelf-devel libglvnd-devel kernel-devel-$(uname -r)
   ```

6. Download the GRID driver installation utility using the following command:

   ```
   ```

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

   ```
   [ec2-user ~] $ aws s3 ls --recursive s3://ec2-linux-nvidia-drivers/
   ```

7. Add permissions to run the driver installation utility using the following command.

   ```
   [ec2-user ~] $ chmod +x NVIDIA-Linux-x86_64*.run
   ```

8. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

   ```
   [ec2-user ~] $ sudo /bin/sh ./NVIDIA-Linux-x86_64* .run
   ```
When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

9. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

10. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA’s documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf

[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
```

11. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

12. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

   a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol **NICE DCV**.

   b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in **Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances**.

**Ubuntu and Debian**

**To install the NVIDIA GRID driver on your instance**

1. Connect to your Linux instance. Install **gcc** and **make**, if they are not already installed.

2. Update your package cache and get the package updates for your instance.
3. (Ubuntu) Upgrade the `linux-aws` package to receive the latest version.

```
$ sudo apt-get upgrade -y linux-aws
```

(Debian) Upgrade package to receive the latest version.

```
$ sudo apt-get upgrade -y
```

4. Reboot your instance to load the latest kernel version.

```
$ sudo reboot
```

5. Reconnect to your instance after it has rebooted.

6. Install the `gcc` compiler and the kernel headers package for the version of the kernel you are currently running.

```
$ sudo apt-get install -y gcc make linux-headers-$(uname -r)
```

7. Disable the `nouveau` open source driver for NVIDIA graphics cards.

   a. Add `nouveau` to the `/etc/modprobe.d/blacklist.conf` blacklist file. Copy the following code block and paste it into a terminal.

```
$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
blacklist rivatv
EOF
```

   b. Edit the `/etc/default/grub` file and add the following line:

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

c. Rebuild the Grub configuration.
8. Download the GRID driver installation utility using the following command:

```
$ aws s3 cp --recursive s3://ec2-linux-nvidia-drivers/latest/ .
```

Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

```
$ aws s3 ls --recursive s3://ec2-linux-nvidia-drivers/
```

9. Add permissions to run the driver installation utility using the following command.

```
$ chmod +x NVIDIA-Linux-x86_64*.run
```

10. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

```
$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

11. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
$ nvidia-smi -q | head
```

12. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA’s documentation.

```
$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
```

13. Reboot the instance.
14. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

   a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol **NICE DCV**.

   b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in [Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances](#).

   c. Install the GUI desktop/workstation package.

```
$ sudo apt-get install -y lightdm ubuntu-desktop
```

### Windows operating systems

#### To install the NVIDIA GRID driver on your Windows instance

1. Connect to your Windows instance and open a PowerShell window.

3. Download the drivers and the **NVIDIA GRID Cloud End User License Agreement** from Amazon S3 to your desktop using the following PowerShell commands.

```
$Bucket = "ec2-windows-nvidia-drivers"
$KeyPrefix = "latest"
$LocalPath = "$home\Desktop\NVIDIA"
$Objects = Get-S3Object -BucketName $Bucket -KeyPrefix $KeyPrefix -Region us-east-1
```
foreach ($Object in $Objects) {
    $LocalFileName = $Object.Key
    if ($LocalFileName -ne '' -and $Object.Size -ne 0) {
        $LocalFilePath = Join-Path $LocalPath $LocalFileName
        Copy-S3Object -BucketName $Bucket -Key $Object.Key -LocalFile $LocalFilePath -Region us-east-1
    }
}

Multiple versions of the NVIDIA GRID driver are stored in this bucket. You can download all of the available Windows versions in the bucket by removing the -KeyPrefix $KeyPrefix option. For information about the version of the NVIDIA GRID driver for your operating system, see the NVIDIA® Virtual GPU (vGPU) Software Documentation on the NVIDIA website.

Starting with GRID version 11.0, you can use the drivers under /latest for both G3 and G4dn instances. We will not add versions later than 11.0 to g4/latest, but will keep version 11.0 and the earlier versions specific to G4dn under g4/latest.

G5 instances require GRID 13.1 or later (or GRID 12.4 or later).

4. Navigate to the desktop and double-click the installation file to launch it (choose the driver version that corresponds to your instance OS version). Follow the instructions to install the driver and reboot your instance as required. To verify that the GPU is working properly, check Device Manager.

5. (Optional) Use the following command to disable the licensing page in the control panel to prevent users from accidentally changing the product type (NVIDIA GRID Virtual Workstation is enabled by default). For more information, see the GRID Licensing User Guide.

**PowerShell**

Run the following PowerShell commands to create the registry value to disable the licensing page in the control panel. The AWS Tools for PowerShell in AWS Windows AMIs defaults to the 32-bit version and this command fails. Instead, use the 64-bit version of PowerShell included with the operating system.

```
New-Item -Path "HKLM:\SOFTWARE\NVIDIA Corporation\Global" -Name GridLicensing
New-ItemProperty -Path "HKLM:\SOFTWARE\NVIDIA Corporation\Global\GridLicensing" -Name "NvCplDisableManageLicensePage" -PropertyType "DWord" -Value "1"
```

**Command Prompt**

NVIDIA drivers
Run the following registry command to create the registry value to disable the licensing page in the control panel. You can run it using the Command Prompt window or a 64-bit version of PowerShell.

```
reg add "HKLM\SOFTWARE\NVIDIA Corporation\Global\GridLicensing" /v NvCplDisableManageLicensePage /t REG_DWORD /d 1
```

6. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

   a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol, **NICE DCV**.

   b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in [Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances](#).

**Option 4: NVIDIA gaming drivers (G5 and G4dn instances)**

These drivers are available to AWS customers only. By downloading them, you agree to use the downloaded software only to develop AMIs for use with the NVIDIA A10G, and NVIDIA Tesla T4 hardware. Upon installation of the software, you are bound by the terms of the [NVIDIA GRID Cloud End User License Agreement](#).

**Considerations**

- G3 instances require AWS provided DNS resolution for GRID licensing to work.
- [IMDSv2](#) is only supported with NVIDIA driver version 495.x or greater.

**Prerequisite**

Before you install the NVIDIA gaming drivers, verify that you have the AWS CLI installed on your instance and have configured default credentials. For more information, see [Installing the AWS CLI](#) in the [AWS Command Line Interface User Guide](#).
### Amazon Linux and Amazon Linux 2

#### To install the NVIDIA gaming driver on your instance

1. Connect to your Linux instance.
2. Install `gcc` and `make`, if they are not already installed.
   ```bash
   [ec2-user ~]$: sudo yum install gcc make
   ```
3. Update your package cache and get the package updates for your instance.
   ```bash
   [ec2-user ~]$: sudo yum update -y
   ```
4. Reboot your instance to load the latest kernel version.
   ```bash
   [ec2-user ~]$: sudo reboot
   ```
5. Reconnect to your instance after it has rebooted.
6. Install the `gcc` compiler and the kernel headers package for the version of the kernel you are currently running.
   ```bash
   [ec2-user ~]$: sudo yum install -y gcc kernel-devel-$(uname -r)
   ```
7. Download the gaming driver installation utility using the following command:
   ```bash
   [ec2-user ~]$: aws s3 cp --recursive s3://nvidia-gaming/linux/latest/ .
   ```
   Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:
   ```bash
   [ec2-user ~]$: aws s3 ls --recursive s3://nvidia-gaming/linux/
   ```
8. Extract the gaming driver installation utility from the downloaded .zip archive.

```bash
[ec2-user ~]$ unzip latest-driver-name.zip -d nvidia-drivers
```

9. Add permissions to run the driver installation utility using the following command:

```bash
[ec2-user ~]$ chmod +x nvidia-drivers/NVIDIA-Linux-x86_64*-grid.run
```

10. Run the installer using the following command:

```bash
[ec2-user ~]$ sudo ./nvidia-drivers/NVIDIA-Linux-x86_64*.run
```

**Note**

If you are using Amazon Linux 2 with kernel version 5.10, use the following command to install the NVIDIA gaming drivers.

```bash
[ec2-user ~]$ sudo CC=/usr/bin/gcc10-cc ./NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

11. Use the following command to create the required configuration file.

```bash
[ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

12. Use the following command to download and rename the certification file.

- For version 460.39 or later:

  ```bash
  ```

- For version 440.68 to 445.48:

  ```bash
  ```
• For earlier versions:

```bash
```

13. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA’s documentation.

```bash
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
```

14. Reboot the instance.

```bash
[ec2-user ~]$ sudo reboot
```

15. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol NICE DCV.

---

**CentOS 7 and Red Hat Enterprise Linux 7**

**To install the NVIDIA gaming driver on your instance**

1. Connect to your Linux instance. Install gcc and make, if they are not already installed.
2. Update your package cache and get the package updates for your instance.

```bash
[ec2-user ~]$ sudo yum update -y
```

3. Reboot your instance to load the latest kernel version.

```bash
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.

5. Install the gcc compiler and the kernel headers package for the version of the kernel you are currently running.
6. Disable the nouveau open source driver for NVIDIA graphics cards.
   a. Add nouveau to the /etc/modprobe.d/blacklist.conf blacklist file. Copy the following code block and paste it into a terminal.

   ```bash
   [ec2-user ~]$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
   blacklist vga16fb
   blacklist nouveau
   blacklist rivafb
   blacklist nvidiafb
   blacklist rivatv
   EOF
   ``

   b. Edit the /etc/default/grub file and add the following line:

   ```
   GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
   ```

   c. Rebuild the Grub configuration.

   ```bash
   [ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
   ```

7. Download the gaming driver installation utility using the following command:

   ```bash
   [ec2-user ~]$ aws s3 cp --recursive s3://nvidia-gaming/linux/latest/ .
   ```

   Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

   ```bash
   [ec2-user ~]$ aws s3 ls --recursive s3://nvidia-gaming/linux/
   ```

8. Extract the gaming driver installation utility from the downloaded .zip archive.

   ```bash
   [ec2-user ~]$ unzip vGPUSW-*vGaming-Linux-Guest-Drivers.zip -d nvidia-drivers
   ```

9. Add permissions to run the driver installation utility using the following command:

   ```bash
   [ec2-user ~]$ chmod +x nvidia-drivers/Linux/NVIDIA-Linux-x86_64*-grid.run
   ```
10. Run the installer using the following command:

```
[ec2-user ~]$ sudo ./nvidia-drivers/Linux/NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

11. Use the following command to create the required configuration file.

```
[ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

12. Use the following command to download and rename the certification file.

- For version 460.39 or later:

  ```
  ```

- For version 440.68 to 445.48:

  ```
  ```

- For earlier versions:

  ```
  ```

13. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA's documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf

[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
```

14. Reboot the instance.
15. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol NICE DCV. If you do not require this functionality, do not complete this step.

CentOS Stream 8 and Red Hat Enterprise Linux 8

To install the NVIDIA gaming driver on your instance

1. Connect to your Linux instance. Install gcc and make, if they are not already installed.

2. Update your package cache and get the package updates for your instance.

   [ec2-user ~] $ sudo yum update -y

3. Reboot your instance to load the latest kernel version.

   [ec2-user ~] $ sudo reboot

4. Reconnect to your instance after it has rebooted.

5. Install the gcc compiler and the kernel headers package for the version of the kernel you are currently running.

   [ec2-user ~] $ sudo yum install -y unzip gcc kernel-devel-$(uname -r)

6. Download the gaming driver installation utility using the following command:

   [ec2-user ~] $ aws s3 cp --recursive s3://nvidia-gaming/linux/latest/ .

Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

   [ec2-user ~] $ aws s3 ls --recursive s3://nvidia-gaming/linux/

7. Extract the gaming driver installation utility from the downloaded .zip archive.

   [ec2-user ~] $ unzip vGPUSW-*vGaming-Linux-Guest-Drivers.zip -d nvidia-drivers
8. Add permissions to run the driver installation utility using the following command:

```bash
[ec2-user ~]$ chmod +x nvidia-drivers/Linux/NVIDIA-Linux-x86_64*-grid.run
```

9. Run the installer using the following command:

```bash
[ec2-user ~]$ sudo ./nvidia-drivers/Linux/NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

10. Use the following command to create the required configuration file.

```bash
[ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

11. Use the following command to download and rename the certification file.

- For version 460.39 or later:

  ```bash
  ```

- For version 440.68 to 445.48:

  ```bash
  ```

- For earlier versions:

  ```bash
  ```

12. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA's documentation.

```bash
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

NVIDIA drivers
13. Reboot the instance.

    $ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf

    $ sudo reboot

14. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol NICE DCV.

    $ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf

    $ sudo reboot

**Rocky Linux 8**

**To install the NVIDIA gaming driver on your instance**

1. Connect to your Linux instance. Install gcc and make, if they are not already installed.

    $ sudo yum update -y

2. Update your package cache and get the package updates for your instance.

3. Reboot your instance to load the latest kernel version.

    $ sudo reboot

4. Reconnect to your instance after it has rebooted.

5. Install the gcc compiler and the kernel headers package for the version of the kernel you are currently running.

    $ sudo dnf install -y unzip gcc make elfutils-libelf-devel libglvnd-devel kernel-devel-$(uname -r)

6. Download the gaming driver installation utility using the following command:

    $ aws s3 cp --recursive s3://nvidia-gaming/linux/latest/ .

    Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

    $ aws s3 ls --recursive s3://nvidia-gaming/linux/
7. Extract the gaming driver installation utility from the downloaded .zip archive.

   ```
   [ec2-user ~]$ unzip vGPUSW-*vGaming-Linux-Guest-Drivers.zip -d nvidia-drivers
   ```

8. Add permissions to run the driver installation utility using the following command:

   ```
   [ec2-user ~]$ chmod +x nvidia-drivers/Linux/NVIDIA-Linux-x86_64*-grid.run
   ```

9. Run the installer using the following command:

   ```
   [ec2-user ~]$ sudo ./nvidia-drivers/Linux/NVIDIA-Linux-x86_64*.run
   ```

   When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

10. Use the following command to create the required configuration file.

   ```
   [ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
   vGamingMarketplace=2
   EOF
   ```

11. Use the following command to download and rename the certification file.

   - For version 460.39 or later:
     ```
     ```
   
   - For version 440.68 to 445.48:
     ```
     ```
   
   - For earlier versions:
     ```
     ```

12. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA's documentation.
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf

[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf

13. Reboot the instance.

[ec2-user ~]$ sudo reboot

14. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol NICE DCV.

Ubuntu and Debian

To install the NVIDIA gaming driver on your instance

1. Connect to your Linux instance. Install gcc and make, if they are not already installed.
2. Update your package cache and get the package updates for your instance.

   $ sudo apt-get update -y

3. Upgrade the linux-aws package to receive the latest version.

   $ sudo apt-get upgrade -y linux-aws

4. Reboot your instance to load the latest kernel version.

   $ sudo reboot

5. Reconnect to your instance after it has rebooted.

6. Install the gcc compiler and the kernel headers package for the version of the kernel you are currently running.

   $ sudo apt-get install -y unzip gcc make linux-headers-$(uname -r)

7. Disable the nouveau open source driver for NVIDIA graphics cards.
   a. Add nouveau to the /etc/modprobe.d/blacklist.conf blacklist file. Copy the following code block and paste it into a terminal.
b. Edit the `/etc/default/grub` file and add the following line:

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

c. Rebuild the Grub configuration.

```
$ sudo update-grub
```

8. Download the gaming driver installation utility using the following command:

```
$ aws s3 cp --recursive s3://nvidia-gaming/linux/latest/ .
```

Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

```
$ aws s3 ls --recursive s3://nvidia-gaming/linux/
```

9. Extract the gaming driver installation utility from the downloaded .zip archive.

```
$ unzip vGPUUSW-*vGaming-Linux-Guest-Driver.zip -d nvidia-drivers
```

10. Add permissions to run the driver installation utility using the following command:

```
$ chmod +x nvidia-drivers/Linux/NVIDIA-Linux-x86_64*-grid.run
```

11. Run the installer using the following command:

```
$ sudo ./nvidia-drivers/Linux/NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).
12. Use the following command to create the required configuration file.

```
$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

13. Use the following command to download and rename the certification file.

- For version 460.39 or later:

```
$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2023_9_22.cert"
```

- For version 440.68 to 445.48:

```
$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2020_04.cert"
```

- For earlier versions:

```
$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2019_09.cert"
```

14. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information, on why this is required visit NVIDIA’s documentation.

```
$ sudo touch /etc/modprobe.d/nvidia.conf
$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
```

15. Reboot the instance.

```
$ sudo reboot
```

16. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol NICE DCV. If you do not require this functionality, do not complete this step.
Windows operating systems

Before you install an NVIDIA gaming driver on your instance, you must ensure that the following prerequisites are met in addition to the considerations mentioned for all gaming drivers.

- If you launch your Windows instance using a custom Windows AMI, the AMI must be a standardized image created with Windows Sysprep to ensure that the gaming driver works. For more information, see [Use EC2 launch agents to create an AMI with Windows Sysprep](#).

To install the NVIDIA gaming driver on your Windows instance

1. Connect to your Windows instance and open a PowerShell window.
2. Download and install the gaming driver using the following PowerShell commands.

```powershell
$Bucket = "nvidia-gaming"
$KeyPrefix = "windows/latest"
$LocalPath = "$home\Desktop\NVIDIA"
$Objects = Get-S3Object -BucketName $Bucket -KeyPrefix $KeyPrefix -Region us-east-1
foreach ($Object in $Objects) {
    $LocalFileName = $Object.Key
    if ($LocalFileName -ne '' -and $Object.Size -ne 0) {
        $LocalFilePath = Join-Path $LocalPath $LocalFileName
        Copy-S3Object -BucketName $Bucket -Key $Object.Key -LocalFile $LocalFilePath -Region us-east-1
    }
}
```

Multiple versions of the NVIDIA GRID driver are stored in this S3 bucket. You can download all of the available versions in the bucket if you change the value of the $KeyPrefix variable from "windows/latest" to "windows".

3. Navigate to the desktop and double-click the installation file to launch it (choose the driver version that corresponds to your instance OS version). Follow the instructions to install the driver and reboot your instance as required. To verify that the GPU is working properly, check Device Manager.
4. Use one of the following methods to register the driver.
Version 527.27 or above

Create the following registry key with the 64-bit version of PowerShell, or the Command Prompt window.

key: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\nvlddmkm\Global

name: vGamingMarketplace

type: DWord

value: 2

**PowerShell**

Run the following PowerShell command to create this registry value. The AWS Tools for PowerShell in AWS Windows AMIs defaults to the 32-bit version and this command fails. Instead, use the 64-bit version of PowerShell included with the operating system.

```
New-ItemProperty -Path "HKLM:\SYSTEM\CurrentControlSet\Services\nvlddmkm\Global" -Name "vGamingMarketplace" -PropertyType "DWord" -Value "2"
```

**Command Prompt**

Run the following registry command to create this registry value. You can run it using the Command Prompt window or a 64-bit version of PowerShell.

```
reg add "HKLM\SYSTEM\CurrentControlSet\Services\nvlddmkm\Global" /v vGamingMarketplace /t REG_DWORD /d 2
```

Earlier versions

Create the following registry key with the 64-bit version of PowerShell, or the Command Prompt window.

key: HKEY_LOCAL_MACHINE\SOFTWARE\NVIDIA Corporation\Global

name: vGamingMarketplace
**type:** DWord

**value:** 2

**PowerShell**

Run the following PowerShell command to create this registry value. The AWS Tools for PowerShell in AWS Windows AMIs defaults to the 32-bit version and this command fails. Instead, use the 64-bit version of PowerShell included with the operating system.

```powershell
New-ItemProperty -Path "HKLM:\SOFTWARE\NVIDIA Corporation\Global" -Name "vGamingMarketplace" -PropertyType "DWord" -Value "2"
```

**Command Prompt**

Run the following registry command to create this registry key with the Command Prompt window. You can also use this command in the 64-bit version of PowerShell.

```cmd
reg add "HKLM\SOFTWARE\NVIDIA Corporation\Global" /v vGamingMarketplace /t REG_DWORD /d 2
```

5. Run the following command in PowerShell. This downloads the certification file, renames the file GridSwCert.txt, and moves the file to the Public Documents folder on your system drive. Typically, the folder path is `C:\Users\Public\Documents`.

   - For version 461.40 or later:

     ```powershell
     ```

   - For version 445.87:

     ```powershell
     ```

   - For earlier versions:

6. Reboot your instance.

7. Verify the NVIDIA Gaming license using the following command.

   C:\Windows\System32\DriverStore\FileRepository\nv_dispswi.inf_*\nvidia-smi.exe -q

   The output should be similar to the following.

   vGPU Software Licensed Product
   Product Name : NVIDIA Cloud Gaming
   License Status : Licensed (Expiry: N/A)

8. (Optional) To help take advantage of the single display of up to 4K resolution, set up the high-performance display protocol **NICE DCV**. If you do not require this functionality, do not complete this step.

**Install an additional version of CUDA**

After you install an NVIDIA graphics driver on your instance, you can install a version of CUDA other than the version that is bundled with the graphics driver. The following procedure demonstrates how to configure multiple versions of CUDA on the instance.
Install the CUDA toolkit on Linux

Follow these steps to install the CUDA toolkit on Linux:

1. Connect to your Linux instance.
2. Open the NVIDIA website and select the version of CUDA that you need.
3. Select the architecture, distribution, and version for the operating system on your instance. For Installer Type, select runfile (local).
4. Follow the instructions to download the install script.
5. Add run permissions to the install script that you downloaded using the following command.

   ```bash
   [ec2-user ~]$ chmod +x downloaded_installer_file
   ```

6. Run the install script as follows to install the CUDA toolkit and add the CUDA version number to the toolkit path.

   ```bash
   ```

7. (Optional) Set the default CUDA version as follows.

   ```bash
   [ec2-user ~]$ sudo ln -s /usr/local/cuda-version /usr/local/cuda
   ```

Install the CUDA toolkit on Windows

Follow these steps to install the CUDA toolkit on Windows:

To install the CUDA toolkit

1. Connect to your Windows instance.
2. Open the NVIDIA website and select the version of CUDA that you need.
3. For Installer Type, select exe (local) and then choose Download.
4. Using your browser, run the downloaded install file. Follow the instructions to install the CUDA toolkit. You might be required to reboot the instance.
AWS NVMe drivers for Windows instances

Amazon EBS volumes and instance store volumes are exposed as NVMe block devices on instances built on the AWS Nitro System. To fully utilize the performance and capabilities of Amazon EBS features for volumes exposed as NVMe block devices, the instance must have the AWS NVMe driver installed. All current generation AWS Windows AMIs come with the AWS NVMe driver installed by default.

For more information about EBS and NVMe, see Amazon EBS and NVMe in the Amazon EBS User Guide. For more information about SSD instance store and NVMe, see SSD instance store volumes for Amazon EC2 instances.

Install or upgrade AWS NVMe drivers using PowerShell

If you are not using the latest AWS Windows AMIs provided by Amazon, use the following procedure to install the current AWS NVMe driver. You should perform this update at a time when it is convenient to reboot your instance. Either the install script will reboot your instance or you must reboot it as the final step.

Prerequisites

PowerShell 3.0 or later

To download and install the latest AWS NVMe driver

1. We recommend that you create an AMI as a backup as follows, in case you need to roll back your changes.

   a. When you stop an instance, the data on any instance store volumes is erased. Before you stop an instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

   b. In the navigation pane, choose Instances.

   c. Select the instance that requires the driver upgrade, and choose Instance state, Stop instance.

   d. After the instance is stopped, select the instance, choose Actions, then Image and templates, and then choose Create image.

   e. Choose Instance state, Start instance.

2. Connect to your instance and log in as the local administrator.
3. Download and extract the drivers to your instance using one of the following options:

   - Using a browser:
     a. Download the latest driver package to the instance.
     b. Extract the zip archive.

   - Using PowerShell:

```
Invoke-WebRequest https://s3.amazonaws.com/ec2-windows-drivers-downloads/NVMe/Latest/AWSNVMe.zip -outfile $env:USERPROFILE\nvme_driver.zip
Expand-Archive $env:userprofile\nvme_driver.zip -DestinationPath $env:userprofile\nvme_driver
```

### Note

If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

```
```

4. Install the driver to your instance by running the `install.ps1` PowerShell script from the `nvme_driver` directory (`\install.ps1`). If you get an error, make sure you are using PowerShell 3.0 or later.

   a. (Optional) Starting with AWS NVMe version 1.5.0, Small Computer System Interface (SCSI) persistent reservations are supported for Windows Server 2016 and later. This feature adds support for Windows Server Failover Clustering with shared Amazon EBS storage. By default, this feature isn't enabled during installation.

   You can enable the feature when running the `install.ps1` script to install the driver by specifying the `EnableSCSIPersistentReservations` parameter with a value of `$true`.

```
PS C:\> .\install.ps1 -EnableSCSIPersistentReservations $true
```
You can disable the feature when running the `install.ps1` script to install the driver by specifying the `EnableSCSIPersistentReservations` parameter with a value of `$false`.

```powershell
PS C:\> .\install.ps1 -EnableSCSIPersistentReservations $false
```

b. Starting with AWS NVMe 1.5.0, the `install.ps1` script always installs the `ebsnvme-id` tool with the driver.

(Optional) For versions 1.4.0, 1.4.1, and 1.4.2, the `install.ps1` script allows you to specify whether the `ebsnvme-id` tool should be installed with the driver.

i. To install the `ebsnvme-id` tool, specify `InstallEBSNVMeIdTool` ‘Yes’.

ii. If you don't want to install the tool, specify `InstallEBSNVMeIdTool` ‘No’.

If you don't specify `InstallEBSNVMeIdTool`, and the tool is already present at `C:\ProgramData\Amazon\Tools`, the package will upgrade the tool by default. If the tool is not present, `install.ps1` will not upgrade the tool by default.

If you don't want to install the tool as part of the package, and want to install it later, you can find the latest version or the tool in the driver package. Alternatively, you can download version `1.0.0` from Amazon S3:

[Download](#) the `ebsnvme-id` tool.

5. If the installer does not reboot your instance, reboot the instance.

### Install or upgrade AWS NVMe drivers with Distributor

You can use Distributor, a capability of AWS Systems Manager, to install the NVMe driver package one time or with scheduled updates.

1. For the instructions for how to install the NVMe driver package using Distributor, see the procedures in [Install or update packages](#) in the *Amazon EC2 Systems Manager User Guide*.
2. For **Installation Type**, select **Uninstall and reinstall**.
3. For **Name**, choose **AWSNVMe**.
4. (Optional) For **Additional Arguments**, you can customize the installation by specifying values. The values must be formatted using valid JSON syntax. For examples of how to
pass additional arguments for the `aws configure` package, see the Amazon EC2 Systems Manager documentation.

a. Starting with AWS NVMe 1.5.0, the driver supports SCSI persistent reservations for Windows Server 2016 and later. By default, this feature isn't enabled during installation.

   • To enable this feature, specify `{"SSM_EnableSCSIPersistentReservations": "true"}`.
   • If you don't want to enable this feature, specify `{"SSM_EnableSCSIPersistentReservations": "false"}`.

b. Starting with AWS NVMe 1.5.0, the `install.ps1` script will always install the ebsnvme-id tool.

   (Optional) For versions 1.4.0, 1.4.1, and 1.4.2, the `install.ps1` script allows you to specify whether the ebsnvme-id tool should be installed with the driver.

   • To install the ebsnvme-id tool, specify `{"SSM_InstallEBSNVMeIdTool": "Yes"}`.
   • If you don't want to install the tool, specify `{"SSM_InstallEBSNVMeIdTool": "No"}`.

   If `SSM_InstallEBSNVMeIdTool` is not specified for Additional Arguments, and the tool is already present at `C:\ProgramData\Amazon\Tools`, the package will upgrade the tool by default. If the tool is not present, the package will not upgrade the tool by default.

   If you don't want to install the tool as part of the package, and want to install it later, you can find the latest version of the tool in the driver package. Alternatively, you can download version 1.0.0 from Amazon S3:

   [Download](#) the ebsnvme-id tool.

5. If the installer does not reboot your instance, reboot the instance.

**Configure SCSI persistent reservations**

After AWS NVMe driver version 1.5.0 or later has been installed, you can enable or disable SCSI persistent reservations using the Windows registry for Windows Server 2016 and later. You must reboot the instance for these registry changes to take effect.
You can enable SCSI persistent reservations with the following command which sets the `EnableSCSIPersistentReservations` to a value of 1.

```bash
PS C:\> $registryPath = "HKLM:\SYSTEM\CurrentControlSet\Services\AWSNVMe\Parameters\Device"
Set-ItemProperty -Path $registryPath -Name EnableSCSIPersistentReservations -Value 1
```

You can disable SCSI persistent reservations with the following command which sets the `EnableSCSIPersistentReservations` to a value of 0.

```bash
PS C:\> $registryPath = "HKLM:\SYSTEM\CurrentControlSet\Services\AWSNVMe\Parameters\Device"
Set-ItemProperty -Path $registryPath -Name EnableSCSIPersistentReservations -Value 0
```

### AWS NVMe Windows driver version history

The following table describes the released versions of the AWS NVMe driver.

<table>
<thead>
<tr>
<th>Package version</th>
<th>Driver version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.5.1</td>
<td>1.5.0</td>
<td>Fixed the install script to create a folder for the ebsnvme-id tool if it is not present.</td>
<td>17 November 2023</td>
</tr>
<tr>
<td>1.5.0</td>
<td>1.5.0</td>
<td>Added support for Small Computer System Interface (SCSI) persistent reservations for instances running Windows Server 2016 and later. The ebsnvme-id tool (ebsnvme-id.exe) is now installed by default.</td>
<td>31 August 2023</td>
</tr>
<tr>
<td>1.4.2</td>
<td>1.4.2</td>
<td>Fixed a bug where the AWS NVMe driver did not support instance store volumes on D3 instances.</td>
<td>16 March 2023</td>
</tr>
<tr>
<td>1.4.1</td>
<td>1.4.1</td>
<td>Reports Namespace Preferred Write Granularity (NPGW) for EBS volumes that support this optional NVMe feature. For more information, see section 8.25, “Improving Performance through I/O Size and Alignment Adherence,” in the <a href="https://nvmecss.github.io/nvme/">NVMe Base Specification, version 1.4</a>.</td>
<td>20 May 2022</td>
</tr>
</tbody>
</table>
### Package version | Driver version | Details | Release date
--- | --- | --- | ---
1.4.0 | 1.4.0 | • Added support for IOCTLS that allow applications to interact with NVMe devices. This support allows applications to get IdentifyController, IdentifyNamespace, and NameSpace list from the NVMe device. For more information, see [Protocol-specific queries](#) in the Microsoft documentation.

• AWSNVMe 1.4.0 installation on Windows Server 2008 R2 will fail. AWSNVMe version 1.3.2 and earlier are supported on Windows Server 2008 R2.

• The 1.4.0 driver version and the latest ebsnvme-id tool (ebsnvme-id.exe) are combined in a single package. This combination allows you to install both driver and tool from a single package. For more details, see [Install or upgrade AWS NVMe drivers using PowerShell](#).

• Bug fixes and reliability improvements.

1.3.2 | 1.3.2 | Fixed issue with modifying EBS volumes actively processing IO, which may result in data corruption. Customers who do not modify online EBS volumes (for example, resizing or changing type) are not impacted. | 10 September 2019

1.3.1 | 1.3.1 | Reliability Improvements. | 21 May 2019

1.3.0 | 1.3.0 | Device optimization improvements. | 31 August 2018
<table>

**Subscribe to notifications**

Amazon SNS can notify you when new versions of EC2 Windows Drivers are released. Use the following procedure to subscribe to these notifications.

**To subscribe to EC2 notifications from the console**

2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to are in this Region.
3. In the navigation pane, choose **Subscriptions**.
4. Choose **Create subscription**.
5. In the **Create subscription** dialog box, do the following:
   a. For **TopicARN**, copy the following Amazon Resource Name (ARN):
      
      arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers
   b. For **Protocol**, choose **Email**.
   c. For **Endpoint**, type an email address that you can use to receive the notifications.
   d. Choose **Create subscription**.
6. You'll receive a confirmation email. Open the email and follow the directions to complete your subscription.

Whenever new EC2 Windows drivers are released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.
To unsubscribe from Amazon EC2 Windows driver notification

2. In the navigation pane, choose Subscriptions.
3. Select the check box for the subscription and then choose Actions, Delete subscriptions. When prompted for confirmation, choose Delete.

To subscribe to EC2 notifications using the AWS CLI

To subscribe to EC2 notifications with the AWS CLI, use the following command.

```bash
aws sns subscribe --topic-arn arn:aws:sns:us-east-1:80119661308:ec2-windows-drivers --protocol email --notification-endpoint YourUserName@YourDomainName.ext
```

To subscribe to EC2 notifications using AWS Tools for Windows PowerShell

To subscribe to EC2 notifications with AWS Tools for Windows PowerShell, use the following command.

```bash
Connect-SNSNotification -TopicArn 'arn:aws:sns:us-east-1:80119661308:ec2-windows-drivers' -Protocol email -Region us-east-1 -Endpoint 'YourUserName@YourDomainName.ext'
```

Configure your Windows instance

After you've launched a Windows instance, you can log in as an administrator to perform additional configuration for launch agents and Windows-specific features. The following topics focus on Windows instance configuration.

Contents

- Configure launch settings for Amazon EC2 Windows instances
- Use EC2 Fast Launch for your Windows instances
- Use Amazon Elastic Graphics accelerators on Windows instances
- Install WSL on your Windows instance
Configure launch settings for Amazon EC2 Windows instances

Amazon EC2 launch agents perform tasks during instance startup and run if an instance is stopped and later started, or restarted. For information about a specific agent, see the detail pages in the following list.

- Configure a Windows instance using EC2Launch v2
- Configure a Windows instance using EC2Launch
- Configure a Windows instance using the EC2Config service (legacy)

Content

- Compare Amazon EC2 launch agents
- Configure DNS Suffix for Windows launch agents

Compare Amazon EC2 launch agents

The following table shows the major functional differences between EC2Config, EC2Launch v1, and EC2Launch v2.

<table>

**Note**

EC2Config documentation is provided for historical reference only. The operating system versions it runs on are no longer supported by Microsoft. We strongly recommend that you upgrade to the latest launch service.

**Configure DNS Suffix for Windows launch agents**

With Amazon EC2 launch agents, you can configure a list of DNS suffixes that Windows instances use for domain name resolution. The launch agents override the standard Windows settings in the `System\CurrentControlSet\Services\Tcpip\Parameters\SearchList` registry key by adding the following values to the DNS suffix search list:

- The domain of the instance
- The suffixes that result from devolution of the instance domain
• NV domain
• The domains specified by each network interface cards

All launch agents support DNS suffix configuration. For more information, see your specific launch agent version:

• For information about the `setDnsSuffix` task and how to configure DNS suffixes in EC2Launch v2, see [setDnsSuffix](#).
• For information about DNS suffix list setup and how to enable or disable devolution for EC2Launch v1, see [Configure EC2Launch](#).
• For information about DNS suffix list setup and how to enable or disable devolution for EC2Config, see [EC2Config settings files](#).

Domain name devolution

Domain name devolution is an Active Directory behavior that allows computers in a child domain to access resources in the parent domain without using a fully qualified domain name. By default, domain name devolution continues until there are only two nodes left in the domain name progression.

Launch agents perform devolution on the domain name if the instance is connected to a domain, and add the results to the DNS suffix search list that's maintained in the *System\CurrentControlSet\Services\Tcpip\Parameters\SearchList* registry key. The agents use the settings from the following registry keys, to determine the devolution behavior.

- **System\CurrentControlSet\Services\Tcpip\Parameters\UseDomainNameDevolution**
  - When not set, disables devolution
  - When set to 1, enables devolution (default)
  - When set to 0, disables devolution
- **System\CurrentControlSet\Services\Dnscache\Parameters\DomainNameDevolutionLevel**
  - When not set, use level of 2 (default)
  - When set to 3 or greater, use value to set level
When you disable devolution or change your devolution settings to a higher level, the `System\CurrentControlSet\Services\Tcpip\Parameters\SearchList` registry key still contains the suffixes that were added previously. They are not automatically removed. You can manually update the list, or you can clear the list and let your agent run through the process to set up the new list.

**Note**

To clear the DNS suffix list from the registry, you can run the following command.

```
PS C:\> Invoke-CimMethod -ClassName Win32_NetworkAdapterConfiguration -MethodName "SetDNSSuffixSearchOrder" -Arguments @{ DNSDomainSuffixSearchOrder = $null } | Out-Null
```

**Devolution examples**

The following examples show domain name progression through the devolution process.

**corp.example.com**

- Progresses to `example.com`

**locale.region.corp.example.com**

1. Progresses to `region.corp.example.com`
2. Progresses to `corp.example.com`
3. Progresses to `example.com`

**locale.region.corp.example.com with a setting of DomainNameDevolutionLevel=3**

1. Progresses to `region.corp.example.com`
2. Progresses to `corp.example.com`. The progression stops here, due to the level setting.
Configure a Windows instance using EC2Launch v2

All supported instances of Amazon EC2 running Windows Server 2022 include the EC2Launch v2 launch agent (EC2Launch.exe) by default. We also provide Windows Server 2016 and 2019 AMIs with EC2Launch v2 installed as the default launch agent. These AMIs are provided in addition to the Windows Server 2016 and 2019 AMIs that include EC2Launch v1. You can search for Windows AMIs that include EC2Launch v2 by default by entering the following prefix in your search from the AMIs page in the Amazon EC2 console: EC2LaunchV2-Windows_Server-*.

EC2Launch v2 performs tasks during instance startup and runs if an instance is stopped and later started, or restarted. EC2Launch v2 can also perform tasks on demand. Some of these tasks are automatically enabled, while others must be enabled manually. The EC2Launch v2 service supports all EC2Config and EC2Launch features.

This service uses a configuration file to control its operation. You can update the configuration file using either a graphical tool or by directly editing it as a single .yml file (agent-config.yml). The service binaries are located in the %ProgramFiles%\Amazon\EC2Launch directory.

EC2Launch v2 publishes Windows event logs to help you troubleshoot errors and set triggers. For more information, see Windows event logs.

Supported operating systems

- Windows Server 2022
- Windows Server 2019 (Long-Term Servicing Channel and Semi-Annual Channel)
- Windows Server 2016

EC2Launch v2 overview

EC2Launch v2 is a service that performs tasks during instance startup and runs if an instance is stopped and later started, or restarted.

Overview topics

- EC2Launch v2 concepts
- EC2Launch v2 tasks
- Telemetry

To compare launch agent version features, see Compare Amazon EC2 launch agents.

EC2Launch v2 concepts

The following concepts are useful to understand when considering EC2Launch v2.

Task

You can invoke a task to perform an action on an instance. You can configure tasks in the agent-config.yml file or through user data. For a list of available tasks for EC2Launch v2, see EC2Launch v2 tasks. For task configuration schema and details, see EC2Launch v2 task configuration.

Stage

A stage is a logical grouping of tasks that the EC2Launch v2 agent runs. Some tasks can run only in a specific stage. Others can run in multiple stages. When using agent-config.yml, you must specify a list of stages, and a list of tasks to run within each stage.

The service runs stages in the following order:

Stage 1: Boot

Stage 2: Network

Stage 3: PreReady
Windows is ready

After the PreReady stage completes, the service sends the Windows is ready message to the Amazon EC2 console.

Stage 4: PostReady

User data runs during the PostReady stage. Some script versions run before the agent-config.yml file PostReady stage, and some run after, as follows:

Before agent-config.yml
- YAML user data version 1.1
- XML user data

After agent-config.yml
- YAML user data version 1.0 (legacy version for backwards compatibility)

For example stages and tasks, see Example: agent-config.yml.

When you use user data, you must specify a list of tasks for the launch agent to run. The stage is implied. For example tasks, see Example: user data.

EC2Launch v2 runs the list of tasks in the order that you specify in agent-config.yml and in user data. Stages run sequentially. The next stage starts after the previous stage completes. Tasks also run sequentially.

Frequency

Task frequency determines when tasks should run, depending on the boot context. Most tasks have only one allowed frequency. You can specify a frequency for executeScript tasks.

You will see the following frequencies in the EC2Launch v2 task configuration.

- Once – The task runs once, when the AMI has booted for the first time (finished Sysprep).
- Always – The task runs every time that the launch agent runs. The launch agent runs when:
  - an instance starts or restarts
  - the EC2Launch service runs
  - EC2Launch.exe run is invoked

agent-config
**Amazon Elastic Compute Cloud User Guide**

agent-config is a file that is located in the configuration folder for EC2Launch v2. It includes configuration for the boot, network, PreReady, and PostReady stages. This file is used to specify the instance configuration for tasks that should run when the AMI is either booted for the first time or for subsequent times.

By default, the EC2Launch v2 installation installs an agent-config file that includes recommended configurations that are used in standard Amazon Windows AMIs. You can update the configuration file to alter the default boot experience for your AMI that EC2Launch v2 specifies.

**User data**

User data is data that is configurable when you launch an instance. You can update user data to dynamically change how custom AMIs or quickstart AMIs are configured. EC2Launch v2 supports 60 kB user data input length. User data includes only the UserData stage, and therefore runs after the agent-config file. You can enter user data when you launch an instance using the launch instance wizard, or you can modify user data from the EC2 console. For more information about working with user data, see [How Amazon EC2 handles user data for Windows instances](#).

**EC2Launch v2 tasks**

EC2Launch v2 can perform the following tasks at each boot:

- Set up new and optionally customized wallpaper that renders information about the instance.
- Set the attributes for the administrator account that is created on the local machine.
- Add DNS suffixes to the list of search suffixes. Only suffixes that do not already exist are added to the list.
- Set drive letters for any additional volumes and extend them to use available space.
- Write files from the configuration to the disk.
- Run scripts specified in the EC2Launch v2 config file or from user-data. Scripts from user-data can be plain text or zipped and provided as a base64 format.
- Run a program with given arguments.
- Set the computer name.
- Send instance information to the Amazon EC2 console.
- Send the RDP certificate thumbprint to the Amazon EC2 console.
- Dynamically extend the operating system partition to include any unpartitioned space.
• Run user data. For more information about specifying user data, see EC2Launch v2 task configuration.
• Set non-persistent static routes to reach the metadata service and AWS KMS servers.
• Set non-boot partitions to mbr or gpt.
• Start the Systems Manager service following Sysprep.
• Optimize ENA settings.
• Enable OpenSSH for later Windows versions.
• Enable Jumbo Frames.
• Set Sysprep to run with EC2Launch v2.
• Publish Windows event logs.

Telemetry

Telemetry is additional information that helps AWS to better understand your requirements, diagnose issues, and deliver features to improve your experience with AWS services.

EC2Launch v2 version 2.0.592 and later collect telemetry, such as usage metrics and errors. This data is collected from the Amazon EC2 instance on which EC2Launch v2 runs. This includes all Windows AMIs owned by AWS.

The following types of telemetry are collected by EC2Launch v2:

• Usage information — agent commands, install method, and scheduled run frequency.
• Errors and diagnostic information — agent installation error codes, run error codes, and error call stacks.

Examples of collected data:

2021/07/15 21:44:12Z: EC2LaunchTelemetry: IsAgentScheduledPerBoot=true
2021/07/15 21:44:12Z: EC2LaunchTelemetry: IsUserDataScheduledPerBoot=true

Telemetry is enabled by default. You can disable telemetry collection at any time. If telemetry is enabled, EC2Launch v2 sends telemetry data without additional customer notifications.
Telemetry visibility

When telemetry is enabled, it appears in the Amazon EC2 console output as follows.

```
2021/07/15 21:44:12Z: Telemetry: <Data>
```

Disable telemetry on an instance

To disable telemetry for a single instance, you can either set a system environment variable, or use the MSI to modify the installation.

To disable telemetry by setting a system environment variable, run the following command as an administrator.

```
setx /M EC2LAUNCH_TELEMETRY 0
```

To disable telemetry using the MSI, run the following command after you download the MSI.

```
msiexec /i ".\AmazonEC2Launch.msi" Remove="Telemetry" /q
```

Install the latest version of EC2Launch v2

You can use one of the following methods to install the EC2Launch v2 agent on your EC2 instance:

- Download the agent from Amazon S3 and install with Windows PowerShell. For download URLs, see [EC2Launch v2 downloads on Amazon S3](https://aws.amazon.com/documentation/ec2/downloads/#v2).
- Install with SSM Distributor.
- Install from an EC2 Image Builder component.
- Launch your instance from an AMI that has EC2Launch v2 pre-installed.

⚠️ Warning

AmazonEC2Launch.msi uninstalls previous versions of the EC2 launch services, such as EC2Launch (v1) and EC2Config.

For install steps, select the tab that matches your preferred method.
To install the latest version of EC2Launch v2 agent with Windows PowerShell, follow these steps.

1. Create your local directory.

   ```powershell
   New-Item -Path "\$env:USERPROFILE\Desktop\EC2Launchv2" -ItemType Directory
   ```

2. Set the URL for your download location. Run the following command with the Amazon S3 URL you'll use. For download URLs, see [EC2Launch v2 downloads on Amazon S3](https://example.com)

   ```powershell
   $Url = "Amazon S3 URL/AmazonEC2Launch.msi"
   ```

3. Use the following compound command to download the agent and run the install

   ```powershell
   $DownloadFile = "\$env:USERPROFILE\Desktop\EC2Launchv2" + $(Split-Path -Path $Url -Leaf)
   Invoke-WebRequest -Uri $Url -OutFile $DownloadFile
   msiexec /i "$DownloadFile"
   ```

   **Note**
   If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

   ```powershell
   ```

4. To verify the install, check that the msi file exists in the EC2Launch v2 directory on your instance (C:\ProgramData\Amazon\EC2Launch).

**AWS Systems Manager Distributor**

To configure automatic updates for EC2Launch v2 with AWS Systems Manager Quick Setup, see [Automatically install and update with Distributor Quick Setup](https://example.com).
You can also perform a one-time install of the AWSEC2Launch-Agent package from AWS Systems Manager Distributor. For instructions on how to install a package from Systems Manager Distributor, see Install or update packages in the AWS Systems Manager User Guide.

EC2 Image Builder component

You can install the ec2launch-v2-windows component when you build a custom image with EC2 Image Builder. For instructions on how to build a custom image with EC2 Image Builder, see Create an image pipeline using the EC2 Image Builder console wizard in the EC2 Image Builder User Guide.

AMI

EC2Launch v2 is preinstalled by default on the following Windows Server 2022 and UEFI AMIs:

- Windows_Server-2022-English-Full-Base
- Windows_Server-2022-English-Core-Base
- Windows Server 2022 AMIs with all other languages
- Windows Server 2022 AMIs with SQL installed
- Windows_Server-2022-English-Core-EKS_Optimized

EC2Launch v2 is also preinstalled on the following Windows Server AMIs. You can find these AMIs from the Amazon EC2 console, or by using the following search prefix: EC2LaunchV2- in the AWS CLI.

- EC2LaunchV2-Windows_Server-2019-English-Core-Base
- EC2LaunchV2-Windows_Server-2019-English-Full-Base
- EC2LaunchV2-Windows_Server-2016-English-Core-Base
- EC2LaunchV2-Windows_Server-2016-English-Full-Base
- EC2LaunchV2-Windows_Server-2012_R2_RTM-English-Full-Base
- EC2LaunchV2-Windows_Server-2012_RTM-English-Full-Base

Automatically install and update EC2Launch v2 with AWS Systems Manager Distributor Quick Setup

With AWS Systems Manager Distributor Quick Setup, you can set up automatic updates for EC2Launch v2. The following process sets up a Systems Manager Association on your instance that
automatically updates the EC2Launch v2 agent at a frequency that you specify. The Association that the Distributor Quick Setup creates can include instances within an AWS account and Region, or instances within an AWS Organization. For more information about setting up an organization, see Tutorial: Creating and configuring an organization in the AWS Organizations User Guide.

Before you begin, make sure that your instances meet all of the prerequisites.

**Prerequisites**

To set up automatic updates with Distributor Quick Setup, your instances must meet the following prerequisites.

- You have at least one running instance that supports EC2Launch v2. See supported operating systems for EC2Launch v2.
- You've performed the Systems Manager set-up tasks on your instances. For more information, see Setting up Systems Manager in the AWS Systems Manager User Guide.
- EC2Launch v2 must be the only launch agent installed on your instance. If you have more than one launch agent installed, your Distributor Quick Setup configuration will fail. Before you configure EC2Launch v2 with a Distributor Quick Setup, uninstall EC2Config or EC2Launch v1 launch agents, if they exist.

**Configure Distributor Quick Setup for EC2Launch v2**

To create a configuration for EC2Launch v2 with Distributor Quick Setup, use the following settings when you complete the steps for Distributor package deployment:

- **Software packages**: Amazon EC2Launch v2 agent.
- **Update frequency**: Select a frequency from the list.
- **Targets**: Choose from the available deployment options.

To check the status of your configuration, navigate to the Systems Manager Quick Setup Configurations tab in the AWS Management Console.

2. In the navigation pane, choose Quick Setup.
3. In the **Configurations** tab, select the row that's associated with the configuration that you created. The **Configurations** tab lists your configurations, and includes a summary of key details, such as **Region**, **Deployment status**, and **Association status**.

![Note]

The association name for every EC2Launch v2 Distributor configuration begins with the following prefix: AWS-QuickSetup-Distributor-EC2Launch-Agent-.

4. To view details, select the configuration and choose **View details**.

For more information and troubleshooting steps, see [Troubleshooting Quick Setup results](#) in the [AWS Systems Manager User Guide](#).

**EC2Launch v2 downloads on Amazon S3**

To install the latest version of EC2Launch v2, download the installer from one of the following locations:

![Note]

The 32-bit installation link will be deprecated. We recommend that you use the 64-bit installation link to install EC2Launch v2. If you require a 32-bit launch agent, use [EC2Config](#).

- **64Bit** — [https://s3.amazonaws.com/amazon-ec2launch-v2/windows/amd64/latest/AmazonEC2Launch.msi](https://s3.amazonaws.com/amazon-ec2launch-v2/windows/amd64/latest/AmazonEC2Launch.msi)
- **32Bit** — [https://s3.amazonaws.com/amazon-ec2launch-v2/windows/386/latest/AmazonEC2Launch.msi](https://s3.amazonaws.com/amazon-ec2launch-v2/windows/386/latest/AmazonEC2Launch.msi)

**Configure install options**

When you install or upgrade EC2Launch v2, you can configure installation options with the EC2Launch v2 install dialog or with the `msiexec` command in a command line shell.

The first time the EC2Launch v2 installer runs on an instance, it initializes launch agent settings on your instance as follows:
• It creates the local path and writes the launch agent file to it. This is sometimes referred to as a clean install.

• It creates the EC2LAUNCH_TELEMETRY environment variable if it doesn't already exist, and sets it based on your configuration.

For configuration details, select the tab that matches the configuration method that you'll use.

Amazon EC2Launch Setup dialog

When you install or upgrade EC2Launch v2, you can configure the following installation options through the EC2Launch v2 install dialog.

**Basic Install options**

**Send Telemetry**

When you include this feature in the setup dialog, the installer sets the EC2LAUNCH_TELEMETRY environment variable to a value of 1. If you disable Send Telemetry, the installer sets the environment variable to a value of 0.

When the EC2Launch v2 agent runs, it reads the EC2LAUNCH_TELEMETRY environment variable to determine whether to upload telemetry data. If the value equals 1, it uploads the data. Otherwise, it doesn't upload.

**Default configuration**

The default configuration for EC2Launch v2 is to overwrite the local launch agent if it exists already. The first time you run an install on an instance, the default configuration performs a clean install. If you disable the default configuration on the initial install, the installation fails.

If you run the install again on the instance, you can disable the default configuration to perform an upgrade that doesn't replace the %ProgramData%/Amazon/EC2Launch/config/agent-config.yml file.

**Example: Upgrade EC2Launch v2 with telemetry**

The following example shows the EC2Launch v2 setup dialog configured to upgrade the current installation and enable telemetry. This configuration performs an install without replacing the
agent configuration file, and sets the EC2LAUNCH_TELEMETRY environment variable to a value of 1.

Command line

When you install or upgrade EC2Launch v2, you can configure the following installation options with the `msiexec` command in a command line shell.

**ADDLOCAL parameter values**

**Basic** (required)

Install the launch agent. If this value is not present in the ADDLOCAL parameter, the installation ends.

**Clean**

When you include the Clean value in the ADDLOCAL parameter, the installer writes the agent configuration file to the following location: `%ProgramData%/Amazon/EC2Launch/config/agent-config.yml`. If the agent configuration file already exists, it overwrites the file.

When you leave the Clean value out of the ADDLOCAL parameter, the installer performs an upgrade that doesn't replace the agent configuration file.
Telemetry

When you include the Telemetry value in the ADDLOCAL parameter, the installer sets the EC2LAUNCH_TELEMETRY environment variable to a value of 1.

When you leave the Telemetry value out of the ADDLOCAL parameter, the installer sets the environment variable to a value of 0.

When the EC2Launch v2 agent runs, it reads the EC2LAUNCH_TELEMETRY environment variable to determine whether to upload telemetry data. If the value equals 1, it uploads the data. Otherwise, it doesn't upload.

Example: install EC2Launch v2 with telemetry

```
& msiexec /i "C:\Users\Administrator\Desktop\EC2Launchv2\AmazonEC2Launch.msi"
ADDLOCAL="Basic,Clean,Telemetry" /q
```

Verify the EC2Launch v2 version

Use one of the following procedures to verify the version of EC2Launch v2 that is installed on your instances.

Windows PowerShell

Verify the installed version of EC2Launch v2 with Windows PowerShell, as follows.

1. Launch an instance from your AMI and connect to it.
2. Run the following command in PowerShell to verify the installed version of EC2Launch v2:

```
& "C:\Program Files\Amazon\EC2Launch\EC2Launch.exe" version
```

Windows Control Panel

Verify the installed version of EC2Launch v2 in the Windows Control Panel, as follows.

1. Launch an instance from your AMI and connect to it.
2. Open the Windows Control Panel and choose Programs and Features.
3. Look for Amazon EC2Launch in the list of installed programs. Its version number appears in the Version column.

To view the latest updates for the AWS Windows AMIs, see Windows AMI version history in the AWS Windows AMI Reference.

For the latest version of EC2Launch v2, see EC2Launch v2 version history.

For the latest version of the EC2Launch v2 migration tool, see EC2Launch v2 migration tool version history.

You can receive notifications when new versions of the EC2Launch v2 service are released. For more information, see Subscribe to EC2Launch v2 service notifications.

Migrate to EC2Launch v2

The EC2Launch migration tool upgrades the installed launch agent (EC2Config and EC2Launch v1) by uninstalling it and installing EC2Launch v2. Applicable configurations from previous launch services are automatically migrated to the new service. The migration tool does not detect any scheduled tasks linked to EC2Launch v1 scripts; therefore, it does not automatically set up those tasks in EC2Launch v2. To configure these tasks, edit the agent-config.yml file, or use the EC2Launch v2 settings dialog box. For example, if an instance has a scheduled task that runs InitializeDisks.ps1, then after you run the migration tool, you must specify the volumes you want to initialize in the EC2Launch v2 settings dialog box. See Step 6 of the procedure to Change settings using the EC2Launch v2 settings dialog box.

You can download the migration tool or install with an SSM RunCommand document.

You can download the tool from the following locations:

- **64Bit** — [https://s3.amazonaws.com/amazon-ec2launch-v2-utils/MigrationTool/windows/amd64/latest/EC2LaunchMigrationTool.zip](https://s3.amazonaws.com/amazon-ec2launch-v2-utils/MigrationTool/windows/amd64/latest/EC2LaunchMigrationTool.zip)

⚠️ **Note**

The 32-bit migration tool link will be deprecated. We recommend that you use the 64-bit link to migrate to EC2Launch v2. If you require a 32-bit launch agent, use EC2Config.
Use the [AWSEC2Launch-RunMigration](SSM document) to migrate to the latest EC2Launch v2 version with SSM Run Command. The document does not require any parameters. For more information about using SSM Run Command, see [AWS Systems Manager Run Command](SSM document).

The migration tool applies the following configurations from EC2Config to EC2Launch v2.

- If `Ec2DynamicBootVolumeSize` is set to false, removes EC2Launch v2 boot stage
- If `Ec2SetPassword` is set to Enabled, sets EC2Launch v2 password type to random
- If `Ec2SetPassword` is set to Disabled, sets EC2Launch v2 password type to donothing
- If `SetDnsSuffixList` is set to false, removes EC2Launch v2 setDnsSuffix task
- If `EC2SetComputerName` is set to true, adds EC2Launch v2 setHostName task to yaml configuration

The migration tool applies the following configurations from EC2Launch v1 to EC2Launch v2.

- If `ExtendBootVolumeSize` is set to false, removes EC2Launch v2 boot stage
- If `AdminPasswordType` is set to Random, sets EC2Launch v2 password type to random
- If `AdminPasswordType` is set to Specify, sets EC2Launch v2password type to static and password data to the password specified in AdminPassword
- If `SetWallpaper` is set to false, removes EC2Launch v2 setWallpaper task
- If `AddDnsSuffixList` is set to false, removes EC2Launch v2 setDnsSuffix task
- If `SetComputerName` is set to true, adds EC2Launch v2 setHostName task

**Stop, restart, delete, or uninstall EC2Launch v2**

You can manage the EC2Launch v2 service just as you would any other Windows service.
EC2Launch v2 runs once on boot and runs all of the configured tasks. After executing tasks, the service enters a stopped state. When you restart the service, the service will run all of the configured tasks again and return to a stopped state.

To apply updated settings to your instance, you can stop and restart the service. If you are manually installing EC2Launch v2, you must first stop the service first.

**To stop the EC2Launch v2 service**

1. Launch and connect to your Windows instance.
2. On the **Start** menu, choose **Administrative Tools**, and then open **Services**.
3. In the list of services, right-click **Amazon EC2Launch**, and select **Stop**.

**To restart the EC2Launch v2 service**

1. Launch and connect to your Windows instance.
2. On the **Start** menu, choose **Administrative Tools**, and then open **Services**.
3. In the list of services, right-click **Amazon EC2Launch**, and select **Restart**.

If you don't need to update the configuration settings, create your own AMI, or use AWS Systems Manager, you can delete and uninstall the service. Deleting a service removes its registry subkey. Uninstalling a service removes the files, the registry subkeys, and any shortcuts to the service.

**To delete the EC2Launch v2 service**

1. Start a command prompt window.
2. Run the following command:

   ```
   sc delete EC2Launch
   ```

**To uninstall EC2Launch v2**

1. Launch and connect to your Windows instance.
2. On the **Start** menu, choose **Control Panel**.
3. Open **Programs** and then **Programs and Features**.
4. In the list of programs, choose **Amazon EC2Launch**. To confirm that you’re choosing v2, check the **Version** column.

5. Choose **Uninstall**.

**Subscribe to EC2Launch v2 service notifications**

Amazon SNS can notify you when new versions of the EC2Launch v2 service are released. Use the following procedure to subscribe to these notifications.

**Subscribe to EC2Launch v2 notifications**

2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to were created in this Region.

3. In the navigation pane, choose **Subscriptions**.

4. Choose **Create subscription**.

5. In the Create subscription dialog box, do the following:
   a. For **Topic ARN**, use the following Amazon Resource Name (ARN): `arn:aws:sns:us-east-1:309726204594:amazon-ec2launch-v2`.
   b. For **Protocol**, choose **Email**.
   c. For **Endpoint**, enter an email address that you can use to receive the notifications.
   d. Choose **Create subscription**.

6. You’ll receive an email asking you to confirm your subscription. Open the email and follow the directions to complete your subscription.

Whenever a new version of the EC2Launch v2 service is released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.

1. Open the Amazon SNS console.

2. In the navigation pane, choose **Subscriptions**.
3. Select the subscription and then choose **Actions, Delete subscriptions**. When prompted for confirmation, choose **Delete**.

**EC2Launch v2 settings**

This section contains information about how to configure settings for EC2Launch v2.

**Topics include:**
- Change settings using the EC2Launch v2 settings dialog box
- **EC2Launch v2 directory structure**
- Configure EC2Launch v2 using the CLI
- **EC2Launch v2 task configuration**
- **EC2Launch v2 exit codes and reboots**
- **EC2Launch v2 and Sysprep**

**Change settings using the EC2Launch v2 settings dialog box**

The following procedure describes how to use the EC2Launch v2 settings dialog box to enable or disable settings.

> **Note**

If you improperly configure custom tasks in the agent-config.yml file, and you attempt to open the Amazon EC2Launch settings dialog box, you will receive an error. For example schema, see **Example: agent-config.yml**.

1. Launch and connect to your Windows instance.
2. From the Start menu, choose **All Programs**, and then navigate to **EC2Launch settings**.
Configure Windows launch agents

Amazon EC2 Launch settings

General

- Set computer name
  - Set the computer name of the instance
  - Set to "ip-<hex private IPv4 address>"
  - Use custom name
  - Reboot after setting computer name

- Extend boot volume
  - Extend OS partition to use free space for boot volume

- Set administrator account
  - Set administrator account
  - Administrator username (leave blank for default)
  - Administrator password settings
    - Random (retrieve from console)
    - Specify (temporarily stored in configuration file)
    - Do not set

- Start SSM service
  - Re-enable and start SSM service after Sysprep

- Optimize ENA
  - Optimize receive side scaling and receive queue depth

- Enable SSH
  - Enable OpenSSH for later Windows versions

- Enable Jumbo Frames
  - Enable Jumbo Frames
  - Important: Do not enable Jumbo Frames if you are not familiar with them

- Prepare for imaging
  - Shutdown without Sysprep
  - Shutdown with Sysprep
3. On the **General** tab of the **EC2Launch settings** dialog box, you can enable or disable the following settings.

   a. **Set Computer Name**

      If this setting is enabled (it is disabled by default), the current host name is compared to the desired host name at each boot. If the host names do not match, the host name is reset, and the system then optionally reboots to pick up the new host name. If a custom host name is not specified, it is generated using the hexadecimal-formatted private IPv4 address, for example, `ip-AC1F4E6`. To prevent your existing host name from being modified, do not enable this setting.

   b. **Extend Boot Volume**

      This setting dynamically extends `Disk 0/Volume 0` to include any unpartitioned space. This can be useful when the instance is booted from a root device volume that has a custom size.

   c. **Set Administrator Account**

      When enabled, you can set the username and password attributes for the administrator account that is created on your local machine. If this feature is not enabled, an administrator account is not created on the system following Sysprep. Provide a password in `adminPassword` only if `adminPasswordType` is `Specify`.

      The password types are defined as follows:

      i. **Random**

         EC2Launch generates a password and encrypts it using the user's key. The system disables this setting after the instance is launched so that this password persists if the instance is rebooted or stopped and started.

      ii. **Specify**

         EC2Launch uses the password that you specify in `adminPassword`. If the password does not meet the system requirements, EC2Launch generates a random password instead. The password is stored in `agent-config.yml` as clear text and is deleted after Sysprep sets the administrator password. EC2Launch encrypts the password using the user's key.

      iii. **Do not set**
EC2Launch uses the password that you specify in the unattend.xml file. If you don't specify a password in unattend.xml, the administrator account is disabled.

d. **Start SSM Service**

When selected, the Systems Manager service is enabled to start following Sysprep. EC2Launch v2 performs all of the tasks described earlier, and the SSM Agent processes requests for Systems Manager capabilities, such as Run Command and State Manager.

You can use Run Command to upgrade your existing instances to use the latest version of the EC2Launch v2 service and SSM Agent. For more information, see *Update SSM Agent by using Run Command* in the *AWS Systems Manager User Guide*.

e. **Optimize ENA**

When selected, ENA settings are configured to ensure that ENA Receive Side Scaling and Receive Queue Depth settings are optimized for AWS. For more information, see *Configure Receive side scaling CPU affinity*.

f. **Enable SSH**

This setting enables OpenSSH for later Windows versions to allow for remote system administration.

g. **Enable Jumbo Frames**

Select to enable Jumbo Frames. Jumbo Frames can have unintended effects on your network communications, so ensure you understand how Jumbo Frames will impact your system before enabling. For more information about Jumbo Frames, see *Jumbo frames (9001 MTU)*.

h. **Prepare for Imaging**

Select whether you want your EC2 instance to shut down with or without Sysprep. When you want to run Sysprep with EC2Launch v2, choose *Shutdown with Sysprep*.

4. On the **DNS Suffix** tab, you can select whether you want to add a DNS suffix list for DNS resolution of servers running in EC2, without providing the fully qualified domain name. DNS suffixes can contain the variables $REGION and $AZ. Only suffixes that do not already exist will be added to the list.
5. On the **Wallpaper** tab, you can configure your instance wallpaper with a background image, and specify instance details for the wallpaper to display. Amazon EC2 generates the details each time you log in.

You can configure your wallpaper with the following controls.

- **Display instance details on wallpaper** – This checkbox activates or deactivates instance detail display on the wallpaper.
- **Image path (.jpg)** – Specify the path to the image to use as the wallpaper background.
- **Select attributes to display on wallpaper** – Select the check boxes for the instance details that you want to appear on the wallpaper. Clear the check boxes for previously selected instance details that you want to remove from the wallpaper.
- **Display Instance Tags on wallpaper** – Select one of the following settings to display instance tags on the wallpaper:
  - **None** – Don’t display any instance tags on the wallpaper.
  - **Show all** – Display all instance tags on the wallpaper.
  - **Show filtered** – Display specified instance tags on the wallpaper. When you select this setting, you can add instance tags that you want to display on your wallpaper in the **Instance tag filter** box.
Note

You must enable tags in metadata to show tags on the wallpaper. For more information about instance tags and metadata, see View tags for your instances using instance metadata.

6. On the Volumes tab, select whether you want to initialize the volumes that are attached to the instance. Enabling sets drive letters for any additional volumes and extends them to use available space. If you select All, all of the storage volumes are initialized. If you select Devices, only devices that are specified in the list are initialized. You must enter the device for each device to be initialized. Use the devices listed on the EC2 console, for example, xvdb or /dev/
nvme0n1. The dropdown list displays the storage volumes that are attached to the instance. To enter a device that is not attached to the instance, enter it in the text field.

**Name, Letter, and Partition** are optional fields. If no value is specified for **Partition**, storage volumes larger than 2 TB are initialized with the gpt partition type, and those smaller than 2 TB are initialized with the mbr partition type. If devices are configured, and a non-NTFS device either contains a partition table, or the first 4 KB of the disk contain data, then the disk is skipped and the action logged.
Amazon EC2 Launch settings

General  DNS suffix  Wallpaper  Volumes

Initialize volumes
- Initialize
- All
- Devices

Devices
If you choose Devices, only the devices listed below are initialized. You must enter the Device for each device to be initialized. Use the devices listed on the EC2 console, for example, xvdb or /dev/nvme0n1. Name, Letter, and Partition are optional.
The following is an example configuration YAML file created from the settings entered in the EC2Launch dialog.

```yaml
version: 1.0
config:
  - stage: boot
    tasks:
      - task: extendRootPartition
    - stage: preReady
      tasks:
        - task: activateWindows
          inputs:
            activation:
              type: amazon
        - task: setDnsSuffix
          inputs:
            suffixes:
            - $REGION.ec2-utilities.amazonaws.com
        - task: setAdminAccount
          inputs:
            password:
              type: random
        - task: setWallpaper
          inputs:
            path: C:\ProgramData\Amazon\EC2Launch\wallpaper\Ec2Wallpaper.jpg
          attributes:
            - hostName
            - instanceId
            - privateIpAddress
            - publicIpAddress
            - instanceSize
            - availabilityZone
            - architecture
            - memory
            - network
    - stage: postReady
      tasks:
        - task: startSsm

EC2Launch v2 directory structure

EC2Launch v2 should be installed in the following directories:
• Service binaries: `%ProgramFiles%\Amazon\EC2Launch`
• Service data (settings, log files, and state files): `%ProgramData%\Amazon\EC2Launch`

**Note**

By default, Windows hides files and folders under `C:\ProgramData`. To view EC2Launch v2 directories and files, you must either enter the path in Windows Explorer or change the folder properties to show hidden files and folders.

The `%ProgramFiles%\Amazon\EC2Launch` directory contains binaries and supporting libraries. It includes the following subdirectories:

- **settings**
  - `EC2LaunchSettingsUI.exe` — user interface for modifying the `agent-config.yml` file
  - `YamlDotNet.dll` — DLL for supporting some operations in the user interface

- **tools**
  - `ebsnvme-id.exe` — tool for examining the metadata of the EBS volumes on the instance
  - `AWSAcpiSpcrReader.exe` — tool for determining the correct COM port to use
  - `EC2LaunchEventMessage.dll` — DLL for supporting the Windows event logging for EC2Launch.

- **service**
  - `EC2LaunchService.exe` — Windows service executable that is launched when the launch agent runs as a service.
  - `EC2Launch.exe` — main EC2Launch executable
  - `EC2LaunchAgentAttribution.txt` — attribution for code used within EC2 Launch

The `%ProgramData%\Amazon\EC2Launch` directory contains the following subdirectories. All of the data produced by the service, including logs, configuration, and state, is stored in this directory.

- **config** — Configuration
  
  The service configuration file is stored in this directory as `agent-config.yml`. This file can be updated to modify, add, or remove default tasks run by the service. Permission to create files in this directory is restricted to the administrator account to prevent privilege escalation.
• log – Instance logs

Logs for the service (agent.log), console (console.log), performance (bench.log), errors (err.log), and telemetry (telemetry.log) are stored in this directory. Log files are appended to on subsequent executions of the service.

• state – Service state data

The state that the service uses to determine which tasks should run is stored here. There is a .run-once file that indicates whether the service has already run after Sysprep (so tasks with a frequency of once will be skipped on the next run). This subdirectory includes a state.json and previous-state.json to track the status of each task.

• sysprep – Sysprep

This directory contains files that are used to determine which operations to perform by Sysprep when it creates a customized Windows AMI that can be reused.

• wallpaper – Wallpaper

This wallpaper images is stored in this directory.

**Configure EC2Launch v2 using the CLI**

You can use the Command Line Interface (CLI) to configure your EC2Launch settings and manage the service. The following section contains descriptions and usage information for the CLI commands that you can use to manage EC2Launch v2.

**Commands**

• collect-logs
• get-agent-config
• list-volumes
• reset
• run
• status
• sysprep
• validate
• version
• wallpaper
**collect-logs**

Collects log files for EC2Launch, zips the files, and places them in a specified directory.

**Example**

```
ec2launch collect-logs -o C:\Mylogs.zip
```

**Usage**

dc2launch collect-logs [flags]

**Flags**

-h, --help
help for collect-logs

-o, --output string
path to zipped output log files

**get-agent-config**

Prints agent-config.yml in the format specified (JSON or YAML). If no format is specified, agent-config.yml is printed in the format previously specified.

**Example**

```
ec2launch get-agent-config -f json
```

**Example 2**

The following PowerShell commands show how to edit and save the agent-config file in JSON format.

```powershell
$config = & "$env:ProgramFiles\Amazon\EC2Launch\EC2Launch.exe" --format json | ConvertFrom-Json
$jumboFrame = @
{
   "task": "enableJumboFrames"
}
"@
Usage

d2launch get-agent-config [flags]

Flags

-h, --help
help for get-agent-config

-f, --format string
output format of agent-config file: json, yaml

list-volumes

Lists all of the storage volumes attached to the instance, including ephemeral and EBS volumes.

Example

d2launch list-volumes

Usage

d2launch list-volumes

Flags

-h, --help
help for list-volumes

reset

The main goal of this task is to reset the agent for the next time that it runs. To do that, the reset command deletes all of the agent state data for EC2Launch v2 from the local EC2Launch directory (see EC2Launch v2 directory structure). Reset optionally deletes the service and Sysprep logs.

Script behavior depends on what mode the agent runs the scripts in – inline, or detached.
Inline (default)

The EC2Launch v2 agent runs scripts one at a time (\texttt{detach: false}). This is the default setting.

\begin{itemize}
  \item \textbf{Note}
  \begin{itemize}
    \item When your inline script issues a \texttt{reset} or \texttt{sysprep} command, it runs immediately and resets the agent. The current task finishes, then the agent shuts down without running any further tasks.
    \item For example, if the task that issues the command would have been followed by a \texttt{startSsm} task (included by default after user data runs), the task doesn't run and the Systems Manager service never starts.
  \end{itemize}
\end{itemize}

Detached

The EC2Launch v2 agent runs scripts concurrently with other tasks (\texttt{detach: true}).

\begin{itemize}
  \item \textbf{Note}
  \begin{itemize}
    \item When your detached script issues a \texttt{reset} or \texttt{sysprep} command, those commands wait for the agent to finish before they run. Tasks after the executeScript will still run.
  \end{itemize}
\end{itemize}

Example

```
ec2launch reset -c
```

Usage

```
ec2launch reset [flags]
```

Flags

\begin{itemize}
  \item \texttt{-c, --clean}
  \begin{itemize}
    \item cleans instance logs before reset
  \end{itemize}
  \item \texttt{-h, --help}
\end{itemize}
help for reset

run

Runs EC2Launch v2.

Example

`ec2launch run`

Usage

`ec2launch run [flags]`

Flags

-h, --help

help for run

status

Gets the status of the EC2Launch v2 agent. Optionally blocks the process until the agent is finished. The process exit code determines the agent state:

- 0 – the agent ran and was successful.
- 1 – the agent ran and failed.
- 2 – the agent is still running.
- 3 – the agent is in an unknown state. The agent state is not running or stopped.
- 4 – an error occurred when attempting to retrieve the agent state.
- 5 – the agent is not running and the status of the last known run is unknown. This could mean one of the following:
  - both the state.json and previous-state.json are deleted.
  - the previous-state.json is corrupted.

This is the agent state after running the `reset` command.

Example:
Usage

e2launch status [flags]

Flags

-b, --block
blocks the process until the agent finishes running

-h, --help
help for status

sysprep

The main goal of this task is to reset the agent for the next time that it runs. To do that, the sysprep command resets the agent state, updates the unattend.xml file, disables RDP, and runs Sysprep.

Script behavior depends on what mode the agent runs the scripts in – inline, or detached.

Inline (default)

The EC2Launch v2 agent runs scripts one at a time (detach: false). This is the default setting.

Note

When your inline script issues a reset or sysprep command, it runs immediately and resets the agent. The current task finishes, then the agent shuts down without running any further tasks.
For example, if the task that issues the command would have been followed by a startSsm task (included by default after user data runs), the task doesn't run and the Systems Manager service never starts.

Detached

The EC2Launch v2 agent runs scripts concurrently with other tasks (detach: true).
Note

When your detached script issues a reset or sysprep command, those commands wait for the agent to finish before they run. Tasks after the executeScript will still run.

Example:

```
ec2launch sysprep
```

Usage

e2launch sysprep [flags]

Flags

- `c`, `--clean`
  cleans instance logs before sysprep

- `h`, `--help`
  help for Sysprep

- `s`, `--shutdown`
  shuts down the instance after sysprep

validate

Validates the agent-config file `C:\ProgramData\Amazon\EC2Launch\config\agent-config.yml`.

Example

```
ec2launch validate
```

Usage

e2launch validate [flags]

Flags
-h, --help

help for validate

version

Gets the executable version.

Example

d2launch version

Usage

d2launch version [flags]

Flags

-h, --help

help for version

wallpaper

Sets new wallpaper to the wallpaper path that is provided (.jpg file), and displays the selected instance details.

Syntax

d2launch wallpaper ^
--path="C:\ProgramData\Amazon\EC2Launch\wallpaper\Ec2Wallpaper.jpg" ^
--all-tags ^
--
attributes=hostName,instanceId,privateIpAddress,publicIpAddress,instanceSize,availabilityZone,architecture,memory,network

Inputs

Parameters

--allowed-tags [tag-name-1, tag-name-n]

(Optional) Base64 encoded JSON array of instance tag names to display on the wallpaper. You can use this tag or the --all-tags, but not both.
--attributes `attribute-string-1, attribute-string-n`

(Optional) A comma-separated list of `wallpaper` attribute strings to apply settings to the wallpaper.

`[--path | -p] path-string`

(Required) Specifies the `wallpaper` background image file path.

Flags

--all-tags

(Optional) Displays all of the instance tags on the wallpaper. You can use this tag or the `--allowed-tags`, but not both.

`[--help | -h]`

Displays help for the `wallpaper` command.

**EC2Launch v2 task configuration**

This section includes the configuration schema, tasks, details, and examples for `agent-config.yml` and user data.

**Tasks and examples**

- **Schema: agent-config.yml**
- **Schema: user data**
- **Task definitions**

**Schema: agent-config.yml**

The structure of the `agent-config.yml` file is shown below. Note that a task cannot be repeated in the same stage. For task properties, see the task descriptions that follow.

**Document structure: agent-config.yml**

**JSON**

```json
{
    "version": "1.0",
```
"config": [ 
  { 
    "stage": "string",
    "tasks": [ 
      { 
        "task": "string",
        "inputs": { 
        ... 
      }
    ],
    ...
  }
  ...
}

YAML

version: 1.0
config: 
- stage: string 
  tasks: 
    - task: string
      inputs: 
        ...
        ...

Example: agent-config.yml

The following example shows settings for the agent-config.yml configuration file.

version: 1.0
config: 
- stage: boot 
  tasks: 
    - task: extendRootPartition
- stage: preReady 
  tasks: 
    - task: activateWindows
      inputs: 
        activation:
- task: setDnsSuffix
  inputs:
    suffixes:
    - $REGION.ec2-utilities.amazonaws.com
- task: setAdminAccount
  inputs:
    password:
      type: random
- task: setWallpaper
  inputs:
    path: C:\ProgramData\Amazon\EC2Launch\wallpaper\Ec2Wallpaper.jpg
    attributes:
    - hostName
    - instanceId
    - privateIpAddress
    - publicIpAddress
    - instanceSize
    - availabilityZone
    - architecture
    - memory
    - network

- stage: postReady
  tasks:
    - task: startSsm

**Schema: user data**

The following JSON and YAML examples show the document structure for user data. Amazon EC2 parses each task named in the `tasks` array that you specify in the document. Each task has its own set of properties and requirements. For details, see the [Task definitions](#).

⚠️ **Note**

A task must only appear once in user data tasks array.

**Document structure: user data**

**JSON**

```json
{

```
YAML

YAML

Example: user data

For more information about user data, see [How Amazon EC2 handles user data for Windows instances](#).

The following YAML document example shows a PowerShell script that EC2Launch v2 runs as user data to create a file.

```
version: 1.1
tasks:
- task: executeScript
  inputs:
    - frequency: always
      type: powershell
      runAs: localSystem
      content: |
        New-Item -Path 'C:\PowerShellTest.txt' -ItemType File
```

You can use an XML format for the user data that's compatible with previous versions of the launch agent. EC2Launch v2 runs the script as an executeScript task in the UserData stage.
To conform with EC2Launch v1 and EC2Config behavior, the user data script runs as an attached/inline process by default.

You can add optional tags to customize how your script runs. For example, to run the user data script when the instance reboots in addition to one time when the instance launches, you can use the following tag:

```xml
<persist>true</persist>
```

**Example:**

```powershell
$file = $env:SystemRoot + \"\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
New-Item $file -ItemType file
</powershell>
<persist>true</persist>
```

You can specify one or more PowerShell arguments with the `<powershellArguments>` tag. If no arguments are passed, EC2Launch v2 adds the following argument by default: `-ExecutionPolicy Unrestricted`.

**Example:**

```powershell
$file = $env:SystemRoot + \"\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
New-Item $file -ItemType file
</powershell>
<powershellArguments>-ExecutionPolicy Unrestricted -NoProfile -NonInteractive</powershellArguments>
```

To run an XML user data script as a detached process, add the following tag to your user data.

```xml
<detach>true</detach>
```

**Example:**

```powershell
$file = $env:SystemRoot + \"\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
New-Item $file -ItemType file
</powershell>
```
Note
The detach tag is not supported on previous launch agents.

Change log: user data
The following table lists changes for user data, and cross-references them to the EC2Launch v2 agent version that applies.

<table>
<thead>
<tr>
<th>User data version</th>
<th>Details</th>
<th>Introduced in</th>
</tr>
</thead>
</table>
| 1.1 | • User data tasks run before the PostReady stage in the agent config file.  
 • Runs user data before starting the Systems Manager Agent (same behavior as EC2Launch v1 and EC2Config).* | EC2Launch v2 version 2.0.1245 |
| 1.0 | • Will be deprecated.  
 • User data tasks run after the PostReady stage in the agent config file. This is not backwards compatible with EC2Launch v1.  
 • Impacted by a race condition between Systems Manager Agent start and user data tasks. | EC2Launch v2 version 2.0.0 |

* When used with the default agent-config.yml file.

Task definitions
Each task has its own set of properties and requirements. For details, see the individual tasks that you want to include in your document.
Tasks

- activateWindows
- enableJumboFrames
- enableOpenSsh
- executeProgram
- executeScript
- extendRootPartition
- initializeVolume
- optimizeEna
- setAdminAccount
- setDnsSuffix
- setHostName
- setWallpaper
- startSsm
- sysprep
- writeFile

activateWindows

Activates Windows against a set of AWS KMS servers. Activation is skipped if the instance is detected as Bring-Your-Own-License (BYOL).

Frequency — once

AllowedStages — [PreReady]

Inputs —

activation: (map)

type: (string) activation type to use, set to amazon

Example

```
task: activateWindows
```
enableJumboFrames

Enables Jumbo Frames, which increase the maximum transmission unit (MTU) of the network adapter. For more information, see Jumbo frames (9001 MTU).

*Frequency* — always

*AllowedStages* — [PostReady, UserData]

*Inputs* — none

*Example*

```yaml
task: enableJumboFrames
```

enableOpenSsh

Enables Windows OpenSSH and adds the public key for the instance to the authorized keys folder.

*Frequency* — once

*AllowedStages* — [PreReady, UserData]

*Inputs* — none

*Example*

The following example shows how to enable OpenSSH on an instance, and to add the public key for the instance to the authorized keys folder. This configuration works only on instances running Windows Server 2019 and later versions.

```yaml
task: enableOpenSsh
```

executeProgram

Runs a program with optional arguments and a specified frequency.
Stages: You can run the `executeProgram` task during the PreReady, PostReady, and UserData stages.

Frequency: configurable, see Inputs.

Inputs

This section contains one or more programs for the `executeProgram` task to run (inputs). Each input can include the following configurable settings:

- **frequency (string)**
  
  (Required) Specify exactly one of the following values:
  
  - once
  - always

- **path (string)**
  
  (Required) The file path for the executable to run.

- **arguments (list of strings)**
  
  (Optional) A comma separated list of arguments to provide to the program as input.

- **runAs (string)**
  
  (Required) Must be set to `localSystem`

Output

All of the tasks write logfile entries to the `agent.log` file. Additional output from the `executeProgram` task is stored separately in a dynamically named folder, as follows:

```
%LocalAppData%\Temp\EC2Launch#####\outputfilename.tmp
```

The exact path to the output files is included in the `agent.log` file, for example:

```
Program file is created at: C:\Windows\system32\config\systemprofile\AppData\Local\Temp\EC2Launch123456789\ExecuteProgramInputs.tmp
Output file is created at: C:\Windows\system32\config\systemprofile\AppData\Local\Temp\EC2Launch123456789\Output.tmp
Error file is created at: C:\Windows\system32\config\systemprofile\AppData\Local\Temp\EC2Launch123456789\Err.tmp
```
**Output files for the `executeProgram` task**

**ExecuteProgramInputs.tmp**

Contains the path for the executable, and all of the input parameters that the `executeProgram` task passes to it when it runs.

**Output.tmp**

Contains runtime output from the program that the `executeProgram` task runs.

**Err.tmp**

Contains runtime error messages from the program that the `executeProgram` task runs.

**Examples**

The following examples show how to run an executable file from a local directory on an instance with the `executeProgram` task.

**Example 1: Setup executable with one argument**

This example shows an `executeProgram` task that runs a setup executable in quiet mode.

```yaml
- task: executeProgram
  inputs:
  - frequency: always
    path: C:\Users\Administrator\Desktop\setup.exe
    arguments: ['-quiet']
```

**Example 2: VLC executable with two arguments**

This example shows an `executeProgram` task that runs a VLC executable file with two arguments passed as input parameters.

```yaml
- task: executeProgram
  inputs:
  - frequency: always
    path: C:\vlc-3.0.11-win64.exe
    arguments: ['/L=1033','/S']
  runAs: localSystem
```
**executeScript**

Runs a script with optional arguments and a specified frequency. Script behavior depends on what mode the agent runs the scripts in – inline, or detached.

**Inline (default)**

The EC2Launch v2 agent runs scripts one at a time (detach: false). This is the default setting.

> **Note**

When your inline script issues a `reset` or `sysprep` command, it runs immediately and resets the agent. The current task finishes, then the agent shuts down without running any further tasks.

For example, if the task that issues the command would have been followed by a `startSsm` task (included by default after user data runs), the task doesn't run and the Systems Manager service never starts.

**Detached**

The EC2Launch v2 agent runs scripts concurrently with other tasks (detach: true).

> **Note**

When your detached script issues a `reset` or `sysprep` command, those commands wait for the agent to finish before they run. Tasks after the `executeScript` will still run.

**Stages:** You can run the `executeScript` task during the PreReady, PostReady, and UserData stages.

**Frequency:** configurable, see `Inputs`.

**Inputs**

This section contains one or more scripts for the `executeScript` task to run (inputs). Each input can include the following configurable settings:
frequency (string)

(Required) Specify exactly one of the following values:

- once
- always

type (string)

(Required) Specify exactly one of the following values:

- batch
- powershell

arguments (list of strings)

(Optional) A list of string arguments to pass to the shell. This parameter isn't supported for type: batch. If no arguments are passed, EC2Launch v2 adds the following argument by default: -ExecutionPolicy Unrestricted.

content (string)

(Required) Script content.

runAs (string)

(Required) Specify exactly one of the following values:

- admin
- localSystem

detach (Boolean)

(Optional) The EC2Launch v2 agent defaults to run scripts one at a time (detach: false). To run the script concurrently with other tasks, set the value to true (detach: true).

Note

Script exit codes (including 3010) have no effect when detach is set to true.

Output

All of the tasks write logfile entries to the agent.log file. Additional output from script that the executeScript task runs is stored separately in a dynamically named folder, as follows:
The exact path to the output files is included in the agent .log file, for example:

Program file is created at: C:\Windows\system32\config\systemprofile\AppData\Local \Temp\EC2Launch123456789\UserScript.ps1
Output file is created at: C:\Windows\system32\config\systemprofile\AppData\Local \Temp\EC2Launch123456789\Output.tmp
Error file is created at: C:\Windows\system32\config\systemprofile\AppData\Local \Temp\EC2Launch123456789\Err.tmp

**Output files for the executeScript task**

**UserScript. ext**

Contains the script that the executeScript task ran. The file extension depends on the type of script you specified in the type parameter for the executeScript task, as follows:

- If the type is batch, then the file extension is .bat.
- If the type is powershell, then the file extension is .ps1.

**Output.tmp**

Contains runtime output from the script that the executeScript task runs.

**Err.tmp**

Contains runtime error messages from the script that the executeScript task runs.

**Examples**

The following examples show how to run an inline script with the executeScript task.

**Example 1: Hello world output text file**

This example shows an executeScript task that runs a PowerShell script to create a "Hello world" text file on the C: drive.

```plaintext
task: executeScript
inputs:
- frequency: always
type: powershell
runAs: admin
content: |
```
Example 2: Run two scripts

This example shows that the `executeScript` task can run more than one script, and the script type doesn't necessarily need to match.

The first script (type: `powershell`) writes a summary of the processes that are currently running on the instance to a text file located on the C: drive.

The second script (type: `batch`) writes the system information to the `Output.tmp` file.

```powershell
Get-Process | Out-File -FilePath C:\Process.txt
```

Example 3: Idempotent system configuration with reboots

This example shows an `executeScript` task that runs an idempotent script to perform the following system configuration with a reboot between each step:

- Rename the computer.
- Join the computer to the domain.
- Enable Telnet.

The script ensures that each operation runs one time only. This prevents a reboot loop and makes the script idempotent.
extendRootPartition

Extends the root volume to use all of the available space on the disk.

Frequency — once

AllowedStages — [Boot]

Inputs — none

Example

task: extendRootPartition

initializeVolume

Initializes empty volumes that are attached to the instance so that they're activated and partitioned. The launch agent skips initialization if it detects that the volume is not empty. A volume is considered empty if the first 4 KiB of the volume are empty, or if the volume doesn't have a Windows-recognizable drive layout.

The letter input parameter is always applied when this task runs, regardless of whether the drive is already initialized.
The initializeVolume task performs the following actions.

- Set disk attributes offline and readonly to false.
- Create a partition. If no partition type is specified in the partition input parameter, the following defaults apply:
  - If the disk size is smaller than 2 TB, set the partition type to mbr.
  - If the disk size is 2 TB or larger, set the partition type to gpt.
- Format the volume as NTFS.
- Set the volume label as follows:
  - Use the value of the name input parameter, if specified.
  - If the volume is ephemeral, and no name was specified, set the volume label to Temporary Storage Z.
- If the volume is ephemeral (SSD or HDD – not Amazon EBS), create an Important.txt file at the root of the volume with the following content:

```
This is an 'Instance Store' disk and is provided at no additional charge.

*This disk offers increased performance since it is local to the host
*The number of Instance Store disks available to an instance vary by instance type
*DATA ON THIS DRIVE WILL BE LOST IN CASES OF IMPAIRMENT OR STOPPING THE INSTANCE.
  PLEASE ENSURE THAT ANY IMPORTANT DATA IS BACKED UP FREQUENTLY

For more information, please refer to: Amazon EC2 instance store temporary block storage for Amazon EC2 instances.
```

- Set the drive letter to the value specified in the letter input parameter.

**Stages:** You can run the initializeVolume task during the PostReady and UserData stages.

**Frequency:** always.

**Inputs**

You can configure runtime parameters as follows:

**devices (list of maps)**

(Conditional) Configuration for each device that the launch agent initializes. This is required if the initialize input parameter is set to devices.
• **device (string, required)** – Identifies the device during instance creation. For example, xvdb, xvdf, or \dev\nvme0n1.

• **letter (string, optional)** – One character. The drive letter to assign.

• **name (string, optional)** – The volume name to assign.

• **partition (string, optional)** – Specify one of the following values for the type of partition to create, or let the launch agent default based on volume size:
  * mbr
  * gpt

**initialize (string)**

(Required) Specify exactly one of the following values:

• all
• devices

**Examples**

The following examples show sample input configurations for the `initializeVolume` task.

**Example 1: Initialize two volumes on an instance**

This example shows an `initializeVolume` task that initializes two secondary volumes on an instance. The device named DataVolume2 in the example is ephemeral.

```json
{  "task": "initializeVolume",  "inputs": {    "initialize": "devices",    "devices": [{      "device": "xvdb",      "name": "DataVolume1",      "letter": "D",      "partition": "mbr"    },      {      "device": "/dev/nvme0n1",      "name": "DataVolume2",      "letter": "E",      "partition": "gpt"    }]  }}
```

**Example 2: Initialize EBS volumes attached to an instance**
This example shows an `initializeVolume` task that initializes all empty EBS volumes that are attached to the instance.

```python
  task: initializeVolume
  inputs:
    initialize: all
```

**optimizeEna**

Optimizes ENA settings based on the current instance type; might reboot the instance.

*Frequency* — always

*AllowedStages* — [PostReady, UserData]

*Inputs* — none

*Example*

```python
  task: optimizeEna
```

**setAdminAccount**

Sets attributes for the default administrator account that is created on the local machine.

*Frequency* — once

*AllowedStages* — [PreReady]

*Inputs* —

- name: (string) name of the administrator account
- password: (map)
- type: (string) strategy to set the password, either as static, random, or doNothing
- data: (string) stores data if the type field is static

*Example*

```python
  task: setAdminAccount
  inputs:
```
setDnsSuffix

Adds DNS suffixes to the list of search suffixes. Only suffixes that do not already exist are added to the list. For more information about how launch agents set DNS suffixes, see Configure DNS Suffix for Windows launch agents.

Frequency — always

AllowedStages — [PreReady]

Inputs —

suffixes: (list of strings) list of one or more valid DNS suffixes; valid substitution variables are $REGION and $AZ

Example

task: setDnsSuffix
inputs:
suffixes:
  - $REGION.ec2-utilities.amazonaws.com

setHostName

Sets the hostname of the computer to a custom string or, if hostName is not specified, the private IPv4 address.

Frequency — always

AllowedStages — [PostReady, UserData]

Inputs —

hostName: (string) optional host name, which must be formatted as follows.

- Must be 15 characters or less
- Must contain only alphanumeric (a-z, A-Z, 0-9) and hyphen (-) characters.
- Must not consist entirely of numerical characters.
reboot: (boolean) denotes whether a reboot is permitted when the hostname is changed

Example

```json
task: setHostName
inputs:
  reboot: true
```

**setWallpaper**

Creates the `setwallpaper.lnk` shortcut file in the startup folder of each existing user except for Default User. This shortcut file runs when the user logs in for the first time after instance boot. It sets up the instance with a custom wallpaper that displays the instance attributes.

The shortcut file path is:

```bash
$env:SystemDrive/Users/<user>/AppData/Roaming/Microsoft/Windows/Start Menu/Programs/Startup/setwallpaper.lnk
```

**Note**

When you remove the `setWallpaper` task, it does not delete this shortcut file. For more information, see [setWallpaper task is not enabled but the wallpaper resets at reboot](#).

**Stages:** You can configure wallpaper during the `PreReady` and `UserData` stages.

**Frequency:** always

**Wallpaper configuration**

You can use the following settings to configure your wallpaper.

**Inputs**

Input parameters that you provide, and attributes that you can set to configure your wallpaper:

- **attributes (list of strings)**

  (Optional) You can add one or more of the following attributes to your wallpaper:
  - architecture
- availabilityZone
- hostName
- instanceId
- instanceSize
- memory
- network
- privateIpAddress
- publicIpAddress

**instanceTags**

(Optional) You can use exactly one of the following options for this setting.

- **AllTags** (string) – Add all instance tags to your wallpaper.

  ```
  instanceTags: AllTags
  ```

- **instanceTags** (list of strings) – Specify a list of instance tag names to add to your wallpaper. For example:

  ```
  instanceTags:
    - Tag 1
    - Tag 2
  ```

**path (string)**

(Required) The filename path of the local .jpg format image file to use for your wallpaper image.

**Example**

The following example shows wallpaper configuration inputs that set the file path for the wallpaper background image, along with instance tags named Tag 1 and Tag 2, and attributes that include the host name, instance ID, and private and public IP addresses for the instance.

```
task: setWallpaper
inputs:
  path: C:\ProgramData\Amazon\EC2Launch\wallpaper\Ec2Wallpaper.jpg
  attributes:
    - hostName
```
- instanceId
- privateIpAddress
- publicIpAddress
instanceTags:
- Tag 1
- Tag 2

**Note**

You must enable tags in metadata to show tags on the wallpaper. For more information about instance tags and metadata, see [View tags for your instances using instance metadata](#).

---

### startSsm

Starts the Systems Manager (SSM) service following Sysprep.

*Frequency* — always

*AllowedStages* — [PostReady, UserData]

*Inputs* — none

*Example*

```yaml
task: startSsm
```

### sysprep

Resets the service state, updates unattend.xml, disables RDP, and runs Sysprep. This task runs only after all other tasks are completed.

*Frequency* — once

*AllowedStages* — [UserData]

*Inputs* —

- `clean`: (boolean) cleans instance logs before running Sysprep
- `shutdown`: (boolean) shuts down the instance after running Sysprep
**Example**

```
[task: sysprep
 inputs:
   clean: true
   shutdown: true]
```

**writeFile**

Writes a file to a destination.

*Frequency* — see *Inputs*

*AllowedStages* — [PostReady, UserData]

*Inputs* —

- `frequency`: (string) one of `once` or `always`
- `destination`: (string) path to which to write the content
- `content`: (string) text to write to the destination

**Example**

```
[task: writeFile
 inputs:
   - frequency: once
     destination: C:\Users\Administrator\Desktop\booted.txt
     content: Windows Has Booted]
```

**EC2Launch v2 exit codes and reboots**

You can use EC2Launch v2 to define how exit codes are handled by your scripts. By default, the exit code of the last command that is run in a script is reported as the exit code for the entire script. For example, if a script includes three commands and the first command fails but the following ones succeed, the run status is reported as `success` because the final command succeeded.

If you want a script to reboot an instance, then you must specify `exit 3010` in your script, even when the reboot is the last step in your script. `exit 3010` instructs EC2Launch v2 to reboot the instance and call the script again until it returns an exit code that is not `3010`, or until the maximum reboot count has been reached. EC2Launch v2 permits a maximum of 5 reboots per
task. If you attempt to reboot an instance from a script by using a different mechanism, such as Close-Computer, then the script run status will be inconsistent. For example, it may get stuck in a restart loop or not perform the restart.

If you are using an XML user data format that is compatible with older agents, the user data may run more times than you intend it to. For more information, see Service runs user data more than once in the Troubleshooting section.

**EC2Launch v2 and Sysprep**

The EC2Launch v2 service runs Sysprep, a Microsoft tool that enables you to create a customized Windows AMI that can be reused. When EC2Launch v2 calls Sysprep, it uses the files in %ProgramData%\Amazon\EC2Launch to determine which operations to perform. You can edit these files indirectly using the EC2Launch settings dialog box, or directly using a YAML editor or a text editor. However, there are some advanced settings that aren't available in the EC2Launch settings dialog box, so you must edit those entries directly.

If you create an AMI from an instance after updating its settings, the new settings are applied to any instance that's launched from the new AMI. For information about creating an AMI, see Create an Amazon EBS-backed AMI.

**Troubleshoot EC2Launch v2**

This section shows common troubleshooting scenarios for EC2Launch v2, information about viewing Windows event logs, and console log output and messages.

**Troubleshooting topics**

- Common troubleshooting scenarios
- Windows event logs
- EC2Launch v2 console log output

**Common troubleshooting scenarios**

This section shows common troubleshooting scenarios and steps for resolution.

**Scenarios**

- Service fails to set the wallpaper
- Service fails to run user data
- **Service runs a task only one time**
- **Service fails to run a task**
- **Service runs user data more than once**
- **Scheduled tasks from EC2Launch v1 fail to run after migration to EC2Launch v2**
- **Service initializes an EBS volume that is not empty**
- **setWallpaper task is not enabled but the wallpaper resets at reboot**
- **Service stuck in running status**
- **Invalid agent-config.yml prevents opening EC2Launch v2 settings dialog box**
- **task:executeScript should be unique and only invoked once**

### Service fails to set the wallpaper

**Resolution**

1. Check that `%AppData%\Roaming\Microsoft\Windows\Start Menu\Programs\Startup\setwallpaper.lnk` exists.
2. Check `%ProgramData%\Amazon\EC2Launch\log\agent.log` to see if any errors occurred.

### Service fails to run user data

**Possible cause:** Service may have failed before running user data.

**Resolution**

1. Check `%ProgramData%\Amazon\EC2Launch\state\previous-state.json`.
2. See if boot, network, preReady, and postReadyLocalData have all been marked as success.
3. If one of the stages failed, check `%ProgramData%\Amazon\EC2Launch\log\agent.log` for specific errors.

### Service runs a task only one time

**Resolution**

1. Check the frequency of the task.
2. If the service already ran after Sysprep, and the task frequency is set to once, the task will not run again.

3. Set the frequency of the task to always if you want it to run the task every time EC2Launch v2 runs.

Service fails to run a task

Resolution

1. Check the latest entries in %ProgramData%\Amazon\EC2Launch\log\agent.log.
2. If no errors occurred, try running the service manually from "%ProgramFiles%\Amazon \EC2Launch\EC2Launch.exe" run to see if the tasks succeed.

Service runs user data more than once

Resolution

User data is handled differently between EC2Launch v1 and EC2Launch v2. EC2Launch v1 runs user data as a scheduled task on the instance when persist is set to true. If persist is set to false, the task is not scheduled even when it exits with a reboot or is interrupted while running.

EC2Launch v2 runs user data as an agent task and tracks its run state. If user data issues a computer restart or if user data was interrupted while running, the run state persists as pending and the user data will run again at the next instance boot. If you want to prevent the user data script from running more than once, make the script idempotent.

The following example idempotent script sets the computer name and joins a domain.

```powershell
$name = $env:computername
if ($name -ne $desiredName) {
    Rename-Computer -NewName $desiredName
}
$domain = Get-ADDomain
if ($domain -ne $desiredDomain) {
    Add-Computer -DomainName $desiredDomain
}
$telnet = Get-WindowsFeature -Name Telnet-Client
```
Scheduled tasks from EC2Launch v1 fail to run after migration to EC2Launch v2

Resolution

The migration tool does not detect any scheduled tasks linked to EC2Launch v1 scripts; therefore, it does not automatically set up those tasks in EC2Launch v2. To configure these tasks, edit the `agent-config.yml` file, or use the EC2Launch v2 settings dialog box. For example, if an instance has a scheduled task that runs `InitializeDisks.ps1`, then after you run the migration tool, you must specify the volumes you want to initialize in the EC2Launch v2 settings dialog box. See Step 6 of the procedure to Change settings using the EC2Launch v2 settings dialog box.

Service initializes an EBS volume that is not empty

Resolution

Before it initializes a volume, EC2Launch v2 attempts to detect whether it is empty. If a volume is not empty, it skips the initialization. Any volumes that are detected as not empty are not initialized. A volume is considered empty if the first 4 KiB of a volume are empty, or if a volume does not have a Windows-recognizable drive layout. A volume that was initialized and formatted on a Linux system does not have a Windows-recognizable drive layout, for example MBR or GPT. Therefore, it will be considered as empty and initialized. If you want to preserve this data, do not rely on EC2Launch v2 empty drive detection. Instead, specify volumes that you would like to initialize in the EC2Launch v2 settings dialog box (see step 6) or in the `agent-config.yml`.

setWallpaper task is not enabled but the wallpaper resets at reboot

The setWallpaper task creates the `setwallpaper.lnk` shortcut file in the startup folder of each existing user except for Default User. This shortcut file runs when the user logs in for the first time after instance boot. It sets up the instance with a custom wallpaper that displays the instance attributes. Removing the setWallpaper task does not delete this shortcut file. You must manually delete this file or delete it using a script.

The shortcut path is:
$env:SystemDrive/Users/<user>/AppData/Roaming/Microsoft/Windows/Start Menu/Programs/Startup/setwallpaper.lnk

Resolution

Manually delete this file, or delete it using a script.

Example PowerShell script to delete shortcut file

```powershell
foreach ($userDir in (Get-ChildItem "C:\Users" -Force -Directory).FullName)
{
    $startupPath = Join-Path $userDir -ChildPath "AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup"
    if (Test-Path $startupPath)
    {
        $wallpaperSetupPath = Join-Path $startupPath -ChildPath "setwallpaper.lnk"
        if (Test-Path $wallpaperSetupPath)
        {
            Remove-Item $wallpaperSetupPath -Force -Confirm:$false
        }
    }
}
```

Service stuck in running status

Description

EC2Launch v2 is blocked, with log messages (agent.log) similar to the following:

```plaintext
2022-02-24 08:08:58 Info: EC2Launch Service starting
2022-02-24 08:08:58 Info: Windows event custom log exists: Amazon EC2Launch
2022-02-24 08:08:58 Info: ACPI SPCR table not supported. Bailing Out
2022-02-24 08:08:58 Info: Serial port is in use. Waiting for Serial Port...
2022-02-24 08:09:00 Info: ACPI SPCR table not supported. Use default console port.
2022-02-24 08:09:02 Info: ACPI SPCR table not supported. Use default console port.
2022-02-24 08:09:04 Info: ACPI SPCR table not supported. Use default console port.
2022-02-24 08:09:06 Info: ACPI SPCR table not supported. Use default console port.
```

Possible cause

Configure Windows launch agents
SAC is enabled and using the serial port. For more information, see [Use SAC to troubleshoot your Windows instance](#).

**Resolution**

Try the following steps to resolve this issue:

- Disable the service that is using the serial port.
- If you want the service to continue to use the serial port, write custom scripts to perform launch agent tasks and invoke them as scheduled tasks.

**Invalid agent-config.yml prevents opening EC2Launch v2 settings dialog box**

**Description**

EC2Launch v2 settings attempts to parse the `agent-config.yml` file before it opens the dialog box. If the YAML configuration file does not follow the supported schema, the dialog box will show the following error:

Unable to parse configuration file `agent-config.yml`. Review configuration file. Exiting application.

**Resolution**

1. Verify that the configuration file follows the [supported schema](#).
2. If you want to start from scratch, copy the default configuration file into `agent-config.yml`. You can use the [example agent-config.yml](#) provided in the Task Configuration section.
3. You can also start over by deleting `agent-config.yml`. EC2Launch v2 settings generates an empty configuration file.

**task:executeScript should be unique and only invoked once**

**Description**

A task cannot be repeated in the same stage.

**Resolution**

Some tasks must be input as an array, such as `executeScript` and `executeProgram`. For an example of how to write the script as an array, see `executeScript`.
Windows event logs

EC2Launch v2 publishes Windows event logs for important events, such as service starting, Windows is ready, and task success and failure. Event identifiers uniquely identify a particular event. Each event contains stage, task, and level information, and a description. You can set triggers for specific events using the event identifier.

Event IDs provide information about an event and uniquely identify some events. The least significant digit of an event ID indicates the severity of an event.

<table>
<thead>
<tr>
<th>Event</th>
<th>Least significant digit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>. . .0</td>
</tr>
<tr>
<td>Informational</td>
<td>. . .1</td>
</tr>
<tr>
<td>Warning</td>
<td>. . .2</td>
</tr>
<tr>
<td>Error</td>
<td>. . .3</td>
</tr>
</tbody>
</table>

Service-related events that are generated when the service starts or stops include a single digit event identifier.

<table>
<thead>
<tr>
<th>Event</th>
<th>Single digit identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>Success</td>
<td>0</td>
</tr>
<tr>
<td>Informational</td>
<td>1</td>
</tr>
<tr>
<td>Warning</td>
<td>2</td>
</tr>
<tr>
<td>Error</td>
<td>3</td>
</tr>
</tbody>
</table>

The event messages for EC2LaunchService.exe events begin with Service:. The event messages for EC2Launch.exe events do not begin with Service:.

Four digit event IDs include information about the stage, task, and severity of an event.

Topics
Event ID format

The following table shows the format of an EC2Launch v2 event identifier.

<table>
<thead>
<tr>
<th></th>
<th>3</th>
<th>21</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>T</td>
<td>L</td>
<td></td>
</tr>
</tbody>
</table>

The letters and numbers in the table represent the following event type and definitions.

<table>
<thead>
<tr>
<th>Event type</th>
<th>Definition</th>
</tr>
</thead>
</table>
| S (Stage)  | 0 - Service-level message  
|            | 1 - Boot  
|            | 2 - Network  
|            | 3 - PreReady  
|            | 5 - Windows is Ready  
|            | 6 - PostReady  
|            | 7 - User Data  |
| T (Task)   | The tasks represented by the corresponding two values are different for each stage.  
<p>|            | To view the complete list of events, see Windows Event log schema.  |
| L (Level of the event) | |</p>
<table>
<thead>
<tr>
<th>Event type</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>1</td>
<td>Informational</td>
</tr>
<tr>
<td>2</td>
<td>Warning</td>
</tr>
<tr>
<td>3</td>
<td>Error</td>
</tr>
</tbody>
</table>

**Event ID examples**

The following are example event IDs.

- 5000 - Windows is ready to use
- 3010 - Activate windows task in PreReady stage was successful
- 6013 - Set wallpaper task in PostReady Local Data stage encountered an error

**Windows event log schema**

<table>
<thead>
<tr>

EC2Launch v2 version histories

Version histories

• EC2Launch v2 version history
• EC2Launch v2 migration tool version history

EC2Launch v2 version history

The following table describes the released versions of EC2Launch v2.

<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.0.1924</td>
<td>• Updated the EC2Launch Settings UI.</td>
<td>June 10, 2024</td>
</tr>
<tr>
<td>Version</td>
<td>Details</td>
<td>Release date</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
| 2.0.1914 | • Updated the wallpaper CLI command.  
               • Updated the EC2Launch installer.  
               • Add routes with unspecified gateway addresses (0.0.0.0 for IPv4 or :: for IPv6).  
               • Always add both IPv4 and IPv6 routes.  
               • Fixed an issue where the Administrator user name was added to the agent-config.yml file when it wasn't specified.  
               • Modified EC2Launch v2 permissions. | June 5, 2024 |
| 2.0.1881 | • Added an encrypted password option to setAdminAccount task.  
               • Added CLI command to encrypt static password in agent-config.yml.  
               • Fixed an issue where XML user data doesn't add PowerShell arguments when it runs with Administrator permissions. For more details, see [How Amazon EC2 handles user data for Windows instances](#).  
               • Adjusted PowerShell arguments for the executeScript task and user data scripts when they run with LocalSystem permissions. When arguments are empty, the agent uses the following default value: -ExecutionPolicy Unrestricted.  
               • Prevented printing duplicate driver versions to the console log. | May 8, 2024 |
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 2.0.1815  | • Adjusted error handling to fail on critical setup issues before sysprep.  
• Fixed an issue where wallpaper and hostname tasks could use an incorrect IP address on instances with multiple IP addresses assigned to the primary network interface.  
• Wallpaper and hostname tasks changed to get private IP from IMDS first, then fail back to WMI if IMDS is disabled.  
• Fixed an issue with the `initializeVolume` task where `sc1` volumes failed to initialize due to a transient error. | March 6, 2024 |
| 2.0.1739  | • Fixed an issue that prevented exit codes from being captured by `executeScript` tasks that were run as the Windows Administrator user.                                                                 | January 17, 2024 |
| 2.0.1702  | • Restricted Telemetry.log permissions to read-execute only for standard users.  
• Configured the EC2Launch Windows service to restart on start-up failure.  
• Made `add-routes` failures actionable by logging `route.exe` `stderr` output.  
• Fixed an issue that occurs when route metrics are outside of the range `[1, 9999]`.  
• Added wallpaper support to several new instance types.  
• Fixed an issue caused by user data scripts that run as the Windows Administrator user and send output to `stderr`. | January 4, 2024 |
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 2.0.1643 | - Updated the ebsnvme-id.exe tool to version 1.1.0.7.  
- Fixed an issue with receive side scaling (RSS) and receive queue depth settings on metal instance types that begin with 'metal-*', such as metal-48x1.  
- Removed telemetry event that reports on XML userdata commands that block the agent.  
- Updated setDnsSuffix task to limit domain name devolution based on registry entry: HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Dnscache\Parameters\DomainNameDevolutionLevel.  
- Added a public task and CLI that adds network routes.  
- *Note* – This is the last version to officially support Windows Server 2012.  
- *Note* – This is the last version to officially support 32-bit operating systems.                                                                                                                      | October 4, 2023 |
| 2.0.1580 | - Changed the way that the launch agent handles errors when you modify log file permissions.  
- Added a timeout for connecting to the serial port. The timeout allows the launch agent to continue running if the serial port is in use.                                                                                                      | September 5, 2023 |
### Release date: July 3, 2023

<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 2.0.1521 | • Deprecated the –block flag of the EC2Launch.exe `reset` and `sysprep` commands.  
  • Updated EC2Launch.exe to detect and handle the `reset` and `sysprep` commands that are used in inline `executeScript` tasks. Those commands cause the agent to stop running after the `executeScript` task runs them.  
  • Updated XML userdata scripts to run inline by default.  
  • Enable XML userdata scripts to run detached with the new `detach` tag. For more details, see [User data scripts](#).  
  • Made the following changes to the agent log.  
    • Updated agent log messages.  
    • Removed `executeScript` content and output from the agent log.  
    • Removed `executeProgram` arguments and output from the agent log.  
  • Made the following changes to the console log.  
    • Added `EnableSCSIPersistentReservations` value to the console log. |
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 2.0.1303    | • Added additional error handling and log lines when adding network routes.  
• Allowed `executeScript` and `executeProgram` tasks in the PreReady stage.  
• Updated `executeProgram` task to generate output files similar to the output from the `executeScript` task. For more information, see `executeProgram`.  
• Added telemetry to monitor usage of blocking agent commands in XML user data. | May 3, 2023   |
| 2.0.1245    | • Improved visibility into crashes by logging crash call stacks in clear text.  
• Added the EventLog service as a startup dependency to fix a crash when the Amazon EC2Launch service starts up faster than the EventLog service.  
• Made XML user data run before PostReady stage from the agent config file (like EC2Launch v1 and EC2Config).  
• Added YAML user data version 1.1 to make user data run before PostReady stage from the agent config file (YAML user data version 1.0 runs after PostReady stage from the agent config file). | March 8, 2023 |
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 2.0.1173  | - Adds an optional feature to display instance tags on wallpaper. For more information, see setWallpaper.  
|           | - Adds error handling when the security group for Elastic Graphics is not properly set up.  
|           | - Fixes a timeout when the Instance Metadata Service is not enabled. | February 6, 2023 |
| 2.0.1121  | - Fixes an issue where a 404 error is printed to the wallpaper when no public IPv4 address is assigned.  
|           | - Fixes an issue where the volume's file system is formatted as RAW instead of NTFS when its device's drive letter is set to D.  
|           | - Fixes an issue where NVMe SSD volumes are incorrectly identified as EBS volumes.  
<p>|           | - Fixes an error when activating Windows when IMDS is disabled.           | January 4, 2023 |</p>
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 2.0.1082  | • Fixes an issue where the `setWallpaper :privateIp Address` field is blank when IMDS is disabled.  
• Fixes an issue with setting the hostname to the private IPv4 address when IMDS is disabled.  
• Fixes an issue with initializing volumes on Windows Server 2012.  
• Fixes an issue with setting jumbo frames.  
• Fixes an error when no SSH key is specified at instance launch.  
• Fixes an error on Windows Server 2012 when Windows does not have a 'ReleaseId' registry key. | December 7, 2022   |
| 2.0.1011  | • Fixes logic for finding network adapter when PnPDeviceID is empty.                                                                                                                                 | November 11, 2022  |
| 2.0.1009  | • Uses PCI segment information to select the console port.                                                                                                                                              | November 8, 2022   |
| 2.0.982   | • Adds retry logic to get RDP information.  
• Fixes errors during volume initialization on `d2.8xlarge` instances.  
• Fixes issue where an incorrect network adapter can be selected after a reboot.  
• Removes false alarm error message when ACPI SPCR is unavailable.                                                                 | October 31, 2022   |
<table>
<thead>
<tr>
<th>Version</th>

</tr>
</thead>
</table>
| 2.0.863 | • Updates IMDS wait logic to make only IMDSv2 requests.  
• Adds logic to assign drive letter to volumes that are already initialized but not mounted.  
• Prints a more specific error message when key pair type is not supported.  
• Fixes 3010 reboot code bug.  
• Adds check for invalid base64-encoded user data.                                                                                                        | July 6, 2022       |
| 2.0.698 | • Fixes typo in log output when executing scripts.                                                                                                                                                     | January 30, 2022   |
| 2.0.674 | • Telemetry uploads the enabled/disabled privacy control.  
• Fixes index out of bounds bug.  
• Removes wallpaper shortcuts during `sysprep`.                                                                                                                                                               | November 15, 2021  |
| 2.0.651 | • Adds logic to uninstall legacy agents during EC2Launch v2 installation.  
• Fixes `list-volume` CLI issue when root volume is not listed as volume 0.                                                                                                                   | October 7, 2021    |
| 2.0.592 | • Fixes bug to correctly report stage status.  
• Removes false alarm error messages when log files are closed.  
• Adds telemetry.                                                                                                                                                                                   | August 31, 2021    |

## EC2Launch v2 migration tool version history

The following table describes the released versions of the EC2Launch v2 migration tool.

<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 2.0.146 | - Fixes issue with RootExtend on non-English AMIs.  
- Grants users group write permission to log files.  
- Creates MS Reserved partition for GPT volumes.  
- Adds list-volumes command and volume dropdown in Amazon EC2Launch settings.  
- Adds get-agent-config command for printing agent-config.yml file in yaml or json format.  
- Erases static password if no public key detected. | October 6, 2020 |
| 2.0.124 | - Adds option to display OS version on wallpaper.  
- Initializes encrypted EBS volumes.  
- Adds routes for VPCs with no local DNS name. | September 10, 2020 |
| 2.0.104 | - Creates DNS suffix search list if it does not exist.  
- Skips Hibernation if not requested. | August 12, 2020 |
<p>| 2.0.0   | Initial release. | June 30, 2020 |</p>

**Configure a Windows instance using EC2Launch**

EC2Launch is a set of Windows PowerShell scripts that replaced the EC2Config service on Windows Server 2016 and 2019 AMIs. Many of these AMIs are still available. EC2Launch v2 is the latest launch agent for all supported Windows versions, which replaces both EC2Config and EC2Launch. For more information, see [Configure a Windows instance using EC2Launch v2](#).

**Note**

To use EC2Launch with IMDSv2, the version must be 1.3.2002730 or later.
The following tasks help to maintain backward compatibility with the EC2Config service. You can also configure EC2Launch to perform these tasks during startup:

- Sets up new wallpaper that renders information about the instance.
- Sets the computer name to the private IPv4 address of the instance.
- Sends instance information to the Amazon EC2 console.
- Sends the RDP certificate thumbprint to the EC2 console.
- Sets a random password for the administrator account.
- Adds DNS suffixes.
- Dynamically extends the operating system partition to include any unpartitioned space.
- Executes user data (if specified). For more information about specifying user data, see Work with instance user data.
- Sets persistent static routes to reach the metadata service and AWS KMS servers.

⚠️ Important

If a custom AMI is created from this instance, these routes are captured as part of the OS configuration and any new instances launched from the AMI will retain the same routes, regardless of subnet placement. In order to update the routes, see Update metadata/KMS routes for Server 2016 and later when launching a custom AMI.
• Initialize secondary EBS volumes.
• Send Windows Event logs to the EC2 console logs.
• Send the *Windows is ready to use* message to the EC2 console.

For more information about Windows Server 2019, see [Compare Features in Windows Server Versions](https://microsoft.com) on Microsoft.com.

**Telemetry**

Telemetry is additional information that helps AWS to better understand your requirements, diagnose issues, and deliver features to improve your experience with AWS services.

EC2Launch version 1.3.2003498 and later collect telemetry, such as usage metrics and errors. This data is collected from the Amazon EC2 instance on which EC2Launch runs. This includes all Windows AMIs owned by AWS.

The following types of telemetry are collected by EC2Launch:

• **Usage information** — agent commands, install method, and scheduled run frequency.
• **Errors and diagnostic information** — agent installation and run error codes.

Examples of collected data:

```
2021/07/15 21:44:12Z: EC2LaunchTelemetry: IsAgentScheduledPerBoot=true
2021/07/15 21:44:12Z: EC2LaunchTelemetry: IsUserDataScheduledPerBoot=true
```

Telemetry is enabled by default. You can disable telemetry collection at any time. If telemetry is enabled, EC2Launch sends telemetry data without additional customer notifications.

Your choice to enable or disable telemetry is collected.

You can opt in or out of telemetry collection. Your selection to opt in or out of telemetry is collected to ensure that we adhere to your telemetry option.

**Telemetry visibility**
When telemetry is enabled, it appears in the Amazon EC2 console output as follows:

```
2021/07/15 21:44:12Z: Telemetry: <Data>
```

Disable telemetry on an instance

To disable telemetry by setting a system environment variable, run the following command as an administrator:

```
setx /M EC2LAUNCH_TELEMETRY 0
```

To disable telemetry during installation, run `install.ps1` as follows:

```
. .\install.ps1 -EnableTelemetry:$false
```

Install the latest version of EC2Launch

Use the following procedure to download and install the latest version of EC2Launch on your instances.

**To download and install the latest version of EC2Launch**

1. If you have already installed and configured EC2Launch on an instance, make a backup of the EC2Launch configuration file. The installation process does not preserve changes in this file. By default, the file is located in the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config` directory.
2. Download `EC2-Windows-Launch.zip` to a directory on the instance.
3. Download `install.ps1` to the same directory where you downloaded `EC2-Windows-Launch.zip`.
4. Run `install.ps1`.
5. If you made a backup of the EC2Launch configuration file, copy it to the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config` directory.

**To download and install the latest version of EC2Launch using PowerShell**

If you have already installed and configured EC2Launch on an instance, make a backup of the EC2Launch configuration file. The installation process does not preserve changes in this file. By
default, the file is located in the C:\ProgramData\Amazon\EC2-Windows\Launch\Config directory.

To install the latest version of EC2Launch using PowerShell, run the following commands from a PowerShell window:

```powershell
mkdir $env:USERPROFILE\Desktop\EC2Launch
$DownloadZipFile = "$env:USERPROFILE\Desktop\EC2Launch\" + $(Split-Path -Path $Url -Leaf)
Invoke-WebRequest -Uri $Url -OutFile $DownloadZipFile
$Url = "https://s3.amazonaws.com/ec2-downloads-windows/EC2Launch/latest/install.ps1"
$DownloadZipFile = "$env:USERPROFILE\Desktop\EC2Launch\" + $(Split-Path -Path $Url -Leaf)
Invoke-WebRequest -Uri $Url -OutFile $DownloadZipFile
& $env:USERPROFILE\Desktop\EC2Launch\install.ps1
```

**Note**

If you receive an error when downloading the file, and you are using Windows Server 2016, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

```powershell
```

Verify the installation by checking C:\ProgramData\Amazon\EC2-Windows\Launch.

**Verify the EC2Launch version**

Use the following Windows PowerShell command to verify the installed version of EC2Launch.

```powershell
PS C:\> Test-ModuleManifest -Path "C:\ProgramData\Amazon\EC2-Windows\Launch\Module\Ec2Launch.psd1" | Select Version
```

**EC2Launch directory structure**

EC2Launch is installed by default on Windows Server 2016 and later AMIs in the root directory C:\ProgramData\Amazon\EC2-Windows\Launch.
Note

By default, Windows hides files and folders under C:\ProgramData. To view EC2Launch directories and files, you must either type the path in Windows Explorer or change the folder properties to show hidden files and folders.

The Launch directory contains the following subdirectories.

- Scripts — Contains the PowerShell scripts that make up EC2Launch.
- Module — Contains the module for building scripts related to Amazon EC2.
- Config — Contains script configuration files that you can customize.
- Sysprep — Contains Sysprep resources.
- Settings — Contains an application for the Sysprep graphical user interface.
- Library — Contains shared libraries for EC2 launch agents.
- Logs — Contains log files generated by scripts.

Configure EC2Launch

After your instance has been initialized the first time, you can configure EC2Launch to run again and perform different start-up tasks.

Tasks

- Configure initialization tasks
- Schedule EC2Launch to run on every boot
- Initialize drives and map drive letters
- Send Windows event logs to the EC2 console
- Send Windows is ready message after a successful boot

Configure initialization tasks

Specify settings in the LaunchConfig.json file to enable or disable the following initialization tasks:

- Set the computer name to the instance private IPv4 address.
- Set the monitor to always stay on.
- Set up new wallpaper.
- Add DNS suffix list.

**Note**

This adds a DNS suffix lookup for the following domain and configures other standard suffixes. For more information about how launch agents set DNS suffixes, see [Configure DNS Suffix for Windows launch agents](#).

```
region.ec2-utilities.amazonaws.com
```

- Extend the boot volume size.
- Set the administrator password.

**To configure initialization settings**

1. On the instance to configure, open the following file in a text editor: C:\ProgramData\Amazon\EC2-Windows\Launch\Config\LaunchConfig.json.
2. Update the following settings as needed and save your changes. Provide a password in `adminPassword` only if `adminPasswordType` is `Specify`.

```json
{
  "setComputerName": false,
  "setMonitorAlwaysOn": true,
  "setWallpaper": true,
  "addDnsSuffixList": true,
  "extendBootVolumeSize": true,
  "handleUserData": true,
  "adminPasswordType": "Random | Specify | DoNothing",
  "adminPassword": "password that adheres to your security policy (optional)"
}
```

The password types are defined as follows:
Random

EC2Launch generates a password and encrypts it using the user's key. The system disables this setting after the instance is launched so that this password persists if the instance is rebooted or stopped and started.

Specify

EC2Launch uses the password you specify in adminPassword. If the password does not meet the system requirements, EC2Launch generates a random password instead. The password is stored in LaunchConfig.json as clear text and is deleted after Sysprep sets the administrator password. EC2Launch encrypts the password using the user's key.

DoNothing

EC2Launch uses the password you specify in the unattend.xml file. If you don't specify a password in unattend.xml, the administrator account is disabled.

3. In Windows PowerShell, run the following command to schedule the script to run as a Windows Scheduled Task. The script runs one time during the next boot and then disables these tasks from running again.

   PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -Schedule

**Schedule EC2Launch to run on every boot**

You can schedule EC2Launch to run on every boot instead of only the initial boot.

To enable EC2Launch to run on every boot:

1. Open Windows PowerShell and run the following command:

   PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -SchedulePerBoot

2. Or, run the executable with the following command:

   PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Settings\Ec2LaunchSettings.exe
Then select Run EC2Launch on every boot. You can specify that your EC2 instance Shutdown without Sysprep or Shutdown with Sysprep.

**Note**

When you enable EC2Launch to run on every boot, the following happens the next time EC2Launch runs:

- If AdminPasswordType is still set to Random, EC2Launch will generate a new password at the next boot. After that boot, AdminPasswordType is automatically set to DoNothing to prevent EC2Launch from generating new passwords on subsequent boots. To prevent EC2Launch from generating a new password on the first boot, manually set AdminPasswordType to DoNothing before you reboot.
- HandleUserData will be set back to false unless the user data has persist set to true. For more information, see the section called “User data scripts”.

**Initialize drives and map drive letters**

Specify settings in the DriveLetterMappingConfig.json file to map drive letters to volumes on your EC2 instance. The script initializes drives that are not already initialized and partitioned. For more information about getting volume details in Windows, see Get-Volume in the Microsoft documentation.

**To map drive letters to volumes**

1. Open the C:\ProgramData\Amazon\EC2-Windows\Launch\Config \DriveLetterMappingConfig.json file in a text editor.
2. Specify the following volume settings and save your changes:

```json
{
   "driveLetterMapping": [
      {
         "volumeName": "sample volume",
         "driveLetter": "H"
      }
   ]
}
```
3. Open Windows PowerShell and use the following command to run the EC2Launch script that initializes the disks:

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeDisks.ps1
```

To initialize the disks each time the instance boots, add the `-Schedule` flag as follows:

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeDisks.ps1 -Schedule
```

### Send Windows event logs to the EC2 console

Specify settings in the `EventLogConfig.json` file to send Windows Event logs to EC2 console logs.

**To configure settings to send Windows Event logs**

1. On the instance, open the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config\EventLogConfig.json` file in a text editor.

2. Configure the following log settings and save your changes:

   ```json
   {
   "events": [
   {
   "logName": "System",
   "source": "An event source (optional)",
   "level": "Error | Warning | Information",
   "numEntries": 3
   }
   ]
   }
   ```

3. In Windows PowerShell, run the following command so that the system schedules the script to run as a Windows Scheduled Task each time the instance boots.

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\SendEventLogs.ps1 -Schedule
```
The logs can take three minutes or more to appear in the EC2 console logs.

**Send Windows is ready message after a successful boot**

The EC2Config service sent the "Windows is ready" message to the EC2 console after every boot. EC2Launch sends this message only after the initial boot. For backwards compatibility with the EC2Config service, you can schedule EC2Launch to send this message after every boot. On the instance, open Windows PowerShell and run the following command. The system schedules the script to run as a Windows Scheduled Task.

```powershell
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\SendWindowsIsReady.ps1 -Schedule
```

**EC2Launch version history**

Windows AMIs starting with Windows Server 2016 include a set of Windows Powershell scripts called EC2Launch. EC2Launch performs tasks during the initial instance boot. For information about the EC2Launch versions included in AWS Windows AMIs, see [AWS Windows AMI version history](#).

To download and install the latest version of EC2Launch, see [Install the latest version of EC2Launch](#).

The following table describes the released versions of EC2Launch. Note that the version format changed after version 1.3.610.

<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.3.2004959</td>
<td>• Updated installer logic to prevent unsupported installation on Windows Server 2025 or later.</td>
<td>2 July 2024</td>
</tr>
</tbody>
</table>
| 1.3.2004891 | • Fixed an issue where HandleUserInputData was not set to false as expected.  
              • Added an Encrypted password option to LaunchConfig.json. | 31 May 2024    |
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Changed Settings UI behavior to encrypt the user specified password by default.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Added <code>SetAdminPasswordConfig.ps1</code> to convert the Specify password option to the Encrypted password option in the agent configuration file.</td>
<td></td>
</tr>
<tr>
<td>1.3.2004617</td>
<td>• Fixed an error when setting the wallpaper.</td>
<td>15 January 2024</td>
</tr>
<tr>
<td>1.3.2004592</td>
<td>• Updated access permissions set by <code>install.ps1</code> for <code>%ProgramData%\Amazon\EC2-Windows\Launch</code>.</td>
<td>2 January 2024</td>
</tr>
<tr>
<td></td>
<td>• Restricted EC2Launch folder/file access to read-execute only for standard user accounts.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Changed the agent to stop waiting for the Instance Metadata Service (IMDS) to initialize if IMDS is not enabled for the instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Added a five minute timeout when waiting for the IMDS to initialize.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Changed the agent to write telemetry to the instance console log before the Windows is Ready message instead of after.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Added wallpaper support to several new instance types.</td>
<td></td>
</tr>
</tbody>
</table>

For more information about access permissions and user account permissions of EC2Launch directories, see the section called “EC2Launch directory structure”.
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.3.2004491</td>
<td>• Added telemetry to monitor usage of the <strong>Specify admin password</strong> option.</td>
<td>9 November 2023</td>
</tr>
<tr>
<td>1.3.2004462</td>
<td>• Added flush after every write to the serial console.</td>
<td>18 October 2023</td>
</tr>
</tbody>
</table>
| 1.3.2004438   | • Limit domain name devolution based on registry entry: HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Dnscache\Parameters\DomainNameDevolutionLevel.
  • Limited UserDataExecution.log permissions to Administrators only.
  • Added error messages in the Windows Event Log when log initialization fails.                                                                 | 4 October 2023   |
| 1.3.2004256   | • Added EnableSCSIPersistentReservations value to console log.
  • Added retry capability for **Get-ConsolePort**.                                                                                                                                                       | 7 July 2023      |
| 1.3.2004052   | • Fixed an error that occurred when no SSH key is specified at instance launch.
  • Updated to retry starting the AmazonSSMAgent Windows service on failure.
  • Updated to fail SysprepInstance.ps1 if BeforeSysprep.cmd fails with a non-zero exit code.                                                                                                           | 8 March 2023     |
<p>| 1.3.2003975   | • Fixed issue impacting Packer AMI builds where SysprepInstance.ps1 returns a $LastErrorCode of 1.                                                                                                       | 24 December 2022 |</p>
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 1.3.2003961     | • Fixed issue where explicitly specified administrator passwords are overwritten with a random password on fast-launched instances.  
• Fixed issue where SSM Agent fails to start on smaller instance types.  
• Fixed an issue where the instance console log contains RDPCERTIFICATE-THUMBPRINT: 00000000000000000000000000000000 instead of a valid RDP certificate thumbprint value. | 6 December 2022  |
| 1.3.2003923     | • Fixes logic for finding network adapter when PnPDeviceID is empty.                                                                                                                                       | 9 November 2022  |
| 1.3.2003919     | • Updated Get-ConsolePort to use PCI segment information.  
• Fixed issue where an incorrect network adapter can be selected after reboot.  
• Fixed start-SSM-Agent timeout logic.  
• Fixed backwards compatibility for Send-AdminCredentials function alias. | 8 November 2022  |
| 1.3.2003857     | • Prioritizes adapters with a default gateway when the primary network adapter is selected.  
• Extended in-memory password encryption.                                                                                                           | 3 October 2022   |

</tbody>
</table>
| 1.3.590 | • Added missing instances types in the wallpaper.  
• Fixed an issue with drive letter mapping and disk installation. | |
| 1.3.580 | • Fixed Get-Metadata to use the default system proxy settings for web requests.  
• Added a special case for NVMe in disk initialization.  
• Fixed minor issues. | |
| 1.3.550 | Added a -NoShutdown option to enable Sysprep with no shutdown. | |
| 1.3.540 | Fixed minor issues. | |
| 1.3.530 | Fixed minor issues. | |
| 1.3.521 | Fixed minor issues. | |
| 1.3.00 | • Fixed a hexadecimal length issue for computer name change.  
• Fixed a possible reboot loop for computer name change.  
• Fixed an issue in wallpaper setup. | |
| 1.2.0  | • Update to display information about installed operating system (OS) in EC2 system log.  
• Update to display EC2Launch and SSM Agent version in EC2 system log.  
• Fixed minor issues. | |
## Configure a Windows instance using the EC2Config service (legacy)

<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 1.1.2   | - Update to display ENA driver information in EC2 system log.  
          - Update to exclude Hyper-V from primary NIC filter logic.  
          - Added AWS KMS server and port into registry key for KMS activation.  
          - Improved wallpaper setup for multiple users.  
          - Update to clear routes from persistent store.  
          - Update to remove the z from availability zone in DNS suffix list.  
          - Update to address an issue with the `<runAsLocalSystem>` tag in user data. |              |
| 1.1.1   | Initial release. |              |

### Note

EC2Config documentation is provided for historical reference only. The operating system versions it runs on are no longer supported by Microsoft. We strongly recommend that you upgrade to the latest launch service. The latest launch service for Windows Server 2022 is [EC2Launch v2](#), which replaces both EC2Config and EC2Launch.

Windows AMIs for Windows Server versions prior to Windows Server 2016 include an optional service, the EC2Config service (`EC2Config.exe`). EC2Config starts when the instance boots and performs tasks during startup and each time you stop or start the instance. EC2Config can also perform tasks on demand. Some of these tasks are automatically enabled, while others must be
enabled manually. Although optional, this service provides access to advanced features that aren’t otherwise available. This service runs in the LocalSystem account.

**Note**

EC2Launch replaced EC2Config on Windows AMIs for Windows Server 2016 and 2019. For more information, see [Configure a Windows instance using EC2Launch](#). The latest launch service for all supported Windows Server versions is **EC2Launch v2**, which replaces both EC2Config and EC2Launch.

EC2Config uses settings files to control its operation. You can update these settings files using either a graphical tool or by directly editing XML files. The service binaries and additional files are contained in the `%ProgramFiles%\Amazon\EC2ConfigService` directory.

**Contents**

- EC2Config tasks
- Install the latest version of EC2Config
- Stop, restart, delete, or uninstall EC2Config
- EC2Config and AWS Systems Manager
- EC2Config and Sysprep
- EC2 service properties
- EC2Config settings files
- Configure proxy settings for the EC2Config service
- EC2Config version history
- Troubleshoot issues with the EC2Config service

**EC2Config tasks**

EC2Config runs initial startup tasks when the instance is first started and then disables them. To run these tasks again, you must explicitly enable them prior to shutting down the instance, or by running Sysprep manually. These tasks are as follows:

- Set a random, encrypted password for the administrator account.
- Generate and install the host certificate used for Remote Desktop Connection.
• Dynamically extend the operating system partition to include any unpartitioned space.

• Execute the specified user data (and Cloud-Init, if it’s installed). For more information about specifying user data, see Work with instance user data.

EC2Config performs the following tasks every time the instance starts:

• Change the host name to match the private IP address in Hex notation (this task is disabled by default and must be enabled in order to run at instance start).

• Configure the key management server (AWS KMS), check for Windows activation status, and activate Windows as necessary.

• Mount all Amazon EBS volumes and instance store volumes, and map volume names to drive letters.

• Write event log entries to the console to help with troubleshooting (this task is disabled by default and must be enabled in order to run at instance start).

• Write to the console that Windows is ready.

• Add a custom route to the primary network adapter to enable the following IP addresses when a single NIC or multiple NICs are attached: 169.254.169.250, 169.254.169.251, and 169.254.169.254. These addresses are used by Windows Activation and when you access instance metadata.

Note

If the Windows OS is configured to use IPv4, these IPv4 link-local addresses can be used. If the Windows OS has the IPv4 network protocol stack disabled and uses IPv6 instead, add [fd00:ec2::240] in place of 169.254.169.250 and 169.254.169.251. Then add [fd00:ec2::254] in place of 169.254.169.254.

EC2Config performs the following task every time a user logs in:

• Display wallpaper information to the desktop background.

While the instance is running, you can request that EC2Config perform the following task on demand:
• Run Sysprep and shut down the instance so that you can create an AMI from it. For more information, see Use EC2 launch agents to create an AMI with Windows Sysprep.

### Install the latest version of EC2Config

By default, the EC2Config service is included in AMIs prior to Windows Server 2016. When the EC2Config service is updated, new Windows AMIs from AWS include the latest version of the service. However, you need to update your own Windows AMIs and instances with the latest version of EC2Config.

**Note**

EC2Launch replaces EC2Config on Windows Server 2016 and 2019. For more information, see Configure a Windows instance using EC2Launch. The latest launch service for all supported Windows Server versions is EC2Launch v2, which replaces both EC2Config and EC2Launch.

For information about how to receive notifications for EC2Config updates, see Subscribe to EC2Config service notifications. For information about the changes in each version, see the EC2Config version history.

### Before you begin

• Verify that you have .NET framework 3.5 SP1 or greater.

• By default, Setup replaces your settings files with default settings files during installation and restarts the EC2Config service when the installation is completed. If you changed EC2Config service settings, copy the config.xml file from the %Program Files%\Amazon\Ec2ConfigService\Settings directory. After you update the EC2Config service, you can restore this file to retain your configuration changes.

• If your version of EC2Config is earlier than version 2.1.19 and you are installing version 2.2.12 or earlier, you must first install version 2.1.19. To install version 2.1.19, download EC2Install_2.1.19.zip, unzip the file, and then run EC2Install.exe.
Verify the EC2Config version

Use the following procedure to verify the version of EC2Config that is installed on your instances.

**To verify the installed version of EC2Config**

1. Launch an instance from your AMI and connect to it.
2. In Control Panel, select *Programs and Features*.
3. In the list of installed programs, look for Ec2ConfigService. Its version number appears in the *Version* column.

Update EC2Config

Use the following procedure to download and install the latest version of EC2Config on your instances.

**To download and install the latest version of EC2Config**

1. Download and unzip the [EC2Config installer](#).
2. Run `EC2Install.exe`. For a complete list of options, run `EC2Install` with the `/?` option. By default, setup displays prompts. To run the command with no prompts, use the `/quiet` option.
3. If you are running EC2Config version 4.0 or later, you must restart SSM Agent on the instance from the Microsoft Services snap-in.

---

### Important

To keep the custom settings from the `config.xml` file that you saved, run `EC2Install` with the `/norestart` option, restore your settings, and then restart the EC2Config service manually.

---

*Note*

If your version of EC2Config is earlier than version 2.1.19 and you are installing version 2.3.313 or later, you can install it directly without installing version 2.1.19 first.
Note

The updated EC2Config version information will not appear in the instance System Log or Trusted Advisor check until you reboot or stop and start your instance.

To download and install the latest version of EC2Config using PowerShell

To download, unzip, and install the latest version of EC2Config using PowerShell, run the following commands from a PowerShell window:

```powershell
$url = "https://s3.amazonaws.com/ec2-downloads-windows/EC2Config/EC2Install.zip"
$downloadzipfile = "$env:USERPROFILE\Desktop\" + $(split-path -path $url -leaf)
$extractpath = "$env:USERPROFILE\Desktop\"
invoke-webrequest -uri $url -outfile $downloadzipfile
$extractshell = new-object -comobject shell.application
$extractfiles = $extractshell.namespace($downloadzipfile).items()
$extractshell.nameSpace($extractpath).copyhere($extractfiles)
start-process $extractpath
start-process ` -filepath $env:USERPROFILE\Desktop\EC2Install.exe ` -argumentlist "/S"
```

Note

If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

```
```

Verify the installation by checking C:\Program Files\Amazon\ for the Ec2ConfigService directory.

Stop, restart, delete, or uninstall EC2Config

You can manage the EC2Config service just as you would any other service.
To apply updated settings to your instance, you can stop and restart the service. If you're manually installing EC2Config, you must stop the service first.

**To stop the EC2Config service**

1. Launch and connect to your Windows instance.
2. On the **Start** menu, point to **Administrative Tools**, and then click **Services**.
3. In the list of services, right-click **EC2Config**, and select **Stop**.

**To restart the EC2Config service**

1. Launch and connect to your Windows instance.
2. On the **Start** menu, point to **Administrative Tools**, and then click **Services**.
3. In the list of services, right-click **EC2Config**, and select **Restart**.

If you don't need to update the configuration settings, create your own AMI, or use AWS Systems Manager, you can delete and uninstall the service. Deleting a service removes its registry subkey. Uninstalling a service removes the files, the registry subkey, and any shortcuts to the service.

**To delete the EC2Config service**

1. Start a command prompt window.
2. Run the following command:

   ```
   sc delete ec2config
   ```

**To uninstall EC2Config**

1. Launch and connect to your Windows instance.
2. On the **Start** menu, click **Control Panel**.
3. Double-click **Programs and Features**.
4. On the list of programs, select **EC2ConfigService**, and click **Uninstall**.
EC2Config and AWS Systems Manager

The EC2Config service processes Systems Manager requests on instances created from AMIs for versions of Windows Server prior to Windows Server 2016 that were published before November 2016.

Instances created from AMIs for versions of Windows Server prior to Windows Server 2016 that were published after November 2016 include the EC2Config service and SSM Agent. EC2Config performs all of the tasks described earlier, and SSM Agent processes requests for Systems Manager capabilities like Run Command and State Manager.

You can use Run Command to upgrade your existing instances to use the latest version of the EC2Config service and SSM Agent. For more information, see Update SSM Agent by using Run Command in the AWS Systems Manager User Guide.

EC2Config and Sysprep

The EC2Config service runs Sysprep, a Microsoft tool that enables you to create a customized Windows AMI that can be reused. When EC2Config calls Sysprep, it uses the files in %ProgramFiles%\Amazon\EC2ConfigService\Settings to determine which operations to perform. You can edit these files indirectly using the EC2 Service Properties dialog box, or directly using an XML editor or a text editor. However, there are some advanced settings that aren’t available in the EC2 Service Properties dialog box, so you must edit those entries directly.

If you create an AMI from an instance after updating its settings, the new settings are applied to any instance that’s launched from the new AMI. For information about creating an AMI, see Create an Amazon EBS-backed AMI.

EC2 service properties

The following procedure describes how to use the EC2 Service Properties dialog box to enable or disable settings.

To change settings using the Ec2 Service Properties dialog box

1. Launch and connect to your Windows instance.
2. From the Start menu, click All Programs, and then click EC2ConfigService Settings.
3. On the **General** tab of the **EC2 Service Properties** dialog box, you can enable or disable the following settings.

**Set Computer Name**

If this setting is enabled (it is disabled by default), the host name is compared to the current internal IP address at each boot; if the host name and internal IP address do not match, the host name is reset to contain the internal IP address and then the system reboots to pick up the new host name. To set your own host name, or to prevent your existing host name from being modified, do not enable this setting.
**User Data**

User data execution enables you to specify scripts in the instance metadata. By default, these scripts are run during the initial launch. You can also configure them to run the next time you reboot or start the instance, or every time you reboot or start the instance.

If you have a large script, we recommend that you use user data to download the script, and then run it.

For more information, see [User data execution](#).

**Event Log**

Use this setting to display event log entries on the console during boot for easy monitoring and debugging.

Click **Settings** to specify filters for the log entries sent to the console. The default filter sends the three most recent error entries from the system event log to the console.

**Wallpaper Information**

Use this setting to display system information on the desktop background. The following is an example of the information displayed on the desktop background.

```
Hostname      : WIN-U0RF0JCTPUU
Instance ID   : i-d563f76a
Public IP Address: 54.208.43.227
Private IP Address: 172.31.42.195
Availability Zone : us-east-1b
Instance Size  : t2.micro
Architecture  : AMD64
```

The information displayed on the desktop background is controlled by the settings file `EC2ConfigService\Settings\WallpaperSettings.xml`.

**Enable Hibernation**

Use this setting to allow EC2 to signal the operating system to perform hibernation.

4. Click the **Storage** tab. You can enable or disable the following settings.
Root Volume

This setting dynamically extends Disk 0/Volume 0 to include any unpartitioned space. This can be useful when the instance is booted from a root device volume that has a custom size.

Initialize Drives

This setting formats and mounts all volumes attached to the instance during start.
Drive Letter Mapping

The system maps the volumes attached to an instance to drive letters. For Amazon EBS volumes, the default is to assign drive letters going from D: to Z:. For instance store volumes, the default depends on the driver. AWS PV drivers and Citrix PV drivers assign instance store volumes drive letters going from Z: to A:. Red Hat drivers assign instance store volumes drive letters going from D: to Z:.

To choose the drive letters for your volumes, click Mappings. In the DriveLetterSetting dialog box, specify the Volume Name and Drive Letter values for each volume, click Apply, and then click OK. We recommend that you select drive letters that avoid conflicts with drive letters that are likely to be in use, such as drive letters in the middle of the alphabet.

![DriveLetterSetting dialog box]

After you specify a drive letter mapping and attach a volume with same label as one of the volume names that you specified, EC2Config automatically assigns your specified drive letter to that volume. However, the drive letter mapping fails if the drive letter is already in use. Note that EC2Config doesn't change the drive letters of volumes that were already mounted when you specified the drive letter mapping.

5. To save your settings and continue working on them later, click OK to close the EC2 Service Properties dialog box. If you have finished customizing your instance and want to create an AMI from that instance, see Use EC2 launch agents to create an AMI with Windows Sysprep.

EC2Config settings files

The settings files control the operation of the EC2Config service. These files are located in the C:\Program Files\Amazon\Ec2ConfigService\Settings directory:
• ActivationSettings.xml—Controls product activation using a key management server (AWS KMS).

• AWS.EC2.Windows.CloudWatch.json—Controls which performance counters to send to CloudWatch and which logs to send to CloudWatch Logs.

• BundleConfig.xml—Controls how EC2Config prepares an instance store-backed instance for AMI creation.

• Config.xml—Controls the primary settings.

• DriveLetterConfig.xml—Controls drive letter mappings.

• EventLogConfig.xml—Controls the event log information that’s displayed on the console while the instance is booting.

• WallpaperSettings.xml—Controls the information that’s displayed on the desktop background.

**ActivationSettings.xml**

This file contains settings that control product activation. When Windows boots, the EC2Config service checks whether Windows is already activated. If Windows is not already activated, it attempts to activate Windows by searching for the specified AWS KMS server.

- SetAutodiscover—Indicates whether to detect a AWS KMS automatically.
- TargetKMSServer—Stores the private IP address of a AWS KMS. The AWS KMS must be in the same Region as your instance.
- DiscoverFromZone—Discovers the AWS KMS server from the specified DNS zone.
- ReadFromUserData—Gets the AWS KMS server from UserData.
- LegacySearchZones—Discovers the AWS KMS server from the specified DNS zone.
- DoActivate—Attempts activation using the specified settings in the section. This value can be true or false.
- LogResultToConsole—Displays the result to the console.

**BundleConfig.xml**

This file contains settings that control how EC2Config prepares an instance for AMI creation.
• **AutoSysprep**—Indicates whether to use Sysprep automatically. Change the value to Yes to use Sysprep.

• **SetRDP**—Sets a self-signed certificate to the Remote Desktop server. This enables you to securely RDP into the instances. Change the value to Yes if the new instances should have the certificate.

  This setting is not used for instances with operating system versions prior to Windows Server 2016, because they can generate their own certificates.

• **SetPasswordAfterSysprep**—Sets a random password on a newly launched instance, encrypts it with the user launch key, and outputs the encrypted password to the console. Change the value of this setting to No if the new instances should not be set to a random encrypted password.

**Config.xml**

**Plug-ins**

• **Ec2SetPassword**—Generates a random encrypted password each time you launch an instance. This feature is disabled by default after the first launch so that reboots of this instance don’t change a password set by the user. Change this setting to Enabled to continue to generate passwords each time you launch an instance.

  This setting is important if you are planning to create an AMI from your instance.

• **Ec2SetComputerName**—Sets the host name of the instance to a unique name based on the IP address of the instance and reboots the instance. To set your own host name, or prevent your existing host name from being modified, you must disable this setting.

• **Ec2InitializeDrives**—Initializes and formats all volumes during startup. This feature is enabled by default.

• **Ec2EventLog**—Displays event log entries in the console. By default, the three most recent error entries from the system event log are displayed. To specify the event log entries to display, edit the EventLogConfig.xml file located in the EC2ConfigService\Settings directory. For information about the settings in this file, see [Eventlog Key](https://msdn.microsoft.com) in the MSDN Library.

• **Ec2ConfigureRDP**—Sets up a self-signed certificate on the instance, so users can securely access the instance using Remote Desktop. This setting is not used for instances with operating system versions prior to Windows Server 2016, because they can generate their own certificates.
• **Ec2OutputRDP_cert**—Displays the Remote Desktop certificate information to the console so that the user can verify it against the thumbprint.

• **Ec2SetDriveLetter**—Sets the drive letters of the mounted volumes based on user-defined settings. By default, when an Amazon EBS volume is attached to an instance, it can be mounted using the drive letter on the instance. To specify your drive letter mappings, edit the DriveLetterConfig.xml file located in the EC2ConfigService\Settings directory.

• **Ec2WindowsActivate**—The plug-in handles Windows activation. It checks to see if Windows is activated. If not, it updates the AWS KMS client settings, and then activates Windows.

  To modify the AWS KMS settings, edit the ActivationSettings.xml file located in the EC2ConfigService\Settings directory.

• **Ec2DynamicBootVolumeSize**—Extends Disk 0/Volume 0 to include any unpartitioned space.

• **Ec2HandleUserData**—Creates and runs scripts created by the user on the first launch of an instance after Sysprep is run. Commands wrapped in script tags are saved to a batch file, and commands wrapped in PowerShell tags are saved to a .ps1 file (corresponds to the User Data check box on the Ec2 Service Properties dialog box).

• **Ec2ElasticGpuSetup**—Installs the Elastic GPU software package if the instance is associated with an elastic GPU.

• **Ec2FeatureLogging**—Sends Windows feature installation and corresponding service status to the console. Supported only for the Microsoft Hyper-V feature and corresponding vmms service.

### Global Settings

• **ManageShutdown**—Ensures that instances launched from instance store-backed AMIs do not terminate while running Sysprep.

• **SetDnsSuffixList**—Sets the DNS suffix of the network adapter for Amazon EC2. This allows DNS resolution of servers running in Amazon EC2 without providing the fully qualified domain name.

---

**Note**

This adds a DNS suffix lookup for the following domain and configures other standard suffixes. For more information about how launch agents set DNS suffixes, see [Configure DNS Suffix for Windows launch agents](#).

---
• **WaitForMetaDataAvailable**—Ensures that the EC2Config service will wait for metadata to be accessible and the network available before continuing with the boot. This check ensures that EC2Config can obtain information from metadata for activation and other plug-ins.

• **ShouldAddRoutes**—Adds a custom route to the primary network adapter to enable the following IP addresses when multiple NICs are attached: 169.254.169.250, 169.254.169.251, and 169.254.169.254. These addresses are used by Windows Activation and when you access instance metadata.

• **RemoveCredentialsfromSyspreponStartup**—Removes the administrator password from Sysprep.xml the next time the service starts. To ensure that this password persists, edit this setting.

**DriveLetterConfig.xml**

This file contains settings that control drive letter mappings. By default, a volume can be mapped to any available drive letter. You can mount a volume to a particular drive letter as follows.

```xml
<?xml version="1.0" standalone="yes"?>
<DriveLetterMapping>
  <Mapping>
    <VolumeName></VolumeName>
    <DriveLetter></DriveLetter>
  </Mapping>
  ...
  <Mapping>
    <VolumeName></VolumeName>
    <DriveLetter></DriveLetter>
  </Mapping>
</DriveLetterMapping>
```

• **VolumeName**—The volume label. For example, *My Volume*. To specify a mapping for an instance storage volume, use the label *Temporary Storage X*, where X is a number from 0 to 25.

• **DriveLetter**—The drive letter. For example, *M:* . The mapping fails if the drive letter is already in use.
**EventLogConfig.xml**

This file contains settings that control the event log information that's displayed on the console while the instance is booting. By default, we display the three most recent error entries from the System event log.

- **Category**—The event log key to monitor.
- **ErrorType**—The event type (for example, Error, Warning, Information.)
- **NumEntries**—The number of events stored for this category.
- **LastMessageTime**—To prevent the same message from being pushed repeatedly, the service updates this value every time it pushes a message.
- **AppName**—The event source or application that logged the event.

**WallpaperSettings.xml**

This file contains settings that control the information that's displayed on the desktop background. The following information is displayed by default.

- **Hostname**—Displays the computer name.
- **Instance ID**—Displays the ID of the instance.
- **Public IP Address**—Displays the public IP address of the instance.
- **Private IP Address**—Displays the private IP address of the instance.
- **Availability Zone**—Displays the Availability Zone in which the instance is running.
- **Instance Size**—Displays the type of instance.
- **Architecture**—Displays the setting of the PROCESSOR_ARCHITECTURE environment variable.

You can remove any of the information that's displayed by default by deleting its entry. You can add additional instance metadata to display as follows.

```
<WallpaperInformation>
  <name>display_name</name>
  <source>metadata</source>
  <identifier>meta-data/path</identifier>
</WallpaperInformation>
```

You can add additional System environment variables to display as follows.
InitializeDrivesSettings.xml

This file contains settings that control how EC2Config initializes drives.

By default, EC2Config initialize drives that were not brought online with the operating system. You can customize the plugin as follows.

Use a settings group to specify how you want to initialize drives:

**FormatWithTRIM**

Enables the TRIM command when formatting drives. After a drive has been formatted and initialized, the system restores TRIM configuration.

Starting with EC2Config version 3.18, the TRIM command is disabled during the disk format operation by default. This improves formatting times. Use this setting to enable TRIM during the disk format operation for EC2Config version 3.18 and later.

**FormatWithoutTRIM**

Disables the TRIM command when formatting drives and improves formatting times in Windows. After a drive has been formatted and initialized, the system restores TRIM configuration.

**DisableInitializeDrives**

Disables formatting for new drives. Use this setting to initialize drives manually.

**Configure proxy settings for the EC2Config service**

You can configure the EC2Config service to communicate through a proxy using one of the following methods: the AWS SDK for .NET, the `system.net` element, or Microsoft Group Policy.
and Internet Explorer. Using the AWS SDK for .NET is the preferred method because you can specify sign-in credentials.

Methods

- Configure proxy settings using the AWS SDK for .NET (Preferred)
- Configure proxy settings using the system.net element
- Configure proxy settings using Microsoft Group Policy and Microsoft Internet Explorer

Configure proxy settings using the AWS SDK for .NET (Preferred)

You can configure proxy settings for the EC2Config service by specifying the `proxy` element in the `Ec2Config.exe.config` file. For more information, see Configuration Files Reference for AWS SDK for .NET.

To specify the proxy element in `Ec2Config.exe.config`

1. Edit the `Ec2Config.exe.config` file on an instance where you want the EC2Config service to communicate through a proxy. By default, the file is located in the following directory: `%ProgramFiles%\Amazon\Ec2ConfigService`.

2. Add the following `aws` element to the `configSections`. Do not add this to any existing sectionGroups.

   For EC2Config versions 3.17 or earlier
   
   ```xml
   <configSections>
   <section name="aws" type="Amazon.AWSSection, AWSSDK"/>
   </configSections>
   ```

   For EC2Config versions 3.18 or later
   
   ```xml
   <configSections>
   <section name="aws" type="Amazon.AWSSection, AWSSDK.Core"/>
   </configSections>
   ```

3. Add the following `aws` element to the `Ec2Config.exe.config` file.

   ```xml
   <aws>
     <proxy
       host="string value"
   ```
Configure proxy settings using the system.net element

You can specify proxy settings in a system.net element in the Ec2Config.exe.config file. For more information, see defaultProxy Element (Network Settings) on MSDN.

To specify the system.net element in Ec2Config.exe.config

1. Edit the Ec2Config.exe.config file on an instance where you want the EC2Config service to communicate through a proxy. By default, the file is located in the following directory: %ProgramFiles%\Amazon\Ec2ConfigService.

2. Add a defaultProxy entry to system.net. For more information, see defaultProxy Element (Network Settings) on MSDN.

   For example, the following configuration routes all traffic to use the proxy that is currently configured for Internet Explorer, with the exception of the metadata and licensing traffic, which will bypass the proxy.

   ```xml
   <defaultProxy>
     <proxy usesystemdefault="true" />
     <bypasslist>
       <add address="169.254.169.250" />
       <add address="169.254.169.251" />
       <add address="169.254.169.254" />
       <add address="[fd00:ec2::250]" />
       <add address="[fd00:ec2::254]" />
     </bypasslist>
   </defaultProxy>
   ```

3. Save your changes.

Configure Windows launch agents

4. Save your changes.
Configure proxy settings using Microsoft Group Policy and Microsoft Internet Explorer

The EC2Config service runs under the Local System user account. You can specify instance-wide proxy settings for this account in Internet Explorer after you change Group Policy settings on the instance.

To configure proxy settings using Group Policy and Internet Explorer

1. On an instance where you want the EC2Config service to communicate through a proxy, open a Command prompt as an Administrator, type `gpedit.msc`, and press Enter.
2. In the Local Group Policy Editor, under **Local Computer Policy**, choose **Computer Configuration**, **Administrative Templates**, **Windows Components**, **Internet Explorer**.
3. In the right-pane, choose **Make proxy settings per-machine (rather than per-user)** and then choose **Edit policy setting**.
4. Choose **Enabled**, and then choose **Apply**.
5. Open Internet Explorer, and then choose the **Tools** button.
6. Choose **Internet Option**, and then choose the **Connections** tab.
7. Choose **LAN settings**.
8. Under **Proxy server**, choose the **Use a proxy server for your LAN** option.
9. Specify address and port information and then choose **OK**.

EC2Config version history

Windows AMIs prior to Windows Server 2016 include an optional service called the EC2Config service (`EC2Config.exe`). EC2Config starts when the instance boots and performs tasks during startup and each time you stop or start the instance.

You can receive notifications when new versions of the EC2Config service are released. For more information, see **Subscribe to EC2Config service notifications**.

The following table describes the released versions of EC2Config. For information about the updates for SSM Agent, see **Systems Manager SSM Agent Release Notes**.

<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>

| 4.9.5554 | - Limit domain name devolution based on registry entry: HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Dnscache\Parameters\DomainNameDevolutionLevel.  
- New version of SSM Agent 3.2.1630.0. | 4 October 2023 |
| 4.9.5467 | - Added retry capability for discovering console port.  
- New version of SSM Agent 3.1.2282.0. | 1 August 2023 |
| 4.9.5288 | - Updated AWS Core SDK to version 3.7.103.23.  
- Fixed issue where the AWS-UpdateEC2Config SSM document fails to update EC2Config on instances enabled with only IMDSv2.  
- New version of SSM Agent 3.1.2144.0. | 8 March 2023 |
| 4.9.5231 | - New version of SSM Agent 3.1.1927.0. | 14 February 2023 |
| 4.9.5103 | - Fixed issue where ephemeral volumes are incorrectly identified on r5d and i4i instance families.  
- New version of SSM Agent 3.1.1856.0. | 5 December 2022 |

</table>
| 4.9.4500  | • Updated `Install-EgpuManagerConfig` with IMDS v2 support.  
• Updated web links to use https.  
• New version of SSM Agent 3.1.282.0                                                                                                          | 7 September 2021    |
| 4.9.4419  | • Fixed IMDS version 1 fallback logic  
• Updated all usage of Windows temp directory to EC2Config temp directory  
• New version of SSM Agent 3.0.1124.0                                                                                                        | 2 June 2021         |
| 4.9.4381  | • Added support for SSM document schema version 2.2 in EC2ConfigUpdater  
• Added AWS Nitro Enclaves package version to console log  
• New version of SSM Agent 3.0.529.0                                                                                                           | 4 May 2021          |
| 4.9.4326  | • Removed all links in the settings UI  
• This is the last EC2Config version that supports Windows Server 2008.                                                                             | 3 March 2021        |
| 4.9.4279  | • Fixed security issue related to `Ec2ConfigMonitor` scheduled task  
• Fixed drive letter mapping issue and incorrect ephemeral disk count  
• Added `OsCurrentBuild` and `OsReleaseId` to console output  
• New version of SSM Agent 2.3.871.0                                                                                                          | 11 December 2020    |
| 4.9.4222  | • Fixed IMDS version 1 fallback logic  
• New version of SSM Agent 2.3.842.0                                                                                                           | 7 April 2020        |
<table>
<thead>
<tr>

<th>Release date</th>
</tr>
</thead>
</table>
| 4.9.4122 | • Added support for IMDS v2  
                   • New version of SSM Agent 2.3.814.0                                  | 4 March 2020     |
| 4.9.3865 | • Fixed issue detecting COM port for Windows Server 2008 R2 on metal instances  
                   • New version of SSM Agent 2.3.722.0                                      | 31 October 2019  |
| 4.9.3519 | • New version of SSM Agent 2.3.634.0                                        | 18 June 2019     |
| 4.9.3429 | • New version of SSM Agent 2.3.542.0                                        | 25 April 2019    |
| 4.9.3289 | • New version of SSM Agent 2.3.444.0                                        | 11 February 2019 |
| 4.9.3270 | • Added plugin for setting the monitor to never turn off to fix ACPI issues  
                   • SQL Server edition and version written to console  
                   • New version of SSM Agent 2.3.415.0                                      | 22 January 2019  |
| 4.9.3230 | • Drive Letter Mapping description updated to better align to functionality  
                   • New version of SSM Agent 2.3.372.0                                      | 10 January 2019  |
| 4.9.3160 | • Increased wait time for primary NIC  
                   • Added default configuration for RSS and Receive Queue settings for ENA devices  
                   • Disabled hibernation during Sysprep  
                   • New version of SSM Agent 2.3.344.0  
                   • Upgraded AWS SDK to 3.3.29.13                                  | 15 December 2018  |
| 4.9.3067 | • Improvements made to instance hibernation  
                   • New version of SSM Agent 2.3.235.0                                      | 8 November 2018   |
| 4.9.3034 | • Added route 169.254.169.253/32 for DNS server  
                   • New version of SSM Agent 2.3.193.0                                      | 24 October 2018   |

<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
</tr>
</thead>
</table>
| 4.0.1343    | - Run Command, State Manager, the CloudWatch agent, and domain join support have been moved into another agent called SSM Agent. SSM Agent will be installed as part of the EC2Config upgrade. For more information, see EC2Config and AWS Systems Manager.  
  - If you have a proxy set up in EC2Config, you will need to update your proxy settings for SSM Agent before upgrading. If you do not update the proxy settings, you will not be able to use Run Command to manage your instances. To avoid this, see the following information before updating to the newer version: Installing and Configuring SSM Agent on Windows Instances in the AWS Systems Manager User Guide.  
  - If you previously enabled CloudWatch integration on your instances by using a local configuration file (AWS.EC2.Windows.CloudWatch.json), you will need to configure the file to work with SSM Agent.                                                                 |
| 3.19.1153   | - Re-enabled activation plugin for instances with old AWS KMS configuration. Skip activation for BYOL users.  
  - Change default TRIM behavior to be disabled during disk format operation and added FormatWithTRIM for overriding InitializeDisks plugin with userdata.                                                                 |
| 3.18.1118   | - Fix to reliably add routes to the primary network adapter.  
  - Updates to improve support for AWS services.                                                                 |
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
</table>
| 3.17.1032 | • Fixes duplicate system logs appearing when filters set to same category.  
• Fixes to prevent from hanging during disk initialization.                                                                                                                                       |              |
| 3.16.930  | Added support to log "Window is Ready to use" event to Windows Event Log on start.                                                                                                                      |              |
| 3.15.880  | Fix to allow uploading Systems Manager Run Command output to S3 bucket names with '.' character.                                                                                                         |              |
| 3.14.786  | Added support to override InitializeDisks plugin settings. For example: To speed up SSD disk initialize, you can temporarily disable TRIM by specifying this in userdata:                                        |              |
|           | <InitializeDrivesSettings><SettingsGroup>FormatWithoutTRIM</SettingsGroup></InitializeDrivesSettings                                                                                               |              |
| 3.13.727  | Systems Manager Run Command - Fixes to process commands reliably after windows reboot.                                                                                                                |              |
| 3.12.649  | • Fix to gracefully handle reboot when running commands/scripts.  
• Fix to reliably cancel running commands.  
• Add support for (optionally) uploading MSI logs to S3 when installing applications via Systems Manager Run Command.                  |              |

| 2.1.19    | • Added ephemeral disk labeling support when using Intel network driver (eg. C3 instance Type). For more information, see [Enhanced networking on Amazon EC2 instances](#).  
• Added AMI Origin Version and AMI Origin Name support to the console output  
• Made changes to the Console Output for consistent formatting/parsing  
• Updated Help File                                                                                               |              |
| 2.1.18    | • Added EC2Config WMI Object for Completion notification (-Namespace root\Amazon -Class EC2_ConfigService)                                                                                      |              |
|           | • Improved Performance of Startup WMI query with large Event Logs; could cause prolonged high CPU during initial execution                                                                        |              |
| 2.1.17    | • Fixed UserData execution issue with Standard Output and Standard Error buffer filling  
• Fixed incorrect RDP thumbprint sometimes appearing in Console Output for >= w2k8 OS  
• Console Output now contains 'RDPCERTIFICATE-SubjectName:' for Windows 2008+, which contains the machine name value  
• Added D:\ to Drive Letter Mapping dropdown  
• Moved Help button to top right and changed look/feel  
• Added Feedback survey link to top right                                                                                   |              |

**Subscribe to EC2Config service notifications**

Amazon SNS can notify you when new versions of the EC2Config service are released. Use the following procedure to subscribe to these notifications.

**To subscribe to EC2Config notifications**

2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to were created in this Region.

3. In the navigation pane, choose **Subscriptions**.

4. Choose **Create subscription**.

5. In the **Create subscription** dialog box, do the following:
   a. For **Topic ARN**, use the following Amazon Resource Name (ARN):

   ```
   arn:aws:sns:us-east-1:801119661308:ec2-windows-ec2config
   ```

   b. For **Protocol**, choose Email.

   c. For **Endpoint**, type an email address that you can use to receive the notifications.

   d. Choose **Create subscription**.

6. You'll receive a email asking you to confirm your subscription. Open the email and follow the directions to complete your subscription.

Whenever a new version of the EC2Config service is released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.
To unsubscribe from EC2Config notifications

1. Open the Amazon SNS console.
2. In the navigation pane, choose Subscriptions.
3. Select the subscription and then choose Actions, Delete subscriptions When prompted for confirmation, choose Delete.

Troubleshoot issues with the EC2Config service

The following information can help you troubleshoot issues with the EC2Config service.

Update EC2Config on an unreachable instance

Use the following procedure to update the EC2Config service on a Windows Server instance that is inaccessible using Remote Desktop.

To update EC2Config on an Amazon EBS-backed Windows instance that you can't connect to

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Locate the affected instance. Select the instance and choose Instance state, and then choose Stop instance.

⚠️ Warning
When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

4. Choose Launch instances and create a temporary t2.micro instance in the same Availability Zone as the affected instance. Use a different AMI than the one that you used to launch the affected instance.

⚠️ Important
If you do not create the instance in the same Availability Zone as the affected instance you will not be able to attach the root volume of the affected instance to the new instance.

5. In the EC2 console, choose Volumes.
6. Locate the root volume of the affected instance. Detach the volume and then attach the volume to the temporary instance that you created earlier. Attach it with the default device name (xvdf).

7. Use Remote Desktop to connect to the temporary instance, and then use the Disk Management utility to make the volume available for use.

8. Download the latest version of the EC2Config service. Extract the files from the .zip file to the Temp directory on the drive you attached.

9. On the temporary instance, open the Run dialog box, type regedit, and press Enter.

10. Choose HKEY_LOCAL_MACHINE. From the File menu, choose Load Hive. Choose the drive and then navigate to and open the following file: Windows\System32\config\SOFTWARE. When prompted, specify a key name.

11. Select the key you just loaded and navigate to Microsoft\Windows\CurrentVersion. Choose the RunOnce key. If this key doesn't exist, choose CurrentVersion from the context (right-click) menu, choose New and then choose Key. Name the key RunOnce.

12. From the context (right-click) menu choose the RunOnce key, choose New and then choose String Value. Enter Ec2Install as the name and C:\Temp\Ec2Install.exe /quiet as the data.

13. Choose the HKEY_LOCAL_MACHINE\specified key name\Microsoft\Windows NT\CurrentVersion\Winlogon key. From the context (right-click) menu choose New, and then choose String Value. Enter AutoAdminLogon as the name and 1 as the value data.

14. Choose the HKEY_LOCAL_MACHINE\specified key name\Microsoft\Windows NT\CurrentVersion\Winlogon> key. From the context (right-click) menu choose New, and then choose String Value. Enter DefaultUserName as the name and Administrator as the value data.

15. Choose the HKEY_LOCAL_MACHINE\specified key name\Microsoft\Windows NT\CurrentVersion\Winlogon key. From the context (right-click) menu choose New, and then choose String Value. Type DefaultPassword as the name and enter a password in the value data.

16. In the Registry Editor navigation pane, choose the temporary key that you created when you first opened Registry Editor.

17. From the File menu, choose Unload Hive.

18. In Disk Management Utility, choose the drive you attached earlier, open the context (right-click) menu, and choose Offline.
19. In the Amazon EC2 console, detach the affected volume from the temporary instance and reattach it to your instance with the device name /dev/sda1. You must specify this device name to designate the volume as a root volume.

20. **Stop and start Amazon EC2 instances** the instance.

21. After the instance starts, check the system log and verify that you see the message Windows is ready to use.

22. Open Registry Editor and choose HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon. Delete the String Value keys you created earlier: **AutoAdminLogon**, **DefaultUserName**, and **DefaultPassword**.

23. Delete or stop the temporary instance you created in this procedure.

**Use EC2 Fast Launch for your Windows instances**

Every Amazon EC2 Windows instance must go through the standard Windows operating system (OS) launch steps, which include several reboots, and often take 15 minutes or longer to complete. Amazon EC2 Windows Server AMIs that have the EC2 Fast Launch feature enabled complete some of those steps and reboots in advance to reduce the time it takes to launch an instance.

When you configure a Windows Server AMI for EC2 Fast Launch, Amazon EC2 creates a set of pre-provisioned snapshots to use for faster launching, as follows.

1. Amazon EC2 launches a set of temporary t3 instances, based on your settings.
2. As each temporary instance completes the standard launch steps, Amazon EC2 creates a pre-provisioned snapshot of the instance. It stores the snapshot in your Amazon S3 bucket.
3. When the snapshot is ready, Amazon EC2 terminates the associated t3 instance to keep resource costs as low as possible.
4. The next time Amazon EC2 launches an instance from the EC2 Fast Launch enabled AMI, it uses one of the snapshots to significantly reduce the time it takes to launch.

Amazon EC2 automatically replenishes the snapshots you have on hand as it uses them to launch instances from the EC2 Fast Launch enabled AMI.

Any account that has access to an AMI with EC2 Fast Launch enabled can benefit from reduced launch times. When the AMI owner grants access for you to launch instances, the pre-provisioned snapshots come from the AMI owner’s account.
If an AMI that supports EC2 Fast Launch is shared with you, you can enable or disable faster launching on the shared AMI yourself. If you enable a shared AMI for EC2 Fast Launch, Amazon EC2 creates the pre-provisioned snapshots directly in your account. If you deplete the snapshots in your account, you can still use snapshots from the AMI owner's account.

**Note**

EC2 Fast Launch deletes pre-provisioned snapshots as soon as they're consumed by a launch to minimize storage costs and prevent reuse. However, if the deleted snapshots match a retention rule, Recycle Bin automatically retains them. We recommend that you review the scope of your Recycle Bin retention rules so that this doesn't happen. For more information, see [Recycle Bin](#) in the *Amazon EBS User Guide*. This feature is not the same as [EBS fast snapshot restore](#). You must explicitly enable EBS fast snapshot restore on a per-snapshot basis, and it has its own associated costs.

The following video demonstrates how to configure your Windows AMI for faster launching with a quick overview of the related key terms and their definitions: [Launching EC2 Windows instances up to 65% faster on AWS](#).

**Resource costs**

There is no service charge to configure Windows AMIs for EC2 Fast Launch. However, standard pricing applies for any underlying AWS resources that Amazon EC2 uses. To learn more about associated resource costs and how to manage them, see [Manage resource costs with EC2 Fast Launch](#).

**Contents**

- **Key terms**
- **EC2 Fast Launch prerequisites**
- [Configure EC2 Fast Launch settings for your Amazon EC2 Windows Server AMI](#)
- [View AMIs with EC2 Fast Launch enabled](#)
- [Manage resource costs with EC2 Fast Launch](#)
- [Monitor EC2 Fast Launch](#)
- [Service-linked role for EC2 Fast Launch](#)
Key terms

The EC2 Fast Launch feature uses the following key terms:

**Pre-provisioned snapshot**

A snapshot of an instance that was launched from a Windows AMI with EC2 Fast Launch enabled, and that has completed the following Windows launch steps, rebooting as required.

- Sysprep specialize
- Windows Out of Box Experience (OOBE)

When these steps are complete, EC2 Fast Launch stops the instance, and creates a snapshot that is later used for faster launching from the AMI, based on your configuration.

**Launch frequency**

Controls the number of pre-provisioned snapshots that Amazon EC2 can launch within the specified timeframe. When you enable EC2 Fast Launch for your AMI, Amazon EC2 creates the initial set of pre-provisioned snapshots in the background. For example, if the launch frequency is set to five launches per hour, which is the default, then EC2 Fast Launch creates an initial set of five pre-provisioned snapshots.

When Amazon EC2 launches an instance from an AMI with EC2 Fast Launch enabled, it uses one of the pre-provisioned snapshots to reduce the launch time. As snapshots are used, they are automatically replenished, up to the number specified by the launch frequency.

If you expect a spike in the number of instances that are launched from your AMI – during a special event, for example – you can increase the launch frequency in advance to cover the additional instances that you'll need. When your launch rate returns to normal, you can adjust the frequency back down.

When you experience a higher number of launches than anticipated, you might use up all the pre-provisioned snapshots that you have available. This doesn't cause any launches to fail. However, it can result in some instances going through the standard launch process, until snapshots can be replenished.

**Target resource count**

The number of pre-provisioned snapshots to keep on hand for an Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled.
Max parallel launches

Controls how many instances Amazon EC2 can launch at the same time to create the pre-provisioned snapshots for EC2 Fast Launch. If your target resource count is higher than the maximum parallel launches that you've configured, then Amazon EC2 launches the number of instances specified by Max parallel launches to start creating the snapshots. As those instances complete the process, Amazon EC2 takes the snapshot and stops the instance. Then it continues to launch more instances until the total number of snapshots available has reached the target resource count. The value for Max parallel launches must be 6 or greater.

EC2 Fast Launch prerequisites

Before you set up EC2 Fast Launch, verify that you've met the following prerequisites that are required to create snapshots for the AMIs in your AWS account:

- If you don't use a launch template to configure your settings, ensure that a default VPC is configured for the Region in which you use EC2 Fast Launch.

  Note

  If you accidentally delete your default VPC in the Region where you plan to configure EC2 Fast Launch, you can create a new default VPC in that Region. To learn more, see Create a default VPC in the Amazon VPC User Guide.

- To specify a non-default VPC, you must use a launch template when you configure Windows fast launch. For more information, see Use a launch template when you set up EC2 Fast Launch.

- If your account includes a policy that enforces IMDSv2 for Amazon EC2 instances, you must create a launch template that specifies the metadata configuration to enforce IMDSv2.

- Private EC2 Fast Launch AMIs must support user data script execution.

- To configure EC2 Fast Launch for an AMI, you must create the AMI using Sysprep with the shutdown option. The EC2 Fast Launch feature doesn't currently support AMIs that were created from a running instance.

  To create an AMI using Sysprep, see Use EC2 launch agents to create an AMI with Windows Sysprep.

- The default quota for Max parallel launches across all AMIs in an AWS account is 40 per Region. You can request a Service Quotas increase for your account, as follows.
1. Sign in to the AWS Management Console and open the Service Quotas console at https://console.aws.amazon.com/servicequotas/.

2. In the navigation pane, choose AWS services.

3. In the search bar, enter EC2 Fast Launch, and select the result.

4. Select the link for Parallel instance launches. This takes you to the Parallel instance launches service quota detail page.

5. Choose Request quota increase.

For more information, see Requesting a quota increase in the Service Quotas User Guide.

**Configure EC2 Fast Launch settings for your Amazon EC2 Windows Server AMI**

You can configure EC2 Fast Launch for Windows AMIs that you own, or AMIs that are shared with you from the AWS Management Console, API, SDKs, CloudFormation, or AWS Command Line Interface (AWS CLI). Before you configure EC2 Fast Launch, verify that your AMI meets all of the prerequisites that are required to create the pre-provisioned snapshots. For more information, see EC2 Fast Launch prerequisites.

When you enable EC2 Fast Launch, Amazon EC2 checks to make sure that you have the required permissions to launch instances from the specified AMI and Launch Template (if provided), including permissions for encrypted AMIs. To prevent errors during the instance launch process, the service validates your permissions before EC2 Fast Launch is enabled. If you don’t have the required permissions, the service returns an error, and does not enable EC2 Fast Launch.

The following sections cover configuration steps for the Amazon EC2 console and AWS CLI.

**Enable EC2 Fast Launch**

To enable EC2 Fast Launch, choose the tab that matches your environment, and follow the steps.

**Note**

Before changing these settings, make sure that your AMI, and the Region that you run in meet all EC2 Fast Launch prerequisites.
Console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, under Images, choose AMIs.
3. Choose the AMI to update by selecting the check box next to the Name.
4. From the Actions menu above the list of AMIs, choose Configure fast launch. This opens the Configure fast launch page, where you configure the settings for EC2 Fast Launch.
5. To start using pre-provisioned snapshots to launch instances from your Windows AMI faster, select the Enable fast launch for Windows check box.
6. From the Set anticipated launch frequency drop-down list, choose a value to specify the number of snapshots that are created and maintained to cover your expected instance launch volume.
7. When you're done making changes, choose Save changes.

**Note**

If you need to use a launch template to specify a non-default VPC, or to configure metadata settings for IMDSv2, see Use a launch template when you set up EC2 Fast Launch.

AWS CLI

The `enable-fast-launch` command calls the Amazon EC2 EnableFastLaunch API operation.

**Syntax:**

```bash
aws ec2 enable-fast-launch \
   --image-id <value> \
   --resource-type <value> (optional) \
   --snapshot-configuration <value> (optional) \
   --launch-template <value> (optional) \
   --max-parallel-launches <value> (optional) \
   --dry-run | --no-dry-run (optional) \
   --cli-input-json <value> (optional) \
   --generate-cli-skeleton <value> (optional)
```

**Example:**
The following `enable-fast-launch` example enables EC2 Fast Launch for the specified AMI, launching six parallel instances for pre-provisioning. The ResourceType is set to snapshot, which is the default value.

```bash
aws ec2 enable-fast-launch \\
   --image-id ami-01234567890abcedf \\
   --max-parallel-launches 6 \\
   --resource-type snapshot
```

Output:

```json
{
   "ImageId": "ami-01234567890abcedf",
   "ResourceType": "snapshot",
   "SnapshotConfiguration": {
      "TargetResourceCount": 10
   },
   "LaunchTemplate": {},
   "MaxParallelLaunches": 6,
   "OwnerId": "0123456789123",
   "State": "enabling",
   "StateTransitionReason": "Client.UserInitiated",
   "StateTransitionTime": "2022-01-27T22:16:03.199000+00:00"
}
```

PowerShell

The **Enable-EC2FastLaunch** cmdlet calls the Amazon EC2 [EnableFastLaunch](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_EnableFastLaunch.html) API operation to enable EC2 Fast Launch on your Windows AMI.

**Syntax:**

```powershell
Enable-EC2FastLaunch
   -ImageId <String>
   -LaunchTemplate_LaunchTemplateId <String>
   -LaunchTemplate_LaunchTemplateName <String>
   -MaxParallelLaunch <Int32>
   -ResourceType <String>
   -SnapshotConfiguration_TargetResourceCount <Int32>
   -LaunchTemplate_Version <String>
   -Select <String>
   -PassThru <SwitchParameter>
```
Example:

The following `Enable-EC2FastLaunch` example enables EC2 Fast Launch for the specified AMI, launching six parallel instances for pre-provisioning. The `ResourceType` is set to `snapshot`, which is the default value.

```
Enable-EC2FastLaunch `  
    -ImageId ami-01234567890abcedf `  
    -MaxParallelLaunches 6 `  
    -Region us-west-2 `  
    -ResourceType snapshot
```

Output:

```
ImageId               : ami-01234567890abcedf
LaunchTemplate        :
MaxParallelLaunches   : 6
OwnerId               : 0123456789123
ResourceType          : snapshot
State                 : enabling
StateTransitionReason : Client.UserInitiated
StateTransitionTime   : 2/25/2022 12:24:11 PM
```

Disable EC2 Fast Launch

To disable EC2 Fast Launch, choose the tab that matches your environment, and follow the steps.

⚠️ Note

Before changing these settings, make sure that your AMI, and the Region that you run in meet all EC2 Fast Launch prerequisites.

Console

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, under **Images**, choose **AMIs**.

3. Choose the AMI to update by selecting the check box next to the **Name**.

4. From the **Actions** menu above the list of AMIs, choose **Configure fast launch**. This opens the **Configure fast launch** page, where you configure the settings for EC2 Fast Launch.

5. Clear the **Enable fast launch for Windows** check box to disable EC2 Fast Launch and to remove pre-provisioned snapshots. This results in the AMI using the standard launch process for each instance, going forward.

   **Note**
   When you disable Windows image optimization, any existing pre-provisioned snapshots are automatically deleted. This step must be completed before you can start using the feature again.

6. When you're done making changes, choose **Save changes**.

**AWS CLI**

The **disable-fast-launch** command calls the Amazon EC2 **DisableFastLaunch** API operation.

**Syntax:**

```bash
aws ec2 disable-fast-launch \
   --image-id <value> \
   --force | --no-force \ (optional)
   --dry-run | --no-dry-run \ (optional)
   --cli-input-json <value> \ (optional)
   --generate-cli-skeleton <value> \ (optional)
```

**Example:**

The following **disable-fast-launch** example disables EC2 Fast Launch on the specified AMI, and cleans up existing pre-provisioned snapshots.

```bash
aws ec2 disable-fast-launch \
   --image-id ami-01234567890abcdef
```

**Output:**
PowerShell

The **Disable-EC2FastLaunch** cmdlet calls the Amazon EC2 [DisableFastLaunch](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_DisableFastLaunch.html) API operation.

**Syntax:**

```powershell
Disable-EC2FastLaunch
    -ImageId <String>
    -ForceStop <Boolean>
    -Select <String>
    -PassThru <SwitchParameter>
    -Force <SwitchParameter>
```

**Example:**

The following **Disable-EC2FastLaunch** example disables EC2 Fast Launch on the specified AMI, and cleans up existing pre-provisioned snapshots.

```powershell
Disable-EC2FastLaunch -ImageId ami-01234567890abcdef
```

**Output:**

```
ImageId : ami-01234567890abcdef
```
Use a launch template when you set up EC2 Fast Launch

With a launch template, you can configure a set of launch parameters that Amazon EC2 uses each time it launches an instance from that template. You can specify such things as an AMI to use for your base image, instance types, storage, network settings, and more.

Launch templates are optional, except for the following specific cases, where you must use a launch template for your Windows AMI when you configure faster launching:

- You must use a launch template to specify a non-default VPC for your Windows AMI.
- If your account includes a policy that enforces IMDSv2 for Amazon EC2 instances, you must create a launch template that specifies the metadata configuration to enforce IMDSv2.

Use the launch template that includes your metadata configuration from the EC2 console, or when you run the `enable-fast-launch` command in the AWS CLI, or call the `EnableFastLaunch` API action.

Amazon EC2 EC2 Fast Launch doesn't support the following configuration when you use a launch template. If you use a launch template for EC2 Fast Launch, you must not specify any of the following:

- User data scripts
- Termination protection
- Disabled metadata
- Spot option
- Shutdown behavior that terminates the instance
- Resource tags for network interface, elastic graphic, or spot instance requests
Specify a non-default VPC

Step 1: Create a launch template

Create a launch template that specifies the following details for your Windows instances:

- The VPC subnet.
- An instance type of t3.xlarge.

For more information, see Create a launch template.

Step 2: Specify the launch template for your EC2 Fast Launch AMI

Choose the tab that matches your process:

Console

To specify the launch template for EC2 Fast Launch from the AWS Management Console, follow these steps:

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, under Images, choose AMIs.
3. Choose the AMI to update by selecting the check box next to the Name.
4. From the Actions menu above the list of AMIs, choose Configure fast launch. This opens the Configure fast launch page, where you configure the settings for EC2 Fast Launch.
5. The Launch template box performs a filtered search that finds launch templates in your account in the current Region that match the text you've entered. Specify all or part of the launch template name or ID in the box to show a list of matching launch templates. For example, if you enter fast in the box, Amazon EC2 finds all of the launch templates in your account in the current Region that have "fast" in the name.

To create a new launch template, you can choose Create launch template.

6. When you select a launch template, Amazon EC2 shows the default version for that template in the Source template version box. To specify a different version, highlight the default version to replace it, and enter the version number you want in the box.
7. When you're done making changes, choose Save changes.
AWS CLI, API

To specify the launch template for EC2 Fast Launch from the AWS CLI, specify the launch template name or ID in the `--launch-template` parameter when you run the `enable-fast-launch` command in the AWS CLI.

To specify the launch template for EC2 Fast Launch in an API request, specify the launch template name or ID in the `LaunchTemplate` parameter when you call the `EnableFastLaunch` API action.

For more information about EC2 launch templates, see [Launch an instance from a launch template](#).

Create a custom image with EC2 Fast Launch enabled

Amazon EC2 EC2 Fast Launch integrates with EC2 Image Builder to help you create custom images with EC2 Fast Launch enabled. For more information, see [Create distribution settings for a Windows AMI with EC2 Fast Launch enabled (AWS CLI)](#) in the EC2 Image Builder User Guide.

View AMIs with EC2 Fast Launch enabled

You can use the `describe-fast-launch-images` command in the AWS CLI, or the `Get-EC2FastLaunchImage` Tools for PowerShell Cmdlet to get details for AMIs that have EC2 Fast Launch enabled.

Amazon EC2 provides the following details for each Windows AMI that is returned in the results:

- The image ID for an AMI with EC2 Fast Launch enabled.
- The resource type that is used for pre-provisioning the associated Windows AMI. Supported value: snapshot.
- The snapshot configuration, which is a group of parameters that configure pre-provisioning for the associated Windows AMI using snapshots.
- Launch template information, including the ID, name, and version of the launch template that the associated AMI uses when it launches Window instances from pre-provisioned snapshots.
- The maximum number of instances that can be launched at the same time for creating resources.
- The owner ID for the associated AMI. This is not populated for AMIs that are shared with you.
- The current state of EC2 Fast Launch for the associated AMI. Supported values include: enabling | enabling-failed | enabled | enabled-failed | disabling | disabling-failed.
Note

You can also see the current state displayed in the Manage image optimization page in the EC2 console, as Image optimization state.

- The reason that EC2 Fast Launch for the associated AMI changed to the current state.
- The time that EC2 Fast Launch for the associated AMI changed to the current state.

Choose the tab that matches your command line environment:

AWS CLI

The describe-fast-launch-images command calls the Amazon EC2 DescribeFastLaunchImages API operation.

**Syntax:**

```bash
aws ec2 describe-fast-launch-images \
--image-ids <value>  \ (optional)
--filters <value> \ (optional)
--dry-run | --no-dry-run \ (optional)
--cli-input-json <value> \ (optional)
--starting-token <value> \ (optional)
--page-size <value> \ (optional)
--max-items <value> \ (optional)
--generate-cli-skeleton <value> \ (optional)
```

**Example:**

The following describe-fast-launch-images example describes the details for each of the AMIs in the account that are configured for EC2 Fast Launch. In this example, only one AMI in the account is configured for EC2 Fast Launch.

```bash
aws ec2 describe-fast-launch-images
```

**Output:**

```json
{}
```
"FastLaunchImages": [  
  {  
    "ImageId": "ami-01234567890abcedf",  
    "ResourceType": "snapshot",  
    "SnapshotConfiguration": {},  
    "LaunchTemplate": {  
      "LaunchTemplateId": "lt-01234567890abcedf",  
      "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-a8c6215d-94e6-441b-9272-dbd1f87b07e2",  
      "Version": "1"  
    },  
    "MaxParallelLaunches": 6,  
    "OwnerId": "0123456789123",  
    "State": "enabled",  
    "StateTransitionReason": "Client.UserInitiated",  
    "StateTransitionTime": "2022-01-27T22:20:06.552000+00:00"  
  }  
]  
}

Tools for PowerShell

The **Get-EC2FastLaunchImage** cmdlet calls the Amazon EC2 **DescribeFastLaunchImages** API operation.

**Syntax:**

```powershell
Get-EC2FastLaunchImage  
-Filter <Filter[]>  
-ImageId <String[]>  
-MaxResult <Int32>  
-NextToken <String>  
-Select <String>  
-NoAutoIteration <SwitchParameter>
```

**Example:**

The following **Get-EC2FastLaunchImage** example describes the details for each of the AMIs in the account that are configured for EC2 Fast Launch. In this example, only one AMI in the account is configured for EC2 Fast Launch.

```powershell
Get-EC2FastLaunchImage -ImageId ami-01234567890abcedf
```
Manage resource costs with EC2 Fast Launch

There is no service charge to configure Windows AMIs for EC2 Fast Launch. However, when you enable EC2 Fast Launch for an Amazon EC2 Windows AMI, standard pricing applies for underlying AWS resources that Amazon EC2 uses to prepare and store the pre-provisioned snapshots. You can configure cost allocation tags to help you track and manage the costs that are associated with EC2 Fast Launch resources. For more information about how to configure cost allocation tags, see Track EC2 Fast Launch costs on your bill.

The following example demonstrates how the costs associated with EC2 Fast Launch snapshots costs might be allocated.

Example scenario: The AtoZ Example company has a Windows AMI with a 50 GiB EBS root volume. They enable EC2 Fast Launch for their AMI, and set the target resource count to five. Over the course of a month, using EC2 Fast Launch for their AMI costs them around $5.00, and the cost breakdown is as follows:

1. When AtoZ Example enables EC2 Fast Launch, Amazon EC2 launches five small instances. Each instance runs through the Sysprep and OOBE Windows launch steps, rebooting as required. This takes several minutes for each instance (time can vary, based on how busy that Region or Availability Zone (AZ) is, and on the size of the AMI).

Costs

- Instance runtime costs (or minimum runtime, if applicable): five instances
- Volume costs: five EBS root volumes
2. When the pre-provisioning process completes, Amazon EC2 takes a snapshot of the instance, which it stores in Amazon S3. Snapshots are typically stored for 4–8 hours before they are consumed by a launch. In this case, the cost is roughly $0.02 to $0.05 per snapshot.

**Costs**

- Snapshot storage (Amazon S3): five snapshots

3. After Amazon EC2 takes the snapshot, it stops the instance. At that point, the instance is no longer accruing costs. However EBS volume costs continue to accrue.

**Costs**

- EBS volumes: costs continue for the associated EBS root volumes.

**Note**

The costs shown here are for demonstration purposes only. Your costs will vary, depending on your AMI configuration and pricing plan.

**Track EC2 Fast Launch costs on your bill**

Cost allocation tags can help you organize your AWS bill to reflect the costs associated with EC2 Fast Launch. You can use the following tag that Amazon EC2 adds to the resources it creates when it prepares and stores pre-provisioned snapshots for EC2 Fast Launch:

**Tag key:** `CreatedBy`, **Value:** `EC2 Fast Launch`

After you activate the tag in the Billing and Cost Management console, and set up your detailed billing report, the `user:CreatedBy` column appears on the report. The column includes values from all services. However, if you download the CSV file, you can import the data into a spreadsheet, and filter for `EC2 Fast Launch` in the value. This information also appears in the AWS Cost and Usage Report when the tag is activated.

**Step 1: Activate user-defined cost allocation tags**

To include resource tags in your cost reports, you must first activate the tag in the Billing and Cost Management console. For more information, see [Activating User-Defined Cost Allocation Tags](#) in the [AWS Billing and Cost Management User Guide](#).
Step 2: Set up a cost report

If you already have a cost report set up, a column for your tag appears the next time the report runs after activation is complete. To set up cost reports for the first time, choose one of the following.

Note

It can take up to 24 hours for AWS to start delivering reports to your S3 bucket.

You can configure EC2 Fast Launch for Windows AMIs that you own, or AMIs that are shared with you from the Amazon EC2 console, API, SDKs, CloudFormation, or ec2 commands in the AWS CLI. The following sections cover configuration steps for the Amazon EC2 console and AWS CLI.

You can also create custom Windows AMIs that are configured for EC2 Fast Launch with EC2 Image Builder. For more information, see Create distribution settings for a Windows AMI with EC2 Fast Launch enabled (AWS CLI).

Monitor EC2 Fast Launch

This section covers how to monitor the Amazon EC2 Windows Server AMIs in your account that have EC2 Fast Launch enabled.

Monitor EC2 Fast Launch state changes with EventBridge

When the state changes for a Windows AMI with EC2 Fast Launch enabled, Amazon EC2 generates an EC2 Fast Launch State-change Notification event. Then Amazon EC2 sends the state change event to Amazon EventBridge (formerly known as Amazon CloudWatch Events).
You can create EventBridge rules that trigger one or more actions in response to the state change event. For example, you can create an EventBridge rule that detects when EC2 Fast Launch is enabled and performs the following actions:

- Sends a message to an Amazon SNS topic that notifies its subscribers.
- Invokes a Lambda function that performs some action.
- Sends the state change data to Amazon Data Firehose for analytics.

For more information, see [Creating Amazon EventBridge rules that react to events](https://docs.aws.amazon.com/AmazonEventBridge/latest/userguide/eventbridgerules.html) in the *Amazon EventBridge User Guide*.

**State change events**

The EC2 Fast Launch feature emits JSON formatted state change events on a best-effort basis. Amazon EC2 sends the events to EventBridge in near real time. This section describes the event fields and shows an example of the event format.

**EC2 Fast Launch State-change Notification**

**imageId**

Identifies the AMI with the EC2 Fast Launch state change.

**resourceType**

The type of resource to use for pre-provisioning. Supported value: snapshot. The default value is snapshot.

**state**

The current state of the EC2 Fast Launch feature for the specified AMI. Valid values include the following:

- **enabling** – You’ve enabled the EC2 Fast Launch feature for the AMI, and Amazon EC2 has started creating snapshots for the pre-provisioning process.
- **enabling-failed** – Something went wrong that caused the pre-provisioning process to fail the first time that you enabled the EC2 Fast Launch for an AMI. This can happen anytime during the pre-provisioning process.
- **enabled** – The EC2 Fast Launch feature is enabled. The state changes to enabled as soon as Amazon EC2 creates the first pre-provisioned snapshot for a newly enabled EC2 Fast Launch
AMI. If the AMI was already enabled and goes through pre-provisioning again, the state change happens right away.

- **enabled-failed** – This state applies only if this is not the first time your EC2 Fast Launch AMI goes through the pre-provisioning process. This can happen if the EC2 Fast Launch feature is disabled and then later enabled again, or if there is a configuration change or other error after pre-provisioning is completed for the first time.

- **disabling** – The AMI owner has turned off the EC2 Fast Launch feature for the AMI, and Amazon EC2 has started the clean up process.

- **disabled** – The EC2 Fast Launch feature is disabled. The state changes to disabled as soon as Amazon EC2 completes the clean up process.

- **disabling-failed** – Something went wrong that caused the clean up process to fail. This means that some pre-provisioned snapshots may still remain in the account.

**stateTransitionReason**

The reason that the state changed for the EC2 Fast Launch AMI.

---

**Note**

All fields in this event message are required.

The following example shows a newly enabled EC2 Fast Launch AMI that has launched the first instance to start the pre-provisioning process. At this point, the state is **enabling**. After Amazon EC2 creates the first pre-provisioned snapshot, the state changes to **enabled**.

```json
{
  "version": "0",
  "id": "01234567-0123-0123-0123-012345678901",
  "detail-type": "EC2 Fast Launch State-change Notification",
  "source": "aws.ec2",
  "account": "123456789012",
  "time": "2022-08-31T20:30:12Z",
  "region": "us-east-1",
  "resources": [
    "arn:aws:ec2:us-east-1:123456789012:image/ami-123456789012"
  ],
  "detail": {
    "imageId": "ami-123456789012",
```
Monitor EC2 Fast Launch metrics with CloudWatch

Amazon EC2 AMIs with EC2 Fast Launch enabled send metrics to Amazon CloudWatch. You can use the AWS Management Console, the AWS CLI, or an API to list the metrics that EC2 Fast Launch sends to CloudWatch. The AWS/EC2 namespace includes the following EC2 Fast Launch metrics:

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NumberOfAvailableFastLaunchSnapshots</td>
<td>The number of pre-provisioned snapshots available per EC2 Fast Launch enabled AMI.</td>
</tr>
<tr>
<td>NumberOfInstancesFastLaunched</td>
<td>The number of instances per EC2 Fast Launch enabled AMI that were launched from pre-provisioned snapshots.</td>
</tr>
<tr>
<td>NumberOfInstancesNotFastLaunched</td>
<td>The number of instances per EC2 Fast Launch enabled AMI that resulted in a cold boot due to the lack of available pre-provisioned snapshots at launch time.</td>
</tr>
<tr>
<td>FastLaunchSnapshotUsedToRefillStartTime</td>
<td>The timestamp when Amazon EC2 launched a new image from a EC2 Fast Launch enabled AMI to create another snapshot after an existing snapshot was used.</td>
</tr>
<tr>
<td>FastLaunchSnapshotCreationTime</td>
<td>Measures the time it took for Amazon EC2 to launch an instance and create a snapshot for a EC2 Fast Launch enabled AMI.</td>
</tr>
</tbody>
</table>

Service-linked role for EC2 Fast Launch

Amazon EC2 uses service-linked roles for the permissions that it requires to call other AWS services on your behalf. A service-linked role is a unique type of IAM role that is linked directly to an AWS
Service-linked roles provide a secure way to delegate permissions to AWS services because only the linked service can assume a service-linked role. For more information about how Amazon EC2 uses IAM roles, including service-linked roles, see IAM roles for Amazon EC2.

Amazon EC2 uses the service-linked role named AWSServiceRoleForEC2FastLaunch to create and manage a set of pre-provisioned snapshots that reduce the time it takes to launch instances from your Windows AMI.

You don't need to create this service-linked role manually. When you start using EC2 Fast Launch for your AMI, Amazon EC2 creates the service-linked role for you, if it doesn't already exist.

**Note**

If the service-linked role is deleted from your account, you can enable EC2 Fast Launch for another Windows AMI to re-create the role in your account. Alternatively, you can disable EC2 Fast Launch for your current AMI, and then enable it again. However, disabling the feature results in your AMI using the standard launch process for all new instances while Amazon EC2 removes all of your pre-provisioned snapshots. After all of the pre-provisioned snapshots are gone, you can enable using EC2 Fast Launch for your AMI again.

Amazon EC2 does not allow you to edit the AWSServiceRoleForEC2FastLaunch service-linked role. After you create a service-linked role, you cannot change the name of the role because various entities might reference the role. However, you can edit the description of the role by using IAM. For more information, see Editing a Service-Linked Role in the IAM User Guide.

You can delete a service-linked role only after first deleting all of the related resources. This protects the Amazon EC2 resources that are associated with your Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled, because you can't inadvertently remove permission to access the resources.

Amazon EC2 supports the EC2 Fast Launch service-linked role in all of the Regions where the Amazon EC2 service is available. For more information, see Regions.

**Permissions granted by AWSServiceRoleForEC2FastLaunch**

Amazon EC2 uses the EC2FastLaunchServiceRolePolicy managed policy to complete the following actions:
• cloudwatch:PutMetricData – Post metric data associated with EC2 Fast Launch to the Amazon EC2 namespace.

• ec2:CreateLaunchTemplate – Create a launch template for your Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled.

• ec2:CreateSnapshot – Create pre-provisioned snapshots for your Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled.

• ec2:CreateTags – Create tags for resources that are associated with launching and pre-provisioning Windows instances for your Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled.

• ec2:DeleteSnapshots – Delete all associated pre-provisioned snapshots if EC2 Fast Launch is turned off for a previously enabled AMI.

• ec2:DescribeImages – Describe images for all resources.

• ec2:DescribeInstanceAttribute – Describe instance attributes for all resources.

• ec2:DescribeInstanceStatus – Describe instance status for all resources.

• ec2:DescribeInstances – Describe instances for all resources.

• ec2:DescribeInstanceTypeOfferings – Describe instance type offerings for all resources.

• ec2:DescribeLaunchTemplates – Describe launch templates for all resources.

• ec2:DescribeLaunchTemplateVersions – Describe launch template versions for all resources.

• ec2:DescribeSnapshots – Describe snapshot resources for all resources.

• ec2:DescribeSubnets – Describe subnets for all resources.

• ec2:RunInstances – Launch instances from an Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled, in order to perform provisioning steps.

• ec2:StopInstances – Stop instances that were launched from an Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled, in order to create pre-provisioned snapshots.

• ec2:TerminateInstances – Terminate an instance that was launched from an Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled, after creating the pre-provisioned snapshot from it.

• iam:PassRole – Allows the AWSServiceRoleForEC2FastLaunch service-linked role to launch instances on your behalf using the instance profile from your launch template.

For more information about using managed policies for Amazon EC2, see AWS managed policies for Amazon EC2.
Access to customer managed keys for use with encrypted AMIs and EBS snapshots

Prerequisite

- To enable Amazon EC2 to access an encrypted AMI on your behalf, you must have permission for the `createGrant` action in the customer managed key.

When you enable EC2 Fast Launch for an encrypted AMI, Amazon EC2 ensures that permission is granted for the `AWSServiceRoleForEC2FastLaunch` role to use the customer managed key to access your AMI. This permission is needed to launch instances and create pre-provisioned snapshots on your behalf.

Use Amazon Elastic Graphics accelerators on Windows instances

⚠️ Important
Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

Amazon Elastic Graphics provides flexible, low-cost, and high performance graphics acceleration for your Windows instances. Elastic Graphics accelerators come in multiple sizes and are a low-cost alternative to using GPU graphics instance types (such as G3). You have the flexibility to choose an instance type that meets the compute, memory, and storage needs of your application. Then, choose the accelerator for your instance that meets the graphics requirements of your workload.

Elastic Graphics is suited for applications that require a small or intermittent amount of additional graphics acceleration, and that use OpenGL graphics support. If you need access to full, directly attached GPUs and use of DirectX, CUDA, or Open Computing Language (OpenCL) parallel computing frameworks, use an accelerated computing instance type instance instead.

Contents

- Elastic Graphics basics
- Pricing for Elastic Graphics
- Elastic Graphics limitations
- Work with Elastic Graphics
Elastic Graphics basics

To use Elastic Graphics, launch a Windows instance and specify an accelerator type for the instance during launch. AWS finds available Elastic Graphics capacity and establishes a network connection between your instance and the Elastic Graphics accelerator.

Note
Bare metal instances are not supported.

Elastic Graphics accelerators are available in the following AWS Regions: us-east-1, us-east-2, us-west-2, ap-northeast-1, ap-southeast-1, ap-southeast-2, eu-central-1, and eu-west-1.

The following instance types support Elastic Graphics accelerators:

- **General purpose:** M3, M4, M5, M5d, M5dn, M5n, T2, T3
  
  Note
  Only t2.medium and larger and t3.medium and larger are supported.

- **Compute optimized:** C3, C4, C5, C5a, C5ad, C5d, C5n
- **Memory optimized:** R3, R4, R5, R5d, R5dn, R5n, X1, X1e, z1d
- **Storage optimized:** D2, D3, D3en, H1, I3, I3en
- **Accelerated computing:** P2, P3, P3dn

The following Elastic Graphics accelerators are available. You can attach any Elastic Graphics accelerator to any supported instance type.
### Elastic Graphics accelerator

<table>
<thead>
<tr>
<th>Elastic Graphics accelerator</th>
<th>Graphics memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>
<td>eg1.medium</td>
<td>1</td>
</tr>
<tr>
<td>eg1.large</td>
<td>2</td>
</tr>
<tr>
<td>eg1.xlarge</td>
<td>4</td>
</tr>
<tr>
<td>eg1.2xlarge</td>
<td>8</td>
</tr>
</tbody>
</table>

An Elastic Graphics accelerator does not form part of the hardware of your instance. Instead, it is network-attached through a network interface, known as the *Elastic Graphics network interface*. When you launch or restart an instance with graphics acceleration, the Elastic Graphics network interface is created in your VPC for you.

The Elastic Graphics network interface is created in the same subnet and VPC as your instance and is assigned a private IPv4 address from that subnet. The accelerator attached to your Amazon EC2 instance is allocated from a pool of available accelerators in the same Availability Zone as your instance.
Elastic Graphics accelerators support the API standards for OpenGL 4.3 API and earlier, which can be used for batch applications or 3D-graphics acceleration. An Amazon-optimized OpenGL library on your instance detects the attached accelerator. It directs OpenGL API calls from your instance to the accelerator, which then processes the requests and returns the results. Traffic between the instance and the accelerator uses the same bandwidth as the instance's network traffic so we recommend that you have adequate network bandwidth available. Consult your software vendor for any OpenGL compliance and version questions.
By default, the default security group for your VPC is associated with the Elastic Graphics network interface. The Elastic Graphics network traffic uses the TCP protocol and port 2007. Ensure that the security group for your instance allows for this. For more information, see Configure your security groups.

**Pricing for Elastic Graphics**

You are charged for each second that an Elastic Graphics accelerator is attached to an instance in the running state when the accelerator is in the Ok state. You are not charged for an accelerator attached to an instance that is in the pending, stopping, stopped, shutting-down, or terminated state. You are also not charged when an accelerator is in the Unknown or Impaired state.

Pricing for accelerators is available at On-Demand rates only. You can attach an accelerator to a Reserved Instance or Spot Instance, however, the On-Demand price for the accelerator applies.

For more information, see Amazon Elastic Graphics Pricing.

**Elastic Graphics limitations**

Before you start using Elastic Graphics accelerators, be aware of the following limitations:

- You can attach accelerators only to Windows instances with Microsoft Windows Server 2012 R2 or later. Linux instances are currently not supported.
- You can attach one accelerator to an instance at a time.
- You can attach an accelerator only during instance launch. You cannot attach an accelerator to an existing instance.
- You can't hibernate an instance with an attached accelerator.
- You can't share an accelerator between instances.
- You can't detach an accelerator from an instance or transfer it to another instance. If you no longer require an accelerator, you must terminate your instance. To change the accelerator type, create an AMI from your instance, terminate the instance, and launch a new instance with a different accelerator specification.
- The only supported versions of the OpenGL API are 4.3 and earlier. DirectX, CUDA, and OpenCL are not supported.
- The Elastic Graphics accelerator is not visible or accessible through the device manager of your instance.
• You can't reserve or schedule accelerator capacity.

Work with Elastic Graphics

⚠️ Important
Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

You can launch an instance and associate it with an Elastic Graphics accelerator during launch. You must then manually install the necessary libraries on your instance that enable communication with the accelerator. For limitations, see Elastic Graphics limitations.

Tasks
• Configure your security groups
• Launch an instance with an Elastic Graphics accelerator
• Install the required software for Elastic Graphics
• Verify Elastic Graphics functionality on your instance
• View Elastic Graphics information
• Submit feedback

Configure your security groups

Elastic Graphics requires a self-referencing security group that allows inbound and outbound traffic to and from the security group itself. The security group must include the following inbound and outbound rules.

Inbound

<table>
<thead>
<tr>
<th>Type</th>
<th>Protocol</th>
<th>Port</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Graphics</td>
<td>TCP</td>
<td>2007</td>
<td>The security group ID (its own resource ID)</td>
</tr>
</tbody>
</table>
### Outbound

<table>
<thead>
<tr>
<th>Type</th>
<th>Protocol</th>
<th>Port range</th>
<th>Destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastic Graphics</td>
<td>TCP</td>
<td>2007</td>
<td>The security group ID (its own resource ID)</td>
</tr>
</tbody>
</table>

If you use the Amazon EC2 console to launch your instance with an Elastic Graphics accelerator, you can either allow the launch instance wizard to automatically create the required security group rules, or you can select a security that you created previously.

If you are launching your instance using the AWS CLI or an SDK, you must specify a security group that you created previously.

**To create a security group for Elastic Graphics**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Security Groups and then choose Create security group.
3. In the Create security group window, do the following:
   a. For Security group name, enter a descriptive name for the security group, such as Elastic Graphics security group.
   b. (Optional) For Description, enter a brief description of the security group.
   c. For VPC, select the VPC into which you intend to use Elastic Graphics.
   d. Choose Create security group.
4. In the navigation pane, choose Security Groups, select the security group that you just created, and on the Details tab, copy the Security group ID.
5. On the Inbound rules tab, choose Edit inbound rules and then do the following:
   a. Choose Add rule.
   b. For Type, choose Elastic Graphics.
   c. For Source type, choose Custom.
   d. For Source, paste the security group ID that you copied previously.
   e. Choose Save rules.
6. On the Outbound rules tab, choose Edit outbound rules and then do the following:
Choose Add rule.

b. For Type, choose Elastic Graphics.

c. For Destination type, choose Custom.

d. For Destination, paste the security group ID that you copied previously.

e. Choose Save rules.

For more information, see Amazon EC2 security groups for your EC2 instances.

Launch an instance with an Elastic Graphics accelerator

You can associate an Elastic Graphics accelerator to an instance during launch. If the launch fails, the following are possible reasons:

- Insufficient Elastic Graphics accelerator capacity
- Exceeded limit on Elastic Graphics accelerators in the Region
- Not enough private IPv4 addresses in your VPC to create a network interface for the accelerator

For more information, see Elastic Graphics limitations.

To associate an Elastic Graphics accelerator during instance launch (console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.

2. From the dashboard, choose Launch Instance.

3. Under Name and tags, enter a value for Name. You can optionally choose Add additional tags to add more tags to resources associated with the instance you are launching.

4. Under Application and OS Images (Amazon Machine Image), select a Windows AMI.

5. Under Instance type, select a supported instance type. For more information, see Elastic Graphics basics.

6. Under Key pair (login), for Key pair name, choose an existing key pair or create a new one.

7. Next to Network settings, choose Edit, and then specify the network settings to use for your instance.

   a. For Network, select a VPC for your instance.

   b. For Subnet, select a subnet in which to launch your instance.
c. For **Firewall (security groups)**, you can use the security group that you created manually in **Configure your security groups**, or let the console create a security group for you with the required inbound and outbound rules. Add additional security groups as needed.

8. (Optional) Under **Configure storage**, configure your root volume size and add additional volumes as needed.

9. Expand the **Advanced details** section.

11. In the **Summary** panel, choose **Launch instance**.

**To associate an Elastic Graphics accelerator during instance launch (AWS CLI)**

You can use the **run-instances** AWS CLI command with the following parameter:

```
--elastic-gpu-specification Type=eg1.medium
```

For the `--security-group-ids` parameter, you must include a security group that has the required inbound and outbound rules. For more information, see **Configure your security groups**.

**To associate an Elastic Graphics accelerator during instance launch (Tools for Windows PowerShell)**

Use the **New-EC2Instance** Tools for Windows PowerShell command.

**Install the required software for Elastic Graphics**

If you launched your instance using a current AWS Windows AMI, the required software is installed automatically during the first boot. If you launched your instance using Windows AMIs that do not automatically install the required software, you must install the required software on the instance manually.

**To install the required software for Elastic Graphics (if necessary)**

1. Connect to the instance.

2. Download the **Elastic Graphics installer** and open it. The installation manager connects to the Elastic Graphics endpoint and downloads the latest version of the required software.
3. Reboot the instance to verify.

**Verify Elastic Graphics functionality on your instance**

The Elastic Graphics packages on your instance include tools that you can use to view the status of the accelerator, and to verify that OpenGL commands from your instance to the accelerator are functional.

If your instance was launched with an AMI that does not have the Elastic Graphics packages pre-installed, you can download and install them yourself. For more information, see [Install the required software for Elastic Graphics](#).

You can use one of the following methods to verify Elastic Graphics functionality on your instance.

---

**Note**

If the Elastic Graphics status monitor or command line tool returns an unexpected result, see [Resolve unhealthy status issues](#).

---

**Elastic Graphics status monitor**

You can use the status monitor tool to view information about the status of an attached Elastic Graphics accelerator. By default, this tool is available in the notification area of the taskbar in your Windows instance and shows the status of the graphics accelerator. The following are the possible values.

**Healthy**

The Elastic Graphics accelerator is enabled and healthy.

**Updating**

The status of the Elastic Graphics accelerator is currently updating. It might take a few minutes to display the status.
Out of service

The Elastic Graphics accelerator is out of service. To get more information about the error, choose Read More.

Elastic Graphics command line tool

You can use the Elastic Graphics command line tool, egcli.exe, to check the status of the accelerator. If there is a problem with the accelerator, the tool returns an error message.

To launch the tool, open a command prompt from within your instance and run the following command:

C:\Program Files\Amazon\EC2ElasticGPUs\manager\egcli.exe

The tool also supports the following parameters:

--json, -j

Indicates whether to show the JSON message. The possible values are true and false. The default is true.

--imds, -i

Indicates whether to check the instance metadata for the availability of the accelerator. The possible values are true and false. The default is true.

The following is example output. A status of OK indicates that the accelerator is enabled and healthy.

EG Infrastructure is available.
Instance ID egpu-f6d94dfa66df4883b284e96db7397ee6
Instance Type eg1.large
EG Version 1.0.0.885 (Manager) / 1.0.0.95 (OpenGL Library) / 1.0.0.69 (OpenGL Redirector)
EG Status: Healthy
JSON Message:
{
    "version": "2016-11-30",
    "status": "OK"
}
The following are the possible values for status:

OK

The Elastic Graphics accelerator is enabled and healthy.

UPDATING

The Elastic Graphics driver is being updated.

NEEDS_REBOOT

The Elastic Graphics driver has been updated and a reboot of the Amazon EC2 instance is required.

LOADING_DRIVER

The Elastic Graphics driver is being loaded.

CONNECTING_EGPU

The Elastic Graphics driver is verifying the connectivity with the Elastic Graphics accelerator.

ERROR_UPDATE_RETRY

An error occurred while updating the Elastic Graphics driver, an update will be retried soon.

ERROR_UPDATE

An unrecoverable error occurred while updating the Elastic Graphics driver.

ERROR_LOAD_DRIVER

An error occurred loading the Elastic Graphics driver.

ERROR_EGPU_CONNECTIVITY

The Elastic Graphics accelerator is unreachable.

View Elastic Graphics information

You can view information about the Elastic Graphics accelerator attached to your instance.

To view information about an Elastic Graphics accelerator (console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Instances** and select your instance.

3. On the **Details** tab, find **Elastic Graphics ID**. Choose the ID to view the following information about the Elastic Graphics accelerator:

- Attachment State
- Type
- Health status

**To view information about an Elastic Graphics accelerator (AWS CLI)**

You can use the **describe-elastic-gpus** AWS CLI command:

```bash
cmd
aws ec2 describe-elastic-gpus
```

You can use the **describe-network-interfaces** AWS CLI command and filter by owner ID to view information about the Elastic Graphics network interface.

```bash
cmd
aws ec2 describe-network-interfaces --filters "Name=attachment.instance-owner-id,Values=amazon-elasticgpus"
```

**To view information about an Elastic Graphics accelerator (Tools for Windows PowerShell)**

Use the following commands:

- **Get-EC2ElasticGpu**
- **Get-EC2NetworkInterface**

**To view information about an Elastic Graphics accelerator using instance metadata**

1. Connect to your Windows instance that is using an Elastic Graphics accelerator.
2. Do one of the following:
   - From PowerShell, use the following cmdlet:
     ```powershell
     ```
   - From your web browser, paste the following URL into the address field:
Submit feedback

You can submit feedback about your experience with Elastic Graphics so that the team can make further improvements.

To submit feedback using the Elastic Graphics Status Monitor

1. In the notification area of the taskbar in your Windows instance, open the Elastic Graphics Status Monitor.
2. In the lower left corner, choose Feedback.
3. Enter your feedback and choose Submit.

Elastic Graphics maintenance

⚠️ Important

Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

AWS might determine that an Elastic Graphics accelerator is in an unhealthy state if:

- A security or infrastructure update is needed
- A software update is needed
- There is an issue with the underlying host

When AWS determines that an Elastic Graphics accelerator is in an unhealthy state, it schedules the accelerator for retirement. AWS notifies you of the accelerator's pending retirement, and provides you with the remedial steps that you need to take.

Topics
• **How will I be notified?**

• **What do I need to do?**

• **What happens when an accelerator reaches its retirement date?**

---

### How will I be notified?

When AWS schedules an Elastic Graphics accelerator for retirement, it sends an accelerator retirement notice to your **AWS Health Dashboard**. AWS also sends an email to the email address that is associated with your AWS account. This is the same email address that you use to log in to the AWS Management Console.

> **Note**
> If you use an email account that you don't check regularly, use the AWS Health Dashboard to determine if any of your Elastic Graphics accelerators are scheduled for retirement. You can also change the contact information for your AWS account on the [Account Settings](#) page.

The retirement notice provides the following:

- The ID of instance to which the accelerator is attached
- Information about the issue impacting the accelerator
- The retirement date for the accelerator
- The remedial steps that you should take

---

### What do I need to do?

When you are notified that your Elastic Graphics accelerator is scheduled for retirement, you must **stop and start the instance** to which the accelerator is attached for the old, *unhealthy* accelerator to be replaced with a new, *healthy* accelerator.

We recommend that you close graphic applications running on the instance before you stop and restart the instance.
Important

If you do not stop and start your instance before the scheduled retirement date, the accelerator associated with your instance is automatically stopped, which might cause your applications to stop working.

You must stop and start the instance. Rebooting the instance will not replace the unhealthy accelerator with a healthy one.

What happens when an accelerator reaches its retirement date?

When an unhealthy Elastic Graphics accelerator reaches its scheduled retirement date, AWS permanently terminates it. To receive a replacement for your unhealthy accelerator, either before or after the retirement date, you must stop and start the instance to which the accelerator is attached.

If you do not stop and start your instance before the scheduled retirement date, the accelerator associated with your instance is automatically stopped, which might cause your applications to stop working.

Use CloudWatch metrics to monitor Elastic Graphics

Important

Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

You can monitor your Elastic Graphics accelerator using Amazon CloudWatch, which collects metrics about your accelerator performance. These statistics are recorded for a period of two weeks, so that you can access historical information and gain a better perspective on how your service is performing.

By default, Elastic Graphics accelerators send metric data to CloudWatch in 5-minute periods.

For more information about Amazon CloudWatch, see the Amazon CloudWatch User Guide.
Elastic Graphics metrics

The AWS/ElasticGPUs namespace includes the following metrics for Elastic Graphics.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPUConnectivityCheckFailed</td>
<td>Reports whether connectivity to the Elastic Graphics accelerator is active or has failed. A value of zero (0) indicates that the connection is active. A value of one (1) indicates a connectivity failure.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td>GPUHealthCheckFailed</td>
<td>Reports whether the Elastic Graphics accelerator has passed a status health check in the last minute. A value of zero (0) indicates that the status check passed. A value of one (1) indicates a status check failure.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td>GPUMemoryUtilization</td>
<td>The GPU memory used</td>
</tr>
<tr>
<td></td>
<td>Units: MiB</td>
</tr>
</tbody>
</table>

Elastic Graphics dimensions

You can filter the metrics data for your Elastic Graphics accelerators using the following dimensions.

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EGPUId</td>
<td>Filters the data by the Elastic Graphics accelerator.</td>
</tr>
<tr>
<td>InstanceId</td>
<td>Filters the data by the instance to which the Elastic Graphics accelerator is attached.</td>
</tr>
</tbody>
</table>
View CloudWatch metrics for Elastic Graphics

Metrics are grouped first by the service namespace, and then by the supported dimensions. You can use the following procedures to view the metrics for your Elastic Graphics accelerators.

To view Elastic Graphics metrics using the CloudWatch console

2. If necessary, change the Region. From the navigation bar, select the Region where your Elastic Graphics accelerator resides. For more information, see Regions and Endpoints.
3. In the navigation pane, choose Metrics.

To view Elastic Graphics metrics (AWS CLI)

Use the following list-metrics command:

```
aws cloudwatch list-metrics --namespace "AWS/ElasticGPUs"
```

Create CloudWatch alarms to monitor Elastic Graphics

You can create a CloudWatch alarm that sends an Amazon SNS message when the alarm changes state. An alarm watches a single metric over a time period you specify, and sends a notification to an Amazon SNS topic based on the value of the metric relative to a given threshold over a number of time periods.

For example, you can create an alarm that monitors the health of an Elastic Graphics accelerator and sends a notification when the graphics accelerator fails a status health check for three consecutive 5-minute periods.

To create an alarm for an Elastic Graphics accelerator health status

2. In the navigation pane, choose Alarms, Create Alarm.
4. Select the GPUHealthCheckFailed metric and choose Select metric.
5. Configure the alarm as follows:
For **Alarm details**, type a name and description for your alarm. For **Whenever**, choose >= and type 1.

For **Actions**, select an existing notification list or choose **New list**.

Choose **Create Alarm**.

**Troubleshoot**

⚠️ **Important**

Amazon Elastic Graphics reached end of life on January 8, 2024. For workloads that require graphics acceleration, we recommend that you use Amazon EC2 G4ad, G4dn, or G5 instances.

The following are common errors and troubleshooting steps.

**Contents**

- **Investigate application performance issues**
  - OpenGL rendering performance issues
  - Remote access performance issues
- **Resolve unhealthy status issues**
  - Check the instance configuration
  - Stop and start the instance
  - Verify the installed components
  - Check the Elastic Graphics logs
- **Why am I seeing multiple ENIs?**

**Investigate application performance issues**

Elastic Graphics uses the instance network to send OpenGL commands to a remotely attached graphics card. In addition, a desktop running an OpenGL application with an Elastic Graphics accelerator is usually accessed using a remote access technology. It is important to distinguish between a performance problem related to the OpenGL rendering or the desktop remote access technology.
OpenGL rendering performance issues

The OpenGL rendering performance is determined by the number of OpenGL commands and frames generated on the remote instance.

Rendering performance may vary depending on the following factors:

- Elastic Graphics accelerator performance
- Network performance
- CPU performance
- Rendering model, scenario complexity
- OpenGL application behavior

An easy way to evaluate performance is to display the number of rendered frames on the remote instance. Elastic Graphics accelerators display a maximum of 25 FPS on the remote instance to achieve the best perceived quality while reducing network usage.

To show the number of frames produced

1. Open the following file in a text editor. If the file does not exist, create it.

   C:\Program Files\Amazon\EC2ElasticGPUs\conf\eg.conf

2. Identify the [Application] section, or add it if it is not present, and add the following configuration parameter:

   [Application]
   show_fps=1

3. Restart the application and check the FPS again.

If the FPS reaches 15-25 FPS when updating the rendered scene, then the Elastic Graphics accelerator is performing at peak. Any other performance problems you experience are likely related to the remote access to the instance desktop. If that is the case, see the Remote Access Performance Issues section.

If the FPS number is lower than 15, you can try the following:
• Improve Elastic Graphics accelerator performance by selecting a more powerful graphics accelerator type.

• Improve overall network performance by using these tips:
  • Check the amount of incoming and outgoing bandwidth to and from the Elastic Graphics accelerator endpoint. The Elastic Graphics accelerator endpoint can be retrieved with the following PowerShell command:

  • The network traffic from the instance to the Elastic Graphics accelerator endpoint relates to the volume of commands the OpenGL application is producing.
  • The network traffic from the Elastic Graphics accelerator endpoint to the instance relates to the number of frames generated by the graphics accelerator.
  • If you see the network usage reaching the instances maximum network throughput, try using an instance with a higher network throughput allowance.

• Improve CPU performance:
  • Applications may require a lot of CPU resources in addition to what the Elastic Graphics accelerator requires. If Windows Task Manager is reporting a high usage of CPU resources, try using an instance with more CPU power.

Remote access performance issues

An instance with an attached Elastic Graphics accelerator can be accessed using different remote access technologies. Performance and quality may vary depending on:

• The remote access technology
• Instance performance
• Client performance
• Network latency and bandwidth between the client and the instance

Possible choices for the remote access protocol include:

• Microsoft Remote Desktop Connection
• NICE DCV
For more information about optimization, see the specific protocol.

Resolve unhealthy status issues

If the Elastic Graphics accelerator is in an unhealthy state, use the following troubleshooting steps to resolve the issue.

Check the instance configuration

If the Elastic Graphics command line tool, egcli.exe, returns output similar to the following, ensure that your security group is properly configured and that you launched the instance with Instance Metadata Service enabled.

| EG Version | 1.0.7.4240 (Manager) / N/A (OpenGL Library) / N/A (OpenGL Redirector) |
|EG Status| Out Of Service |
|Something prevented the EG Infrastructure to work properly.|

Stop and start the instance

If your Elastic Graphics accelerator is in an unhealthy state, stopping the instance and starting it again is the simplest option. For more information, see Manually stop and start your instances.

⚠️ Warning
When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

Verify the installed components

Open the Windows Control Panel and confirm that the following components are installed:

- Amazon Elastic Graphics Manager
- Amazon Elastic Graphics OpenGL Library
- Amazon EC2 Elastic GPUs OpenGL Redirector

If any of these items are missing, you must install them manually. For more information, see Install the required software for Elastic Graphics.
Check the Elastic Graphics logs

Open the Windows Event Viewer, expand the Application and Services Logs section, and search for errors in the following event logs:

- EC2ElasticGPUs
- EC2ElasticGPUs GUI

Why am I seeing multiple ENIs?

When calling StartInstances on an EC2 instance with an Elastic Graphics accelerator, a new Elastic Network Interface (ENI) is created on the instance to allow OpenGL commands to be sent to the remotely attached graphics card.

If you call StartInstances many times in a short period of time (a few seconds or less) on the same EC2 instance, a new network interface is created on each call. However:

- Only one network interface will be used by the Elastic Graphics accelerator.
- Extra network interfaces don't incur any charges and will be automatically released in 24 hours.

Install WSL on your Windows instance

Windows Subsystem for Linux (WSL) is a free download that you can install on your Windows instance. By installing WSL, you can run native Linux command line tools directly on your Windows instance and use the Linux tools for scripting, alongside your traditional Windows desktop. You can easily swap between Linux and Windows on a single Windows instance, which you might find useful in a development environment.

For more information about WSL, see the Windows Subsystem for Linux Documentation on the Microsoft Build website.

Limitations

- WSL is available in two versions: WSL 1 and WSL 2.
  - For .metal EC2 instances, you can install either WSL 1 or WSL 2.
  - For virtualized EC2 instances, you must install WSL 1.
- For Windows Server operating systems, WSL can only be installed on instances running the following:
• Windows Server 2019
• Windows Server 2022

Install WSL

The following instructions install WSL on an EC2 instance running Windows Server 2022. For the instructions to install WSL on an EC2 instance running Windows Server 2019, see Install WSL on previous versions of Windows Server on the Microsoft website. After you've followed those instructions, you can use step 3 in the instructions below to configure WSL to use WSL 1.

Install WSL 1

1. To install WSL, run the following standard installation command on your EC2 instance, but make sure to enable WSL 1 by including --enable-wsl1. By default, WSL 2 is installed. If your instance was launched using a virtualized instance type, you must complete step 3 in this procedure to set the version to WSL 1.

   ```
   wsl --install --enable-wsl1 --no-launch
   ```

2. Restart your EC2 instance.

   ```
   shutdown -r -t 20
   ```

3. To configure WSL to use WSL 1, run the following command on your instance. For more information about setting the WSL version, see Manual installation steps for older versions of WSL on the Microsoft Build website.

   ```
   wsl --set-default-version 1
   ```

4. Install the default distribution.

   ```
   wsl --install
   ```

Install WSL 2

• To install WSL, run the following standard installation command on your EC2 instance. By default, WSL 2 is installed. If you are installing WSL on a .metal instance, then this is the only step to perform.
For more information, see Install Linux on Windows with WSL on the Microsoft Build website.

Upgrade an Amazon EC2 Windows instance to a newer version of Windows Server

There are two methods to upgrade an earlier version of Windows Server running on an instance: in-place upgrade and migration (also called side-by-side upgrade). An in-place upgrade upgrades the operating system files while your personal settings and files are intact. A migration involves capturing settings, configurations, and data and porting these to a newer operating system on a fresh Amazon EC2 instance.

Microsoft has traditionally recommended migrating to a newer version of Windows Server instead of upgrading. Migrating can result in fewer upgrade errors or issues, but can take longer than an in-place upgrade because of the need to provision a new instance, plan for and port applications, and adjust configurations settings on the new instance. An in-place upgrade can be faster, but software incompatibilities can produce errors.

Contents

- Perform an in-place upgrade on your Windows instance
- Perform an automated upgrade on your Windows instance
- Migrate a Windows instance to a current generation instance type
- Windows to Linux replatforming assistant for Microsoft SQL Server databases
- Troubleshoot an upgrade on a Windows instance

Perform an in-place upgrade on your Windows instance

Before you perform an in-place upgrade, you must determine which network drivers the instance is running. PV network drivers enable you to access your instance using Remote Desktop. Instances use either AWS PV, Intel Network Adapter, or the Enhanced Networking drivers. For more information, see Paravirtual drivers for Windows instances.
Before you begin an in-place upgrade

Complete the following tasks and note the following important details before you begin your in-place upgrade.

• Read the Microsoft documentation to understand the upgrade requirements, known issues, and restrictions. Also review the official instructions for upgrading.
  • Upgrade Options for Windows Server 2012
  • Upgrade Options for Windows Server 2012 R2
  • Upgrade and conversion options for Windows Server 2016
  • Upgrade and conversion options for Windows Server 2019
  • Upgrade and conversion options for Windows Server 2022
  • Windows Server Upgrade Center

• We recommend performing an operating system upgrade on instances with at least 2 vCPUs and 4GB of RAM. If needed, you can change the instance to a larger size of the same type (t2.small to t2.large, for example), perform the upgrade, and then resize it back to the original size. If you are required to retain the instance size, you can monitor the progress using the instance console screenshot. For more information, see Change the instance type.

• Verify that the root volume on your Windows instance has enough free disk space. The Windows Setup process might not warn you of insufficient disk space. For information about how much disk space is required to upgrade a specific operating system, see the Microsoft documentation. If the volume does not have enough space, it can be expanded. For more information, see Amazon EBS Elastic Volumes in the Amazon EBS User Guide.

• Determine your upgrade path. You must upgrade the operating system to the same architecture. For example, you must upgrade a 32-bit system to a 32-bit system. Windows Server 2008 R2 and later are 64-bit only.

• Disable antivirus and anti-spyware software and firewalls. These types of software can conflict with the upgrade process. Re-enable antivirus and anti-spyware software and firewalls after the upgrade completes.

• Update to the latest drivers as described in Migrate a Windows instance to a current generation instance type.

• The Upgrade Helper Service only supports instances running Citrix PV drivers. If the instance is running Red Hat drivers, you must manually upgrade those drivers first.
Upgrade an instance in-place with AWS PV, Intel Network Adapter, or the Enhanced Networking drivers

Use the following procedure to upgrade a Windows Server instance using the AWS PV, Intel Network Adapter, or the Enhanced Networking network drivers.

To perform the in-place upgrade

1. Create an AMI of the system you plan to upgrade for either backup or testing purposes. You can then perform the upgrade on the copy to simulate a test environment. If the upgrade completes, you can switch traffic to this instance with little downtime. If the upgrade fails, you can revert to the backup. For more information, see Create an Amazon EBS-backed AMI.

2. Ensure that your Windows Server instance is using the latest network drivers.
   a. To update your AWS PV driver, see Upgrade PV drivers on EC2 Windows instances.
   b. To update your ENA driver, see Install the ENA driver on EC2 Windows instances.
   c. To update your Intel drivers, see Enhanced networking with the Intel 82599 VF interface.

3. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.

4. In the navigation pane, choose Instances. Locate the instance. Make a note of the instance ID and Availability Zone for the instance. You need this information later in this procedure.

5. If you are upgrading from Windows Server 2012 or 2012 R2 to Windows Server 2016, 2019, or 2022, perform the following on your instance before proceeding:
   a. Uninstall the EC2Config service. For more information, see Stop, restart, delete, or uninstall EC2Config.
   b. Install EC2Launch v1 or the EC2Launch v2 agent. For more information, see Configure a Windows instance using EC2Launch and Configure a Windows instance using EC2Launch v2.
   c. Install the AWS Systems Manager SSM Agent. For more information, see Working with SSM Agent in the AWS Systems Manager User Guide.

6. Create a new volume from a Windows Server installation media snapshot.
   a. In the left navigation pane, under Elastic Block Store, choose Snapshots.
   b. From the filter bar, choose Public snapshots.
   c. In the search bar, specify the following filters:
- Choose **Owner Alias**, then =, then **amazon**.

- Choose **Description**, and then start typing **Windows**. Select the Windows filter that matches the system architecture and language preference you're upgrading to. For example, choose **Windows 2019 English Installation Media** to upgrade to Windows Server 2019.

d. Select the check box next to the snapshot that matches the system architecture and language preference you're upgrading to, and then choose **Actions, Create volume from snapshot**.

e. On the **Create volume** page, choose the Availability Zone that matches your Windows instance, and then choose **Create volume**.

7. In the **Successfully created volume vol-1234567890example** banner at the top of the page, choose the ID of the volume that you just created.

8. Choose **Actions, Attach volume**.

9. On the **Attach volume** page, for **Instance**, select the instance ID of your Windows instance, and then choose **Attach volume**.

10. Make the new volume available for use by following the steps at **Make an Amazon EBS volume available for use**.

    **Important**
    
    Do not initialize the disk because doing so will delete the existing data.

11. In Windows PowerShell, switch to the new volume drive. Begin the upgrade by opening the installation media volume you attached to the instance.

    a. If you are upgrading to Windows Server 2016 or later, run the following:

    ```
    .\setup.exe /auto upgrade /dynamicupdate disable
    ```

    **Note**
    
    Running the setup.exe with the /dynamicupdate option set to disabled prevents Windows from installing updates during the Windows Server upgrade process, as installing updates during the upgrade can cause failures. You can install updates with Windows Update after the upgrade completes.
If you are upgrading to an earlier version of Windows Server, run the following:

```
Sources\setup.exe
```

b. For **Select the operating system you want to install**, select the full installation SKU for your Windows Server instance, and choose **Next**.

c. For **Which type of installation do you want?**, choose **Upgrade**.

d. Complete the wizard.

Windows Server Setup copies and processes files. After several minutes, your Remote Desktop session closes. The time it takes to upgrade depends on the number of applications and server roles running on your Windows Server instance. The upgrade process could take as little as 40 minutes or several hours. The instance fails status check 1 of 2 during the upgrade process. When the upgrade completes, both status checks pass. You can check the system log for console output or use Amazon CloudWatch metrics for disk and CPU activity to determine whether the upgrade is progressing.

**Note**

If upgrading to Windows Server 2019, after the upgrade is complete you can change the desktop background manually to remove the previous operating system name if desired.

If the instance has not passed both status checks after several hours, see [Troubleshoot an upgrade on a Windows instance](#).

**Post upgrade tasks**

1. Log in to the instance to initiate an upgrade for the .NET Framework and reboot the system when prompted.

2. If you haven’t already done so in a prior step, install the EC2Launch v1 or EC2Launch v2 agent. For more information, see [Configure a Windows instance using EC2Launch](#) and [Configure a Windows instance using EC2Launch v2](#).

3. If you upgraded to Windows Server 2012 R2, we recommend that you upgrade the PV drivers to AWS PV drivers. If you upgraded on a Nitro-based instance, we recommend that you install or upgrade the NVME and ENA drivers. For more information, see [Windows Server 2012 R2](#).
Install or upgrade AWS NVMe drivers using PowerShell, or Enable enhanced networking on Windows.

4. Re-enable antivirus and anti-spyware software and firewalls.

Perform an automated upgrade on your Windows instance

You can perform an automated upgrade of your Windows and SQL Server instances on AWS with AWS Systems Manager Automation runbooks.

Contents

- Related services
- Execution options
- Upgrade Windows Server
- Upgrade SQL Server

Related services

The following AWS services are used in the automated upgrade process:

- **AWS Systems Manager.** AWS Systems Manager is a powerful, unified interface for centrally managing your AWS resources. For more information, see the [AWS Systems Manager User Guide](https://aws.amazon.com/documentation/systems-manager/).

- AWS Systems Manager Agent (SSM Agent) is Amazon software that can be installed and configured on an Amazon EC2 instance, an on-premises server, or a virtual machine (VM). SSM Agent makes it possible for Systems Manager to update, manage, and configure these resources. The agent processes requests from the Systems Manager service in the AWS Cloud, and then runs them as specified in the request. For more information, see [Working with SSM Agent](https://aws.amazon.com/documentation/systems-manager/) in the [AWS Systems Manager User Guide](https://aws.amazon.com/documentation/systems-manager/).

- **AWS Systems Manager SSM runbooks.** An SSM runbook defines the actions that Systems Manager performs on your managed instances. SSM runbooks use JavaScript Object Notation (JSON) or YAML, and they include steps and parameters that you specify. This topic uses two Systems Manager SSM runbooks for automation. For more information, see [AWS Systems Manager Automation runbook reference](https://aws.amazon.com/documentation/systems-manager/) in the [AWS Systems Manager User Guide](https://aws.amazon.com/documentation/systems-manager/).
Execution options

When you select Automation on the Systems Manager console, select Execute. After you select an Automation document, you are then prompted to choose an automation execution option. You choose from the following options. In the steps for the paths provided later in this topic, we use the Simple execution option.

Simple execution

Choose this option if you want to update a single instance but do not want to go through each automation step to audit the results. This option is explained in further detail in the upgrade steps that follow.

Rate control

Choose this option if you want to apply the upgrade to more than one instance. You define the following settings.

- **Parameter**

  This setting, which is also set in Multi-Account and Region settings, defines how your automation branches out.

- **Targets**

  Select the target to which you want to apply the automation. This setting is also set in Multi-Account and Region settings.

- **Parameter Values**

  Use the values defined in the automation document parameters.

- **Resource Group**

  In AWS, a resource is an entity you can work with. Examples include Amazon EC2 instances, AWS CloudFormation stacks, or Amazon S3 buckets. If you work with multiple resources, it might be useful to manage them as a group as opposed to moving from one AWS service to another for every task. In some cases, you may want to manage large numbers of related resources, such as EC2 instances that make up an application layer. In this case, you will likely need to perform bulk actions on these resources at one time.

- **Tags**
Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This categorization is useful when you have many resources of the same type. You can quickly identify a specific resource using the assigned tags.

- **Rate Control**

  Rate Control is also set in Multi-Account and Region settings. When you set the rate control parameters, you define how many of your fleet to apply the automation to, either by target count or by percentage of the fleet.

**Multi-Account and Region**

In addition to the parameters specified under Rate Control that are also used in the Multi-Account and Region settings, there are two additional settings:

- **Accounts and organizational units (OUs)**
  
  Specify multiple accounts on which you want to run the automation.

- **AWS Regions**
  
  Specify multiple AWS Regions where you want to run the automation.

**Manual execution**

This option is similar to Simple execution, but allows you to step through each automation step and audit the results.

**Upgrade Windows Server**

The AWSEC2-CloneInstanceAndUpgradeWindows runbook creates an Amazon Machine Image (AMI) from a Windows Server instance in your account and upgrades this AMI to a supported version of your choice. This multi-step process can take up to two hours to complete.

There are two AMIs included in the automated upgrade process:

- **Current running instance.** The first AMI is the current running instance, which is not upgraded. This AMI is used to launch another instance to run the in-place upgrade. When the process is complete, this AMI is deleted from your account, unless you specifically request to keep the original instance. This setting is handled by the parameter KeepPreUpgradeImageBackUp (default value is false, which means the AMI is deleted by default).
• **Upgraded AMI.** This AMI is the outcome of the automation process.

The final result is one AMI, which is the upgraded instance of the AMI.

When the upgrade is complete, you can test your application functionality by launching the new AMI in your Amazon VPC. After testing, and before you perform another upgrade, schedule application downtime before completely switching to the upgraded instance.

**Prerequisites**

In order to automate your Windows Server upgrade with the AWS Systems Manager Automation document, you must perform the following tasks:

• Create an IAM role with the specified IAM policies to allow Systems Manager to perform automation tasks on your Amazon EC2 instances and verify that you meet the prerequisites to use Systems Manager. For more information, see Creating a role to delegate permissions to an AWS service in the AWS Identity and Access Management User Guide.

• **Select the option for how you want the automation to be run.** The options for execution are Simple execution, Rate control, Multi-account and Region, and Manual execution. For more information about these options, see Execution options.

• Verify that SSM Agent is installed on your instance. For more information see Installing and configuring SSM Agent on Amazon EC2 instances for Windows Server.

• Windows PowerShell 3.0 or later must be installed on your instance.

• For instances that are joined to a Microsoft Active Directory domain, we recommend specifying a SubnetId that does not have connectivity to your domain controllers to help avoid hostname conflicts.

• The instance subnet must have outbound connectivity to the internet, which provides access to AWS services such as Amazon S3 and access to download patches from Microsoft. This requirement is met if either the subnet is a public subnet and the instance has a public IP address, or if the subnet is a private subnet with a route that sends internet traffic to a public NAT device.

• Verify that the instance has 20 GB of free disk space in the boot disk.

• If the instance does not use a Windows license provided by AWS, then specify an Amazon EBS snapshot ID that includes Windows Server 2012 R2 installation media. To do this:
1. Verify that the Amazon EC2 instance is running Windows Server 2012 or later.

2. Create a 6 GB Amazon EBS volume in the same Availability Zone where the instance is running. Attach the volume to the instance. Mount it, for example, as drive D.

3. Right-click the ISO and mount it to an instance as, for example, drive E.

4. Copy the content of the ISO from drive E:\ to drive D:\

5. Create an Amazon EBS snapshot of the 6 GB volume created in step 2 above.

**Windows Server upgrade limitations**

This automation doesn't support upgrading Windows domain controllers, clusters, or Windows desktop operating systems. In addition, this automation doesn't support Amazon EC2 instances for Windows Server with the following roles installed:

- Remote Desktop Session Host (RDSH)
- Remote Desktop Connection Broker (RDCB)
- Remote Desktop Virtualization Host (RDVH)
- Remote Desktop Web Access (RDWA)

**Steps to perform an automated upgrade of Windows Server**

Follow these steps to upgrade your Windows Server instance using the [AWSEC2-CloneInstanceAndUpgradeWindows](https://aws.amazon.com/) automation runbook.

1. Open Systems Manager from the [AWS Management Console](https://aws.amazon.com/).
2. From the left navigation pane, under **Change Management**, choose **Automation**.
3. Choose **Execute automation**.
4. Search for the automation document called AWSEC2-CloneInstanceAndUpgradeWindows.
5. When the document name appears, select it. When you select it, the document details appear.
6. Choose **Execute automation** to input the parameters for this document. Leave **Simple execution** selected at the top of the page.
7. Enter the requested parameters based on the following guidance.

   - **InstanceID**
     
     **Type:** String
(Required) The instance running Windows Server 2008 R2, 2012 R2, 2016, or 2019 with the SSM agent installed.

- **InstanceProfile**

  **Type**: String

  (Required) The IAM instance profile. This is the IAM role used to perform the Systems Manager automation against the Amazon EC2 instance and AWS AMIs. For more information, see Create an IAM Instance Profile for Systems Manager in the AWS Systems Manager User Guide.

- **TargetWindowsVersion**

  **Type**: String

  (Required) Select the target Windows version.

- **SubnetId**

  **Type**: String

  (Required) This is the subnet for the upgrade process and where your source EC2 instance resides. Verify that the subnet has outbound connectivity to AWS services, including Amazon S3, and also to Microsoft (in order to download patches).

- **KeepPreUpgradedBackUp**

  **Type**: String

  (Optional) If this parameter is set to `true`, the automation retains the image created from the instance. The default setting is `false`.

- **RebootInstanceBeforeTakingImage**

  **Type**: String

  (Optional) The default is `false` (no reboot). If this parameter is set to `true`, Systems Manager reboots the instance before creating an AMI for the upgrade.

8. After you have entered the parameters, choose **Execute**. When the automation begins, you can monitor the execution progress.

9. When the automation completes, you will see the AMI ID. You can launch the AMI to verify that the Windows OS is upgraded.
Note

It is not necessary for the automation to run all of the steps. The steps are conditional based on the behavior of the automation and instance. Systems Manager might skip some steps that are not required. Additionally, some steps may time out. Systems Manager attempts to upgrade and install all of the latest patches. Sometimes, however, patches time out based on a definable timeout setting for the given step. When this happens, the Systems Manager automation continues to the next step to ensure that the internal OS is upgraded to the target Windows Server version.

10. After the automation completes, you can launch an Amazon EC2 instance using the AMI ID to review your upgrade. For more information about how to create an Amazon EC2 instance from an AWS AMI, see How do I launch an EC2 instance from a custom AMI?

Upgrade SQL Server

The AWSEC2-CloneInstanceAndUpgradeSQLServer script creates an AMI from an Amazon EC2 instance running SQL Server in your account, and then upgrades the AMI to a later version of SQL Server. This multi-step process can take up to two hours to complete.

In this workflow, the automation creates an AMI from the instance and then launches the new AMI in the subnet you provide. The automation then performs an in-place upgrade of SQL Server. After the upgrade is complete, the automation creates a new AMI before terminating the upgraded instance.

There are two AMIs included in the automated upgrade process:

- **Current running instance.** The first AMI is the current running instance, which is not upgraded. This AMI is used to launch another instance to run the in-place upgrade. When the process is complete, this AMI is deleted from your account, unless you specifically request to keep the original instance. This setting is handled by the parameter KeepPreUpgradeImageBackUp (default value is false, which means the AMI is deleted by default).

- **Upgraded AMI.** This AMI is the outcome of the automation process.

The final result is one AMI, which is the upgraded instance of the AMI.
When the upgrade is complete, you can test your application functionality by launching the new AMI in your Amazon VPC. After testing, and before you perform another upgrade, schedule application downtime before completely switching to the upgraded instance.

**Prerequisites**

In order to automate your SQL Server upgrade with the AWS Systems Manager Automation document, you must perform the following tasks:

- Create an IAM role with the specified IAM policies to allow Systems Manager to perform automation tasks on your Amazon EC2 instances and verify that you meet the prerequisites to use Systems Manager. For more information, see [Creating a role to delegate permissions to an AWS service](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_service-role.html) in the *AWS Identity and Access Management User Guide*.

- **Select the option for how you want the automation to be run.** The options for execution are **Simple execution**, **Rate control**, **Multi-account and Region**, and **Manual execution**. For more information about these options, see [Execution options](https://doc.bash.co/).

- The Amazon EC2 instance must use Windows Server 2008 R2 or later and SQL Server 2008 or later.

- Verify that SSM Agent is installed on your instance. For more information, see [Working with SSM Agent on Amazon EC2 instances for Windows Server](https://docs.aws.amazon.com/systems-manager/latest/userguide/ssm-agent-manual-install-windows.html).

- Verify that the instance has enough free disk space:
  - If you are upgrading from Windows Server 2008 R2 to 2012 R2, or from Windows Server 2012 R2 to a later operating system, verify that you have 20 GB of free disk space in the instance boot disk.
  - If you are upgrading from Windows Server 2008 R2 to 2016 or later, verify that the instance has 40 GB of free disk space in the instance boot disk.

- For instances that use a Bring Your Own License (BYOL) SQL Server version, the following additional prerequisites apply:
  - Provide an Amazon EBS snapshot ID that includes the target SQL Server installation media. To do this:
    1. Verify that the Amazon EC2 instance is running Windows Server 2008 R2 or later.
    2. Create a 6 GB Amazon EBS volume in the same Availability Zone where the instance is running. Attach the volume to the instance. Mount it, for example, as drive D.
    3. Right-click the ISO and mount it to an instance as, for example, drive E.
    4. Copy the content of the ISO from drive E:\ to drive D:\
5. Create an Amazon EBS snapshot of the 6 GB volume created in step 2.

SQL Server automated upgrade limitations

The following limitations apply when using the AWSEC2-CloneInstanceAndUpgradeSQLServer runbook to perform an automated upgrade:

- The upgrade can be performed on only a SQL Server using Windows authentication.
- Verify that no security patch updates are pending on the instances. Open Control Panel, then choose Check for updates.
- SQL Server deployments in HA and mirroring mode are not supported.

Steps to perform an automated upgrade of SQL Server

Follow these steps to upgrade your SQL Server using the AWSEC2-CloneInstanceAndUpgradeSQLServer automation runbook.

1. If you haven't already, download the SQL Server 2016 .iso file and mount it to the source server.
2. After the .iso file is mounted, copy all of the component files and place them on any volume of your choice.
3. Take an Amazon EBS snapshot of the volume and copy the snapshot ID onto a clipboard for later use. For more information, see Create Amazon EBS snapshots in the Amazon EBS User Guide.
4. Attach the instance profile to the Amazon EC2 source instance. This allows Systems Manager to communicate with the EC2 instance and run commands on it after it is added to the AWS Systems Manager service. For this example, we named the role SSM-EC2-Profile-Role with the AmazonSSMManagedInstanceCore policy attached to the role. See Create an IAM instance profile for Systems Manager in the AWS Systems Manager User Guide.
5. In the AWS Systems Manager console, in the left navigation pane, choose Managed Instances. Verify that your EC2 instance is in the list of managed instance. If you don't see your instance after a few minutes, see Where Are My Instances? in the AWS Systems Manager User Guide.
6. In the left navigation pane, under Change Management choose Automation.
7. Choose Execute automation.
8. Search for the automation document called AWSEC2-CloneInstanceAndUpgradeSQLServer.

9. Choose the AWSEC2-CloneInstanceAndUpgradeSQLServer SSM document, and then choose Next.

10. Ensure that the **Simple execution** option is selected.

11. Enter the requested parameters based on the following guidance.

   - **InstanceId**
     
     **Type:** String
     
     (Required) The instance running SQL Server 2008 R2 (or later).
   
   - **IamInstanceProfile**
     
     **Type:** String
     
     (Required) The IAM instance profile.
   
   - **SQLServerSnapshotId**
     
     **Type:** String
     
     (Required) The Snapshot ID for the target SQL Server installation media. This parameter is not required for SQL Server license-included instances.
   
   - **SubnetId**
     
     **Type:** String
     
     (Required) This is the subnet for the upgrade process and where your source EC2 instance resides. Verify that the subnet has outbound connectivity to AWS services, including Amazon S3, and also to Microsoft (in order to download patches).
   
   - **KeepPreUpgradedBackUp**
     
     **Type:** String
     
     (Optional) If this parameter is set to true, the automation retains the image created from the instance. The default setting is false.
   
   - **RebootInstanceBeforeTakingImage**
     
     **Type:** String
(Optional) The default is false (no reboot). If this parameter is set to true, Systems Manager reboots the instance before creating an AMI for the upgrade.

- TargetSQLVersion
  
  **Type:** String

  (Optional) The target SQL Server version. The default is 2016.

12. After you have entered the parameters, choose **Execute**. When the automation begins, you can monitor the execution progress.

13. When **Execution status** shows **Success**, expand **Outputs** to view the AMI information. You can use the AMI ID to launch your SQL Server instance for the VPC of your choice.

14. Open the Amazon EC2 console. In the left navigation pane, choose **AMIs**. You should see the new AMI.

15. To verify that the new SQL Server version has been successfully installed, choose the new AMI and choose **Launch**.

16. Choose the type of instance that you want for the AMI, the VPC and subnet that you want to deploy to, and the storage that you want to use. Because you're launching the new instance from an AMI, the volumes are presented to you as an option to include within the new EC2 instance you are launching. You can remove any of these volumes, or you can add volumes.

17. Add a tag to help you identify your instance.

18. Add the security group or groups to the instance.

19. Choose **Launch Instance**.

20. Choose the tag name for the instance and select **Connect** under the **Actions** dropdown.

21. Verify that the new SQL Server version is the database engine on the new instance.

---

**Migrate a Windows instance to a current generation instance type**

The AWS Windows AMIs are configured with the default settings used by the Microsoft installation media, with some customizations. The customizations include drivers and configurations that support the latest generation instance types, which are **instances built on the AWS Nitro System**, such as an M5 or C5.

When migrating to Nitro-based instances, including bare metal instances, we recommend that you follow the steps in this topic in the following cases:
• If you are launching instances from custom Windows AMIs
• If you are launching instances from Windows AMIs provided by Amazon that were created before August 2018

For more information, see Amazon EC2 Update — Additional Instance Types, Nitro System, and CPU Options.

**Note**

The following migration procedures can be performed on Windows Server version 2008 R2 and later. To migrate Linux instances to the latest generation instance types, see the section called “Change the instance type”.

**Contents**

• Part 1: Install and upgrade AWS PV drivers
• Part 2: Install and upgrade ENA
• Part 3: Upgrade AWS NVMe drivers
• Part 4: Update EC2Config and EC2Launch
• Part 5: Install the serial port driver for bare metal instances
• Part 6: Update power management settings
• Part 7: Update Intel chipset drivers for new instance types
• *(Alternative) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager*
• **Migrate a Windows instance from Nitro to Xen instance types**

**Note**

Alternatively, you can use the AWSSupport-UpgradeWindowsAWSDrivers automation document to automate the procedures described in Part 1, Part 2, and Part 3. If you choose to use the automated procedure, see *(Alternative) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager*, and then continue with Part 4 and Part 5.

**Before you begin**
This procedure assumes that you are currently running on a previous generation Xen-based instance type, such as an M4 or C4, and you are migrating to an instance built on the AWS Nitro System.

You must use PowerShell version 3.0 or later to successfully perform the upgrade.

**Note**
When migrating to the latest generation instances, the static IP or custom DNS network settings on the existing ENI may be lost as the instance will default to a new Enhanced Networking Adapter device.

Before following the steps in this procedure, we recommend that you create a backup of the instance. From the EC2 console, choose the instance that requires the migration, open the context (right-click) menu, and choose Instance State, Stop.

**Warning**
When you stop an instance, the data on any instance store volumes is erased. To preserve data on instance store volumes, ensure that you back up the data to persistent storage.

Open the context (right-click) menu for the instance in the EC2 console, choose Image, and then choose Create Image.

**Note**
Parts 4 and 5 of these instructions can be completed after you migrate or change the instance type to the latest generation. However, we recommend that you complete them before you migrate if you are migrating specifically to an bare metal instance type.

**Part 1: Install and upgrade AWS PV drivers**

Though AWS PV drivers are not used in the Nitro system, you should still upgrade them if you are on previous versions of either Citrix PV or AWS PV. The latest AWS PV drivers resolve bugs in previous versions of the drivers that may appear while you are on a Nitro system, or if you need to
migrate back to a Xen-based instance. As a best practice, we recommend always updating to the latest drivers for Windows instances on AWS.

Use the following procedure to perform an in-place upgrade of AWS PV drivers, or to upgrade from Citrix PV drivers to AWS PV drivers on Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2, Windows Server 2016, or Windows Server 2019. For more information, see Upgrade PV drivers on EC2 Windows instances.

To upgrade a Domain Controller, see Upgrade a domain controller (AWS PV upgrade).

To perform an upgrade of or to AWS PV drivers

1. Connect to the instance using Remote Desktop and prepare the instance for upgrade. Take all non-system disks offline before you perform the upgrade. If you are performing an in-place update of AWS PV drivers, this step is not required. Set non-essential services to Manual startup in the Services console.
2. Download the latest driver package to the instance.
3. Extract the contents of the folder and run AWSPVDriverSetup.msi.

After running the MSI, the instance automatically reboots and upgrades the driver. The instance may not be available for up to 15 minutes.

After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop and verify that the new driver was installed. In Device Manager, under Storage Controllers, locate AWS PV Storage Host Adapter. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history.

Part 2: Install and upgrade ENA

Upgrade to the latest Elastic Network Adapter driver to ensure that all network features are supported. If you launched your instance and it does not have enhanced networking already enabled, you must download and install the required network adapter driver on your instance. Then, set the enaSupport instance attribute to activate enhanced networking. You can only enable this attribute on supported instance types and only if the ENA driver is installed. For more information, see Enable enhanced networking with ENA on your EC2 instances.

1. Download the latest driver to the instance. If you need a previous version of the driver, see ENA Windows driver version history.
2. Extract the zip archive.

3. Install the driver by running the `install.ps1` PowerShell script from the extracted folder.

   **Note**
   To avoid installation errors, run the `install.ps1` script as an administrator.

4. Check if your AMI has enaSupport activated. If not, continue by following the documentation at [Enable enhanced networking with ENA on your EC2 instances](#).

---

**Part 3: Upgrade AWS NVMe drivers**

AWS NVMe drivers are used to interact with Amazon EBS and SSD instance store volumes that are exposed as NVMe block devices in the Nitro system for better performance.

**Important**

The following instructions are modified specifically for when you install or upgrade AWS NVMe on a previous generation instance with the intention to migrate the instance to the latest generation instance type.

---

1. **Download** the latest driver package to the instance.

2. Extract the zip archive.

3. Install the driver by running `dpinst.exe`.

4. Open a **PowerShell** session and run the following command:

   ```powershell
   PS C:\> start rundll32.exe sppnp.dll,Sysprep_Generalize_Pnp -wait
   ```

   **Note**
   To apply the command, you must run the PowerShell session as an administrator. PowerShell (x86) versions will result in an error. This command only runs sysprep on the device drivers. It does not run the full sysprep preparation.
5. For Windows Server 2008 R2 and Windows Server 2012, shut down the instance, change the instance type to a latest generation instance and start it, then proceed to Part 4. If you start the instance again on a previous generation instance type before migrating to a latest generation instance type, it will not boot. For other supported Windows AMIs, you can change the instance type anytime after the device sysprep.

**Part 4: Update EC2Config and EC2Launch**

For Windows instances, the latest EC2Config and EC2Launch utilities provide additional functionality and information when running on the Nitro system, including on EC2 Bare Metal. By default, the EC2Config service is included in AMIs prior to Windows Server 2016. EC2Launch replaces EC2Config on Windows Server 2016 and later AMIs.

When the EC2Config and EC2Launch services are updated, new Windows AMIs from AWS include the latest version of the service. However, you must update your own Windows AMIs and instances with the latest version of EC2Config and EC2Launch.

**To install or update EC2Config**

1. Download and unzip the EC2Config Installer.
2. Run EC2Install.exe. For a complete list of options, run EC2Install with the /? option. By default, setup displays prompts. To run the command with no prompts, use the /quiet option.

For more information, see Install the latest version of EC2Config.

**To install or update EC2Launch**

1. If you have already installed and configured EC2Launch on an instance, make a backup of the EC2Launch configuration file. The installation process does not preserve changes in this file. By default, the file is located in the C:\ProgramData\Amazon\EC2-Windows\Launch\Config directory.
2. Download EC2-Windows-Launch.zip to a directory on the instance.
3. Download install.ps1 to the same directory where you downloaded EC2-Windows-Launch.zip.
4. Run install.ps1.
Part 5: Install the serial port driver for bare metal instances

The i3.metal instance type uses a PCI-based serial device rather than an I/O port-based serial device. The latest Windows AMIs automatically use the PCI-based serial device and have the serial port driver installed. If you are not using an instance launched from an Amazon-provided Windows AMI dated 2018.04.11 or later, you must install the Serial Port Driver to enable the serial device for EC2 features such as Password Generation and Console Output. The latest EC2Config and EC2Launch utilities also support i3.metal and provide additional functionality. Follow the steps in Part 4, if you have not yet done so.

To install the serial port driver

1. Download the serial driver package to the instance.
2. Extract the contents of the folder, open the context (right-click) menu for aws_ser.INF, and choose install.
3. Choose Okay.

Part 6: Update power management settings

The following update to power management settings sets displays to never turn off, which allows for graceful OS shutdowns on the Nitro system. All Windows AMIs provided by Amazon as of 2018.11.28 already have this default configuration.

1. Open a command prompt or PowerShell session.
2. Run the following commands:

```
powercfg /setacvalueindex 381b4222-f694-41f0-9685-ff5bb260df2e 7516b95f-f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbbc2b7e 0
```
Part 7: Update Intel chipset drivers for new instance types

The u-6tb1.metal, u-9tb1.metal, and u-12tb1.metal instance types use hardware that requires chipset drivers that were not previously installed on Windows AMIs. If you are not using an instance launched from an Amazon-provided Windows AMI dated 2018.11.19 or later, you must install the drivers using the Intel Chipset INF Utility.

To install the chipset drivers

1. Download the chipset utility to the instance.
2. Extract the files.
3. Run SetupChipset.exe.
4. Accept the Intel software license agreement and install the chipset drivers.
5. Reboot the instance.

(Alternative) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

The AWSSupport-UpgradeWindowsAWSDrivers automation document automates the steps described in Part 1, Part 2, and Part 3. This method can also repair an instance where the driver upgrades have failed.

The AWSSupport-UpgradeWindowsAWSDrivers automation document upgrades or repairs storage and network AWS drivers on the specified EC2 instance. The document attempts to install the latest versions of AWS drivers online by calling the AWS Systems Manager Agent (SSM Agent). If SSM Agent is not contactable, the document can perform an offline installation of the AWS drivers if explicitly requested.

Note

This procedure will fail on a domain controller. To update drivers on a domain controller, see Upgrade a domain controller (AWS PV upgrade).
To automatically upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

2. Choose Automation, Execute Automation.
3. Search for and then select the AWSSupport-UpgradeWindowsAWSDrivers automation document, and then choose Execute automation.
4. In the Input Parameters section, configure the following options:

   Instance ID

   Enter the unique ID of the instance to upgrade.

   AllowOffline

   (Optional) Choose one of the following options:
   
   • True — Choose this option to perform an offline installation. The instance is stopped and restarted during the upgrade process.
   
   

   Warning
   
   When you stop an instance, the data on any instance store volumes is erased. To preserve data on instance store volumes, ensure that you back up the data to persistent storage.
   
   • False — (Default) To perform an online installation, leave this option selected. The instance is restarted during the upgrade process.
   
   

   Important
   
   Online and offline upgrades create an AMI before attempting the upgrade operations. The AMI persists after the automation completes. Secure your access to the AMI, or delete it if it is no longer needed.
   
   SubnetId

   (Optional) Enter one of the following values:
- **SelectedInstanceSubnet** — (Default) The upgrade process launches the helper instance into the same subnet as the instance that is to be upgraded. The subnet must allow communication to the Systems Manager endpoints (ssm.*).

- **CreateNewVPC** — The upgrade process launches the helper instance into a new VPC. Use this option if you're not sure whether the target instance's subnet allows communication to the ssm.* endpoints. Your user must have permission to create a VPC.

- **A specific subnet ID** — Specify the ID of a specific subnet into which to launch the helper instance. The subnet must be in the same Availability Zone as the instance that is to be upgraded, and it must allow communication with the ssm.* endpoints.

5. Choose **Execute**.

6. Allow the upgrade to complete. It could take up to 10 minutes to complete an online upgrade, and up to 25 minutes to complete an offline upgrade.

### Migrate a Windows instance from Nitro to Xen instance types

The following procedure assumes that you are currently running on a Nitro-based instance type, and that you are migrating to an instance based on the Xen System, such as M4 or C4. For instance type specifications, see the [Amazon EC2 Instance Types Guide](https://docs.aws.amazon.com/ec2/userguide/instance-types.html). Perform the following steps before the migration to avoid errors during the booting process.

#### To migrate from Nitro to Xen

1. Back up your data.

2. Verify that your Windows san policy allows non-root storage volumes to come online.

3. AWS PV drivers must be installed and upgraded on a Nitro instance before you migrate to a Xen instance. For steps to install and upgrade AWS PV drivers, see [Part 1: Install and upgrade AWS PV drivers](https://docs.aws.amazon.com/systemsmanager/latest/smguide/sysprep.html).

4. Update to the latest EC2Launch v2 version. See [Migrate to EC2Launch v2](https://docs.aws.amazon.com/systemsmanager/latest/smguide/sysprep.html) for steps.

5. Open a PowerShell session and run the following command as an administrator to sysprep the device drivers. Running sysprep ensures that early boot storage drivers required for booting on Xen instances are properly registered with Windows.
Note

Running the command using PowerShell (x86) versions will result in an error. This command adds only the boot-critical device drivers to the critical device database. It does not run the full sysprep preparation.

Start-Process rundll32.exe sppnp.dll, Sysprep_Generalize_Pnp -wait

6. Perform the migration to a Xen instance type when the sysprep process completes.

Windows to Linux replatforming assistant for Microsoft SQL Server databases

For information about replatforming Microsoft SQL Server databases from Windows to Linux, see Windows to Linux replatforming assistant for Microsoft SQL Server Databases in the Microsoft SQL Server on Amazon EC2 User Guide.

Troubleshoot an upgrade on a Windows instance

AWS provides upgrade support for issues or problems with the Upgrade Helper Service, an AWS utility that helps you perform in-place upgrades involving Citrix PV drivers.

After the upgrade, the instance might temporarily experience higher than average CPU utilization while the .NET Runtime Optimization service optimizes the .NET framework. This is expected behavior.

If the instance has not passed both status checks after several hours, check the following.

- If you upgraded to Windows Server 2008 and both status checks fail after several hours, the upgrade may have failed and be presenting a prompt to Click OK to confirm rolling back. Because the console is not accessible at this state, there is no way to click the button. To get around this, perform a reboot via the Amazon EC2 console or API. The reboot takes ten minutes or more to initiate. The instance might become available after 25 minutes.
- Remove applications or server roles from the server and try again.
If the instance does not pass both status checks after removing applications or server roles from the server, do the following.

- Stop the instance and attach the root volume to another instance. For more information, see the description of how to stop and attach the root volume to another instance in "Waiting for the metadata service".
- Analyze Windows Setup log files and event logs for failures.

For other issues or problems with an operating system upgrade or migration, we recommend reviewing the articles listed in Before you begin an in-place upgrade.
EC2 Fleet and Spot Fleet

EC2 Fleet and Spot Fleet are designed to be a useful way to launch a fleet of tens, hundreds, or thousands of Amazon EC2 instances in a single operation. Each instance in a fleet is either configured by a launch template or a set of launch parameters that you configure manually at launch.

Topics
- Features and benefits
- Which is the best fleet method to use?
- EC2 Fleet

- Quotas for EC2 Fleet and Spot Fleet

Features and benefits

Fleets provide the following features and benefits. They make it possible for you to maximize cost savings and optimize availability and performance when running applications on multiple EC2 instances.

Multiple instance types

A fleet can launch multiple instance types, ensuring it isn't dependent on the availability of any single instance type. This increases the overall availability of instances in your fleet.

Distributing instances across Availability Zones

A fleet automatically attempts to distribute instances evenly across multiple Availability Zones for high availability. This provides resiliency in case an Availability Zone becomes unavailable.

Multiple purchasing options

A fleet can launch multiple purchase options (Spot and On-Demand Instances), allowing you to optimize costs through Spot Instance usage. You can also take advantage of Reserved Instance
and Savings Plan discounts by using them in conjunction with On-Demand Instances in the fleet.

**Automated replacement of Spot Instances**

If your fleet includes Spot Instances, it can automatically request replacement Spot capacity if your Spot Instances are interrupted. Through [Capacity Rebalancing](#), a fleet can also monitor and proactively replace your Spot Instances that are at an elevated risk of interruption.

### Which is the best fleet method to use?

EC2 Fleet and Spot Fleet offer the same core functionality. However, EC2 Fleet is only available on the command line and does not provide console support. Spot Fleet, on the other hand, provides console support, but it's based on a legacy API with no planned investment. Therefore, if you plan to use a command line, use EC2 Fleet. If you need to use a console, use Spot Fleet.

**Tip**

As a general best practice, we recommend rather launching fleets of Spot and On-Demand Instances with Amazon EC2 Auto Scaling because it provides additional features you can use to manage your fleet. The list of additional features includes automatic health check replacements for both Spot and On-Demand Instances, application-based health checks, and an integration with Elastic Load Balancing to ensure an even distribution of application traffic to your healthy instances. You can also use Auto Scaling groups when you use AWS services such as Amazon ECS, Amazon EKS (self-managed node groups), and Amazon VPC Lattice. For more information, see the [Amazon EC2 Auto Scaling User Guide](#).

Use the following table to determine which fleet method to use.

<table>
<thead>
<tr>
<th>Fleet method</th>
<th>When to use?</th>
<th>Use case</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon EC2 Auto Scaling</td>
<td>• You need multiple instances with either a single configuration or a mixed configuration.</td>
<td>Create an Auto Scaling group that manages the lifecycle of your instances while maintaining the desired number of instances. Supports horizontal scaling (adding more...</td>
</tr>
</tbody>
</table>

Which is the best fleet method to use?
<table>
<thead>
<tr>
<th>Fleet method</th>
<th>When to use?</th>
<th>Use case</th>
</tr>
</thead>
</table>
| **EC2 Fleet** |  - You need multiple instances with either a single configuration or a mixed configuration.  
  - You want to self-manage your instance lifecycle.  
  - If you don’t need auto scaling, we recommend that you use an instant type EC2 Fleet. | Create an instant fleet of both On-Demand Instances and Spot Instances in a single operation, with multiple launch specifications that vary by instance type, AMI, Availability Zone, or subnet. The Spot Instance allocation strategy defaults to lowest-price per unit, but we recommend changing it to price-capacity-optimized. |
| **Spot Fleet** |  - We strongly discourage using Spot Fleet because it is based on a legacy API with no planned investment.  
  - If you want to manage your instance lifecycle, rather use EC2 Fleet.  
  - If you don’t want to manage your instance lifecycle, rather use an Auto Scaling group. | Use Spot Fleet only if you need console support for creating a fleet. |
EC2 Fleet

An EC2 Fleet contains the configuration information to launch a fleet of instances. In a single API call, a fleet can launch multiple instance types across multiple Availability Zones, using the Spot Instance, On-Demand Instance, Reserved Instance, and Savings Plan purchasing options together. Using EC2 Fleet, you can:

- Define separate Spot and On-Demand capacity targets and the maximum amount you're willing to pay per hour
- Specify the instance types that work best for your applications
- Specify how Amazon EC2 should distribute your fleet capacity within each purchasing option

You can also set a maximum amount per hour that you're willing to pay for your fleet, and EC2 Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

The EC2 Fleet attempts to launch the number of instances that are required to meet the target capacity specified in your request. If you specified a total maximum price per hour, it fulfills the capacity until it reaches the maximum amount that you're willing to pay. The fleet can also attempt to maintain its target Spot capacity if your Spot Instances are interrupted. For more information, see How Spot Instances work.
You can specify an unlimited number of instance types per EC2 Fleet. Those instance types can be provisioned using both Spot and On-Demand purchasing options. You can also specify multiple Availability Zones, specify different maximum Spot prices for each instance, and choose additional Spot options for each fleet. Amazon EC2 uses the specified options to provision capacity when the fleet launches.

While the fleet is running, if Amazon EC2 reclaims a Spot Instance because of a price increase or instance failure, EC2 Fleet can try to replace the instances with any of the instance types that you specify. This makes it easier to regain capacity during a spike in Spot pricing. You can develop a flexible and elastic resourcing strategy for each fleet. For example, within specific fleets, your primary capacity can be On-Demand supplemented with less-expensive Spot capacity if available.

If you have Reserved Instances and you specify On-Demand Instances in your fleet, EC2 Fleet uses your Reserved Instances. For example, if your fleet specifies an On-Demand Instance as c4.large, and you have Reserved Instances for c4.large, you receive the Reserved Instance pricing. The same applies if you use a Savings Plan.

There is no additional charge for using EC2 Fleet. You pay only for the EC2 instances that the fleet launches for you.
EC2 Fleet limitations

The following limitations apply to EC2 Fleet:

- EC2 Fleet is available only through the Amazon EC2 API, AWS CLI, AWS SDKs, and AWS CloudFormation.
- An EC2 Fleet request can't span AWS Regions. You need to create a separate EC2 Fleet for each Region.
- An EC2 Fleet request can't span different subnets from the same Availability Zone.

Burstable performance instances

If you launch your Spot Instances using a burstable performance instance type, and if you plan to use your burstable performance Spot Instances immediately and for a short duration, with no idle time for accruing CPU credits, we recommend that you launch them in Standard mode to avoid paying higher costs. If you launch burstable performance Spot Instances in Unlimited mode and burst CPU immediately, you'll spend surplus credits for bursting. If you use the instance for a short duration, the instance doesn't have time to accrue CPU credits to pay down the surplus credits, and you are charged for the surplus credits when you terminate the instance.

Unlimited mode is suitable for burstable performance Spot Instances only if the instance runs long enough to accrue CPU credits for bursting. Otherwise, paying for surplus credits makes burstable performance Spot Instances more expensive than using other instances. For more information, see When to use unlimited mode versus fixed CPU.

Launch credits are meant to provide a productive initial launch experience for T2 instances by providing sufficient compute resources to configure the instance. Repeated launches of T2 instances to access new launch credits is not permitted. If you require sustained CPU, you can earn
credits (by idling over some period), use Unlimited mode for T2 Spot Instances, or use an instance type with dedicated CPU.

**EC2 Fleet request types**

There are three types of EC2 Fleet requests:

**instant**

If you configure the request type as instant, EC2 Fleet places a synchronous one-time request for your desired capacity. In the API response, it returns the instances that launched, along with errors for those instances that could not be launched. For more information, see Use an EC2 Fleet of type 'instant'.

**request**

If you configure the request type as request, EC2 Fleet places an asynchronous one-time request for your desired capacity. Thereafter, if capacity is diminished because of Spot interruptions, the fleet does not attempt to replenish Spot Instances, nor does it submit requests in alternative Spot capacity pools if capacity is unavailable.

**maintain**

( Default) If you configure the request type as maintain, EC2 Fleet places an asynchronous request for your desired capacity, and maintains capacity by automatically replenishing any interrupted Spot Instances.

All three types of requests benefit from an allocation strategy. For more information, see Allocation strategies for Spot Instances.

**Use an EC2 Fleet of type 'instant'*

The EC2 Fleet of type instant is a synchronous one-time request that makes only one attempt to launch your desired capacity. The API response lists the instances that launched, along with errors for those instances that could not be launched. There are several benefits to using an EC2 Fleet of type instant, which are described in this article. Example configurations are provided at the end of the article.

For workloads that need a launch-only API to launch EC2 instances, you can use the RunInstances API. However, with RunInstances, you can only launch On-Demand Instances or Spot Instances, but not both in the same request. Furthermore, when you use RunInstances to launch Spot Instances,
your Spot Instance request is limited to one instance type and one Availability Zone. This targets a single Spot capacity pool (a set of unused instances with the same instance type and Availability Zone). If the Spot capacity pool does not have sufficient Spot Instance capacity for your request, the RunInstances call fails.

Instead of using RunInstances to launch Spot Instances, we recommend that you rather use the CreateFleet API with the type parameter set to instant for the following benefits:

- **Launch On-Demand Instances and Spot Instances in one request.** An EC2 Fleet can launch On-Demand Instances, Spot Instances, or both. The request for Spot Instances is fulfilled if there is available capacity and the maximum price per hour for your request exceeds the Spot price.

- **Increase the availability of Spot Instances.** By using an EC2 Fleet of type instant, you can launch Spot Instances following [Spot best practices](#) with the resulting benefits:
  - **Spot best practice: Be flexible about instance types and Availability Zones.**
    
    Benefit: By specifying several instance types and Availability Zones, you increase the number of Spot capacity pools. This gives the Spot service a better chance of finding and allocating your desired Spot compute capacity. A good rule of thumb is to be flexible across at least 10 instance types for each workload and make sure that all Availability Zones are configured for use in your VPC.
  
    - **Spot best practice: Use the price-capacity-optimized allocation strategy.**
      
      Benefit: The price-capacity-optimized allocation strategy identifies instances from the most-available Spot capacity pools, and then automatically provisions instances from the lowest priced of these pools. Because your Spot Instance capacity is sourced from pools with optimal capacity, this decreases the possibility that your Spot Instances will be interrupted when Amazon EC2 needs the capacity back.

- **Get access to a wider set of capabilities.** For workloads that need a launch-only API, and where you prefer to manage the lifecycle of your instance rather than let EC2 Fleet manage it for you, use the EC2 Fleet of type instant instead of the RunInstances API. EC2 Fleet provides a wider set of capabilities than RunInstances, as demonstrated in the following examples. For all other workloads, you should use Amazon EC2 Auto Scaling because it supplies a more comprehensive feature set for a wide variety of workloads, like ELB-backed applications, containerized workloads, and queue processing jobs.

You can use EC2 Fleet of type *instant* to launch instances into Capacity Blocks. For more information, see [Tutorial: Launch instances into Capacity Blocks](#).
AWS services like Amazon EC2 Auto Scaling and Amazon EMR use EC2 Fleet of type *instant* to launch EC2 instances.

**Prerequisites for EC2 Fleet of type instant**

For the prerequisites for creating an EC2 Fleet, see [EC2 Fleet prerequisites](#).

**How instant EC2 Fleet works**

When working with an EC2 Fleet of type *instant*, the sequence of events is as follows:

1. Configure the [CreateFleet](#) request type as *instant*. For more information, see [Create an EC2 Fleet](#). Note that after you make the API call, you can't modify it.
2. When you make the API call, EC2 Fleet places a synchronous one-time request for your desired capacity.
3. The API response lists the instances that launched, along with errors for those instances that could not be launched.
4. You can describe your EC2 Fleet, list the instances associated with your EC2 Fleet, and view the history of your EC2 Fleet.
5. After your instances launch, you can [delete the fleet request](#). When deleting the fleet request, you can also choose to terminate the associated instances, or leave them running.
6. You can terminate the instances at any time.

**Examples**

The following examples show how to use EC2 Fleet of type *instant* for different use cases. For more information about using the EC2 CreateFleet API parameters, see [CreateFleet](#) in the *Amazon EC2 API Reference*.

**Examples**

- [Example 1: Launch Spot Instances with the capacity-optimized allocation strategy](#)
- [Example 2: Launch a single Spot Instance with the capacity-optimized allocation strategy](#)
- [Example 3: Launch Spot Instances using instance weighting](#)
- [Example 4: Launch Spot Instances within single Availability zone](#)
- [Example 5: Launch Spot Instances of single instance type within single Availability zone](#)
- [Example 6: Launch Spot Instances only if minimum target capacity can be launched](#)
Example 1: Launch Spot Instances with the capacity-optimized allocation strategy

The following example specifies the parameters required in an EC2 Fleet of type `instance`: a launch template, target capacity, default purchasing option, and launch template overrides.

- The launch template is identified by its launch template name and version number.
- The 12 launch template overrides specify 4 different instance types and 3 different subnets, each in a separate Availability Zone. Each instance type and subnet combination defines a Spot capacity pool, resulting in 12 Spot capacity pools.
- The target capacity for the fleet is 20 instances.
- The default purchasing option is `spot`, which results in the fleet attempting to launch 20 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```json
{
  "SpotOptions": {
    "AllocationStrategy": "capacity-optimized"
  },
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateName": "ec2-fleet-lt1",
        "Version": "$Latest"
      },
      "Overrides": [
        {
          "InstanceType": "c5.large",
          "SubnetId": "subnet-fae8c380"
        }
      ]
    }
  ]
}
```
EC2 Fleet request types

```json
[
  {
    "InstanceType": "c5.large",
    "SubnetId": "subnet-e7188bab"
  },
  {
    "InstanceType": "c5.large",
    "SubnetId": "subnet-49e41922"
  },
  {
    "InstanceType": "c5d.large",
    "SubnetId": "subnet-fae8c380"
  },
  {
    "InstanceType": "c5d.large",
    "SubnetId": "subnet-e7188bab"
  },
  {
    "InstanceType": "c5d.large",
    "SubnetId": "subnet-49e41922"
  },
  {
    "InstanceType": "m5.large",
    "SubnetId": "subnet-fae8c380"
  },
  {
    "InstanceType": "m5.large",
    "SubnetId": "subnet-e7188bab"
  },
  {
    "InstanceType": "m5.large",
    "SubnetId": "subnet-49e41922"
  },
  {
    "InstanceType": "m5d.large",
    "SubnetId": "subnet-fae8c380"
  },
  {
    "InstanceType": "m5d.large",
    "SubnetId": "subnet-e7188bab"
  },
  {
    "InstanceType": "m5d.large",
    "SubnetId": "subnet-49e41922"
  }
]
Example 2: Launch a single Spot Instance with the capacity-optimized allocation strategy

You can optimally launch one Spot Instance at a time by making multiple EC2 Fleet API calls of type *instant*, by setting the TotalTargetCapacity to 1.

The following example specifies the parameters required in an EC2 Fleet of type *instant*: a launch template, target capacity, default purchasing option, and launch template overrides. The launch template is identified by its launch template name and version number. The 12 launch template overrides have 4 different instance types and 3 different subnets, each in a separate Availability Zone. The target capacity for the fleet is 1 instance, and the default purchasing option is spot, which results in the fleet attempting to launch a Spot Instance from one of the 12 Spot capacity pools based on the capacity-optimized allocation strategy, to launch a Spot Instance from the most-available capacity pool.

```json
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "ec2-fleet-lt1",
                "Version": "$Latest"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.large",
                    "SubnetId": "subnet-fae8c380"
                },
                {
                    "InstanceType": "c5.large",
                    "SubnetId": "subnet-e7188bab"
```
EC2 Fleet request types
Example 3: Launch Spot Instances using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight based on how many units of the workload can run on the instance assuming a unit of the workload requires a 15 GB of memory and 4 vCPUs. For example an m5.xlarge (4 vCPUs and 16 GB of memory) can run one unit and is weighted 1, m5.2xlarge (8 vCPUs and 32 GB of memory) can run 2 units and is weighted 2, and so on. The total target capacity is set to 40 units. The default purchasing option is spot, and the allocation strategy is capacity-optimized, which results in either 40 m5.xlarge (40 divided by 1), 20 m5.2xlarge (40 divided by 2), 10 m5.4xlarge (40 divided by 4), 5 m5.8xlarge (40 divided by 8), or a mix of the instance types with weights adding up to the desired capacity based on the capacity-optimized allocation strategy.

For more information, see EC2 Fleet instance weighting.

```json
{
    "SpotOptions":{
        "AllocationStrategy":"capacity-optimized"
    },
    "LaunchTemplateConfigs":[
        {
            "LaunchTemplateSpecification":{
                "LaunchTemplateName":"ec2-fleet-lt1",
                "Version":"$Latest"
            },
            "Overrides":[
                {
                    "InstanceType":"m5.xlarge",
                    "SubnetId":"subnet-fae8c380",
                    "WeightedCapacity":1
                },
                {
                    "InstanceType":"m5.xlarge",
                    "SubnetId":"subnet-e7188bab",
                    "WeightedCapacity":1
                }
            ]
        }
    ]
}
```
EC2 Fleet request types

1703
Example 4: Launch Spot Instances within single Availability zone

You can configure a fleet to launch all instances in a single Availability Zone by setting the Spot options SingleAvailabilityZone to true.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity is 20 instances, the default purchasing option is spot, and the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances all in a single AZ, from the Spot capacity pool(s) with optimal capacity using the launch specifications.

```json
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "SingleAvailabilityZone": true
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "ec2-fleet-lt1",
                "Version": "$Latest"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.4xlarge",
                    "SubnetId": "subnet-fae8c380"
                }
            ]
        }
    ]
}
```
},
  {  
    "InstanceType":"c5.4xlarge",
    "SubnetId":"subnet-e7188bab"
  },
  {  
    "InstanceType":"c5.4xlarge",
    "SubnetId":"subnet-49e41922"
  },
  {  
    "InstanceType":"c5d.4xlarge",
    "SubnetId":"subnet-fae8c380"
  },
  {  
    "InstanceType":"c5d.4xlarge",
    "SubnetId":"subnet-e7188bab"
  },
  {  
    "InstanceType":"c5d.4xlarge",
    "SubnetId":"subnet-49e41922"
  },
  {  
    "InstanceType":"m5.4xlarge",
    "SubnetId":"subnet-fae8c380"
  },
  {  
    "InstanceType":"m5.4xlarge",
    "SubnetId":"subnet-e7188bab"
  },
  {  
    "InstanceType":"m5.4xlarge",
    "SubnetId":"subnet-49e41922"
  },
  {  
    "InstanceType":"m5d.4xlarge",
    "SubnetId":"subnet-fae8c380"
  },
  {  
    "InstanceType":"m5d.4xlarge",
    "SubnetId":"subnet-e7188bab"
  },
  {  
    "InstanceType":"m5d.4xlarge",
    "SubnetId":"subnet-49e41922"
  },
Example 5: Launch Spot Instances of single instance type within single Availability zone

You can configure a fleet to launch all instances of the same instance type and in a single Availability Zone by setting the SpotOptions SingleInstanceType to true and SingleAvailabilityZone to true.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity is 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances of the same instance type all in a single AZ from the Spot Instance pool with optimal capacity using the launch specifications.

    "SubnetId": "subnet-e7188bab"
  },
  {
    "InstanceType": "m5d.4xlarge",
    "SubnetId": "subnet-49e41922"
  }
]
Example 6: Launch Spot Instances only if minimum target capacity can be launched

You can configure a fleet to launch instances only if the minimum target capacity can be launched by setting the Spot options MinTargetCapacity to the minimum target capacity you want to launch together.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity and the minimum target capacity are both set to 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances from the Spot capacity pool with optimal capacity using the launch template overrides, only if it can launch all 20 instances at the same time.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "MinTargetCapacity": 20
    },
    "LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
            "LaunchTemplateName": "ec2-fleet-lt1",
            "Version": "$Latest"
        },
        "Overrides": [
            {
                "InstanceType": "c5.4xlarge",
                "SubnetId": "subnet-fae8c380"
            },
            {
                "InstanceType": "c5.4xlarge",

"TargetCapacitySpecification": {
  "TotalTargetCapacity": 20,
  "DefaultTargetCapacityType": "spot"
Example 7: Launch Spot Instances only if minimum target capacity can be launched of same Instance Type in a single Availability Zone

You can configure a fleet to launch instances only if the minimum target capacity can be launched with a single instance type in a single Availability Zone by setting the Spot options MinTargetCapacity to the minimum target capacity you want to launch together along with SingleInstanceType and SingleAvailabilityZone options.

The 12 launch specifications which override the launch template, have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity and the minimum target capacity are both set to 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized, the SingleInstanceType is true and SingleAvailabilityZone is true. The EC2 Fleet launches 20 Spot Instances of the same Instance type all in a single AZ from the Spot capacity pool with optimal capacity using the launch specifications, only if it can launch all 20 instances at the same time.

```json
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",

Example 8: Launch instances with multiple Launch Templates

You can configure a fleet to launch instances with different launch specifications for different instance types or a group of instance types, by specifying multiple launch templates. In this example we want to have different EBS volume sizes for different instance types and we have that configured in the launch templates ec2-fleet-lt-4xl, ec2-fleet-lt-9xl and ec2-fleet-lt-18xl.

In this example, we are using 3 different launch templates for the 3 instance types based on their size. The launch specification overrides on all the launch templates use instance weights based on the vCPUs on the instance type. The total target capacity is 144 units, the default purchasing option is spot, and the Spot allocation strategy is capacity-optimized. The EC2 Fleet can either launch 9 c5n.4xlarge (144 divided by 16) using the launch template ec2-fleet-lt-4xl or 4 c5n.9xlarge (144 divided by 36) using the launch template ec2-fleet-lt-9xl, or 2 c5n.18xlarge (144 divided by 72) using the launch template ec2-fleet-lt-18xl, or a mix of the instance types with weights adding up to the desired capacity based on the capacity-optimized allocation strategy.

Example 9: Launch Spot Instance with a base of On-Demand Instances

The following example specifies the total target capacity of 20 instances for the fleet, and a target capacity of 5 On-Demand Instances. The default purchasing option is spot. The fleet launches 5 On-Demand Instance as specified, but needs to launch 15 more instances to fulfill the total target capacity. The purchasing option for the difference is calculated as TotalTargetCapacity – OnDemandTargetCapacity = DefaultTargetCapacityType, which results in the fleet launching 15 Spot Instances form one of the 12 Spot capacity pools based on the capacity-optimized allocation strategy.

```
Example 10: Launch Spot Instances using capacity-optimized allocation strategy with a base of On-Demand Instances using Capacity Reservations and the prioritized allocation strategy

You can configure a fleet to use On-Demand Capacity Reservations first when launching a base of On-Demand Instances with the default target capacity type as spot by setting the usage strategy for Capacity Reservations to use-capacity-reservations-first. And if multiple instance pools have unused Capacity Reservations, the chosen On-Demand allocation strategy is applied. In this example, the On-Demand allocation strategy is prioritized.

In this example, there are 6 available unused Capacity Reservations. This is less than the fleet's target On-Demand capacity of 10 On-Demand Instances.

The account has the following 6 unused Capacity Reservations in 2 pools. The number of Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```json
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```
The following fleet configuration shows only the pertinent configurations for this example. The
On-Demand allocation strategy is prioritized, and the usage strategy for Capacity Reservations is
use-capacity-reservations-first. The Spot allocation strategy is capacity-optimized. The total target
capacity is 20, the On-Demand target capacity is 10, and the default target capacity type is spot.

```json
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized"
    },
    "OnDemandOptions": {
        "CapacityReservationOptions": {
            "UsageStrategy": "use-capacity-reservations-first"
        },
        "AllocationStrategy": "prioritized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "ec2-fleet-lt1",
                "Version": "$Latest"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.large",
                    "SubnetId": "subnet-fae8c380",
                    "Priority": 1.0
                },
                {
                    "InstanceType": "c5.large",
                    "SubnetId": "subnet-e7188bab",
                    "Priority": 2.0
                },
                {
                    "InstanceType": "c5.large",
                    "SubnetId": "subnet-49e41922",
                    "Priority": 3.0
                }
            ]
        }
    ]
}
```
"InstanceType":"c5d.large",
"SubnetId":"subnet-fae8c380",
"Priority": 4.0
},
{
"InstanceType":"c5d.large",
"SubnetId":"subnet-e7188bab",
"Priority": 5.0
},
{
"InstanceType":"c5d.large",
"SubnetId":"subnet-49e41922",
"Priority": 6.0
},
{
"InstanceType":"m5.large",
"SubnetId":"subnet-fae8c380",
"Priority": 7.0
},
{
"InstanceType":"m5.large",
"SubnetId":"subnet-e7188bab",
"Priority": 8.0
},
{
"InstanceType":"m5.large",
"SubnetId":"subnet-49e41922",
"Priority": 9.0
},
{
"InstanceType":"m5d.large",
"SubnetId":"subnet-fae8c380",
"Priority": 10.0
},
{
"InstanceType":"m5d.large",
"SubnetId":"subnet-e7188bab",
"Priority": 11.0
},
{
"InstanceType":"m5d.large",
"SubnetId":"subnet-49e41922",
"Priority": 12.0
}
After you create the instant fleet using the preceding configuration, the following 20 instances are launched to meet the target capacity:

- 7 c5.large On-Demand Instances in us-east-1a – c5.large in us-east-1a is prioritized first, and there are 3 available unused c5.large Capacity Reservations. The Capacity Reservations are used first to launch 3 On-Demand Instances plus 4 additional On-Demand Instances are launched according to the On-Demand allocation strategy, which is prioritized in this example.

- 3 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is prioritized second, and there are 3 available unused c3.large Capacity Reservations.

- 10 Spot Instances from one of the 12 Spot capacity pools that has the optimal capacity according to the capacity-optimized allocation strategy.

After the fleet is launched, you can run `describe-capacity-reservations` to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the c5.large and m5.large Capacity Reservations were used.

```json
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}
{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.large",
    "AvailableInstanceCount": 0
}
```
Example 11: Launch Spot Instances using capacity-optimized-prioritized allocation strategy

The following example specifies the parameters required in an EC2 Fleet of type instant: a launch template, target capacity, default purchasing option, and launch template overrides. The launch template is identified by its launch template name and version number. The 12 launch specifications which override the launch template have 4 different instance types with a priority assigned, and 3 different subnets, each in a separate Availability Zone. The target capacity for the fleet is 20 instances, and the default purchasing option is spot, which results in the fleet attempting to launch 20 Spot Instances from one of the 12 Spot capacity pools based on the capacity-optimized-prioritized allocation strategy, which implements priorities on a best-effort basis, but optimizes for capacity first.

```json
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized-prioritized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "ec2-fleet-lt1",
                "Version": "$Latest"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.large",
                    "SubnetId": "subnet-fae8c380",
                    "Priority": 1.0
                },
                {
                    "InstanceType": "c5.large",
                    "SubnetId": "subnet-e7188bab",
                    "Priority": 1.0
                },
                {
                    "InstanceType": "c5.large",
                    "SubnetId": "subnet-49e41922",
                    "Priority": 1.0
                },
                {
                    "InstanceType": "c5d.large",
                    "SubnetId": "subnet-fae8c380",
                    "Priority": 2.0
                }
            ]
        }
    ]
}```

EC2 Fleet configuration strategies

An EC2 Fleet is a group of On-Demand Instances and Spot Instances. EC2 Fleet can also be a group of Capacity Blocks instances.

On-Demand Instances and Spot Instances

The EC2 Fleet attempts to launch the number of instances that are required to meet the target capacity that you specify in the fleet request. The fleet can comprise only On-Demand Instances, only Spot Instances, or a combination of both On-Demand Instances and Spot Instances. The request for Spot Instances is fulfilled if there is available capacity and the maximum price per hour for your request exceeds the Spot price. The fleet also attempts to maintain its target capacity if your Spot Instances are interrupted.

You can also set a maximum amount per hour that you're willing to pay for your fleet, and EC2 Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

A Spot capacity pool is a set of unused EC2 instances with the same instance type and Availability Zone. When you create an EC2 Fleet, you can include multiple launch specifications, which vary by instance type, Availability Zone, subnet, and maximum price. The fleet selects the Spot capacity pools that are used to fulfill the request, based on the launch specifications included in your request, and the configuration of the request. The Spot Instances come from the selected pools.

An EC2 Fleet enables you to provision large amounts of EC2 capacity that makes sense for your application based on number of cores or instances, or amount of memory. For example, you can specify an EC2 Fleet to launch a target capacity of 200 instances, of which 130 are On-Demand Instances and the rest are Spot Instances.

Capacity Blocks instances

Capacity Blocks for ML allow you to reserve GPU instances on a future date to support you short duration machine learning (ML) workloads. Instances that run in a Capacity Block are automatically
placed close together inside Amazon EC2 UltraClusters. For more information about Capacity Blocks, see Capacity Blocks for ML.

Use the appropriate configuration strategies to create an EC2 Fleet that meets your needs.

Contents

- Plan an EC2 Fleet
- Allocation strategies for Spot Instances
- Attribute-based instance type selection for EC2 Fleet
- Configure EC2 Fleet for On-Demand backup
- Capacity Rebalancing
- Maximum price overrides
- Control spending
- EC2 Fleet instance weighting

Plan an EC2 Fleet

When planning your EC2 Fleet, we recommend that you do the following:

- Determine whether you want to create an EC2 Fleet that submits a synchronous or asynchronous one-time request for the desired target capacity, or one that maintains a target capacity over time. For more information, see EC2 Fleet request types.
- Determine the instance types that meet your application requirements.
- If you plan to include Spot Instances in your EC2 Fleet, review Spot Best Practices before you create the fleet. Use these best practices when you plan your fleet so that you can provision the instances at the lowest possible price.
- Determine the target capacity for your EC2 Fleet. You can set target capacity in instances or in custom units. For more information, see EC2 Fleet instance weighting.
- Determine what portion of the EC2 Fleet target capacity must be On-Demand capacity and Spot capacity. You can specify 0 for On-Demand capacity or Spot capacity, or both.
- Determine your price per unit, if you are using instance weighting. To calculate the price per unit, divide the price per instance hour by the number of units (or weight) that this instance represents. If you are not using instance weighting, the default price per unit is the price per instance hour.
• Determine the maximum amount per hour that you’re willing to pay for your fleet. For more information, see Control spending.

• Review the possible options for your EC2 Fleet. For information about the fleet parameters, see create-fleet in the AWS CLI Command Reference. For EC2 Fleet configuration examples, see EC2 Fleet example configurations.

Allocation strategies for Spot Instances

Your launch configuration determines all the possible Spot capacity pools (instance types and Availability Zones) from which EC2 Fleet can launch Spot Instances. However, when launching instances, EC2 Fleet uses the allocation strategy that you specify to pick the specific pools from all your possible pools.

Note

(Linux instances only) If you configure your Spot Instance to launch with AMD SEV-SNP turned on, you are charged an additional hourly usage fee that is equivalent to 10% of the On-Demand hourly rate for the selected instance type. If the allocation strategy uses price as an input, EC2 Fleet does not include this additional fee; only the Spot price is used.

Allocation strategies

You can specify one of the following allocation strategies for Spot Instances:

price-capacity-optimized (recommended)

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. EC2 Fleet then requests Spot Instances from the lowest priced of these pools.

The price-capacity-optimized allocation strategy is the best choice for most Spot workloads, such as stateless containerized applications, microservices, web applications, data and analytics jobs, and batch processing.

capacity-optimized

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we
believe have the lowest chance of interruption in the near term. You can optionally set a priority for each instance type in your fleet using capacity-optimized-prioritized. EC2 Fleet optimizes for capacity first, but honors instance type priorities on a best-effort basis.

With Spot Instances, pricing changes slowly over time based on long-term trends in supply and demand, but capacity fluctuates in real time. The capacity-optimized strategy automatically launches Spot Instances into the most available pools by looking at real-time capacity data and predicting which are the most available. This works well for workloads that may have a higher cost of interruption associated with restarting work, such as long Continuous Integration (CI), image and media rendering, Deep Learning, and High Performance Compute (HPC) workloads that may have a higher cost of interruption associated with restarting work. By offering the possibility of fewer interruptions, the capacity-optimized strategy can lower the overall cost of your workload.

Alternatively, you can use the capacity-optimized-prioritized allocation strategy with a priority parameter to order instance types from highest to lowest priority. You can set the same priority for different instance types. EC2 Fleet will optimize for capacity first, but will honor instance type priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect EC2 Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters. Note that when you set the priority for capacity-optimized-prioritized, the same priority is also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

diversified

The Spot Instances are distributed across all Spot capacity pools.

lowest-price **(not recommended)**

⚠️ **Warning**

We don't recommend the lowest-price allocation strategy because it has the highest risk of interruption for your Spot Instances.

The Spot Instances come from the lowest priced pool that has available capacity. This is the default strategy. However, we recommend that you override the default by specifying the price-capacity-optimized allocation strategy.
If the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity.

If a pool runs out of capacity before fulfilling your desired capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools.

Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

InstancePoolsToUseCount

The number of Spot pools across which to allocate your target Spot capacity. Valid only when the allocation strategy is set to lowest-price. EC2 Fleet selects the lowest priced Spot pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that EC2 Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

**Choose the appropriate allocation strategy**

You can optimize your fleet for your use case by choosing the appropriate Spot allocation strategy. For On-Demand Instance target capacity, EC2 Fleet always selects the least expensive instance type based on the public On-Demand price, while following the allocation strategy—either price-capacity-optimized, capacity-optimized, diversified, or lowest-price—for Spot Instances.

**Balance lowest price and capacity availability**

To balance the trade-offs between the lowest priced Spot capacity pools and the Spot capacity pools with the highest capacity availability, we recommend that you use the price-capacity-optimized allocation strategy. This strategy makes decisions about which pools to request Spot Instances from based on both the price of the pools and the capacity availability of Spot Instances in those pools. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term, while still taking price into consideration.
If your fleet runs resilient and stateless workloads, including containerized applications, microservices, web applications, data and analytics jobs, and batch processing, then use the price-capacity-optimized allocation strategy for optimal cost savings and capacity availability.

If your fleet runs workloads that might have a higher cost of interruption associated with restarting work, then you should implement checkpointing so that applications can restart from that point if they're interrupted. By using checkpointing, you make the price-capacity-optimized allocation strategy a good fit for these workloads because it allocates capacity from the lowest priced pools that also offer a low Spot Instance interruption rate.

For an example configuration that uses the price-capacity-optimized allocation strategy, see Example 10: Launch Spot Instances in a price-capacity-optimized fleet.

**When workloads have a high cost of interruption**

You can optionally use the capacity-optimized strategy if you run workloads that either use similarly priced instance types, or where the cost of interruption is so significant that any cost saving is inadequate in comparison to a marginal increase in interruptions. This strategy allocates capacity from the most available Spot capacity pools that offer the possibility of fewer interruptions, which can lower the overall cost of your workload. For an example configuration that uses the capacity-optimized allocation strategy, see Example 8: Launch Spot Instances in a capacity-optimized fleet.

When the possibility of interruptions must be minimized but the preference for certain instance types matters, you can express your pool priorities by using the capacity-optimized-prioritized allocation strategy and then setting the order of instance types to use from highest to lowest priority. For an example configuration, see Example 9: Launch Spot Instances in a capacity-optimized fleet with priorities.

Note that when you set priorities for capacity-optimized-prioritized, the same priorities are also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

**When your workload is time flexible and capacity availability is not a factor**

If your fleet is small or runs for a short time, you can use price-capacity-optimized to maximize cost savings while still considering capacity availability.
When your fleet is large or runs for a long time

If your fleet is large or runs for a long time, you can improve the availability of your fleet by distributing the Spot Instances across multiple pools using the diversified strategy. For example, if your EC2 Fleet specifies 10 pools and a target capacity of 100 instances, the fleet launches 10 Spot Instances in each pool. If the Spot price for one pool exceeds your maximum price for this pool, only 10% of your fleet is affected. Using this strategy also makes your fleet less sensitive to increases in the Spot price in any one pool over time. With the diversified strategy, the EC2 Fleet does not launch Spot Instances into any pools with a Spot price that is equal to or higher than the On-Demand price.

Maintain target capacity

After Spot Instances are terminated due to a change in the Spot price or available capacity of a Spot capacity pool, an EC2 Fleet of type maintain launches replacement Spot Instances. The allocation strategy determines the pools from which the replacement instances are launched, as follows:

- If the allocation strategy is price-capacity-optimized, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability while also taking price into consideration and identifying lowest priced pools with high capacity availability.
- If the allocation strategy is capacity-optimized, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability.
- If the allocation strategy is diversified, the fleet distributes the replacement Spot Instances across the remaining pools.

Attribute-based instance type selection for EC2 Fleet

When you create an EC2 Fleet, you must specify one or more instance types for configuring the On-Demand Instances and Spot Instances in the fleet. As an alternative to manually specifying the instance types, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. This is known as attribute-based instance type selection. For example, you can specify the minimum and maximum number of vCPUs required for your instances, and EC2 Fleet will launch the instances using any available instance types that meet those vCPU requirements.
Attribute-based instance type selection is ideal for workloads and frameworks that can be flexible about what instance types they use, such as when running containers or web fleets, processing big data, and implementing continuous integration and deployment (CI/CD) tooling.

**Benefits**

Attribute-based instance type selection has the following benefits:

- **Easily use the right instance types** – With so many instance types available, finding the right instance types for your workload can be time consuming. When you specify instance attributes, the instance types will automatically have the required attributes for your workload.

- **Simplified configuration** – To manually specify multiple instance types for an EC2 Fleet, you must create a separate launch template override for each instance type. But with attribute-based instance type selection, to provide multiple instance types, you need only specify the instance attributes in the launch template or in a launch template override.

- **Automatic use of new instance types** – When you specify instance attributes rather than instance types, your fleet can use newer generation instance types as they’re released, "future proofing" the fleet's configuration.

- **Instance type flexibility** – When you specify instance attributes rather than instance types, EC2 Fleet can select from a wide range of instance types for launching Spot Instances, which adheres to the [Spot best practice of instance type flexibility](#).

**Topics**

- [How attribute-based instance type selection works](#)
- [Price protection](#)
- [Considerations](#)
- [Create an EC2 Fleet with attribute-based instance type selection](#)
- [Examples of configurations that are valid and not valid](#)
- [Preview instance types with specified attributes](#)

**How attribute-based instance type selection works**

To use attribute-based instance type selection in your fleet configuration, you replace the list of instance types with a list of instance attributes that your instances require. EC2 Fleet will launch instances on any available instance types that have the specified instance attributes.
Types of instance attributes

There are several instance attributes that you can specify to express your compute requirements, such as:

- **vCPU count** – The minimum and maximum number of vCPUs per instance.
- **Memory** – The minimum and maximum GiBs of memory per instance.
- **Local storage** – Whether to use EBS or instance store volumes for local storage.
- **Burstable performance** – Whether to use the T instance family, including T4g, T3a, T3, and T2 types.

For a description of each attribute and the default values, see [InstanceRequirements](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/AmazonEC2.html) in the *Amazon EC2 API Reference*.

Where to configure attribute-based instance type selection

Depending on whether you use the console or the AWS CLI, you can specify the instance attributes for attribute-based instance type selection as follows:

In the console, you can specify the instance attributes in the following fleet configuration component:

- In a launch template, and then reference the launch template in the fleet request

In the AWS CLI, you can specify the instance attributes in one or all of the following fleet configuration components:

- In a launch template, and then reference the launch template in the fleet request
- In a launch template override
If you want a mix of instances that use different AMIs, you can specify instance attributes in multiple launch template overrides. For example, different instance types can use x86 and Arm-based processors.

**How EC2 Fleet uses attribute-based instance type selection when provisioning a fleet**

EC2 Fleet provisions a fleet in the following way:

- EC2 Fleet identifies the instance types that have the specified attributes.
- EC2 Fleet uses price protection to determine which instance types to exclude.
- EC2 Fleet determines the capacity pools from which it will consider launching the instances based on the AWS Regions or Availability Zones that have matching instance types.
- EC2 Fleet applies the specified allocation strategy to determine from which capacity pools to launch the instances.

Note that attribute-based instance type selection does not pick the capacity pools from which to provision the fleet; that's the job of the allocation strategies.

If you specify an allocation strategy, EC2 Fleet will launch instances according to the specified allocation strategy.

- For Spot Instances, attribute-based instance type selection supports the price-capacity-optimized, capacity-optimized, and lowest-price allocation strategies. Note that we don't recommend the lowest-price Spot allocation strategy because it has the highest risk of interruption for your Spot Instances.
- For On-Demand Instances, attribute-based instance type selection supports the lowest-price allocation strategy.
- If there is no capacity for the instance types with the specified instance attributes, no instances can be launched, and the fleet returns an error.

**Price protection**

Price protection is a feature that prevents your EC2 Fleet from using instance types that you would consider too expensive even if they happen to fit the attributes that you specified. To use price protection, you set a price threshold. Then, when Amazon EC2 selects instance types with your attributes, it excludes instance types priced above your threshold.
The way that Amazon EC2 calculates the price threshold is as follows:

- Amazon EC2 first identifies the lowest priced instance type from those that match your attributes.
- Amazon EC2 then takes the value (expressed as a percentage) that you specified for the price protection parameter and multiplies it with the price of the identified instance type. The result is the price that is used as the price threshold.

There are separate price thresholds for On-Demand Instances and Spot Instances.

When you create a fleet with attribute-based instance type selection, price protection is enabled by default. You can keep the default values, or you can specify your own.

You can also turn off price protection. To indicate no price protection threshold, specify a high percentage value, such as 999999.

Topics
- How the lowest priced instance type is identified
- On-Demand Instance price protection
- Spot Instance price protection
- Specify the price protection threshold

How the lowest priced instance type is identified

Amazon EC2 determines the price to base the price threshold on by identifying the instance type with the lowest price from those that match your specified attributes. It does this in the following way:

- It first looks at the current generation C, M, or R instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
- If there is no match, it then looks at any current generation instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
- If there is no match, it then looks at any previous generation instance types that match your attributes, and identifies the lowest priced instance type.
On-Demand Instance price protection

The price protection threshold for On-Demand instance types is calculated as a percentage higher than the identified lowest priced On-Demand instance type (OnDemandMaxPricePercentageOverLowestPrice). You specify the percentage higher that you're willing to pay. If you don't specify this parameter, then a default value of 20 is used to calculate a price protection threshold of 20% higher than the identified price.

For example, if the identified On-Demand instance price is 0.4271, and you specify 25, then the price threshold is 25% more than 0.4271. It is calculated as follows: 0.4271 * 1.25 = 0.533875. The calculated price is the maximum you're willing to pay for On-Demand Instances, and, in this example, Amazon EC2 will exclude any On-Demand instance types that cost more than 0.533875.

Spot Instance price protection

By default, Amazon EC2 will automatically apply optimal Spot Instance price protection to consistently select from a wide range of instance types. You can also manually set the price protection yourself. However, letting Amazon EC2 do it for you can improve the likelihood that your Spot capacity is fulfilled.

You can manually specify the price protection using one of the following options. If you manually set the price protection, we recommend using the first option.

- **A percentage of the identified lowest priced On-Demand instance type**
  [MaxSpotPriceAsPercentageOfOptimalOnDemandPrice]

  For example, if the identified On-Demand instance type price is 0.4271, and you specify 60, then the price threshold is 60% of 0.4271. It is calculated as follows: 0.4271 * 0.60 = 0.25626. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than 0.25626.

- **A percentage higher than the identified lowest priced Spot instance type**
  [SpotMaxPricePercentageOverLowestPrice]

  For example, if the identified Spot instance type price is 0.1808, and you specify 25, then the price threshold is 25% more than 0.1808. It is calculated as follows: 0.1808 * 1.25 = 0.226. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than 0.226. We do
not recommend using this parameter because Spot prices can fluctuate, and therefore your price protection threshold might also fluctuate.

Specify the price protection threshold

To specify the price protection threshold

While creating the EC2 Fleet, configure the fleet for attribute-based instance type selection, and then do the following:

- To specify the On-Demand Instance price protection threshold, in the JSON configuration file, in the InstanceRequirements structure, for OnDemandMaxPricePercentageOverLowestPrice, enter the price protection threshold as a percentage.
- To specify the Spot Instance price protection threshold, in the JSON configuration file, in the InstanceRequirements structure, specify one of the following parameters:
  - For MaxSpotPriceAsPercentageOfOptimalOnDemandPrice, enter the price protection threshold as a percentage.
  - For SpotMaxPricePercentageOverLowestPrice, enter the price protection threshold as a percentage.

For more information about creating the fleet, see [Create an EC2 Fleet with attribute-based instance type selection](#).

**Note**

When creating the EC2 Fleet, if you set TargetCapacityUnitType to vcpu or memory-mib, the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Considerations

- You can specify either instance types or instance attributes in an EC2 Fleet, but not both at the same time.

  When using the CLI, the launch template overrides will override the launch template. For example, if the launch template contains an instance type and the launch template override
contains instance attributes, the instances that are identified by the instance attributes will override the instance type in the launch template.

- When using the CLI, when you specify instance attributes as overrides, you can't also specify weights or priorities.
- You can specify a maximum of four InstanceRequirements structures in a request configuration.

Create an EC2 Fleet with attribute-based instance type selection

You can configure a fleet to use attribute-based instance type selection by using the AWS CLI.

To create an EC2 Fleet with attribute-based instance type selection (AWS CLI)

Use the `create-fleet` (AWS CLI) command to create an EC2 Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 create-fleet \
  --region us-east-1 \
  --cli-input-json file://file_name.json
```

Example `file_name`.json file

The following example contains the parameters that configure an EC2 Fleet to use attribute-based instance type selection, and is followed by a text explanation.

```json
{
  "SpotOptions": {
    "AllocationStrategy": "price-capacity-optimized"
  },
  "LaunchTemplateConfigs": [{
    "LaunchTemplateSpecification": {
      "LaunchTemplateName": "my-launch-template",
      "Version": "1"
    },
    "Overrides": [{
      "InstanceRequirements": {
        "VCpuCount": {
          "Min": 2
        },
        "MemoryMiB": {
          "Min": 4
```
The attributes for attribute-based instance type selection are specified in the `InstanceRequirements` structure. In this example, two attributes are specified:

- **VCpuCount** – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- **MemoryMiB** – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when the fleet provisions the fleet.

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](https://docs.aws.amazon.com/AmazonEC2/latest/APIReference/api-summary.html) in the Amazon EC2 API Reference.

**Note**

When `InstanceRequirements` is included in the fleet configuration, `InstanceType` and `WeightedCapacity` must be excluded; they cannot determine the fleet configuration at the same time as instance attributes.

The JSON also contains the following fleet configuration:

- "AllocationStrategy": "price-capacity-optimized" – The allocation strategy for the Spot Instances in the fleet.
- "LaunchTemplateName": "my-launch-template", "Version": "1" – The launch template contains some instance configuration information, but if any instance
types are specified, they will be overridden by the attributes that are specified in InstanceRequirements.

- "TotalTargetCapacity": 20 – The target capacity is 20 instances.
- "DefaultTargetCapacityType": "spot" – The default capacity is Spot Instances.
- "Type": "instant" – The request type for the fleet is instant.

Examples of configurations that are valid and not valid

If you use the AWS CLI to create an EC2 Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single Overrides structure with both InstanceRequirements and InstanceType
- Two Overrides structures, one with InstanceRequirements and the other with InstanceType
- Two InstanceRequirements structures with overlapping attribute values within the same LaunchTemplateSpecification

Example configurations

- **Valid configuration: Single launch template with overrides**
- **Valid configuration: Single launch template with multiple InstanceRequirements**
- **Valid configuration: Two launch templates, each with overrides**
- **Valid configuration: Only InstanceRequirements specified, no overlapping attribute values**
- **Configuration not valid: Overrides contain InstanceRequirements and InstanceType**
- **Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType**
- **Configuration not valid: Overlapping attribute values**

**Valid configuration: Single launch template with overrides**

The following configuration is valid. It contains one launch template and one Overrides structure containing one InstanceRequirements structure. A text explanation of the example configuration follows.

```json
{
}
```
"LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
            "LaunchTemplateName": "My-launch-template",
            "Version": "1"
        },
        "Overrides": [
            {
                "InstanceRequirements": {
                    "VCpuCount": {
                        "Min": 2,
                        "Max": 8
                    },
                    "MemoryMib": {
                        "Min": 0,
                        "Max": 10240
                    },
                    "MemoryGiBPerVCpu": {
                        "Max": 10000
                    },
                    "RequireHibernateSupport": true
                }
            }
        ],
        "TargetCapacitySpecification": {
            "TotalTargetCapacity": 5000,
            "DefaultTargetCapacityType": "spot",
            "TargetCapacityUnitType": "vcpu"
        }
    }
]

InstanceRequirements

To use attribute-based instance selection, you must include the InstanceRequirements structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- VcpuCount – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
• MemoryMiB – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.

• MemoryGiBPerVCpu – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The Min parameter is optional. By omitting it, you indicate no minimum limit.

**TargetCapacityUnitType**

The TargetCapacityUnitType parameter specifies the unit for the target capacity. In the example, the target capacity is 5000 and the target capacity unit type is vcpu, which together specify a desired target capacity of 5,000 vCPUs. EC2 Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

**Valid configuration: Single launch template with multiple InstanceRequirements**

The following configuration is valid. It contains one launch template and one Overrides structure containing two InstanceRequirements structures. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a VcpuCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.

```json
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VcpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                },
                {
                    "InstanceRequirements": {
                        "VcpuCount": {
                            "Min": 4,
                            "Max": 8
                        }
                    }
                }
            ]
        }
    ]
}
```
Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one Overrides structure containing one InstanceRequirements structure. This configuration is useful for arm and x86 architecture support in the same fleet.

```json
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "armLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VcpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 1,
        "DefaultTargetCapacityType": "spot"
    }
}
```
Valid configuration: Only InstanceRequirements specified, no overlapping attribute values

The following configuration is valid. It contains two LaunchTemplateSpecification structures, each with a launch template and an Overrides structure containing an InstanceRequirements structure. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a VcpuCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.
"Overrides": [
  {
    "InstanceRequirements": {
      "VCpuCount": {
        "Min": 0,
        "Max": 2
      },
      "MemoryMiB": {
        "Min": 0
      }
    }
  }
],
"LaunchTemplateSpecification": {
  "LaunchTemplateName": "MyOtherLaunchTemplate",
  "Version": "1"
},
"Overrides": [
  {
    "InstanceRequirements": {
      "VCpuCount": {
        "Min": 4,
        "Max": 8
      },
      "MemoryMiB": {
        "Min": 0
      }
    }
  }
],
"TargetCapacitySpecification": {
  "TotalTargetCapacity": 1,
  "DefaultTargetCapacityType": "spot"
}
Configuration not valid: Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structure contains both InstanceRequirements and InstanceType. For the Overrides, you can specify either InstanceRequirements or InstanceType, but not both.

```json
{
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateName": "MyLaunchTemplate",
        "Version": "1"
      },
      "Overrides": [
        {
          "InstanceRequirements": {
            "VCpuCount": {
              "Min": 0,
              "Max": 2
            },
            "MemoryMiB": {
              "Min": 0
            }
          }
        },
        {
          "InstanceType": "m5.large"
        }
      ]
    },
    "TargetCapacitySpecification": {
      "TotalTargetCapacity": 1,
      "DefaultTargetCapacityType": "spot"
    }
  }
}
```

Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structures contain both InstanceRequirements and InstanceType. You can specify either InstanceRequirements or InstanceType, but not both, even if they're in different Overrides structures.
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceRequirements": {
                        "VcpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
            ]
        },
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "MyOtherLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "m5.large"
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 1,
        "DefaultTargetCapacityType": "spot"
    }
}
Configuration not valid: Overlapping attribute values

The following configuration is not valid. The two InstanceRequirements structures each contain "VCpuCount": {"Min": 0, "Max": 2}. The values for these attributes overlap, which will result in duplicate capacity pools.

```json
{
   "LaunchTemplateConfigs": [
      {
         "LaunchTemplateSpecification": {
            "LaunchTemplateName": "MyLaunchTemplate",
            "Version": "1"
         },
         "Overrides": [
            {
               "InstanceRequirements": {
                 "VCpuCount": {
                   "Min": 0,
                   "Max": 2
                 },
                 "MemoryMiB": {
                   "Min": 0
                 }
               },
               "InstanceRequirements": {
                 "VCpuCount": {
                   "Min": 0,
                   "Max": 2
                 },
                 "MemoryMiB": {
                   "Min": 0
                 }
               }
            }
         ]
      }
   ],
   "TargetCapacitySpecification": {
      "TotalTargetCapacity": 1,
      "DefaultTargetCapacityType": "spot"
   }
}```
Preview instance types with specified attributes

You can use the `get-instance-types-from-instance-requirements` AWS CLI command to preview the instance types that match the attributes that you specify. This is especially useful for working out what attributes to specify in your request configuration without launching any instances. Note that the command does not consider available capacity.

**To preview a list of instance types by specifying attributes using the AWS CLI**

1. (Optional) To generate all of the possible attributes that can be specified, use the `get-instance-types-from-instance-requirements` command and the `--generate-cli-skeleton` parameter. You can optionally direct the output to a file to save it by using `input > attributes.json`.

   ```bash
   aws ec2 get-instance-types-from-instance-requirements \
   --region us-east-1 \
   --generate-cli-skeleton input > attributes.json
   ```

**Expected output**

```json
{
   "DryRun": true,
   "ArchitectureTypes": [
      "i386"
   ],
   "VirtualizationTypes": [
      "hvm"
   ],
   "InstanceRequirements": {
      "VCpuCount": {
         "Min": 0,
         "Max": 0
      },
      "MemoryMiB": {
         "Min": 0,
         "Max": 0
      },
      "CpuManufacturers": [
```
EC2 Fleet configuration strategies

EC2 Fleet configuration strategies

EC2 Fleet configuration strategies

EC2 Fleet configuration strategies

EC2 Fleet configuration strategies

EC2 Fleet configuration strategies

EC2 Fleet configuration strategies
2. Create a JSON configuration file using the output from the previous step, and configure it as follows:

```
"a100",
"AcceleratorTotalMemoryMiB": {
   "Min": 0,
   "Max": 0
},
"NetworkBandwidthGbps": {
   "Min": 0.0,
   "Max": 0.0
},
"AllowedInstanceTypes": [
   ""
],
"MaxResults": 0,
"NextToken": ""
```

### Note

You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes; when omitted, the default values are used.

For a description of each attribute and their default values, see [get-instance-types-from-instance-requirements](#) in the Amazon EC2 Command Line Reference.

- For `ArchitectureTypes`, specify one or more types of processor architecture.
- For `VirtualizationTypes`, specify one or more types of virtualization.
- For `VCpuCount`, specify the minimum and maximum number of vCPUs. To specify no minimum limit, for `Min`, specify 0. To specify no maximum limit, omit the `Max` parameter.
- For `MemoryMiB`, specify the minimum and maximum amount of memory in MiB. To specify no minimum limit, for `Min`, specify 0. To specify no maximum limit, omit the `Max` parameter.
- You can optionally specify one or more of the other attributes to further constrain the list of instance types that are returned.
3. To preview the instance types that have the attributes that you specified in the JSON file, use the `get-instance-types-from-instance-requirements` command, and specify the name and path to your JSON file by using the `--cli-input-json` parameter. You can optionally format the output to appear in a table format.

```
aws ec2 get-instance-types-from-instance-requirements \
  --cli-input-json file://attributes.json \
  --output table
```

Example `attributes.json` file

In this example, the required attributes are included in the JSON file. They are `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. In addition, the optional `InstanceGenerations` attribute is also included. Note that for `MemoryMiB`, the `Max` value can be omitted to indicate that there is no limit.

```
{
  "ArchitectureTypes": [
    "x86_64"
  ],
  "VirtualizationTypes": [
    "hvm"
  ],
  "InstanceRequirements": {
    "VCpuCount": {
      "Min": 4,
      "Max": 6
    },
    "MemoryMiB": {
      "Min": 2048
    },
    "InstanceGenerations": [
      "current"
    ]
  }
}
```

Example output

```

4. After identifying instance types that meet your needs, make note of the instance attributes that you used so that you can use them when configuring your fleet request.

---

**Configure EC2 Fleet for On-Demand backup**

If you have urgent, unpredictable scaling needs, such as a news website that must scale during a major news event or game launch, we recommend that you specify alternative instance types for your On-Demand Instances, in the event that your preferred option does not have sufficient available capacity. For example, you might prefer `c5.2xlarge` On-Demand Instances, but if there is insufficient available capacity, you'd be willing to use some `c4.2xlarge` instances during peak load. In this case, EC2 Fleet attempts to fulfill all of your target capacity using `c5.2xlarge` instances, but if there is insufficient capacity, it automatically launches `c4.2xlarge` instances to fulfill the target capacity.

**Topics**

- Prioritize instance types for On-Demand capacity
- Use Capacity Reservations for On-Demand Instances

**Prioritize instance types for On-Demand capacity**

When EC2 Fleet attempts to fulfill your On-Demand capacity, it defaults to launching the lowest priced instance type first. If `AllocationStrategy` is set to `prioritized`, EC2 Fleet uses priority to determine which instance type to use first in fulfilling On-Demand capacity. The priority is assigned to the launch template override, and the highest priority is launched first.
Example: Prioritize instance types

In this example, you configure three launch template overrides, each with a different instance type.

The On-Demand price for the instance types range in price. The following are the instance types used in this example, listed in order of price, starting with the least expensive instance type:

- m4.large – least expensive
- m5.large
- m5a.large

If you do not use priority to determine the order, the fleet fulfills the On-Demand capacity by starting with the least expensive instance type.

However, say you have unused m5.large Reserved Instances that you want to use first. You can set the launch template override priority so that the instance types are used in the order of priority, as follows:

- m5.large – priority 1
- m4.large – priority 2
- m5a.large – priority 3

Use Capacity Reservations for On-Demand Instances

With On-Demand Capacity Reservations, you can reserve compute capacity for your On-Demand Instances in a specified Availability Zone for any duration. You can configure an EC2 Fleet to use the Capacity Reservations first when launching On-Demand Instances.

Capacity Reservations are configured as either open or targeted. EC2 Fleet can launch On-Demand Instances into either open or targeted Capacity Reservations, as follows:

- If a Capacity Reservation is open, On-Demand Instances that have matching attributes automatically run in the reserved capacity.
- If a Capacity Reservation is targeted, On-Demand Instances must specifically target it to run in the reserved capacity. This is useful for using up specific Capacity Reservations or for controlling when to use specific Capacity Reservations.
If you use targeted Capacity Reservations in your EC2 Fleet, there must be enough Capacity Reservations to fulfil the target On-Demand capacity, otherwise the launch fails. To avoid a launch fail, rather add the targeted Capacity Reservations to a resource group, and then target the resource group. The resource group doesn't need to have enough Capacity Reservations; if it runs out of Capacity Reservations before the target On-Demand capacity is fulfilled, the fleet can launch the remaining target capacity into regular On-Demand capacity.

**To use Capacity Reservations with EC2 Fleet**

1. Configure the fleet as type instant. You can't use Capacity Reservations for fleets of other types.
2. Configure the usage strategy for Capacity Reservations as use-capacity-reservations-first.
3. In the launch template, for **Capacity reservation**, choose either Open or Target by group. If you choose Target by group, specify the Capacity Reservations resource group ID.

When the fleet attempts to fulfil the On-Demand capacity, if it finds that multiple instance pools have unused matching Capacity Reservations, it determines the pools in which to launch the On-Demand Instances based on the On-Demand allocation strategy (lowest-price or prioritized).

For examples of how to configure a fleet to use Capacity Reservations to fulfil On-Demand capacity, see [EC2 Fleet example configurations](#), specifically Examples 5 through 7.

For information about configuring Capacity Reservations, see [On-Demand Capacity Reservations](#) and the [On-Demand Capacity Reservation FAQs](#).

**Capacity Rebalancing**

You can configure EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation to notify you that a Spot Instance is at an elevated risk of interruption. Capacity Rebalancing helps you maintain workload availability by proactively augmenting your fleet with a new Spot Instance before a running instance is interrupted by Amazon EC2. For more information, see [EC2 instance rebalance recommendations](#).

To configure EC2 Fleet to launch a replacement Spot Instance, use the `create-fleet` (AWS CLI) command and the relevant parameters in the `MaintenanceStrategies` structure. For more information, see the [example launch configuration](#).
Limitations

• Capacity Rebalancing is available only for fleets of type maintain.

• When the fleet is running, you can't modify the Capacity Rebalancing setting. To change the Capacity Rebalancing setting, you must delete the fleet and create a new fleet.

Configuration options

The ReplacementStrategy for EC2 Fleet supports the following two values:

launch-before-terminate

Amazon EC2 terminates the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched. When you specify launch-before-terminate, you must also specify a value for termination-delay. After the new replacement instances are launched, Amazon EC2 waits for the duration of the termination-delay, and then terminates the old instances. For termination-delay, the minimum is 120 seconds (2 minutes), and the maximum is 7200 seconds (2 hours).

We recommend that you use launch-before-terminate only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed. Note that Amazon EC2 can interrupt the old instances with a two-minute warning before the termination-delay.

We strongly recommend against using the lowest-price allocation strategy in combination with launch-before-terminate to avoid having replacement Spot Instances that are also at an elevated risk of interruption.

launch

Amazon EC2 launches replacement Spot Instances when a rebalance notification is emitted for existing Spot Instances. Amazon EC2 does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

Considerations

If you configure an EC2 Fleet for Capacity Rebalancing, consider the following:
Provide as many Spot capacity pools in the request as possible

Configure your EC2 Fleet to use multiple instance types and Availability Zones. This provides the flexibility to launch Spot Instances in various Spot capacity pools. For more information, see Be flexible about instance types and Availability Zones.

Avoid an elevated risk of interruption of replacement Spot Instances

Your replacement Spot Instances may be at an elevated risk of interruption if you use the lowest-price allocation strategy. This is because Amazon EC2 will always launch instances in the lowest priced pool that has available capacity at that moment, even if your replacement Spot Instances are likely to be interrupted soon after being launched. To avoid an elevated risk of interruption, we strongly recommend against using the lowest-price allocation strategy, and instead recommend the capacity-optimized or capacity-optimized-prioritized allocation strategy. These strategies ensure that replacement Spot Instances are launched in the most optimal Spot capacity pools, and are therefore less likely to be interrupted in the near future. For more information, see Use the price and capacity optimized allocation strategy.

Amazon EC2 will only launch a new instance if availability is the same or better

One of the goals of Capacity Rebalancing is to improve a Spot Instance's availability. If an existing Spot Instance receives a rebalance recommendation, Amazon EC2 will only launch a new instance if the new instance provides the same or better availability than the existing instance. If the risk of interruption of a new instance will be worse than the existing instance, then Amazon EC2 will not launch a new instance. Amazon EC2 will, however, continue to assess the Spot capacity pools, and will launch a new instance if availability improves.

There is a chance that your existing instance will be interrupted without Amazon EC2 proactively launching a new instance. When this happens, Amazon EC2 will attempt to launch a new instance regardless of whether the new instance has a high risk of interruption.

Capacity Rebalancing does not increase your Spot Instance interruption rate

When you enable Capacity Rebalancing, it does not increase your Spot Instance interruption rate (the number of Spot Instances that are reclaimed when Amazon EC2 needs the capacity back). However, if Capacity Rebalancing detects an instance is at risk of interruption, Amazon EC2 will immediately attempt to launch a new instance. The result is that more instances might be replaced than if you’d waited for Amazon EC2 to launch a new instance after the at-risk instance was interrupted.

While you might replace more instances with Capacity Rebalancing enabled, you benefit from being proactive rather than reactive by having more time to take action before your instances
are interrupted. With a **Spot Instance interruption notice**, you typically only have up to two minutes to gracefully shut down your instance. With Capacity Rebalancing launching a new instance in advance, you give existing processes a better chance of completing on your at-risk instance, you can start your instance shutdown procedures, and prevent new work from being scheduled on your at-risk instance. You can also start preparing the newly-launched instance to take over the application. With Capacity Rebalancing’s proactive replacement, you benefit from graceful continuity.

As a theoretical example to demonstrate the risks and benefits of using Capacity Rebalancing, consider the following scenario:

- **2:00 PM** – A rebalance recommendation is received for instance-A, and Amazon EC2 immediately starts attempting to launch a replacement instance-B, giving you time to start your shutdown procedures.*
- **2:30 PM** – A rebalance recommendation is received for instance-B, replaced with instance-C, giving you time to start your shutdown procedures.*
- **2:32 PM** – If Capacity Rebalancing wasn’t enabled, and if a Spot Instance interruption notice would’ve been received at 2:32 PM for instance-A, you would only have had up to two minutes to take action, but Instance-A would have been running up till this time.

* If **launch-before-terminate** is specified, Amazon EC2 will terminate the at-risk instance after the replacement instance comes online.

**Amazon EC2 can launch new replacement Spot Instances until fulfilled capacity is double target capacity**

When an EC2 Fleet is configured for Capacity Rebalancing, the fleet attempts to launch a new replacement Spot Instance for every Spot Instance that receives a rebalance recommendation. After a Spot Instance receives a rebalance recommendation, it is no longer counted as part of the fulfilled capacity. Depending on the replacement strategy, Amazon EC2 either terminates the instance after a preconfigured termination delay, or leaves it running. This gives you the opportunity to perform **rebalancing actions** on the instance.

If your fleet reaches double its target capacity, it stops launching new replacement instances even if the replacement instances themselves receive a rebalance recommendation.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. All of the Spot Instances receive a rebalance recommendation, which causes Amazon EC2 to launch 100 replacement Spot Instances. This raises the number of fulfilled Spot Instances to 200, which is double the target capacity. Some of the replacement instances receive a rebalance
recommendation, but no more replacement instances are launched because the fleet cannot exceed double its target capacity.

Note that you are charged for all of the instances while they are running.

**We recommend that you configure EC2 Fleet to terminate Spot Instances that receive a rebalance recommendation**

If you configure your EC2 Fleet for Capacity Rebalancing, we recommend that you choose `launch-before-terminate` with an appropriate termination delay only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed.

If you choose to terminate the instances that are recommended for rebalance yourself, we recommend that you monitor the rebalance recommendation signal that is received by the Spot Instances in the fleet. By monitoring the signal, you can quickly perform rebalancing actions on the affected instances before Amazon EC2 interrupts them, and then you can manually terminate them. If you do not terminate the instances, you continue paying for them while they are running. Amazon EC2 does not automatically terminate the instances that receive a rebalance recommendation.

You can set up notifications using Amazon EventBridge or instance metadata. For more information, see [Monitor rebalance recommendation signals](#).

**EC2 Fleet does not count instances that receive a rebalance recommendation when calculating fulfilled capacity during scale in or out**

If your EC2 Fleet is configured for Capacity Rebalancing, and you change the target capacity to either scale in or scale out, the fleet does not count the instances that are marked for rebalance as part of the fulfilled capacity, as follows:

- **Scale in** – If you decrease your desired target capacity, Amazon EC2 terminates instances that are not marked for rebalance until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then reduce the target capacity to 50 (scale in), but the fulfilled capacity is actually 60 instances because the 10 instances that are marked for rebalance are not terminated by Amazon EC2. You need to manually terminate these instances, or you can leave them running.
• Scale out – If you increase your desired target capacity, Amazon EC2 launches new instances until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

For example, you create an EC2 Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so the fleet launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then increase the target capacity to 200 (scale out), but the fulfilled capacity is actually 210 instances because the 10 instances that are marked for rebalance are not counted by the fleet as part of the target capacity. You need to manually terminate these instances, or you can leave them running.

**Maximum price overrides**

Each EC2 Fleet can either include a global maximum price, or use the default (the On-Demand price). The fleet uses this as the default maximum price for each of its launch specifications.

You can optionally specify a maximum price in one or more launch specifications. This price is specific to the launch specification. If a launch specification includes a specific price, the EC2 Fleet uses this maximum price, overriding the global maximum price. Any other launch specifications that do not include a specific maximum price still use the global maximum price.

**Control spending**

EC2 Fleet stops launching instances when it has met one of the following parameters: the TotalTargetCapacity or the MaxTotalPrice (the maximum amount you’re willing to pay). To control the amount you pay per hour for your fleet, you can specify the MaxTotalPrice. When the maximum total price is reached, EC2 Fleet stops launching instances even if it hasn’t met the target capacity.

The following examples show two different scenarios. In the first, EC2 Fleet stops launching instances when it has met the target capacity. In the second, EC2 Fleet stops launching instances when it has reached the maximum amount you’re willing to pay (MaxTotalPrice).

**Example: Stop launching instances when target capacity is reached**

Given a request for m4.large On-Demand Instances, where:

• On-Demand Price: $0.10 per hour
• OnDemandTargetCapacity: 10
• MaxTotalPrice: $1.50

EC2 Fleet launches 10 On-Demand Instances because the total of $1.00 (10 instances x $0.10) does not exceed the MaxTotalPrice of $1.50 for On-Demand Instances.

Example: Stop launching instances when maximum total price is reached

Given a request for m4.large On-Demand Instances, where:

• On-Demand Price: $0.10 per hour
• OnDemandTargetCapacity: 10
• MaxTotalPrice: $0.80

If EC2 Fleet launches the On-Demand target capacity (10 On-Demand Instances), the total cost per hour would be $1.00. This is more than the amount ($0.80) specified for MaxTotalPrice for On-Demand Instances. To prevent spending more than you're willing to pay, EC2 Fleet launches only 8 On-Demand Instances (below the On-Demand target capacity) because launching more would exceed the MaxTotalPrice for On-Demand Instances.

EC2 Fleet instance weighting

When you create an EC2 Fleet, you can define the capacity units that each instance type would contribute to your application's performance. You can then adjust your maximum price for each launch specification by using instance weighting.

By default, the price that you specify is per instance hour. When you use the instance weighting feature, the price that you specify is per unit hour. You can calculate your price per unit hour by dividing your price for an instance type by the number of units that it represents. EC2 Fleet calculates the number of instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity. The fleet can select any pool that you specify in your launch specification, even if the capacity of the instances launched exceeds the requested target capacity.

The following table includes examples of calculations to determine the price per unit for an EC2 Fleet with a target capacity of 10.
<table>
<thead>
<tr>
<th>Instance type</th>
<th>Instance weight</th>
<th>Target capacity</th>
<th>Number of instances launched</th>
<th>Price per instance hour</th>
<th>Price per unit hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>r3.xlarge</td>
<td>2</td>
<td>10</td>
<td>5</td>
<td>$0.05</td>
<td>$0.025</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(10 divided by 2)</td>
<td></td>
<td>(.05 divided by 2)</td>
</tr>
<tr>
<td>r3.8xlarge</td>
<td>8</td>
<td>10</td>
<td>2</td>
<td>$0.10</td>
<td>$0.0125</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>(10 divided by 8, result rounded up)</td>
<td></td>
<td>(.10 divided by 8)</td>
</tr>
</tbody>
</table>

Use EC2 Fleet instance weighting as follows to provision the target capacity that you want in the pools with the lowest price per unit at the time of fulfillment:

1. Set the target capacity for your EC2 Fleet either in instances (the default) or in the units of your choice, such as virtual CPUs, memory, storage, or throughput.
2. Set the price per unit.
3. For each launch specification, specify the weight, which is the number of units that the instance type represents toward the target capacity.

**Instance weighting example**

Consider an EC2 Fleet request with the following configuration:

- A target capacity of 24
- A launch specification with an instance type r3.2xlarge and a weight of 6
- A launch specification with an instance type c3.xlarge and a weight of 5

The weights represent the number of units that instance type represents toward the target capacity. If the first launch specification provides the lowest price per unit (price for r3.2xlarge
per instance hour divided by 6), the EC2 Fleet would launch four of these instances (24 divided by 6).

If the second launch specification provides the lowest price per unit (price for \(c3.xlarge\) per instance hour divided by 5), the EC2 Fleet would launch five of these instances (24 divided by 5, result rounded up).

**Instance weighting and allocation strategy**

Consider an EC2 Fleet request with the following configuration:

- A target capacity of 30 Spot Instances
- A launch specification with an instance type \(c3.2xlarge\) and a weight of 8
- A launch specification with an instance type \(m3.xlarge\) and a weight of 8
- A launch specification with an instance type \(r3.xlarge\) and a weight of 8

The EC2 Fleet would launch four instances (30 divided by 8, result rounded up). With the diversified strategy, the fleet launches one instance in each of the three pools, and the fourth instance in whichever of the three pools provides the lowest price per unit.

**Work with EC2 Fleets**

To start using an EC2 Fleet, you create a request that includes the total target capacity, On-Demand capacity, Spot capacity, one or more launch specifications for the instances, and the maximum price that you are willing to pay. The fleet request must include a launch template that defines the information that the fleet needs to launch an instance, such as an AMI, instance type, subnet or Availability Zone, and one or more security groups. You can specify launch specification overrides for the instance type, subnet, Availability Zone, and maximum price you're willing to pay, and you can assign weighted capacity to each launch specification override.

The EC2 Fleet launches On-Demand Instances when there is available capacity, and launches Spot Instances when your maximum price exceeds the Spot price and capacity is available.

If your fleet includes Spot Instances, Amazon EC2 can attempt to maintain your fleet target capacity as Spot prices change.

An EC2 Fleet request of type \(maintain\) or \(request\) remains active until it expires or you delete it. When you delete a fleet of type \(maintain\) or \(request\), you can specify whether deletion
terminates the instances in that fleet. Otherwise, the On-Demand Instances run until you terminate them, and the Spot Instances run until they are interrupted or you terminate them.

EC2 Fleet request states

An EC2 Fleet request can be in one of the following states:

submitted

The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances. The request can include On-Demand Instances, Spot Instances, or both. If a request would exceed your fleet limits, it is deleted immediately.

active

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances. The request remains in this state until it is modified or deleted.

modifying

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed or the request is deleted. Only a maintain fleet type can be modified. This state does not apply to other request types.

deleted_running

The EC2 Fleet request is deleted and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated manually. The request remains in this
state until all instances are interrupted or terminated. Only an EC2 Fleet of type maintain or request can have running instances after the EC2 Fleet request is deleted. A deleted instant fleet with running instances is not supported. This state does not apply to instant fleets.

deleted_terminating

The EC2 Fleet request is deleted and its instances are terminating. The request remains in this state until all instances are terminated.

deleted

The EC2 Fleet is deleted and has no running instances. The request is deleted two days after its instances are terminated.

**EC2 Fleet prerequisites**

**To create an EC2 Fleet, the following prerequisites must be in place:**

- [Launch template](#)
- [Service-linked role for EC2 Fleet](#)
- [Grant access to customer managed keys for use with encrypted AMIs and EBS snapshots](#)
- [Permissions for EC2 Fleet users](#)

**Launch template**

A launch template includes information about the instances to launch, such as the instance type, Availability Zone, and the maximum price that you are willing to pay. For more information, see [Launch an instance from a launch template](#).

**Service-linked role for EC2 Fleet**

The `AWSServiceRoleForEC2Fleet` role grants the EC2 Fleet permission to request, launch, terminate, and tag instances on your behalf. Amazon EC2 uses this service-linked role to complete the following actions:

- `ec2:RunInstances` – Launch instances.
- `ec2:RequestSpotInstances` – Request Spot Instances.
- `ec2:TerminateInstances` – Terminate instances.
- `ec2:DescribeImages` – Describe Amazon Machine Images (AMIs) for the Spot Instances.
- `ec2:DescribeInstanceStatus` – Describe the status of the Spot Instances.
Amazon Elastic Compute Cloud

- `ec2:DescribeSubnets` – Describe the subnets for Spot Instances.
- `ec2:CreateTags` – Add tags to the EC2 Fleet, instances, and volumes.

Ensure that this role exists before you use the AWS CLI or an API to create an EC2 Fleet.

**Note**

An instant EC2 Fleet does not require this role.

To create the role, use the IAM console as follows.

**To create the AWSServiceRoleForEC2Fleet role for EC2 Fleet**

2. In the navigation pane, choose Roles, and then choose Create role.
3. On the Select type of trusted entity page, do the following:
   a. For Trusted entity type, choose AWS service.
   b. Under Use case, for Service or use case, choose EC2 - Fleet.
   c. Choose Next.
4. On the Add permissions page, choose Next.
5. On the Name, review, and create page, choose Create role.

If you no longer need to use EC2 Fleet, we recommend that you delete the `AWSServiceRoleForEC2Fleet` role. After this role is deleted from your account, you can create the role again if you create another fleet.

For more information, see Using service-linked roles in the IAM User Guide.
Grant access to customer managed keys for use with encrypted AMIs and EBS snapshots

If you specify an encrypted AMI or an encrypted Amazon EBS snapshot in your EC2 Fleet and you use an AWS KMS key for encryption, you must grant the AWSServiceRoleForEC2Fleet role permission to use the customer managed key so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the customer managed key, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see Using grants and Using key policies in AWS KMS in the AWS Key Management Service Developer Guide.

To grant the AWSServiceRoleForEC2Fleet role permissions to use the customer managed key

- Use the create-grant command to add a grant to the customer managed key and to specify the principal (the AWSServiceRoleForEC2Fleet service-linked role) that is given permission to perform the operations that the grant permits. The customer managed key is specified by the key-id parameter and the ARN of the customer managed key. The principal is specified by the grantee-principal parameter and the ARN of the AWSServiceRoleForEC2Fleet service-linked role.

```
aws kms create-grant \
  --region us-east-1 \
  --key-id arn:aws:kms:us-east-1:444455556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
  --grantee-principal arn:aws:iam::111122223333:role/AWSServiceRoleForEC2Fleet \
  --operations "Decrypt" "Encrypt" "GenerateDataKey" "GenerateDataKeyWithoutPlaintext" "CreateGrant" "DescribeKey" "ReEncryptFrom" "ReEncryptTo"
```

Permissions for EC2 Fleet users

If your users will create or manage an EC2 Fleet, be sure to grant them the required permissions.

To create a policy for EC2 Fleet

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose Policies.
3. Choose Create policy.
4. On the **Create policy** page, choose the **JSON** tab, replace the text with the following, and choose **Review policy**.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": ["ec2:*"],
         "Resource": "*"
      },
      {
         "Effect": "Allow",
         "Action": ["iam:ListRoles",
                     "iam:PassRole",
                     "iam:ListInstanceProfiles"],
         "Resource": "arn:aws:iam::123456789012:role/DevTeam*"
      }
   ]
}
```

The **ec2:** grant a user permission to call all Amazon EC2 API actions. To limit the user to specific Amazon EC2 API actions, specify those actions instead.

The user must have permission to call the **iam:ListRoles** action to enumerate existing IAM roles, the **iam:PassRole** action to specify the EC2 Fleet role, and the **iam:ListInstanceProfiles** action to enumerate existing instance profiles.

(Optional) To enable a user to create roles or instance profiles using the IAM console, you must also add the following actions to the policy:

- **iam:AddRoleToInstanceProfile**
- **iam:AttachRolePolicy**
- **iam:CreateInstanceProfile**
- **iam:CreateRole**
- **iam:GetRole**
5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.

6. To provide access, add permissions to your users, groups, or roles:

   - Users and groups in AWS IAM Identity Center:
     
     Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

   - Users managed in IAM through an identity provider:
     
     Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider (federation)](#) in the *IAM User Guide*.

   - IAM users:
     
     - Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the *IAM User Guide*.
     
     - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user (console)](#) in the *IAM User Guide*.

---

### EC2 Fleet health checks

EC2 Fleet checks the health status of the instances in the fleet every two minutes. The health status of an instance is either healthy or unhealthy.

EC2 Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as unhealthy when the status of either the instance status check or the system status check is impaired for three consecutive health status checks. For more information, see [Status checks for Amazon EC2 instances](#).

You can configure your fleet to replace unhealthy Spot Instances. After setting `ReplaceUnhealthyInstances` to true, a Spot Instance is replaced when it is reported as unhealthy. The fleet can go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.

**Requirements**

- Health check replacement is supported only for EC2 Fleets that maintain a target capacity (fleets of type `maintain`), and not for fleets of type `request` or `instant`. 
• Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
• You can configure your EC2 Fleet to replace unhealthy instances only when you create it.
• Users can use health check replacement only if they have permission to call the ec2:DescribeInstanceStatus action.

To configure an EC2 Fleet to replace unhealthy Spot Instances

1. Follow the steps for creating an EC2 Fleet. For more information, see Create an EC2 Fleet.
2. To configure the fleet to replace unhealthy Spot Instances, in the JSON file, for ReplaceUnhealthyInstances, enter true.

Generate an EC2 Fleet JSON configuration file

To view the full list of EC2 Fleet configuration parameters, you can generate a JSON file. For a description of each parameter, see create-fleet in the AWS CLI Command Reference.

To generate a JSON file with all possible EC2 Fleet parameters using the command line

• Use the create-fleet (AWS CLI) command and the --generate-cli-skeleton parameter to generate an EC2 Fleet JSON file, and direct the output to a file to save it.

```bash
aws ec2 create-fleet \
    --generate-cli-skeleton input > ec2createfleet.json
```

Example output

```

Create an EC2 Fleet

To create an EC2 Fleet, you need only specify the following parameters:

- LaunchTemplateName or LaunchTemplateId – Specifies the launch template to use (which contains the parameters for the instances to launch, such as the instance type, Availability Zone, and the maximum price you're willing to pay)
- TotalTargetCapacity – Specifies the total target capacity for the fleet
- DefaultTargetCapacityType – Specifies whether the default purchasing option is On-Demand or Spot

You can specify multiple launch specifications that override the launch template. The launch specifications can vary by instance type, Availability Zone, subnet, and maximum price, and can include a different weighted capacity. Alternatively, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. For more information, see Attribute-based instance type selection for EC2 Fleet.

If you do not specify a parameter, the fleet uses the default value for the parameter.

Specify the fleet parameters in a JSON file. For more information, see Generate an EC2 Fleet JSON configuration file.

There is currently no console support for creating an EC2 Fleet.

To create an EC2 Fleet (AWS CLI)

- Use the create-fleet (AWS CLI) command to create an EC2 Fleet and specify the JSON file that contains the fleet configuration parameters.

```
aws ec2 create-fleet --cli-input-json file://file_name.json
```

For example configuration files, see EC2 Fleet example configurations.

The following is example output for a fleet of type request or maintain.

```
{
   "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```
The following is example output for a fleet of type instant that launched the target capacity.

```json
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
  "Errors": [],
  "Instances": [
    {
      "LaunchTemplateAndOverrides": {
        "LaunchTemplateSpecification": {
          "LaunchTemplateId": "lt-01234a567b8910abcEXAMPLE",
          "Version": "1"
        },
        "Overrides": {
          "InstanceType": "c5.large",
          "AvailabilityZone": "us-east-1a"
        }
      },
      "Lifecycle": "on-demand",
      "InstanceIds": [
        "i-1234567890abcdef0",
        "i-9876543210abcdef9"
      ],
      "InstanceType": "c5.large",
      "Platform": null
    },
    {
      "LaunchTemplateAndOverrides": {
        "LaunchTemplateSpecification": {
          "LaunchTemplateId": "lt-01234a567b8910abcEXAMPLE",
          "Version": "1"
        },
        "Overrides": {
          "InstanceType": "c4.large",
          "AvailabilityZone": "us-east-1a"
        }
      },
      "Lifecycle": "on-demand",
      "InstanceIds": [
        "i-5678901234abcdef0",
        "i-5432109876abcdef9"
      ]
    }
  ]
}
```
The following is example output for a fleet of type instant that launched part of the target capacity with errors for instances that were not launched.

```json
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
    "Errors": [
        {
            "LaunchTemplateAndOverrides": {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateId": "lt-01234a567b8910abcEXAMPLE",
                    "Version": "1"
                },
                "Overrides": {
                    "InstanceType": "c4.xlarge",
                    "AvailabilityZone": "us-east-1a"
                },
                "Lifecycle": "on-demand",
                "ErrorCode": "InsufficientInstanceCapacity",
                "ErrorMessage": ""
            },
            "Instances": [
                {
                    "LaunchTemplateAndOverrides": {
                        "LaunchTemplateSpecification": {
                            "LaunchTemplateId": "lt-01234a567b8910abcEXAMPLE",
                            "Version": "1"
                        },
                        "Overrides": {
                            "InstanceType": "c5.large",
                            "AvailabilityZone": "us-east-1a"
                        }
                    },
                    "Lifecycle": "on-demand",
                    "InstanceId": "i-1234567890abcdef0",
                    "InstanceId": "i-9876543210abcdef9"
                }
            ]
        }
    ]
}
```

The following is example output for a fleet of type instant that launched no instances.
Tag an EC2 Fleet

To help categorize and manage your EC2 Fleet requests, you can tag them with custom metadata. You can assign a tag to an EC2 Fleet request when you create it, or afterward.
When you tag a fleet request, the instances and volumes that are launched by the fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the fleet. You can choose to assign tags to only the fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all three.

**Note**

For instant fleet types, you can tag volumes that are attached to On-Demand Instances and Spot Instances. For request or maintain fleet types, you can only tag volumes that are attached to On-Demand Instances.

For more information about how tags work, see Tag your Amazon EC2 resources.

**Prerequisite**

Grant the user the permission to tag resources. For more information, see Example: Tag resources.

**To grant a user the permission to tag resources**

Create a IAM policy that includes the following:

- The `ec2:CreateTags` action. This grants the user permission to create tags.
- The `ec2:CreateFleet` action. This grants the user permission to create an EC2 Fleet request.
- For `Resource`, we recommend that you specify "*". This allows users to tag all resource types.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "TagEC2FleetRequest",
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags",
                "ec2:CreateFleet"
            ],
            "Resource": "*"
        }
    ]
}
```
Important

We currently do not support resource-level permissions for the create-fleet resource. If you specify create-fleet as a resource, you will get an unauthorized exception when you try to tag the fleet. The following example illustrates how not to set the policy.

```json
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateTags",
        "ec2:CreateFleet"
    ],
}
```

To provide access, add permissions to your users, groups, or roles:

- **Users and groups in AWS IAM Identity Center:**
  

- **Users managed in IAM through an identity provider:**
  

- **IAM users:**
  
  - Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](https://docs.aws.amazon.com/IAM/latest/UserGuide/id宓create-role-for-user.html) in the [IAM User Guide](https://docs.aws.amazon.com/IAM/latest/UserGuide/).
  
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user (console)](https://docs.aws.amazon.com/IAM/latest/UserGuide/id宓permissions-console.html) in the [IAM User Guide](https://docs.aws.amazon.com/IAM/latest/UserGuide/).

**To tag a new EC2 Fleet request**

To tag an EC2 Fleet request when you create it, specify the key-value pair in the [JSON file](https://docs.aws.amazon.com/AWSFAQ/latest/dg/Tags.html) used to create the fleet. The value for ResourceType must be fleet. If you specify another value, the fleet request fails.
To tag instances and volumes launched by an EC2 Fleet

To tag instances and volumes when they are launched by the fleet, specify the tags in the launch template that is referenced in the EC2 Fleet request.

ℹ️ Note

You can't tag volumes attached to Spot Instances that are launched by a request or maintain fleet type.

To tag an existing EC2 Fleet request, instance, and volume (AWS CLI)

Use the create-tags command to tag existing resources.

```bash
aws ec2 create-tags \
   --resources fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE i-1234567890abcdef0 vol-1234567890EXAMPLE \
   --tags Key=purpose,Value=test
```

Describe your EC2 Fleet

You can describe your EC2 Fleet configuration, the instances in your EC2 Fleet, and the event history of your EC2 Fleet.

To describe your EC2 Fleets (AWS CLI)

Use the describe-fleets command to describe your EC2 Fleets.

```bash
aws ec2 describe-fleets
```

⚠️ Important

If a fleet is of type instant, you must specify the fleet ID, otherwise it does not appear in the response. Include --fleet-ids as follows:

```bash
aws ec2 describe-fleets --fleet-ids fleet-8a22eee4-f489-ab02-06b8-832a7EXAMPLE
```
Use the `describe-fleet-instances` command to describe the instances for the specified EC2 Fleet. The returned list of running instances is refreshed periodically and might be out of date.

```bash
aws ec2 describe-fleet-instances --fleet-id fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```
Example output

```
{
    "ActiveInstances": [
        {
            "InstanceId": "i-09cd595998cb3765e",
            "InstanceHealth": "healthy",
            "InstanceType": "m4.large",
            "SpotInstanceRequestId": "sir-86k84j6p"
        },
        {
            "InstanceId": "i-09cf95167ca219f17",
            "InstanceHealth": "healthy",
            "InstanceType": "m4.large",
            "SpotInstanceRequestId": "sir-dvxi7fsm"
        }
    ],
    "FleetId": "fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

Use the `describe-fleet-history` command to describe the history for the specified EC2 Fleet for the specified time.

```
aws ec2 describe-fleet-history --fleet-id fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE --start-time 2018-04-10T00:00:00Z
```

Example output

```
{
    "HistoryRecords": [
        {
            "EventInformation": {
                "EventSubType": "submitted"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:05.000Z"
        },
        {
            "EventInformation": {
                "EventSubType": "active"
            },
            "EventType": "fleetRequestChange",
```
Modify an EC2 Fleet

You can modify an EC2 Fleet that is in the submitted or active state. When you modify a fleet, it enters the modifying state.

You can only modify an EC2 Fleet that is of type maintain. You cannot modify an EC2 Fleet of type request or instant.

You can modify the following parameters of an EC2 Fleet:
• `target-capacity-specification` – Increase or decrease the target capacity for `TotalTargetCapacity`, `OnDemandTargetCapacity`, and `SpotTargetCapacity`.

• `excess-capacity-termination-policy` – Whether running instances should be terminated if the total target capacity of the EC2 Fleet is decreased below the current size of the fleet. Valid values are `no-termination` and `termination`.

When you increase the target capacity, the EC2 Fleet launches the additional instances according to the instance purchasing option specified for `DefaultTargetCapacityType`, which are either On-Demand Instances or Spot Instances.

If the `DefaultTargetCapacityType` is `spot`, the EC2 Fleet launches the additional Spot Instances according to its allocation strategy.

When you decrease the target capacity, the EC2 Fleet deletes any open requests that exceed the new target capacity. You can request that the fleet terminate instances until the size of the fleet reaches the new target capacity. If the allocation strategy is `lowest-price`, the fleet terminates the instances with the highest price per unit. If the allocation strategy is `diversified`, the fleet terminates instances across the pools. Alternatively, you can request that EC2 Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or any instances that you terminate manually.

When an EC2 Fleet terminates a Spot Instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

**To modify an EC2 Fleet (AWS CLI)**

Use the `modify-fleet` command to update the target capacity of the specified EC2 Fleet.

```bash
aws ec2 modify-fleet \
  --fleet-id fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
  --target-capacity-specification TotalTargetCapacity=20
```

If you are decreasing the target capacity but want to keep the fleet at its current size, you can modify the previous command as follows.

```bash
aws ec2 modify-fleet \
  --fleet-id fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
  --target-capacity-specification TotalTargetCapacity=10 \
  --excess-capacity-termination-policy no-termination
```
Delete an EC2 Fleet

If you no longer require an EC2 Fleet, you can delete it. After you delete a fleet, all Spot requests associated with the fleet are canceled, so that no new Spot Instances are launched.

When you delete an EC2 Fleet, you must also specify if you want to terminate all of its instances. These include both On-Demand Instances and Spot Instances. For instant fleets, EC2 Fleet must terminate the instances when the fleet is deleted. A deleted instant fleet with running instances is not supported.

If you specify that the instances must be terminated when the fleet is deleted, the fleet enters the deleted_terminating state. Otherwise, it enters the deleted_running state, and the instances continue to run until they are interrupted or you terminate them manually.

Restrictions

• You can delete up to 25 fleets of type instant in a single request.
• You can delete up to 100 fleets of type maintain or request in a single request.
• You can delete up to 125 fleets in a single request, provided you do not exceed the quota for each fleet type, as specified above.
• If you exceed the specified number of fleets to delete, no fleets are deleted.
• Up to 1000 instances can be terminated in a single request to delete instant fleets.

To delete an EC2 Fleet and terminate its instances (AWS CLI)

Use the delete-fleets command and the --terminate-instances parameter to delete the specified EC2 Fleet and terminate its associated instances.

```bash
aws ec2 delete-fleets \
   --fleet-ids fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
   --terminate-instances
```

Example output

```json
{
   "UnsuccessfulFleetDeletions": [],
   "SuccessfulFleetDeletions": [
      {
         "CurrentFleetState": "deleted_terminating",
      }
   ]
}
```
To delete an EC2 Fleet without terminating its instances (AWS CLI)

You can modify the previous command using the `--no-terminate-instances` parameter to delete the specified EC2 Fleet without terminating its associated instances.

```
aws ec2 delete-fleets
  --fleet-ids fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
  --no-terminate-instances
```

Example output

```
{
  "UnsuccessfulFleetDeletions": [],
  "SuccessfulFleetDeletions": [
    {
      "CurrentFleetState": "deleted_running",
      "PreviousFleetState": "active",
      "FleetId": "fleet-4b8aaae8-dfb5-436d-a4c6-3dafa4c6b7dcEXAMPLE"
    }
  ]
}
```

Troubleshoot when a fleet fails to delete

If an EC2 Fleet fails to delete, `UnsuccessfulFleetDeletions` in the output returns the ID of the EC2 Fleet, an error code, and an error message.

The error codes are:

- ExceededInstantFleetNumForDeletion
Troubleshooting ExceededInstantFleetNumForDeletion

If you try to delete more than 25 instant fleets in a single request, the ExceededInstantFleetNumForDeletion error is returned. The following is example output for this error.

```
{
  "UnsuccessfulFleetDeletions": [
    {
      "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",
      "Error": {
        "Message": "Can’t delete more than 25 instant fleets in a single request.",
        "Code": "ExceededInstantFleetNumForDeletion"
      }
    },
    {
      "FleetId": "fleet-9a941b23-0286-5bf4-2430-03a029a07e31",
      "Error": {
        "Message": "Can’t delete more than 25 instant fleets in a single request.",
        "Code": "ExceededInstantFleetNumForDeletion"
      }
    }
  ],
  "SuccessfulFleetDeletions": []
}
```

Troubleshoot NoTerminateInstancesNotSupported
If you specify that the instances in an instant fleet must not be terminated when you delete the fleet, the NoTerminateInstancesNotSupported error is returned. --no-terminate-instances is not supported for instant fleets. The following is example output for this error.

```
{
  "UnsuccessfulFleetDeletions": [
    {
      "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",
      "Error": {
        "Message": "NoTerminateInstances option is not supported for instant fleet",
        "Code": "NoTerminateInstancesNotSupported"
      }
    }
  ],
  "SuccessfulFleetDeletions": []
}
```

**Troubleshoot UnauthorizedOperation**

If you do not have permission to terminate instances, you get the UnauthorizedOperation error when deleting a fleet that must terminate its instances. The following is the error response.

```
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not authorized to perform this operation. Encoded authorization failure message: VvuncIj7Z_CPGNYXWqnuFV-YjByeUA6Q9752NtO-I3-qnDLWs6JLFdKnSMMiq6scGqjPtEDpsnGHzyHasFHQAryJpaDVravoW25aazn6KNKUQQ1FwHjyujt2dtNCdudJfrqcFYAjl1EiRMkfDHT7BHturzDK6A560Y2nDSUmmAb1y9UNtqazJ95Ne5sNxxKMrzQkTjrbk02RZu5V2vn9VMK6fsm2aVMhbY9JhLvGypLCUjjtJ7rVPiu5v5s-

}
Spot Fleet

A Spot Fleet is a set of Spot Instances and optionally On-Demand Instances that is launched based on criteria that you specify. The Spot Fleet selects the Spot capacity pools that meet your needs and launches Spot Instances to meet the target capacity for the fleet. By default, Spot Fleets are set to maintain target capacity by launching replacement instances after Spot Instances in the fleet are terminated. You can submit a Spot Fleet as a one-time request, which does not persist after the instances have been terminated. You can include On-Demand Instance requests in a Spot Fleet request.

Note

If you want to use a console to create a fleet that includes Spot Instances, we recommend using an Auto Scaling group rather than Spot Fleet. For more information, see Auto Scaling groups with multiple instance types and purchase options in the Amazon EC2 Auto Scaling User Guide.

If you want to use the AWS CLI to create a fleet that includes Spot Instances, we recommend using either an Auto Scaling group or EC2 Fleet rather than Spot Fleet. The RequestSpotFleet API, on which Spot Fleet is based, is a legacy API with no planned investment.

For more information about the recommended APIs to use, see Which is the best Spot request method to use?

Topics

- Spot Fleet configuration strategies
- Work with Spot Fleets
- CloudWatch metrics for Spot Fleet
- Automatic scaling for Spot Fleet

Spot Fleet request types

There are two types of Spot Fleet requests:
request

If you configure the request type as request, Spot Fleet places an asynchronous one-time request for your desired capacity. Thereafter, if capacity is diminished because of Spot interruptions, the fleet does not attempt to replenish Spot Instances, nor does it submit requests in alternative Spot capacity pools if capacity is unavailable.

maintain

If you configure the request type as maintain, Spot Fleet places an asynchronous request for your desired capacity, and maintains capacity by automatically replenishing any interrupted Spot Instances.

To specify the type of request in the Amazon EC2 console, do the following when creating a Spot Fleet request:

• To create a Spot Fleet of type request, clear the Maintain target capacity check box.
• To create a Spot Fleet of type maintain, select the Maintain target capacity check box.

For more information, see Create a Spot Fleet request using defined parameters (console).

Both types of requests benefit from an allocation strategy. For more information, see Allocation strategies for Spot Instances.

Spot Fleet configuration strategies

A Spot Fleet is a collection, or fleet, of Spot Instances, and optionally On-Demand Instances.

The Spot Fleet attempts to launch the number of Spot Instances and On-Demand Instances to meet the target capacity that you specified in the Spot Fleet request. The request for Spot Instances is fulfilled if there is available capacity and the maximum price you specified in the request exceeds the current Spot price. The Spot Fleet also attempts to maintain its target capacity fleet if your Spot Instances are interrupted.

You can also set a maximum amount per hour that you're willing to pay for your fleet, and Spot Fleet launches instances until it reaches the maximum amount. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.
A **Spot capacity pool** is a set of unused EC2 instances with the same instance type (for example, m5.large), operating system, Availability Zone, and network platform. When you make a Spot Fleet request, you can include multiple launch specifications, that vary by instance type, AMI, Availability Zone, or subnet. The Spot Fleet selects the Spot capacity pools that are used to fulfill the request, based on the launch specifications included in your Spot Fleet request, and the configuration of the Spot Fleet request. The Spot Instances come from the selected pools.

- Attribute-based instance type selection for Spot Fleet
- On-Demand in Spot Fleet
- Capacity Rebalancing
- Spot price overrides
- Control spending
- Spot Fleet instance weighting

**Plan a Spot Fleet request**

Before you create a Spot Fleet request, review [Spot Best Practices](#). Use these best practices when you plan your Spot Fleet request so that you can provision the type of instances you want at the lowest possible price. We also recommend that you do the following:

- Determine whether you want to create a Spot Fleet that submits a one-time request for the desired target capacity, or one that maintains a target capacity over time.
- Determine the instance types that meet your application requirements.
- Determine the target capacity for your Spot Fleet request. You can set the target capacity in instances or in custom units. For more information, see [Spot Fleet instance weighting](#).
- Determine what portion of the Spot Fleet target capacity must be On-Demand capacity. You can specify 0 for On-Demand capacity.
- Determine your price per unit, if you are using instance weighting. To calculate the price per unit, divide the price per instance hour by the number of units (or weight) that this instance represents. If you are not using instance weighting, the default price per unit is the price per instance hour.
• Review the possible options for your Spot Fleet request. For more information, see the `request-spot-fleet` command in the *AWS CLI Command Reference*. For additional examples, see *Spot Fleet example configurations*.

### Allocation strategies for Spot Instances

Your launch configuration determines all the possible Spot capacity pools (instance types and Availability Zones) from which Spot Fleet can launch Spot Instances. However, when launching instances, Spot Fleet uses the allocation strategy that you specify to pick the specific pools from all your possible pools.

**Note**

(Linux instances only) If you configure your Spot Instance to launch with AMD SEV-SNP turned on, you are charged an additional hourly usage fee that is equivalent to 10% of the On-Demand hourly rate for the selected instance type. If the allocation strategy uses price as an input, EC2 Fleet does not include this additional fee; only the Spot price is used.

### Allocation strategies

You can specify one of the following allocation strategies for your Spot Instances:

**priceCapacityOptimized (recommended)**

Spot Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. Spot Fleet then requests Spot Instances from the lowest priced of these pools.

The `priceCapacityOptimized` allocation strategy is the best choice for most Spot workloads, such as stateless containerized applications, microservices, web applications, data and analytics jobs, and batch processing.

**capacityOptimized**

Spot Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. You can optionally set a priority...
for each instance type in your fleet using capacityOptimizedPrioritized. Spot Fleet optimizes for capacity first, but honors instance type priorities on a best-effort basis.

With Spot Instances, pricing changes slowly over time based on long-term trends in supply and demand, but capacity fluctuates in real time. The capacityOptimized strategy automatically launches Spot Instances into the most available pools by looking at real-time capacity data and predicting which are the most available. This works well for workloads that may have a higher cost of interruption associated with restarting work, such as long Continuous Integration (CI), image and media rendering, Deep Learning, and High Performance Compute (HPC) workloads that may have a higher cost of interruption associated with restarting work. By offering the possibility of fewer interruptions, the capacityOptimized strategy can lower the overall cost of your workload.

Alternatively, you can use the capacityOptimizedPrioritized allocation strategy with a priority parameter to order instance types from highest to lowest priority. You can set the same priority for different instance types. Spot Fleet will optimize for capacity first, but will honor instance type priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters. Using priorities is supported only if your fleet uses a launch template. Note that when you set the priority for capacityOptimizedPrioritized, the same priority is also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.

diversified

The Spot Instances are distributed across all pools.

**Choose an appropriate allocation strategy**

You can optimize your fleet for your use case by choosing the appropriate Spot allocation strategy. For On-Demand Instance target capacity, Spot Fleet always selects the least expensive instance type based on the public On-Demand price, while following the allocation strategy—either priceCapacityOptimized, capacityOptimized, or diversified—for Spot Instances.

**Balance lowest price and capacity availability**

To balance the trade-offs between the lowest priced Spot capacity pools and the Spot capacity pools with the highest capacity availability, we recommend that you use the
priceCapacityOptimized allocation strategy. This strategy makes decisions about which pools to request Spot Instances from based on both the price of the pools and the capacity availability of Spot Instances in those pools. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term, while still taking price into consideration.

If your fleet runs resilient and stateless workloads, including containerized applications, microservices, web applications, data and analytics jobs, and batch processing, then use the priceCapacityOptimized allocation strategy for optimal cost savings and capacity availability.

If your fleet runs workloads that might have a higher cost of interruption associated with restarting work, then you should implement checkpointing so that applications can restart from that point if they're interrupted. By using checkpointing, you make the priceCapacityOptimized allocation strategy a good fit for these workloads because it allocates capacity from the lowest priced pools that also offer a low Spot Instance interruption rate.

For an example configuration that uses the priceCapacityOptimized allocation strategy, see Example 9: Launch Spot Instances in a capacity-optimized fleet with priorities.

**When workloads have a high cost of interruption**

You can optionally use the capacityOptimized strategy if you run workloads that either use similarly priced instance types, or where the cost of interruption is so significant that any cost saving is inadequate in comparison to a marginal increase in interruptions. This strategy allocates capacity from the most available Spot capacity pools that offer the possibility of fewer interruptions, which can lower the overall cost of your workload. For an example configuration that uses the capacityOptimized allocation strategy, see Example 7: Configure Capacity Rebalancing to launch replacement Spot Instances.

When the possibility of interruptions must be minimized but the preference for certain instance types matters, you can express your pool priorities by using the capacityOptimizedPrioritized allocation strategy and then setting the order of instance types to use from highest to lowest priority. For an example configuration, see Example 8: Launch Spot Instances in a capacity-optimized fleet.

Note that using priorities is supported only if your fleet uses a launch template. Also note that when you set priorities for capacityOptimizedPrioritized, the same priorities are also applied to your On-Demand Instances if the On-Demand AllocationStrategy is set to prioritized.
When your workload is time flexible and capacity availability is not a factor

If your fleet is small or runs for a short time, you can use priceCapacityOptimized to maximize cost savings while still considering capacity availability.

When your fleet is large or runs for a long time

If your fleet is large or runs for a long time, you can improve the availability of your fleet by distributing the Spot Instances across multiple pools using the diversified strategy. For example, if your Spot Fleet specifies 10 pools and a target capacity of 100 instances, the fleet launches 10 Spot Instances in each pool. If the Spot price for one pool exceeds your maximum price for this pool, only 10% of your fleet is affected. Using this strategy also makes your fleet less sensitive to increases in the Spot price in any one pool over time. With the diversified strategy, the Spot Fleet does not launch Spot Instances into any pools with a Spot price that is equal to or higher than the On-Demand price.

Maintain target capacity

After Spot Instances are terminated due to a change in the Spot price or available capacity of a Spot capacity pool, a Spot Fleet of type maintain launches replacement Spot Instances. The allocation strategy determines the pools from which the replacement instances are launched, as follows:

- If the allocation strategy is priceCapacityOptimized, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability while also taking price into consideration and identifying lowest priced pools with high capacity availability.
- If the allocation strategy is capacityOptimized, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability.
- If the allocation strategy is diversified, the fleet distributes the replacement Spot Instances across the remaining pools.

Attribute-based instance type selection for Spot Fleet

When you create a Spot Fleet, you must specify one or more instance types for configuring the On-Demand Instances and Spot Instances in the fleet. As an alternative to manually specifying the instance types, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. This is known as attribute-based instance type selection. For example, you can specify the minimum and maximum number of vCPUs required...
for your instances, and Spot Fleet will launch the instances using any available instance types that meet those vCPU requirements.

Attribute-based instance type selection is ideal for workloads and frameworks that can be flexible about what instance types they use, such as when running containers or web fleets, processing big data, and implementing continuous integration and deployment (CI/CD) tooling.

**Benefits**

Attribute-based instance type selection has the following benefits:

- **Easily use the right instance types** – With so many instance types available, finding the right instance types for your workload can be time consuming. When you specify instance attributes, the instance types will automatically have the required attributes for your workload.

- **Simplified configuration** – To manually specify multiple instance types for a Spot Fleet, you must create a separate launch template override for each instance type. But with attribute-based instance type selection, to provide multiple instance types, you need only specify the instance attributes in the launch template or in a launch template override.

- **Automatic use of new instance types** – When you specify instance attributes rather than instance types, your fleet can use newer generation instance types as they’re released, “future proofing” the fleet's configuration.

- **Instance type flexibility** – When you specify instance attributes rather than instance types, Spot Fleet can select from a wide range of instance types for launching Spot Instances, which adheres to the [Spot best practice of instance type flexibility](#).

**Topics**

- [Considerations](#)
- [Create a Spot Fleet with attribute-based instance type selection](#)
- [Examples of configurations that are valid and not valid](#)
- [Preview instance types with specified attributes](#)
How attribute-based instance type selection works

To use attribute-based instance type selection in your fleet configuration, you replace the list of instance types with a list of instance attributes that your instances require. Spot Fleet will launch instances on any available instance types that have the specified instance attributes.

Topics

- **Types of instance attributes**
- **Where to configure attribute-based instance type selection**
- **How Spot Fleet uses attribute-based instance type selection when provisioning a fleet**

Types of instance attributes

There are several instance attributes that you can specify to express your compute requirements, such as:

- **vCPU count** – The minimum and maximum number of vCPUs per instance.
- **Memory** – The minimum and maximum GiBs of memory per instance.
- **Local storage** – Whether to use EBS or instance store volumes for local storage.
- **Burstable performance** – Whether to use the T instance family, including T4g, T3a, T3, and T2 types.

For a description of each attribute and the default values, see `InstanceRequirements` in the *Amazon EC2 API Reference*.

Where to configure attribute-based instance type selection

Depending on whether you use the console or the AWS CLI, you can specify the instance attributes for attribute-based instance type selection as follows:

In the console, you can specify the instance attributes in one or both of the following fleet configuration components:

- In a launch template, and then reference the launch template in the fleet request
- In the fleet request
In the AWS CLI, you can specify the instance attributes in one or all of the following fleet configuration components:

- In a launch template, and reference the launch template in the fleet request
- In a launch template override

If you want a mix of instances that use different AMIs, you can specify instance attributes in multiple launch template overrides. For example, different instance types can use x86 and Arm-based processors.

- In a launch specification

**How Spot Fleet uses attribute-based instance type selection when provisioning a fleet**

Spot Fleet provisions a fleet in the following way:

- Spot Fleet identifies the instance types that have the specified attributes.
- Spot Fleet uses price protection to determine which instance types to exclude.
- Spot Fleet determines the capacity pools from which it will consider launching the instances based on the AWS Regions or Availability Zones that have matching instance types.
- Spot Fleet applies the specified allocation strategy to determine from which capacity pools to launch the instances.

Note that attribute-based instance type selection does not pick the capacity pools from which to provision the fleet; that's the job of the allocation strategies. There might be a large number of instance types with the specified attributes, and some of them might be expensive.

If you specify an allocation strategy, Spot Fleet will launch instances according to the specified allocation strategy.

- For Spot Instances, attribute-based instance type selection supports the `capacityOptimizedPrioritized` and `capacityOptimized` allocation strategies.
- For On-Demand Instances, attribute-based instance type selection supports the `lowestPrice` allocation strategy, which guarantees that Spot Fleet will launch On-Demand Instances from the least expensive capacity pools.
- If there is no capacity for the instance types with the specified instance attributes, no instances can be launched, and the fleet returns an error.
Price protection

Price protection is a feature that prevents your Spot Fleet from using instance types that you would consider too expensive even if they happen to fit the attributes that you specified. To use price protection, you set a price threshold. Then, when Amazon EC2 selects instance types with your attributes, it excludes instance types priced above your threshold.

The way that Amazon EC2 calculates the price threshold is as follows:

- Amazon EC2 first identifies the lowest priced instance type from those that match your attributes.
- Amazon EC2 then takes the value (expressed as a percentage) that you specified for the price protection parameter and multiplies it with the price of the identified instance type. The result is the price that is used as the price threshold.

There are separate price thresholds for On-Demand Instances and Spot Instances.

When you create a fleet with attribute-based instance type selection, price protection is enabled by default. You can keep the default values, or you can specify your own.

You can also turn off price protection. To indicate no price protection threshold, specify a high percentage value, such as 999999.

Topics

- How the lowest priced instance type is identified
- On-Demand Instance price protection
- Spot Instance price protection
- Specify the price protection threshold

How the lowest priced instance type is identified

Amazon EC2 determines the price to base the price threshold on by identifying the instance type with the lowest price from those that match your specified attributes. It does this in the following way:

- It first looks at the current generation C, M, or R instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
• If there is no match, it then looks at any current generation instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.

• If there is no match, it then looks at any previous generation instance types that match your attributes, and identifies the lowest priced instance type.

**On-Demand Instance price protection**

The price protection threshold for On-Demand instance types is calculated as a percentage higher than the identified lowest priced On-Demand instance type (OnDemandMaxPricePercentageOverLowestPrice). You specify the percentage higher that you're willing to pay. If you don't specify this parameter, then a default value of 20 is used to calculate a price protection threshold of 20% higher than the identified price.

For example, if the identified On-Demand instance type price is 0.4271, and you specify 25, then the price threshold is 25% more than 0.4271. It is calculated as follows: 0.4271 * 1.25 = 0.533875. The calculated price is the maximum you're willing to pay for On-Demand Instances, and, in this example, Amazon EC2 will exclude any On-Demand instance types that cost more than 0.533875.

**Spot Instance price protection**

By default, Amazon EC2 will automatically apply optimal Spot Instance price protection to consistently select from a wide range of instance types. You can also manually set the price protection yourself. However, letting Amazon EC2 do it for you can improve the likelihood that your Spot capacity is fulfilled.

You can manually specify the price protection using one of the following options. If you manually set the price protection, we recommend using the first option.

- **A percentage of the identified lowest priced On-Demand instance type**
  
  [MaxSpotPriceAsPercentageOfOptimalOnDemandPrice]

  For example, if the identified On-Demand instance type price is 0.4271, and you specify 60, then the price threshold is 60% of 0.4271. It is calculated as follows: 0.4271 * 0.60 = 0.25626. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than 0.25626.

- **A percentage higher than the identified lowest priced Spot instance type**
  
  [SpotMaxPricePercentageOverLowestPrice]
For example, if the identified Spot instance type price is 0.1808, and you specify 25, then the price threshold is 25% more than 0.1808. It is calculated as follows: 0.1808 \times 1.25 = 0.226. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than 0.266. We do not recommend using this parameter because Spot prices can fluctuate, and therefore your price protection threshold might also fluctuate.

Specify the price protection threshold

To specify the price protection threshold

While creating the Spot Fleet, configure the fleet for attribute-based instance type selection, and then do the following:

• Console

To specify the On-Demand Instance price protection threshold, under Additional instance attribute, choose On-demand price protection, and then choose Add attribute. For On-Demand price protection percentage, enter the price protection threshold as a percentage.

To specify the Spot Instance price protection threshold, under Additional instance attribute, choose Spot price protection, and then choose Add attribute. Choose a parameter and enter the price protection threshold as a percentage.

• AWS CLI

To specify the On-Demand Instance price protection threshold, in the JSON configuration file, in the InstanceRequirements structure, for OnDemandMaxPricePercentageOverLowestPrice, enter the price protection threshold as a percentage.

To specify the Spot Instance price protection threshold, in the JSON configuration file, in the InstanceRequirements structure, specify one of the following parameters:

• For MaxSpotPriceAsPercentageOfOptimalOnDemandPrice, enter the price protection threshold as a percentage.

• For SpotMaxPricePercentageOverLowestPrice, enter the price protection threshold as a percentage.
For more information about creating the fleet, see Create a Spot Fleet with attribute-based instance type selection.

Note

When creating the Spot Fleet, if you set **Total target capacity** type to **vCPUs** or **Memory (MiB)** (console) or **TargetCapacityUnitType** to **vcpu** or **memory-mib** (AWS CLI), the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Considerations

- You can specify either instance types or instance attributes in a Spot Fleet, but not both at the same time.

  When using the CLI, the launch template overrides will override the launch template. For example, if the launch template contains an instance type and the launch template override contains instance attributes, the instances that are identified by the instance attributes will override the instance type in the launch template.

- When using the CLI, when you specify instance attributes as overrides, you can't also specify weights or priorities.

- You can specify a maximum of four **InstanceRequirements** structures in a request configuration.

Create a Spot Fleet with attribute-based instance type selection

You can configure a fleet to use attribute-based instance type selection by using the Amazon EC2 console or the AWS CLI.

Topics

- [Create a Spot Fleet using the console](#)
- [Create a Spot Fleet using the AWS CLI](#)
Create a Spot Fleet using the console

To configure a Spot Fleet for attribute-based instance type selection (console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Spot Requests, and then choose Request Spot Instances.
3. Follow the steps to create a Spot Fleet. For more information, see Create a Spot Fleet request using defined parameters (console).

While creating the Spot Fleet, configure the fleet for attribute-based instance type selection as follows:

a. For Instance type requirements, choose Specify instance attributes that match your compute requirements.

b. For vCPUs, enter the desired minimum and maximum number of vCPUs. To specify no limit, select No minimum, No maximum, or both.

c. For Memory (GiB), enter the desired minimum and maximum amount of memory. To specify no limit, select No minimum, No maximum, or both.

d. (Optional) For Additional instance attributes, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds further constraints to your request.

e. (Optional) Expand Preview matching instance types to view the instance types that have your specified attributes.

Create a Spot Fleet using the AWS CLI

To configure a Spot Fleet for attribute-based instance type selection (AWS CLI)

Use the request-spot-fleet (AWS CLI) command to create a Spot Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 request-spot-fleet \
  --region us-east-1 \
  --spot-fleet-request-config file://file_name.json
```

Example file_name.json file
The following example contains the parameters that configure a Spot Fleet to use attribute-based instance type selection, and is followed by a text explanation.

```json
{
  "AllocationStrategy": "priceCapacityOptimized",
  "TargetCapacity": 20,
  "Type": "request",
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateName": "my-launch-template",
        "Version": "1"
      },
      "Overrides": [
        {
          "InstanceRequirements": {
            "VCpuCount": {
              "Min": 2
            },
            "MemoryMiB": {
              "Min": 4
            }
          }
        }
      ]
    }
  ],
  "Overrides": [
    {
      "InstanceRequirements": {
        "VCpuCount": {
          "Min": 2
        },
        "MemoryMiB": {
          "Min": 4
        }
      }
    }
  ]
}
```

The attributes for attribute-based instance type selection are specified in the `InstanceRequirements` structure. In this example, two attributes are specified:

- **VCpuCount** – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- **MemoryMiB** – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when **Spot Fleet provisions the fleet**.

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/), in the *Amazon EC2 API Reference*. 
Note

When InstanceRequirements is included in the fleet configuration, InstanceType and WeightedCapacity must be excluded; they cannot determine the fleet configuration at the same time as instance attributes.

The JSON also contains the following fleet configuration:

- "AllocationStrategy": "priceCapacityOptimized" – The allocation strategy for the Spot Instances in the fleet.
- "LaunchTemplateName": "my-launch-template", "Version": "1" – The launch template contains some instance configuration information, but if any instance types are specified, they will be overridden by the attributes that are specified in InstanceRequirements.
- "TargetCapacity": 20 – The target capacity is 20 instances.
- "Type": "request" – The request type for the fleet is request.

Examples of configurations that are valid and not valid

If you use the AWS CLI to create a Spot Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single Overrides structure with both InstanceRequirements and InstanceType
- Two Overrides structures, one with InstanceRequirements and the other with InstanceType
- Two InstanceRequirements structures with overlapping attribute values within the same LaunchTemplateSpecification

Example configurations

- Valid configuration: Single launch template with overrides
- Valid configuration: Single launch template with multiple InstanceRequirements
- Valid configuration: Two launch templates, each with overrides
- Valid configuration: Only InstanceRequirements specified, no overlapping attribute values
• Configuration not valid: Overrides contain InstanceRequirements and InstanceType
• Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType
• Configuration not valid: Overlapping attribute values

Valid configuration: Single launch template with overrides

The following configuration is valid. It contains one launch template and one Overrides structure containing one InstanceRequirements structure. A text explanation of the example configuration follows.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "My-launch-template",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VcpuCount": {
                                "Min": 2,
                                "Max": 8
                            },
                            "MemoryMib": {
                                "Min": 0,
                                "Max": 10240
                            },
                            "MemoryGiBPerVcpu": {
                                "Max": 10000
                            },
                            "RequireHibernateSupport": true
                        }
                    }
                ]
            }
        ]
    }
}
```
InstanceRequirements

To use attribute-based instance selection, you must include the InstanceRequirements structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- **VCpuCount** – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
- **MemoryMiB** – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.
- **MemoryGiBPerVCpu** – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The Min parameter is optional. By omitting it, you indicate no minimum limit.

TargetCapacityUnitType

The TargetCapacityUnitType parameter specifies the unit for the target capacity. In the example, the target capacity is 5000 and the target capacity unit type is vcpu, which together specify a desired target capacity of 5,000 vCPUs. Spot Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

Valid configuration: Single launch template with multiple InstanceRequirements

The following configuration is valid. It contains one launch template and one Overrides structure containing two InstanceRequirements structures. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a V Cp uCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.

```json
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "TargetCapacity": 5000,
        "OnDemandTargetCapacity": 0,
        "TargetCapacityUnitType": "vcpu"
    }
}
```
"IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",

"LaunchTemplateConfigs": [
    {
        "LaunchTemplateSpecification": {
            "LaunchTemplateName": "MyLaunchTemplate",
            "Version": "1"
        },
        "Overrides": [
            {
                "InstanceRequirements": {
                    "VcpuCount": {
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                }
            },
            {
                "InstanceRequirements": {
                    "VcpuCount": {
                        "Min": 4,
                        "Max": 8
                    },
                    "MemoryMiB": {
                        "Min": 0
                    }
                }
            }
        ]
    },
    "TargetCapacity": 1,
    "OnDemandTargetCapacity": 0,
    "Type": "maintain"
}
]
Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one Overrides structure containing one InstanceRequirements structure. This configuration is useful for arm and x86 architecture support in the same fleet.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "armLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {
                                "Min": 0
                            }
                        }
                    }
                ]
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "x86LaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceRequirements": {
                            "VCpuCount": {
                                "Min": 0,
                                "Max": 2
                            },
                            "MemoryMiB": {

```
Valid configuration: Only InstanceRequirements specified, no overlapping attribute values

The following configuration is valid. It contains two LaunchTemplateSpecification structures, each with a launch template and an Overrides structure containing an InstanceRequirements structure. The attributes specified in InstanceRequirements are valid because the values do not overlap—the first InstanceRequirements structure specifies a VcpuCount of 0-2 vCPUs, while the second InstanceRequirements structure specifies 4-8 vCPUs.

```json
{
  "SpotFleetRequestConfig": {
    "AllocationStrategy": "priceCapacityOptimized",
    "ExcessCapacityTerminationPolicy": "default",
    "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchTemplateConfigs": [
      {
        "LaunchTemplateSpecification": {
          "LaunchTemplateName": "MyLaunchTemplate",
          "Version": "1"
        },
        "Overrides": [
          {
            "InstanceRequirements": {
              "VcpuCount": {
                "Min": 0,
                "Max": 2
              },
              "MemoryMiB": {
                "Min": 0
              }
            }
          }
        ]
      }
    ]
  }
}
```
Configuration not valid: Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structure contains both InstanceRequirements and InstanceType. For the Overrides, you can specify either InstanceRequirements or InstanceType, but not both.

```json
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iamb:000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
```
Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType

The following configuration is not valid. The Overrides structures contain both InstanceRequirements and InstanceType. You can specify either InstanceRequirements or InstanceType, but not both, even if they're in different Overrides structures.
"LaunchTemplateSpecification": {
  "LaunchTemplateName": "MyLaunchTemplate",
  "Version": "1"
},
"Overrides": [
{
  "InstanceRequirements": {
    "VCpuCount": {
      "Min": 0,
      "Max": 2
    },
    "MemoryMiB": {
      "Min": 0
    }
  }
}
],
"LaunchTemplateSpecification": {
  "LaunchTemplateName": "MyOtherLaunchTemplate",
  "Version": "1"
},
"Overrides": [
{
  "InstanceType": "m5.large"
}
],
"TargetCapacity": 1,
"OnDemandTargetCapacity": 0,
"Type": "maintain"
}

Configuration not valid: Overlapping attribute values

The following configuration is not valid. The two InstanceRequirements structures each contain "VCpuCount": {"Min": 0, "Max": 2}. The values for these attributes overlap, which will result in duplicate capacity pools.
"SpotFleetRequestConfig": {
    "AllocationStrategy": "priceCapacityOptimized",
    "ExcessCapacityTerminationPolicy": "default",
    "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchTemplateConfigs": [ 
        { 
            "LaunchTemplateSpecification": { 
                "LaunchTemplateName": "MyLaunchTemplate",
                "Version": "1"
            },
            "Overrides": [ 
                { "InstanceRequirements": { 
                    "VcpuCount": { 
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": { 
                        "Min": 0
                    }
                },
                { "InstanceRequirements": { 
                    "VcpuCount": { 
                        "Min": 0,
                        "Max": 2
                    },
                    "MemoryMiB": { 
                        "Min": 0
                    }
                }
            ]
        }
    ],
    "TargetCapacity": 1,
    "OnDemandTargetCapacity": 0,
    "Type": "maintain"
}
Preview instance types with specified attributes

You can use the `get-instance-types-from-instance-requirements` AWS CLI command to preview the instance types that match the attributes that you specify. This is especially useful for working out what attributes to specify in your request configuration without launching any instances. Note that the command does not consider available capacity.

To preview a list of instance types by specifying attributes using the AWS CLI

1. (Optional) To generate all of the possible attributes that can be specified, use the `get-instance-types-from-instance-requirements` command and the `--generate-cli-skeleton` parameter. You can optionally direct the output to a file to save it by using `input > attributes.json`.

   ```bash
   aws ec2 get-instance-types-from-instance-requirements \
     --region us-east-1 \
     --generate-cli-skeleton input > attributes.json
   ``

   **Expected output**

   ```json
   {
     "DryRun": true,
     "ArchitectureTypes": [
       "i386"
     ],
     "VirtualizationTypes": [
       "hvm"
     ],
     "InstanceRequirements": {
       "VCpuCount": {
         "Min": 0,
         "Max": 0
       },
       "MemoryMiB": {
         "Min": 0,
         "Max": 0
       },
       "CpuManufacturers": [
         "intel"
       ],
       "MemoryGiBPerVCpu": {
         "Min": 0.0,
         "Max": 0.0
       },
"Max": 0.0
},
"ExcludedInstanceTypes": [
 ""
],
"InstanceGenerations": [
 "current"
],
"SpotMaxPricePercentageOverLowestPrice": 0,
"OnDemandMaxPricePercentageOverLowestPrice": 0,
"BareMetal": "included",
"BurstablePerformance": "included",
"RequireHibernateSupport": true,
"NetworkInterfaceCount": {
 "Min": 0,
 "Max": 0
},
"LocalStorage": "included",
"LocalStorageTypes": [
 "hdd"
],
"TotalLocalStorageGB": {
 "Min": 0.0,
 "Max": 0.0
},
"BaselineEbsBandwidthMbps": {
 "Min": 0,
 "Max": 0
},
"AcceleratorTypes": [
 "gpu"
],
"AcceleratorCount": {
 "Min": 0,
 "Max": 0
},
"AcceleratorManufacturers": [
 "nvidia"
],
"AcceleratorNames": [
 "a100"
],
"AcceleratorTotalMemoryMiB": {
 "Min": 0,
2. Create a JSON configuration file using the output from the previous step, and configure it as follows:

```json
{
  "ArchitectureTypes": [],
  "VirtualizationTypes": [],
  "VCpuCount": 0,
  "MemoryMiB": 0,
  "NetworkBandwidthGbps": {
    "Min": 0.0,
    "Max": 0.0
  },
  "AllowedInstanceTypes": [],
  "MaxResults": 0,
  "NextToken": ""
}
```

### Note

You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes; when omitted, the default values are used.

a. For `ArchitectureTypes`, specify one or more types of processor architecture.

b. For `VirtualizationTypes`, specify one or more types of virtualization.

c. For `VCpuCount`, specify the minimum and maximum number of vCPUs. To specify no minimum limit, for `Min`, specify 0. To specify no maximum limit, omit the `Max` parameter.

d. For `MemoryMiB`, specify the minimum and maximum amount of memory in MiB. To specify no minimum limit, for `Min`, specify 0. To specify no maximum limit, omit the `Max` parameter.

e. You can optionally specify one or more of the other attributes to further constrain the list of instance types that are returned.

3. To preview the instance types that have the attributes that you specified in the JSON file, use the `get-instance-types-from-instance-requirements` command, and specify the name and path
to your JSON file by using the `--cli-input-json` parameter. You can optionally format the output to appear in a table format.

```
aws ec2 get-instance-types-from-instance-requirements \
    --cli-input-json file://attributes.json \
    --output table
```

**Example attributes.json file**

In this example, the required attributes are included in the JSON file. They are `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. In addition, the optional `InstanceGenerations` attribute is also included. Note that for `MemoryMiB`, the `Max` value can be omitted to indicate that there is no limit.

```json
{
    "ArchitectureTypes": [
        "x86_64"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 4,
            "Max": 6
        },
        "MemoryMiB": {
            "Min": 2048
        },
        "InstanceGenerations": [
            "current"
        ]
    }
}
```

**Example output**

```
<table>
<thead>
<tr>
<th>GetInstanceTypesFromInstanceRequirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>------------------------------------------</td>
</tr>
<tr>
<td>InstanceTypes</td>
</tr>
</tbody>
</table>
```
4. After identifying instance types that meet your needs, make note of the instance attributes that you used so that you can use them when configuring your fleet request.

**On-Demand in Spot Fleet**

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. In your Spot Fleet request, you specify your desired target capacity and how much of that capacity must be On-Demand. The balance comprises Spot capacity, which is launched if there is available Amazon EC2 capacity and availability. For example, if in your Spot Fleet request you specify the target capacity as 10 and the On-Demand capacity as 8, Amazon EC2 launches 8 capacity units as On-Demand, and 2 capacity units (10-8=2) as Spot.

**Prioritize instance types for On-Demand capacity**

When Spot Fleet attempts to fulfill your On-Demand capacity, it defaults to launching the lowest priced instance type first. If OnDemandAllocationStrategy is set to prioritized, Spot Fleet uses priority to determine which instance type to use first in fulfilling On-Demand capacity.

The priority is assigned to the launch template override, and the highest priority is launched first.

**Example: Prioritize instance types**

In this example, you configure three launch template overrides, each with a different instance type.

The On-Demand price for the instance types range in price. The following are the instance types used in this example, listed in order of price, starting with the cheapest instance type:

- m4.large – cheapest
- m5.large
• m5a.large

If you do not use priority to determine the order, the fleet fulfills the On-Demand capacity by starting with the cheapest instance type.

However, say you have unused m5.large Reserved Instances that you want to use first. You can set the launch template override priority so that the instance types are used in the order of priority, as follows:

• m5.large – priority 1
• m4.large – priority 2
• m5a.large – priority 3

Capacity Rebalancing

You can configure Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation to notify you that a Spot Instance is at an elevated risk of interruption. Capacity Rebalancing helps you maintain workload availability by proactively augmenting your fleet with a new Spot Instance before a running instance is interrupted by Amazon EC2. For more information, see EC2 instance rebalance recommendations.

To configure Spot Fleet to launch a replacement Spot Instance, you can use the Amazon EC2 console or the AWS CLI.

• Amazon EC2 console: You must select the Capacity rebalance check box when you create the Spot Fleet. For more information, see step 6.d. in Create a Spot Fleet request using defined parameters (console).

• AWS CLI: Use the request-spot-fleet command and the relevant parameters in the SpotMaintenanceStrategies structure. For more information, see the example launch configuration.

Limitations

• Capacity Rebalancing is available only for fleets of type maintain.

• When the fleet is running, you can't modify the Capacity Rebalancing setting. To change the Capacity Rebalancing setting, you must delete the fleet and create a new fleet.
Configuration options

The ReplacementStrategy for Spot Fleet supports the following two values:

`launch-before-terminate`

Amazon EC2 terminates the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched. When you specify `launch-before-terminate`, you must also specify a value for `termination-delay`. After the new replacement instances are launched, Amazon EC2 waits for the duration of the `termination-delay`, and then terminates the old instances. For `termination-delay`, the minimum is 120 seconds (2 minutes), and the maximum is 7200 seconds (2 hours).

We recommend that you use `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed. Note that Amazon EC2 can interrupt the old instances with a two-minute warning before the `termination-delay`.

`launch`

Amazon EC2 launches replacement Spot Instances when a rebalance notification is emitted for existing Spot Instances. Amazon EC2 does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

Considerations

If you configure a Spot Fleet for Capacity Rebalancing, consider the following:

**Provide as many Spot capacity pools in the request as possible**

Configure your Spot Fleet to use multiple instance types and Availability Zones. This provides the flexibility to launch Spot Instances in various Spot capacity pools. For more information, see [Be flexible about instance types and Availability Zones](#).

**Avoid an elevated risk of interruption of replacement Spot Instances**

To avoid an elevated risk of interruption, we recommend the `capacityOptimized` or `capacityOptimizedPrioritized` allocation strategy. These strategies ensure that replacement Spot Instances are launched in the most optimal Spot capacity pools, and are therefore less likely to be interrupted in the near future. For more information, see [Use the price and capacity optimized allocation strategy](#).
Amazon EC2 will only launch a new instance if availability is the same or better

One of the goals of Capacity Rebalancing is to improve a Spot Instance's availability. If an existing Spot Instance receives a rebalance recommendation, Amazon EC2 will only launch a new instance if the new instance provides the same or better availability than the existing instance. If the risk of interruption of a new instance will be worse than the existing instance, then Amazon EC2 will not launch a new instance. Amazon EC2 will, however, continue to assess the Spot capacity pools, and will launch a new instance if availability improves.

There is a chance that your existing instance will be interrupted without Amazon EC2 proactively launching a new instance. When this happens, Amazon EC2 will attempt to launch a new instance regardless of whether the new instance has a high risk of interruption.

Capacity Rebalancing does not increase your Spot Instance interruption rate

When you enable Capacity Rebalancing, it does not increase your Spot Instance interruption rate (the number of Spot Instances that are reclaimed when Amazon EC2 needs the capacity back). However, if Capacity Rebalancing detects an instance is at risk of interruption, Amazon EC2 will immediately attempt to launch a new instance. The result is that more instances might be replaced than if you'd waited for Amazon EC2 to launch a new instance after the at-risk instance was interrupted.

While you might replace more instances with Capacity Rebalancing enabled, you benefit from being proactive rather than reactive by having more time to take action before your instances are interrupted. With a Spot Instance interruption notice, you typically only have up to two minutes to gracefully shut down your instance. With Capacity Rebalancing launching a new instance in advance, you give existing processes a better chance of completing on your at-risk instance, you can start your instance shutdown procedures, and prevent new work from being scheduled on your at-risk instance. You can also start preparing the newly-launched instance to take over the application. With Capacity Rebalancing's proactive replacement, you benefit from graceful continuity.

As a theoretical example to demonstrate the risks and benefits of using Capacity Rebalancing, consider the following scenario:

- 2:00 PM – A rebalance recommendation is received for instance-A, and Amazon EC2 immediately starts attempting to launch a replacement instance-B, giving you time to start your shutdown procedures.*
- 2:30 PM – A rebalance recommendation is received for instance-B, replaced with instance-C, giving you time to start your shutdown procedures.*
• 2:32 PM – If Capacity Rebalancing wasn’t enabled, and if a Spot Instance interruption notice
would’ve been received at 2:32 PM for instance-A, you would only have had up to two
minutes to take action, but Instance-A would have been running up till this time.

* If launch-before-terminate is specified, Amazon EC2 will terminate the at-risk instance
after the replacement instance comes online.

**Amazon EC2 can launch new replacement Spot Instances until fulfilled capacity is double target
capacity**

When a Spot Fleet is configured for Capacity Rebalancing, Amazon EC2 attempts to
launch a new replacement Spot Instance for every Spot Instance that receives a rebalance
recommendation. After a Spot Instance receives a rebalance recommendation, it is no longer
counted as part of the fulfilled capacity. Depending on the replacement strategy, Amazon EC2
either terminates the instance after a preconfigured termination delay, or leaves it running. This
gives you the opportunity to perform rebalancing actions on the instance.

If your fleet reaches double its target capacity, it stops launching new replacement instances
even if the replacement instances themselves receive a rebalance recommendation.

For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. All of the
Spot Instances receive a rebalance recommendation, which causes Amazon EC2 to launch
100 replacement Spot Instances. This raises the number of fulfilled Spot Instances to 200,
which is double the target capacity. Some of the replacement instances receive a rebalance
recommendation, but no more replacement instances are launched because the fleet cannot
exceed double its target capacity.

Note that you are charged for all of the instances while they are running.

**We recommend that you configure Spot Fleet to terminate Spot Instances that receive a
rebalance recommendation**

If you configure your Spot Fleet for Capacity Rebalancing, we recommend that you choose
launch-before-terminate with an appropriate termination delay only if you can predict
how long your instance shutdown procedures will take to complete. This will ensure that the old
instances are terminated only after the shutdown procedures are completed.

If you choose to terminate the instances that are recommended for rebalance yourself, we
recommend that you monitor the rebalance recommendation signal that is received by the Spot
Instances in the fleet. By monitoring the signal, you can quickly perform rebalancing actions
on the affected instances before Amazon EC2 interrupts them, and then you can manually
terminate them. If you do not terminate the instances, you continue paying for them while they are running. Amazon EC2 does not automatically terminate the instances that receive a rebalance recommendation.

You can set up notifications using Amazon EventBridge or instance metadata. For more information, see Monitor rebalance recommendation signals.

**Spot Fleet does not count instances that receive a rebalance recommendation when calculating fulfilled capacity during scale in or out**

If your Spot Fleet is configured for Capacity Rebalancing, and you change the target capacity to either scale in or scale out, the fleet does not count the instances that are marked for rebalance as part of the fulfilled capacity, as follows:

- **Scale in** – If you decrease your desired target capacity, Amazon EC2 terminates instances that are not marked for rebalance until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

  For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then reduce the target capacity to 50 (scale in), but the fulfilled capacity is actually 60 instances because the 10 instances that are marked for rebalance are not terminated by Amazon EC2. You need to manually terminate these instances, or you can leave them running.

- **Scale out** – If you increase your desired target capacity, Amazon EC2 launches new instances until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

  For example, you create a Spot Fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then increase the target capacity to 200 (scale out), but the fulfilled capacity is actually 210 instances because the 10 instances that are marked for rebalance are not counted by the fleet as part of the target capacity. You need to manually terminate these instances, or you can leave them running.

**Spot price overrides**

Each Spot Fleet request can include a global maximum price, or use the default (the On-Demand price). Spot Fleet uses this as the default maximum price for each of its launch specifications.
You can optionally specify a maximum price in one or more launch specifications. This price is specific to the launch specification. If a launch specification includes a specific price, the Spot Fleet uses this maximum price, overriding the global maximum price. Any other launch specifications that do not include a specific maximum price still use the global maximum price.

**Control spending**

Spot Fleet stops launching instances when it has either reached the target capacity or the maximum amount you’re willing to pay. To control the amount you pay per hour for your fleet, you can specify the SpotMaxTotalPrice for Spot Instances and the OnDemandMaxTotalPrice for On-Demand Instances. When the maximum total price is reached, Spot Fleet stops launching instances even if it hasn’t met the target capacity.

The following examples show two different scenarios. In the first, Spot Fleet stops launching instances when it has met the target capacity. In the second, Spot Fleet stops launching instances when it has reached the maximum amount you’re willing to pay.

**Example: Stop launching instances when target capacity is reached**

Given a request for m4.large On-Demand Instances, where:

- On-Demand Price: $0.10 per hour
- OnDemandTargetCapacity: 10
- OnDemandMaxTotalPrice: $1.50

Spot Fleet launches 10 On-Demand Instances because the total of $1.00 (10 instances x $0.10) does not exceed the OnDemandMaxTotalPrice of $1.50.

**Example: Stop launching instances when maximum total price is reached**

Given a request for m4.large On-Demand Instances, where:

- On-Demand Price: $0.10 per hour
- OnDemandTargetCapacity: 10
- OnDemandMaxTotalPrice: $0.80

If Spot Fleet launches the On-Demand target capacity (10 On-Demand Instances), the total cost per hour would be $1.00. This is more than the amount ($0.80) specified for
OnDemandMaxTotalPrice. To prevent spending more than you're willing to pay, Spot Fleet launches only 8 On-Demand Instances (below the On-Demand target capacity) because launching more would exceed the OnDemandMaxTotalPrice.

**Spot Fleet instance weighting**

When you request a fleet of Spot Instances, you can define the capacity units that each instance type would contribute to your application's performance, and adjust your maximum price for each Spot capacity pool accordingly using *instance weighting*.

By default, the price that you specify is *per instance hour*. When you use the instance weighting feature, the price that you specify is *per unit hour*. You can calculate your price per unit hour by dividing your price for an instance type by the number of units that it represents. Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity. Spot Fleet can select any pool that you specify in your launch specification, even if the capacity of the instances launched exceeds the requested target capacity.

The following tables provide examples of calculations to determine the price per unit for a Spot Fleet request with a target capacity of 10.

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Instance weight</th>
<th>Price per instance hour</th>
<th>Price per unit hour</th>
<th>Number of instances launched</th>
</tr>
</thead>
<tbody>
<tr>
<td>r3.xlarge</td>
<td>2</td>
<td>$0.05</td>
<td>.025</td>
<td>5</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(.05 divided by 2)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>r3.8xlarge</td>
<td>8</td>
<td>$0.10</td>
<td>.0125</td>
<td>2</td>
</tr>
</tbody>
</table>

**Spot Fleet configuration strategies**
Use Spot Fleet instance weighting as follows to provision the target capacity that you want in the pools with the lowest price per unit at the time of fulfillment:

1. Set the target capacity for your Spot Fleet either in instances (the default) or in the units of your choice, such as virtual CPUs, memory, storage, or throughput.
2. Set the price per unit.
3. For each launch configuration, specify the weight, which is the number of units that the instance type represents toward the target capacity.

**Instance weighting example**

Consider a Spot Fleet request with the following configuration:

- A target capacity of 24
- A launch specification with an instance type `r3.2xlarge` and a weight of 6
- A launch specification with an instance type `c3.xlarge` and a weight of 5

The weights represent the number of units that instance type represents toward the target capacity. If the first launch specification provides the lowest price per unit (price for `r3.2xlarge` per instance hour divided by 6), the Spot Fleet would launch four of these instances (24 divided by 6).

If the second launch specification provides the lowest price per unit (price for `c3.xlarge` per instance hour divided by 5), the Spot Fleet would launch five of these instances (24 divided by 5, result rounded up).

**Instance weighting and allocation strategy**

Consider a Spot Fleet request with the following configuration:
A target capacity of 30

A launch specification with an instance type `c3.2xlarge` and a weight of 8

A launch specification with an instance type `m3.xlarge` and a weight of 8

A launch specification with an instance type `r3.xlarge` and a weight of 8

The Spot Fleet would launch four instances (30 divided by 8, result rounded up). With the diversified strategy, the Spot Fleet launches one instance in each of the three pools, and the fourth instance in whichever pool provides the lowest price per unit.

Work with Spot Fleets

To start using a Spot Fleet, you create a Spot Fleet request that includes the target capacity, an optional On-Demand portion, one or more launch specifications for the instances, and the maximum price that you are willing to pay. The fleet request must include a launch specification that defines the information that the fleet needs to launch an instance, such as an AMI, instance type, subnet or Availability Zone, and one or more security groups.

If your fleet includes Spot Instances, Amazon EC2 can attempt to maintain your fleet target capacity as Spot prices change.

It is not possible to modify the target capacity of a one-time request after it's been submitted. To change the target capacity, cancel the request and submit a new one.

A Spot Fleet request remains active until it expires or you cancel it. When you cancel a fleet request, you can specify whether canceling the request terminates the Spot Instances in that fleet.

Contents

- Spot Fleet request states

- Modify a Spot Fleet request
- Cancel a Spot Fleet request
Spot Fleet request states

A Spot Fleet request can be in one of the following states:

- **submitted** – The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances. If a request would exceed your Spot Fleet limits, it is canceled immediately.

- **active** – The Spot Fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot Instances. The request remains in this state until it is modified or canceled.

- **modifying** – The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed or the Spot Fleet is canceled. A one-time request cannot be modified, and this state does not apply to such Spot requests.

- **cancelled_running** – The Spot Fleet is canceled and does not launch additional Spot Instances. Its existing Spot Instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

- **cancelled_terminating** – The Spot Fleet is canceled and its Spot Instances are terminating. The request remains in this state until all instances are terminated.

- **cancelled** – The Spot Fleet is canceled and has no running Spot Instances. The Spot Fleet request is deleted two days after its instances were terminated.

Spot Fleet health checks

Spot Fleet checks the health status of the Spot Instances in the fleet every two minutes. The health status of an instance is either healthy or unhealthy.

Spot Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as unhealthy when the status of either the instance status check or the system status check is impaired for three consecutive health checks. For more information, see [Status checks for Amazon EC2 instances](#).

You can configure your fleet to replace unhealthy Spot Instances. After enabling health check replacement, a Spot Instance is replaced when it is reported as unhealthy. The fleet could go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.
Requirements

- Health check replacement is supported only for Spot Fleets that maintain a target capacity (fleets of type maintain), not for one-time Spot Fleets (fleets of type request).
- Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
- You can configure your Spot Fleet to replace unhealthy instances only when you create it.
- Users can use health check replacement only if they have permission to call the ec2:DescribeInstanceStatus action.

Console

To configure a Spot Fleet to replace unhealthy Spot Instances using the console

1. Follow the steps for creating a Spot Fleet. For more information, see Create a Spot Fleet request using defined parameters (console).
2. To configure the fleet to replace unhealthy Spot Instances, for Health check, choose Replace unhealthy instances. To enable this option, you must first choose Maintain target capacity.

AWS CLI

To configure a Spot Fleet to replace unhealthy Spot Instances using the AWS CLI

1. Follow the steps for creating a Spot Fleet. For more information, see Create a Spot Fleet using the AWS CLI.
2. To configure the fleet to replace unhealthy Spot Instances, for ReplaceUnhealthyInstances, enter true.

Spot Fleet permissions

If your users will create or manage a Spot Fleet, you need to grant them the required permissions.

If you use the Amazon EC2 console to create a Spot Fleet, it creates two service-linked roles named AWSServiceRoleForEC2SpotFleet and AWSServiceRoleForEC2Spot, and a role named aws-ec2-spot-fleet-tagging-role that grant the Spot Fleet the permissions to request,
launch, terminate, and tag resources on your behalf. If you use the AWS CLI or an API, you must ensure that these roles exist.

Use the following instructions to grant the required permissions and create the roles.

Permissions and roles

- Grant permission to users for Spot Fleet
- Service-linked role for Spot Fleet
- Service-linked role for Spot Instances
- IAM role for tagging a Spot Fleet

Grant permission to users for Spot Fleet

If your users will create or manage a Spot Fleet, be sure to grant them the required permissions.

To create a policy for Spot Fleet

2. In the navigation pane, choose Policies, Create policy.
3. On the Create policy page, choose JSON, and replace the text with the following.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances",
                "ec2:CreateTags",
                "ec2:RequestSpotFleet",
                "ec2:ModifySpotFleetRequest",
                "ec2:CancelSpotFleetRequests",
                "ec2:DescribeSpotFleetRequests",
                "ec2:DescribeSpotFleetInstances",
                "ec2:DescribeSpotFleetRequestHistory"
            ],
            "Resource": "*
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:StopInstances",
                "ec2:TerminateInstances",
                "ec2:DescribeInstances",
                "ec2:DescribeTags",
                "ec2:DescribeSpotFleetInstances"
            ],
            "Resource": "*
        }
    ]
}
```
The preceding example policy grants a user the permissions required for most Spot Fleet use cases. To limit the user to specific API actions, specify only those API actions instead.

**Required EC2 and IAM APIs**

The following APIs must be included in the policy:

- `ec2:RunInstances` – Required to launch instances in a Spot Fleet
- `ec2:CreateTags` – Required to tag the Spot Fleet request, instances, or volumes
- `iam:PassRole` – Required to specify the Spot Fleet role
- `iam:CreateServiceLinkedRole` – Required to create the service-linked role
- `iam:ListRoles` – Required to enumerate existing IAM roles
- `iam:ListInstanceProfiles` – Required to enumerate existing instance profiles

⚠️ **Important**

If you specify a role for the IAM instance profile in the launch specification or launch template, you must grant the user the permission to pass the role to the service. To do this, in the IAM policy include "arn:aws:iam::*:role/IamInstanceProfile-role" as a resource for the `iam:PassRole` action. For more information, see [Granting a user permissions to pass a role to an AWS service](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_with_entities.html) in the *IAM User Guide*. 
**Spot Fleet APIs**

Add the following Spot Fleet API actions to your policy, as needed:

- ec2:RequestSpotFleet
- ec2:ModifySpotFleetRequest
- ec2:CancelSpotFleetRequests
- ec2:DescribeSpotFleetRequests
- ec2:DescribeSpotFleetInstances
- ec2:DescribeSpotFleetRequestHistory

**Optional IAM APIs**

(Optional) To enable a user to create roles or instance profiles using the IAM console, you must add the following actions to the policy:

- iam:AddRoleToInstanceProfile
- iam:AttachRolePolicy
- iam:CreateInstanceProfile
- iam:CreateRole
- iam:GetRole
- iam:ListPolicies

4. Choose **Review policy**.

5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.

6. To provide access, add permissions to your users, groups, or roles:

   - Users and groups in AWS IAM Identity Center:
     
     Create a permission set. Follow the instructions in [Create a permission set](#) in the *AWS IAM Identity Center User Guide*.

   - Users managed in IAM through an identity provider:
     
     Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider (federation)](#) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](#) in the IAM User Guide.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user (console)](#) in the IAM User Guide.

**Service-linked role for Spot Fleet**

Amazon EC2 uses service-linked roles for the permissions that it requires to call other AWS services on your behalf. A service-linked role is a unique type of IAM role that is linked directly to an AWS service. Service-linked roles provide a secure way to delegate permissions to AWS services because only the linked service can assume a service-linked role. For more information, see [Using service-linked roles](#) in the IAM User Guide.

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2SpotFleet** to launch and manage instances on your behalf.

⚠️ **Important**

If you specify an [encrypted AMI](#) or an encrypted Amazon EBS snapshot in your Spot Fleet, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. For more information, see [Grant access to CMKs for use with encrypted AMIs and EBS snapshots](#).

**Permissions granted by AWSServiceRoleForEC2SpotFleet**

Amazon EC2 uses **AWSServiceRoleForEC2SpotFleet** to complete the following actions:

- `ec2:RequestSpotInstances` - Request Spot Instances
- `ec2:RunInstances` - Launch instances
- `ec2:TerminateInstances` - Terminate instances
- `ec2:DescribeImages` - Describe Amazon Machine Images (AMIs) for the instances
- `ec2:DescribeInstanceStatus` - Describe the status of the instances
- `ec2:DescribeSubnets` - Describe the subnets for the instances
- `ec2:CreateTags` - Add tags to the Spot Fleet request, instances, and volumes
- elasticloadbalancing:RegisterInstancesWithLoadBalancer - Add the specified instances to the specified load balancer
- elasticloadbalancing:RegisterTargets - Register the specified targets with the specified target group

Create the service-linked role

Under most circumstances, you don't need to manually create a service-linked role. Amazon EC2 creates the AWSServiceRoleForEC2SpotFleet service-linked role the first time you create a Spot Fleet using the console.

If you had an active Spot Fleet request before October 2017, when Amazon EC2 began supporting this service-linked role, Amazon EC2 created the AWSServiceRoleForEC2SpotFleet role in your AWS account. For more information, see A new role appeared in my AWS account in the IAM User Guide.

If you use the AWS CLI or an API to create a Spot Fleet, you must first ensure that this role exists.

To create AWSServiceRoleForEC2SpotFleet using the console

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose Roles.
3. Choose Create role.
4. On the Select trusted entity page, do the following:
   a. For Trusted entity type, choose AWS service.
   b. Under Use case, for Service or use case, choose EC2.
   c. For Use case, choose EC2 - Spot Fleet.
   d. Choose Next.
5. On the Add permissions page, choose Next.
6. On the Name, review, and create page, choose Create role.

To create AWSServiceRoleForEC2SpotFleet using the AWS CLI

Use the create-service-linked-role command as follows.

```
aws iam create-service-linked-role --aws-service-name spotfleet.amazonaws.com
```
If you no longer need to use Spot Fleet, we recommend that you delete the `AWSServiceRoleForEC2SpotFleet` role. After this role is deleted from your account, Amazon EC2 will create the role again if you request a Spot Fleet using the console. For more information, see Deleting a service-linked role in the `IAM User Guide`.

Grant access to CMKs for use with encrypted AMIs and EBS snapshots

If you specify an encrypted AMI or an encrypted Amazon EBS snapshot in your Spot Fleet request and you use a customer managed key for encryption, you must grant the `AWSServiceRoleForEC2SpotFleet` role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the CMK, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see Using Grants and Using Key Policies in AWS KMS in the `AWS Key Management Service Developer Guide`.

To grant the `AWSServiceRoleForEC2SpotFleet` role permissions to use the CMK

- Use the `create-grant` command to add a grant to the CMK and to specify the principal (the `AWSServiceRoleForEC2SpotFleet` service-linked role) that is given permission to perform the operations that the grant permits. The CMK is specified by the `key-id` parameter and the ARN of the CMK. The principal is specified by the `grantee-principal` parameter and the ARN of the `AWSServiceRoleForEC2SpotFleet` service-linked role.

```bash
aws kms create-grant \
   --region us-east-1 \
   --key-id arn:aws:kms:us-east-1:444455556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
   --grantee-principal arn:aws:iam::111122223333:role/AWSServiceRoleForEC2SpotFleet \
   --operations Decrypt Encrypt GenerateDataKey GenerateDataKeyWithoutPlaintext CreateGrant DescribeKey ReEncryptFrom ReEncryptTo
```

Service-linked role for Spot Instances

Amazon EC2 uses the service-linked role named `AWSServiceRoleForEC2Spot` to launch and manage Spot Instances on your behalf. For more information, see Service-linked role for Spot Instance requests.
IAM role for tagging a Spot Fleet

The aws-ec2-spot-fleet-tagging-role IAM role grants the Spot Fleet permission to tag the Spot Fleet request, instances, and volumes. For more information, see Tag a Spot Fleet.

⚠️ Important

If you choose to tag instances in the fleet and you also choose to maintain target capacity (the Spot Fleet request is of type maintain), the differences in the permissions that are set for the user and the IamFleetRole might lead to inconsistent tagging behavior of instances in the fleet. If the IamFleetRole does not include the CreateTags permission, some of the instances launched by the fleet might not be tagged. While we are working to fix this inconsistency, to ensure that all instances launched by the fleet are tagged, we recommend that you use the aws-ec2-spot-fleet-tagging-role role for the IamFleetRole. Alternatively, to use an existing role, attach the AmazonEC2SpotFleetTaggingRole AWS Managed Policy to the existing role. Otherwise, you need to manually add the CreateTags permission to your existing policy.

To create the IAM role for tagging a Spot Fleet

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose Roles.
3. Choose Create role.
4. On the Select trusted entity page, under Trusted entity type, choose AWS service.
5. Under Use case, from Use cases for other AWS services, choose EC2, and then choose EC2 - Spot Fleet Tagging.
6. Choose Next.
7. On the Add permissions page, choose Next.
8. On the Name, review, and create page, for Role name, enter a name for the role (for example, aws-ec2-spot-fleet-tagging-role).
9. Review the information on the page, and then choose Create role.
Cross-service confused deputy prevention

The confused deputy problem is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. We recommend that you use the `aws:SourceArn` and `aws:SourceAccount` global condition context keys in the `aws-ec2-spot-fleet-tagging-role` trust policy to limit the permissions that Spot Fleet gives another service to the resource.

To add the `aws:SourceArn` and `aws:SourceAccount` condition keys to the `aws-ec2-spot-fleet-tagging-role` trust policy

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose Roles.
3. Find the `aws-ec2-spot-fleet-tagging-role` that you created previously and choose the link (not the check box).
4. Under Summary, choose the Trust relationships tab, and then choose Edit trust policy.
5. In the JSON statement, add a Condition element containing your `aws:SourceAccount` and `aws:SourceArn` global condition context keys to prevent the confused deputy problem, as follows:

```json
"Condition": {
    "ArnLike": {
        "aws:SourceArn": "arn:aws:ec2:us-east-1:account_id:spot-fleet-request/sfr-*
    },
    "StringEquals": {
        "aws:SourceAccount": "account_id"
    }
}
```

Note

If the `aws:SourceArn` value contains the account ID and you use both global condition context keys, the `aws:SourceAccount` value and the account in the `aws:SourceArn` value must use the same account ID when used in the same policy statement.

The final trust policy will be as follows:
6. Choose **Update policy**.

The following table provides potential values for `aws:SourceArn` to limit the scope of the your `aws-ec2-spot-fleet-tagging-role` in varying degrees of specificity.

<table>
<thead>
<tr>
<th>API operation</th>
<th>Called service</th>
<th>Scope</th>
<th><code>aws:SourceArn</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>RequestSpotFleet</td>
<td>AWS STS (AssumeRole)</td>
<td>Limit the AssumeRole capability on <code>aws-ec2-spot-fleet-tagging-role</code> to spot-fleet-requests in the specified account.</td>
<td><code>arn:aws:ec2:*:123456789012:spot-fleet-request/sfr-*</code></td>
</tr>
<tr>
<td>RequestSpotFleet</td>
<td>AWS STS (AssumeRole)</td>
<td>Limit the AssumeRole capability on <code>aws-ec2-spot-fleet-tagging-role</code> to spot-fleet-requests in the specified account.</td>
<td><code>arn:aws:ec2:*:us-east-1:123456789:spot-fleet-request/sfr-*</code></td>
</tr>
</tbody>
</table>
API operation | Called service | Scope | aws:SourceArn
--- | --- | --- | ---

RequestSpotFleet | AWS STS (AssumeRole) | Limit the AssumeRole capability on aws-ec2-spot-fleet-tagging-role to only actions affecting the fleet sfr-1111111-111111111-1111111111-11111111111. Note that this role may not be usable for other Spot Fleets. Also, this role cannot be used to launch any new Spot Fleets through request-spot-fleet. | arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-*

Create a Spot Fleet request

Using the AWS Management Console, quickly create a Spot Fleet request by choosing only your application or task need and minimum compute specs. Amazon EC2 configures a fleet that best meets your needs and follows Spot best practice. For more information, see Quickly create a Spot Fleet request (console). Otherwise, you can modify any of the default settings. For more information, see Create a Spot Fleet request using defined parameters (console) and Create a Spot Fleet using the AWS CLI.
Options for creating a Spot Fleet

- Quickly create a Spot Fleet request (console)
- Create a Spot Fleet request using defined parameters (console)
- Create a Spot Fleet using the AWS CLI

Quickly create a Spot Fleet request (console)

Follow these steps to quickly create a Spot Fleet request.

To create a Spot Fleet request using the recommended settings (console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Spot Requests.
3. If you are new to Spot, you see a welcome page; choose Get started. Otherwise, choose Request Spot Instances.
4. Under Launch parameters, choose Manually configure launch parameters.
5. For AMI, choose an AMI.
6. Under Target capacity, for Total target capacity, specify the number of units to request. For the type of unit, you can choose Instances, vCPUs, or Memory (MiB).
7. For Your fleet request at a glance, review your fleet configuration, and choose Launch.

Create a Spot Fleet request using defined parameters (console)

You can create a Spot Fleet by using parameters that you define.

To create a Spot Fleet request using defined parameters (console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Spot Requests.
3. If you are new to Spot, you see a welcome page; choose Get started. Otherwise, choose Request Spot Instances.
4. For Launch parameters, do the following:
   a. To define the launch parameters in the Spot console, choose Manually configure launch parameters.
b. For **AMI**, choose one of the basic AMIs provided by AWS, or choose **Search for AMI** to use an AMI from our user community, the AWS Marketplace, or one of your own.

![Note]

If an AMI specified in the launch parameters is deregistered or disabled, no new instances can be launched from the AMI. For fleets that are set to maintain target capacity, the target capacity will not be maintained.

c. (Optional) For **Key pair name**, choose an existing key pair or create a new one.

[Existing key pair] Choose the key pair.

[New key pair] Choose **Create new key pair** to go the **Key Pairs** page. When you are done, return to the **Spot Requests** page and refresh the list.

d. (Optional) Expand **Additional launch parameters**, and do the following:

i. (Optional) To enable Amazon EBS optimization, for **EBS-optimized**, select **Launch EBS-optimized instances**.

ii. (Optional) To add temporary block-level storage for your instances, for **Instance store**, choose **Attach at launch**.

iii. (Optional) To add storage, choose **Add new volume**, and specify additional instance store volumes or Amazon EBS volumes, depending on the instance type.

iv. (Optional) By default, basic monitoring is enabled for your instances. To enable detailed monitoring, for **Monitoring**, select **Enable CloudWatch detailed monitoring**.

v. (Optional) To run a Dedicated Spot Instance, for **Tenancy**, choose **Dedicated - run a dedicated instance**.

vi. (Optional) For **Security groups**, choose one or more security groups or create a new one.

[Existing security group] Choose one or more security groups.

[New security group] Choose **Create new security group** to go the **Security Groups** page. When you are done, return to the **Spot Requests** and refresh the list.

vii. (Optional) To make your instances reachable from the internet, for **Auto-assign IPv4 Public IP**, choose **Enable**.
viii. (Optional) To launch your Spot Instances with an IAM role, for IAM instance profile, choose the role.

ix. (Optional) To run a start-up script, copy it to User data.

x. (Optional) To add a tag, choose Create tag and enter the key and value for the tag, and choose Create. Repeat for each tag.

For each tag, to tag the instances and the Spot Fleet request with the same tag, ensure that both Instances and Fleet are selected. To tag only the instances launched by the fleet, clear Fleet. To tag only the Spot Fleet request, clear Instances.

5. For Additional request details, do the following:

a. Review the additional request details. To make changes, clear Apply defaults.

b. (Optional) For IAM fleet role, you can use the default role or choose a different role. To use the default role after changing the role, choose Use default role.

c. (Optional) For Maximum price, you can use the default maximum price (the On-Demand price) or specify the maximum price you are willing to pay. If your maximum price is lower than the Spot price for the instance types that you selected, your Spot Instances are not launched.

d. (Optional) To create a request that is valid only during a specific time period, edit Request valid from and Request valid until.

e. (Optional) By default, we terminate your Spot Instances when the Spot Fleet request expires. To keep them running after your request expires, clear Terminate the instances when the request expires.

f. (Optional) To register your Spot Instances with a load balancer, choose Receive traffic from one or more load balancers and choose one or more Classic Load Balancers or target groups.

6. For Minimum compute unit, choose the minimum hardware specifications (vCPUs, memory, and storage) that you need for your application or task, either as specs or as an instance type.

   • For as specs, specify the required number of vCPUs and amount of memory.

   • For as an instance type, accept the default instance type, or choose Change instance type to choose a different instance type.

7. For Target capacity, do the following:
a. For **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (MiB)**. To specify a target capacity of 0 so that you can add capacity later, choose **Maintain target capacity**.

b. (Optional) For **Include On-Demand base capacity**, specify the number of On-Demand units to request. The number must be less than the **Total target capacity**. Amazon EC2 calculates the difference, and allocates the difference to Spot units to request.

---

**Important**

To specify optional On-Demand capacity, you must first choose a launch template.

---

c. (Optional) By default, Amazon EC2 terminates Spot Instances when they are interrupted. To maintain the target capacity, select **Maintain target capacity**. You can then specify that Amazon EC2 terminates, stops, or hibernates Spot Instances when they are interrupted. To do so, choose the corresponding option from **Interruption behavior**.

---

**Note**

If an AMI specified in the launch parameters is deregistered or disabled, no new instances can be launched from the AMI. For fleets that are set to maintain target capacity, the target capacity will not be maintained.

---

d. (Optional) To allow Spot Fleet to launch a replacement Spot Instance when an instance rebalance notification is emitted for an existing Spot Instance in the fleet, select **Capacity rebalance**, and then choose an instance replacement strategy. If you choose **Launch before terminate**, specify the delay (in seconds) before Spot Fleet terminates the old instances. For more information, see **Capacity Rebalancing**.

e. (Optional) To control the amount you pay per hour for all the Spot Instances in your fleet, select **Set maximum cost for Spot Instances** and then enter the maximum total amount you’re willing to pay per hour. When the maximum total amount is reached, Spot Fleet stops launching Spot Instances even if it hasn’t met the target capacity. For more information, see **Control spending**.

8. For **Network**, do the following:

a. For **Network**, choose an existing VPC or create a new one.

   [Existing VPC] Choose the VPC.
[New VPC] Choose Create new VPC to go the Amazon VPC console. When you are done, return to the wizard and refresh the list.

b. (Optional) For Availability Zone, let AWS choose the Availability Zones for your Spot Instances, or specify one or more Availability Zones.

If you have more than one subnet in an Availability Zone, choose the appropriate subnet from Subnet. To add subnets, choose Create new subnet to go to the Amazon VPC console. When you are done, return to the wizard and refresh the list.

9. For Instance type requirements, you can either specify instance attributes and let Amazon EC2 identify the optimal instance types with these attributes, or you can specify a list of instances. For more information, see Attribute-based instance type selection for Spot Fleet.

a. If you choose Specify instance attributes that match your compute requirements, specify your instance attributes as follows:

i. For vCPUs, enter the desired minimum and maximum number of vCPUs. To specify no limit, select No minimum, No maximum, or both.

ii. For Memory (GiB), enter the desired minimum and maximum amount of memory. To specify no limit, select No minimum, No maximum, or both.

iii. (Optional) For Additional instance attributes, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds a further constraint to your request. You can omit the additional attributes; when omitted, the default values are used. For a description of each attribute and their default values, see get-spot-placement-scores in the Amazon EC2 Command Line Reference.

iv. (Optional) To view the instance types with your specified attributes, expand Preview matching instance types. To exclude instance types from being used in your request, select the instances and then choose Exclude selected instance types.

b. If you choose Manually select instance types, Spot Fleet provides a default list of instance types. To select more instance types, choose Add instance types, select the instance types to use in your request, and choose Select. To delete instance types, select the instance types and choose Delete.

10. For Allocation strategy, choose the strategy that meets your needs. For more information, see Allocation strategies for Spot Instances.
11. For **Your fleet request at a glance**, review your fleet configuration, and make any adjustments if necessary.

12. (Optional) To download a copy of the launch configuration for use with the AWS CLI, choose **JSON config**.

13. Choose **Launch**.

    The Spot Fleet request type is **fleet**. When the request is fulfilled, requests of type **instance** are added, where the state is **active** and the status is **fulfilled**.

---

**Create a Spot Fleet using the AWS CLI**

**To create a Spot Fleet request using the AWS CLI**

- Use the `request-spot-fleet` command to create a Spot Fleet request.

    ```bash
    aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
    ```

    For example configuration files, see [Spot Fleet example configurations](#).

    The following is example output:

    ```json
    {
      "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
    }
    ```

**Tag a Spot Fleet**

To help categorize and manage your Spot Fleet requests, you can tag them with custom metadata. You can assign a tag to a Spot Fleet request when you create it, or afterward. You can assign tags using the Amazon EC2 console or a command line tool.

When you tag a Spot Fleet request, the instances and volumes that are launched by the Spot Fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the Spot Fleet. You can choose to assign tags to only the Spot Fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all three.
Note

Volume tags are only supported for volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances.

For more information about how tags work, see Tag your Amazon EC2 resources.

Contents

- Prerequisite
- Tag a new Spot Fleet
- Tag a new Spot Fleet and the instances and volumes that it launches
- Tag an existing Spot Fleet
- View Spot Fleet request tags

Prerequisite

Grant the user the permission to tag resources. For more information, see Example: Tag resources.

To grant a user the permission to tag resources

Create an IAM policy that includes the following:

- The ec2:CreateTags action. This grants the user permission to create tags.
- The ec2:RequestSpotFleet action. This grants the user permission to create a Spot Fleet request.
- For Resource, you must specify "*". This allows users to tag all resource types.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "TagSpotFleetRequest",
            "Effect": "Allow",
            "Action": ["ec2:CreateTags",
```
Important

We currently do not support resource-level permissions for the spot-fleet-request resource. If you specify spot-fleet-request as a resource, you will get an unauthorized exception when you try to tag the fleet. The following example illustrates how not to set the policy.

```json
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateTags",
        "ec2:RequestSpotFleet"
    ],
}
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the AWS IAM Identity Center User Guide.

- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Creating a role for a third-party identity provider (federation) in the IAM User Guide.

- IAM users:
  - Create a role that your user can assume. Follow the instructions in Creating a role for an IAM user in the IAM User Guide.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the IAM User Guide.
Tag a new Spot Fleet

To tag a new Spot Fleet request using the console

1. Follow the Create a Spot Fleet request using defined parameters (console) procedure.
2. To add a tag, expand Additional configurations, choose Add new tag, and enter the key and value for the tag. Repeat for each tag.

   For each tag, you can tag the Spot Fleet request and the instances with the same tag. To tag both, ensure that both Instance tags and Fleet tags are selected. To tag only the Spot Fleet request, clear Instance tags. To tag only the instances launched by the fleet, clear Fleet tags.
3. Complete the required fields to create a Spot Fleet request, and then choose Launch. For more information, see Create a Spot Fleet request using defined parameters (console).

To tag a new Spot Fleet request using the AWS CLI

To tag a Spot Fleet request when you create it, configure the Spot Fleet request configuration as follows:

- Specify the tags for the Spot Fleet request in SpotFleetRequestConfig.
- For ResourceType, specify spot-fleet-request. If you specify another value, the fleet request will fail.
- For Tags, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the Spot Fleet request is tagged with two tags: Key=Environment and Value=Production, and Key=Cost-Center and Value=123.

```json
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchSpecifications": [
            {
                "ImageId": "ami-0123456789EXAMPLE",
                "InstanceType": "c4.large"
            }
        ]
    }
}
```
Tag a new Spot Fleet and the instances and volumes that it launches

To tag a new Spot Fleet request and the instances and volumes that it launches using the AWS CLI

To tag a Spot Fleet request when you create it, and to tag the instances and volumes when they are launched by the fleet, configure the Spot Fleet request configuration as follows:

**Spot Fleet request tags:**

- Specify the tags for the Spot Fleet request in `SpotFleetRequestConfig`.
- For `ResourceType`, specify `spot-fleet-request`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.
Instance tags:

- Specify the tags for the instances in LaunchSpecifications.
- For ResourceType, specify instance. If you specify another value, the fleet request will fail.
- For Tags, specify the key-value pair. You can specify more than one key-value pair.

Alternatively, you can specify the tags for the instance in the launch template that is referenced in the Spot Fleet request.

Volume tags:

- Specify the tags for the volumes in the launch template that is referenced in the Spot Fleet request. Volume tagging in LaunchSpecifications is not supported.

In the following example, the Spot Fleet request is tagged with two tags: Key=Environment and Value=Production, and Key=Cost-Center and Value=123. The instances that are launched by the fleet are tagged with one tag (which is the same as one of the tags for the Spot Fleet request): Key=Cost-Center and Value=123.

```json
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchSpecifications": [
            {
                "ImageId": "ami-0123456789EXAMPLE",
                "InstanceType": "c4.large",
                "TagSpecifications": [
                    {
                        "ResourceType": "instance",
                        "Tags": [
                            {
                                "Key": "Cost-Center",
                                "Value": "123"
                            }
                        ]
                    }
                ]
            }
        ]
    }
}
```
To tag instances launched by a Spot Fleet using the AWS CLI

To tag instances when they are launched by the fleet, you can either specify the tags in the launch template that is referenced in the Spot Fleet request, or you can specify the tags in the Spot Fleet request configuration as follows:

- Specify the tags for the instances in LaunchSpecifications.
- For ResourceType, specify instance. If you specify another value, the fleet request will fail.
- For Tags, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the instances that are launched by the fleet are tagged with one tag: Key=Cost-Center and Value=123.
To tag volumes attached to On-Demand Instances launched by a Spot Fleet using the AWS CLI

To tag volumes when they are created by the fleet, you must specify the tags in the launch template that is referenced in the Spot Fleet request.

Note
Volume tags are only supported for volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances. Volume tagging in LaunchSpecifications is not supported.
Tag an existing Spot Fleet

To tag an existing Spot Fleet request using the console

After you have created a Spot Fleet request, you can add tags to the fleet request using the console.

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Tags** tab and choose **Create Tag**.

To tag an existing Spot Fleet request using the AWS CLI

You can use the `create-tags` command to tag existing resources. In the following example, the existing Spot Fleet request is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
    --resources sfr-11112222-3333-4444-5555-66666EXAMPLE \
    --tags Key=purpose,Value=test
```

View Spot Fleet request tags

To view Spot Fleet request tags using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Tags** tab.

To describe Spot Fleet request tags

Use the `describe-tags` command to view the tags for the specified resource. In the following example, you describe the tags for the specified Spot Fleet request.

```
aws ec2 describe-tags \
    --filters "Name=resource-id,Values=sfr-11112222-3333-4444-5555-66666EXAMPLE"
```

```json
{
}
```
You can also view the tags of a Spot Fleet request by describing the Spot Fleet request.

Use the `describe-spot-fleet-requests` command to view the configuration of the specified Spot Fleet request, which includes any tags that were specified for the fleet request.

```
aws ec2 describe-spot-fleet-requests \
    --spot-fleet-request-ids sfr-11112222-3333-4444-5555-66666EXAMPLE
```

```json
{
    "SpotFleetRequestConfigs": [
        {
            "ActivityStatus": "fulfilled",
            "CreateTime": "2020-02-13T02:49:19.709Z",
            "SpotFleetRequestConfig": {
                "AllocationStrategy": "capacityOptimized",
                "OnDemandAllocationStrategy": "lowestPrice",
                "ExcessCapacityTerminationPolicy": "Default",
                "FulfilledCapacity": 2.0,
                "OnDemandFulfilledCapacity": 0.0,
                "IamFleetRole": "arn:aws:iam::111122223333:role/aws-ec2-spot-fleet-tagging-role",
                "LaunchSpecifications": [
                    {
                        "ImageId": "ami-0123456789EXAMPLE",
                        "InstanceType": "c4.large"
                    }
                ],
            }
        }
    ]
}
Describe your Spot Fleet

The Spot Fleet launches Spot Instances when your maximum price exceeds the Spot price and capacity is available. The Spot Instances run until they are interrupted or you terminate them.

To describe your Spot Fleet (console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Spot Requests.
3. Select your Spot Fleet request. To see the configuration details, choose Description.
4. To list the Spot Instances for the Spot Fleet, choose Instances.
5. To view the history for the Spot Fleet, choose History.

To describe your Spot Fleet (AWS CLI)

Use the describe-spot-fleet-requests command to describe your Spot Fleet requests.

aws ec2 describe-spot-fleet-requests
Use the `describe-spot-fleet-instances` command to describe the Spot Instances for the specified Spot Fleet.

```
aws ec2 describe-spot-fleet-instances \
  --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Use the `describe-spot-fleet-request-history` command to describe the history for the specified Spot Fleet request.

```
aws ec2 describe-spot-fleet-request-history \
  --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
  --start-time 2015-05-18T00:00:00Z
```

**Modify a Spot Fleet request**

You can modify an active Spot Fleet request to complete the following tasks:

- Increase the target capacity and On-Demand portion
- Decrease the target capacity and On-Demand portion

**Note**

You can't modify a one-time Spot Fleet request. You can only modify a Spot Fleet request if you selected **Maintain target capacity** when you created the Spot Fleet request.

When you increase the target capacity, the Spot Fleet launches additional Spot Instances. When you increase the On-Demand portion, the Spot Fleet launches additional On-Demand Instances.

When you increase the target capacity, the Spot Fleet launches the additional Spot Instances according to the **allocation strategy** for its Spot Fleet request.

When you decrease the target capacity, the Spot Fleet cancels any open requests that exceed the new target capacity. You can request that the Spot Fleet terminate Spot Instances until the size of the fleet reaches the new target capacity. If the allocation strategy is diversified, the Spot Fleet terminates instances across the pools. Alternatively, you can request that the Spot Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or that you terminate manually.
When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

**To modify a Spot Fleet request (console)**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose **Actions, Modify target capacity**.
5. In **Modify target capacity**, do the following:
   a. Enter the new target capacity and On-Demand portion.
   b. (Optional) If you are decreasing the target capacity but want to keep the fleet at its current size, clear **Terminate instances**.
   c. Choose **Submit**.

**To modify a Spot Fleet request using the AWS CLI**

Use the `modify-spot-fleet-request` command to update the target capacity of the specified Spot Fleet request.

```
aws ec2 modify-spot-fleet-request \
   --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
   --target-capacity 20
```

You can modify the previous command as follows to decrease the target capacity of the specified Spot Fleet without terminating any Spot Instances as a result.

```
aws ec2 modify-spot-fleet-request \
   --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
   --target-capacity 10 \n   --excess-capacity-termination-policy NoTermination
```

**Cancel a Spot Fleet request**

If you no longer require a Spot Fleet, you can cancel the Spot Fleet request. After you cancel a fleet request, all Spot requests associated with the fleet are also canceled, so that no new Spot Instances are launched.
When you cancel a Spot Fleet request, you must also specify if you want to terminate all of its instances. These include both On-Demand Instances and Spot Instances.

If you specify that the instances must be terminated when the fleet request is canceled, the fleet request enters the `cancelled_terminating` state. Otherwise, the fleet request enters the `cancelled_running` state and the instances continue to run until they are interrupted or you terminate them manually.

**Restrictions**

- You can delete up to 100 fleets in a single request. If you exceed the specified number, no fleets are deleted.

**To cancel a Spot Fleet request (console)**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose **Actions, Cancel request**.
5. In the **Cancel Spot request** dialog box, do the following:
   a. To terminate the associated instances at the same time as canceling the Spot Fleet request, leave the **Terminate instances** check box selected. To cancel the Spot Fleet request without terminating the associated instances, clear the **Terminate instances** check box.
   b. Choose **Confirm**.

**To cancel a Spot Fleet request and terminate its instances using the AWS CLI**

Use the `cancel-spot-fleet-requests` command to cancel the specified Spot Fleet request and terminate its On-Demand Instances and Spot Instances.

```bash
aws ec2 cancel-spot-fleet-requests \    
--spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \    
--terminate-instances
```

**Example output**
{  "SuccessfulFleetRequests": [  {  "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",  "CurrentSpotFleetRequestState": "cancelled_terminating",  "PreviousSpotFleetRequestState": "active"  }  ],  "UnsuccessfulFleetRequests": []}

**To cancel a Spot Fleet request without terminating its instances using the AWS CLI**

You can modify the previous command using the `--no-terminate-instances` parameter to cancel the specified Spot Fleet request without terminating its On-Demand Instances and Spot Instances.

```
aws ec2 cancel-spot-fleet-requests \
  --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
  --no-terminate-instances
```

Example output

```
{  "SuccessfulFleetRequests": [  {  "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",  "CurrentSpotFleetRequestState": "cancelled_running",  "PreviousSpotFleetRequestState": "active"  }  ],  "UnsuccessfulFleetRequests": []}
```

**CloudWatch metrics for Spot Fleet**

Amazon EC2 provides Amazon CloudWatch metrics that you can use to monitor your Spot Fleet.
Important
To ensure accuracy, we recommend that you enable detailed monitoring when using these metrics. For more information, see Enable or turn off detailed monitoring for your instances.

For more information about CloudWatch metrics provided by Amazon EC2, see Monitor your instances using CloudWatch.

Spot Fleet metrics

The AWS/EC2Spot namespace includes the following metrics, plus the CloudWatch metrics for the Spot Instances in your fleet. For more information, see Instance metrics.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AvailableInstancePoolsCount</td>
<td>The Spot capacity pools specified in the Spot Fleet request. Units: Count</td>
</tr>
<tr>
<td>BidsSubmittedForCapacity</td>
<td>The capacity for which Amazon EC2 has submitted Spot Fleet requests. Units: Count</td>
</tr>
<tr>
<td>EligibleInstancePoolCount</td>
<td>The Spot capacity pools specified in the Spot Fleet request where Amazon EC2 can fulfill requests. Amazon EC2 does not fulfill requests in pools where the maximum price you're willing to pay for Spot Instances is less than the Spot price or the Spot price is greater than the price for On-Demand Instances. Units: Count</td>
</tr>
<tr>
<td>FulfilledCapacity</td>
<td>The capacity that Amazon EC2 has fulfilled.</td>
</tr>
<tr>
<td>Metric</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MaxPercentCapacity Allocation</td>
<td>The maximum value of PercentCapacityAllocation across all Spot Fleet pools specified in the Spot Fleet request.</td>
</tr>
<tr>
<td></td>
<td>Units: Percent</td>
</tr>
<tr>
<td>PendingCapacity</td>
<td>The difference between TargetCapacity and FulfilledCapacity.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td>PercentCapacityAllocation</td>
<td>The capacity allocated for the Spot capacity pool for the specified dimensions. To get the maximum value recorded across all Spot capacity pools, use MaxPercentCapacityAllocation.</td>
</tr>
<tr>
<td></td>
<td>Units: Percent</td>
</tr>
<tr>
<td>TargetCapacity</td>
<td>The target capacity of the Spot Fleet request.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
<tr>
<td>TerminatingCapacity</td>
<td>The capacity that is being terminated because the provisioned capacity is greater than the target capacity.</td>
</tr>
<tr>
<td></td>
<td>Units: Count</td>
</tr>
</tbody>
</table>

If the unit of measure for a metric is Count, the most useful statistic is Average.

**Spot Fleet dimensions**

To filter the data for your Spot Fleet, use the following dimensions.
### Dimensions

<table>
<thead>
<tr>
<th>Dimensions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AvailabilityZone</td>
<td>Filter the data by Availability Zone.</td>
</tr>
<tr>
<td>FleetRequestId</td>
<td>Filter the data by Spot Fleet request.</td>
</tr>
<tr>
<td>InstanceType</td>
<td>Filter the data by instance type.</td>
</tr>
</tbody>
</table>

### View the CloudWatch metrics for your Spot Fleet

You can view the CloudWatch metrics for your Spot Fleet using the Amazon CloudWatch console. These metrics are displayed as monitoring graphs. These graphs show data points if the Spot Fleet is active.

Metrics are grouped first by namespace, and then by the various combinations of dimensions within each namespace. For example, you can view all Spot Fleet metrics or Spot Fleet metrics groups by Spot Fleet request ID, instance type, or Availability Zone.

#### To view Spot Fleet metrics

2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2 Spot** namespace.

#### Note

If the EC2 Spot namespace is not displayed, there are two reasons for this. Either you've not yet used Spot Fleet—only the AWS services that you're using send metrics to Amazon CloudWatch. Or, if you've not used Spot Fleet for the past two weeks, the namespace does not appear.

4. (Optional) To filter the metrics by dimension, select one of the following:

   - **Fleet Request Metrics** – Group by Spot Fleet request
   - **By Availability Zone** – Group by Spot Fleet request and Availability Zone
   - **By Instance Type** – Group by Spot Fleet request and instance type
• **By Availability Zone/Instance Type** – Group by Spot Fleet request, Availability Zone, and instance type

5. To view the data for a metric, select the check box next to the metric.

---

**Automatic scaling for Spot Fleet**

*Automatic scaling* is the ability to increase or decrease the target capacity of your Spot Fleet automatically based on demand. A Spot Fleet can either launch instances (scale out) or terminate instances (scale in), within the range that you choose, in response to one or more scaling policies.

Spot Fleet supports the following types of automatic scaling:

- **Target tracking scaling** – Increase or decrease the current capacity of the fleet based on a target value for a specific metric. This is similar to the way that your thermostat maintains the temperature of your home—you select temperature and the thermostat does the rest.

- **Step scaling** – Increase or decrease the current capacity of the fleet based on a set of scaling adjustments, known as step adjustments, that vary based on the size of the alarm breach.

- **Scheduled scaling** – Increase or decrease the current capacity of the fleet based on the date and time.

If you are using *instance weighting*, keep in mind that Spot Fleet can exceed the target capacity as needed. Fulfilled capacity can be a floating-point number but target capacity must be an integer, so Spot Fleet rounds up to the next integer. You must take these behaviors into account when you look at the outcome of a scaling policy when an alarm is triggered. For example, suppose that the
target capacity is 30, the fulfilled capacity is 30.1, and the scaling policy subtracts 1. When the alarm is triggered, the automatic scaling process subtracts 1 from 30.1 to get 29.1 and then rounds it up to 30, so no scaling action is taken. As another example, suppose that you selected instance weights of 2, 4, and 8, and a target capacity of 10, but no weight 2 instances were available so Spot Fleet provisioned instances of weights 4 and 8 for a fulfilled capacity of 12. If the scaling policy decreases target capacity by 20% and an alarm is triggered, the automatic scaling process subtracts 12*0.2 from 12 to get 9.6 and then rounds it up to 10, so no scaling action is taken.

The scaling policies that you create for Spot Fleet support a cooldown period. This is the number of seconds after a scaling activity completes where previous trigger-related scaling activities can influence future scaling events. For scale-out policies, while the cooldown period is in effect, the capacity that has been added by the previous scale-out event that initiated the cooldown is calculated as part of the desired capacity for the next scale out. The intention is to continuously (but not excessively) scale out. For scale in policies, the cooldown period is used to block subsequent scale in requests until it has expired. The intention is to scale in conservatively to protect your application's availability. However, if another alarm triggers a scale-out policy during the cooldown period after a scale-in, automatic scaling scales out your scalable target immediately.

We recommend that you scale based on instance metrics with a 1-minute frequency because that ensures a faster response to utilization changes. Scaling on metrics with a 5-minute frequency can result in slower response time and scaling on stale metric data. To send metric data for your instances to CloudWatch in 1-minute periods, you must specifically enable detailed monitoring. For more information, see Enable or turn off detailed monitoring for your instances and Create a Spot Fleet request using defined parameters (console).

For more information about configuring scaling for Spot Fleet, see the following resources:

- application-autoscaling section of the AWS CLI Command Reference
- Application Auto Scaling API Reference
- Application Auto Scaling User Guide

**IAM permissions required for Spot Fleet automatic scaling**

Automatic scaling for Spot Fleet is made possible by a combination of the Amazon EC2, Amazon CloudWatch, and Application Auto Scaling APIs. Spot Fleet requests are created with Amazon EC2, alarms are created with CloudWatch, and scaling policies are created with Application Auto Scaling.
In addition to the IAM permissions for Spot Fleet and Amazon EC2, the user that accesses fleet scaling settings must have the appropriate permissions for the services that support dynamic scaling. Users must have permissions to use the actions shown in the following example policy.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "application-autoscaling:*",
        "ec2:DescribeSpotFleetRequests",
        "ec2:ModifySpotFleetRequest",
        "cloudwatch:DeleteAlarms",
        "cloudwatch:DescribeAlarmHistory",
        "cloudwatch:DescribeAlarms",
        "cloudwatch:DescribeAlarmsForMetric",
        "cloudwatch:GetMetricStatistics",
        "cloudwatch:ListMetrics",
        "cloudwatch:PutMetricAlarm",
        "cloudwatch:DisableAlarmActions",
        "cloudwatch:EnableAlarmActions",
        "iam:CreateServiceLinkedRole",
        "sns:CreateTopic",
        "sns:Subscribe",
        "sns:Get*",
        "sns:List*"
      ],
      "Resource": "*"
    }
  ]
}
```

You can also create your own IAM policies that allow more fine-grained permissions for calls to the Application Auto Scaling API. For more information, see Authentication and Access Control in the Application Auto Scaling User Guide.

The Application Auto Scaling service also needs permission to describe your Spot Fleet and CloudWatch alarms, and permissions to modify your Spot Fleet target capacity on your behalf. If you enable automatic scaling for your Spot Fleet, it creates a service-linked role named AWSServiceRoleForApplicationAutoScaling_EC2SpotFleetRequest. This service-linked role grants Application Auto Scaling permission to describe the alarms for your policies, to monitor
the current capacity of the fleet, and to modify the capacity of the fleet. The original managed Spot Fleet role for Application Auto Scaling was `aws-ec2-spot-fleet-autoscale-role`, but it is no longer required. The service-linked role is the default role for Application Auto Scaling. For more information, see Service-Linked Roles in the Application Auto Scaling User Guide.

**Scale Spot Fleet using a target tracking policy**

With target tracking scaling policies, you select a metric and set a target value. Spot Fleet creates and manages the CloudWatch alarms that trigger the scaling policy and calculates the scaling adjustment based on the metric and the target value. The scaling policy adds or removes capacity as required to keep the metric at, or close to, the specified target value. In addition to keeping the metric close to the target value, a target tracking scaling policy also adjusts to the fluctuations in the metric due to a fluctuating load pattern and minimizes rapid fluctuations in the capacity of the fleet.

You can create multiple target tracking scaling policies for a Spot Fleet, provided that each of them uses a different metric. The fleet scales based on the policy that provides the largest fleet capacity. This enables you to cover multiple scenarios and ensure that there is always enough capacity to process your application workloads.

To ensure application availability, the fleet scales out proportionally to the metric as fast as it can, but scales in more gradually.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Do not edit or delete the CloudWatch alarms that Spot Fleet manages for a target tracking scaling policy. Spot Fleet deletes the alarms automatically when you delete the target tracking scaling policy.

**Limitation**

The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`.

**To configure a target tracking policy (console)**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Spot Requests.
3. Select your Spot Fleet request and choose Auto Scaling.
4. If automatic scaling is not configured, choose **Configure**.

5. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Automatic scaling does not scale your fleet below the minimum capacity or above the maximum capacity.

6. For **Policy name**, enter a name for the policy.

7. Choose a **Target metric**.

8. Enter a **Target value** for the metric.

9. For **Cooldown period**, specify a new value (in seconds) or keep the default.

10. (Optional) Select **Disable scale-in** to omit creating a scale-in policy based on the current configuration. You can create a scale-in policy using a different configuration.

11. Choose **Save**.

**To configure a target tracking policy using the AWS CLI**

1. Register the Spot Fleet request as a scalable target using the `register-scalable-target` command.

2. Create a scaling policy using the `put-scaling-policy` command.

**Scale Spot Fleet using step scaling policies**

With step scaling policies, you specify CloudWatch alarms to trigger the scaling process. For example, if you want to scale out when CPU utilization reaches a certain level, create an alarm using the CPUUtilization metric provided by Amazon EC2.

When you create a step scaling policy, you must specify one of the following scaling adjustment types:

- **Add** – Increase the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.

- **Remove** – Decrease the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.

- **Set to** – Set the target capacity of the fleet to the specified number of capacity units.

When an alarm is triggered, the automatic scaling process calculates the new target capacity using the fulfilled capacity and the scaling policy, and then updates the target capacity accordingly.
example, suppose that the target capacity and fulfilled capacity are 10 and the scaling policy adds 1. When the alarm is triggered, the automatic scaling process adds 1 to 10 to get 11, so Spot Fleet launches 1 instance.

When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Limitation

The Spot Fleet request must have a request type of maintain. Automatic scaling is not supported for requests of type request, or Spot blocks.

Prerequisites

- Consider which CloudWatch metrics are important to your application. You can create CloudWatch alarms based on metrics provided by AWS or your own custom metrics.
- For the AWS metrics that you will use in your scaling policies, enable CloudWatch metrics collection if the service that provides the metrics does not enable it by default.

To create a CloudWatch alarm

2. In the navigation pane, choose Alarms.
3. Choose Create alarm.
4. On the Specify metric and conditions page, choose Select metric.
5. Choose EC2 Spot, Fleet Request Metrics, select a metric (for example, TargetCapacity), and then choose Select metric.

   The Specify metric and conditions page appears, showing a graph and other information about the metric you selected.
6. For Period, choose the evaluation period for the alarm, for example, 1 minute. When evaluating the alarm, each period is aggregated into one data point.

   Note
   A shorter period creates a more sensitive alarm.
7. For **Conditions**, define the alarm by defining the threshold condition. For example, you can define a threshold to trigger the alarm whenever the value of the metric is greater than or equal to 80 percent.

8. Under **Additional configuration**, for **Datapoints to alarm**, specify how many datapoints (evaluation periods) must be in the ALARM state to trigger the alarm, for example, 1 evaluation period or 2 out of 3 evaluation periods. This creates an alarm that goes to ALARM state if that many consecutive periods are breaching. For more information, see Evaluating an alarm in the Amazon CloudWatch User Guide.

9. For **Missing data treatment**, choose one of the options (or leave the default of Treat missing data as missing). For more information, see Configuring how CloudWatch alarms treat missing data in the Amazon CloudWatch User Guide.

10. Choose **Next**.

11. (Optional) To receive notification of a scaling event, for **Notification**, you can choose or create the Amazon SNS topic you want to use to receive notifications. Otherwise, you can delete the notification now and add one later as needed.

12. Choose **Next**.

13. Under **Add a description**, enter a name and description for the alarm and choose **Next**.

14. Choose **Create alarm**.

---

**To configure a step scaling policy for your Spot Fleet (console)**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.

2. In the navigation pane, choose **Spot Requests**.

3. Select your Spot Fleet request and choose **Auto Scaling**.

4. If automatic scaling is not configured, choose **Configure**.

5. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Scaling policies do not scale your fleet below the minimum capacity or above the maximum capacity.

6. For **Scaling policies, Policy type**, choose **Step scaling policy**.

7. Initially, **Scaling policies** contain step scaling policies named ScaleUp and ScaleDown. You can complete these policies, or choose **Remove policy** to delete them. You can also choose **Add policy**.

8. To define a policy, do the following:

   a. For **Policy name**, enter a name for the policy.
b. For **Policy trigger**, select an existing alarm or choose **Create alarm** to open the Amazon CloudWatch console and create an alarm.

c. For **Modify capacity**, define the amount by which to scale and the lower and upper bound of the step adjustment. You can add or remove a specific number of instances or a percentage of the existing fleet size, or set the fleet to an exact size.

   For example, to create a step scaling policy that increases the capacity of the fleet by 30 percent, choose Add, type 30 in the next field, and then choose percent. By default, the lower bound for an add policy is the alarm threshold and the upper bound is positive (+) infinity. By default, the upper bound for a remove policy is the alarm threshold and the lower bound is negative (-) infinity.

d. (Optional) To add another step, choose **Add step**.

e. For **Cooldown period**, specify a new value (in seconds) or keep the default.

9. Choose **Save**.

**To configure step scaling policies for your Spot Fleet using the AWS CLI**

1. Register the Spot Fleet request as a scalable target using the `register-scalable-target` command.

2. Create a scaling policy using the `put-scaling-policy` command.

3. Create an alarm that triggers the scaling policy using the `put-metric-alarm` command.

**Scale Spot Fleet using scheduled scaling**

Scaling based on a schedule enables you to scale your application in response to predictable changes in demand. To use scheduled scaling, you create **scheduled actions**, which tell Spot Fleet to perform scaling activities at specific times. When you create a scheduled action, you specify an existing Spot Fleet, when the scaling activity should occur, minimum capacity, and maximum capacity. You can create scheduled actions that scale one time only or that scale on a recurring schedule.

You can only create a scheduled action for Spot Fleets that already exist. You can't create a scheduled action at the same time that you create a Spot Fleet.

**Limitation**
The Spot Fleet request must have a request type of maintain. Automatic scaling is not supported for requests of type request, or Spot blocks.

To create a one-time scheduled action

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Spot Requests.
3. Select your Spot Fleet request and choose the Scheduled Scaling tab near the bottom of the screen.
5. For Name, specify a name for the scheduled action.
6. Enter a value for Minimum capacity, Maximum capacity, or both.
7. For Recurrence, choose Once.
8. (Optional) Choose a date and time for Start time, End time, or both.
9. Choose Submit.

To scale on a recurring schedule

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Spot Requests.
3. Select your Spot Fleet request and choose the Scheduled Scaling tab near the bottom of the screen.
4. For Recurrence, choose one of the predefined schedules (for example, Every day), or choose Custom and enter a cron expression. For more information about the cron expressions supported by scheduled scaling, see Cron Expressions in the Amazon CloudWatch Events User Guide.
5. (Optional) Choose a date and time for Start time, End time, or both.
6. Choose Submit.

To edit a scheduled action

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Spot Requests.
3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.

4. Select the scheduled action and choose **Actions, Edit**.

5. Make the needed changes and choose **Submit**.

**To delete a scheduled action**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the navigation pane, choose **Spot Requests**.

3. Select your Spot Fleet request and choose the **Scheduled Scaling** tab near the bottom of the screen.

4. Select the scheduled action and choose **Actions, Delete**.

5. When prompted for confirmation, choose **Delete**.

**To manage scheduled scaling using the AWS CLI**

Use the following commands:

- [put-scheduled-action](https://docs.aws.amazon.com/cli/latest/reference/ec2/put-scheduled-action)
- [describe-scheduled-actions](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-scheduled-actions)
- [delete-scheduled-action](https://docs.aws.amazon.com/cli/latest/reference/ec2/delete-scheduled-action)

**Monitor fleet events using Amazon EventBridge**

When the state of an EC2 Fleet or Spot Fleet changes, the fleet emits a notification. The notification is made available as an event that is sent to Amazon EventBridge (formerly known as Amazon CloudWatch Events). Events are emitted on a best effort basis.

With Amazon EventBridge, you can create rules that trigger programmatic actions in response to an event. For example, you can create two EventBridge rules, one that's triggered when a fleet state changes, and one that's triggered when an instance in the fleet is terminated. You can configure the first rule so that, if the fleet state changes, the rule invokes an SNS topic to send an email notification to you. You can configure the second rule so that, if an instance is terminated, the rule invokes a Lambda function to launch a new instance.

**Topics**
EC2 Fleet event types

Note

Only fleets of type maintain and request emit events. Fleets of type instant do not emit events because they submit synchronous one-time requests, and the state of the fleet is known immediately in the response.

There are five EC2 Fleet event types. For each event type, there are several sub-types.

The events are sent to EventBridge in JSON format. The following fields in the event form the event pattern that is defined in the rule, and which trigger an action:

"source": "aws.ec2fleet"

Identifies that the event is from EC2 Fleet.

"detail-type": "EC2 Fleet State Change"

Identifies the event type.

"detail": { "sub-type": "submitted" }

Identifies the event sub-type.

Event types

- EC2 Fleet State Change
- EC2 Fleet Spot Instance Request Change
- EC2 Fleet Instance Change
- EC2 Fleet Information
- EC2 Fleet Error
EC2 Fleet State Change

EC2 Fleet sends an EC2 Fleet State Change event to Amazon EventBridge when an EC2 Fleet changes state.

The following is example data for this event.

```json
{
    "version": "0",
    "id": "715ed6b3-b8fc-27fe-fad6-528c7b8bf8a2",
    "detail-type": "EC2 Fleet State Change",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-11-09T09:00:20Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-be4d-6b0809bfff0a"
    ],
    "detail": {
        "sub-type": "active"
    }
}
```

The possible values for sub-type are:

active

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

deleted

The EC2 Fleet request is deleted and has no running instances. The EC2 Fleet will be deleted two days after its instances are terminated.

deleted_running

The EC2 Fleet request is deleted and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.
deleted_terminating

The EC2 Fleet request is deleted and its instances are terminating. The request remains in this state until all instances are terminated.

expired

The EC2 Fleet request has expired. If the request was created with TerminateInstancesWithExpiration set, a subsequent terminated event indicates that the instances are terminated.

modify_in_progress

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed.

modify_succeeded

The EC2 Fleet request was modified.

submitted

The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

progress

The EC2 Fleet request is in the process of being fulfilled.

EC2 Fleet Spot Instance Request Change

EC2 Fleet sends an EC2 Fleet Spot Instance Request Change event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```json
{
    "version": "0",
    "id": "19331f74-bf4b-a3dd-0f1b-ddb1422032b9",
    "detail-type": "EC2 Fleet Spot Instance Request Change",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-11-09T09:00:05Z",
    "region": "us-east-1",
    "resources": [
```
The possible values for sub-type are:

- **active**
  - The Spot Instance request is fulfilled and has an associated Spot Instance.

- **cancelled**
  - You cancelled the Spot Instance request, or the Spot Instance request expired.

- **disabled**
  - You stopped the Spot Instance.

- **submitted**
  - The Spot Instance request is submitted.

### EC2 Fleet Instance Change

EC2 Fleet sends an EC2 Fleet Instance Change event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```json
{
    "version": "0",
    "id": "542ce428-c8f1-0608-c015-e8ed6522c5bc",
    "detail-type": "EC2 Fleet Instance Change",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-11-09T09:00:23Z",
    "region": "us-east-1",
    "resources": [
```
"arn:aws:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-be4d-6b0809bff0a"
]
"detail": {
  "instance-id": "i-0c594155dd5ff1829",
  "description": "{"instanceType":"c5.large","image":"ami-6057e21a","productDescription":"Linux/UNIX","availabilityZone":"us-east-1d"}",
  "sub-type": "launched"
}
}

The possible values for sub-type are:

launched

A new instance was launched.

terminated

The instance was terminated.
termination_notified

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

**EC2 Fleet Information**

EC2 Fleet sends an EC2 Fleet Information event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```json
{
  "version": "0",
  "id": "76529817-d605-4571-7224-d36cc1b2c0c4",
  "detail-type": "EC2 Fleet Information",
  "source": "aws.ec2fleet",
  "account": "123456789012",
  "time": "2020-11-09T08:17:07Z",
  "region": "us-east-1",
}
"resources": [
    "arn:aws:ec2:us-east-1:123456789012:fleet/fleet-8becf5fe-
    bb9e-415d-8f54-3fa5a8628b91"
],
"detail": {
    "description": "c4.xlarge, ami-0947d2ba12ee1ff75, Linux/UNIX, us-east-1a,
    Spot price in either SpotFleetRequestConfigData or SpotFleetLaunchSpecification or
    LaunchTemplate or LaunchTemplateOverrides is less than Spot market price $0.0619",
    "sub-type": "launchSpecUnusable"
}
}

The possible values for sub-type are:

fleetProgressHalted

The price in every launch specification is not valid because it is below the Spot price (all the
launch specifications have produced launchSpecUnusable events). A launch specification
might become valid if the Spot price changes.

launchSpecTemporarilyBlacklisted

The configuration is not valid and several attempts to launch instances have failed. For more
information, see the description of the event.

launchSpecUnusable

The price in a launch specification is not valid because it is below the Spot price.

registerWithLoadBalancersFailed

An attempt to register instances with load balancers failed. For more information, see the
description of the event.

**EC2 Fleet Error**

EC2 Fleet sends an EC2 Fleet Error event to Amazon EventBridge when there is an error during
fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```json
{
    "version": "0",
    "id": "69849a22-6d0f-d4ce-602b-b47c1c98240e",
}
The possible values for sub-type are:

iamFleetRoleInvalid

The EC2 Fleet does not have the required permissions to either launch or terminate an instance.

allLaunchSpecsTemporarilyBlacklisted

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

spotInstanceCountLimitExceeded

You've reached the limit on the number of Spot Instances that you can launch.

spotFleetRequestConfigurationInvalid

The configuration is not valid. For more information, see the description of the event.

**Spot Fleet event types**

There are five Spot Fleet event types. For each event type, there are several sub-types.

The events are sent to EventBridge in JSON format. The following fields in the event form the event pattern that is defined in the rule, and which trigger an action:

"source": "aws.ec2spotfleet"

Identifies that the event is from Spot Fleet.
"detail-type": "EC2 Spot Fleet State Change"

Identifies the event type.

"detail": {
    "sub-type": "submitted"
}

Identifies the event sub-type.

Event types

- **EC2 Spot Fleet State Change**
- **EC2 Spot Fleet Spot Instance Request Change**
- **EC2 Spot Fleet Instance Change**
- **EC2 Spot Fleet Information**
- **EC2 Spot Fleet Error**

**EC2 Spot Fleet State Change**

Spot Fleet sends an EC2 Spot Fleet State Change event to Amazon EventBridge when a Spot Fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "d1af1091-6cc3-2e24-203a-3b870e455d5b",
    "detail-type": "EC2 Spot Fleet State Change",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-09T08:57:06Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-4b6d274d-0cea-4b2c-b3be-9dc627ad1f55"
    ],
    "detail": {
        "sub-type": "submitted"
    }
}```
The possible values for sub-type are:

**active**

The Spot Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

**cancelled**

The Spot Fleet request is canceled and has no running instances. The Spot Fleet will be deleted two days after its instances are terminated.

**cancelled_running**

The Spot Fleet request is canceled and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

**cancelled_terminating**

The Spot Fleet request is canceled and its instances are terminating. The request remains in this state until all instances are terminated.

**expired**

The Spot Fleet request has expired. If the request was created with `TerminateInstancesWithExpiration` set, a subsequent terminated event indicates that the instances are terminated.

**modify_in_progress**

The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed.

**modify_succeeded**

The Spot Fleet request was modified.

**submitted**

The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

**progress**

The Spot Fleet request is in the process of being fulfilled.
EC2 Spot Fleet Spot Instance Request Change

Spot Fleet sends an EC2 Spot Fleet Spot Instance Request Change event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "cd141ef0-14af-d670-a71d-fe46e9971bd2",
    "detail-type": "EC2 Spot Fleet Spot Instance Request Change",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-09T08:53:21Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-a98d2133-941a-47dc-8b03-0f94c6852ad1"
    ],
    "detail": {
        "spot-instance-request-id": "sir-a2w9gc5h",
        "description": "SpotInstanceRequestId sir-a2w9gc5h, PreviousState: cancelled_running",
        "sub-type": "cancelled"
    }
}
```

The possible values for `sub-type` are:

- **active**
  
  The Spot Instance request is fulfilled and has an associated Spot Instance.

- **cancelled**
  
  You cancelled the Spot Instance request, or the Spot Instance request expired.

- **disabled**
  
  You stopped the Spot Instance.

- **submitted**
  
  The Spot Instance request is submitted.
EC2 Spot Fleet Instance Change

Spot Fleet sends an EC2 Spot Fleet Instance Change event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "11591686-5bd7-bb8a-eb40-d46529c2710f",
    "detail-type": "EC2 Spot Fleet Instance Change",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-09T07:25:02Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-c8a764a4-bedc-4b62-af9c-0095e6e3ba61"
    ],
    "detail": {
        "instance-id": "i-08b90df1e09c30c9b",
        "description": "{"instanceType":"r4.2xlarge","image":"ami-032930428bf1abbf","productDescription":"Linux/UNIX","availabilityZone":"us-east-1a"},
        "sub-type": "launched"
    }
}
```

The possible values for sub-type are:

- **launched**
  
  A new instance was launched.

- **terminated**
  
  The instance was terminated.

- **termination_notified**
  
  An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.
EC2 Spot Fleet Information

Spot Fleet sends an EC2 Spot Fleet Information event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```json
{
    "version": "0",
    "id": "73a60f70-3409-a66c-635c-7f66c5f5b669",
    "detail-type": "EC2 Spot Fleet Information",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-08T20:56:12Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-2531ea06-
        af18-4647-8757-7d69c94971b1"
    ],
    "detail": {
        "description": "r3.8xlarge, ami-032930428bf1abbff, Linux/UNIX, us-east-1a, Spot
bid price is less than Spot market price $0.5291",
        "sub-type": "launchSpecUnusable"
    }
}
```

The possible values for sub-type are:

**fleetProgressHalted**

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced `launchSpecUnusable` events). A launch specification might become valid if the Spot price changes.

**launchSpecTemporarilyBlacklisted**

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

**launchSpecUnusable**

The price in a launch specification is not valid because it is below the Spot price.
registerWithLoadBalancersFailed

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Spot Fleet Error

Spot Fleet sends an EC2 Spot Fleet Error event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```json
{
   "version": "0",
   "id": "10adc4e7-675c-643e-125c-5bfa1b1ba5d2",
   "detail-type": "EC2 Spot Fleet Error",
   "source": "aws.ec2spotfleet",
   "account": "123456789012",
   "time": "2020-11-09T06:56:07Z",
   "region": "us-east-1",
   "resources": [
      "arn:aws:ec2:us-east-1:123456789012:spot-fleet-request/sfr-38725d30-25f1-4f30-83ce-2907c56dba17"
   ],
   "detail": {
      "description": "r4.2xlarge, ami-032930428bf1abbff, Linux/UNIX: The associatePublicIPAddress parameter can only be specified for the network interface with DeviceIndex 0.",
      "sub-type": "spotFleetRequestConfigurationInvalid"
   }
}
```

The possible values for sub-type are:

iamFleetRoleInvalid

The Spot Fleet does not have the required permissions to either launch or terminate an instance.
None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

You've reached the limit on the number of Spot Instances that you can launch.

The configuration is not valid. For more information, see the description of the event.

**Create Amazon EventBridge rules**

When a notification of a state change is emitted for an EC2 Fleet or Spot Fleet, the event for the notification is sent to Amazon EventBridge. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes a target (or targets) specified in the rule.

You can write an EventBridge rule and automate what actions to take when the event pattern matches the rule.

**Topics**

- [Create Amazon EventBridge rules to monitor EC2 Fleet events](#)
- [Create Amazon EventBridge rules to monitor Spot Fleet events](#)

**Create Amazon EventBridge rules to monitor EC2 Fleet events**

When a notification of a state change is emitted for an EC2 Fleet, the event for the notification is sent to Amazon EventBridge in the form of a JSON file. You can write an EventBridge rule to automate what actions to take when an event pattern matches the rule. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

The following fields form the event pattern that is defined in the rule:

```
"source": "aws.ec2fleet"
```

Identifies that the event is from EC2 Fleet.
"detail-type": "EC2 Fleet State Change"

Identifies the event type.

"detail": { "sub-type": "submitted" }

Identifies the event sub-type.

For the list of EC2 Fleet events and example event data, see the section called “EC2 Fleet event types”.

Examples

- Create an EventBridge rule to send a notification
- Create an EventBridge rule to trigger a Lambda function

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits an EC2 Fleet state change notification. The signal in this example is emitted as an EC2 Fleet State Change event, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when an EC2 Fleet state changes

1. Open the Amazon EventBridge console at https://console.aws.amazon.com/events/.
2. Choose Create rule.
3. For Define rule detail, do the following:
   a. Enter a Name for the rule, and, optionally, a description.
      A rule can't have the same name as another rule in the same Region and on the same event bus.
   b. For Event bus, choose default. When an AWS service in your account generates an event, it always goes to your account's default event bus.
   c. For Rule type, choose Rule with an event pattern.
d. Choose **Next**.

4. **For Build event pattern**, do the following:

   a. **For Event source**, choose **AWS events or EventBridge partner events**.

   b. **For Event pattern**, for this example you'll specify the following event pattern to match the EC2 Fleet Instance Change event.

   ```json
   {
   "source": ["aws.ec2fleet"],
   "detail-type": ["EC2 Fleet Instance Change"]
   }
   ```

   To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

   i. To use a template to create the event pattern, do the following:

      A. Choose **Event pattern form**.

      B. **For Event source**, choose **AWS services**.

      C. **For AWS Service**, choose **EC2 Fleet**.

      D. **For Event type**, choose **EC2 Fleet Instance Change**.

      E. To customize the template, choose **Edit pattern** and make your changes to match the example event pattern.

   ii. **(Alternative)** To specify a custom event pattern, do the following:

      A. Choose **Custom pattern (JSON editor)**.

      B. In the **Event pattern** box, add the event pattern for this example.

   c. Choose **Next**.

5. **For Select target(s)**, do the following:

   a. **For Target types**, choose **AWS service**.

   b. **For Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.

   c. **For Topic**, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person (A2P) messaging](https://docs.aws.amazon.com/sns/latest/dg/app-to-person.html) in the Amazon Simple Notification Service Developer Guide.
d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see Creating Amazon EventBridge rules that react to events (step 16) in the Amazon EventBridge User Guide.

e. Choose Next.

6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose Next.

7. For **Review and create**, do the following:

   a. Review the details of the rule and modify them as necessary.

   b. Choose **Create rule**.

For more information, see Amazon EventBridge rules and Amazon EventBridge event patterns in the Amazon EventBridge User Guide

**Create an EventBridge rule to trigger a Lambda function**

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits an EC2 Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an EC2 Fleet Instance Change event, sub-type launched, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Lambda function.

**To create the Lambda function to use in the EventBridge rule**

1. Open the AWS Lambda console at https://console.aws.amazon.com/lambda/.
2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

   For more information about using Lambda, see Create a Lambda function with the console in the AWS Lambda Developer Guide.

**To create an EventBridge rule to trigger a Lambda function when an instance in an EC2 Fleet changes state**

1. Open the Amazon EventBridge console at https://console.aws.amazon.com/events/.
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:

   a. Enter a **Name** for the rule, and, optionally, a description.

      A rule can't have the same name as another rule in the same Region and on the same event bus.

   b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.

   c. For **Rule type**, choose **Rule with an event pattern**.

   d. Choose **Next**.

4. For **Build event pattern**, do the following:

   a. For **Event source**, choose **AWS events or EventBridge partner events**.

   b. For **Event pattern**, for this example you'll specify the following event pattern to match the **EC2 Fleet Instance Change** event and **launched** sub-type.

```json
{
  "source": ["aws.ec2fleet"],
  "detail-type": ["EC2 Fleet Instance Change"],
  "detail": {
    "sub-type": ["launched"]
  }
}
```

To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

i. To use a template to create the event pattern, do the following:

   A. Choose **Event pattern form**.

   B. For **Event source**, choose **AWS services**.

   C. For **AWS Service**, choose **EC2 Fleet**.

   D. For **Event type**, choose **EC2 Fleet Instance Change**.

   E. Choose **Edit pattern**, and add "detail": {"sub-type": ["launched"]} to match the example event pattern. For proper JSON format, insert a comma (,) after the preceding square bracket (]).

ii. (Alternative) To specify a custom event pattern, do the following:
A. Choose Custom pattern (JSON editor).

B. In the Event pattern box, add the event pattern for this example.

c. Choose Next.

5. For Select target(s), do the following:

a. For Target types, choose AWS service.

b. For Select a target, choose SNS topic to send an email, text message, or mobile push notification when the event occurs.

c. For Topic, choose Lambda function, and for Function, choose the function that you created to respond when the event occurs.

d. (Optional) Under Additional settings, you can optionally configure additional settings. For more information, see Creating Amazon EventBridge rules that react to events (step 16) in the Amazon EventBridge User Guide.

e. Choose Next.

6. (Optional) For Tags, you can optionally assign one or more tags to your rule, and then choose Next.

7. For Review and create, do the following:

a. Review the details of the rule and modify them as necessary.

b. Choose Create rule.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge in the AWS Lambda Developer Guide.

Create Amazon EventBridge rules to monitor Spot Fleet events

When a notification of a state change is emitted for a Spot Fleet, the event for the notification is sent to Amazon EventBridge in the form of a JSON file. You can write an EventBridge rule to automate what actions to take when an event pattern matches the rule. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

The following fields form the event pattern that is defined in the rule:
"source": "aws.ec2spotfleet"

Identifies that the event is from Spot Fleet.

"detail-type": "EC2 Spot Fleet State Change"

Identifies the event type.

"detail": { "sub-type": "submitted" }

Identifies the event sub-type.

For the list of Spot Fleet events and example event data, see the section called “Spot Fleet event types”.

Examples

- Create an EventBridge rule to send a notification
- Create an EventBridge rule to trigger a Lambda function

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits a Spot Fleet state change notification. The signal in this example is emitted as an EC2 Spot Fleet State Change event, which triggers the action defined by the rule. Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when a Spot Fleet state changes

1. Open the Amazon EventBridge console at https://console.aws.amazon.com/events/.
2. Choose Create rule.
3. For Define rule detail, do the following:
   a. Enter a Name for the rule, and, optionally, a description.
      A rule can't have the same name as another rule in the same Region and on the same event bus.
   b. For Event bus, choose default. When an AWS service in your account generates an event, it always goes to your account's default event bus.
   c. For Rule type, choose Rule with an event pattern.
d. Choose Next.

4. For Build event pattern, do the following:
   a. For Event source, choose AWS events or EventBridge partner events.
   b. For Event pattern, for this example you’ll specify the following event pattern to match the EC2 Spot Fleet Instance Change event.

   ```json
   {
     "source": ["aws.ec2spotfleet"],
     "detail-type": ["EC2 Spot Fleet Instance Change"]
   }
   ```

   To add the event pattern, you can either use a template by choosing Event pattern form, or specify your own pattern by choosing Custom pattern (JSON editor), as follows:

   i. To use a template to create the event pattern, do the following:

      A. Choose Event pattern form.
      B. For Event source, choose AWS services.
      C. For AWS Service, choose EC2 Spot Fleet.
      D. For Event type, choose EC2 Spot Fleet Instance Change.
      E. To customize the template, choose Edit pattern and make your changes to match the example event pattern.

   ii. (Alternative) To specify a custom event pattern, do the following:

      A. Choose Custom pattern (JSON editor).
      B. In the Event pattern box, add the event pattern for this example.

   c. Choose Next.

5. For Select target(s), do the following:
   a. For Target types, choose AWS service.
   b. For Select a target, choose SNS topic to send an email, text message, or mobile push notification when the event occurs.
   c. For Topic, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see Using Amazon SNS for application-to-person (A2P) messaging in the Amazon Simple Notification Service Developer Guide.
d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see *Creating Amazon EventBridge rules that react to events* (step 16) in the *Amazon EventBridge User Guide*.

e. Choose **Next**.

6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.

7. For **Review and create**, do the following:
   a. Review the details of the rule and modify them as necessary.
   b. Choose **Create rule**.

For more information, see *Amazon EventBridge rules* and *Amazon EventBridge event patterns* in the *Amazon EventBridge User Guide*

**Create an EventBridge rule to trigger a Lambda function**

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits a Spot Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an EC2 Spot Fleet Instance Change event, sub-type launched, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Lambda function.

**To create the Lambda function to use in the EventBridge rule**

2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

   For more information about using Lambda, see *Create a Lambda function with the console* in the *AWS Lambda Developer Guide*.

**To create an EventBridge rule to trigger a Lambda function when an instance in a Spot Fleet changes state**

1. Open the Amazon EventBridge console at [https://console.aws.amazon.com/events/](https://console.aws.amazon.com/events/).
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:
   a. Enter a **Name** for the rule, and, optionally, a description.
      
      A rule can't have the same name as another rule in the same Region and on the same event bus.
   b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
   c. For **Rule type**, choose **Rule with an event pattern**.
   d. Choose **Next**.

4. For **Build event pattern**, do the following:
   a. For **Event source**, choose **AWS events or EventBridge partner events**.
   b. For **Event pattern**, for this example you'll specify the following event pattern to match the **EC2 Spot Fleet Instance Change** event and **launched** sub-type.

   ```json
   {
      "source": ["aws.ec2spotfleet"],
      "detail-type": ["EC2 Spot Fleet Instance Change"],
      "detail": {
         "sub-type": ["launched"]
      }
   }
   
   To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

   i. To use a template to create the event pattern, do the following:
      
      A. Choose **Event pattern form**.
      B. For **Event source**, choose **AWS services**.
      C. For **AWS Service**, choose **EC2 Spot Fleet**.
      D. For **Event type**, choose **EC2 Spot Fleet Instance Change**.
      E. Choose **Edit pattern**, and add "detail": {"sub-type": ["launched"]} to match the example event pattern. For proper JSON format, insert a comma (,) after the preceding square bracket (]).

   ii. (Alternative) To specify a custom event pattern, do the following:
A. Choose **Custom pattern (JSON editor)**.

B. In the **Event pattern** box, add the event pattern for this example.

c. Choose **Next**.

5. For **Select target(s)**, do the following:

   a. For **Target types**, choose **AWS service**.

   b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.

   c. For **Topic**, choose **Lambda function**, and for **Function**, choose the function that you created to respond when the event occurs.

   d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see [Creating Amazon EventBridge rules that react to events](https://docs.aws.amazon.com/AmazonEventBridge/latest/UG/eventbridge-rule-examples.html) (step 16) in the [Amazon EventBridge User Guide](https://docs.aws.amazon.com/AmazonEventBridge/latest/UG/).

   e. Choose **Next**.

6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.

7. For **Review and create**, do the following:

   a. Review the details of the rule and modify them as necessary.

   b. Choose **Create rule**.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see [Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge](https://docs.aws.amazon.com/AmazonEventBridge/latest/UG/eventbridge-rule-examples.html) in the [AWS Lambda Developer Guide](https://docs.aws.amazon.com/AmazonLambda/latest/DevGuide/)

### Tutorials for EC2 Fleet and Spot Fleet

The following tutorials take you through the common processes for creating EC2 Fleets and Spot Fleets.

**Tutorials**

- [Tutorial: Use EC2 Fleet with On-Demand as the primary capacity](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/Tutorials-Use-EC2-Fleet-On-Demand-Primary-Capacity.html)
Tutorial: Use EC2 Fleet with instance weighting

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting an EC2 Fleet using instance weighting.

Objective

Example Corp, a pharmaceutical company, wants to use the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

Planning

Example Corp first reviews Spot Best Practices. Next, Example Corp determines the requirements for their EC2 Fleet.

Instance types

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Memory (GiB)</th>
<th>vCPUs</th>
</tr>
</thead>
<tbody>
<tr>
<td>r3.2xlarge</td>
<td>61</td>
<td>8</td>
</tr>
<tr>
<td>r3.4xlarge</td>
<td>122</td>
<td>16</td>
</tr>
<tr>
<td>r3.8xlarge</td>
<td>244</td>
<td>32</td>
</tr>
</tbody>
</table>

Target capacity in units

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the
base for their application (60 GB of RAM and eight vCPUs) as one unit, Example Corp decides that 20 times this amount would meet their needs. So the company sets the target capacity of their EC2 Fleet request to 20.

**Instance weights**

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20
- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their EC2 Fleet request.

**Price per unit hour**

Example Corp uses the On-Demand price per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

<table>
<thead>
<tr>
<th>Instance type</th>
<th>On-Demand price</th>
<th>Instance weight</th>
<th>Price per unit hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>r3.2xLarge</td>
<td>$0.7</td>
<td>1</td>
<td>$0.7</td>
</tr>
<tr>
<td>r3.4xLarge</td>
<td>$1.4</td>
<td>2</td>
<td>$0.7</td>
</tr>
<tr>
<td>r3.8xLarge</td>
<td>$2.8</td>
<td>4</td>
<td>$0.7</td>
</tr>
</tbody>
</table>

Example Corp could use a global price per unit hour of $0.7 and be competitive for all three instance types. They could also use a global price per unit hour of $0.7 and a specific price per unit hour of $0.9 in the r3.8xlarge launch specification.
Verify permissions

Before creating an EC2 Fleet, Example Corp verifies that it has an IAM role with the required permissions. For more information, see EC2 Fleet prerequisites.

Create a launch template

Next, Example Corp creates a launch template. The launch template ID is used in the following step. For more information, see Create a launch template.

Create the EC2 Fleet

Example Corp creates a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```json
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-07b3bc7625cdab851",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r3.2xlarge",
                    "SubnetId": "subnet-482e4972",
                    "WeightedCapacity": 1
                },
                {
                    "InstanceType": "r3.4xlarge",
                    "SubnetId": "subnet-482e4972",
                    "WeightedCapacity": 2
                },
                {
                    "InstanceType": "r3.8xlarge",
                    "MaxPrice": "0.90",
                    "SubnetId": "subnet-482e4972",
                    "WeightedCapacity": 4
                }
            ]
        }
    ]
}
```
Example Corp creates the EC2 Fleet using the following `create-fleet` command.

```bash
aws ec2 create-fleet \
  --cli-input-json file://config.json
```

For more information, see Create an EC2 Fleet.

**Fulfillment**

The allocation strategy determines which Spot capacity pools your Spot Instances come from.

With the lowest-price strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the EC2 Fleet launches either 20 `r3.2xlarge` instances (20 divided by 1), 10 `r3.4xlarge` instances (20 divided by 2), or 5 `r3.8xlarge` instances (20 divided by 4).

If Example Corp used the diversified strategy, the Spot Instances would come from all three pools. The EC2 Fleet would launch 6 `r3.2xlarge` instances (which provide 6 units), 3 `r3.4xlarge` instances (which provide 6 units), and 2 `r3.8xlarge` instances (which provide 8 units), for a total of 20 units.

**Tutorial: Use EC2 Fleet with On-Demand as the primary capacity**

This tutorial uses a fictitious company called ABC Online to illustrate the process of requesting an EC2 Fleet with On-Demand as the primary capacity, and Spot capacity if available.

**Objective**

ABC Online, a restaurant delivery company, wants to be able to provision Amazon EC2 capacity across EC2 instance types and purchasing options to achieve their desired scale, performance, and cost.
Plan

ABC Online requires a fixed capacity to operate during peak periods, but would like to benefit from increased capacity at a lower price. ABC Online determines the following requirements for their EC2 Fleet:

- On-Demand Instance capacity – ABC Online requires 15 On-Demand Instances to ensure that they can accommodate traffic at peak periods.
- Spot Instance capacity – ABC Online would like to improve performance, but at a lower price, by provisioning 5 Spot Instances.

Verify permissions

Before creating an EC2 Fleet, ABC Online verifies that it has an IAM role with the required permissions. For more information, see EC2 Fleet prerequisites.

Create a launch template

Next, ABC Online creates a launch template. The launch template ID is used in the following step. For more information, see Create a launch template.

Create the EC2 Fleet

ABC Online creates a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{
   "LaunchTemplateConfigs": [
   {
      "LaunchTemplateSpecification": {
         "LaunchTemplateId": "lt-07b3bc7625cdab851",
         "Version": "2"
      }
   }
   ],
   "TargetCapacitySpecification": {
      "TotalTargetCapacity": 20,
      "OnDemandTargetCapacity": 15,
      "DefaultTargetCapacityType": "spot"
   }
}
ABC Online creates the EC2 Fleet using the following `create-fleet` command.

```
aws ec2 create-fleet \\
  --cli-input-json file://config.json
```

For more information, see [Create an EC2 Fleet](#).

**Fulfillment**

The allocation strategy determines that the On-Demand capacity is always fulfilled, while the balance of the target capacity is fulfilled as Spot if there is capacity and availability.

**Tutorial: Launch On-Demand Instances using targeted Capacity Reservations**

This tutorial walks you through all the steps that you must perform so that your EC2 Fleet launches On-Demand Instances into targeted Capacity Reservations.

You will learn how to configure a fleet to use targeted On-Demand Capacity Reservations first when launching On-Demand Instances. You will also learn how to configure the fleet so that, when the total On-Demand target capacity exceeds the number of available unused Capacity Reservations, the fleet uses the specified allocation strategy for selecting the instance pools in which to launch the remaining target capacity.

**EC2 Fleet configuration**

In this tutorial, the fleet configuration is as follows:

- **Target capacity:** 10 On-Demand Instances
- **Total unused targeted Capacity Reservations:** 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- **Number of Capacity Reservation pools:** 2 (`us-east-1a` and `us-east-1b`)
- **Number of Capacity Reservations per pool:** 3
- **On-Demand allocation strategy:** `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)
Note that you can also use the prioritized allocation strategy instead of the lowest-price allocation strategy.

To launch On-Demand Instances into targeted Capacity Reservations, you must perform a number of steps, as follows:

- **Step 1: Create Capacity Reservations**
- **Step 2: Create a Capacity Reservation resource group**
- **Step 3: Add the Capacity Reservations to the Capacity Reservation resource group**
- **(Optional) Step 4: View the Capacity Reservations in the resource group**
- **Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group**
- **(Optional) Step 6: Describe the launch template**
- **Step 7: Create an EC2 Fleet**
- **(Optional) Step 8: View the number of remaining unused Capacity Reservations**

### Step 1: Create Capacity Reservations

Use the `create-capacity-reservation` command to create the Capacity Reservations, three for `us-east-1a` and another three for `us-east-1b`. Except for the Availability Zone, the other attributes of the Capacity Reservations are identical.

**3 Capacity Reservations in us-east-1a**

```
aws ec2 create-capacity-reservation \
    --availability-zone us-east-1a\n    --instance-type c5.xlarge\n    --instance-platform Linux/UNIX \n    --instance-count 3 \n    --instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-1234567890abcdef1
```

**3 Capacity Reservations in us-east-1b**
aws ec2 create-capacity-reservation \
    --availability-zone us-east-1b\n    --instance-type c5.xlarge\n    --instance-platform Linux/UNIX \n    --instance-count 3 \n    --instance-match-criteria targeted

Example of resulting Capacity Reservation ID

cr-54321abcdef567890

Step 2: Create a Capacity Reservation resource group

Use the resource-groups service and the create-group command to create a Capacity Reservation resource group. In this example, the resource group is named my-cr-group. For information about why you must create a resource group, see Use Capacity Reservations for On-Demand Instances.

aws resource-groups create-group \ 
    --name my-cr-group \ 
    --configuration '{"Type":"AWS::EC2::CapacityReservationPool"}'\n    '{"Type":"AWS::ResourceGroups::Generic", "Parameters": ["Name": "allowed-resource-types", "Values": ["AWS::EC2::CapacityReservation"]}]

Step 3: Add the Capacity Reservations to the Capacity Reservation resource group

Use the resource-groups service and the group-resources command to add the Capacity Reservations that you created in Step 1 to the Capacity Reservations resource group. Note that you must reference the On-Demand Capacity Reservations by their ARNs.

aws resource-groups group-resources \ 
    --group my-cr-group \ 
    --resource-arns \ 
    arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1 \ 
    arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890

Example output

{
    "Failed": [],
]

(Optional) Step 4: View the Capacity Reservations in the resource group

Use the resource-groups service and the list-group-resources command to optionally describe the resource group to view its Capacity Reservations.

```bash
aws resource-groups list-group-resources --group my-cr-group
```

Example output

```json
{
   "ResourceIdentifiers": [  
   
      {  
         "ResourceType": "AWS::EC2::CapacityReservation",
         "ResourceArn": "arn:aws:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1"
      },
      {  
         "ResourceType": "AWS::EC2::CapacityReservation",
      }
   ]
}
```

Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group

Use the create-launch-template command to create a launch template in which to specify the Capacity Reservations to use. In this example, the fleet will use targeted Capacity Reservations, which have been added to a resource group. Therefore, the launch template data specifies that the Capacity Reservation targets a specific resource group. In this example, the launch template is named my-launch-template.

```bash
aws ec2 create-launch-template \
```

Tutorial: Launch On-Demand Instances using targeted Capacity Reservations
(Optional) Step 6: Describe the launch template

Use the `describe-launch-template` command to optionally describe the launch template to view its configuration.

```
aws ec2 describe-launch-template-versions --launch-template-name my-launch-template
```

Example output

```
{
  "LaunchTemplateVersions": [
    {
      "LaunchTemplateId": "lt-01234567890example",
      "LaunchTemplateName": "my-launch-template",
      "VersionNumber": 1,
      "CreateTime": "2021-01-19T20:50:19.000Z",
      "CreatedBy": "arn:aws:iam::123456789012:user/Admin",
      "DefaultVersion": true,
      "LaunchTemplateData": {
        "ImageId": "ami-0947d2ba12ee1ff75",
        "CapacityReservationSpecification": {
          "CapacityReservationTarget": {
            "CapacityReservationResourceGroupArn": "arn:aws:resource-groups:us-east-1:123456789012:group/my-cr-group"
          }
        }
      }
    }
  ]
}
```
Step 7: Create an EC2 Fleet

Create an EC2 Fleet that specifies the configuration information for the instances that it will launch. The following EC2 Fleet configuration shows only the pertinent configurations for this example. The launch template `my-launch-template` is the launch template you created in Step 5. There are two instance pools, each with the same instance type (`c5.xlarge`), but with different Availability Zones (`us-east-1a` and `us-east-1b`). The price of the instance pools is the same because pricing is defined for the Region, not per Availability Zone. The total target capacity is 10, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

Note

The fleet type must be instant. Other fleet types do not support use-capacity-reservations-first.

```json
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "c5.xlarge",
                    "AvailabilityZone": "us-east-1a"
                },
                {
                    "InstanceType": "c5.xlarge",
                    "AvailabilityZone": "us-east-1b"
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 10,
        "DefaultTargetCapacityType": "on-demand"
    }
}
```
After you create the **instant** fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
  - 3 On-Demand Instances are launched into the 3 `c5.xlarge` targeted Capacity Reservations in `us-east-1a`
  - 3 On-Demand Instances are launched into the 3 `c5.xlarge` targeted Capacity Reservations in `us-east-1b`
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is `lowest-price` in this example. However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

**Optional** Step 8: View the number of remaining unused Capacity Reservations

After the fleet is launched, you can optionally run `describe-capacity-reservations` to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```json

{ "CapacityReservationId": "cr-111",
  "InstanceType": "c5.xlarge",
  "AvailableInstanceCount": 0
}

{ "CapacityReservationId": "cr-222",
  "InstanceType": "c5.xlarge",
  "AvailableInstanceCount": 0
}
```
Tutorial: Launch instances into Capacity Blocks

This tutorial walks you through the steps that you must perform so that your EC2 Fleet launches instances into Capacity Blocks. For more information about Capacity Blocks, see Capacity Blocks for ML.

You can use EC2 Fleet of type instant to launch instances into Capacity Blocks. For more information, see Use an EC2 Fleet of type 'instant'.

In most cases, the target capacity of the EC2 Fleet request should be less then or equal to the available capacity of the Capacity Block reservation that you are targeting. Target capacity requests that exceed the limits of the Capacity Block reservation will not be fulfilled. If the target capacity request exceeds the limits of your Capacity Block reservation, you will receive an Insufficient Capacity Exception for the capacity that exceeds the limits of your Capacity Block reservation.

Note

For Capacity Blocks, EC2 Fleet will not fallback to launching On-Demand Instances for the remainder of the desired target capacity.

If EC2 Fleet is unable to fulfill the requested target capacity in an available Capacity Block reservation, EC2 Fleet will fulfill as much capacity as it can and return the instances that it was able to launch. You can repeat the call to EC2 Fleet again until all the instances are provisioned.

After configuring the EC2 Fleet request, you must wait until the start date of your Capacity Block reservation. If you make requests to EC2 Fleet to launch into a Capacity Block that hasn't started yet, you will receive an Insufficient Fleet Capacity Error.

After your Capacity Block reservation becomes active, you can make EC2 Fleet API calls and provision the instances into your Capacity Block based on the parameters you selected. Instances running in the Capacity Block continue to run until you stop or terminate them through a separate Amazon EC2 API call or until Amazon EC2 terminates the instances when the Capacity Block reservation ends.

Considerations

- Multiple Capacity Blocks in the same CreateFleet request aren't supported.
- Using OnDemandTargetCapacity or SpotTargetCapacity while also setting capacity-block as the DefaultTargetCapacity isn't supported.
If DefaultTargetCapacityType is set to capacity-block, you can't provide OnDemandOptions::CapacityReservationOptions. An exception will occur.

Create a launch template

The launch template ID is used in the following step. For more information, see Create a launch template.

To configure the launch template, for InstanceMarketOptionsRequest, set MarketType to capacity-block. Specify the Capacity Block reservation ID that you are targeting by setting the CapacityReservationID parameter.

Create the EC2 Fleet

Create a file, config.json, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```json
{
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateName": "CBR-launch-template",
        "Version": "1"
      },
      "Overrides": [
        {
          "InstanceType": "p5.48xlarge",
          "AvailabilityZone": "us-east-1a"
        }
      ]
    }]
  "TargetCapacitySpecification": {
    "TotalTargetCapacity": 10,
    "DefaultTargetCapacityType": "capacity-block"
  },
  "Type": "instant"
}
```

Use the following create-fleet command.

```
aws ec2 create-fleet \
```
For more information, see Create an EC2 Fleet.

**Tutorial: Use Spot Fleet with instance weighting**

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting a Spot Fleet using instance weighting.

**Objective**

Example Corp, a pharmaceutical company, wants to leverage the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

**Planning**

Example Corp first reviews Spot Best Practices. Next, Example Corp determines the following requirements for their Spot Fleet.

**Instance types**

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Memory (GiB)</th>
<th>vCPUs</th>
</tr>
</thead>
<tbody>
<tr>
<td>r3.2xlarge</td>
<td>61</td>
<td>8</td>
</tr>
<tr>
<td>r3.4xlarge</td>
<td>122</td>
<td>16</td>
</tr>
<tr>
<td>r3.8xlarge</td>
<td>244</td>
<td>32</td>
</tr>
</tbody>
</table>

**Target capacity in units**

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the base for their application (60 GB of RAM and eight vCPUs) as 1 unit, Example Corp decides that 20
times this amount would meet their needs. So the company sets the target capacity of their Spot Fleet request to 20.

**Instance weights**

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20
- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their Spot Fleet request.

**Price per unit hour**

Example Corp uses the **On-Demand price** per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

<table>
<thead>
<tr>
<th>Instance type</th>
<th>On-Demand price</th>
<th>Instance weight</th>
<th>Price per unit hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>r3.2xLarge</td>
<td>$0.7</td>
<td>1</td>
<td>$0.7</td>
</tr>
<tr>
<td>r3.4xLarge</td>
<td>$1.4</td>
<td>2</td>
<td>$0.7</td>
</tr>
<tr>
<td>r3.8xLarge</td>
<td>$2.8</td>
<td>4</td>
<td>$0.7</td>
</tr>
</tbody>
</table>

Example Corp could use a global price per unit hour of $0.7 and be competitive for all three instance types. They could also use a global price per unit hour of $0.7 and a specific price per unit hour of $0.9 in the r3.8xlarge launch specification.

**Verify permissions**

Before creating a Spot Fleet request, Example Corp verifies that it has an IAM role with the required permissions. For more information, see [Spot Fleet permissions](#).
Create the request

Example Corp creates a file, `config.json`, with the following configuration for its Spot Fleet request:

```json
{
  "SpotPrice": "0.70",
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
  "LaunchSpecifications": [
    {
      "ImageId": "ami-1a2b3c4d",
      "InstanceType": "r3.2xlarge",
      "SubnetId": "subnet-482e4972",
      "WeightedCapacity": 1
    },
    {
      "ImageId": "ami-1a2b3c4d",
      "InstanceType": "r3.4xlarge",
      "SubnetId": "subnet-482e4972",
      "WeightedCapacity": 2
    },
    {
      "ImageId": "ami-1a2b3c4d",
      "InstanceType": "r3.8xlarge",
      "SubnetId": "subnet-482e4972",
      "SpotPrice": "0.90",
      "WeightedCapacity": 4
    }
  ]
}
```

Example Corp creates the Spot Fleet request using the `request-spot-fleet` command.

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

For more information, see [Spot Fleet request types](#).

Fulfillment

The allocation strategy determines which Spot capacity pools your Spot Instances come from.
With the lowestPrice strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the Spot Fleet launches either 20 \( r3.2xlarge \) instances (20 divided by 1), 10 \( r3.4xlarge \) instances (20 divided by 2), or 5 \( r3.8xlarge \) instances (20 divided by 4).

If Example Corp used the diversified strategy, the Spot Instances would come from all three pools. The Spot Fleet would launch 6 \( r3.2xlarge \) instances (which provide 6 units), 3 \( r3.4xlarge \) instances (which provide 6 units), and 2 \( r3.8xlarge \) instances (which provide 8 units), for a total of 20 units.

**Example configurations for EC2 Fleet and Spot Fleet**

The following examples show launch configurations that you can use to create EC2 Fleets and Spot Fleets.

**Topics**

- [EC2 Fleet example configurations](#)
- [Spot Fleet example configurations](#)

**EC2 Fleet example configurations**

The following examples show launch configurations that you can use with the `create-fleet` command to create an EC2 Fleet. For more information about the parameters, see `create-fleet` in the [AWS CLI Command Reference](#).

**Examples**

- [Example 1: Launch Spot Instances as the default purchasing option](#)
- [Example 2: Launch On-Demand Instances as the default purchasing option](#)
- [Example 3: Launch On-Demand Instances as the primary capacity](#)
- [Example 4: Launch On-Demand Instances using multiple Capacity Reservations](#)
- [Example 5: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations](#)
- [Example 6: Launch On-Demand Instances using targeted Capacity Reservations](#)
- [Example 7: Configure Capacity Rebalancing to launch replacement Spot Instances](#)
- [Example 8: Launch Spot Instances in a capacity-optimized fleet](#)
• Example 9: Launch Spot Instances in a capacity-optimized fleet with priorities
• Example 10: Launch Spot Instances in a price-capacity-optimized fleet
• Example 11: Configure attribute-based instance type selection

Example 1: Launch Spot Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is spot, which results in the fleet launching 2 Spot Instances.

```json
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Example 2: Launch On-Demand Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is on-demand, which results in the fleet launching 2 On-Demand Instances.

```json
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
```
Example 3: Launch On-Demand Instances as the primary capacity

The following example specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing option is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfill the total target capacity. The purchasing option for the difference is calculated as TotalTargetCapacity – OnDemandTargetCapacity = DefaultTargetCapacityType, which results in the fleet launching 1 Spot Instance.

Example 4: Launch On-Demand Instances using multiple Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to use-capacity-
reservations-first. This example demonstrates how the fleet selects the Capacity Reservations to use when there are more Capacity Reservations than are needed to fulfil the target capacity.

In this example, the fleet configuration is as follows:

- Target capacity: 12 On-Demand Instances
- Total unused Capacity Reservations: 15 (more than the fleet's target capacity of 12 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (m5.large, m4.xlarge, and m4.2xlarge)
- Number of Capacity Reservations per pool: 5
- On-Demand allocation strategy: lowest-price (When there are multiple unused Capacity Reservations in multiple instance pools, the fleet determines the pools in which to launch the On-Demand Instances based on the On-Demand allocation strategy.)

Note that you can also use the prioritized allocation strategy instead of the lowest-price allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```json
{
   "CapacityReservationId": "cr-111",
   "InstanceType": "m5.large",
   "InstancePlatform": "Linux/UNIX",
   "AvailabilityZone": "us-east-1a",
   "AvailableInstanceCount": 5,
   "InstanceMatchCriteria": "open",
   "State": "active"
}

{
   "CapacityReservationId": "cr-222",
   "InstanceType": "m4.xlarge",
   "InstancePlatform": "Linux/UNIX",
   "AvailabilityZone": "us-east-1a",
   "AvailableInstanceCount": 5,
   "State": "active"
}
```
Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 12, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price is:

- m5.large – $0.096 per hour
- m4.xlarge – $0.20 per hour
- m4.2xlarge – $0.40 per hour

Note

The fleet type must be of type instant. Other fleet types do not support use-capacity-reservations-first.
After you create the instant fleet using the preceding configuration, the following 12 instances are launched to meet the target capacity:

- 5 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is the lowest price, and there are 5 available unused m5.large Capacity Reservations
- 5 m4.xlarge On-Demand Instances in us-east-1a – m4.xlarge in us-east-1a is the next lowest price, and there are 5 available unused m4.xlarge Capacity Reservations
• 2 m4.2xlarge On-Demand Instances in us-east-1a – m4.2xlarge in us-east-1a is the third lowest price, and there are 5 available unused m4.2xlarge Capacity Reservations of which only 2 are needed to meet the target capacity

After the fleet is launched, you can run `describe-capacity-reservations` to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the m5.large and m4.xlarge Capacity Reservations were used, with 3 m4.2xlarge Capacity Reservations remaining unused.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}
{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "AvailableInstanceCount": 0
}
{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "AvailableInstanceCount": 3
}
```

**Example 5: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations**

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

• Target capacity: 16 On-Demand Instances
• Total unused Capacity Reservations: 15 (less than the fleet's target capacity of 16 On-Demand
Instances)
• Number of Capacity Reservation pools: 3 (m5.large, m4.xlarge, and m4.2xlarge)
• Number of Capacity Reservations per pool: 5
• On-Demand allocation strategy: lowest-price (When the number of unused Capacity
Reservations is less than the On-Demand target capacity, the fleet determines the pools in which
to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the prioritized allocation strategy instead of the lowest-price allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of
Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```json
{
   "CapacityReservationId": "cr-111",
   "InstanceType": "m5.large",
   "InstancePlatform": "Linux/UNIX",
   "AvailabilityZone": "us-east-1a",
   "AvailableInstanceCount": 5,
   "InstanceMatchCriteria": "open",
   "State": "active"
}

{
   "CapacityReservationId": "cr-222",
   "InstanceType": "m4.xlarge",
   "InstancePlatform": "Linux/UNIX",
   "AvailabilityZone": "us-east-1a",
   "AvailableInstanceCount": 5,
   "InstanceMatchCriteria": "open",
   "State": "active"
}

{
   "CapacityReservationId": "cr-333",
   "InstanceType": "m4.2xlarge",
   "InstancePlatform": "Linux/UNIX",
   "AvailabilityZone": "us-east-1a",
}
Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 16, and the default target capacity type is on-demand. The On-Demand allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price is:

- m5.large – $0.096 per hour
- m4.xlarge – $0.20 per hour
- m4.2xlarge – $0.40 per hour

ℹ️ Note

The fleet type must be instant. Other fleet types do not support use-capacity-reservations-first.
After you create the instant fleet using the preceding configuration, the following 16 instances are launched to meet the target capacity:

- 6 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is the lowest price, and there are 5 available unused m5.large Capacity Reservations. The Capacity Reservations are used first to launch 5 On-Demand Instances. After the remaining m4.xlarge and m4.2xlarge Capacity Reservations are used, to meet the target capacity an additional On-Demand Instance is launched according to the On-Demand allocation strategy, which is lowest-price in this example.

- 5 m4.xlarge On-Demand Instances in us-east-1a – m4.xlarge in us-east-1a is the next lowest price, and there are 5 available unused m4.xlarge Capacity Reservations

- 5 m4.2xlarge On-Demand Instances in us-east-1a – m4.2xlarge in us-east-1a is the third lowest price, and there are 5 available unused m4.2xlarge Capacity Reservations
After the fleet is launched, you can run `describe-capacity-reservations` to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}
{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "AvailableInstanceCount": 0
}
{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "AvailableInstanceCount": 0
}
```

**Example 6: Launch On-Demand Instances using targeted Capacity Reservations**

You can configure a fleet to use targeted On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how to launch On-Demand Instances into targeted Capacity Reservations, where the attributes of the Capacity Reservations are the same except for their Availability Zones (`us-east-1a` and `us-east-1b`). It also demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 10 On-Demand Instances
- Total unused targeted Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (`us-east-1a` and `us-east-1b`)
- Number of Capacity Reservations per pool: 3
• **On-Demand allocation strategy: lowest-price** (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

Note that you can also use the prioritized allocation strategy instead of the lowest-price allocation strategy.

For a walkthrough of the procedures that you must perform to accomplish this example, see [Tutorial: Launch On-Demand Instances using targeted Capacity Reservations](#).

### Capacity Reservations

The account has the following 6 unused Capacity Reservations in 2 different pools. In this example, the pools differ by their Availability Zones. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{
   "CapacityReservationId": "cr-111",
   "InstanceType": "c5.xlarge",
   "InstancePlatform": "Linux/UNIX",
   "AvailabilityZone": "us-east-1a",
   "AvailableInstanceCount": 3,
   "InstanceMatchCriteria": "open",
   "State": "active"
}

{
   "CapacityReservationId": "cr-222",
   "InstanceType": "c5.xlarge",
   "InstancePlatform": "Linux/UNIX",
   "AvailabilityZone": "us-east-1b",
   "AvailableInstanceCount": 3,
   "InstanceMatchCriteria": "open",
   "State": "active"
}
```

### Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 10, and the default target capacity type is on-demand. The On-Demand
The allocation strategy is lowest-price. The usage strategy for Capacity Reservations is use-capacity-reservations-first.

In this example, the On-Demand Instance price for c5.xlarge in us-east-1 is $0.17 per hour.

**Note**

The fleet type must be instant. Other fleet types do not support use-capacity-reservations-first.

```json
{
   "LaunchTemplateConfigs": [
      {
         "LaunchTemplateSpecification": {
            "LaunchTemplateName": "my-launch-template",
            "Version": "1"
         },
         "Overrides": [
            {
               "InstanceType": "c5.xlarge",
               "AvailabilityZone": "us-east-1a"
            },
            {
               "InstanceType": "c5.xlarge",
               "AvailabilityZone": "us-east-1b"
            }
         ]
      }
   ],
   "TargetCapacitySpecification": {
      "TotalTargetCapacity": 10,
      "DefaultTargetCapacityType": "on-demand"
   },
   "OnDemandOptions": {
      "AllocationStrategy": "lowest-price",
      "CapacityReservationOptions": {
         "UsageStrategy": "use-capacity-reservations-first"
      }
   },
   "Type": "instant"
}
```
After you create the instant fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
  - 3 On-Demand Instances are launched into the 3 \textit{c5.xlarge} targeted Capacity Reservations in \textit{us-east-1a}
  - 3 On-Demand Instances are launched into the 3 \textit{c5.xlarge} targeted Capacity Reservations in \textit{us-east-1b}
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is \textit{lowest-price} in this example. However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

After the fleet is launched, you can run \texttt{describe-capacity-reservations} to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

\begin{verbatim}
{
   "CapacityReservationId": "cr-111",
   "InstanceType": "c5.xlarge",
   "AvailableInstanceCount": 0
}
{
   "CapacityReservationId": "cr-222",
   "InstanceType": "c5.xlarge",
   "AvailableInstanceCount": 0
}
\end{verbatim}

**Example 7: Configure Capacity Rebalancing to launch replacement Spot Instances**

The following example configures the EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for \texttt{ReplacementStrategy}, specify \texttt{launch-before-terminate}. To configure the time delay from when the new replacement Spot Instances are launched to when the old Spot Instances are automatically deleted, for \texttt{termination-delay}, specify a value in seconds. For more information, see \texttt{Configuration options}.
Note

We recommend using `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete so that the old instances are only terminated after these procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the EC2 Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for `AllocationStrategy`, specify `capacity-optimized`. For more information about what you should consider when configuring an EC2 Fleet for Capacity Rebalancing, see [Capacity Rebalancing](#).

```json
{
  "ExcessCapacityTerminationPolicy": "termination",
  "LaunchTemplateConfigs": [
    {
      "LaunchTemplateSpecification": {
        "LaunchTemplateName": "LaunchTemplate",
        "Version": "1"
      },
      "Overrides": [
        {
          "InstanceType": "c3.large",
          "WeightedCapacity": 1,
          "Placement": {
            "AvailabilityZone": "us-east-1a"
          }
        },
        {
          "InstanceType": "c4.large",
          "WeightedCapacity": 1,
          "Placement": {
            "AvailabilityZone": "us-east-1a"
          }
        },
        {
          "InstanceType": "c5.large",
          "WeightedCapacity": 1,
          "Placement": {
```
Example 8: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set AllocationStrategy to capacity-optimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```json
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "MaintenanceStrategies": {
            "CapacityRebalance": {
                "ReplacementStrategy": "launch-before-terminate",
                "TerminationDelay": "720"
            }
        }
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
```
Example 9: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the capacity-optimized-prioritized allocation strategy, you can use the Priority parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set AllocationStrategy to capacity-optimized-prioritized. EC2 Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect EC2 Fleet's ability to
provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```json
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized-prioritized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateName": "my-launch-template",
            "Version": "1"
        },
        "Overrides": [
            {
                "InstanceType": "r4.2xlarge",
                "Priority": 1,
                "Placement": {
                    "AvailabilityZone": "us-west-2a"
                }
            },
            {
                "InstanceType": "m4.2xlarge",
                "Priority": 2,
                "Placement": {
                    "AvailabilityZone": "us-west-2b"
                }
            },
            {
                "InstanceType": "c5.2xlarge",
                "Priority": 3,
                "Placement": {
                    "AvailabilityZone": "us-west-2b"
                }
            }
        ]
    ]
}
```
Example 10: Launch Spot Instances in a price-capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for both capacity and lowest price. To optimize for capacity while taking price into consideration, you must set the Spot AllocationStrategy to price-capacity-optimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching while also choosing the pool that is the lowest priced.

```json
{
    "SpotOptions": {
        "AllocationStrategy": "price-capacity-optimized",
        "MinTargetCapacity": 2,
        "SingleInstanceType": true
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r4.2xlarge",
                    "Placement": {
                        "AvailabilityZone": "us-west-2a"
                    }
                },
                {
                    "InstanceType": "m4.2xlarge",
                    "Placement": {
                        "AvailabilityZone": "us-west-2b"
                    }
                }
            ]
        }
    ]
}
```
Example 11: Configure attribute-based instance type selection

The following example demonstrates how to configure an EC2 Fleet to use attribute-based instance type selection for identifying instance types. To specify the required instance attributes, you specify the attributes in the `InstanceRequirements` structure.

In the following example, two instance attributes are specified:

- **VCpuCount** – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- **MemoryMiB** – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when EC2 Fleet provisions the fleet.

For a list and descriptions of all the possible attributes that you can specify, see `InstanceRequirements` in the Amazon EC2 API Reference.
"SpotOptions": {
  "AllocationStrategy": "price-capacity-optimized"
},
"LaunchTemplateConfigs": [{
  "LaunchTemplateSpecification": {

Spot Fleet example configurations

The following examples show launch configurations that you can use with the request-spot-fleet command to create a Spot Fleet request. For more information, see Create a Spot Fleet request.

⚠️ Note

For Spot Fleet, you can’t specify a network interface ID in a launch template or launch specification. Make sure you omit the NetworkInterfaceID parameter in your launch template or launch specification.

Examples

• Example 1: Launch Spot Instances using the lowest-priced Availability Zone or subnet in the Region
Example 2: Launch Spot Instances using the lowest-priced Availability Zone or subnet in a specified list

Example 3: Launch Spot Instances using the lowest-priced instance type in a specified list

Example 4. Override the price for the request

Example 5: Launch a Spot Fleet using the diversified allocation strategy

Example 6: Launch a Spot Fleet using instance weighting

Example 7: Launch a Spot Fleet with On-Demand capacity

Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

Example 9: Launch Spot Instances in a capacity-optimized fleet

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

Example 11: Launch Spot Instances in a priceCapacityOptimized fleet

Example 12: Configure attribute-based instance type selection

Example 1: Launch Spot Instances using the lowest-priced Availability Zone or subnet in the Region

The following example specifies a single launch specification without an Availability Zone or subnet. The Spot Fleet launches the instances in the lowest-priced Availability Zone that has a default subnet. The price you pay does not exceed the On-Demand price.

```json
{
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```
Example 2: Launch Spot Instances using the lowest-priced Availability Zone or subnet in a specified list

The following examples specify two launch specifications with different Availability Zones or subnets, but the same instance type and AMI.

Availability Zones

The Spot Fleet launches the instances in the default subnet of the lowest-priced Availability Zone that you specified.

```json
{
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "Placement": {
                "AvailabilityZone": "us-west-2a, us-west-2b"
            },
            "IamInstanceProfile": {
                "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Subnets

You can specify default subnets or nondefault subnets, and the nondefault subnets can be from a default VPC or a nondefault VPC. The Spot service launches the instances in whichever subnet is in the lowest-priced Availability Zone.
You can't specify different subnets from the same Availability Zone in a Spot Fleet request.

```
{
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
  "LaunchSpecifications": [
    {
      "ImageId": "ami-1a2b3c4d",
      "KeyName": "my-key-pair",
      "SecurityGroups": [
        {
          "GroupId": "sg-1a2b3c4d"
        }
      ],
      "InstanceType": "m3.medium",
      "SubnetId": "subnet-a61dafcf, subnet-65ea5f08",
      "IamInstanceProfile": {
        "Arn": "arn:aws:iam::123456789012:instance-profile/my-iam-role"
      }
    }
  ]
}
```

If the instances are launched in a default VPC, they receive a public IPv4 address by default. If the instances are launched in a nondefault VPC, they do not receive a public IPv4 address by default. Use a network interface in the launch specification to assign a public IPv4 address to instances launched in a nondefault VPC. When you specify a network interface, you must include the subnet ID and security group ID using the network interface.

```
...
{
  "ImageId": "ami-1a2b3c4d",
  "KeyName": "my-key-pair",
  "InstanceType": "m3.medium",
  "NetworkInterfaces": [
    {
      "DeviceIndex": 0,
      "SubnetId": "subnet-1a2b3c4d",
      "Groups": [ "sg-1a2b3c4d" ],
      "AssociatePublicIpAddress": true
    }
  ]
}
```
Example 3: Launch Spot Instances using the lowest-priced instance type in a specified list

The following examples specify two launch configurations with different instance types, but the same AMI and Availability Zone or subnet. The Spot Fleet launches the instances using the specified instance type with the lowest price.

Availability Zone

```json
{
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
  "LaunchSpecifications": [
    {
      "ImageId": "ami-1a2b3c4d",
      "SecurityGroups": [
        {
          "GroupId": "sg-1a2b3c4d"
        }
      ],
      "InstanceType": "c5.4xlarge",
      "Placement": {
        "AvailabilityZone": "us-west-2b"
      }
    },
    {
      "ImageId": "ami-1a2b3c4d",
      "SecurityGroups": [
        {
          "GroupId": "sg-1a2b3c4d"
        }
      ],
      "InstanceType": "r3.8xlarge",
      "Placement": {
        "AvailabilityZone": "us-west-2b"
      }
    }
  ]
}
```
Example 4. Override the price for the request

We recommended that you use the default maximum price, which is the On-Demand price. If you prefer, you can specify a maximum price for the fleet request and maximum prices for individual launch specifications.

The following examples specify a maximum price for the fleet request and maximum prices for two of the three launch specifications. The maximum price for the fleet request is used for any launch specification that does not specify a maximum price. The Spot Fleet launches the instances using the instance type with the lowest price.
Availability Zone

```json
{
"SpotPrice": "1.00",
"TargetCapacity": 30,
"IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
"LaunchSpecifications": [
{
"ImageId": "ami-1a2b3c4d",
"InstanceType": "c3.2xlarge",
"Placement": {
"AvailabilityZone": "us-west-2b"
},
"SpotPrice": "0.10"
},
{
"ImageId": "ami-1a2b3c4d",
"InstanceType": "c3.4xlarge",
"Placement": {
"AvailabilityZone": "us-west-2b"
},
"SpotPrice": "0.20"
},
{
"ImageId": "ami-1a2b3c4d",
"InstanceType": "c3.8xlarge",
"Placement": {
"AvailabilityZone": "us-west-2b"
}
}
]
}
```

Subnet

```json
{
"SpotPrice": "1.00",
"TargetCapacity": 30,
"IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
"LaunchSpecifications": [
{
"ImageId": "ami-1a2b3c4d",
"InstanceType": "c3.2xlarge",
"Placement": {
"AvailabilityZone": "us-west-2b"
}
}
]```
Example 5: Launch a Spot Fleet using the diversified allocation strategy

The following example uses the diversified allocation strategy. The launch specifications have different instance types but the same AMI and Availability Zone or subnet. The Spot Fleet distributes the 30 instances across the three launch specifications, such that there are 10 instances of each type. For more information, see Allocation strategies for Spot Instances.

Availability Zone

```json
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            }
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            }
        }
    ]
}
```
A best practice to increase the chance that a spot request can be fulfilled by EC2 capacity in the event of an outage in one of the Availability Zones is to diversify across zones. For this scenario,
include each Availability Zone available to you in the launch specification. And, instead of using the same subnet each time, use three unique subnets (each mapping to a different zone).

**Availability Zone**

```json
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2a"
            }
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            }
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2c"
            }
        }
    ]
}
```

**Subnet**

```json
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
```
Example 6: Launch a Spot Fleet using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight. The Spot Fleet selects the instance type with the lowest price per unit hour. The Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity.

If the `r3.2xlarge` request is successful, Spot provisions 4 of these instances. Divide 20 by 6 for a total of 3.33 instances, then round up to 4 instances.

If the `c3.xlarge` request is successful, Spot provisions 7 of these instances. Divide 20 by 3 for a total of 6.66 instances, then round up to 7 instances.

For more information, see [Spot Fleet instance weighting](#).

Availability Zone

```json
{
    "SpotPrice": "0.70",
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
}
```
"LaunchSpecifications": [
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "r3.2xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        },
        "WeightedCapacity": 6
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "InstanceType": "c3.xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        },
        "WeightedCapacity": 3
    }
]

Subnet

{
    "SpotPrice": "0.70",
    "TargetCapacity": 20,
    "IamFleetRole": "arn:aws:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d",
            "WeightedCapacity": 6
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c3.xlarge",
            "SubnetId": "subnet-1a2b3c4d",
            "WeightedCapacity": 3
        }
    ]
}
Example 7: Launch a Spot Fleet with On-Demand capacity

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. If there is capacity, the On-Demand request is always fulfilled. The balance of the target capacity is fulfilled as Spot if there is capacity and availability.

The following example specifies the desired target capacity as 10, of which 5 must be On-Demand capacity. Spot capacity is not specified; it is implied in the balance of the target capacity minus the On-Demand capacity. Amazon EC2 launches 5 capacity units as On-Demand, and 5 capacity units (10-5=5) as Spot if there is available Amazon EC2 capacity and availability.

For more information, see On-Demand in Spot Fleet.

```
{
   "IamFleetRole": "arn:aws:iam::781603563322:role/aws-ec2-spot-fleet-tagging-role",
   "AllocationStrategy": "lowestPrice",
   "TargetCapacity": 10,
   "SpotPrice": null,
   "ValidFrom": "2018-04-04T15:58:13Z",
   "ValidUntil": "2019-04-04T15:58:13Z",
   "TerminateInstancesWithExpiration": true,
   "LaunchSpecifications": [],
   "Type": "maintain",
   "OnDemandTargetCapacity": 5,
   "LaunchTemplateConfigs": [
      {
         "LaunchTemplateSpecification": {
            "LaunchTemplateId": "lt-0dbb04d4a6cca5ad1",
            "Version": "2"
         },
         "Overrides": [
            {
               "InstanceType": "t2.medium",
               "WeightedCapacity": 1,
               "SubnetId": "subnet-d0dc51fb"
            }
         ]
      }
   ]
}
```
Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for ReplacementStrategy, specify launch-before-terminate. To configure the time delay from the launch of the new replacement Spot Instances to the automatic deletion of the old Spot Instances, for termination-delay, specify a value in seconds. For more information, see Configuration options.

Note

We recommend using launch-before-terminate only if you can predict how long your instance shutdown procedures will take to complete. This ensures that the old instances are terminated only after the shutdown procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the Spot Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for AllocationStrategy, specify capacityOptimized. For more information about what you should consider when configuring a Spot Fleet for Capacity Rebalancing, see Capacity Rebalancing.

```json
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "capacityOptimized",
        "IamFleetRole": "arn:aws:iam::000000000000:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "LaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceType": "c3.large",
                        "WeightedCapacity": 1,
                        "Placement": {
                            "AvailabilityZone": "us-east-1a"
                        }
                    }
                ]
            }
        ]
    }
}
```
Example 9: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set AllocationStrategy to capacityOptimized.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```json
{
    "TargetCapacity": "50",
    "SpotFleetRequestConfig": {
        "InstanceType": "c4.large",
        "WeightedCapacity": 1,
        "Placement": {
            "AvailabilityZone": "us-east-1a"
        },
        "InstanceType": "c5.large",
        "WeightedCapacity": 1,
        "Placement": {
            "AvailabilityZone": "us-east-1a"
        }
    }
}
```
"AllocationStrategy": "capacityOptimized",
},
"LaunchTemplateConfigs": [
{
   "LaunchTemplateSpecification": {
      "LaunchTemplateName": "my-launch-template",
      "Version": "1"
   },
   "Overrides": [
       {
          "InstanceType": "r4.2xlarge",
          "AvailabilityZone": "us-west-2a"
       },
       {
          "InstanceType": "m4.2xlarge",
          "AvailabilityZone": "us-west-2b"
       },
       {
          "InstanceType": "c5.2xlarge",
          "AvailabilityZone": "us-west-2b"
       }
    ]
}]

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the capacityOptimizedPrioritized allocation strategy, you can use the Priority parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set AllocationStrategy to capacityOptimizedPrioritized. Spot Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.
In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```json
{
    "TargetCapacity": "50",
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "capacityOptimizedPrioritized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateName": "my-launch-template",
            "Version": "1"
        },
        "Overrides": [
            {
                "InstanceType": "r4.2xlarge",
                "Priority": 1,
                "AvailabilityZone": "us-west-2a"
            },
            {
                "InstanceType": "m4.2xlarge",
                "Priority": 2,
                "AvailabilityZone": "us-west-2b"
            },
            {
                "InstanceType": "c5.2xlarge",
                "Priority": 3,
                "AvailabilityZone": "us-west-2b"
            }
        ]
    }
}
```

**Example 11: Launch Spot Instances in a priceCapacityOptimized fleet**

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for both capacity and lowest price. To optimize for capacity while taking price into consideration, you must set the Spot AllocationStrategy to priceCapacityOptimized.
In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching while also choosing the pool that is the lowest priced.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "OnDemandAllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws:iam::111111111111:role/aws-ec2-spot-fleet-tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateId": "lt-0123456789example",
                    "Version": "1"
                },
                "Overrides": [
                    {
                        "InstanceType": "r4.2xlarge",
                        "AvailabilityZone": "us-west-2a"
                    },
                    {
                        "InstanceType": "m4.2xlarge",
                        "AvailabilityZone": "us-west-2b"
                    },
                    {
                        "InstanceType": "c5.2xlarge",
                        "AvailabilityZone": "us-west-2b"
                    }
                ]
            }
        ],
        "TargetCapacity": 50,
        "Type": "request"
    }
}
```
Example 12: Configure attribute-based instance type selection

The following example demonstrates how to configure a Spot Fleet to use attribute-based instance type selection for identifying instance types. To specify the required instance attributes, you specify the attributes in the InstanceRequirements structure.

In the following example, two instance attributes are specified:

- **VCpuCount** – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- **MemoryMiB** – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when Spot Fleet provisions the fleet.

For a list and descriptions of all the possible attributes that you can specify, see [InstanceRequirements](https://docs.aws.amazon.com/AWSEC2/latest/APIReference/API_InstanceRequirements.html) in the *Amazon EC2 API Reference*.

```json
{
   "AllocationStrategy": "priceCapacityOptimized",
   "TargetCapacity": 20,
   "Type": "request",
   "LaunchTemplateConfigs": [{
      "LaunchTemplateName": "my-launch-template",
      "Version": "1"
   }],
   "Overrides": [{
      "InstanceRequirements": {
         "VCpuCount": {
            "Min": 2
         },
         "MemoryMiB": {
            "Min": 4
         }
      }
   }]
}
```
Quotas for EC2 Fleet and Spot Fleet

Your AWS account has default quotas, formerly referred to as limits, for each AWS service. Unless otherwise noted, each quota is Region-specific.

The usual Amazon EC2 quotas apply to instances launched by an EC2 Fleet or a Spot Fleet, such as [Spot Instance limits](#) and [volume limits](#).

In addition, your AWS account has the following quotas related to EC2 Fleet and Spot Fleet:

<table>
<thead>
<tr>
<th>Quota description</th>
<th>Quota</th>
</tr>
</thead>
<tbody>
<tr>
<td>The number of EC2 Fleets and Spot Fleets per Region of type maintain and request in the active, deleted_running, and cancelled_running states</td>
<td>1,000 ¹ ² ³</td>
</tr>
<tr>
<td>The number of EC2 Fleets of type instant</td>
<td>Unlimited</td>
</tr>
<tr>
<td>The number of Spot capacity pools (unique combination of instance type and subnet) for EC2 Fleets and Spot Fleets of type maintain and request</td>
<td>300 ¹</td>
</tr>
<tr>
<td>The number of Spot capacity pools (unique combination of instance type and subnet) for EC2 Fleets of type instant</td>
<td>Unlimited</td>
</tr>
<tr>
<td>The size of the user data in a launch specification</td>
<td>16 KB ²</td>
</tr>
<tr>
<td>The target capacity per EC2 Fleet or Spot Fleet</td>
<td>10,000</td>
</tr>
<tr>
<td>The target capacity across all EC2 Fleets and Spot Fleets in a Region</td>
<td>100,000 ¹</td>
</tr>
<tr>
<td>An EC2 Fleet request or a Spot Fleet request can't span Regions.</td>
<td></td>
</tr>
</tbody>
</table>

¹ fleet quotas

² volume limits

³ spot instance limits
Quota description | Quota
--- | ---
An EC2 Fleet request or a Spot Fleet request can't span different subnets from the same Availability Zone.

¹ These quotas apply to both your EC2 Fleets and your Spot Fleets.

² These are hard quotas. You can't request an increase for these quotas.

³ After you delete an EC2 Fleet or cancel a Spot Fleet request, and if you specified that the fleet should *not* terminate its Spot Instances when you deleted or canceled the request, the fleet request enters the deleted_running (EC2 Fleet) or cancelled_running (Spot Fleet) state and the instances continue to run until they are interrupted or you terminate them manually. If you terminate the instances, the fleet request enters the deleted_terminating (EC2 Fleet) or cancelled_terminating (Spot Fleet) state and does not count towards this quota. For more information, see [Delete an EC2 Fleet](#) and [Cancel a Spot Fleet request](#).

### Request a quota increase for target capacity

If you need more than the default quota for target capacity, you can request a quota increase.

#### To request a quota increase for target capacity

1. Open the AWS Support Center [Create case](#) form.
2. Choose **Service limit increase**.
3. For **Limit type**, choose **EC2 Fleet**.
4. For **Region**, choose the AWS Region in which to request the quota increase.
5. For **Limit**, choose **Target Fleet Capacity per Fleet (in units)** or **Target Fleet Capacity per Region (in units)**, depending on which quota you want to increase.
6. For **New limit value**, enter the new quota value.
7. To request an increase for another quota, choose **Add another request**, and repeat Steps 4–6.
8. For **Use case description**, enter your reason for requesting a quota increase.
9. Under **Contact options**, specify your preferred contact language and contact method.
10. Choose **Submit**.
Networking in Amazon EC2

Amazon VPC enables you to launch AWS resources, such as Amazon EC2 instances, into a virtual network dedicated to your AWS account, known as a virtual private cloud (VPC). When you launch an instance, you can select a subnet from the VPC. The instance is configured with a primary network interface, which is a logical virtual network card. The instance receives a primary private IP address from the IPv4 address of the subnet, and it is assigned to the primary network interface.

You can control whether the instance receives a public IP address from Amazon's pool of public IP addresses. The public IP address of an instance is associated with your instance only until it is stopped or terminated. If you require a persistent public IP address, you can allocate an Elastic IP address for your AWS account and associate it with an instance or a network interface. An Elastic IP address remains associated with your AWS account until you release it, and you can move it from one instance to another as needed. You can bring your own IP address range to your AWS account, where it appears as an address pool, and then allocate Elastic IP addresses from your address pool.

To increase network performance and reduce latency, you can launch instances in a placement group. You can get significantly higher packet per second (PPS) performance using enhanced networking. You can accelerate high performance computing and machine learning applications using an Elastic Fabric Adapter (EFA), which is a network device that you can attach to a supported instance type.

Features

- Regions and Zones
- Amazon EC2 instance IP addressing
- Amazon EC2 instance hostname types
- Bring your own IP addresses (BYOIP) in Amazon EC2
- Elastic IP addresses
- Elastic network interfaces
- Amazon EC2 instance network bandwidth
- Enhanced networking on Amazon EC2 instances
- Elastic Fabric Adapter
- Amazon EC2 instance topology
- Placement groups
• Network maximum transmission unit (MTU) for your EC2 instance
• Virtual private clouds for your EC2 instances

Regions and Zones

Amazon EC2 is hosted in multiple locations world-wide. These locations are composed of AWS Regions, Availability Zones, Local Zones, AWS Outposts, and Wavelength Zones.

• Each Region is a separate geographic area.
• Availability Zones are multiple, isolated locations within each Region.
• Local Zones provide you the ability to place resources, such as compute and storage, in multiple locations closer to your end users.
• AWS Outposts brings native AWS services, infrastructure, and operating models to virtually any data center, co-location space, or on-premises facility.
• Wavelength Zones allow developers to build applications that deliver ultra-low latencies to 5G devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks.

AWS operates state-of-the-art, highly available data centers. Although rare, failures can occur that affect the availability of instances that are in the same location. If you host all of your instances in a single location that is affected by a failure, none of your instances would be available.

To help you determine which deployment is best for you, see AWS Wavelength FAQs.

Contents
• Regions
• Availability Zones
• Local Zones
• Wavelength Zones
• AWS Outposts

Regions

Each Region is designed to be isolated from the other Regions. This achieves the greatest possible fault tolerance and stability.
When you view your resources, you see only the resources that are tied to the Region that you specified. This is because Regions are isolated from each other, and we don't automatically replicate resources across Regions.

When you launch an instance, you must select an AMI that's in the same Region. If the AMI is in another Region, you can copy the AMI to the Region you're using. For more information, see Copy an AMI.

Note that there is a charge for data transfer between Regions. For more information, see Amazon EC2 Pricing - Data Transfer.

Contents

- Available Regions
- Regions and endpoints
- Describe your Regions
- Get the Region display name
- Specify the Region for a resource

Available Regions

Your account determines the Regions that are available to you.

- An AWS account provides multiple Regions so that you can launch Amazon EC2 instances in locations that meet your requirements. For example, you might want to launch instances in Europe to be closer to your European customers or to meet legal requirements.

- An AWS GovCloud (US-West) account provides access to the AWS GovCloud (US-West) Region and the AWS GovCloud (US-East) Region. For more information, see AWS GovCloud (US).

- An Amazon AWS (China) account provides access to the Beijing and Ningxia Regions only. For more information, see Amazon Web Services in China.

The following table lists the Regions provided by an AWS account. You can't describe or access additional Regions from an AWS account, such as the AWS GovCloud (US) Regions or the China Regions. To use a Region introduced after March 20, 2019, you must enable the Region. For more information, see Specify which AWS Regions your account can use in the AWS Account Management Reference Guide.

For more information, see [AWS Global Infrastructure](#).

The number and mapping of Availability Zones per Region may vary between AWS accounts. To list the Availability Zones that are available to your account, you can use the Amazon EC2 console or the command line interface. For more information, see [Describe your Regions](#).

**Regions and endpoints**

When you work with an instance using the command line interface or API actions, you must specify its Regional endpoint. For more information about the Regions and endpoints for Amazon EC2, see [Amazon EC2 endpoints and quotas](#) in the *Amazon Web Services General Reference*.

For more information about endpoints and protocols in AWS GovCloud (US-West), see [Service Endpoints](#) in the *AWS GovCloud (US) User Guide*.

**Describe your Regions**

You can use the Amazon EC2 console or the command line interface to determine which Regions are available for your account. For more information about these command line interfaces, see [Access Amazon EC2](#).
**To find your Regions using the console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. From the navigation bar, choose the **Regions** selector.

   ![Regions selector](image)

<table>
<thead>
<tr>
<th>Region</th>
<th>Region Code</th>

</tr>
<tr>
<td>Asia Pacific (Jakarta)</td>
<td>ap-southeast-3</td>
</tr>
</tbody>
</table>

3. Your EC2 resources for the selected Region are displayed on the **EC2 Dashboard** in the **Resources** section.

**To find your Regions using the AWS CLI**

Use the `describe-regions` command as follows to describe the Regions that are enabled for your account.

```
aws ec2 describe-regions
```

To describe all Regions, including any Regions that are disabled for your account, add the `--all-regions` option as follows.

```
aws ec2 describe-regions --all-regions
```
Get the Region display name

You can use AWS Systems Manager Parameter Store to view the display name of a Region. Each Region has public parameters in the following path.

/aws/service/global-infrastructure/regions/region-code

The public parameters for a Region include the following:

- /aws/service/global-infrastructure/regions/region-code/domain
- /aws/service/global-infrastructure/regions/region-code/geolocationCountry
- /aws/service/global-infrastructure/regions/region-code/geolocationRegion
- /aws/service/global-infrastructure/regions/region-code/longName
- /aws/service/global-infrastructure/regions/region-code/partition

The longName parameter contains the Region display name. The following `get-parameters-by-path` command returns the display name of the af-south-1 Region. It uses the `--query` option to scope the output to the name of the Region. You must enclose the query string in single quotes on Linux. To run this command using the Windows Command Prompt, either omit the single quotes or change them to double quotes.

AWS CLI on Linux

```bash
aws ssm get-parameters-by-path \
   --path /aws/service/global-infrastructure/regions/af-south-1 \
   --query 'Parameters[?Name.contains(@,`longName`)].Value' \
   --output text
```

AWS CLI on Windows

```bash
aws ssm get-parameters-by-path ^
   --path /aws/service/global-infrastructure/regions/af-south-1 ^
   --query "Parameters[?Name.contains(@,`longName`)].Value" ^
   --output text
```
Tools for PowerShell

```powershell
$parameterPath = '/aws/service/global-infrastructure/regions/af-south-1'
$substringToMatch = 'longName'
$filterParameters = Get-SSMParametersByPath -Path $parameterPath | Where-Object { $_.Name -like '*$substringToMatch*' } | ForEach-Object { Write-Output $_.Value }
$filterParameters
```

The following is example output.

Africa (Cape Town)

### Specify the Region for a resource

Every time you create an Amazon EC2 resource, you can specify the Region for the resource. You can specify the Region for a resource using the AWS Management Console or the command line.

**Considerations**

Some AWS resources might not be available in all Regions. Ensure that you can create the resources that you need in the desired Regions before you launch an instance.

**To specify the Region for a resource using the console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. From the navigation bar, choose the **Regions** selector and then choose the Region.
To specify the default Region using the command line

You can set the value of an environment variable to the desired Regional endpoint (for example, https://ec2.us-east-2.amazonaws.com):

- AWS_DEFAULT_REGION (AWS CLI)
- Set-AWSDefaultRegion (AWS Tools for Windows PowerShell)

Alternatively, you can use the --region (AWS CLI) or -Region (AWS Tools for Windows PowerShell) command line option with each individual command. For example, --region us-east-2.

For more information about the endpoints for Amazon EC2, see Amazon EC2 endpoints and quotas in the AWS General Reference.

Availability Zones

Each Region has multiple, isolated locations known as Availability Zones. The code for Availability Zone is its Region code followed by a letter identifier. For example, us-east-1a.
When you launch an instance, you select a Region and a virtual private cloud (VPC), and then you can either select a subnet from one of the Availability Zones or let us choose one for you. If you distribute your instances across multiple Availability Zones and one instance fails, you can design your application so that an instance in another Availability Zone can handle requests. You can also use Elastic IP addresses to mask the failure of an instance in one Availability Zone by rapidly remapping the address to an instance in another Availability Zone.

The following diagram illustrates multiple Availability Zones in an AWS Region. Availability Zone A and Availability Zone B each have one subnet, and each subnet has instances. Availability Zone C has no subnets, therefore you can't launch instances into this Availability Zone.

As Availability Zones grow over time, our ability to expand them can become constrained. If this happens, we might restrict you from launching an instance in a constrained Availability Zone unless you already have an instance in that Availability Zone. Eventually, we might also remove the constrained Availability Zone from the list of Availability Zones for new accounts. Therefore, your account might have a different number of available Availability Zones in a Region than another account.

Contents
AZ IDs

To ensure that resources are distributed across the Availability Zones for a Region, we independently map Availability Zones to codes for each AWS account in our oldest Regions. For example, the us-east-1a for your AWS account might not be the same physical location as the us-east-1a for another AWS account.

To coordinate Availability Zones across accounts in all Regions even those that map Availability Zones, use the AZ IDs, which are unique and consistent identifiers for an Availability Zone. For example, use1-az1 is an AZ ID for the us-east-1 Region, and it has the same physical location in every AWS account. You can view the AZ IDs for your account to determine the physical location of your resources relative to the resources in another account. For example, if you share a subnet in the Availability Zone with the AZ ID use1-az2 with another account, this subnet is available to that account in the Availability Zone whose AZ ID is also use1-az2.

The following diagram illustrates two accounts with different mappings of Availability Zone code to AZ ID.
Describe your Availability Zones

You can use the Amazon EC2 console or the command line interface to determine which Availability Zones are available for your account. For more information about these command line interfaces, see Access Amazon EC2.

To find your Availability Zones using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. From the navigation bar, choose the Regions selector and then choose the Region.
3. On the navigation pane, choose EC2 Dashboard.
4. The Availability Zones are listed in the Service health pane.

To find your Availability Zones using the AWS CLI

- Use the describe-availability-zones command as follows to describe the Availability Zones within the specified Region that are enabled for your account.

  ```
  aws ec2 describe-availability-zones --region region-name
  ```

- Use the describe-availability-zones command as follows to describe the Availability Zones regardless of the opt-in status.

  ```
  aws ec2 describe-availability-zones --all-availability-zones
  ```

Launch instances in an Availability Zone

When you launch an instance, select a Region that puts your instances closer to specific customers, or meets the legal or other requirements that you have. By launching your instances in separate Availability Zones, you can protect your applications from the failure of a single location.

When you launch an instance, you can optionally specify an Availability Zone in the Region that you are using. If you do not specify an Availability Zone, we select an Availability Zone for you. When you launch your initial instances, we recommend that you accept the default Availability Zone, because this allows us to select the best Availability Zone for you based on system health and available capacity. If you launch additional instances, specify an Availability Zone only if your new instances must be close to, or separated from, your running instances.
Migrate an instance to another Availability Zone

If necessary, you can migrate an instance from one Availability Zone to another. For example, if you try to modify the instance type of your instance and we can't launch an instance of the new instance type in the current Availability Zone, you can migrate the instance to an Availability Zone with capacity for the new instance type.

The migration process involves:

- Creating an AMI from the original instance
- Launching an instance in the new Availability Zone
- Updating the configuration of the new instance, as shown in the following procedure

To migrate an instance to another Availability Zone

1. Create an AMI from the instance. The procedure depends on the type of root device volume for the instance. For more information, see the documentation that corresponds to your root device volume:

   - [Create an Amazon EBS-backed AMI](#)
   - [Create an instance store-backed Linux AMI](#)

2. If you need to preserve the private IPv4 address of the instance, you must delete the subnet in the current Availability Zone and then create a subnet in the new Availability Zone with the same IPv4 address range as the original subnet. Note that you must terminate all instances in a subnet before you can delete it. Therefore, you should create AMIs from all of the instances in your subnet so that you can move all instances from the current subnet to the new subnet.

3. Launch an instance from the AMI that you just created, specifying the new Availability Zone or subnet. You can use the same instance type as the original instance, or select a new instance type. For more information, see [Launch instances in an Availability Zone](#).

4. If the original instance has an associated Elastic IP address, associate it with the new instance. For more information, see [Disassociate an Elastic IP address](#).

5. If the original instance is a Reserved Instance, change the Availability Zone for your reservation. (If you also changed the instance type, you can also change the instance type for your reservation.) For more information, see [Submit modification requests](#).

6. (Optional) Terminate the original instance. For more information, see [Terminate an instance](#).
Local Zones

A Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support AWS Direct Connect, so that resources created in a Local Zone can serve local users with low-latency communications. For more information, see What is AWS Local Zones? in the AWS Local Zones User Guide.

The code for a Local Zone is its Region code followed by an identifier that indicates its physical location. For example, us-west-2-lax-1 in Los Angeles.

The following diagram illustrates the AWS Region us-west-2, two of its Availability Zones, and two of its Local Zones. The VPC spans the Availability Zones and one of the Local Zones. Each zone in the VPC has one subnet, and each subnet has an instance.

To use a Local Zone, you must first enable it. For more information, see the section called “Opt in to Local Zones”. Next, create a subnet in the Local Zone. Finally, launch resources in the Local Zone subnet, such as instances, so that your applications are close to your users.

Contents

- Available Local Zones
- Opt in to Local Zones
- Launch instances in a Local Zone
Available Local Zones

You can use the Amazon EC2 console or a command line interface to determine which Local Zones are available for your account. For a complete list, see AWS Local Zones Locations.

To find your Local Zones using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. From the navigation bar, choose the Regions selector and then choose the parent Region.
3. On the navigation pane, choose EC2 Dashboard.
4. In the upper-right corner of the page, choose Account attributes, Zones.

To find your Local Zones using the AWS CLI

Use the describe-availability-zones command as follows to describe all Local Zones in the specified Region, even if they are not enabled. To describe only the Local Zones that you've enabled, omit the --all-availability-zones option.

```
aws ec2 describe-availability-zones --region region-name --filters Name=zone-type,Values=local-zone --all-availability-zones
```

Opt in to Local Zones

Before you can specify a Local Zone for a resource or service, you must opt in to Local Zones.

Consideration

Some AWS resources might not be available in all Regions. Make sure that you can create the resources that you need in the desired Regions or Local Zones before launching an instance in a specific Local Zone. For a list of services supported in each Local Zone see AWS Local Zones Features.

To opt in to Local Zones using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the upper-left corner of the page, select New EC2 Experience. You cannot complete this task using the old console experience.
3. From the navigation bar, choose the Regions selector and then choose the parent Region.
4. On the navigation pane, choose EC2 Dashboard.
5. In the upper-right corner of the page, choose **Account attributes**, **Zones**.
6. Choose a Local Zone and choose **Action > Manage Zone group**.
7. Under **Opt-in status**, choose **Enable**.
8. Choose **Update**.

**To opt in to Local Zones using the AWS CLI**

Use the [modify-availability-zone-group](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-availability-zone-group.html) command.

**Launch instances in a Local Zone**

When you launch an instance, you can specify a subnet that is in a Local Zone. You also allocate an IP address from a network border group. A network border group is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, `us-west-2-lax-1a`.

You can allocate the following IP addresses from a network border group:

- Amazon-provided Elastic IPv4 addresses
- Amazon-provided IPv6 VPC addresses (available only in the Los Angeles zones)

For more information about how to launch an instance in a Local Zone, see [Getting started with AWS Local Zones](https://docs.aws.amazon.com/localzones/latest/userguide/index.html) in the *AWS Local Zones User Guide*.

**Wavelength Zones**

AWS Wavelength enables developers to build applications that deliver ultra-low latencies to mobile devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks. Developers can extend a virtual private cloud (VPC) to one or more Wavelength Zones, and then use AWS resources like Amazon EC2 instances to run applications that require ultra-low latency and a connection to AWS services in the Region.

A Wavelength Zone is an isolated zone in the carrier location where the Wavelength infrastructure is deployed. Wavelength Zones are tied to a Region. A Wavelength Zone is a logical extension of a Region, and is managed by the control plane in the Region.

The code for a Wavelength Zone is its Region code followed by an identifier that indicates the physical location. For example, `us-east-1-wl1-bos-wlz-1` in Boston.
The following diagram illustrates the AWS Region `us-west-2`, two of its Availability Zones, and a Wavelength Zone. The VPC spans the Availability Zones and the Wavelength Zone. Each zone in the VPC has one subnet, and each subnet has an instance.

To use a Wavelength Zone, you must first opt in to the Zone. For more information, see the section called “Enable Wavelength Zones”. Next, create a subnet in the Wavelength Zone. Finally, launch your resources in the Wavelength Zones subnet, so that your applications are closer to your end users.

Wavelength Zones are not available in every Region. For information about the Regions that support Wavelength Zones, see Available Wavelength Zones in the AWS Wavelength Developer Guide.

Contents

- Describe your Wavelength Zones
- Enable Wavelength Zones
- Launch instances in a Wavelength Zone

Describe your Wavelength Zones

You can use the Amazon EC2 console or the command line interface to determine which Wavelength Zones are available for your account. For more information about these command line interfaces, see Access Amazon EC2.
To find your Wavelength Zones using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. From the navigation bar, choose the Regions selector and then choose the Region.
3. On the navigation pane, choose EC2 Dashboard.
4. In the upper-right corner of the page, choose Account attributes, Zones.

To find your Wavelength Zones using the AWS CLI

- Use the describe-availability-zones command as follows to describe the Wavelength Zones within the specified Region that are enabled for your account.

   ```bash
   aws ec2 describe-availability-zones --region region-name
   ```

- Use the describe-availability-zones command as follows to describe the Wavelength Zones regardless of the opt-in status.

   ```bash
   aws ec2 describe-availability-zones --all-availability-zones
   ```

Enable Wavelength Zones

Before you specify a Wavelength Zone for a resource or service, you must opt in to Wavelength Zones.

Considerations

- Some AWS resources are not available in all Regions. Make sure that you can create the resources that you need in the desired Region or Wavelength Zone before launching an instance in a specific Wavelength Zone.

To opt in to Wavelength Zone using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the upper-left corner of the page, select New EC2 Experience. You cannot complete this task using the old console experience.
3. From the navigation bar, choose the Regions selector and then choose the Region.
4. On the navigation pane, choose **EC2 Dashboard**.

5. In the upper-right corner of the page, choose **Account attributes, Zones**.

6. Choose a Wavelength Zone and choose **Action > Manage Zone group**.

7. Under **Opt-in status**, choose **Enable**.

8. Choose **Update**.

**To enable Wavelength Zones using the AWS CLI**

Use the [modify-availability-zone-group](https://docs.aws.amazon.com/cli/latest/reference/ec2/modify-availability-zone-group.html) command.

**Launch instances in a Wavelength Zone**

When you launch an instance, you can specify a subnet which is in a Wavelength Zone. You also allocate a carrier IP address from a network border group, which is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, `us-east-1-wl1-bos-wlz-1`.

For information about how to launch an instance in a Wavelength Zone, see [Get started with AWS Wavelength](https://docs.aws.amazon.com/wavelength/latest/userguide/) in the **AWS Wavelength Developer Guide**.

**AWS Outposts**

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming interfaces as in AWS Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region. You can create subnets on your Outpost and specify them when you create AWS resources. Instances in Outpost subnets communicate with other instances in the AWS Region using private IP addresses, all within the same VPC.

The following diagram illustrates the AWS Region `us-west-2`, two of its Availability Zones, and an Outpost. The VPC spans the Availability Zones and the Outpost. The Outpost is in an on-premises customer data center. Each zone in the VPC has one subnet, and each subnet has an instance.
To begin using AWS Outposts, you must create an Outpost and order Outpost capacity. For more information about Outposts configurations, see our catalog. After your Outpost equipment is installed, the compute and storage capacity is available for you when you launch Amazon EC2 instances on your Outpost.

**Launch instances on an Outpost**

You can launch EC2 instances in the Outpost subnet that you created. Security groups control inbound and outbound traffic for instances with elastic network interfaces in an Outpost subnet, as they do for instances in an Availability Zone subnet. To connect to an EC2 instance in an Outpost subnet, you can specify a key pair when you launch the instance, as you do for instances in an Availability Zone subnet.

We recommend that you limit the root volume for an instance on an Outpost rack to 30 GiB or smaller. You can specify data volumes in the block device mapping of the AMI or the instance to provide additional storage. To trim unused blocks from the boot volume, see [How to Build Sparse EBS Volumes](https://aws.amazon.com/blogs/aws/how-to-build-sparse-ebsvolumes/) in the AWS Partner Network Blog.

We recommend that you increase the NVMe timeout for the root volume. For more information, see [I/O operation timeout](https://docs.aws.amazon.com/elasticfilesystem/latest/upt/outposts.html#outposts-nvme-timeout).

For information about how to create an Outpost, see [Get started with AWS Outposts](https://docs.aws.amazon.com/outsposts/latest/userguide/get-started.html) in the AWS Outposts User Guide.
Create a volume on an Outpost rack

AWS Outposts offers rack and server form factors. If your capacity is on an Outpost rack, you can create EBS volumes in the Outpost subnet that you created. When you create the volume, specify the Amazon Resource Name (ARN) of the Outpost.

The following `create-volume` command creates an empty 50 GB volume on the specified Outpost.

```
aws ec2 create-volume --availability-zone us-east-2a --outpost-arn arn:aws:outposts:us-east-2:123456789012:outpost/op-03e6fecad652a6138 --size 50
```

You can dynamically modify the size of your Amazon EBS gp2 volumes without detaching them. For more information about modifying a volume without detaching it, see Request modifications to your EBS volumes.

Amazon EC2 instance IP addressing

Amazon EC2 and Amazon VPC support both the IPv4 and IPv6 addressing protocols. By default, Amazon VPC uses the IPv4 addressing protocol; you can't disable this behavior. When you create a VPC, you must specify an IPv4 CIDR block (a range of private IPv4 addresses). You can optionally assign an IPv6 CIDR block to your VPC and assign IPv6 addresses from that block to instances in your subnets.

Contents

- Private IPv4 addresses
- Public IPv4 addresses
- Public IPv4 address optimization
- Elastic IP addresses (IPv4)
- IPv6 addresses
- Work with the IPv4 addresses for your instances
- Work with the IPv6 addresses for your instances
- Multiple IP addresses for your EC2 instances
- Configure a secondary private IPv4 address for your Windows instance
- EC2 instance hostnames
Private IPv4 addresses

A private IPv4 address is an IP address that's not reachable over the Internet. You can use private IPv4 addresses for communication between instances in the same VPC. For more information about the standards and specifications of private IPv4 addresses, see RFC 1918. We allocate private IPv4 addresses to instances using DHCP.

Note

You can create a VPC with a publicly routable CIDR block that falls outside of the private IPv4 address ranges specified in RFC 1918. However, for the purposes of this documentation, we refer to private IPv4 addresses (or 'private IP addresses') as the IP addresses that are within the IPv4 CIDR range of your VPC.

VPC subnets can be one of the following types:

- IPv4-only subnets: You can only create resources in these subnets with IPv4 addresses assigned to them.
- IPv6-only subnets: You can only create resources in these subnets with IPv6 addresses assigned to them.
- IPv4 and IPv6 subnets: You can create resources in these subnets with either IPv4 or IPv6 addresses assigned to them.

When you launch an EC2 instance into an IPv4-only or dual stack (IPv4 and IPv6) subnet, the instance receives a primary private IP address from the IPv4 address range of the subnet. For more information, see IP addressing in the Amazon VPC User Guide. If you don't specify a primary private IP address when you launch the instance, we select an available IP address in the subnet's IPv4 range for you. Each instance has a default network interface (eth0) that is assigned the primary private IPv4 address. You can also specify additional private IPv4 addresses, known as secondary private IPv4 addresses. Unlike primary private IP addresses, secondary private IP addresses can be reassigned from one instance to another. For more information, see Multiple IP addresses for your EC2 instances.
A private IPv4 address, regardless of whether it is a primary or secondary address, remains associated with the network interface when the instance is stopped and started, or hibernated and started, and is released when the instance is terminated.

Public IPv4 addresses

A public IP address is an IPv4 address that's reachable from the Internet. You can use public addresses for communication between your instances and the Internet.

When you launch an instance in a default VPC, we assign it a public IP address by default. When you launch an instance into a nondefault VPC, the subnet has an attribute that determines whether instances launched into that subnet receive a public IP address from the public IPv4 address pool. By default, we don't assign a public IP address to instances launched in a nondefault subnet.

You can control whether your instance receives a public IP address as follows:

- Modifying the public IP addressing attribute of your subnet. For more information, see Modify the public IPv4 addressing attribute for your subnet in the Amazon VPC User Guide.
- Enabling or disabling the public IP addressing feature during launch, which overrides the subnet's public IP addressing attribute. For more information, see Assign a public IPv4 address during instance launch.
- You can unassign a public IP address from your instance after launch by managing the IP addresses associated with a network interface.

A public IP address is assigned to your instance from Amazon's pool of public IPv4 addresses, and is not associated with your AWS account. When a public IP address is disassociated from your instance, it is released back into the public IPv4 address pool, and you cannot reuse it.

In certain cases, we release the public IP address from your instance, or assign it a new one:

- We release your instance's public IP address when it is stopped, hibernated, or terminated. Your stopped or hibernated instance receives a new public IP address when it is started.
- We release your instance's public IP address when you associate an Elastic IP address with it. When you disassociate the Elastic IP address from your instance, it receives a new public IP address.
- If the public IP address of your instance in a VPC has been released, it will not receive a new one if there is more than one network interface attached to your instance.
- If your instance's public IP address is released while it has a secondary private IP address that is associated with an Elastic IP address, the instance does not receive a new public IP address.

If you require a persistent public IP address that can be associated to and from instances as you require, use an Elastic IP address instead.

If you use dynamic DNS to map an existing DNS name to a new instance's public IP address, it might take up to 24 hours for the IP address to propagate through the Internet. As a result, new instances might not receive traffic while terminated instances continue to receive requests. To solve this problem, use an Elastic IP address. You can allocate your own Elastic IP address, and associate it with your instance. For more information, see Elastic IP addresses.

### Note

- AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the Public IPv4 Address tab on the Amazon VPC pricing page.
- Instances that access other instances through their public NAT IP address are charged for regional or Internet data transfer, depending on whether the instances are in the same Region.

### Public IPv4 address optimization

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the Public IPv4 Address tab on the Amazon VPC pricing page.

The following list contains actions you can take to optimize the number of public IPv4 addresses you use:

- Use an elastic load balancer to load balance traffic to your EC2 instances and disable Auto-assign public IP on the primary ENI assigned to the instances. Load balancers use a single public IPv4 address, so this reduces your public IPv4 address count. You may also want consolidate existing load balancers to further reduce the public IPv4 address count.
- If the only reason for using a NAT gateway is to SSH into an EC2 instance in a private subnet for maintenance or emergencies, consider using EC2 Instance Connect Endpoint instead. With EC2
Instance Connect Endpoint, you can connect to an instance from the internet without requiring the instance to have a public IPv4 address.

- If your EC2 instances are in a public subnet with public IP addresses allocated to them, consider moving the instances to a private subnet, removing the public IP addresses, and using a public NAT gateway to allow access to and from your EC2 instances. There are cost considerations for using NAT gateways. Use this calculation method to decide if NAT gateways are cost effective. You can get the Number of public IPv4 addresses required for this calculation by creating an AWS Billing Cost and Usage Report.

\[
\text{NAT gateway per hour + NAT gateway public IPs + NAT gateway transfer / Existing public IP cost}
\]

Where:

- NAT gateway per hour = $0.045 * 730 hours in a month * Number of Availability Zones the NAT gateways are in
- NAT gateway public IPs = $0.005 * 730 hours in a month * Number of IPs associated with your NAT gateways
- NAT gateway transfer = $0.045 * Number of GBs that will go through the NAT gateway in a month
- Existing public IP cost = $0.005 * 730 hours in a month * Number of public IPv4 addresses

If the total is less than 1, NAT gateways are cheaper than public IPv4 addresses.

- Use AWS PrivateLink to connect privately to AWS services or services hosted by other AWS accounts rather than using public IPv4 addresses and internet gateways.
- Bring your own IP address range (BYOIP) to AWS and use the range for public IPv4 addresses rather than using Amazon-owned public IPv4 addresses.
- Turn off auto-assign public IPv4 address for instances launched into subnets. This option is generally disabled by default for VPCs when you create a subnet, but you should check your existing subnets to ensure it’s disabled.
- If you have EC2 instances that do not need public IPv4 addresses, check that the network interfaces attached to your instances have Auto-assign public IP disabled.
- Configure accelerator endpoints in AWS Global Accelerator for EC2 instances in private subnets to enable internet traffic to flow directly to the endpoints in your VPCs without requiring public IPv4 address optimization
IP addresses. You can also bring your own addresses to AWS Global Accelerator and use your own IPv4 addresses for your accelerator's static IP addresses.

Elastic IP addresses (IPv4)

An Elastic IP address is a public IPv4 address that you can allocate to your account. You can associate it to and disassociate it from instances as you require. It's allocated to your account until you choose to release it. For more information about Elastic IP addresses and how to use them, see Elastic IP addresses.

We do not support Elastic IP addresses for IPv6.

IPv6 addresses

You can optionally associate an IPv6 CIDR block with your VPC and associate IPv6 CIDR blocks with your subnets. The IPv6 CIDR block for your VPC is automatically assigned from Amazon's pool of IPv6 addresses; you cannot choose the range yourself. For more information, see the following topics in the Amazon VPC User Guide:

- IP addressing for your VPCs and subnets
- Add an IPv6 CIDR block to your VPC
- Add an IPv6 CIDR block to your subnet

IPv6 addresses are globally unique and can be configured to remain private or reachable over the Internet. Your instance receives an IPv6 address if an IPv6 CIDR block is associated with your VPC and subnet, and if one of the following is true:

- Your subnet is configured to automatically assign an IPv6 address to an instance during launch. For more information, see Modify the IPv6 addressing attribute for your subnet.
- You assign an IPv6 address to your instance during launch.
- You assign an IPv6 address to the primary network interface of your instance after launch.
- You assign an IPv6 address to a network interface in the same subnet, and attach the network interface to your instance after launch.
When your instance receives an IPv6 address during launch, the address is associated with the primary network interface (eth0) of the instance. You can manage the IPv6 addresses for your instances primary network interface (eth0) in the following ways:

- Assign and unassign IPv6 addresses from the network interface. The number of IPv6 addresses you can assign to a network interface and the number of network interfaces you can attach to an instance varies per instance type. For more information, see [IP addresses per network interface per instance type](#).
- Enable a primary IPv6 address. A primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. For more information, see [Create a network interface](#) or [Manage IP addresses](#).

An IPv6 address persists when you stop and start, or hibernate and start, your instance, and is released when you terminate your instance. You cannot reassign an IPv6 address while it's assigned to another network interface—you must first unassign it.

You can control whether instances are reachable via their IPv6 addresses by controlling the routing for your subnet or by using security group and network ACL rules. For more information, see [Internetwork traffic privacy](#) in the Amazon VPC User Guide.

For more information about reserved IPv6 address ranges, see [IANA IPv6 Special-Purpose Address Registry](#) and [RFC4291](#).

**Work with the IPv4 addresses for your instances**

You can assign a public IPv4 address to your instance when you launch it. You can view the IPv4 addresses for your instance in the console through either the Instances page or the Network Interfaces page.

**Contents**

- [View the IPv4 addresses](#)
- [Assign a public IPv4 address during instance launch](#)

**View the IPv4 addresses**

You can use the Amazon EC2 console to view the public and private IPv4 addresses of your instances. You can also determine the public IPv4 and private IPv4 addresses of your instance from within your instance by using instance metadata. For more information, see [Work with instance metadata](#).
The public IPv4 address is displayed as a property of the network interface in the console, but it's mapped to the primary private IPv4 address through NAT. Therefore, if you inspect the properties of your network interface on your instance, for example, through `ifconfig` (Linux) or `ipconfig` (Windows), the public IPv4 address is not displayed. To determine your instance's public IPv4 address from an instance, use instance metadata.

**To view the IPv4 addresses for an instance using the command line**

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/AccessAmazonEC2.html).

- **describe-instances** (AWS CLI)

**To determine your instance's IPv4 addresses using instance metadata**

1. Connect to your instance. For more information, see [Connect to your EC2 instance](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/AccessEC2.html).
2. Use the following command to access the private IP address.

   **IMDSv2**
   
   ```bash
   ```

   **IMDSv1**
   
   ```bash
   ```

3. Use the following command to access the public IP address. If an Elastic IP address is associated with the instance, the value returned is that of the Elastic IP address.

   **Tools for Windows PowerShell**
   
   ```powershell
   ```
**Assign a public IPv4 address during instance launch**

Each subnet has an attribute that determines whether instances launched into that subnet are assigned a public IP address. By default, nondefault subnets have this attribute set to false, and default subnets have this attribute set to true. When you launch an instance, a public IPv4 addressing feature is also available for you to control whether your instance is assigned a public IPv4 address; you can override the default behavior of the subnet's IP addressing attribute. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses, and is assigned to the network interface with the device index of eth0. This feature depends on certain conditions at the time you launch your instance.

**Considerations**

- You can unassign the public IP address from your instance after launch by managing the IP addresses associated with a network interface. For more information about public IPv4 addresses, see Public IPv4 addresses.
- You cannot auto-assign a public IP address if you specify more than one network interface. Additionally, you cannot override the subnet setting using the auto-assign public IP feature if you specify an existing network interface for eth0.
• Whether you assign a public IP address to your instance during launch or not, you can associate an Elastic IP address with your instance after it's launched. For more information, see Elastic IP addresses. You can also modify your subnet's public IPv4 addressing behavior. For more information, see Modify the public IPv4 addressing attribute for your subnet.

To assign a public IPv4 address during instance launch using the console

Follow the procedure to launch an instance, and when you configure Network Settings, choose the option to Auto-assign Public IP.

To enable or disable the public IP addressing feature using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- Use the --associate-public-ip-address or the --no-associate-public-ip-address option with the run-instances command (AWS CLI)
- Use the -AssociatePublicIp parameter with the New-EC2Instance command (AWS Tools for Windows PowerShell)

Work with the IPv6 addresses for your instances

You can view the IPv6 addresses assigned to your instance, assign a public IPv6 address to your instance, or unassign an IPv6 address from your instance. You can view these addresses in the console through either the Instances page or the Network Interfaces page.

Contents

- View the IPv6 addresses
- Assign an IPv6 address to an instance
- Unassign an IPv6 address from an instance

View the IPv6 addresses

You can use the Amazon EC2 console, AWS CLI, and instance metadata to view the IPv6 addresses for your instances.
To view the IPv6 addresses for an instance using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance.

To view the IPv6 addresses for an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- `describe-instances` (AWS CLI)

To view the IPv6 addresses for an instance using instance metadata

1. Connect to your instance. For more information, see Connect to your EC2 instance.
3. Use the following command to view the IPv6 address.

   **IMDSv2**

   ```bash
   ```

   **IMDSv1**

   ```bash
   ```

Work with the IPv6 addresses for your instances
**Tools for Windows PowerShell**

```
```

**Assign an IPv6 address to an instance**

If your VPC and subnet have IPv6 CIDR blocks associated with them, you can assign an IPv6 address to your instance during or after launch. The IPv6 address is assigned from the IPv6 address range of the subnet, and is assigned to the network interface with the device index of eth0.

**To assign an IPv6 address during instance launch**

Follow the procedure to [launch an instance](https://console.aws.amazon.com/ec2/), and when you configure [Network Settings](https://console.aws.amazon.com/ec2/), choose the option to [Auto-assign IPv6 IP](https://console.aws.amazon.com/ec2/).

**To assign an IPv6 address after launch**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions**, **Networking**, **Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Assign new IP address**. Enter an IPv6 address from the range of the subnet or leave the field blank to let Amazon choose an IPv6 address for you.
5. Choose **Save**.

**To assign an IPv6 address using the command line**

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](https://console.aws.amazon.com/ec2/).

- Use the `--ipv6-addresses` option with the `run-instances` command (AWS CLI)
- Use the `Ipv6Addresses` property for `-NetworkInterface` in the `New-EC2Instance` command (AWS Tools for Windows PowerShell)
- `assign-ipv6-addresses` (AWS CLI)
- `Register-EC2Ipv6AddressList` (AWS Tools for Windows PowerShell)
Unassign an IPv6 address from an instance

You can unassign an IPv6 address from an instance at any time.

To unassign an IPv6 address from an instance using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select your instance, and choose Actions, Networking, Manage IP addresses.
4. Expand the network interface. Under IPv6 addresses, choose Unassign next to the IPv6 address.
5. Choose Save.

To unassign an IPv6 address from an instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- unassign-ipv6-addresses (AWS CLI)

Multiple IP addresses for your EC2 instances

You can specify multiple private IPv4 and IPv6 addresses for your instances. The number of network interfaces and private IPv4 and IPv6 addresses that you can specify for an instance depends on the instance type. For more information, see IP addresses per network interface per instance type.

It can be useful to assign multiple IP addresses to an instance in your VPC to do the following:

- Host multiple websites on a single server by using multiple SSL certificates on a single server and associating each certificate with a specific IP address.
- Operate network appliances, such as firewalls or load balancers, that have multiple IP addresses for each network interface.
- Redirect internal traffic to a standby instance in case your instance fails, by reassigning the secondary IP address to the standby instance.
How multiple IP addresses work

The following list explains how multiple IP addresses work with network interfaces:

• You can assign a secondary private IPv4 address to any network interface.
• You can assign multiple IPv6 addresses to a network interface that's in a subnet that has an associated IPv6 CIDR block.
• You must choose a secondary IPv4 address from the IPv4 CIDR block range of the subnet for the network interface.
• You must choose IPv6 addresses from the IPv6 CIDR block range of the subnet for the network interface.
• You associate security groups with network interfaces, not individual IP addresses. Therefore, each IP address you specify in a network interface is subject to the security group of its network interface.
• Multiple IP addresses can be assigned and unassigned to network interfaces attached to running or stopped instances.
• Secondary private IPv4 addresses that are assigned to a network interface can be reassigned to another one if you explicitly allow it.
• An IPv6 address cannot be reassigned to another network interface; you must first unassign the IPv6 address from the existing network interface.
• When assigning multiple IP addresses to a network interface using the command line tools or API, the entire operation fails if one of the IP addresses can't be assigned.
• Primary private IPv4 addresses, secondary private IPv4 addresses, Elastic IP addresses, and IPv6 addresses remain with a secondary network interface when it is detached from an instance or attached to an instance.
• Although you can't detach the primary network interface from an instance, you can reassign the secondary private IPv4 address of the primary network interface to another network interface.

The following list explains how multiple IP addresses work with Elastic IP addresses (IPv4 only):
Each private IPv4 address can be associated with a single Elastic IP address, and vice versa.

When a secondary private IPv4 address is reassigned to another interface, the secondary private IPv4 address retains its association with an Elastic IP address.

When a secondary private IPv4 address is unassigned from an interface, an associated Elastic IP address is automatically disassociated from the secondary private IPv4 address.

Work with multiple IPv4 addresses

You can assign a secondary private IPv4 address to an instance, associate an Elastic IPv4 address with a secondary private IPv4 address, and unassign a secondary private IPv4 address.

Tasks

- Assign a secondary private IPv4 address
- Configure the operating system to recognize secondary private IPv4 addresses
- Associate an Elastic IP address with the secondary private IPv4 address
- View your secondary private IPv4 addresses
- Unassign a secondary private IPv4 address

Assign a secondary private IPv4 address

You can assign the secondary private IPv4 address to the network interface for an instance as you launch the instance, or after the instance is running.

To assign a secondary private IPv4 address when launching an instance

1. Follow the procedure to launch an instance. For Network settings, choose Edit.
2. Select a VPC and a subnet.
3. Expand Advanced network configuration.
4. For Secondary IP, choose Automatically assign and enter the number of IP addresses (Amazon automatically assigns secondary IPv4 addresses) or choose Manually assign and enter the IPv4 addresses.
5. Complete the remaining steps to launch the instance.
To assign a secondary IPv4 address during launch using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- The `--secondary-private-ip-addresses` option with the `run-instances` command (AWS CLI)
- Define `-NetworkInterface` and specify the `PrivateIpAddresses` parameter with the `New-EC2Instance` command (AWS Tools for Windows PowerShell).

To assign a secondary private IPv4 address to a network interface

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces, and then select the network interface for the instance.
3. Choose Actions, Manage IP Addresses.
4. Expand the network interface. Under IPv4 addresses, choose Assign new IP address.
5. Enter a specific IPv4 address that's within the subnet range for the instance, or leave the field blank to let Amazon select an IPv4 address for you.
6. (Optional) Select Allow to allow the secondary private IP address to be reassigned if it is already assigned to another network interface.
7. Choose Save.

Alternatively, you can assign a secondary private IPv4 address to an instance. Choose Instances in the navigation pane, select the instance, and then choose Actions, Networking, Manage IP addresses. You can configure the same information as you did in the steps above. The IP address is assigned to the primary network interface (eth0) for the instance.

To assign a secondary private IPv4 address to an existing instance using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- `assign-private-ip-addresses` (AWS CLI)
- `Register-EC2PrivatetIpAddress` (AWS Tools for Windows PowerShell)
Configure the operating system to recognize secondary private IPv4 addresses

After you assign a secondary private IPv4 address to your instance, you need to configure the operating system on your instance to recognize the secondary private IP address.

Linux instances

- If you are using Amazon Linux, the ec2-net-utils package can take care of this step for you. It configures additional network interfaces that you attach while the instance is running, refreshes secondary IPv4 addresses during DHCP lease renewal, and updates the related routing rules. You can immediately refresh the list of interfaces by using the command `sudo service network restart` and then view the up-to-date list using `ip addr li`. If you require manual control over your network configuration, you can remove the ec2-net-utils package. For more information, see Configure your network interface using ec2-net-utils for Amazon Linux 2.

- If you are using another Linux distribution, see the documentation for your Linux distribution. Search for information about configuring additional network interfaces and secondary IPv4 addresses. If the instance has two or more interfaces on the same subnet, search for information about using routing rules to work around asymmetric routing.

Windows instances

For more information, see Configure a secondary private IPv4 address for your Windows instance.

Associate an Elastic IP address with the secondary private IPv4 address

To associate an Elastic IP address with a secondary private IPv4 address

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Elastic IPs.
3. Select the check box for the Elastic IP address.
4. Choose Actions, Associate Elastic IP address.
5. For Resource type, choose Network interface. select the network interface, and then select the secondary IP address from the Private IP address list.
6. For Network interface, select the network interface. select the secondary IP address from the Private IP address list.
7. For Private IP address, select the secondary IP address.
8. Choose Associate.
To associate an Elastic IP address with a secondary private IPv4 address using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- `associate-address` (AWS CLI)
- `Register-EC2Address` (AWS Tools for Windows PowerShell)

View your secondary private IPv4 addresses

To view the private IPv4 addresses assigned to a network interface

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Network Interfaces.
3. Select the check box for the network interface.
4. On the Details tab, under IP addresses, locate Private IPv4 address and Secondary private IPv4 addresses.

To view the private IPv4 addresses assigned to an instance

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Instances.
3. Select the check box for the instance.

Unassign a secondary private IPv4 address

If you no longer require a secondary private IPv4 address, you can unassign it from the instance or the network interface. When a secondary private IPv4 address is unassigned from a network interface, the Elastic IP address (if it exists) is also disassociated.

To unassign a secondary private IPv4 address from an instance

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Instances.
3. Select an instance, choose **Actions, Networking, Manage IP addresses**.
4. Expand the network interface. For **IPv4 addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Save**.

To unassign a secondary private IPv4 address from a network interface

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface, choose **Actions, Manage IP addresses**.
4. Expand the network interface. For **IPv4 addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Save**.

To unassign a secondary private IPv4 address using the command line

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/working-with-private-ip-addresses.html).

- **unassign-private-ip-addresses** (AWS CLI)
- **Unregister-EC2PrivateIpAddress** (AWS Tools for Windows PowerShell)

Work with multiple IPv6 addresses

You can assign multiple IPv6 addresses to your instance, view the IPv6 addresses assigned to your instance, and unassign IPv6 addresses from your instance.

**Contents**

- Assign multiple IPv6 addresses
- View your IPv6 addresses
- Unassign an IPv6 address
Assign multiple IPv6 addresses

You can assign one or more IPv6 addresses to your instance during launch or after launch. To assign an IPv6 address to an instance, the VPC and subnet in which you launch the instance must have an associated IPv6 CIDR block.

To assign multiple IPv6 addresses during launch

1. Follow the procedure to launch an instance. For Network settings, choose Edit.
2. Select a VPC and a subnet.
3. Expand Advanced network configuration.
4. For IPv6 IPs, choose Automatically assign and the number of IP addresses (Amazon automatically assigns the IPv6 addresses) or choose Manually assign and enter the IPv6 addresses.
5. Complete the remaining steps to launch the instance.

You can use the Instances screen Amazon EC2 console to assign multiple IPv6 addresses to an existing instance. This assigns the IPv6 addresses to the primary network interface (eth0) for the instance. To assign a specific IPv6 address to the instance, ensure that the IPv6 address is not already assigned to another instance or network interface.

To assign multiple IPv6 addresses to an existing instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select your instance, choose Actions, Networking, Manage IP addresses.
4. Expand the network interface. For IPv6 addresses, choose Assign new IP address for each IPv6 address to add. You can specify an IPv6 address from the range of the subnet, or leave the field empty to let Amazon choose an IPv6 address for you.
5. Choose Save.

Alternatively, you can assign multiple IPv6 addresses to an existing network interface. The network interface must have been created in a subnet that has an associated IPv6 CIDR block. To assign a specific IPv6 address to the network interface, ensure that the IPv6 address is not already assigned to another network interface.
To assign multiple IPv6 addresses to a network interface

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select your network interface, choose Actions, Manage IP addresses.
4. Expand the network interface. For IPv6 addresses, choose Assign new IP address for each IPv6 address to add. You can specify an IPv6 address from the range of the subnet, or leave the field empty to let Amazon choose an IPv6 address for you.
5. Choose Save.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- **Assign an IPv6 address during launch:**
  - Use the --ipv6-addresses or --ipv6-address-count options with the run-instances command (AWS CLI)
  - Define -NetworkInterface and specify the Ipv6Addresses or Ipv6AddressCount parameters with the New-EC2Instance command (AWS Tools for Windows PowerShell).

- **Assign an IPv6 address to a network interface:**
  - assign-ipv6-addresses (AWS CLI)
  - Register-EC2Ipv6AddressList (AWS Tools for Windows PowerShell)

View your IPv6 addresses

You can view the IPv6 addresses for an instance or for a network interface.

To view the IPv6 addresses assigned to an instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the check box for your instance.
4. On the Networking tab, locate the IPv6 addresses field.
To view the IPv6 addresses assigned to a network interface

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the check box for your network interface.
4. On the Details tab, under IP addresses, locate the IPv6 addresses field.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- **View the IPv6 addresses for an instance:**
  - describe-instances (AWS CLI)

- **View the IPv6 addresses for a network interface:**
  - describe-network-interfaces (AWS CLI)
  - Get-EC2NetworkInterface (AWS Tools for Windows PowerShell)

Unassign an IPv6 address

You can unassign an IPv6 address from the primary network interface of an instance, or you can unassign an IPv6 address from a network interface.

To unassign an IPv6 address from an instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the check box for your instance, and then choose Actions, Networking, Manage IP addresses.
4. Expand the network interface. Under IPv6 addresses, choose Unassign next to the IPv6 address.
5. Choose Save.
To unassign an IPv6 address from a network interface

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the check box for your network interface, and then choose Actions, Manage IP addresses.
4. Expand the network interface. Under IPv6 addresses, choose Unassign next to the IPv6 address.
5. Choose Save.

CLI overview

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- unassign-ipv6-addresses (AWS CLI)
- Unregister-EC2Ipv6AddressList (AWS Tools for Windows PowerShell)

Configure a secondary private IPv4 address for your Windows instance

You can specify multiple private IPv4 addresses for your instances. After you assign a secondary private IPv4 address to an instance, you must configure the operating system on the instance to recognize the secondary private IPv4 address.

⚠️ Note

These instructions are based on Windows Server 2022. The implementation of these steps might vary based on the operating system of the Windows instance.

Tasks

- Prerequisites
- Step 1: Configure static IP addressing in your instance
- Step 2: Configure a secondary private IP address for your instance
- Step 3: Configure applications to Use the secondary private IP address
Prerequisites

1. Assign the secondary private IPv4 address to the network interface for the instance. You can assign the secondary private IPv4 address when you launch the instance, or after the instance is running. For more information, see Assign a secondary private IPv4 address.

2. Allocate an Elastic IP address and associate it with the secondary private IPv4 address. For more information, see Allocate an Elastic IP address and Associate an Elastic IP address with the secondary private IPv4 address.

Step 1: Configure static IP addressing in your instance

To enable your Windows instance to use multiple IP addresses, you must configure your instance to use static IP addressing rather than a DHCP server.

⚠️ Important

When you configure static IP addressing in your instance, the IP address must match exactly what is shown in the console, CLI, or API. If you enter these IP addresses incorrectly, the instance could become unreachable.

To configure static IP addressing on a Windows instance

1. Connect to your instance.

2. Find the IP address, subnet mask, and default gateway addresses for the instance by performing the following steps:

   • Run the following command in PowerShell:

   ```
   ipconfig /all
   ```

   Review the output and note the IPv4 Address, Subnet Mask, Default Gateway, and DNS Servers values for the network interface. Your output should resemble the following example:

   ```
   ... 
   Ethernet adapter Ethernet 4:
   ```
3. Open the **Network and Sharing Center** by running the following command in PowerShell:

```bash
& $env:SystemRoot\system32\control.exe ncpa.cpl
```

4. Open the context (right-click) menu for the network interface (Local Area Connection or Ethernet) and choose **Properties**.

5. Choose **Internet Protocol Version 4 (TCP/IPv4)**, **Properties**.

6. In the **Internet Protocol Version 4 (TCP/IPv4) Properties** dialog box, choose **Use the following IP address**, enter the following values, and then choose **OK**.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>The IPv4 address obtained in step 2 above.</td>
</tr>
<tr>
<td>Subnet mask</td>
<td>The subnet mask obtained in step 2 above.</td>
</tr>
<tr>
<td>Default gateway</td>
<td>The default gateway address obtained in step 2 above.</td>
</tr>
<tr>
<td>Preferred DNS server</td>
<td>The DNS server obtained in step 2 above.</td>
</tr>
</tbody>
</table>
### Field

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate DNS server</td>
<td>The alternate DNS server obtained in step 2 above. If an alternate DNS server was not listed, leave this field blank.</td>
</tr>
</tbody>
</table>

⚠️ **Important**

If you set the IP address to any value other than the current IP address, you will lose connectivity to the instance.
You will lose RDP connectivity to the Windows instance for a few seconds while the instance converts from using DHCP to static addressing. The instance retains the same IP address information as before, but now this information is static and not managed by DHCP.

**Step 2: Configure a secondary private IP address for your instance**

After you have set up static IP addressing on your Windows instance, you are ready to prepare a second private IP address.

**To configure a secondary IP address**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances** and select your instance.
3. On the **Networking**, note the secondary IP address.
4. Connect to your instance.
5. On your Windows instance, choose **Start, Control Panel**.
6. Choose **Network and Internet, Network and Sharing Center**.
7. Select the network interface (Local Area Connection or Ethernet) and choose **Properties**.
8. On the **Local Area Connection Properties** page, choose **Internet Protocol Version 4 (TCP/IPv4), Properties, Advanced**.
9. Choose **Add**.
10. In the **TCP/IP Address** dialog box, type the secondary private IP address for **IP address**. For **Subnet mask**, type the same subnet mask that you entered for the primary private IP address in **Step 1: Configure static IP addressing in your instance**, and then choose **Add**.
11. Verify the IP address settings and choose **OK**.

![TCP/IP Address dialog box](image-url)
12. Choose **OK**, **Close**.

13. To confirm that the secondary IP address has been added to the operating system, run the `ipconfig /all` command in PowerShell. Your output should resemble the following:

```
Ethernet adapter Ethernet 4:

    Connection-specific DNS Suffix . : 
    Description . . . . . . . . . . : Amazon Elastic Network Adapter #2
    Physical Address. . . . . . . . : 02-9C-3B-FC-8E-67
    DHCP Enabled. . . . . . . . . . : No
    Autoconfiguration Enabled . . . : Yes
    Link-local IPv6 Address . . . : fe80::f4d1:a773:5afa:cd1%7(Preferred)
    IPv4 Address. . . . . . . . . : 10.200.0.128(Preferred)
```
Step 3: Configure applications to Use the secondary private IP address

You can configure any applications to use the secondary private IP address. For example, if your instance is running a website on IIS, you can configure IIS to use the secondary private IP address.

To configure IIS to use the secondary private IP address

1. Connect to your instance.
2. Open Internet Information Services (IIS) Manager.
3. In the **Connections** pane, expand **Sites**.
4. Open the context (right-click) menu for your website and choose **Edit Bindings**.
5. In the **Site Bindings** dialog box, for **Type**, choose **http**, **Edit**.
6. In the **Edit Site Binding** dialog box, for **IP address**, select the secondary private IP address. (By default, each website accepts HTTP requests from all IP addresses.)
Choose OK, Close.

**EC2 instance hostnames**

When you create an EC2 instance, AWS creates a hostname for that instance. For more information on the types of hostnames and how they're provisioned by AWS, see [Amazon EC2 instance hostname types](#). Amazon provides a DNS server that resolves Amazon-provided hostnames to IPv4 and IPv6 addresses. The Amazon DNS server is located at the base of your VPC network range plus two. For more information, see [DNS attributes for your VPC](#) in the *Amazon VPC User Guide*.

**Link-local addresses**

Link-local addresses are well-known, non-routable IP addresses. Amazon EC2 uses addresses from the link-local address space to provide services that are accessible only from an EC2 instance. These services do not run on the instance, they run on the underlying host. When you access the link-local addresses for these services, you're communicating with either the Xen hypervisor or the Nitro controller.

**Link-local address ranges**

- IPv4 – 169.254.0.0/16 (169.254.0.0 to 169.254.255.255)
• IPv6 – fe80::/10

Services that you access using link-local addresses

• Instance Metadata Service
• Amazon Route 53 Resolver (also known as the Amazon DNS server)
• Amazon Time Sync Service

Amazon EC2 instance hostname types

This section describes the Amazon EC2 instance guest OS hostname types available when you launch instances into your VPC subnets.

The hostname distinguishes the EC2 instances on your network. You may use the hostname of an instance if, for example, you want to run scripts to communicate with some or all of the instances on your network.

Contents

• Types of EC2 hostnames
• Where you see Resource name and IP name
• How to decide whether to choose Resource name or IP name
• Modify Hostname type and DNS Hostname configurations

Types of EC2 hostnames

There are two hostname types for the guest OS hostname when EC2 instances are launched in a VPC:

• **IP name**: The legacy naming scheme where, when you launch an instance, the *private IPv4 address* of the instance is included in the hostname of the instance. The IP name exists for the life of the EC2 instance. When used as the Private DNS hostname, it will only return the private IPv4 address (A record).

• **Resource name**: When you launch an instance, the *EC2 instance ID* is included in the hostname of the instance. The resource name exists for the life of the EC2 instance. When used as the Private DNS hostname, it can return both the private IPv4 address (A record) and/or the IPv6 Global Unicast Address (AAAA record).
The EC2 instance guest OS hostname type depends on the subnet settings:

- If the instance is launched into an IPv4-only subnet, you can select either IP name or resource name.
- If the instance is launched into a dual-stack (IPv4+IPv6) subnet, you can select either IP name or resource name.
- If the instance is launched into an IPv6-only subnet, resource name is used automatically.

Contents

- IP name
- Resource name
- The difference between IP name and Resource name

IP name

When you launch an EC2 instance with the Hostname type of IP name, the guest OS hostname is configured to use the private IPv4 address.

- Format for an instance in us-east-1: `private-ipv4-address.ec2.internal`
- Example: `ip-10-24-34-0.ec2.internal`
- Format for an instance in any other AWS Region: `private-ipv4-address.region.compute.internal`
- Example: `ip-10-24-34-0.us-west-2.compute.internal`

Resource name

When you launch EC2 instances in IPv6-only subnets, the Hostname type of Resource name is selected by default. When you launch an instance in IPv4-only or dual-stack (IPv4+IPv6) subnets, Resource name is an option that you can select. After you launch an instance, you can manage the hostname configuration. For more information, see Modify Hostname type and DNS Hostname configurations.

When you launch an EC2 instance with a Hostname type of Resource name, the guest OS hostname is configured to use the EC2 instance ID.

- Format for an instance in us-east-1: `ec2-instance-id.ec2.internal`
• Example: $i-0123456789abcdef.ec2.internal$
• Format for an instance in any other AWS Region: $ec2-instance-id.region.compute.internal$
• Example: $i-0123456789abcdef.us-west-2.compute.internal$

The difference between IP name and Resource name

DNS queries for both IP names and resource names coexist to ensure backward compatibility and to allow you to migrate from IP based-naming for hostnames to resource-based naming. For private DNS hostnames based on IP names, you cannot configure whether a DNS A record query for the instance is responded to or not. DNS A record queries are always responded to irrespective of the guest OS hostname settings. In contrast, for private DNS hostnames based on resource name, you can configure whether DNS A and/or DNS AAAA queries for the instance are responded to or not. You configure the response behavior when you launch an instance or modify a subnet. For more information, see Modify Hostname type and DNS Hostname configurations.

Where you see Resource name and IP name

This section describes where you see the hostname types resource name and IP name in the EC2 console.

Contents

• When creating an EC2 instance
• When viewing the details of an existing EC2 instance

When creating an EC2 instance

When you create an EC2 instance, depending on which type of subnet you select, Hostname type of Resource name might be available or it might be selected and not be modifiable. This section explains the scenarios in which you see the hostname types resource name and IP name.

Scenario 1

You create an EC2 instance in the wizard (see Launch an instance using the new launch instance wizard) and, when you configure the details, you choose a subnet that you configured to be IPv6-only.
In this case, the **Hostname type** of **Resource name** is selected automatically and is not modifiable. **DNS Hostname** options of **Enable IP name IPv4 (A record) DNS requests** and **Enable resource-based IPv4 (A record) DNS requests** are deselected automatically and are not modifiable. **Enable resource-based IPv6 (AAAA record) DNS requests** is selected by default but is modifiable. If selected, DNS requests to the resource name will resolve to the IPv6 address (AAAA record) of this EC2 instance.

**Scenario 2**

You create an EC2 instance in the wizard (see [Launch an instance using the new launch instance wizard](#)) and, when you configure the details, you choose a subnet configured with an IPv4 CIDR block or both an IPv4 and IPv6 CIDR block ("dual stack").

In this case, **Enable IP name IPv4 (A record) DNS requests** is selected automatically and can't be changed. This means that requests to the IP name will resolve to the IPv4 address (A record) of this EC2 instance.

The options default to the configurations of the subnet, but you can modify the options for this instance depending on the subnet settings:

- **Hostname type**: Determines whether you want the guest OS hostname of the EC2 instance to be the resource name or IP name. The default value is **IP name**.
- **Enable resource-based IPv4 (A record) DNS requests**: Determines whether requests to your resource name resolve to the private IPv4 address (A record) of this EC2 instance. This option is not selected by default.
- **Enable resource-based IPv6 (AAAA record) DNS requests**: Determines whether requests to your resource name resolve to the IPv6 GUA address (AAAA record) of this EC2 instance. This option is not selected by default.

**When viewing the details of an existing EC2 instance**

You can see the hostname values for an existing EC2 instance in the **Details** tab for the EC2 instance:

- **Hostname type**: The hostname in IP name or resource name format.
- **Private IP DNS name (IPv4 only)**: The IP name that will always resolve to the private IPv4 address of the instance.
Private resource DNS name: The resource name that resolves to the DNS records selected for this instance.

Answer private resource DNS name: The resource name resolves to IPv4 (A), IPv6 (AAAA) or IPv4 and IPv6 (A and AAAA) DNS records.

In addition, if you connect to your EC2 instance directly over SSH and enter the hostname command, you'll see the hostname in either the IP name or resource name format.

How to decide whether to choose Resource name or IP name

When you launch an EC2 instance (see Launch an instance using the new launch instance wizard), if you choose a Hostname type of Resource name, the EC2 instance launches with a hostname in the resource name format. In such cases, the DNS record for this EC2 instance can also point to the resource name. This gives you the flexibility to choose whether that hostname resolves to the IPv4 address, the IPv6 address, or both the IPv4 and IPv6 address of the instance. If you plan to use IPv6 in the future or if you are using dual-stack subnets today, it's best to use a Hostname type of Resource name so that you change DNS resolution for the hostnames of your instances without making any changes to the DNS records themselves. The resource name allows you to add and remove IPv4 and IPv6 DNS resolution on an EC2 instance.

If instead you choose a Hostname type of IP name, and use it as the DNS hostname, it can only resolve to the IPv4 address of the instance. It will not resolve to the IPv6 address of the instance even if the instance has both an IPv4 address and an IPv6 address associated with it.

Modify Hostname type and DNS Hostname configurations

Follow the steps in this section to modify Hostname type and DNS Hostname configurations for subnets or EC2 instances after they've been launched.

Contents

- Subnets
- EC2 instances

Subnets

Modify the configurations for a subnet by selecting a subnet in the VPC console and choosing Actions, Edit subnet settings.
Note

Changing the subnet settings doesn't change the configuration of EC2 instances that are already launched in the subnet.

- **Hostname type**: Determines whether you want the default setting of the guest OS hostname of the EC2 instance launched in the subnet to be the resource name or IP name.
- **Enable DNS hostname IPv4 (A record) requests**: Determines whether DNS requests/queries to your resource name resolve to the private IPv4 address (A record) of this EC2 instance.
- **Enable DNS hostname IPv6 (AAAA record) requests**: Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.

**EC2 instances**

Follow the steps in this section to modify the Hostname type and DNS Hostname configurations for an EC2 instance.

Important

- To change the **Use resource based naming as guest OS hostname** setting, you must first stop the instance. To change the **Answer DNS hostname IPv4 (A record) request** or **Answer DNS hostname IPv6 (AAAA record) requests** settings, you don't have to stop the instance.
- To modify any of the settings for non-EBS backed EC2 instance types, you cannot stop the instance. You must terminate the instance and launch a new instance with the desired Hostname type and DNS Hostname configurations.

To modify the Hostname type and DNS Hostname configurations for an EC2 instance

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. If you're going to change the **Use resource based naming as guest OS hostname** setting, first stop the EC2 instance. Otherwise, skip this step.
   
   To stop the instance, select the instance and choose **Instance state, Stop instance**.
3. Select the instance and choose **Actions, Instance settings, Change resource based naming options**.

   - **Use resource based naming as guest OS hostname**: Determines whether you want the guest OS hostname of the EC2 instance to be the resource name or IP name.
   - **Answer DNS hostname IPv4 (A record) requests**: Determines whether DNS requests/queries to your resource name resolve to the private IPv4 address of this EC2 instance.
   - **Answer DNS hostname IPv6 (AAAA record) requests**: Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.

4. Choose **Save**.

5. If you stopped the instance, start it again.

### Bring your own IP addresses (BYOIP) in Amazon EC2

You can bring part or all of your publicly routable IPv4 or IPv6 address range from your on-premises network to your AWS account. You continue to control the address range and you can advertise the address range on the internet through AWS. After you bring the address range to AWS, it appears in your AWS account as an address pool.

For a list of Regions where BYOIP is available, see [Regional availability](#).

#### Note

- When you bring an IP address range to AWS, AWS validates that you control the IP address range. There are two methods that you can use to show that you control the range:
  - If your IP address range is registered with an Internet Registry that supports RDAP (such as ARIN, RIPE and APNIC), you can verify control of your domain with an X.509 certificate by using the process on this page.
  - Regardless of whether your Internet Registry supports RDAP, you can use Amazon VPC IPAM to verify control of your domain with a DNS TXT record. That process is documented in [Tutorial: Bring your IP addresses to IPAM](#) in the [Amazon VPC IPAM User guide](#).

- The steps on this page describe how to bring your own IP address range for use in Amazon EC2 only. To bring your own IP address range for use in AWS Global Accelerator,
see **Bring your own IP addresses (BYOIP)** in the *AWS Global Accelerator Developer Guide*. To bring your own IP address range for use with Amazon VPC IP Address Manager, see **Tutorial: Bring your IP addresses to IPAM** in the *Amazon VPC IPAM User Guide*.

**Contents**

- **BYOIP definitions**
- **Requirements and quotas**
- **Onboarding prerequisites for your BYOIP address range**
- **Onboard your BYOIP**
- **Work with your address range**
- **Validate your BYOIP**
- **Regional availability**
- **Local Zone availability**
- **Learn more**

**BYOIP definitions**

- **X.509 Self-sign certificate** — A certificate standard most commonly used to encrypt and authenticate data within a network. It is a certificate used by AWS to validate control over IP space from an RDAP record. For more information about X.509 certificates, see [RFC 3280](https://tools.ietf.org/html/rfc3280).

- **Autonomous System Number (ASN)** — A globally unique identifier that defines a group of IP prefixes run by one or more network operators that maintain a single, clearly-defined routing policy.

- **Regional Internet Registry (RIR)** — An organization that manages allocation and registration of IP addresses and ASNs within a region of the world.

- **Registry Data Access Protocol (RDAP)** — A read-only protocol to query current registration data within a RIR. Entries within the queried RIR database are referred to as "RDAP records". Certain record types need to be updated by customers via a RIR-provided mechanism. These records are queried by AWS to verify control of an address space in the RIR.

- **Route Origin Authorization (ROA)** — An object created by RIRs for customers to authenticate IP advertisement in particular autonomous systems. For an overview, see [Route Origin Authorizations (ROAs)](https://www.arin.net/route-policiy Rogers) on the ARIN website.
• **Local Internet Registry (LIR)** — Organizations such as internet service providers that allocate a block of IP addresses from an RIR for their customers.

## Requirements and quotas

- The address range must be registered with your Regional Internet Registry (RIR). See your RIR for any policies regarding geographic regions. BYOIP currently supports registration in the American Registry for Internet Numbers (ARIN), Réseaux IP Européens Network Coordination Centre (RIPE), or Asia-Pacific Network Information Centre (APNIC). It must be registered to a business or institutional entity and cannot be registered to an individual person.

- The most specific IPv4 address range that you can bring is /24.

- The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertisable and /56 for CIDRs that are **not publicly advertisable**.

- ROAs are not required for CIDR ranges that are not publicly advertisable, but the RDAP records still need to be updated.

- You can bring each address range to one AWS Region at a time.

- You can bring a total of five BYOIP IPv4 and IPv6 address ranges per AWS Region to your AWS account. You cannot adjust the quotas for BYOIP CIDRs using the Service Quotas console, but you can request a quota increase by contacting the AWS Support Center as described in [AWS service quotas](https://aws.amazon.com/servicequotas) in the *AWS General Reference*.

- You cannot share your IP address range with other accounts using AWS RAM unless you use Amazon VPC IP Address Manager (IPAM) and integrate IPAM with AWS Organizations. For more information, see [Integrate IPAM with AWS Organizations](https://docs.aws.amazon.com/vpc-ipam/latest/userguide/ipam-integrate-organizations.html) in the *Amazon VPC IPAM User Guide*.

- The addresses in the IP address range must have a clean history. We might investigate the reputation of the IP address range and reserve the right to reject an IP address range if it contains an IP address that has a poor reputation or is associated with malicious behavior.

- Legacy address space, the IPv4 address space that was distributed by the Internet Assigned Numbers Authority’s (IANA) central registry prior to the formation of the Regional Internet Registry (RIR) system, still requires a corresponding ROA object.

- For LIRs, it is common that they use a manual process to update their records. This can take days to deploy depending on the LIR.

- A single ROA object and RDAP record are needed for a large CIDR block. You can bring multiple smaller CIDR blocks from that range to AWS, even across multiple AWS Regions, using the single object and record.
• BYOIP is not supported for Wavelength Zones or on AWS Outposts.

• Do not make any manual changes for BYOIP in RADb or any other IRR. BYOIP will automatically update RADb. Any manual changes that include the BYOIP ASN will cause the BYOIP provision operation to fail.

• Once you bring an IPv4 address range to AWS, you can use all of the IP addresses in the range, including the first address (the network address) and the last address (the broadcast address).

**Onboarding prerequisites for your BYOIP address range**

The onboarding process for BYOIP has two phases, for which you must perform three steps. These steps correspond to the steps depicted in the following diagram. We include manual steps in this documentation, but your RIR might offer managed services to help you with these steps.

**Preparation phase**

1. [Create a private key](#) and use it to generate a self-signed X.509 certificate for authentication purposes. This certificate is only used during the provisioning phase.

**RIR configuration phase**

2. [Upload the self-signed certificate](#) to your RDAP record comments.

3. [Create a ROA object](#) in your RIR. The ROA defines the desired address range, the Autonomous System Numbers (ASNs) allowed to advertise the address range, and an expiration date to register with the Resource Public Key Infrastructure (RPKI) of your RIR.

**Note**

A ROA is not required for non-publicly advertisable IPv6 address space.
To bring on multiple non-contiguous address ranges, you must repeat this process with each address range. However, the preparation and RIR configuration steps don't need to be repeated if splitting a contiguous block across several different AWS Regions.

Bringing on an address range has no effect on any address ranges that you brought on previously.
Important

Before onboarding your address range, complete the following prerequisites. The tasks in this section require a Linux terminal and may be performed using Linux, the AWS CloudShell, or the Windows Subsystem for Linux.

1. Create a private key and generate an X.509 certificate

Use the following procedure to create a self-signed X.509 certificate and add it to the RDAP record for your RIR. This key pair is used to authenticate the address range with the RIR. The openssl commands require OpenSSL version 1.0.2 or later.

Copy the following commands and replace only the placeholder values (in colored italic text).

This procedure follows the best practice of encrypting your private RSA key and requiring a passphrase to access it.

1. Generate an RSA 2048-bit private key as shown in the following.

   ```sh
   $ openssl genpkey -aes256 -algorithm RSA -pkeyopt rsa_keygen_bits:2048 -out private-key.pem
   ```

   The `-aes256` parameter specifies the algorithm used to encrypt the private key. The command returns the following output, including prompts to set a passphrase:

   ```
   ......+++ 
   .+++ 
   Enter PEM pass phrase: xxxxxxx 
   Verifying - Enter PEM pass phrase: xxxxxxx 
   ```

   You can inspect the key using the following command:

   ```sh
   $ openssl pkey -in private-key.pem -text
   ```

   This returns a passphrase prompt and the contents of the key, which should be similar to the following:

   ```
   Enter pass phrase for private-key.pem: xxxxxxx 
   ```
8a:3e:2b:74:37:97:06:e0:6e:63:8a:0f:fc:fd:b2:
e0:cb
publicExponent: 65537 (0x10001)
privateExponent:
01:9d:cc:44:06:4f:8c:71:e0:a5:89:00:02:c5:16:
b9

9a:77:5a:e5:87:d5:4f:01

Keep your private key in a secure location when it is not in use.

2. Generate an X.509 certificate using the private key created in the previous step. In this example, the certificate expires in 365 days, after which time it cannot be trusted. Be sure to set the expiration appropriately. The certificate must only be valid for the duration of the provisioning process. You can remove the certificate from your RIR's record after provisioning is complete. The `tr` `-d "\n"` command strips newline characters (line breaks) from the output. You need to provide a Common Name when prompted, but the other fields can be left blank.

```
$ openssl req -new -x509 -key private-key.pem -days 365 | tr -d "\n" > certificate.pem
```
This results in output similar to the following:

```
Enter pass phrase for private-key.pem: xxxxxxxx
You are about to be asked to enter information that will be incorporated into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) []:
State or Province Name (full name) []:
Locality Name (eg, city) []:
Organization Name (eg, company) []:
Organizational Unit Name (eg, section) []:
Common Name (eg, fully qualified host name) []: example.com
Email Address []:
```

### Note

The Common Name is not needed for AWS provisioning. It can be any internal or public domain name.

You can inspect the certificate with the following command:

```
$ cat certificate.pem
```

The output should be a long, PEM-encoded string without line breaks, prefaced by `-----BEGIN CERTIFICATE-----` and followed by `-----END CERTIFICATE-----`.

2. **Upload the X.509 certificate to the RDAP record in your RIR**

Add the certificate that you previously created to the RDAP record for your RIR. Be sure to include the `-----BEGIN CERTIFICATE-----` and `-----END CERTIFICATE-----` strings before and after the encoded portion. All of this content must be on a single, long line. The procedure for updating RDAP depends on your RIR:
• For ARIN, use the Account Manager portal to add the certificate in the "Public Comments" section for the "Network Information" object representing your address range. Do not add it to the comments section for your organization.

• For RIPE, add the certificate as a new "descr" field to the "inetnum" or "inet6num" object representing your address range. These can usually be found in the "My Resources" section of the RIPE Database portal. Do not add it to the comments section for your organization or the "remarks" field of the above objects.

• For APNIC, email the certificate to helpdesk@apnic.net to manually add it to the "remarks" field for your address range. Send the email using the APNIC authorized contact for the IP addresses.

You can remove the certificate from your RIR's record after the provisioning stage below has been completed.

3. Create a ROA object in your RIR

Create a ROA object to authorize the Amazon ASNs 16509 and 14618 to advertise your address range, as well as the ASNs that are currently authorized to advertise the address range. For the AWS GovCloud (US) Regions, authorize ASN 8987 instead of 16509 and 14618. You must set the maximum length to the size of the CIDR that you are bringing in. The most specific IPv4 prefix you can bring is /24. The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertisable and /56 for CIDRs that are not publicly advertisable.

⚠️ Important

If you are creating a ROA object for Amazon VPC IP Address Manager (IPAM), when you create the ROAs, for IPv4 CIDRs you must set the maximum length of an IP address prefix to /24. For IPv6 CIDRs, if you are adding them to an advertisable pool, the maximum length of an IP address prefix must be /48. This ensures that you have full flexibility to divide your public IP address across AWS Regions. IPAM enforces the maximum length you set. For more information about BYOIP addresses to IPAM, see Tutorial: BYOIP address CIDRs to IPAM in the Amazon VPC IPAM User Guide.

It might take up to 24 hours for the ROA to become available to Amazon. For more information, consult your RIR:

• ARIN — ROA Requests
When you migrate advertisements from an on-premises workload to AWS, you must create a ROA for your existing ASN before creating the ROAs for Amazon's ASNs. Otherwise, you might see an impact to your existing routing and advertisements.

⚠️ **Important**

For Amazon to advertise and continue advertising your IP address range, your ROAs with Amazon ASNs must be compliant with the above guidelines. If your ROAs are invalid or not compliant with the above guidelines, Amazon reserves the right to stop advertising your IP address range.

ℹ️ **Note**

This step is not required for non-publicly advertisable IPv6 address space.

### Onboard your BYOIP

The onboarding process for BYOIP has the following tasks depending on your needs.

**Tasks**

- [Provision a publicly advertisable address range in AWS](#)
- [Provision an IPv6 address range that's not publicly advertisable](#)
- [Advertise the address range through AWS](#)
- [Deprovision the address range](#)

### Provision a publicly advertisable address range in AWS

When you provision an address range for use with AWS, you are confirming that you control the address range and are authorizing Amazon to advertise it. We also verify that you control the address range through a signed authorization message. This message is signed with the self-signed X.509 key pair that you used when updating the RDAP record with the X.509 certificate.
AWS requires a cryptographically signed authorization message that it presents to the RIR. The RIR authenticates the signature against the certificate that you added to RDAP, and checks the authorization details against the ROA.

**To provision the address range**

1. **Compose message**

   Compose the plaintext authorization message. The format of the message is as follows, where the date is the expiry date of the message:

   ```
   1|aws|account|cidr|YYYYMMDD|SHA256|RSAPSS
   ```

   Replace the account number, address range, and expiry date with your own values to create a message resembling the following:

   ```
   text_message="1|aws|0123456789AB|198.51.100.0/24|20211231|SHA256|RSAPSS"
   ```

   This is not to be confused with a ROA message, which has a similar appearance.

2. **Sign message**

   Sign the plaintext message using the private key that you created previously. The signature returned by this command is a long string that you need to use in the next step.

   ```
   signed_message=$( echo -n $text_message | openssl dgst -sha256 -sigopt rsa_padding_mode:pss -sigopt rsa_pss_saltlen:-1 -sign private-key.pem -keyform PEM | openssl base64 | tr -- '+=/-' '-_~' | tr -d '
')
   ```

3. **Provision address**

   Use the AWS CLI `provision-byoip-cidr` command to provision the address range. The `--cidr-authorization-context` option uses the message and signature strings that you created previously.
Important

You must specify the AWS Region where the BYOIP range should be provisioned if it differs from your AWS CLI configuration Default region name.

aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context Message="$text_message",Signature="$signed_message" --region us-east-1

Provisioning an address range is an asynchronous operation, so the call returns immediately, but the address range is not ready to use until its status changes from pending-provision to provisioned.

4. Monitor progress

While most provisioning will be completed within two hours, it might take up to one week to complete the provisioning process for publicly advertisable ranges. Use the `describe-byoip-cidrs` command to monitor progress, as in this example:

aws ec2 describe-byoip-cidrs --max-results 5 --region us-east-1

If there are issues during provisioning and the status goes to failed-provision, you must run the `provision-byoip-cidr` command again after the issues have been resolved.

Provision an IPv6 address range that's not publicly advertisable

By default, an address range is provisioned to be publicly advertisable to the internet. You can provision an IPv6 address range that will not be publicly advertisable. For routes that are not publicly advertisable, the provisioning process generally completes within minutes. When you associate an IPv6 CIDR block from a non-public address range with a VPC, the IPv6 CIDR can only be accessed through hybrid connectivity options that support IPv6, such as AWS Direct Connect, AWS Site-to-Site VPN, or Amazon VPC Transit Gateways.

A ROA is not required to provision a non-public address range.
Important

- You can only specify whether an address range is publicly advertisable during provisioning. You cannot change the advertisable status later on.
- Amazon VPC doesn't support unique local address (ULA) CIDRs. All VPCs must have unique IPv6 CIDRs. Two VPCs can't have the same IPv6 CIDR range.

To provision an IPv6 address range that will not be publicly advertisable, use the following `provision-byoip-cidr` command.

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context Message="$text_message",Signature="$signed_message" --no-publicly-advertisable --region us-east-1
```

Advertise the address range through AWS

After the address range is provisioned, it is ready to be advertised. You must advertise the exact address range that you provisioned. You can't advertise only a portion of the provisioned address range.

If you provisioned an IPv6 address range that will not be publicly advertised, you do not need to complete this step.

We recommend that you stop advertising the address range or any portion of the range from other locations before you advertise it through AWS. If you keep advertising your IP address range or any portion of it from other locations, we can't reliably support it or troubleshoot issues. Specifically, we can't guarantee that traffic to the address range or a portion of the range will enter our network.

To minimize down time, you can configure your AWS resources to use an address from your address pool before it is advertised, and then simultaneously stop advertising it from the current location and start advertising it through AWS. For more information about allocating an Elastic IP address from your address pool, see Allocate an Elastic IP address.

Limitations

- You can run the `advertise-byoip-cidr` command at most once every 10 seconds, even if you specify different address ranges each time.
You can run the `withdraw-byoip-cidr` command at most once every 10 seconds, even if you specify different address ranges each time.

To advertise the address range, use the following `advertise-byoip-cidr` command.

```
aws ec2 advertise-byoip-cidr --cidr address-range --region us-east-1
```

To stop advertising the address range, use the following `withdraw-byoip-cidr` command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

**Deprovision the address range**

To stop using your address range with AWS, first release any Elastic IP addresses and disassociate any IPv6 CIDR blocks that are still allocated from the address pool. Then stop advertising the address range, and finally, deprovision the address range.

You cannot deprovision a portion of the address range. If you want to use a more specific address range with AWS, deprovision the entire address range and provision a more specific address range.

(IPv4) To release each Elastic IP address, use the following `release-address` command.

```
aws ec2 release-address --allocation-id eipalloc-12345678abcabcabc --region us-east-1
```

(IPv6) To disassociate an IPv6 CIDR block, use the following `disassociate-vpc-cidr-block` command.

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-12345abcd1234abc1 --region us-east-1
```

To stop advertising the address range, use the following `withdraw-byoip-cidr` command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

To deprovision the address range, use the following `deprovision-byoip-cidr` command.

```
aws ec2 deprovision-byoip-cidr --cidr address-range --region us-east-1
```

It can take up to a day to deprovision an address range.
Work with your address range

You can view and use the IPv4 and IPv6 address ranges that you've provisioned in your account.

IPv4 address ranges

You can create an Elastic IP address from your IPv4 address pool and use it with your AWS resources, such as EC2 instances, NAT gateways, and Network Load Balancers.

To view information about the IPv4 address pools that you've provisioned in your account, use the following `describe-public-ipv4-pools` command.

```bash
aws ec2 describe-public-ipv4-pools --region us-east-1
```

To create an Elastic IP address from your IPv4 address pool, use the `allocate-address` command. You can use the `--public-ipv4-pool` option to specify the ID of the address pool returned by `describe-byoip-cidrs`. Or you can use the `--address` option to specify an address from the address range that you provisioned.

IPv6 address ranges

To view information about the IPv6 address pools that you've provisioned in your account, use the following `describe-ipv6-pools` command.

```bash
aws ec2 describe-ipv6-pools --region us-east-1
```

To create a VPC and specify an IPv6 CIDR from your IPv6 address pool, use the following `create-vpc` command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```bash
aws ec2 create-vpc --cidr-block 10.0.0.0/16 --ipv6-cidr-block ipv6-cidr --ipv6-pool pool-id --region us-east-1
```

To associate an IPv6 CIDR block from your IPv6 address pool with a VPC, use the following `associate-vpc-cidr-block` command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```bash
aws ec2 associate-vpc-cidr-block --vpc-id vpc-123456789abc123ab --ipv6-cidr-block ipv6-cidr --ipv6-pool pool-id --region us-east-1
```
To view your VPCs and the associated IPv6 address pool information, use the `describe-vpcs` command. To view information about associated IPv6 CIDR blocks from a specific IPv6 address pool, use the following `get-associated-ipv6-pool-cidrs` command.

```bash
aws ec2 get-associated-ipv6-pool-cidrs --pool-id pool-id --region us-east-1
```

If you disassociate the IPv6 CIDR block from your VPC, it's released back into your IPv6 address pool.

**Validate your BYOIP**

1. Validate the self-signed x.509 key pair

   Validate that the certificate has been uploaded and is valid via the `whois` command.

   For ARIN, use `whois -h whois.arin.net r + 2001:0DB8:6172::/48` to look up the RDAP record for your address range. Check the Public Comments section for the NetRange (network range) in the command output. The certificate should be added in the Public Comments section for the address range.

   You can inspect the Public Comments containing the certificate using the following command:

   ```bash
   whois -h whois.arin.net r + 2001:0DB8:6172::/48 | grep Comments | grep BEGIN
   ```

   This returns output with the contents of the key, which should be similar to the following:

   ```plaintext
   Public Comments:
   -----BEGIN CERTIFICATE-----
   MIID1zCCAr+gAwIBAgIUBkRPNSLrPqbRAFP8RDAHSP+I1TowDQYJKoZIhvcNAQEB
   LBQAwezELMAkGA1UEBhMCTloxDTAQBgNVBAoMCkFtYXpvbiBGaWBzMDQGMRKzBgNV
   BAsMCkJZT0lQIERlbW8wggEiMA0GCCsGAQUFBwEBBjowMTQFMRMwEQYDVQQD
   Ym4wZzEwggEiMA0GCCsGAQUFBwEBBjowMTQFMRMwEQYDVQQD
   ```
For RIPE, use `whois -r -h whois.ripe.net 2001:0DB8:7269::/48` to look up the RDAP record for your address range. Check the `descr` section for the `inetnum` object (network range) in the command output. The certificate should be added as a new `descr` field for the address range.

You can inspect the `descr` containing the certificate using the following command:

```
whois -r -h whois.ripe.net 2001:0DB8:7269::/48 | grep descr | grep BEGIN
```

This returns output with the contents of the key, which should be similar to the following:

```
descr:
------BEGIN CERTIFICATE------
3A7Nj0QbAgMBAAGjUzBRMB0GA1UDgQWBBSFyujN65Ybr2g1HpGt0XGF7GbGTAFBgnNVHSMEDGAWbGStFyujN65Ybr2g1HpGt0XGF7GbGTA PBgNVHMRMBAf8EBTADAQH/MA0GCSqGSIb3DQEBcUA4IABAQBX6nn6YLh2z511fyFvxY0t6o3410bQAeAF08ud+ICtmQ4I0A4B7v3zIYVr0c1r00aFyLxngwMYN0XY5tVhDQqq4/gmDNEKS Zy20QxyEg0YVUWv2o6tFp2j0vJLcsqc1hcF9wySL507Qz76Uk5cFypB0bnk35 UkwRzaA9KK97cXckfIESGk/k1N4ecwwG6VQ8mBqVpPpey+dXpzzzv1iBKN/VY4 ydjgH/LBfDtsVarmmy2vttWbxwqFvpdhSGCvRDI/qdO/GIDJr77dmZWhk/ic90 MNk1f38gs1jrCj8lThoar17uo9y/Q5qJIs0NyQrJRzqFU9F3FbjiPjF
------END CERTIFICATE------
```

Validate your BYOIP 2028
For APNIC, use whois -h whois.apnic.net `2001:0DB8:6170::/48` to look up the RDAP record for your BYOIP address range. Check the remarks section for the inetnum object (network range) in the command output. The certificate should be added as a new remarks field for the address range.

You can inspect the remarks containing the certificate using the following command:

```
whois -h whois.apnic.net `2001:0DB8:6170::/48` | grep remarks | grep BEGIN
```

This returns output with the contents of the key, which should be similar to the following:

```
remarks:
-----BEGIN CERTIFICATE-----
MIID1zCCAr+gAwIBAgIUBkRPNSLrPqbRAFP8RDAHSP+I1TowDQYJKoZIhvCAQE
LBOaweZELMAkGA1UEBhMC1IoETAPBgNVBAgMCCEF1Y2tsYw5kMREwDwYDVQQHDA
hBdWnrbGFuZDEcMB0GA1UECgwTQW1hem9uIFdiYiBTZXJ2aWNlczzTMEGA1UEE

rbGFuZDERMA8GA1UEBwwIQXVja2xhbmxQHDAaBgNVBAoME0FtYXpsbixMZWlJgU2
Vydm1jZXNzEzARBgNVBAcMfMk5cKzJZ0QIERldmRyb28gM3k5cKzJZ0QIERldmRyb28g
M3k5cKzJZ0QIERldmRyb28g
-----END CERTIFICATE-----
```

2. Validate the creation of a ROA object
Validate the successful creation of the ROA objects using the RIPEstat Data API. Be sure to test your address range against the Amazon ASNs 16509 and 14618, plus the ASNs that are currently authorized to advertise the address range.

You can inspect the ROA objects from different Amazon ASNs with your address range by using the following command:

```
curl --location --request GET "https://stat.ripe.net/data/rpki-validation/data.json?resource=ASN&prefix=CIDR"
```

In this example output, the response has a result of "status": "valid" for the Amazon ASN 16509. This indicates the ROA object for the address range was created successfully:

```json
{
   "messages": [],
   "see_also": [],
   "version": "0.3",
   "data_call_name": "rpki-validation",
   "data_call_status": "supported",
   "cached": false,
   "data": {
      "validating_roas": [
      {
         "origin": "16509",
         "prefix": "2001:0DB8::/32",
         "max_length": 48,
         "validity": "valid"
      },
      {
         "origin": "14618",
         "prefix": "2001:0DB8::/32",
         "max_length": 48,
         "validity": "invalid_asn"
      },
      {
         "origin": "64496",
         "prefix": "2001:0DB8::/32",
         "max_length": 48,
         "validity": "invalid_asn"
      }
      ],
```
A status of “unknown” indicates the ROA object for the address range has not been created. A status of “invalid_asn” indicates that the ROA object for the address range was not created successfully.

**Regional availability**

The BYOIP feature is currently available in all commercial [AWS Regions](https://aws.amazon.com/regions/) except for China Regions.

**Local Zone availability**

A [Local Zone](https://aws.amazon.com/localzone/) is an extension of an AWS Region in geographic proximity to your users. Local Zones are grouped into "network border groups". In AWS, a network border group is a collection of Availability Zones (AZs), Local Zones, or Wavelength Zones from which AWS advertises a public IP address. Local Zones may have different network border groups than the AZs in an AWS Region to ensure minimum latency or physical distance between the AWS network and the customers accessing the resources in these Zones.

You can provision BYOIPv4 address ranges to and advertise them in the following Local Zone network border groups using the `--network-border-group` option:

- us-east-1-dfw-2
- us-west-2-lax-1
- us-west-2-phx-2
If you have Local Zones enabled (see Enable a Local Zone), you can choose a network border group for Local Zones when you provision and advertise a BYOIPv4 CIDR. Choose the network border group carefully as the EIP and the AWS resource it is associated with must reside in the same network border group.

⚠️ Note

You cannot provision or advertise BYOIPv6 address ranges in Local Zones at this time.

Learn more

For more information, see the AWS Online Tech talk Deep Dive on Bring Your Own IP.

Elastic IP addresses

An Elastic IP address is a static IPv4 address designed for dynamic cloud computing. An Elastic IP address is allocated to your AWS account, and is yours until you release it. By using an Elastic IP address, you can mask the failure of an instance or software by rapidly remapping the address to another instance in your account. Alternatively, you can specify the Elastic IP address in a DNS record for your domain, so that your domain points to your instance. For more information, see the documentation for your domain registrar.

An Elastic IP address is a public IPv4 address, which is reachable from the internet. If your instance does not have a public IPv4 address, you can associate an Elastic IP address with your instance to enable communication with the internet. For example, this allows you to connect to your instance from your local computer.

- Elastic IP address quota
Elastic IP address pricing

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the Public IPv4 Address tab on the Amazon VPC pricing page.

Elastic IP address basics

The following are the basic characteristics of an Elastic IP address:

- An Elastic IP address is static; it does not change over time.
- An Elastic IP address is for use in a specific Region only, and cannot be moved to a different Region.
- An Elastic IP address comes from Amazon's pool of IPv4 addresses, or from a custom IPv4 address pool that you have brought to your AWS account.
- To use an Elastic IP address, you first allocate one to your account, and then associate it with your instance or a network interface.
- When you associate an Elastic IP address with an instance, it is also associated with the instance's primary network interface. When you associate an Elastic IP address with a network interface that is attached to an instance, it is also associated with the instance.
- When you associate an Elastic IP address with an instance or its primary network interface, if the instance already has a public IPv4 address associated with it, that public IPv4 address is released back into Amazon's pool of public IPv4 addresses and the Elastic IP address is associated with the instance instead. You cannot reuse the public IPv4 address previously associated with the instance and you cannot convert that public IPv4 address to an Elastic IP address. For more information, see Public IPv4 addresses.
- You can disassociate an Elastic IP address from a resource, and then associate it with a different resource. To avoid unexpected behavior, ensure that all active connections to the resource named in the existing association are closed before you make the change. After you have associated your Elastic IP address to a different resource, you can reopen your connections to the newly associated resource.
- A disassociated Elastic IP address remains allocated to your account until you explicitly release it. You are charged for all Elastic IP addresses in your account, regardless of whether they are associated or disassociated with an instance. For more information, see the Public IPv4 Address tab on the Amazon VPC pricing page.
• When you associate an Elastic IP address with an instance that previously had a public IPv4 address, the public DNS host name of the instance changes to match the Elastic IP address.

• We resolve a public DNS host name to the public IPv4 address or the Elastic IP address of the instance outside the network of the instance, and to the private IPv4 address of the instance from within the network of the instance.

• When you allocate an Elastic IP address from an IP address pool that you have brought to your AWS account, it does not count toward your Elastic IP address limits. For more information, see Elastic IP address quota.

• When you allocate the Elastic IP addresses, you can associate the Elastic IP addresses with a network border group. This is the location from which we advertise the CIDR block. Setting the network border group limits the CIDR block to this group. If you do not specify the network border group, we set the border group containing all of the Availability Zones in the Region (for example, us-west-2).

• An Elastic IP address is for use in a specific network border group only.

Work with Elastic IP addresses

The following sections describe how you can work with Elastic IP addresses.

Tasks
  • Allocate an Elastic IP address
  • Describe your Elastic IP addresses
  • Tag an Elastic IP address
  • Associate an Elastic IP address with an instance or network interface
  • Disassociate an Elastic IP address
  • Transfer Elastic IP addresses
  • Release an Elastic IP address
  • Recover an Elastic IP address
  • Use reverse DNS for email applications

Allocate an Elastic IP address

You can allocate an Elastic IP address from Amazon’s pool of public IPv4 addresses, or from a custom IP address pool that you have brought to your AWS account. For more information about
bringing your own IP address range to your AWS account, see Bring your own IP addresses (BYOIP) in Amazon EC2.

You can allocate an Elastic IP address using one of the following methods.

**Console**

**To allocate an Elastic IP address**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Network & Security, Elastic IPs**.
3. Choose **Allocate Elastic IP address**.
4. (Optional) When you allocate an Elastic IP address (EIP), you choose the **Network border group** in which to allocate the EIP. A network border group is a collection of Availability Zones (AZs), Local Zones, or Wavelength Zones from which AWS advertises a public IP address. Local Zones and Wavelength Zones may have different network border groups than the AZs in a Region to ensure minimum latency or physical distance between the AWS network and the customers accessing the resources in these Zones.

**Important**

You must allocate an EIP in the same network border group as the AWS resource that will be associated with the EIP. An EIP in one network border group can only be advertised in zones in that network border group and not in any other zones represented by other network border groups.

If you have Local Zones or Wavelength Zones enabled (for more information, see Enable a Local Zone or Enable Wavelength Zones), you can choose a network border group for AZs, Local Zones, or Wavelength Zones. Choose the network border group carefully as the EIP and the AWS resource it is associated with must reside in the same network border group. You can use the EC2 console to view the network border group that your Availability Zones, Local Zones, or Wavelength Zones are in. Typically, all Availability Zones in a Region belong to the same network border group, whereas Local Zones or Wavelength Zones belong to their own separate network border groups.

If you don't have Local Zones or Wavelength Zones enabled, when you allocate an EIP, the network border group that represents all of the AZs for the Region (such as us-west-2) is
predefined for you and you cannot change it. This means that the EIP that you allocate to this network border group will be advertised in all AZs in the Region you're in.

5. For **Public IPv4 address pool**, choose one of the following:

   • **Amazon's pool of IPv4 addresses**—If you want an IPv4 address to be allocated from Amazon's pool of IPv4 addresses.

   • **Public IPv4 address that you bring to your AWS account**—If you want to allocate an IPv4 address from an IP address pool that you have brought to your AWS account. This option is disabled if you do not have any IP address pools.

   • **Customer owned pool of IPv4 addresses**—If you want to allocate an IPv4 address from a pool created from your on-premises network for use with an AWS Outpost. This option is disabled if you do not have an AWS Outpost.

6. (Optional) Add or remove a tag.

   [Add a tag] Choose **Add new tag** and do the following:

   • For **Key**, enter the key name.

   • For **Value**, enter the key value.

   [Remove a tag] Choose **Remove** to the right of the tag’s Key and Value.

7. Choose **Allocate**.

**AWS CLI**

**To allocate an Elastic IP address**

Use the `allocate-address` AWS CLI command.

**PowerShell**

**To allocate an Elastic IP address**

**Describe your Elastic IP addresses**

You can describe an Elastic IP address using one of the following methods.
Console

To describe your Elastic IP addresses

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Elastic IPs.
3. Select the Elastic IP address to view and choose Actions, View details.

AWS CLI

To describe your Elastic IP addresses

Use the describe-addresses AWS CLI command.

PowerShell

To describe your Elastic IP addresses

Tag an Elastic IP address

You can assign custom tags to your Elastic IP addresses to categorize them in different ways, for example, by purpose, owner, or environment. This helps you to quickly find a specific Elastic IP address based on the custom tags that you assigned to it.

Cost allocation tracking using Elastic IP address tags is not supported.

You can tag an Elastic IP address using one of the following methods.

Console

To tag an Elastic IP address

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Elastic IPs.
3. Select the Elastic IP address to tag and choose Actions, View details.
4. In the Tags section, choose Manage tags.
5. Specify a tag key and value pair.
6. (Optional) Choose Add tag to add additional tags.
Choose **Save**.

**AWS CLI**

**To tag an Elastic IP address**

Use the `create-tags` AWS CLI command.

```
aws ec2 create-tags --resources eipalloc-12345678 --tags Key=Owner,Value=TeamA
```

**PowerShell**

**To tag an Elastic IP address**

Use the `New-EC2Tag` AWS Tools for Windows PowerShell command.

The `New-EC2Tag` command needs a `Tag` parameter, which specifies the key and value pair to be used for the Elastic IP address tag. The following commands create the `Tag` parameter.

```
PS C:\> $tag = New-Object Amazon.EC2.Model.Tag
PS C:\> $tag.Key = "Owner"
PS C:\> $tag.Value = "TeamA"
```

```
PS C:\> New-EC2Tag -Resource eipalloc-12345678 -Tag $tag
```

**Associate an Elastic IP address with an instance or network interface**

If you're associating an Elastic IP address with your instance to enable communication with the internet, you must also ensure that your instance is in a public subnet. For more information, see **Internet gateways** in the *Amazon VPC User Guide*.

You can associate an Elastic IP address with an instance or network interface using one of the following methods.

**Console**

**To associate an Elastic IP address with an instance**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to associate and choose **Actions, Associate Elastic IP address**.

4. For **Resource type**, choose **Instance**.

5. For instance, choose the instance with which to associate the Elastic IP address. You can also enter text to search for a specific instance.

6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.

7. Choose **Associate**.

**To associate an Elastic IP address with a network interface**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the navigation pane, choose **Elastic IPs**.

3. Select the Elastic IP address to associate and choose **Actions, Associate Elastic IP address**.

4. For **Resource type**, choose **Network interface**.

5. For **Network interface**, choose the network interface with which to associate the Elastic IP address. You can also enter text to search for a specific network interface.

6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.

7. Choose **Associate**.

**AWS CLI**

**To associate an Elastic IP address**

Use the **associate-address** AWS CLI command.

**PowerShell**

**To associate an Elastic IP address**

Use the **Register-EC2Address** AWS Tools for Windows PowerShell command.

**Disassociate an Elastic IP address**

You can disassociate an Elastic IP address from an instance or network interface at any time. After you disassociate the Elastic IP address, you can reassociate it with another resource.
You can disassociate an Elastic IP address using one of the following methods.

**Console**

**To disassociate and reassociate an Elastic IP address**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to disassociate, choose **Actions, Disassociate Elastic IP address**.
4. Choose **Disassociate**.

**AWS CLI**

**To disassociate an Elastic IP address**

Use the `disassociate-address` AWS CLI command.

**PowerShell**

**To disassociate an Elastic IP address**

Use the `Unregister-EC2Address` AWS Tools for Windows PowerShell command.

**Transfer Elastic IP addresses**

This section describes how to transfer Elastic IP addresses from one AWS account to another. Transferring Elastic IP addresses can be helpful in the following situations:

- **Organizational restructuring** – Use Elastic IP address transfers to quickly move workloads from one AWS account to another. You don’t have to wait for new Elastic IP addresses to be allowlisted in your security groups and NACLs.
- **Centralized security administration** – Use a centralized AWS security account to track and transfer Elastic IP addresses that have been vetted for security compliance.
- **Disaster recovery** – Use Elastic IP address transfers to quickly remap IPs for public-facing internet workloads during emergency events.

There is no charge for transferring Elastic IP addresses.
Tasks

- Enable Elastic IP address transfer
- Disable Elastic IP address transfer
- Accept a transferred Elastic IP address

Enable Elastic IP address transfer

This section describes how to accept a transferred Elastic IP address. Note the following limitations related to enabling Elastic IP addresses for transfer:

- You can transfer Elastic IP addresses from any AWS account (source account) to any other AWS account in the same AWS Region (transfer account).
- When you transfer an Elastic IP address, there is a two-step handshake between the AWS accounts. When the source account starts the transfer, the transfer accounts have seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer (for example in the AWS console or by using the `describe-address-transfers` AWS CLI command). After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account.
- Accepted transfers are visible to the source account (for example in the AWS console or by using the `describe-address-transfers` AWS CLI command) for three days after the transfers have been accepted.
- AWS does not notify transfer accounts about pending Elastic IP address transfer requests. The owner of the source account must notify the owner of the transfer account that there is an Elastic IP address transfer request that they must accept.
- Any tags that are associated with an Elastic IP address being transferred are reset when the transfer is complete.
- You cannot transfer Elastic IP addresses allocated from public IPv4 address pools that you bring to your AWS account – commonly referred to as Bring Your Own IP (BYOIP) address pools.
- If you attempt to transfer an Elastic IP address that has a reverse DNS record associated with it, you can begin the transfer process, but the transfer account will not be able to accept the transfer until the associated DNS record is removed.
- If you have enabled and configured AWS Outposts, you might have allocated Elastic IP addresses from a customer-owned IP address pool (CoIP). You cannot transfer Elastic IP addresses allocated from a CoIP. However, you can use AWS RAM to share a CoIP with another account. For more information, see Customer-owned IP addresses in the AWS Outposts User Guide.
• You can use Amazon VPC IPAM to track the transfer of Elastic IP addresses to accounts in an organization from AWS Organizations. For more information, see View IP address history. If an Elastic IP address is transferred to an AWS account outside of the organization, the IPAM audit history of the Elastic IP address is lost.

These steps must be completed by the source account.

Console

To enable Elastic IP address transfer

1. Ensure that you're using the source AWS account.
2. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
3. In the navigation pane, choose Elastic IPs.
4. Select one or more Elastic IP address to enable for transfer and choose Actions, Enable transfer.
5. If you are transferring multiple Elastic IP addresses, you’ll see the Transfer type option. Choose one of the following options:
   • Choose Single account if you are transferring the Elastic IP addresses to a single AWS account.
   • Choose Multiple accounts if you are transferring the Elastic IP addresses to multiple AWS accounts.
6. Under Transfer account ID, enter the IDs of the AWS accounts that you want to transfer the Elastic IP addresses to.
7. Confirm the transfer by entering enable in the text box.
8. Choose Submit.
9. To accept the transfer, see Accept a transferred Elastic IP address. To disable the transfer, see Disable Elastic IP address transfer.

AWS CLI

To enable Elastic IP address transfer

Use the enable-address-transfer command.
PowerShell

To enable Elastic IP address transfer

Use the `Enable-EC2AddressTransfer` command.

Disable Elastic IP address transfer

This section describes how to disable an Elastic IP transfer after the transfer has been enabled.

These steps must be completed by the source account that enabled the transfer.

Console

To disable an Elastic IP address transfer

1. Ensure that you're using the source AWS account.
2. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
3. In the navigation pane, choose Elastic IPs.
4. In the resource list of Elastic IPs, ensure that you have the property enabled that shows the column Transfer status.
5. Select one or more Elastic IP address that have a Transfer status of Pending, and choose Actions, Disable transfer.
6. Confirm by entering disable in the text box.
7. Choose Submit.

AWS CLI

To disable Elastic IP address transfer

Use the `disable-address-transfer` command.

PowerShell

To disable Elastic IP address transfer

Use the `Disable-EC2AddressTransfer` command.
Accept a transferred Elastic IP address

This section describes how to accept a transferred Elastic IP address.

When you transfer an Elastic IP address, there is a two-step handshake between the AWS accounts. When the source account starts the transfer, the transfer accounts have seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer (for example in the AWS console or by using the `describe-address-transfers` AWS CLI command). After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account.

When accepting transfers, note the following exceptions that might occur and how to resolve them:

- **AddressLimitExceeded**: If your transfer account has exceeded the Elastic IP address quota, the source account can enable Elastic IP address transfer, but this exception occurs when the transfer account tries to accept the transfer. By default, all AWS accounts are limited to 5 Elastic IP addresses per Region. See [Elastic IP address quota](https://docs.aws.amazon.com/elasticip/latest/guide/elastic-ip-address-quota.html) for instructions on increasing the limit.

- **InvalidTransfer.AddressCustomPtrSet**: If you or someone in your organization has configured the Elastic IP address that you are attempting to transfer to use reverse DNS lookup, the source account can enable transfer for the Elastic IP address, but this exception occurs when the transfer account tries to accept the transfer. To resolve this issue, the source account must remove the DNS record for the Elastic IP address. For more information, see [Use reverse DNS for email applications](https://docs.aws.amazon.com/elasticip/latest/guide/use-reverse-dns.html).

- **InvalidTransfer.AddressAssociated**: If an Elastic IP address is associated with an ENI or EC2 instance, the source account can enable transfer for the Elastic IP address, but this exception occurs when the transfer account tries to accept the transfer. To resolve this issue, the source account must disassociate the Elastic IP address. For more information, see [Disassociate an Elastic IP address](https://docs.aws.amazon.com/elasticip/latest/guide/disassociate-address.html).

For any other exceptions, contact AWS Support.

These steps must be completed by the transfer account.

**Console**

**To accept an Elastic IP address transfer**

1. Ensure that you're using the transfer account.
2. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.

3. In the navigation pane, choose Elastic IPs.

4. Choose Actions, Accept transfer.

5. No tags that are associated with the Elastic IP address being transferred are transferred with the Elastic IP address when you accept the transfer. If you want to define a Name tag for the Elastic IP address that you are accepting, select Create a tag with a key of 'Name' and a value that you specify.

6. Enter the Elastic IP address that you want to transfer.

7. If you are accepting multiple transferred Elastic IP addresses, choose Add address to enter an additional Elastic IP address.

8. Choose Submit.

AWS CLI

To accept an Elastic IP address transfer

Use the accept-address-transfer command.

PowerShell

To accept an Elastic IP address transfer

Use the Approve-EC2AddressTransfer command.

Release an Elastic IP address

If you no longer need an Elastic IP address, we recommend that you release it using one of the following methods. The address to release must not be currently associated with an AWS resource, such as an EC2 instance, NAT gateway, or Network Load Balancer.

Note

If you contacted AWS support to set up reverse DNS for an Elastic IP (EIP) address, you can remove the reverse DNS, but you can’t release the Elastic IP address because it’s been locked by AWS support. To unlock the Elastic IP address, contact AWS Support. After the Elastic IP address is unlocked, you can release the Elastic IP address.
Console

To release an Elastic IP address

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Elastic IPs.
3. Select the Elastic IP address to release and choose Actions, Release Elastic IP addresses.

AWS CLI

To release an Elastic IP address

Use the release-address AWS CLI command.

PowerShell

To release an Elastic IP address

Use the Remove-EC2Address AWS Tools for Windows PowerShell command.

Recover an Elastic IP address

If you have released your Elastic IP address, you might be able to recover it. The following rules apply:

- You cannot recover an Elastic IP address if it has been allocated to another AWS account, or if it will result in your exceeding your Elastic IP address limit.
- You cannot recover tags associated with an Elastic IP address.
- You can recover an Elastic IP address using the Amazon EC2 API or a command line tool only.

AWS CLI

To recover an Elastic IP address

Use the allocate-address AWS CLI command and specify the IP address using the --address parameter as follows.

```
aws ec2 allocate-address --domain vpc --address 203.0.113.3
```
PowerShell

To recover an Elastic IP address

Use the **New-EC2Address** AWS Tools for Windows PowerShell command and specify the IP address using the `-Address` parameter as follows.

```powershell
PS C:\> New-EC2Address -Address 203.0.113.3 -Domain vpc -Region us-east-1
```

Use reverse DNS for email applications

If you intend to send email to third parties from an instance, we recommend that you provision one or more Elastic IP addresses and assign static reverse DNS records to the Elastic IP addresses that you use to send email. This can help you avoid having your email flagged as spam by some anti-spam organizations. AWS works with ISPs and internet anti-spam organizations to reduce the chance that your email sent from these addresses will be flagged as spam.

Considerations

- Before you create a reverse DNS record, you must set a corresponding forward DNS record (record type A) that points to your Elastic IP address.
- If a reverse DNS record is associated with an Elastic IP address, the Elastic IP address is locked to your account and cannot be released from your account until the record is removed.
- **AWS GovCloud (US) Region**
  
  You can't create a reverse DNS record using the console or AWS CLI. AWS must assign the static reverse DNS records for you. Open Request to remove reverse DNS and email sending limitations and provide us with your Elastic IP addresses and reverse DNS records.

Create a reverse DNS record

To create a reverse DNS record, choose the tab that matches your preferred method.

Console

1. Open the Amazon EC2 console at **https://console.aws.amazon.com/ec2/**.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address and choose **Actions, Update reverse DNS**.
4. For **Reverse DNS domain name**, enter the domain name.

5. Enter **update** to confirm.

6. Choose **Update**.

**AWS CLI**

Use the **modify-address-attribute** command in the AWS CLI, as shown in the following example:

```bash
aws ec2 modify-address-attribute --allocation-id eipalloc-abcdef01234567890 --domain-name example.com
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.net."
            "PtrRecordUpdate": {
            "Value": "example.com.",
            "Status": "PENDING"
            }
        }
    ]
}
```

**Remove a reverse DNS record**

To remove a reverse DNS record, choose the tab that matches your preferred method.

**Console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the navigation pane, choose **Elastic IPs**.

3. Select the Elastic IP address and choose **Actions**, **Update reverse DNS**.

4. For **Reverse DNS domain name**, clear the domain name.

5. Enter **update** to confirm.

6. Choose **Update**.
AWS CLI

Use the `reset-address-attribute` command in the AWS CLI, as shown in the following example:

```bash
aws ec2 reset-address-attribute --allocation-id eipalloc-abcdef01234567890 --attribute domain-name
{
   "Addresses": [  
      {
         "PublicIp": "192.0.2.0",
         "AllocationId": "eipalloc-abcdef01234567890",
         "PtrRecord": "example.com."
      }
   ]
}
```

Note

If you receive the following error when you run the command, you can submit a Request to remove email sending limitations to AWS Support for assistance. *The address with allocation id cannot be released because it is locked to your account.*

Elastic IP address quota

By default, all AWS accounts have a quota of five (5) Elastic IP addresses per Region, because public (IPv4) internet addresses are a scarce public resource. We strongly encourage you to use an Elastic IP address primarily for the ability to remap the address to another instance in the case of instance failure, and to use DNS hostnames for all other inter-node communication.

To verify how many Elastic IP addresses are in use

Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/ and choose Elastic IPs from the navigation pane.

To verify your current account quota for Elastic IP addresses

2. From the navigation bar (at the top of the screen), select a Region.

3. On the Dashboard, choose **Amazon Elastic Compute Cloud (Amazon EC2)**.

   If Amazon Elastic Compute Cloud (Amazon EC2) is not listed on the Dashboard, choose **AWS services**, enter **EC2** in the search field, and then choose **Amazon Elastic Compute Cloud (Amazon EC2)**.

4. On the Amazon EC2 service quotas page, enter **IP** in the search field. The limit is **EC2-VPC Elastic IPs**. For more information, choose the limit.

If you think your architecture warrants additional Elastic IP addresses, you can request a quota increase directly from the Service Quotas console. To request a quota increase, choose **Request increase at account-level**. For more information, see [Amazon EC2 service quotas](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/elastic-ipv4-addresses.html#elastic-ipv4-addresses-request).

### Elastic network interfaces

An **elastic network interface** is a logical networking component in a VPC that represents a virtual network card. It can include the following attributes:

- A primary private IPv4 address from the IPv4 address range of your VPC
- A primary IPv6 address from the IPv6 address range of your VPC
- One or more secondary private IPv4 addresses from the IPv4 address range of your VPC
- One Elastic IP address (IPv4) per private IPv4 address
- One public IPv4 address
- One or more IPv6 addresses
- One or more security groups
- A MAC address
- A source/destination check flag
- A description

You can create and configure network interfaces and attach them to instances in the same Availability Zone. Your account might also have **requester-managed** network interfaces, which are created and managed by AWS services to enable you to use other resources and services. You cannot manage these network interfaces yourself. For more information, see [Requester-managed network interfaces](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/network-interfaces.html).
This AWS resource is referred to as a network interface in the AWS Management Console and the Amazon EC2 API. Therefore, we use "network interface" in this documentation instead of "elastic network interface". The term "network interface" in this documentation always means "elastic network interface".

Contents
- Network interface basics
- Network cards
- IP addresses per network interface per instance type
- Work with network interfaces
- Best practices for configuring network interfaces
- Scenarios for network interfaces
- Requester-managed network interfaces
- Assign prefixes to Amazon EC2 network interfaces

Network interface basics

You can create a network interface, attach it to an instance, detach it from an instance, and attach it to another instance. The attributes of a network interface follow it as it's attached or detached from an instance and reattached to another instance. When you move a network interface from one instance to another, network traffic is redirected to the new instance.

Primary network interface

Each instance has a default network interface, called the primary network interface. You cannot detach a primary network interface from an instance. You can create and attach additional network interfaces. The maximum number of network interfaces that you can use varies by instance type. For more information, see IP addresses per network interface per instance type.

Public IPv4 addresses for network interfaces

In a VPC, all subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are assigned a public IPv4 address. For more information, see Subnet settings in the Amazon VPC User Guide. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses. When you launch an instance, the IP address is assigned to the primary network interface that's created.
When you create a network interface, it inherits the public IPv4 addressing attribute from the subnet. If you later modify the public IPv4 addressing attribute of the subnet, the network interface keeps the setting that was in effect when it was created. If you launch an instance and specify an existing network interface as the primary network interface, the public IPv4 address attribute is determined by this network interface.

For more information, see Public IPv4 addresses.

**Elastic IP addresses for network interface**

If you have an Elastic IP address, you can associate it with one of the private IPv4 addresses for the network interface. You can associate one Elastic IP address with each private IPv4 address.

If you disassociate an Elastic IP address from a network interface, you can release it back to the address pool. This is the only way to associate an Elastic IP address with an instance in a different subnet or VPC, as network interfaces are specific to subnets.

**IPv6 addresses for network interfaces**

If you associate IPv6 CIDR blocks with your VPC and subnet, you can assign one or more IPv6 addresses from the subnet range to a network interface. Each IPv6 address can be assigned to one network interface.

All subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are automatically assigned an IPv6 address from the range of the subnet. For more information, see Subnet settings in the Amazon VPC User Guide. When you launch an instance, the IPv6 address is assigned to the primary network interface that's created.

For more information, see IPv6 addresses.

**Prefix Delegation**

A Prefix Delegation prefix is a reserved private IPv4 or IPv6 CIDR range that you allocate for automatic or manual assignment to network interfaces that are associated with an instance. By using Delegated Prefixes, you can launch services faster by assigning a range of IP addresses as a single prefix.

**Termination behavior**
You can set the termination behavior for a network interface that's attached to an instance. You can specify whether the network interface should be automatically deleted when you terminate the instance to which it's attached.

**Source/destination checking**

You can enable or disable source/destination checks, which ensure that the instance is either the source or the destination of any traffic that it receives. Source/destination checks are enabled by default. You must disable source/destination checks if the instance runs services such as network address translation, routing, or firewalls.

**Monitoring IP traffic**

You can enable a VPC flow log on your network interface to capture information about the IP traffic going to and from a network interface. After you've created a flow log, you can view and retrieve its data in Amazon CloudWatch Logs. For more information, see [VPC Flow Logs](#) in the Amazon VPC User Guide.

**Automatic public IPv4 address assignment**

You can enable and disable automatic assignment of a public IPv4 address to a network interface. This option can be enabled for any network interface but will only apply to the primary network interface (eth0). For more information, see Manage IP addresses.

**Network cards**

Most instance types support one network card. Instance types that support multiple network cards provide higher network performance, including bandwidth capabilities above 100 Gbps and improved packet rate performance. When you attach a network interface to an instance that supports multiple network cards, you can select the network card for the network interface. The primary network interface must be assigned to network card index 0.

If you enable Elastic Fabric Adapter (EFA) when you launch an instance that supports multiple network cards, all network cards are available. You can assign up to one EFA per network card. An EFA counts as a network interface.

The following instance types support multiple network cards.

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Number of network cards</th>
</tr>
</thead>
<tbody>
<tr>
<td>c6in.32xlarge</td>
<td>2</td>
</tr>
<tr>
<td>Instance type</td>
<td>Number of network cards</td>
</tr>
<tr>

</tbody>
</table>

**IP addresses per network interface per instance type**

Each instance type supports a maximum number of network interfaces, maximum number of private IPv4 addresses per network interface, and maximum number of IPv6 addresses per network interface. The limit for IPv6 addresses is separate from the limit for private IPv4 addresses per network interface. Not all instance types support IPv6 addressing.

**Available network interfaces**

The *Amazon EC2 Instance Types Guide* provides the information about the network interfaces available for each instance type. For more information, see the following:

- [Network specifications – General purpose](#)
- [Network specifications – Compute optimized](#)
- [Network specifications – Memory optimized](#)
- [Network specifications – Storage optimized](#)
- [Network specifications – Accelerated computing](#)
- [Network specifications – High-performance computing](#)
- [Network specifications – Previous generation](#)

**To retrieve network interface information using the AWS CLI**

You can use the `describe-instance-types` AWS CLI command to display information about an instance type, such as its supported network interfaces and IP addresses per interface. The following example displays this information for all C5 instances.

```bash
aws ec2 describe-instance-types \
    --filters "Name=instance-type,Values=c5.*" \
    --query "InstanceTypes[]" \
```
### Expected output

<table>
<thead>
<tr>
<th>IPv4addr</th>
<th>MaxENI</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>8</td>
<td>c5.4xlarge</td>
</tr>
<tr>
<td>50</td>
<td>15</td>
<td>c5.24xlarge</td>
</tr>
<tr>
<td>15</td>
<td>4</td>
<td>c5.xlarge</td>
</tr>
<tr>
<td>30</td>
<td>8</td>
<td>c5.12xlarge</td>
</tr>
<tr>
<td>10</td>
<td>3</td>
<td>c5.large</td>
</tr>
<tr>
<td>15</td>
<td>4</td>
<td>c5.2xlarge</td>
</tr>
<tr>
<td>50</td>
<td>15</td>
<td>c5.metal</td>
</tr>
<tr>
<td>30</td>
<td>8</td>
<td>c5.9xlarge</td>
</tr>
<tr>
<td>50</td>
<td>15</td>
<td>c5.18xlarge</td>
</tr>
</tbody>
</table>

To retrieve network interface information using the AWS Tools for PowerShell

You can use the [Get-EC2InstanceType](https://docs.aws.amazon.com/powershell/latest/reference/Get-EC2InstanceType.html) PowerShell command to display information about an instance type, such as its supported network interfaces and IP addresses per interface. The following example displays this information for all C5 instances.

```powershell
Get-EC2InstanceType -Filter @{Name = "instance-type"; Values = "c5.*" } | 
Select-Object 
 @{Name = 'Ipv4AddressesPerInterface'; Expression = 
{($_.Networkinfo.Ipv4AddressesPerInterface)}}, 
@{Name = 'MaximumNetworkInterfaces'; Expression = 
{($_.Networkinfo.MaximumNetworkInterfaces)}}, 
InstanceType | 
Format-Table -AutoSize
```

### Expected output

<table>
<thead>
<tr>
<th>IPv4AddressesPerInterface</th>
<th>MaximumNetworkInterfaces</th>
<th>InstanceType</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP addresses per network interface per instance type</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Work with network interfaces

You can work with network interfaces using the Amazon EC2 console or the command line.

Contents

- Create a network interface
- View details about a network interface
- Attach a network interface to an instance
- Detach a network interface from an instance
- Manage IP addresses
- Modify network interface attributes
- Add or edit tags
- Delete a network interface

Create a network interface

You can create a network interface in a subnet. You can't move the network interface to another subnet after it's created. You must attach a network interface to an instance in the same Availability Zone.

To create a network interface using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Choose Create network interface.
4. (Optional) For Description, enter a descriptive name.
5. For **Subnet**, select a subnet. The options available in the subsequent steps change depending on the type of subnet you select (IPv4-only, IPv6-only, or dual-stack (IPv4 and IPv6)).

6. For **Private IPv4 address**, do one of the following:
   - Choose **Auto-assign** to allow Amazon EC2 to select an IPv4 address from the subnet.
   - Choose **Custom** and enter an IPv4 address that you select from the subnet.

7. (Subnets with IPv6 addresses only) For **IPv6 address**, do one of the following:
   - Choose **None** if you do not want to assign an IPv6 address to the network interface.
   - Choose **Auto-assign** to allow Amazon EC2 to select an IPv6 address from the subnet.
   - Choose **Custom** and enter an IPv6 address that you select from the subnet.

8. (Optional) If you’re creating a network interface in a dual-stack or IPv6-only subnet, you have the option to **Assign Primary IPv6 IP**. This assigns a primary IPv6 global unicast address (GUA) to the network interface. Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. Choose **Enable** if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.

9. (Optional) To create an Elastic Fabric Adapter, choose **Elastic Fabric Adapter, Enable**.

10. (Optional) Under **Advanced settings**, for **Idle connection tracking timeout**, modify the default idle connection timeouts. For more information about these options, see *Idle connection tracking timeout*.

   - **TCP established timeout**: Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 432000 seconds. Recommended: Less than 432000 seconds.
   - **UDP timeout**: Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.
• **UDP stream timeout**: Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

11. For **Security groups**, select one or more security groups.

12. (Optional) For each tag, choose **Add new tag** and enter a tag key and an optional tag value.

13. Choose **Create network interface**.

**To create a network interface using the command line**

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](https://console.aws.amazon.com/ec2).

- `create-network-interface` (AWS CLI)
- `New-EC2NetworkInterface` (AWS Tools for Windows PowerShell)

**View details about a network interface**

You can view all the network interfaces in your account.

**To describe a network interface using the console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the navigation pane, choose **Network Interfaces**.

3. To view the details page for a network interface, select the ID of the network interface. Alternatively, to view information without leaving the network interfaces page, select the checkbox for the network interface.

**To describe a network interface using the command line**

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](https://console.aws.amazon.com/ec2).

- `describe-network-interfaces` (AWS CLI)
- `Get-EC2NetworkInterface` (AWS Tools for Windows PowerShell)
To describe a network interface attribute using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- `describe-network-interface-attribute` (AWS CLI)

Attach a network interface to an instance

You can attach a network interface to any instance in the same Availability Zone as the network interface, using either the Instances or Network Interfaces page of the Amazon EC2 console. Alternatively, you can specify existing network interfaces when you launch instances.

⚠️ Important

For EC2 instances in an IPv6-only subnet, if you attach a secondary network interface to the instance, the private DNS hostname of the second network interface will resolve to the first IPv6 address on the instance's first network interface. For more information about EC2 instance private DNS hostnames, see Amazon EC2 instance hostname types.

If the public IPv4 address on your instance is released, it does not receive a new one if there is more than one network interface attached to the instance. For more information about the behavior of public IPv4 addresses, see Public IPv4 addresses.

Instances page

To attach a network interface to an instance using the Instances page

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the checkbox for the instance.
5. Choose a VPC. If you are attaching a secondary network interface to the instance, the network interface can reside in the same VPC as your instance or in a different VPC that you own (as long as the network interface is in a subnet that is in the same Availability Zone as
your instance). This enables you to create multi-homed instances across VPCs with different networking and security configurations.

6. Select a network interface. If the instance supports multiple network cards, you can choose a network card.

7. Choose **Attach**.

**Network Interfaces page**

**To attach a network interface to an instance using the Network Interfaces page**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the navigation pane, choose **Network Interfaces**.

3. Select the checkbox for the network interface.

4. Choose **Actions, Attach**.

5. Choose an instance. If the instance supports multiple network cards, you can choose a network card.

6. Choose **Attach**.

**To attach a network interface to an instance using the command line**

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/network-devices.html).

- **attach-network-interface** (AWS CLI)
- **Add-EC2NetworkInterface** (AWS Tools for Windows PowerShell)

**Note**

You can attach a network interface that’s in another VPC (but in the same Availability Zone) to an instance using the [attach-network-interface](https://docs.aws.amazon.com/cli/latest/reference/ec2/attach-network-interface.html) AWS CLI command. You cannot do this using the AWS Management Console.
Detach a network interface from an instance

You can detach a secondary network interface that is attached to an EC2 instance at any time, using either the Instances or Network Interfaces page of the Amazon EC2 console.

If you try to detach a network interface that is attached to a resource from another service, such as an Elastic Load Balancing load balancer, a Lambda function, a WorkSpace, or a NAT gateway, you get an error that you do not have permission to access the resource. To find which service created the resource attached to a network interface, check the description of the network interface. If you delete the resource, then its network interface is deleted.

Instances page

To detach a network interface from an instance using the Instances page

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the checkbox for the instance. Check the Network interfaces section of the Networking tab to verify that the network interface is attached to an instance as a secondary network interface.
5. Select the network interface and choose Detach.

Network Interfaces page

To detach a network interface from an instance using the Network Interfaces page

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the checkbox for the network interface. Check the Instance details section of the Details tab to verify that the network interface is attached to an instance as a secondary network interface.
4. Choose Actions, Detach.
5. When prompted for confirmation, choose Detach.
6. If the network interface fails to detach from the instance, choose Force detachment, Enable and then try again. We recommend that force detachment only as a last resort.
Forcing a detachment can prevent you from attaching a different network interface on the same index until you restart the instance. It can also prevent the instance metadata from reflecting that the network interface was detached until you restart the instance.

To detach a network interface using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- **detach-network-interface** (AWS CLI)
- **Dismount-EC2NetworkInterface** (AWS Tools for Windows PowerShell)

Manage IP addresses

You can manage the following IP addresses for your network interfaces:

- Elastic IP addresses (one per private IPv4 address)
- IPv4 addresses
- IPv6 addresses
- Primary IPv6 address

To manage the Elastic IP addresses of a network interface using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. To associate an Elastic IP address, do the following:
   a. Choose **Actions, Associate address**.
   b. For **Elastic IP address**, select the Elastic IP address.
   c. For **Private IPv4 address**, select the private IPv4 address to associate with the Elastic IP address.
   d. (Optional) Choose **Allow the Elastic IP address to be reassociated** if the network interface is currently associated with another instance or network interface.
   e. Choose **Associate**.
5. To disassociate an Elastic IP address, do the following:
   a. Choose Actions, Disassociate address.
   b. For Public IP address, select the Elastic IP address.
   c. Choose Disassociate.

To manage the IPv4 and IPv6 addresses of a network interface using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the network interface.
4. Choose Actions, Manage IP addresses.
5. Expand the network interface.
6. For IPv4 addresses, modify the IP addresses as needed. To assign an IPv4 address, choose Assign new IP address and then specify an IPv4 address from the subnet range or let AWS choose one for you. To unassign an IPv4 address, choose Unassign next to the address.
7. To assign or unassign a public IPv4 address to a network interface, choose Auto-assign public IP. This option can be enabled or disabled for any network interface but will only apply to the primary network interface (eth0).
8. For IPv6 addresses, modify the IP addresses as needed. To assign an IPv6 address, choose Assign new IP address and then specify an IPv6 address from the subnet range or let AWS choose one for you. To unassign an IPv6 address, choose Unassign next to the address.
9. (Optional) If your modifying a network interface in a dual-stack or IPv6-only subnet, you have the option to Assign Primary IPv6 IP. Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. Choose Enable if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.
10. Choose Save.
To manage the IP addresses of a network interface using the AWS CLI

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- `assign-ipv6-addresses`
- `associate-address`
- `disassociate-address`
- `unassign-ipv6-addresses`

To manage the IP addresses of a network interface using the Tools for Windows PowerShell

You can use one of the following commands.

- `Register-EC2Address`
- `Register-EC2Ipv6AddressList`
- `Unregister-EC2Address`
- `Unregister-EC2Ipv6AddressList`

Modify network interface attributes

You can change the following network interface attributes:

- `Description`
- `Security groups`
- `Delete on termination`
- `Source/destination check`

To change the description of a network interface using the console

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Network Interfaces.
3. Select the checkbox for the network interface.
5. For **Description**, enter a description for the network interface.

6. Choose **Save**.

**To change the security groups of a network interface using the console**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change security groups**.
5. For **Associated security groups**, select the security groups to use, and then choose **Save**.

   The security group and network interface must be created for the same VPC. To change the security group for interfaces owned by other services, such as Elastic Load Balancing, do so through that service.

**To change the termination behavior of a network interface using the console**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change termination behavior**.
5. Select or clear **Delete on termination, Enable** as needed, and then choose **Save**.

**To change source/destination checking for a network interface using the console**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions, Change source/dest check**.
5. Select or clear **Source/destination check, Enable** as needed, and then choose **Save**.
To change idle connection tracking timeouts:

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the checkbox for the network interface.
4. Choose Actions, Modify connection timeout.
5. Modify the idle connection tracking timeouts. For more information about these options, see Idle connection tracking timeout.
   - UDP timeout: Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.
   - UDP stream timeout: Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.
6. Choose Save.

To modify network interface attributes using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- modify-network-interface-attribute (AWS CLI)
- Edit-EC2NetworkInterfaceAttribute (AWS Tools for Windows PowerShell)

Add or edit tags

Tags are metadata that you can add to a network interface. Tags are private and are only visible to your account. Each tag consists of a key and an optional value. For more information about tags, see Tag your Amazon EC2 resources.

To add or edit tags for a network interface using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Network Interfaces**.

3. Select the checkbox for the network interface.

4. In **Tags** tab, choose **Manage tags**.

5. For each tag to create, choose **Add new tag** and enter a key and optional value. When you're done, choose **Save**.

**To add or edit tags for a network interface using the command line**

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/an-introduction-to-networks.html).

- `create-tags` (AWS CLI)
- `New-EC2Tag` (AWS Tools for Windows PowerShell)

**Delete a network interface**

Deleting a network interface releases all attributes associated with the interface and releases any private IP addresses or Elastic IP addresses to be used by another instance.

You cannot delete a network interface that is in use. First, you must [detach the network interface](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/an-introduction-to-networks.html).

**To delete a network interface using the console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the navigation pane, choose **Network Interfaces**.

3. Select the checkbox for the network interface, and then choose **Actions**, **Delete**.

4. When prompted for confirmation, choose **Delete**.

**To delete a network interface using the command line**

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/an-introduction-to-networks.html).

- `delete-network-interface` (AWS CLI)
- `Remove-EC2NetworkInterface` (AWS Tools for Windows PowerShell)
Best practices for configuring network interfaces

- You can attach a network interface to an instance when it's running (hot attach), when it's stopped (warm attach), or when the instance is being launched (cold attach).

- You can detach secondary network interfaces when the instance is running or stopped. However, you can't detach the primary network interface.

- You can move a secondary network interface from one instance to another, if the instances are in the same Availability Zone and VPC but in different subnets.

- When launching an instance using the CLI, API, or an SDK, you can specify the primary network interface and additional network interfaces.

-Launching an Amazon Linux or Windows Server instance with multiple network interfaces automatically configures interfaces, private IPv4 addresses, and route tables on the operating system of the instance.

- A warm or hot attach of an additional network interface might require you to manually bring up the second interface, configure the private IPv4 address, and modify the route table accordingly. Instances running Amazon Linux or Windows Server automatically recognize the warm or hot attach and configure themselves.

- You cannot attach another network interface to an instance (for example, a NIC teaming configuration) to increase or double the network bandwidth to or from the dual-homed instance.

- If you attach two or more network interfaces from the same subnet to an instance, you might encounter networking issues such as asymmetric routing. If possible, use a secondary private IPv4 address on the primary network interface instead.

- **Windows instances** – If you use multiple network interfaces, you must configure the network interfaces to use static routing.

Configure your network interface using `ec2-net-utils` for Amazon Linux 2

**Note**

For AL2023, the `amazon-ec2-net-utils` package generates interface-specific configurations in the `/run/systemd/network` directory. For more information, see Networking service in the *Amazon Linux 2023 User Guide*. 
Amazon Linux 2 AMIs may contain additional scripts installed by AWS, known as ec2-net-utils. These scripts optionally automate the configuration of your network interfaces. These scripts are available for Amazon Linux 2 only.

Use the following command to install the package on Amazon Linux 2 if it's not already installed, or update it if it's installed and additional updates are available:

```
$ yum install ec2-net-utils
```

The following components are part of ec2-net-utils:

**udev rules (*/etc/udev/rules.d*)**

Identifies network interfaces when they are attached, detached, or reattached to a running instance, and ensures that the hotplug script runs (53-ec2-network-interfaces.rules). Maps the MAC address to a device name (75-persistent-net-generator.rules, which generates 70-persistent-net.rules).

**hotplug script**

**DHCP script**

Whenever the network interface receives a new DHCP lease, this script queries the instance metadata for Elastic IP addresses. For each Elastic IP address, it adds a rule to the routing policy database to ensure that outbound traffic from that address uses the correct network interface. It also adds each private IP address to the network interface as a secondary address.

**ec2ifup ethN (/usr/sbin/)**

Extends the functionality of the standard `ifup`. After this script rewrites the configuration files `ifcfg-ethN` and `route-ethN`, it runs `ifup`.

**ec2ifdown ethN (/usr/sbin/)**

Extends the functionality of the standard `ifdown`. After this script removes any rules for the network interface from the routing policy database, it runs `ifdown`.

**ec2ifscan (/usr/sbin/)**

Checks for network interfaces that have not been configured and configures them.
This script isn't available in the initial release of ec2-net-utils.

To list any configuration files that were generated by ec2-net-utils, use the following command:

```bash
$ ls -l /etc/sysconfig/network-scripts/*-eth?
```

To disable the automation, you can add EC2SYNC=no to the corresponding ifcfg-ethN file. For example, use the following command to disable the automation for the eth1 interface:

```bash
$ sed -i -e 's/^EC2SYNC=yes/EC2SYNC=no/' /etc/sysconfig/network-scripts/ifcfg-eth1
```

To disable the automation completely, you can remove the package using the following command:

```bash
$ yum remove ec2-net-utils
```

**Scenarios for network interfaces**

Attaching multiple network interfaces to an instance is useful when you want to:

- Create a management network.
- Use network and security appliances in your Virtual Private Cloud (VPC).
- Create dual-homed instances with workloads/roles on distinct subnets.
- Create a low-budget, high-availability solution.

**Create a management network**

This scenario describes how you can create a management network with network interfaces, given the following criteria and settings (image follows).

**Criteria**

- The primary network interface on the instance (eth0) handles public traffic.
- The secondary network interface on the instance (eth1) handles backend management traffic. It's connected to a separate subnet that has more restrictive access controls, and is located within the same Availability Zone (AZ) as the primary network interface.
Settings

• The primary network interface, which may or may not be behind a load balancer, has an associated security group that allows access to the server from the internet. For example, allow TCP port 80 and 443 from 0.0.0.0/0 or from the load balancer.

• The secondary network interface has an associated security group that allows SSH access only, initiated from one of the following locations:
  • An allowed range of IP addresses, either within the VPC, or from the internet.
  • A private subnet within the same AZ as the primary network interface.
  • A virtual private gateway.

Note

To ensure failover capabilities, consider using a secondary private IPv4 for incoming traffic on a network interface. In the event of an instance failure, you can move the interface and/or secondary private IPv4 address to a standby instance.
Use network and security appliances in your VPC

Some network and security appliances, such as load balancers, network address translation (NAT) servers, and proxy servers prefer to be configured with multiple network interfaces. You can create and attach secondary network interfaces to instances that are running these types of applications and configure the additional interfaces with their own public and private IP addresses, security groups, and source/destination checking.
Creating dual-homed instances with workloads/roles on distinct subnets

You can place a network interface on each of your web servers that connects to a mid-tier network where an application server resides. The application server can also be dual-homed to a backend network (subnet) where the database server resides. Instead of routing network packets through the dual-homed instances, each dual-homed instance receives and processes requests on the front end, initiates a connection to the backend, and then sends requests to the servers on the backend network.

Creating dual-homed instances with workloads/roles on distinct VPCs within the same account

You can launch an EC2 instance in one VPC and attach a secondary ENI from another VPC (but in the same Availability Zone) to the instance. This enables you to create multi-homed instances across VPCs with different networking and security configurations. You cannot create multi-homed instances across VPCs across different AWS accounts.

You can use dual-homed instances across VPCs in the following use cases:

- **Overcome CIDR overlaps between two VPCs that can’t be peered together**: You can leverage a secondary CIDR in a VPC and allow an instance to communicate across two non-overlapping IP ranges.

- **Connect multiple VPCs within a single account**: Enable communication between individual resources that would normally be separated by VPC boundaries.

Create a low budget high availability solution

If one of your instances serving a particular function fails, its network interface can be attached to a replacement or hot standby instance pre-configured for the same role in order to rapidly recover the service. For example, you can use a network interface as your primary or secondary network interface to a critical service such as a database instance or a NAT instance. If the instance fails, you (or more likely, the code running on your behalf) can attach the network interface to a hot standby instance. Because the interface maintains its private IP addresses, Elastic IP addresses, and MAC address, network traffic begins flowing to the standby instance as soon as you attach the network interface to the replacement instance. Users experience a brief loss of connectivity between the time the instance fails and the time that the network interface is attached to the standby instance, but no changes to the route table or your DNS server are required.
Requester-managed network interfaces

A requester-managed network interface is a network interface that an AWS service creates in your VPC on your behalf. The network interface is associated with a resource for another service, such as a DB instance from Amazon RDS, a NAT gateway, or an interface VPC endpoint from AWS PrivateLink.

Considerations

- You can view the requester-managed network interfaces in your account. You can add or remove tags, but you can't change other properties of a requester-managed network interface.
- You can't detach a requester-managed network interface.
- When you delete the resource associated with a requester-managed network interface, the AWS service detaches the network interface and deletes it. If the service detached a network interface but didn't delete it, you can delete the detached network interface.

To view requester-managed network interfaces using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network & Security, Network Interfaces.
3. Select the ID of the network interface to open its details page.
4. The following are the key fields that you can use to determine the purpose of the network interface:
   - **Description**: A description provided by the AWS service that created the interface. For example, "VPC Endpoint Interface vpce 089f2123488812123".
   - **Requester-managed**: Indicates whether the network interface is managed by AWS.
   - **Requester ID**: The alias or AWS account ID of the principal or service that created the network interface. If you created the network interface, this is your AWS account ID. Otherwise, another principal or service created it.

To view requester-managed network interfaces using the AWS CLI

Use the `describe-network-interfaces` command as follows.

```
aws ec2 describe-network-interfaces --filters Name=requester-managed,Values=true
```
The following is example output that shows the key fields that you can use to determine the purpose of the network interface: Description and InterfaceType.

```json
{
    "Description": "VPC Endpoint Interface vpce-089f2123488812123",
    "InterfaceType": "vpc_endpoint",
    "NetworkInterfaceId": "eni-0d11e3ccd2c0e6c57",
    "RequesterId": "727180483921",
    "RequesterManaged": true
}
```

To view requester-managed network interfaces using the Tools for Windows PowerShell

Use the **Get-EC2NetworkInterface** cmdlet as follows.

```
Get-EC2NetworkInterface -Filter @{ Name="requester-managed"; Values="true" }
```

The following is example output that shows the key fields that you can use to determine the purpose of the network interface: Description and InterfaceType.

<table>
<thead>
<tr>
<th>Description</th>
<th>VPC Endpoint Interface vpce-089f2123488812123</th>
</tr>

</tbody>
</table>

**Assign prefixes to Amazon EC2 network interfaces**

You can assign a private IPv4 or IPv6 CIDR range, either automatically or manually, to your network interfaces. By assigning prefixes, you scale and simplify the management of applications, including container and networking applications that require multiple IP addresses on an instance. For more information about IPv4 and IPv6 addresses, see [Amazon EC2 instance IP addressing](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/assign-private-cidr.html).
The following assignment options are available:

- **Automatic assignment** — AWS chooses the prefix from your VPC subnet’s IPv4 or IPv6 CIDR block and assigns it to your network interface.

- **Manual Assignment** — You specify the prefix from your VPC subnet’s IPv4 or IPv6 CIDR block, and AWS verifies that the prefix is not already assigned to other resources before assigning it to your network interface.

Assigning prefixes has the following benefits:

- **Increased IP addresses on a network interface** — When you use a prefix, you assign a block of IP addresses as opposed to individual IP addresses. This increases the number of IP addresses for a network interface.

- **Simplified VPC management for containers** — In container applications, each container requires a unique IP address. Assigning prefixes to your instance simplifies the management of your VPCs, as you can launch and terminate containers without having to call Amazon EC2 APIs for individual IP assignments.

### Contents

- Considerations and limits for prefixes
- Work with prefixes

### Basics for assigning prefixes

- You can assign a prefix to new or existing network interfaces.

- To use prefixes, you assign a prefix to your network interface, attach the network interface to your instance, and then configure your operating system.

- When you choose the option to specify a prefix, the prefix must meet the following requirements:
  - The IPv4 prefix that you can specify is /28.
  - The IPv6 prefix that you can specify is /80.
  - The prefix is in the subnet CIDR of the network interface, and does not overlap with other prefixes or IP addresses assigned to existing resources in the subnet.
You can assign a prefix to the primary or secondary network interface.

You can assign an Elastic IP address to a network interface that has a prefix assigned to it.

You can also assign an Elastic IP address to the IP address part of the assigned prefix.

We resolve the private DNS host name of an instance to the primary private IPv4 address.

We assign each private IPv4 address for a network interface, including those from prefixes, using the following format:

- **us-east-1 Region**

  ```
  ip-private-ipv4-address.ec2.internal
  ```

- **All other Regions**

  ```
  ip-private-ipv4-address.region.compute.internal
  ```

### Considerations and limits for prefixes

Take the following into consideration when you use prefixes:

- Network interfaces with prefixes are supported with [instances built on the AWS Nitro System](https://aws.amazon.com/nitro).
- Prefixes for network interfaces are limited to IPv6 addresses and private IPv4 addresses.
- The maximum number of IP addresses that you can assign to a network interface depends on the instance type. Each prefix that you assign to a network interface counts as one IP address. For example, a `c5.large` instance has a limit of 10 IPv4 addresses per network interface. Each network interface for this instance has a primary IPv4 address. If a network interface has no secondary IPv4 addresses, you can assign up to 9 prefixes to the network interface. For each additional IPv4 address that you assign to a network interface, you can assign one less prefix to the network interface. For more information, see [IP addresses per network interface per instance type](https://aws.amazon.com/nitro).
- Prefixes are included in source/destination checks.

### Work with prefixes

You can use prefixes with your network interfaces as follows.

#### Tasks

Assign prefixes
• Assign prefixes during network interface creation
• Assign prefixes to existing network interfaces
• Configure your operating system for network interfaces with prefixes
• View the prefixes assigned to your network interfaces
• Remove prefixes from your network interfaces

Assign prefixes during network interface creation

If you use the automatic assignment option, you can reserve a block of IP addresses in your subnet. AWS chooses the prefixes from this block. For more information, see Subnet CIDR reservations in the Amazon VPC User Guide.

After you have created the network interface, use the attach-network-interface AWS CLI command to attach the network interface to your instance. You must configure your operating system to work with network interfaces with prefixes. For more information, see Configure your operating system for network interfaces with prefixes.

Tasks
• Assign automatic prefixes during network interface creation
• Assign specific prefixes during network interface creation

Assign automatic prefixes during network interface creation

You can assign automatic prefixes during network interface creation using one of the following methods.

Console

To assign automatic prefixes during network interface creation

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces and then choose Create network interface.
3. Specify a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.
4. Expand Advanced settings and do the following:
a. To automatically assign an IPv4 prefix, for **IPv4 prefix delegation**, choose **Auto-assign.** Then for **Number of IPv4 prefixes**, specify the number of prefixes to assign.

b. To automatically assign an IPv6 prefix, for **IPv6 prefix delegation**, choose **Auto-assign.** Then for **Number of IPv6 prefixes**, specify the number of prefixes to assign.

**Note**

**IPv6 prefix delegation** appears only if the selected subnet is enabled for IPv6.

5. Select the security groups to associate with the network interface and assign resource tags if needed.

6. Choose **Create network interface.**

**AWS CLI**

**To assign automatic IPv4 prefixes during network interface creation**

Use the **create-network-interface** command and set **--ipv4-prefix-count** to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 prefix.

```
$ C:\> aws ec2 create-network-interface \
    --subnet-id subnet-047cfed18eEXAMPLE \
    --description "IPv4 automatic example" \
    --ipv4-prefix-count 1
```

**Example output**

```json
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv4 automatic example",
        "Groups": [
            {
                "GroupName": "default",
                "GroupId": "sg-044c2de2c4EXAMPLE"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": []
    }
}
```
To assign automatic IPv6 prefixes during network interface creation

Use the `create-network-interface` command and set `--ipv6-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 prefix.

```
$ C:\> aws ec2 create-network-interface \
--subnet-id subnet-047cfed18eEXAMPLE \
--description "IPv6 automatic example" \
--ipv6-prefix-count 1
```

Example output

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv6 automatic example",
        "Groups": [
```
Assign specific prefixes during network interface creation

You can assign specific prefixes during network interface creation using one of the following methods.

Console

To assign specific prefixes during network interface creation

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Network Interfaces** and then choose **Create network interface**.

3. Specify a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.

4. Expand **Advanced settings** and do the following:

   a. To assign a specific IPv4 prefix, for **IPv4 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

   b. To assign a specific IPv6 prefix, for **IPv6 prefix delegation**, choose **Custom**. Then choose **Add new prefix** and enter the prefix to use.

   ![](img)
   **Note**
   
   **IPv6 prefix delegation** appears only if the selected subnet is enabled for IPv6.

5. Select the security groups to associate with the network interface and assign resource tags if needed.

6. Choose **Create network interface**.

**AWS CLI**

**To assign specific IPv4 prefixes during network interface creation**

Use the **create-network-interface** command and set **--ipv4-prefixes** to the prefixes. AWS selects IP addresses from this range. In the following example, the prefix CIDR is **10.0.0.208/28**.

```
$ C:\> aws ec2 create-network-interface \
    --subnet-id subnet-047cfed18eEXAMPLE \
    --description "IPv4 manual example" \
    --ipv4-prefixes Ipv4Prefix=10.0.0.208/28
```

**Example output**

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv4 manual example",
```

To assign specific IPv6 prefixes during network interface creation

Use the `create-network-interface` command and set `--ipv6-prefixes` to the prefixes. AWS selects IP addresses from this range. In the following example, the prefix CIDR is 2600:1f13:fc2:a700:1768::/80.

```bash
$ C:\> aws ec2 create-network-interface \
  --subnet-id subnet-047cfed18eEXAMPLE \
  --description "IPv6 manual example"
```
--ipv6-prefixes Ipv6Prefix=2600:1f13:fc2:a700:1768::/80

Example output

```
{
    "NetworkInterface": {
        "AvailabilityZone": "us-west-2a",
        "Description": "IPv6 automatic example",
        "Groups": [
            {
                "GroupName": "default",
                "GroupId": "sg-044c2de2c4EXAMPLE"
            }
        ],
        "InterfaceType": "interface",
        "Ipv6Addresses": [],
        "MacAddress": "02:bb:e4:31:fe:09",
        "NetworkInterfaceId": "eni-006edbcfa4EXAMPLE",
        "OwnerId": "123456789012",
        "PrivateIpAddress": "10.0.0.73",
        "PrivateIpAddresses": [
            {
                "Primary": true,
                "PrivateIpAddress": "10.0.0.73"
            }
        ],
        "Ipv6Prefixes": [
            {
                "Ipv6Prefix": "2600:1f13:fc2:a700:1768::/80"
            }
        ],
        "RequestId": "AIDAIV5AJI5LXF5XXDPCO",
        "RequesterManaged": false,
        "SourceDestCheck": true,
        "Status": "pending",
        "SubnetId": "subnet-047c6fed18eEXAMPLE",
        "TagSet": [],
        "VpcId": "vpc-0e12f52b21EXAMPLE"
    }
}
```
Assign prefixes to existing network interfaces

After you have assigned the prefixes, use the `attach-network-interface` AWS CLI command to attach the network interface to your instance. You must configure your operating system to work with network interfaces with prefixes. For more information, see Configure your operating system for network interfaces with prefixes.

Tasks

- Assign automatic prefixes to an existing network interface
- Assign specific prefixes to an existing network interface

Assign automatic prefixes to an existing network interface

You can assign automatic prefixes to an existing network interface using one of the following methods.

Console

To assign automatic prefixes to an existing network interface

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the network interface to which to assign the prefixes, and choose Actions, Manage prefixes.
4. To automatically assign an IPv4 prefix, for IPv4 prefix delegation, choose Auto-assign. Then for Number of IPv4 prefixes, specify the number of prefixes to assign.
5. To automatically assign an IPv6 prefix, for IPv6 prefix delegation, choose Auto-assign. Then for Number of IPv6 prefixes, specify the number of prefixes to assign.

Note

IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

6. Choose Save.
You can use the `assign-ipv6-addresses` command to assign IPv6 prefixes and the `assign-private-ip-addresses` command to assign IPv4 prefixes to existing network interfaces.

**To assign automatic IPv4 prefixes to an existing network interface**

Use the `assign-private-ip-addresses` command and set `--ipv4-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 IPv4 prefix.

```bash
$ C:\> aws ec2 assign-private-ip-addresses \
   --network-interface-id eni-081fbb4095EXAMPLE \
   --ipv4-prefix-count 1
```

Example output

```json
{
   "NetworkInterfaceId": "eni-081fbb4095EXAMPLE",
   "AssignedIpv4Prefixes": [
      {
         "Ipv4Prefix": "10.0.0.176/28"
      }
   ]
}
```

**To assign automatic IPv6 prefixes to an existing network interface**

Use the `assign-ipv6-addresses` command and set `--ipv6-prefix-count` to the number of prefixes that you want AWS to assign. In the following example, AWS assigns 1 IPv6 prefix.

```bash
$ C:\> aws ec2 assign-ipv6-addresses \
   --network-interface-id eni-00d577338cEXAMPLE \
   --ipv6-prefix-count 1
```

Example output

```json
{
   "NetworkInterfaceId": "eni-00d577338cEXAMPLE",
   "AssignedIpv6Prefixes": [
      "2600:1f13:fc2:a700:18bb::/80"
   ]
}
```
Assign specific prefixes to an existing network interface

You can assign specific prefixes to an existing network interface using one of the following methods.

Console

To assign specific prefixes to an existing network interface

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the network interface to which to assign the prefixes, and choose Actions, Manage prefixes.
4. To assign a specific IPv4 prefix, for IPv4 prefix delegation, choose Custom. Then choose Add new prefix and enter the prefix to use.
5. To assign a specific IPv6 prefix, for IPv6 prefix delegation, choose Custom. Then choose Add new prefix and enter the prefix to use.

   Note
   IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

6. Choose Save.

AWS CLI

Assign specific IPv4 prefixes to an existing network interface

Use the assign-private-ip-addresses command and set --ipv4-prefixes to the prefix. AWS selects IPv4 addresses from this range. In the following example, the prefix CIDR is 10.0.0.208/28.

```bash
$ C:\> aws ec2 assign-private-ip-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
--ipv4-prefixes 10.0.0.208/28
```

Example output

```json
{
```
Assign specific IPv6 prefixes to an existing network interface

Use the `assign-ipv6-addresses` command and set `--ipv6-prefixes` to the prefix. AWS selects IPv6 addresses from this range. In the following example, the prefix CIDR is `2600:1f13:fc2:a700:18bb::/80`.

```bash
$ C:\> aws ec2 assign-ipv6-addresses \
--network-interface-id eni-081fbb4095EXAMPLE \
--ipv6-prefixes 2600:1f13:fc2:a700:18bb::/80
```

Example output

```json
{
   "NetworkInterfaceId": "eni-081fbb4095EXAMPLE",
   "AssignedIpv6Prefixes": [
       {
           "Ipv6Prefix": "2600:1f13:fc2:a700:18bb::/80"
       }
   ]
}
```

Configure your operating system for network interfaces with prefixes

Amazon Linux AMIs might contain additional scripts installed by AWS, known as `ec2-net-utils`. These scripts optionally automate the configuration of your network interfaces. They are available for Amazon Linux only.

If you are not using Amazon Linux, you can use a Container Network Interface (CNI) for Kubernetes plug-in, or `dockerd` if you use Docker to manage your containers.

View the prefixes assigned to your network interfaces

You can view the prefixes assigned to your network interfaces using one of the following methods.
Console

To view the automatic prefixes assigned to an existing network interface

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the network interface for which to view the prefixes and choose the Details tab.
4. The IPv4 Prefix Delegation field lists the assigned IPv4 prefixes, and the IPv6 Prefix Delegation field lists the assigned IPv6 prefixes.

AWS CLI

You can use the describe-network-interfaces AWS CLI command to view the prefixes assigned to your network interfaces.

$ C:\> aws ec2 describe-network-interfaces

Example output

```json
{
  "NetworkInterfaces": [
    {
      "AvailabilityZone": "us-west-2a",
      "Description": "IPv4 automatic example",
      "Groups": [
        {
          "GroupName": "default",
          "GroupId": "sg-044c2de2c4EXAMPLE"
        }
      ],
      "InterfaceType": "interface",
      "Ipv6Addresses": [],
      "MacAddress": "02:98:65:dd:18:47",
      "NetworkInterfaceId": "eni-02b80b4668EXAMPLE",
      "OwnerId": "123456789012",
      "PrivateIpAddress": "10.0.0.62",
      "PrivateIpAddresses": [
        {
          "Primary": true,
          "PrivateIpAddress": "10.0.0.62"
        }
      ]
    }
  ]
}
```
Assign prefixes
Remove prefixes from your network interfaces

You can remove prefixes from your network interfaces using one of the following methods.

Console

To remove the prefixes from a network interface

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Select the network interface from which to remove the prefixes and choose Actions, Manage prefixes.
4. Do one of the following:
   - To remove all assigned prefixes, for IPv4 prefix delegation and IPv6 prefix delegation, choose Do not assign.
   - To remove specific assigned prefixes, for IPv4 prefix delegation or IPv6 prefix delegation, choose Custom and then choose Unassign next to the prefixes to remove.

   Note

   IPv6 prefix delegation appears only if the selected subnet is enabled for IPv6.

5. Choose Save.

AWS CLI

You can use the unassign-ipv6-addresses command to remove IPv6 prefixes and the unassign-private-ip-addresses commands to remove IPv4 prefixes from your existing network interfaces.
To remove IPv4 prefixes from a network interface

Use the `unassign-private-ip-addresses` command and set `--ipv4-prefix` to the address that you want to remove.

```
$ C:\> aws ec2 unassign-private-ip-addresses \
    --network-interface-id eni-081fbb4095EXAMPLE \
    --ipv4-prefixes 10.0.0.176/28
```

To remove IPv6 prefixes from a network interface

Use the `unassign-ipv6-addresses` command and set `--ipv6-prefix` to the address that you want to remove.

```
$ C:\> aws ec2 unassign-ipv6-addresses \
    --network-interface-id eni-00d577338cEXAMPLE \
    --ipv6-prefix 2600:1f13:fc2:a700:18bb::/80
```

Amazon EC2 instance network bandwidth

Instance bandwidth specifications apply to both inbound and outbound traffic for the instance. For example, if an instance specifies up to 10 Gbps of bandwidth, that means it has up to 10 Gbps of bandwidth for inbound traffic, and up to 10 Gbps for outbound traffic. The network bandwidth that's available to an EC2 instance depends on several factors, as follows.

Multi-flow traffic

Bandwidth for aggregate multi-flow traffic available to an instance depends on the destination of the traffic.

- Within the Region – Traffic can utilize the full network bandwidth available to the instance.
- To other Regions, an internet gateway, Direct Connect, or local gateways (LGW) – Traffic can utilize up to 50% of the network bandwidth available to a current generation instance with a minimum of 32 vCPUs. Bandwidth for a current generation instance with less than 32 vCPUs is limited to 5 Gbps.

Single-flow traffic
Baseline bandwidth for single-flow traffic is limited to 5 Gbps when instances are not in the same cluster placement group. To reduce latency and increase single-flow bandwidth, try one of the following:

- Use a cluster placement group to achieve up to 10 Gbps bandwidth for instances within the same placement group.
- Set up multiple paths between two endpoints to achieve higher bandwidth with Multipath TCP (MPTCP).
- Configure ENA Express for eligible instances within the same subnet to achieve up to 25 Gbps between those instances.

Available instance bandwidth

The available network bandwidth of an instance depends on the number of vCPUs that it has. For example, an m5.8xlarge instance has 32 vCPUs and 10 Gbps network bandwidth, and an m5.16xlarge instance has 64 vCPUs and 20 Gbps network bandwidth. However, instances might not achieve this bandwidth; for example, if they exceed network allowances at the instance level, such as packet per second or number of tracked connections. How much of the available bandwidth the traffic can utilize depends on the number of vCPUs and the destination. For example, an m5.16xlarge instance has 64 vCPUs, so traffic to another instance in the Region can utilize the full bandwidth available (20 Gbps). However, traffic to another instance in a different Region can utilize only 50% of the bandwidth available (10 Gbps).

Typically, instances with 16 vCPUs or fewer (size 4xlarge and smaller) are documented as having "up to" a specified bandwidth; for example, "up to 10 Gbps". These instances have a baseline bandwidth. To meet additional demand, they can use a network I/O credit mechanism to burst beyond their baseline bandwidth. Instances can use burst bandwidth for a limited time, typically from 5 to 60 minutes, depending on the instance size.

An instance receives the maximum number of network I/O credits at launch. If the instance exhausts its network I/O credits, it returns to its baseline bandwidth. A running instance earns network I/O credits whenever it uses less network bandwidth than its baseline bandwidth. A stopped instance does not earn network I/O credits. Instance burst is on a best effort basis, even when the instance has credits available, as burst bandwidth is a shared resource.

There are separate network I/O credit buckets for inbound and outbound traffic.
Base and burst network performance

The *Amazon EC2 Instance Types Guide* describes the network performance for each instance type, plus the baseline network bandwidth available for instances that can use burst bandwidth. For more information, see the following:

- Network specifications – General purpose
- Network specifications – Compute optimized
- Network specifications – Memory optimized
- Network specifications – Storage optimized
- Network specifications – Accelerated computing
- Network specifications – High-performance computing
- Network specifications – Previous generation

To view network performance using the AWS CLI

You can use the `describe-instance-types` AWS CLI command to display information about an instance type. The following example displays network performance information for all C5 instances.

```
aws ec2 describe-instance-types \
  --filters "Name=instance-type,Values=c5.*" \
  --query "InstanceTypes[].[ \
    InstanceType, \
    NetworkInfo.NetworkPerformance, \
    NetworkInfo.NetworkCards[0].BaselineBandwidthInGbps"]" \
  --output table
```

Expected output

```
| DescribeInstanceTypes          |               |
|-------------------------------+---------------|
| c5.4xlarge                    | Up to 10 Gigabit | 5.0 |
| c5.xlarge                     | Up to 10 Gigabit | 1.25 |
| c5.12xlarge                   | 12 Gigabit     | 12.0 |
| c5.24xlarge                   | 25 Gigabit     | 25.0 |
| c5.metal                      | 25 Gigabit     | 25.0 |
```

Available instance bandwidth
To view network performance using the AWS Tools for PowerShell

You can use the `Get-EC2InstanceType` PowerShell command to display information about an instance type. The following example displays network performance information for all C5 instances.

```
Get-EC2InstanceType -Filter @{Name = "instance-type"; Values = "c5.*" } | `
  Select-Object `
  InstanceType, `
  @{Name = 'NetworkPerformance'; Expression = `
  {($_.Networkinfo.NetworkCards.NetworkPerformance)}}, `
  @{Name = 'BaselineBandwidthInGbps'; Expression = `
  {($_.Networkinfo.NetworkCards.BaselineBandwidthInGbps)}} | `
  Format-Table -AutoSize
```

Expected output

<table>
<thead>
<tr>
<th>InstanceType</th>
<th>NetworkPerformance</th>
<th>BaselineBandwidthInGbps</th>
</tr>
</thead>
<tbody>
<tr>
<td>c5.4xlarge</td>
<td>Up to 10 Gigabit</td>
<td>5.00</td>
</tr>
<tr>
<td>c5.xlarge</td>
<td>Up to 10 Gigabit</td>
<td>1.25</td>
</tr>
<tr>
<td>c5.12xlarge</td>
<td>12 Gigabit</td>
<td>12.00</td>
</tr>
<tr>
<td>c5.9xlarge</td>
<td>12 Gigabit</td>
<td>12.00</td>
</tr>
<tr>
<td>c5.24xlarge</td>
<td>25 Gigabit</td>
<td>25.00</td>
</tr>
<tr>
<td>c5.metal</td>
<td>25 Gigabit</td>
<td>25.00</td>
</tr>
<tr>
<td>c5.2xlarge</td>
<td>Up to 10 Gigabit</td>
<td>2.50</td>
</tr>
<tr>
<td>c5.large</td>
<td>Up to 10 Gigabit</td>
<td>0.75</td>
</tr>
<tr>
<td>c5.18xlarge</td>
<td>25 Gigabit</td>
<td>25.00</td>
</tr>
</tbody>
</table>

Monitor instance bandwidth

You can use CloudWatch metrics to monitor instance network bandwidth and the packets sent and received. You can use the network performance metrics provided by the Elastic Network Adapter (ENA) driver to monitor when traffic exceeds the network allowances that Amazon EC2 defines at the instance level.
You can configure whether Amazon EC2 sends metric data for the instance to CloudWatch using one-minute periods or five-minute periods. It is possible that the network performance metrics would show that an allowance was exceeded and packets were dropped while the CloudWatch instance metrics do not. This can happen when the instance has a short spike in demand for network resources (known as a microburst), but the CloudWatch metrics are not granular enough to reflect these microsecond spikes.

- [Monitor network performance](#)

**Enhanced networking on Amazon EC2 instances**

Enhanced networking uses single root I/O virtualization (SR-IOV) to provide high-performance networking capabilities on supported instance types. SR-IOV is a method of device virtualization that provides higher I/O performance and lower CPU utilization when compared to traditional virtualized network interfaces. Enhanced networking provides higher bandwidth, higher packet per second (PPS) performance, and consistently lower latency between instances. There is no additional charge for using enhanced networking.

For information about the supported network speed for each instance type, see [Amazon EC2 Instance Types](#).

All current generation instance types support enhanced networking, except for T2 instances.

You can enable enhanced networking using one of the following mechanisms:

**Elastic Network Adapter (ENA)**

The Elastic Network Adapter (ENA) supports network speeds of up to 100 Gbps for supported instance types.

All [instances built on the AWS Nitro System](#) use ENA for enhanced networking. In addition, the following Xen instance types support ENA: H1, I3, G3, m4.16xlarge, P2, P3, P3dn, and R4.

For more information, see [Enable enhanced networking with ENA on your EC2 instances](#).
Intel 82599 Virtual Function (VF) interface

The Intel 82599 Virtual Function interface supports network speeds of up to 10 Gbps for supported instance types.

The following instance types use the Intel 82599 VF interface for enhanced networking: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.

For more information, see Enhanced networking with the Intel 82599 VF interface.

Contents

• Optimize network performance on EC2 Windows instances

Enable enhanced networking with ENA on your EC2 instances

Amazon EC2 provides enhanced networking capabilities through the Elastic Network Adapter (ENA). To use enhanced networking, you must use an AMI that includes the required ENA driver or manually install it. Then you can enable ENA support on your instance.

To review release notes or install instructions for an ENA driver, see the tab that matches your instance operating system platform.

Linux

You can review the following documentation on GitHub:

• Review ENA Linux kernel driver release notes on GitHub.
• For an overview of the ENA Linux kernel driver that includes install instructions see Linux kernel driver for Elastic Network Adapter (ENA) family on GitHub.

Windows

You can review the following documentation from the Manage device drivers section of this guide:

• Track ENA Windows driver version releases.
• Install the ENA driver on EC2 Windows instances.

For Nitro-based instances, enhanced networking capabilities vary by the Nitro version that the instance type implements.

To review network specifications for your instance, choose the instance family link for your instance type. If you’re not sure which instance family applies, see Naming conventions in the Amazon EC2 Instance Types guide.

• Network specifications for accelerated computing instances
• Network specifications for compute optimized instances
• Network specifications for general purpose instances

• Network specifications for memory optimized instances
• Network specifications for storage optimized instances

Contents

• Prerequisites for enhanced networking with ENA
• Test whether enhanced networking is enabled
• Enable enhanced networking on your instance

Prerequisites for enhanced networking with ENA

To prepare for enhanced networking using the ENA, set up your instance as follows:

• Launch an instance built on the AWS Nitro System.
• Ensure that the instance has internet connectivity.

• If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating the ENA kernel driver and enabling the enaSupport attribute might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.

• **Linux instances** – Launch the instance using a supported version of the Linux kernel and a supported distribution, so that ENA enhanced networking is enabled for your instance automatically. For more information, see [ENA Linux Kernel Driver Release Notes](#).

• **Windows instances** – If the instance is running Windows Server 2008 R2 SP1, ensure that it has the [SHA-2 code signing support update](#).

• Use [AWS CloudShell](#) from the AWS Management Console, or install and configure the [AWS CLI](#) or the [AWS Tools for Windows PowerShell](#) on any computer you choose, preferably your local desktop or laptop. For more information, see [Access Amazon EC2](#) or the [AWS CloudShell User Guide](#). Enhanced networking cannot be managed from the Amazon EC2 console.

### Test whether enhanced networking is enabled

You can test whether enhanced networking is enabled in your instances or your AMIs.

#### Instance attribute

To check whether an instance has the enhanced networking enaSupport attribute set, use one of the following commands. If the attribute is set, the response is true.

- **describe-instances** *(AWS CLI/AWS CloudShell)*

  ```
  aws ec2 describe-instances --instance-ids instance_id --query "Reservations[].Instances[].EnaSupport"
  ```

- **Get-EC2Instance** *(Tools for Windows PowerShell)*

  ```
  (Get-EC2Instance -InstanceId instance-id).Instances.EnaSupport
  ```

#### Image attribute

To check whether an AMI has the enhanced networking enaSupport attribute set, use one of the following commands. If the attribute is set, the response is true.
• **describe-images** (AWS CLI/AWS CloudShell)

```
aws ec2 describe-images --image-id ami_id --query "Images[].EnaSupport"
```

• **Get-EC2Image** (Tools for Windows PowerShell)

```
(Get-EC2Image -ImageId ami_id).EnaSupport
```

**Linux network interface driver**

Use the following command to verify that the ena kernel driver is being used on a particular interface, substituting the interface name that you want to check. If you are using a single interface (default), it this is eth0. If the operating system supports **predictable network names**, this could be a name like ens5.

In the following example, the ena kernel driver is not loaded, because the listed driver is vif.

```
[ec2-user ~]$ ethtool -i eth0
driver: vif
version:
firmware-version:
bis-info: vif-0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no
```

In this example, the ena kernel driver is loaded and at the minimum recommended version. This instance has enhanced networking properly configured.

```
[ec2-user ~]$ ethtool -i eth0
driver: ena
version: 1.5.0g
firmware-version:
expansion-rom-version:
bis-info: 0000:00:05.0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
```
Enable enhanced networking on your instance

The procedure that you use depends on the operating system of the instance.

Amazon Linux

Amazon Linux 2 and the latest versions of the Amazon Linux AMI include the kernel driver required for enhanced networking with ENA installed and have ENA support enabled. Therefore, if you launch an instance with an HVM version of Amazon Linux on a supported instance type, enhanced networking is already enabled for your instance. For more information, see Test whether enhanced networking is enabled.

If you launched your instance using an older Amazon Linux AMI and it does not have enhanced networking enabled already, use the following procedure to enable enhanced networking.

To enable enhanced networking on Amazon Linux AMI

1. Connect to your instance.
2. From the instance, run the following command to update your instance with the latest kernel drivers, including ena:

   [ec2-user ~]$ sudo yum update

3. From your local computer, reboot your instance using the Amazon EC2 console or one of the following commands: reboot-instances (AWS CLI), Restart-EC2Instance (AWS Tools for Windows PowerShell).
4. Connect to your instance again and verify that the ena kernel driver is installed and at the minimum recommended version using the modinfo ena command from Test whether enhanced networking is enabled.
5. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: stop-instances (AWS CLI), Stop-EC2Instance (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

   [Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: To enable enhanced networking on Amazon Linux AMI (instance store-backed instances).
6. From your local computer, enable the enhanced networking attribute using one of the following commands:

   - **modify-instance-attribute** (AWS CLI)
     
     ```bash
     aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
     ```

   - **Edit-EC2InstanceAttribute** (Tools for Windows PowerShell)
     
     ```powershell
     Edit-EC2InstanceAttribute -InstanceId instance-id -EnaSupport $true
     ```

7. (Optional) Create an AMI from the instance, as described in [Create an Amazon EBS-backed AMI](#). The AMI inherits the enhanced networking `enaSupport` attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

8. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: **start-instances** (AWS CLI), **Start-EC2Instance** (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

9. Connect to your instance and verify that the ena kernel driver is installed and loaded on your network interface using the `ethtool -i ethn` command from [Test whether enhanced networking is enabled.](#)

    If you are unable to connect to your instance after enabling enhanced networking, see [Troubleshoot the ENA kernel driver on Linux.](#)

**To enable enhanced networking on Amazon Linux AMI (instance store-backed instances)**

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in [Create an instance store-backed Linux AMI](#), making sure to enable the enhanced networking attribute when you register the AMI.

   - **register-image** (AWS CLI)
     
     ```bash
     aws ec2 register-image --ena-support ...
     ```

   - **Register-EC2Image** (AWS Tools for Windows PowerShell)
Ubuntu

The latest Ubuntu HVM AMIs include the kernel driver required for enhanced networking with ENA installed and have ENA support enabled. Therefore, if you launch an instance with the latest Ubuntu HVM AMI on a supported instance type, enhanced networking is already enabled for your instance. For more information, see Test whether enhanced networking is enabled.

If you launched your instance using an older AMI and it does not have enhanced networking enabled already, you can install the `linux-aws` kernel package to get the latest enhanced networking drivers and update the required attribute.

**To install the `linux-aws` kernel package (Ubuntu 16.04 or later)**

Ubuntu 16.04 and 18.04 ship with the Ubuntu custom kernel (`linux-aws` kernel package). To use a different kernel, contact [AWS Support](https://aws.amazon.com/support/).

**To install the `linux-aws` kernel package (Ubuntu Trusty 14.04)**

1. Connect to your instance.
2. Update the package cache and packages.

```bash
ubuntu:~$ sudo apt-get update && sudo apt-get upgrade -y linux-aws
```

⚠️ **Important**

If during the update process you are prompted to install `grub`, use `/dev/xvda` to install `grub` onto, and then choose to keep the current version of `/boot/grub/menu.lst`.

3. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: `stop-instances` (AWS CLI), `Stop-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.
[Instance store-backed instance] You can’t stop the instance to modify the attribute. Instead, proceed to this procedure: To enable enhanced networking on Ubuntu (instance store-backed instances).

4. From your local computer, enable the enhanced networking attribute using one of the following commands:

- **modify-instance-attribute** (AWS CLI)
  
  ```bash
  aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
  ```

- **Edit-EC2InstanceAttribute** (Tools for Windows PowerShell)
  
  ```powershell
  Edit-EC2InstanceAttribute -InstanceId instance-id -EnaSupport $true
  ```

5. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking enaSupport attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

6. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: **start-instances** (AWS CLI), **Start-EC2Instance** (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

To enable enhanced networking on Ubuntu (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in Create an instance store-backed Linux AMI, making sure to enable the enhanced networking attribute when you register the AMI.

- **register-image** (AWS CLI)
  
  ```bash
  aws ec2 register-image --ena-support ...
  ```

- **Register-EC2Image** (AWS Tools for Windows PowerShell)
  
  ```powershell
  Register-EC2Image -EnaSupport $true ...
  ```
RHEL, SUSE, CentOS

The latest AMIs for Red Hat Enterprise Linux, SUSE Linux Enterprise Server, and CentOS include the kernel driver required for enhanced networking with ENA and have ENA support enabled. Therefore, if you launch an instance with the latest AMI on a supported instance type, enhanced networking is already enabled for your instance. For more information, see Test whether enhanced networking is enabled.

The following procedure provides the general steps for enabling enhanced networking on a Linux distribution other than Amazon Linux AMI or Ubuntu. For more information, such as detailed syntax for commands, file locations, or package and tool support, see the documentation for your Linux distribution.

To enable enhanced networking on Linux

1. Connect to your instance.
2. Clone the source code for the ena kernel driver on your instance from GitHub at https://github.com/amzn/amzn-drivers. (SUSE Linux Enterprise Server 12 SP2 and later include ENA 2.02 by default, so you are not required to download and compile the ENA driver. For SUSE Linux Enterprise Server 12 SP2 and later, you should file a request to add the driver version you want to the stock kernel).

   git clone https://github.com/amzn/amzn-drivers

3. Compile and install the ena kernel driver on your instance. These steps depend on the Linux distribution. For more information about compiling the kernel driver on Red Hat Enterprise Linux, see How do I install the latest ENS driver for enhanced network support on an Amazon EC2 instance that runs RHEL?
4. Run the sudo depmod command to update kernel driver dependencies.
5. Update initramfs on your instance to ensure that the new kernel driver loads at boot time. For example, if your distribution supports dracut, you can use the following command.

   dracut -f -v

6. Determine if your system uses predictable network interface names by default. Systems that use systemctl or udev versions 197 or greater can rename Ethernet devices and they do not guarantee that a single network interface will be named eth0. This behavior can cause
problems connecting to your instance. For more information and to see other configuration options, see Predictable Network Interface Names on the freedesktop.org website.

a. You can check the systemd or udev versions on RPM-based systems with the following command.

```
rpm -qa | grep -e '^systemd-[0-9]+|udev-[0-9]+$'
```

```
systemd-208-11.el7_0.2.x86_64
```

In the above Red Hat Enterprise Linux 7 example, the systemd version is 208, so predictable network interface names must be disabled.

b. Disable predictable network interface names by adding the net.ifnames=0 option to the GRUB_CMDLINE_LINUX line in /etc/default/grub.

```
sudo sed -i '/^GRUB_CMDLINE_LINUX/s/"$/ net.ifnames=0"/' /etc/default/grub
```

c. Rebuild the grub configuration file.

```
sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

7. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: stop-instances (AWS CLI), Stop-EC2Instance (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

[Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: To enable enhanced networking on Linux (instance store–backed instances).

8. From your local computer, enable the enhanced networking enaSupport attribute using one of the following commands:

- modify-instance-attribute (AWS CLI)

```
aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
```

- Edit-EC2InstanceAttribute (Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $true
```
9. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking enaSupport attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

If your instance operating system contains an /etc/udev/rules.d/70-persistent-net.rules file, you must delete it before creating the AMI. This file contains the MAC address for the Ethernet adapter of the original instance. If another instance boots with this file, the operating system will be unable to find the device and eth0 might fail, causing boot issues. This file is regenerated at the next boot cycle, and any instances launched from the AMI create their own version of the file.

10. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI), Start-EC2Instance (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

11. (Optional) Connect to your instance and verify that the kernel driver is installed.

If you are unable to connect to your instance after enabling enhanced networking, see Troubleshoot the ENA kernel driver on Linux.

To enable enhanced networking on Linux (instance store–backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in Create an instance store-backed Linux AMI, making sure to enable the enhanced networking attribute when you register the AMI.

- register-image (AWS CLI)

  aws ec2 register-image --ena-support ...

- Register-EC2Image (AWS Tools for Windows PowerShell)

  Register-EC2Image -EnaSupport ...
Ubuntu with DKMS

This method is for testing and feedback purposes only. It is not intended for use with production deployments. For production deployments, see Ubuntu.

⚠️ Important

Using DKMS voids the support agreement for your subscription. It should not be used for production deployments.

To enable enhanced networking with ENA on Ubuntu (EBS-backed instances)

1. Follow steps 1 and 2 in Ubuntu.
2. Install the build-essential packages to compile the kernel driver and the dkms package so that your ena kernel driver is rebuilt every time your kernel is updated.

   ubuntu:~$ sudo apt-get install -y build-essential dkms

3. Clone the source for the ena kernel driver on your instance from GitHub at https://github.com/amzn/amzn-drivers.

   ubuntu:~$ git clone https://github.com/amzn/amzn-drivers

4. Move the amzn-drivers package to the /usr/src/ directory so DKMS can find it and build it for each kernel update. Append the version number (you can find the current version number in the release notes) of the source code to the directory name. For example, version 1.0.0 is shown in the following example.

   ubuntu:~$ sudo mv amzn-drivers /usr/src/amzn-drivers-1.0.0

5. Create the DKMS configuration file with the following values, substituting your version of ena.

   Create the file.

   ubuntu:~$ sudo touch /usr/src/amzn-drivers-1.0.0/dkms.conf

   Edit the file and add the following values.

   ubuntu:~$ sudo vim /usr/src/amzn-drivers-1.0.0/dkms.conf
6. Add, build, and install the ena kernel driver on your instance using DKMS.

Add the kernel driver to DKMS.

```bash
ubuntu:~$ sudo dkms add -m amzn-drivers -v 1.0.0
```

Build the kernel driver using the `dkms` command.

```bash
ubuntu:~$ sudo dkms build -m amzn-drivers -v 1.0.0
```

Install the kernel driver using `dkms`.

```bash
ubuntu:~$ sudo dkms install -m amzn-drivers -v 1.0.0
```

7. Rebuild initramfs so the correct kernel driver is loaded at boot time.

```bash
ubuntu:~$ sudo update-initramfs -u -k all
```

8. Verify that the ena kernel driver is installed using the `modinfo ena` command from Test whether enhanced networking is enabled.

```bash
ubuntu:~$ modinfo ena
filename:   /lib/modules/3.13.0-74-generic/updates/dkms/ena.ko
version:    1.0.0
license:    GPL
description: Elastic Network Adapter (ENA)
author:     Amazon.com, Inc. or its affiliates

9. Continue with Step 3 in **Ubuntu**.

### Enable enhanced networking on Windows

If you launched your instance and it does not have enhanced networking enabled already, you must download and install the required network adapter driver on your instance, and then set the enaSupport instance attribute to activate enhanced networking.

#### To enable enhanced networking

1. Connect to your instance and log in as the local administrator.

2. [Windows Server 2016 and 2019 only] Run the following EC2Launch PowerShell script to configure the instance after the driver is installed.

   ```powershell
   PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -Schedule
   ```

3. From the instance, install the driver as follows:
   
   a. **Download** the latest driver to the instance.

   b. Extract the zip archive.

   c. Install the driver by running the install.ps1 PowerShell script.
4. From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: `stop-instances` (AWS CLI/AWS CloudShell), `Stop-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

5. Enable ENA support on your instance as follows:

   a. From your local computer, check the EC2 instance ENA support attribute on your instance by running one of the following commands. If the attribute is not enabled, the output will be "[]" or blank. `EnaSupport` is set to false by default.

      • `describe-instances` (AWS CLI/AWS CloudShell)

      ```
      aws ec2 describe-instances --instance-ids instance_id --query "Reservations[].Instances[].EnaSupport"
      ```

      • `Get-EC2Instance` (Tools for Windows PowerShell)

      ```
      (Get-EC2Instance -InstanceId instance-id).Instances.EnaSupport
      ```

   b. To enable ENA support, run one of the following commands:

      • `modify-instance-attribute` (AWS CLI/AWS CloudShell)

      ```
      aws ec2 modify-instance-attribute --instance-id instance_id --ena-support
      ```

      • `Edit-EC2InstanceAttribute` (AWS Tools for Windows PowerShell)

      ```
      Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $true
      ```

If you encounter problems when you restart the instance, you can also disable ENA support using one of the following commands:
• **modify-instance-attribute** (AWS CLI/AWS CloudShell)

```
aws ec2 modify-instance-attribute --instance-id instance_id --no-ena-support
```

• **Edit-EC2InstanceAttribute** (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId instance_id -EnaSupport $false
```

c. Verify that the attribute has been set to `true` using **describe-instances** or **Get-EC2Instance** as shown previously. You should now see the following output:

```
[
  true
]
```

6. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: **start-instances** (AWS CLI/AWS CloudShell), **Start-EC2Instance** (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance using the AWS OpsWorks console so that the instance state remains in sync.

7. On the instance, validate that the ENA driver is installed and enabled as follows:

   a. Right-click the network icon and choose **Open Network and Sharing Center**.
   b. Choose the Ethernet adapter (for example, **Ethernet 2**).
   c. Choose **Details**. For **Network Connection Details**, check that **Description** is **Amazon Elastic Network Adapter**.

8. (Optional) Create an AMI from the instance. The AMI inherits the `enaSupport` attribute from the instance. Therefore, you can use this AMI to launch another instance with ENA enabled by default.

### Improve network performance between EC2 instances with ENA Express

ENA Express is powered by AWS Scalable Reliable Datagram (SRD) technology. SRD is a high performance network transport protocol that uses dynamic routing to increase throughput and minimize tail latency. With ENA Express, you can communicate between two EC2 instances in the same Availability Zone.
Benefits of ENA Express

- Increases the maximum bandwidth a single flow can use from 5 Gbps to 25 Gbps within the Availability Zone, up to the aggregate instance limit.
- Reduces tail latency of network traffic between EC2 instances, especially during periods of high network load.
- Detects and avoids congested network paths.
- Handles some tasks directly in the network layer, such as packet reordering on the receiving end, and most retransmits that are needed. This frees up the application layer for other work.

Note

- If your application sends or receives a high volume of packets per second, and needs to optimize for latency most of the time, especially during periods when there is no congestion on the network, Enhanced networking might be a better fit for your network.
- ENA Express traffic can't be sent across subnets in a Local Zone.

After you've enabled ENA Express for the network interface attachment on an instance, the sending instance initiates communication with the receiving instance, and SRD detects if ENA Express is operating on both the sending instance and the receiving instance. If ENA Express is operating, the communication can use SRD transmission. If ENA Express is not operating, the communication falls back to standard ENA transmission.

During periods of time when network traffic is light, you might notice a slight increase in packet latency (tens of microseconds) when the packet uses ENA Express. During those times, applications that prioritize specific network performance characteristics can benefit from ENA Express as follows:

- Processes can benefit from increased maximum single flow bandwidth from 5 Gbps to 25 Gbps within the same Availability Zone, up to the aggregate instance limit. For example, if a specific instance type supports up to 12.5 Gbps, the single flow bandwidth is also limited to 12.5 Gbps.
- Longer running processes should experience reduced tail latency during periods of network congestion.
- Processes can benefit from a smoother and more standard distribution for network response times.
How ENA Express works

ENA Express is powered by AWS Scalable Reliable Datagram (SRD) technology. It distributes packets for each network flow across different AWS network paths, and dynamically adjusts distribution when it detects signs of congestion. It also manages packet reordering on the receiving end.

To ensure that ENA Express can manage network traffic as intended, sending and receiving instances and the communication between them must meet all of the following requirements:

- Both sending and receiving instance types are supported. See the Supported instance types for ENA Express table for more information.
- Both sending and receiving instances must have ENA Express configured. If there are differences in the configuration, you can run into situations where traffic defaults to standard ENA transmission. The following scenario shows what can happen.

**Scenario: Differences in configuration**

<table>
<thead>
<tr>
<th>Instance</th>
<th>ENA Express Enabled</th>
<th>UDP uses ENA Express</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance 1</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Instance 2</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

In this case, TCP traffic between the two instances can use ENA Express, as both instances have enabled it. However, since one of the instances does not use ENA Express for UDP traffic, communication between these two instances over UDP uses standard ENA transmission.
• The sending and receiving instances must run in the same Availability Zone.
• The network path between the instances must not include middleware boxes. ENA Express doesn't currently support middleware boxes.
• (Linux instances only) To utilize full bandwidth potential, use driver version 2.2.9 or higher.
• (Linux instances only) To produce metrics, use driver version 2.8 or higher.

If any requirement is unmet, the instances use the standard TCP/UDP protocol but without SRD to communicate.

To ensure that your instance network driver is configured for optimum performance, review the recommended best practices for ENA drivers. These best practices apply to ENA Express, as well. For more information, see the ENA Linux Driver Best Practices and Performance Optimization Guide on the GitHub website.

Note
Amazon EC2 refers to the relationship between an instance and a network interface that's attached to it as an attachment. ENA Express settings apply to the attachment. If the network interface is detached from the instance, the attachment no longer exists, and the ENA Express settings that applied to it are no longer in force. The same is true when an instance is terminated, even if the network interface remains.

After you've enabled ENA Express for the network interface attachments on both the sending instance and the receiving instance, you can use ENA Express metrics to help ensure that your instances take full advantage of the performance improvements that SRD technology provides. For more information about ENA Express metrics, see Metrics for ENA Express.

Supported instance types for ENA Express

The following tabs show instance types that support ENA Express.

General purpose

### Prerequisites for Linux instances

To ensure that ENA Express can operate effectively, update the settings for your Linux instance as follows.

- If your instance uses jumbo frames, run the following command to set your maximum transmission unit (MTU) to 8900.

  ```bash
  [ec2-user ~]$ sudo ip link set dev eth0 mtu 8900
  ```

- Increase the receiver (Rx) ring size, as follows:
To maximize ENA Express bandwidth, configure your TCP queue limits as follows:

1. Set the TCP small queue limit to 1MB or higher. This increases the amount of data that's queued for transmission on a socket.
   ```
   sudo sh -c 'echo 1048576 > /proc/sys/net/ipv4/tcp_limit_output_bytes'
   ```

2. Disable byte queue limits on the eth device if they're enabled for your Linux distribution. This increases data queued for transmission for the device queue.
   ```
   sudo sh -c 'for txq in /sys/class/net/eth0/queues/tx-\*; do echo max > ${txq}/byte_queue_limits/limit_min; done'
   ```

**Note**

The ENA driver for the Amazon Linux distribution disables byte queue limits by default.

---

**Tune performance for ENA Express settings on Linux instances**

To check your Linux instance configuration for optimal ENA Express performance, you can run the following script that's available on the Amazon GitHub repository:

The script runs a series of tests and suggests both recommended and required configuration changes.

**Review ENA Express settings for your EC2 instance**

This section covers how to view ENA Express information from the AWS Management Console or from the AWS CLI. For more information, choose the tab that matches the method you'll use.
Console

This tab covers how to find information about your current ENA Express settings in the AWS Management Console.

View settings from the Network interface list

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the left navigation pane, choose Network interfaces.
3. Select a network interface to see the details for that instance. You can choose the Network interface ID link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the Network interface attachment section on the the Details tab or detail page, review settings for ENA Express and ENA Express UDP.

View settings from the Instances list

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the left navigation pane, choose Instances.
3. Select an instance to see the details for that instance. You can choose the Instance ID link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the Network interfaces section on the Networking tab, scroll right to review settings for ENA Express and ENA Express UDP.

AWS CLI

This tab covers how to find information about your current ENA Express settings in the AWS CLI.

Describe instances

For information about ENA Express configuration for specified instances, run the `describe-instances` command in the AWS CLI, as follows. This command example returns a list of ENA Express configurations for the network interfaces attached to each of the running instances that are specified by the `--instance-ids` parameter.
Describe network interfaces

For information about ENA Express settings for a networking interface, run the `describe-network-interfaces` command in the AWS CLI as follows:

```
[ec2-user ~]$ aws ec2 describe-network-interfaces
{
  "NetworkInterfaces": [
  {
    "Association": {
      ....IPs, DNS...
    }
  }
]
```
PowerShell

This tab covers how to find information about your current ENA Express settings using PowerShell.

**Describe network interfaces**

For information on ENA Express settings for a networking interface, run the `Get-EC2NetworkInterface` Cmdlet with the Tools for PowerShell as follows:

```powershell
PS C:\> Get-EC2NetworkInterface -NetworkInterfaceId eni-0d1234e5f6a78901b | ` Select-Object `    Association, NetworkInterfaceId, OwnerId, @{Name = 'AttachTime'; Expression = { $_.Attachment.AttachTime } }, @{Name = 'AttachmentId'; Expression = { $_.Attachment.AttachmentId } }, @{Name = 'DeleteOnTermination'; Expression = { $_.Attachment.DeleteOnTermination } }, @{Name = 'NetworkCardIndex'; Expression = { $_.Attachment.NetworkCardIndex } },
```
Configure ENA Express settings for your EC2 instance

You can configure ENA Express for supported EC2 instance types without needing to install any additional software.

This section covers how to configure ENA Express from the AWS Management Console or from the AWS CLI. For more information, choose the tab that matches the method you'll use.

Console

This tab covers how to manage ENA Express settings for network interfaces that are attached to an instance.

Manage ENA Express from the Network interface list

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the left navigation pane, choose Network interfaces.
3. Select a network interface that is attached to an instance. You can choose the Network interface ID link to open the detail page, or you can select the checkbox on the left side of the list.
4. Choose **Manage ENA Express** from the **Action** menu at the top right side of the page. This opens the **Manage ENA Express** dialog, with the selected network interface ID and current settings displayed.

**Note**

If the network interface you selected is not attached to an instance, this action does not appear in the menu.

5. To use **ENA Express**, select the **Enable** check box.

6. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** check box.

7. To save your settings, choose **Save**.

### Manage ENA Express from the Instance list

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the left navigation pane, choose **Instances**.

3. Select the instance that you want to manage. You can choose the **Instance ID** to open the detail page, or you can select the checkbox on the left side of the list.

4. Select the **Network interface** to configure for your instance.

5. Choose **Manage ENA Express** from the **Action** menu at the top right side of the page.

6. To configure ENA Express for a network interface that's attached to your instance, select it from the **Network interface** list.

7. To use **ENA Express** for the selected network interface attachment, select the **Enable** check box.

8. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** check box.

9. To save your settings, choose **Save**.

### Configure ENA Express when you attach a network interface to an EC2 instance

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface that is not attached to an instance (*Status* is *Available*). You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list.

4. Select the **Instance** that you’ll attach to.

5. To use **ENA Express** after you attach the network interface to the instance, select the **Enable** check box.

6. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** check box.

7. To attach the network interface to the instance and save your ENA Express settings, choose **Attach**.

**AWS CLI**

This tab covers how to configure ENA Express settings in the AWS CLI.

**Configure ENA Express when you attach a network interface**

To configure ENA Express when you attach a network interface to an instance, run the `attach-network-interface` command in the AWS CLI, as shown in the following examples:

**Example 1: Use ENA Express for TCP traffic, but not for UDP traffic**

In this example, we configure `EnaSrdEnabled` as `true`, and we allow `EnaSrdUdpEnabled` to default to `false`.

```bash
[ec2-user ~]$ aws ec2 attach-network-interface --network-interface-id eni-0123f4567890a1b23 --instance-id i-0f1a234b5cd67e890 --device-index 1 --ena-srd-specification 'EnaSrdEnabled=true'
{
   "AttachmentId": "eni-attach-012c3d45678f9012"
}
```

**Example 2: Use ENA Express for both TCP traffic and UDP traffic**

In this example, we configure both `EnaSrdEnabled` and `EnaSrdUdpEnabled` as `true`.

```bash
[ec2-user ~]$ aws ec2 attach-network-interface --network-interface-id eni-0123f4567890a1b23 --instance-id i-0f1a234b5cd67e890 --device-index 1 --ena-srd-specification 'EnaSrdEnabled=true & EnaSrdUdpEnabled=true'
{
   "AttachmentId": "eni-attach-012c3d45678f9012"
}
```
Update ENA Express settings for your network interface attachment

To update ENA Express settings for a network interface that's attached to an instance, run the `modify-network-interface-attribute` command in the AWS CLI, as shown in the following examples:

**Example 1: Use ENA Express for TCP traffic, but not for UDP traffic**

In this example, we configure `EnaSrdEnabled` as `true`, and we allow `EnaSrdUdpEnabled` to default to `false` if it has never been set previously.

```
[ec2-user ~]$ aws ec2 modify-network-interface-attribute --network-interface-id eni-0123f4567890a1b23 --ena-srd-specification 'EnaSrdEnabled=true'
```

**Example 2: Use ENA Express for both TCP traffic and UDP traffic**

In this example, we configure both `EnaSrdEnabled` and `EnaSrdUdpEnabled` as `true`.

```
```

**Example 3: Stop using ENA Express for UDP traffic**

In this example, we configure `EnaSrdUdpEnabled` as `false`.

```
```

PowerShell

This tab covers how to configure ENA Express settings using PowerShell.

Configure ENA Express when you attach a network interface
To configure ENA Express settings for a networking interface, run the `Add-EC2NetworkInterface` Cmdlet with the Tools for PowerShell as shown in the following examples:

**Example 1: Use ENA Express for TCP traffic, but not for UDP traffic**

In this example, we configure `EnaSrdEnabled` as `true`, and we allow `EnaSrdUdpEnabled` to default to `false`.

```
PS C:\> Add-EC2NetworkInterface ` `-NetworkInterfaceId eni-0123f4567890a1b23 ` `-InstanceId i-0f1a234b5cd67e890 ` `-DeviceIndex 1 ` `-EnaSrdSpecification_EnaSrdEnabled $true`
eni-attach-012c3d45e678f9012
```

**Example 2: Use ENA Express for both TCP traffic and UDP traffic**

In this example, we configure both `EnaSrdEnabled` and `EnaSrdUdpEnabled` as `true`.

```
PS C:\> Add-EC2NetworkInterface ` `-NetworkInterfaceId eni-0123f4567890a1b23 ` `-InstanceId i-0f1a234b5cd67e890 ` `-DeviceIndex 1 ` `-EnaSrdSpecification_EnaSrdEnabled $true ` `-EnaSrdUdpSpecification_EnaSrdUdpEnabled $true`
eni-attach-012c3d45e678f9012
```

**Update ENA Express settings for your network interface attachment**

To update ENA Express settings for a network interface that's attached to an instance, run the `Add-EC2NetworkInterface` command in the Tools for PowerShell, as shown in the following examples:

**Example 1: Use ENA Express for TCP traffic, but not for UDP traffic**

In this example, we configure `EnaSrdEnabled` as `true`, and we allow `EnaSrdUdpEnabled` to default to `false` if it has never been set previously.

```
PS C:\> Edit-EC2NetworkInterfaceAttribute ` `-NetworkInterfaceId eni-0123f4567890a1b23`
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

In this example, we configure both EnaSrdEnabled and EnaSrdUdpEnabled as true.

```powershell

NetworkInterfaceId : eni-0123f4567890a1b23
EnaSrdEnabled      : True
EnaSrdUdpEnabled   : True
```

Example 3: Stop using ENA Express for UDP traffic

In this example, we configure EnaSrdUdpEnabled as false.

```powershell
Get-EC2NetworkInterface -NetworkInterfaceId eni-0123f4567890a1b23 | `
Configure ENA Express at launch

You can use one of the following methods to configure ENA Express directly when you launch an instance. The specified links refer you to the AWS Management Console instructions for these methods.

- **Launch instance wizard:** You can configure ENA Express at launch with the launch instance wizard. For more information, see Advanced network configuration in the Network settings for the launch instance wizard.

- **Launch template:** You can configure ENA Express at launch when you use a launch template. For more information, see the Create a launch template page, then expand the Network settings section and review the Advanced network configuration.

Enhanced networking with the Intel 82599 VF interface

For EC2 instance types that are not built on top of the AWS Nitro system, the Intel 82599 Virtual Function (VF) interface provides enhanced networking capabilities. The interface uses the Intel ixgbevf driver.

The following tabs show how to verify the network adapter driver that's installed for your instance operating system.

**Linux**

**Linux network interface driver**

Use the following command to verify that the module is being used on a particular interface, substituting the interface name that you want to check. If you are using a single interface
(default), this is eth0. If the operating system supports predictable network names, this could be a name like ens5.

In the following example, the ixgbevf module is not loaded, because the listed driver is vif.

```
[ec2-user ~]$ ethtool -i eth0
driver: vif
version:
firmware-version:
bus-info: vif-0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no
```

In this example, the ixgbevf module is loaded. This instance has enhanced networking properly configured.

```
[ec2-user ~]$ ethtool -i eth0
driver: ixgbevf
version: 4.0.3
firmware-version: N/A
bus-info: 0000:00:03.0
supports-statistics: yes
supports-test: yes
supports-eeprom-access: no
supports-register-dump: yes
supports-priv-flags: no
```

Windows

Windows network adapter

To verify that the driver is installed, connect to your instance and open Device Manager. You should see Intel(R) 82599 Virtual Function listed under Network adapters.

Contents

- Prepare your instance for enhanced networking
- Test whether enhanced networking is enabled
• **Enable enhanced networking on your instance**

• **Troubleshoot connectivity issues**

**Prepare your instance for enhanced networking**

To prepare for enhanced networking using the Intel 82599 VF interface, set up your instance as follows:

• Select from the following supported instance types: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.

• Ensure that the instance has internet connectivity.

• If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating kernels and kernel modules, as well as enabling the `sriovNetSupport` attribute, might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.

• **Linux instances** – Launch the instance from an HVM AMI using Linux kernel version of 2.6.32 or later. The latest Amazon Linux HVM AMIs have the modules required for enhanced networking installed and have the required attributes set. Therefore, if you launch an Amazon EBS–backed, enhanced networking–supported instance using a current Amazon Linux HVM AMI, enhanced networking is already enabled for your instance.

  ![](Warning_icon.png)

  **Warning**

  Enhanced networking is supported only for HVM instances. Enabling enhanced networking with a PV instance can make it unreachable. Setting this attribute without the proper module or module version can also make your instance unreachable.

• **Windows instances** – Launch the instance from a 64-bit HVM AMI. You can't enable enhanced networking on Windows Server 2008. Enhanced networking is already enabled for Windows Server 2012 R2 and Windows Server 2016 and later AMIs. Windows Server 2012 R2 includes Intel driver 1.0.15.3 and we recommend that you upgrade that driver to the latest version using the `Pnputil.exe` utility.

• Use [AWS CloudShell](https://aws.amazon.com/cloudshell/) from the AWS Management Console, or install and configure the [AWS CLI](https://aws.amazon.com/cli/) or the [AWS Tools for Windows PowerShell](https://aws.amazon.com/powershell/) on any computer you choose, preferably your local desktop or laptop. For more information, see [Access Amazon EC2](https://aws.amazon.com/efs/) or the [AWS CloudShell User Guide](https://aws.amazon.com/cloudshell/user-guide/). Enhanced networking cannot be managed from the Amazon EC2 console.
Test whether enhanced networking is enabled

Verify that the sriovNetSupport attribute is set.

**Instance attribute (sriovNetSupport)**

To check whether an instance has the enhanced networking sriovNetSupport attribute set, use one of the following commands. If the attribute is set, the value is simple.

- **describe-instance-attribute** (AWS CLI) (AWS CLI/AWS CloudShell)
  
  ```bash
  aws ec2 describe-instance-attribute --instance-id instance_id --attribute sriovNetSupport
  ```

- **Get-EC2InstanceAttribute** (AWS Tools for Windows PowerShell)
  
  ```powershell
  Get-EC2InstanceAttribute -InstanceId instance-id -Attribute sriovNetSupport
  ```

**Image attribute (sriovNetSupport)**

To check whether an AMI already has the enhanced networking sriovNetSupport attribute set, use one of the following commands. If the attribute is set, the value is simple.

- **describe-images** (AWS CLI)
  
  ```bash
  aws ec2 describe-images --image-id ami_id --query "Images[].SriovNetSupport"
  ```

- **Get-EC2Image** (AWS Tools for Windows PowerShell)
  
  ```powershell
  (Get-EC2Image -ImageId ami-id).SriovNetSupport
  ```

**Enable enhanced networking on your instance**

The procedure that you use depends on the operating system of the instance.

⚠️ **Warning**

There is no way to disable the enhanced networking attribute after you've enabled it.
Amazon Linux

The latest Amazon Linux HVM AMIs have the `ixgbevf` module required for enhanced networking installed and have the required `sriovNetSupport` attribute set. Therefore, if you launch an instance type using a current Amazon Linux HVM AMI, enhanced networking is already enabled for your instance. For more information, see Test whether enhanced networking is enabled.

If you launched your instance using an older Amazon Linux AMI and it does not have enhanced networking enabled already, use the following procedure to enable enhanced networking.

**To enable enhanced networking**

1. Connect to your instance.

2. From the instance, run the following command to update your instance with the newest kernel and kernel modules, including `ixgbevf`:

   ```bash
   [ec2-user ~]$ sudo yum update
   ```

3. From your local computer, reboot your instance using the Amazon EC2 console or one of the following commands: `reboot-instances` (AWS CLI), `Restart-EC2Instance` (AWS Tools for Windows PowerShell).

4. Connect to your instance again and verify that the `ixgbevf` module is installed and at the minimum recommended version using the `modinfo ixgbevf` command from Test whether enhanced networking is enabled.

5. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: `stop-instances` (AWS CLI), `Stop-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

   [Instance store-backed instance] You can’t stop the instance to modify the attribute. Instead, skip to the next procedure.

6. From your local computer, enable the enhanced networking attribute using one of the following commands:

   AWS CLI

   ```bash
   modify-instance-attribute
   ```
aws ec2 modify-instance-attribute --instance-id instance_id --sriov-net-support simple

PowerShell

Edit-EC2InstanceAttribute (AWS Tools for Windows PowerShell)

Edit-EC2InstanceAttribute -InstanceId instance_id -SriovNetSupport "simple"

7. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

8. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI), Start-EC2Instance (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

9. Connect to your instance and verify that the ixgbevf module is installed and loaded on your network interface using the ethtool -i ethn command from Test whether enhanced networking is enabled.

To enable enhanced networking (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in Create an instance store-backed Linux AMI, making sure to enable the enhanced networking attribute when you register the AMI.

AWS CLI

register-image (AWS CLI/AWS CloudShell)

aws ec2 register-image --sriov-net-support simple ...

PowerShell

Register-EC2Image (AWS Tools for Windows PowerShell)

Register-EC2Image -SriovNetSupport "simple" ...
Ubuntu

Before you begin, check if enhanced networking is already enabled on your instance.

The Quick Start Ubuntu HVM AMIs include the necessary drivers for enhanced networking. If you have a version of ixgbevf earlier than 2.16.4, you can install the linux-aws kernel package to get the latest enhanced networking drivers.

The following procedure provides the general steps for compiling the ixgbevf module on an Ubuntu instance.

To install the linux-aws kernel package

1. Connect to your instance.
2. Update the package cache and packages.

```
ubuntu:~$ sudo apt-get update && sudo apt-get upgrade -y linux-aws
```

⚠️ Important

If during the update process, you are prompted to install grub, use /dev/xvda to install grub, and then choose to keep the current version of /boot/grub/menu.lst.

Other Linux distributions

Before you begin, check if enhanced networking is already enabled on your instance. The latest Quick Start HVM AMIs include the necessary drivers for enhanced networking, therefore you do not need to perform additional steps.

The following procedure provides the general steps if you need to enable enhanced networking with the Intel 82599 VF interface on a Linux distribution other than Amazon Linux or Ubuntu. For more information, such as detailed syntax for commands, file locations, or package and tool support, see the specific documentation for your Linux distribution.

To enable enhanced networking on Linux

1. Connect to your instance.
2. Download the source for the ixgbevf module on your instance from Sourceforge at https://sourceforge.net/projects/e1000/files/ixgbevf%20stable/.

Intel 82599 VF
Versions of ixgbevf earlier than 2.16.4, including version 2.14.2, do not build properly on some Linux distributions, including certain versions of Ubuntu.

3. Compile and install the ixgbevf module on your instance.

⚠️ Warning

If you compile the ixgbevf module for your current kernel and then upgrade your kernel without rebuilding the driver for the new kernel, your system might revert to the distribution-specific ixgbevf module at the next reboot. This could make your system unreachable if the distribution-specific version is incompatible with enhanced networking.

4. Run the `sudo depmod` command to update module dependencies.

5. Update initramfs on your instance to ensure that the new module loads at boot time.

6. Determine if your system uses predictable network interface names by default. Systems that use systemd or udev versions 197 or greater can rename Ethernet devices and they do not guarantee that a single network interface will be named eth0. This behavior can cause problems connecting to your instance. For more information and to see other configuration options, see Predictable Network Interface Names on the freedesktop.org website.

   a. You can check the systemd or udev versions on RPM-based systems with the following command:

      ```bash
      [ec2-user ~]$ rpm -qa | grep -e '^systemd-[0-9]+|^udev-[0-9]+'
      systemd-208-11.el7_0.2.x86_64
      ```

      In the above Red Hat Enterprise Linux 7 example, the systemd version is 208, so predictable network interface names must be disabled.

   b. Disable predictable network interface names by adding the `net.ifnames=0` option to the GRUB_CMDLINE_LINUX line in `/etc/default/grub`.

      ```bash
      [ec2-user ~]$ sudo sed -i '/^GRUB\_CMDLINE\_LINUX/s/"$/ net\_ifnames=0"/' /etc/default/grub
      ```

   c. Rebuild the grub configuration file.
7. **[EBS-backed instance]** From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: `stop-instances` (AWS CLI/AWS CloudShell), `Stop-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.

**[Instance store-backed instance]** You can't stop the instance to modify the attribute. Instead, skip to the next procedure.

8. From your local computer, enable the enhanced networking attribute using one of the following commands:

AWS CLI

```
modify-instance-attribute (AWS CLI/AWS CloudShell)
```

```
aws ec2 modify-instance-attribute --instance-id instance_id --sriov-net-support simple
```

PowerShell

```
Edit-EC2InstanceAttribute (AWS Tools for Windows PowerShell)
```

```
Edit-EC2InstanceAttribute -InstanceId instance_id -SriovNetSupport "simple"
```

9. (Optional) Create an AMI from the instance, as described in [Create an Amazon EBS-backed AMI](#). The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

If your instance operating system contains an `/etc/udev/rules.d/70-persistent-net.rules` file, you must delete it before creating the AMI. This file contains the MAC address for the Ethernet adapter of the original instance. If another instance boots with this file, the operating system will be unable to find the device and `eth0` might fail, causing boot issues. This file is regenerated at the next boot cycle, and any instances launched from the AMI create their own version of the file.

10. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: `start-instances` (AWS CLI), `Start-EC2Instance` (AWS Tools for Windows PowerShell).
PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

11. (Optional) Connect to your instance and verify that the module is installed.

**To enable enhanced networking (instance store–backed instances)**

Follow the previous procedure until the step where you stop the instance. Create a newAMI as described in Create an instance store-backed Linux AMI, making sure to enable the enhanced networking attribute when you register the AMI.

**AWS CLI**

```
register-image (AWS CLI/AWS CloudShell)
```

```
aws ec2 register-image --sriov-net-support simple ...
```

**PowerShell**

```
Register-EC2Image (AWS Tools for Windows PowerShell)
```

```
Register-EC2Image -SriovNetSupport "simple" ...
```

**Windows**

If you launched your instance and it does not have enhanced networking enabled already, you must download and install the required network adapter driver on your instance, and then set the sriovNetSupport instance attribute to activate enhanced networking. You can only enable this attribute on supported instance types. For more information, see Enhanced networking on Amazon EC2 instances.

⚠️ **Important**

To view the latest driver updates in the Windows AMIs, see Windows AMI version history in the AWS Windows AMI Reference.

**To enable enhanced networking**

1. Connect to your instance and log in as the local administrator.
2. [Windows Server 2016 and later] Run the following EC2 Launch PowerShell script to configure
the instance after the driver is installed.

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -Schedule
```

⚠️ **Important**

The administrator password will reset when you enable the initialize instance EC2
Launch script. You can modify the configuration file to disable the administrator
password reset by specifying it in the settings for the initialization tasks.

3. From the instance, download the Intel network adapter driver for your operating system:

   - **Windows Server 2022**
     
     Visit the [download page](#) and download Wired_driver_version_x64.zip.

   - **Windows Server 2019** including for Server version 1809 and later*
     
     Visit the [download page](#) and download Wired_driver_version_x64.zip.

   - **Windows Server 2016** including for Server version 1803 and earlier*
     
     Visit the [download page](#) and download Wired_driver_version_x64.zip.

   - **Windows Server 2012 R2**
     
     Visit the [download page](#) and download Wired_driver_version_x64.zip.

   - **Windows Server 2012**
     
     Visit the [download page](#) and download Wired_driver_version_x64.zip.

   - **Windows Server 2008 R2**
     
     Visit the [download page](#) and download PROWinx64Legacy.exe.

*Server versions 1803 and earlier as well as 1809 and later are not specifically addressed on
the Intel Drivers and Software pages.

4. Install the Intel network adapter driver for your operating system.
1. In the Downloads folder, locate the PROWinx64Legacy.exe file and rename it to PROWinx64Legacy.zip.

2. Extract the contents of the PROWinx64Legacy.zip file.

3. Open the command line, navigate to the extracted folder, and run the following command to use the pnputil utility to add and install the INF file in the driver store.

   ```
   C:\> pnputil -a PROXGB\Winx64\NDIS62\vxn62x64.inf
   ```

1. In the Downloads folder, extract the contents of the Wired_driver_version_x64.zip file.

2. In the extracted folder, locate the Wired_driver_version_x64.exe file and rename it to Wired_driver_version_x64.zip.

3. Extract the contents of the Wired_driver_version_x64.zip file.

4. Open the command line, navigate to the extracted folder, and run one of the following commands to use the pnputil utility to add and install the INF file in the driver store.

   - **Windows Server 2022**
     ```
     C:\> pnputil -i -a PROXGB\Winx64\WS2022\vxn63x64.inf
     ```

   - **Windows Server 2019**
     ```
     C:\> pnputil -i -a PROXGB\Winx64\NDIS68\vxn68x64.inf
     ```

   - **Windows Server 2016**
     ```
     C:\> pnputil -i -a PROXGB\Winx64\NDIS65\vxn65x64.inf
     ```

   - **Windows Server 2012 R2**
     ```
     C:\> pnputil -i -a PROXGB\Winx64\NDIS64\vxn64x64.inf
     ```

   - **Windows Server 2012**
     ```
     C:\> pnputil -i -a PROXGB\Winx64\NDIS63\vxn63x64.inf
     ```
5. From your local computer, enable the enhanced networking attribute using one of the following commands:

**AWS CLI**

```
modify-instance-attribute (AWS CLI/AWS CloudShell)
```

```
aws ec2 modify-instance-attribute --instance-id instance_id --sriov-net-support simple
```

**PowerShell**

```
Edit-EC2InstanceAttribute (AWS Tools for Windows PowerShell)
```

```
Edit-EC2InstanceAttribute -InstanceId instance_id -SriovNetSupport "simple"
```

6. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

7. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI), Start-EC2Instance (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

**Troubleshoot connectivity issues**

If you lose connectivity while enabling enhanced networking, the ixgbevf module might be incompatible with the kernel. Try installing the version of the ixgbevf module included with the distribution of Linux for your instance.

If you enable enhanced networking for a PV instance or AMI, this can make your instance unreachable.

For more information, see How do I turn on and configure enhanced networking on my EC2 instances?

**Monitor network performance for ENA settings on your EC2 instance**

The Elastic Network Adapter (ENA) driver publishes network performance metrics from the instances where they are enabled. You can use these metrics to troubleshoot instance performance.
issues, choose the right instance size for a workload, plan scaling activities proactively, and benchmark applications to determine whether they maximize the performance available on an instance.

Amazon EC2 defines network maximums at the instance level to ensure a high-quality networking experience, including consistent network performance across instance sizes. AWS provides maximums for the following for each instance:

- **Bandwidth capability** – Each EC2 instance has a maximum bandwidth for aggregate inbound and outbound traffic, based on instance type and size. Some instances use a network I/O credit mechanism to allocate network bandwidth based on average bandwidth utilization. Amazon EC2 also has maximum bandwidth for traffic to AWS Direct Connect and the internet. For more information, see [Amazon EC2 instance network bandwidth](#).

- **Packet-per-second (PPS) performance** – Each EC2 instance has a maximum PPS performance, based on instance type and size.

- **Connections tracked** – The security group tracks each connection established to ensure that return packets are delivered as expected. There is a maximum number of connections that can be tracked per instance. For more information, see [Security group connection tracking](#).

- **Link-local service access** – Amazon EC2 provides a maximum PPS per network interface for traffic to services such as the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.

When the network traffic for an instance exceeds a maximum, AWS shapes the traffic that exceeds the maximum by queueing and then dropping network packets. You can monitor when traffic exceeds a maximum using the network performance metrics. These metrics inform you, in real time, of impact to network traffic and possible network performance issues.

**Contents**

- [Requirements](#)
- [Metrics for the ENA driver](#)
- [View the network performance metrics for your instance](#)
- [Metrics for ENA Express](#)
- [Network performance metrics with the DPDK driver for ENA](#)
- [Metrics on instances running FreeBSD](#)
Requirements

Linux instances

- Install ENA driver version 2.2.10 or later. To verify the installed version, use the `ethtool` command. In the following example, the version meets the minimum requirement.

  ```
  [ec2-user ~]$ ethtool -i eth0 | grep version
  version: 2.2.10
  ```

  To upgrade your ENA driver, see [Enhanced networking](#).

- To import these metrics to Amazon CloudWatch, install the CloudWatch agent. For more information, see [Collect network performance metrics](#) in the [Amazon CloudWatch User Guide](#).

- To support `conntrack_allowance_available` metric, install ENA driver version 2.8.1.

Windows instances

- Install ENA driver version 2.2.2 or later. To verify the installed version, use Device Manager as follows.

  1. Open Device Manager by running `devmgmt.msc`.
  2. Expand Network Adapters.

  To upgrade your ENA driver, see [Enhanced networking](#).

- To import these metrics to Amazon CloudWatch, install the CloudWatch agent. For more information, see [Collect advanced network metrics](#) in the [Amazon CloudWatch User Guide](#).

Metrics for the ENA driver

The ENA driver delivers the following metrics to the instance in real time. They provide the cumulative number of packets queued or dropped on each network interface since the last driver reset.
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
<th>Supported on</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bw_in_allowance_exceeded</code></td>
<td>The number of packets queued or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance.</td>
<td>All instance types</td>
</tr>
<tr>
<td><code>bw_out_allowance_exceeded</code></td>
<td>The number of packets queued or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance.</td>
<td>All instance types</td>
</tr>
<tr>
<td><code>conntrack_allowance_exceeded</code></td>
<td>The number of packets dropped because connection tracking exceeded the maximum for the instance and new connections could not be established. This can result in packet loss for traffic to or from the instance.</td>
<td>All instance types</td>
</tr>
<tr>
<td><code>conntrack_allowance_available</code></td>
<td>The number of tracked connections that can be established by the instance before hitting the Connections Tracked allowance of that instance type.</td>
<td>Instances built on the AWS Nitro System only</td>
</tr>
<tr>
<td><code>linklocal_allowance_exceeded</code></td>
<td>The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic to the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.</td>
<td>All instance types</td>
</tr>
<tr>
<td>Metric</td>
<td>Description</td>
<td>Supported on</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td>pps_allowance_exceeded</td>
<td>The number of packets queued or dropped because the bidirectional PPS exceeded the maximum for the instance.</td>
<td>All instance types</td>
</tr>
</tbody>
</table>

**View the network performance metrics for your instance**

The procedure that you use depends on the operating system of the instance.

**Linux instances**

You can publish metrics to your favorite tools to visualize the metric data. For example, you can publish the metrics to Amazon CloudWatch using the CloudWatch agent. The agent enables you to select individual metrics and control publication.

You can also use the `ethtool` to retrieve the metrics for each network interface, such as `eth0`, as follows.

```
[ec2-user ~]$ ethtool -S eth0
    bw_in_allowance_exceeded: 0
    bw_out_allowance_exceeded: 0
    pps_allowance_exceeded: 0
    conntrack_allowance_exceeded: 0
    linklocal_allowance_exceeded: 0
    conntrack_allowance_available: 136812
```

**Windows instances**

You can view the metrics using any consumer of Windows performance counters. The data can be parsed according to the EnaPerfCounters manifest. This is an XML file that defines the performance counter provider and its countersets.

**To install the manifest**

If you launched the instance using an AMI that contains ENA driver 2.2.2 or later, or used the install script in the driver package for ENA driver 2.2.2, the manifest is already installed. To install the manifest manually, use the following steps:
1. Remove the existing manifest using the following command:

   `unlodctr /m:EnaPerfCounters.man`

2. Copy the manifest file `EnaPerfCounters.man` from the driver installation package to `%SystemRoot%\System32\drivers`.

3. Install the new manifest using the following command:

   `lodctr /m:EnaPerfCounters.man`

To view metrics using Performance Monitor

1. Open Performance Monitor.
2. Press Ctrl+N to add new counters.
3. Choose **ENA Packets Shaping** from the list.
4. Select the instances to monitor and choose **Add**.
5. Choose **OK**.

Metrics for ENA Express

ENA Express is powered by AWS Scalable Reliable Datagram (SRD) technology. SRD is a high performance network transport protocol that uses dynamic routing to increase throughput and minimize tail latency. If you've enabled ENA Express for the network interface attachments on both the sending instance and receiving instance, you can use ENA Express metrics to help ensure that your instances take full advantage of the performance improvements that SRD technology provides. For example:

- Evaluate your resources to ensure that they have sufficient capacity to establish more SRD connections.
- Identify where there are potential issues that prevent eligible outgoing packets from using SRD.
- Calculate the percentage of outgoing traffic that uses SRD for the instance.
- Calculate the percentage of incoming traffic that uses SRD for the instance.
To produce metrics, use driver version 2.8 or higher.

To see a list of metrics for your Linux instance that's filtered for ENA Express, run the following `ethtool` command for your network interface (shown here as `eth0`). Take note of the value of the `ena_srd_mode` metric.

```
[ec2-user ~]$ ethtool -S eth0 | grep ena_srd
NIC statistics:
  ena_srd_mode: 1
  ena_srd_tx_pkts: 0
  ena_srd_eligible_tx_pkts: 0
  ena_srd_rx_pkts: 0
  ena_srd_resource_utilization: 0
```

The following metrics are available for all instances that have ENA Express enabled.

**ena_srd_mode**

Describes which ENA Express features are enabled. Values are as follows:

- 0 = ENA Express off, UDP off
- 1 = ENA Express on, UDP off
- 2 = ENA Express off, UDP on
- 3 = ENA Express on, UDP on

**Note**

This only happens when ENA Express was originally enabled, and UDP was configured to use it. The prior value is retained for UDP traffic.

**ena_srd_eligible_tx_pkts**

The number of network as follows:

- Both sending and receiving instance types are supported. See the [Supported instance types for ENA Express](#) table for more information.
- Both sending and receiving instances must have ENA Express configured.
- The sending and receiving instances must run in the same Availability Zone.
- The network path between the instances must not include middleware boxes. ENA Express doesn't currently support middleware boxes.

**Note**

The ENA Express eligibility metric covers source and destination requirements, and the network between the two endpoints. Eligible packets can still be disqualified after they've already been counted. For example, if an eligible packet is over the maximum transmission unit (MTU) limit, it falls back to standard ENA transmission, though the packet is still reflected as eligible in the counter.

**ena_srd_txPkts**

The number of SRD packets transmitted within a given time period.

**ena_srd_rxPkts**

The number of SRD packets received within a given time period.

**ena_srd_resource_utilization**

The percentage of the maximum allowed memory utilization for concurrent SRD connections that the instance has consumed.

To confirm if packet transmission is using SRD, you can compare the number of eligible packets (**ena_srd_eligible_txPkts** metric) to the number of SRD packets transmitted (**ena_srd_txPkts** metric) during a given time period.

**Egress traffic (outgoing packets)**

To ensure that your egress traffic uses SRD as expected, compare the number of SRD eligible packets (**ena_srd_eligible_txPkts**) with the number of SRD packets sent (**ena_srd_txPkts**) over a given time period.

Significant differences between the number of eligible packets and the number of SRD packets sent are often caused by resource utilization issues. When the network card attached to the instance has used up its maximum resources, or if packets are over the MTU limit, eligible packets are not able to transmit via SRD, and must fall back to standard ENA transmission. Packets can
also fall into this gap during live migrations or live server updates. Additional troubleshooting is required to determine the root cause.

Note

You can ignore occasional minor differences between the number of eligible packets and the number of SRD packets. This can happen when your instance establishes a connection to another instance for SRD traffic, for example.

To find out what percentage of your total egress traffic over a given time period uses SRD, compare the number of SRD packets sent (ena_srd_tx_pkts) to the total number of packets sent for the instance (NetworkPacketOut) during that time.

**Ingress traffic (incoming packets)**

To find out what percentage of your ingress traffic uses SRD, compare the number of SRD packets received (ena_srd_rx_pkts) over a given time period to the total number of packets received for the instance (NetworkPacketIn) during that time.

**Resource utilization**

Resource utilization is based on the number of concurrent SRD connections a single instance can hold at a given time. The resource utilization metric (ena_srd_resource_utilization) keeps track of your current utilization for the instance. As utilization approaches 100%, you can expect to see performance issues. ENA Express falls back from SRD to standard ENA transmission, and the possibility of dropped packets increases. High resource utilization is a sign that it's time to scale the instance out to improve network performance.

Note

When the network traffic for an instance exceeds a maximum, AWS shapes the traffic that exceeds the maximum by queueing and then dropping network packets.

**Persistence**

Egress and ingress metrics accrue while ENA Express is enabled for the instance. Metrics stop accruing if ENA Express is deactivated, but persist as long as the instance is still running. Metrics
reset if the instance reboots or is terminated, or if the network interface is detached from the instance.

**Network performance metrics with the DPDK driver for ENA**

The ENA driver version 2.2.0 and later supports network metrics reporting. DPDK 20.11 includes the ENA driver 2.2.0 and is the first DPDK version to support this feature.

You can use an example application to view DPDK statistics. To start an interactive version of the example application, run the following command.

```
./app/dpdk-testpmd -- -i
```

Within this interactive session, you can enter a command to retrieve extended statistics for a port. The following example command retrieves the statistics for port 0.

```
show port xstats 0
```

The following is an example of an interactive session with the DPDK example application.

```
[root@ip-192.0.2.0 build]# ./app/dpdk-testpmd -- -i
    EAL: Detected 4 lcore(s)
    EAL: Detected 1 NUMA nodes

Monitor network performance
For more information about the example application and using it to retrieve extended statistics, see Testpmd Application User Guide in the DPDK documentation.

**Metrics on instances running FreeBSD**

Starting with version 2.3.0, the ENA FreeBSD driver supports collecting network performance metrics on instances running FreeBSD. To enable the collection of FreeBSD metrics, enter the following command and set `interval` to a value between 1 and 3600. This specifies how often, in seconds, to collect FreeBSD metrics.

```bash
sysctl dev.ena.network_interface.eni_metrics.sample_interval=interval
```

For example, the following command sets the driver to collect FreeBSD metrics on network interface 1 every 10 seconds:

```bash
sysctl dev.ena.1.eni_metrics.sample_interval=10
```

To turn off the collection of FreeBSD metrics, you can run the preceding command and specify 0 as the `interval`.

After you enable collecting FreeBSD metrics, you can retrieve the latest set of collected metrics by running the following command.

```bash
sysctl dev.ena.network_interface.eni_metrics
```

**Troubleshoot the ENA kernel driver on Linux**

The Elastic Network Adapter (ENA) is designed to improve operating system health and reduce the chances of long-term disruption because of unexpected hardware behavior and or failures. The ENA architecture keeps device or driver failures as transparent to the system as possible. This topic provides troubleshooting information for ENA.

If you are unable to connect to your instance, start with the Troubleshoot connectivity issues section.
If you experience performance degradation after migrating to a sixth generation instance type, see the article [What do I need to do before I migrate my EC2 instance to a sixth generation instance to make sure that I get maximum network performance?](#)

If you are able to connect to your instance, you can gather diagnostic information by using the failure detection and recovery mechanisms that are covered in the later sections of this topic.

**Contents**

- Troubleshoot connectivity issues
- Keep-alive mechanism
- Register read timeout
- Statistics
- Driver error logs in syslog
- Sub-optimal configuration notifications

**Troubleshoot connectivity issues**

If you lose connectivity while enabling enhanced networking, the ena module might be incompatible with your instance's current running kernel. This can happen if you install the module for a specific kernel version (without `dkms`, or with an improperly configured `dkms.conf` file) and then your instance kernel is updated. If the instance kernel that is loaded at boot time does not have the ena module properly installed, your instance will not recognize the network adapter and your instance becomes unreachable.

If you enable enhanced networking for a PV instance or AMI, this can also make your instance unreachable.

If your instance becomes unreachable after enabling enhanced networking with ENA, you can disable the `enaSupport` attribute for your instance and it will fall back to the stock network adapter.

**To disable enhanced networking with ENA (EBS-backed instances)**

1. From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: `stop-instances` (AWS CLI), `Stop-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should stop the instance in the AWS OpsWorks console so that the instance state remains in sync.
Tip

If you are using an instance store-backed instance, you can't stop the instance. Instead, skip to To disable enhanced networking with ENA (instance store-backed instances).

2. From your local computer, disable the enhanced networking attribute using the following command.

   * `modify-instance-attribute` (AWS CLI)

     ```
     $ C:\> aws ec2 modify-instance-attribute --instance-id instance_id --no-ena-support
     ```

3. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: `start-instances` (AWS CLI), `Start-EC2Instance` (AWS Tools for Windows PowerShell). If your instance is managed by AWS OpsWorks, you should start the instance in the AWS OpsWorks console so that the instance state remains in sync.

4. (Optional) Connect to your instance and try reinstalling the ena module with your current kernel version by following the steps in Enable enhanced networking with ENA on your EC2 instances.

To disable enhanced networking with ENA (instance store-backed instances)

If your instance is an instance store-backed instance, create a new AMI as described in Create an instance store-backed Linux AMI. Be sure to disable the enhanced networking enaSupport attribute when you register the AMI.

   * `register-image` (AWS CLI)

     ```
     $ C:\> aws ec2 register-image --no-ena-support ...
     ```

   * `Register-EC2Image` (AWS Tools for Windows PowerShell)

     ```
     C:\> Register-EC2Image -EnaSupport $false ...
     ```
Keep-alive mechanism

The ENA device posts keep-alive events at a fixed rate (usually once every second). The ENA driver implements a watchdog mechanism, which checks for the presence of these keep-alive messages. If a message or messages are present, the watchdog is rearmed, otherwise the driver concludes that the device experienced a failure and then does the following:

- Dumps its current statistics to syslog
- Resets the ENA device
- Resets the ENA driver state

The above reset procedure may result in some traffic loss for a short period of time (TCP connections should be able to recover), but should not otherwise affect the user.

The ENA device may also indirectly request a device reset procedure, by not sending a keep-alive notification, for example, if the ENA device reaches an unknown state after loading an irrecoverable configuration.

The following is an example of the reset procedure:

```
[18509.800135] ena 0000:00:07.0 eth1: Keep alive watchdog timeout. // The watchdog process initiates a reset
[18509.815244] ena 0000:00:07.0 eth1: Trigger reset is on
[18509.825589] ena 0000:00:07.0 eth1: tx_timeout: 0 // The driver logs the current statistics
[18509.834253] ena 0000:00:07.0 eth1: io_suspend: 0
[18509.842674] ena 0000:00:07.0 eth1: io_resume: 0
[18509.850275] ena 0000:00:07.0 eth1: wd_expired: 1
[18509.857855] ena 0000:00:07.0 eth1: interface_up: 1
[18509.865415] ena 0000:00:07.0 eth1: interface_down: 0
[18509.873468] ena 0000:00:07.0 eth1: admin_q_pause: 0
[18509.881075] ena 0000:00:07.0 eth1: queue_0_tx_cnt: 0
[18509.888629] ena 0000:00:07.0 eth1: queue_0_tx_bytes: 0
[18509.895286] ena 0000:00:07.0 eth1: queue_0_tx_queue_stop: 0
...........
[18511.280972] ena 0000:00:07.0 eth1: free uncompleted tx skb qid 3 idx 0x7 // At the end of the down process, the driver discards incomplete packets.
[18511.420112] [ENA_COM: ena_com_validate_version] ena device version: 0.10 // The driver begins its up process
```
Register read timeout

The ENA architecture suggests a limited usage of memory mapped I/O (MMIO) read operations. MMIO registers are accessed by the ENA device driver only during its initialization procedure.

If the driver logs (available in `dmesg` output) indicate failures of read operations, this may be caused by an incompatible or incorrectly compiled driver, a busy hardware device, or hardware failure.

Intermittent log entries that indicate failures on read operations should not be considered an issue; the driver will retry them in this case. However, a sequence of log entries containing read failures indicate a driver or hardware problem.

Below is an example of driver log entry indicating a read operation failure due to a timeout:

```
[ 47.346221] [ENA_COM: ena_com_dev_reset] Reg read32 timeout occurred
```
Statistics

If you experience insufficient network performance or latency issues, you should retrieve the device statistics and examine them. These statistics can be obtained using `ethtool` as follows.

```
[ec2-user ~]$ ethtool -S ethN
NIC statistics:
  tx_timeout: 0
  suspend: 0
  resume: 0
  wd_expired: 0
  interface_up: 1
  interface_down: 0
  admin_q_pause: 0
  bw_in_allowance_exceeded: 0
  bw_out_allowance_exceeded: 0
  pps_allowance_exceeded: 0
  conntrack_allowance_available: 450878
  conntrack_allowance_exceeded: 0
  linklocal_allowance_exceeded: 0
  queue_0_tx_cnt: 4329
  queue_0_tx_bytes: 1075749
  queue_0_tx_queue_stop: 0
  ...
```

The following command output parameters are described below:

- **tx_timeout**: $N$
  - The number of times that the Netdev watchdog was activated.

- **suspend**: $N$
  - The number of times the driver performed a suspend operation.

- **resume**: $N$
  - The number of times the driver performed a resume operation.

- **wd_expired**: $N$
  - The number of times that the driver did not receive the keep-alive event in the preceding three seconds.
interface_up: \(N\)

The number of times that the ENA interface was brought up.

interface_down: \(N\)

The number of times that the ENA interface was brought down.

admin_q_pause: \(N\)

The number of times the admin queue was not found in a running state.

bw_in_allowance_exceeded: \(N\)

The number of packets queued or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance.

bw_out_allowance_exceeded: \(N\)

The number of packets queued or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance.

pps_allowance_exceeded: \(N\)

The number of packets queued or dropped because the bidirectional PPS exceeded the maximum for the instance.

conntrack_allowance_available: \(N\)

The number of tracked connections that can be established by the instance before hitting the Connections Tracked allowance of that instance type. Only available for Nitro-based instances. Not supported with FreeBSD instances or DPDK environments.

conntrack_allowance_exceeded: \(N\)

The number of packets dropped because connection tracking exceeded the maximum for the instance and new connections could not be established. This can result in packet loss for traffic to or from the instance.

linklocal_allowance_exceeded: \(N\)

The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic to the DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.

queue\_N\_tx\_cnt: \(N\)

The number of transmitted packets for this queue.
queue\_N\_tx\_bytes: N

The number of transmitted bytes for this queue.

queue\_N\_tx\_queue\_stop: N

The number of times that queue N was full and stopped.

queue\_N\_tx\_queue\_wakeup: N

The number of times that queue N resumed after being stopped.

queue\_N\_tx\_dma\_mapping\_err: N

Direct memory access error count. If this value is not 0, it indicates low system resources.

queue\_N\_tx\_linearize: N

The number of times SKB linearization was attempted for this queue.

queue\_N\_tx\_linearize\_failed: N

The number of times SKB linearization failed for this queue.

queue\_N\_tx\_napi\_comp: N

The number of times the napi handler called napi\_complete for this queue.

queue\_N\_tx\_tx\_poll: N

The number of times the napi handler was scheduled for this queue.

queue\_N\_tx\_doorbells: N

The number of transmission doorbells for this queue.

queue\_N\_tx\_prepare\_ctx\_err: N

The number of times ena\_com\_prepare\_tx failed for this queue.

queue\_N\_tx\_bad\_req\_id: N

Invalid req\_id for this queue. The valid req\_id is zero, minus the queue\_size, minus 1.

queue\_N\_tx\_llq\_buffer\_copy: N

The number of packets whose headers size are larger than llq entry for this queue.

queue\_N\_tx\_missed\_tx: N

The number of packets that were left uncompleted for this queue.
queue\_N\_tx\_unmask\_interrupt: N

The number of times the tx interrupt was unmasked for this queue.

queue\_N\_rx\_cnt: N

The number of received packets for this queue.

queue\_N\_rx\_bytes: N

The number of received bytes for this queue.

queue\_N\_rx\_rx\_copybreak\_pkt: N

The number of times the rx queue received a packet that is less than the rx\_copybreak packet size for this queue.

queue\_N\_rx\_csum\_good: N

The number of times the rx queue received a packet where the checksum was checked and was correct for this queue.

queue\_N\_rx\_refil\_partial: N

The number of times the driver did not succeed in refilling the empty portion of the rx queue with the buffers for this queue. If this value is not zero, it indicates low memory resources.

queue\_N\_rx\_bad\_csum: N

The number of times the rx queue had a bad checksum for this queue (only if rx checksum offload is supported).

queue\_N\_rx\_page\_alloc\_fail: N

The number of time that page allocation failed for this queue. If this value is not zero, it indicates low memory resources.

queue\_N\_rx\_skb\_alloc\_fail: N

The number of time that SKB allocation failed for this queue. If this value is not zero, it indicates low system resources.

queue\_N\_rx\_dma\_mapping\_err: N

Direct memory access error count. If this value is not 0, it indicates low system resources.

queue\_N\_rx\_bad\_desc\_num: N

Too many buffers per packet. If this value is not 0, it indicates the use of very small buffers.
queue_N_rx_bad_req_id: N

The req_id for this queue is not valid. The valid req_id is from [0, queue_size - 1 ].
queue_N_rx_empty_rx_ring: N

The number of times the rx queue was empty for this queue.
queue_N_rx_csum_unchecked: N

The number of times the rx queue received a packet whose checksum wasn't checked for this queue.
queue_N_rx_xdp_aborted: N

The number of times that an XDP packet was classified as XDP_ABORT.
queue_N_rx_xdp_drop: N

The number of times that an XDP packet was classified as XDP_DROP.
queue_N_rx_xdp_pass: N

The number of times that an XDP packet was classified as XDP_PASS.
queue_N_rx_xdp_tx: N

The number of times that an XDP packet was classified as XDP_TX.
queue_N_rx_xdp_invalid: N

The number of times that the XDP return code for the packet was not valid.
queue_N_rx_xdp_redirect: N

The number of times that an XDP packet was classified as XDP_REDIRECT.
queue_N_xdp_tx_cnt: N

The number of transmitted packets for this queue.
queue_N_xdp_tx_bytes: N

The number of transmitted bytes for this queue.
queue_N_xdp_tx_queue_stop: N

The number of times that this queue was full and stopped.
queue\_N\_xdp\_tx\_queue\_wakeup: N

The number of times that this queue resumed after being stopped.

queue\_N\_xdp\_tx\_dma\_mapping\_err: N

Direct memory access error count. If this value is not 0, it indicates low system resources.

queue\_N\_xdp\_tx\_linearize: N

The number of times XDP buffer linearization was attempted for this queue.

queue\_N\_xdp\_tx\_linearize\_failed: N

The number of times XDP buffer linearization failed for this queue.

queue\_N\_xdp\_tx\_napi\_comp: N

The number of times the napi handler called napi_complete for this queue.

queue\_N\_xdp\_tx\_tx\_poll: N

The number of times the napi handler was scheduled for this queue.

queue\_N\_xdp\_tx\_doorbells: N

The number of transmission doorbells for this queue.

queue\_N\_xdp\_tx\_prepare\_ctx\_err: N

The number of times ena_com_prepare_tx failed for this queue. This value should always be zero; if not, see the driver logs.

queue\_N\_xdp\_tx\_bad\_req\_id: N

The req_id for this queue is not valid. The valid req_id is from [0, queue\_size - 1].

queue\_N\_xdp\_tx\_llq\_buffer\_copy: N

The number of packets that had their headers copied using llq buffer copy for this queue.

queue\_N\_xdp\_tx\_missed\_tx: N

The number of times a tx queue entry missed a completion timeout for this queue.

queue\_N\_xdp\_tx\_unmask\_interrupt: N

The number of times the tx interrupt was unmasked for this queue.
ena_admin_q_aborted_cmd: $N$

The number of admin commands that were aborted. This usually happens during the auto-recovery procedure.

ena_admin_q_submitted_cmd: $N$

The number of admin queue doorbells.

ena_admin_q_completed_cmd: $N$

The number of admin queue completions.

ena_admin_q_out_of_space: $N$

The number of times that the driver tried to submit new admin command, but the queue was full.

ena_admin_q_no_completion: $N$

The number of times that the driver did not get an admin completion for a command.

**Driver error logs in syslog**

The ENA driver writes log messages to *syslog* during system boot. You can examine these logs to look for errors if you are experiencing issues. Below is an example of information logged by the ENA driver in *syslog* during system boot, along with some annotations for select messages.

```
Jun  3 22:37:46 ip-172-31-2-186 kernel: [  478.416939] [ENA_COM: ena_com_validate_version] ena device version: 0.10
Jun  3 22:37:46 ip-172-31-2-186 kernel: [  478.420915] [ENA_COM: ena_com_validate_version] ena controller version: 0.0.1 implementation version 1
Jun  3 22:37:46 ip-172-31-2-186 kernel: [  479.256831] ena 0000:00:03.0: Device watchdog is Enabled
Jun  3 22:37:46 ip-172-31-2-186 kernel: [  479.672947] ena 0000:00:03.0: creating 8 io queues. queue size: 1024
Jun  3 22:37:46 ip-172-31-2-186 kernel: [  479.680885] [ENA_COM: ena_com_init_interrupt_moderation] Feature 20 isn't supported  // Interrupt moderation is not supported by the device

Jun  3 22:37:46 ip-172-31-2-186 kernel: [  479.694583] [ENA_COM:]
```
Which errors can I ignore?

The following warnings that may appear in your system's error logs can be ignored for the Elastic Network Adapter:

Set host attribute isn't supported

- Host attributes are not supported for this device.

failed to alloc buffer for rx queue

- This is a recoverable error, and it indicates that there may have been a memory pressure issue when the error was thrown.

Feature X isn't supported

- The referenced feature is not supported by the Elastic Network Adapter. Possible values for X include:
  - **10**: RSS Hash function configuration is not supported for this device.
  - **12**: RSS Indirection table configuration is not supported for this device.
  - **18**: RSS Hash Input configuration is not supported for this device.
  - **20**: Interrupt moderation is not supported for this device.
  - **27**: The Elastic Network Adapter driver does not support polling the Ethernet capabilities from snmpd.

Failed to config AENQ

- The Elastic Network Adapter does not support AENQ configuration.
Trying to set unsupported AENQ events

This error indicates an attempt to set an AENQ events group that is not supported by the Elastic Network Adapter.

Sub-optimal configuration notifications

The ENA device detects sub-optimal configuration settings in the driver that you can change. The device notifies the ENA driver and logs a warning to the console. The following example shows the format of the warning message.

```
Sub-optimal configuration notification code: 1. Refer to AWS ENA documentation for additional details and mitigation options.
```

The following list shows notification code details and recommended actions for sub-optimal configuration findings.

- **Code 1: ENA Express with wide LLQ configuration is not recommended**

  ENA Express ENI is configured with wide LLQ. This configuration is sub-optimal and could impact performance for ENA Express. We recommend that you disable wide LLQ settings when you use ENA Express ENIs as follows.

  ```
sudo rmmod ena && sudo modprobe ena force_large_llq_header=0
  ```

  For more information about optimal configuration for ENA Express, see [Improve network performance between EC2 instances with ENA Express](https://aws.amazon.com/documentation/ena/index.html).

- **Code 2: ENA Express ENI with sub-optimal Tx queue depth is not recommended**

  ENA Express ENI is configured with sub-optimal Tx queue depth. This configuration could impact performance for ENA Express. We recommend that you enlarge all Tx queues to the maximum value for the network interface when you use ENA Express ENIs as follows.

  You can run the following `ethtool` commands to adjust LLQ size. To learn more about how to control, query, and enable wide-LLQ, see the [Large Low-Latency Queue (Large LLQ)](https://docs.aws.amazon.com/enablers/en/ena/latest/quick-start-guide/index.html) topic of the Linux kernel driver for ENA documentation in the Amazon Drivers GitHub repository.

  ```
ethtool -g interface
  ```
Set your Tx queues to the maximum depth:

```
ethtool -G interface  tx depth
```

For more information about optimal configuration for ENA Express, see Improve network performance between EC2 instances with ENA Express.

- **Code 3: ENA with regular LLQ size and Tx packet traffic exceeds the maximum header supported size**

  By default, ENA LLQ supports Tx packet header size up to 96 bytes. If the packet header size is larger than 96 bytes, the packet is dropped. To mitigate this issue, we recommend that you enable wide-LLQ, which increases the supported Tx packet header size to a maximum of 224 bytes.

  However, when you enable wide-LLQ, the maximum Tx ring size is reduced from 1000 to 512 entries. Wide-LLQ is enabled by default for all Nitro v4 and later instance types.

  - Nitro v4 instance types have a default maximum wide-LLQ Tx ring size of 512 entries, which can't be changed.
  - Nitro v5 instance types have a default wide-LLQ Tx ring size of 512 entries, which you can increase up to 1000 entries.

  You can run the following `ethtool` commands to adjust LLQ size. To learn more about how to control, query, and enable wide-LLQ, see the Large Low-Latency Queue (Large LLQ) topic of the Linux kernel driver for ENA documentation in the Amazon Drivers GitHub repository.

Find the maximum depth for your Tx queues:

```
ethtool -g interface
```

Set your Tx queues to the maximum depth:

```
ethtool -G interface  tx depth
```
Troubleshoot the Elastic Network Adapter Windows driver

The Elastic Network Adapter (ENA) is designed to improve operating system health and to reduce unexpected hardware behavior or failures that can disrupt the operation of your Windows instance. The ENA architecture keeps device or driver failures as transparent to the operating system as possible.

Collect diagnostic information on the instance

The steps to open Windows operating system (OS) tools vary, depending on what version of the OS is installed on your instance. In the following sections, we use the Run dialog to open the tools, which works the same across all OS versions. However, you can access these tools using any method that you prefer.

Access the Run dialog

- Using the Windows logo key combination: Windows + R
- Using the search bar:
  - Enter run in the search bar.
  - Select the Run application from the search results.

Some steps require the context menu to access properties or context-sensitive actions. There are several ways to do this, depending on your OS version and hardware.

Access the context menu

- Using your mouse: right-click an item to bring up its context menu.
- Using your keyboard:
  - Depending on your OS version, use Shift + F10, or Ctrl + Shift + F10.
  - If you have the context key on your keyboard (three horizontal lines in a box), select the item you want and then press the context key.

If you can connect to your instance, use the following techniques to gather diagnostic information for troubleshooting.
Check ENA device status

To check the status of your ENA Windows driver using the Windows Device Manager, follow these steps:

1. Open the Run dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the Run box.
3. Choose OK. This opens the Device Manager window.
4. Select the arrow to the left of Network adapters to expand the list.
5. Choose the name, or open the context menu for the Amazon Elastic Network Adapter, and then choose Properties. This opens the Amazon Elastic Network Adapter Properties dialog.
6. Verify that the message in the General tab says "This device is working properly."

Investigate driver event messages

To review ENA Windows driver event logs using the Windows Event Viewer, follow these steps:

1. Open the Run dialog using one of the methods described in the preceding section.
2. To open the Windows Event Viewer, enter `eventvwr.msc` in the Run box.
3. Choose OK. This opens the Event Viewer window.
4. Expand the Windows Logs menu, and then choose System.
5. Under Actions, in the top-right panel, choose Filter Current Log. This displays the filtering dialog.
6. In the Event sources box, enter ena. This limits results to events that were generated by the ENA Windows driver.
7. Choose OK. This shows filtered event log results in the detail sections of the window.
8. To drill down into the details, select an event message from the list.

The following example shows an ENA driver event in the Windows Event Viewer system events list:
**Event message summary**

The following table shows event messages that the ENA Windows driver generates.

**Input**

<table>
<thead>
<tr>
<th>Event ID</th>
<th>ENA driver event description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>5001</td>
<td>Hardware is out of resources</td>
<td>Error</td>
</tr>
<tr>
<td>5002</td>
<td>Adapter has detected a hardware error</td>
<td>Error</td>
</tr>
<tr>
<td>5005</td>
<td>Adapter has timed out on NDIS operation that did not complete in a timely manner</td>
<td>Error</td>
</tr>
<tr>
<td>5032</td>
<td>Adapter has failed to reset the device</td>
<td>Error</td>
</tr>
<tr>
<td>5200</td>
<td>Adapter has been initialized</td>
<td>Informational</td>
</tr>
<tr>
<td>5201</td>
<td>Adapter has been halted</td>
<td>Informational</td>

<td>Adapter initialization routine has failed</td>
<td>Error</td>
</tr>
<tr>
<td>5210</td>
<td>Adapter has encountered and successfully recovered an internal issue</td>
<td>Error</td>
</tr>
</tbody>
</table>

### Review performance metrics

The ENA Windows driver publishes network performance metrics from the instances where metrics are enabled. You can view and enable metrics on the instance using the native Performance Monitor application. For more information about the metrics that the ENA Windows driver produces, see [Monitor network performance for ENA settings on your EC2 instance](#).

On instances where ENA metrics are enabled, and the Amazon CloudWatch agent is installed, CloudWatch collects the metrics that are associated with the counters in Windows Performance Monitor, as well as some advanced metrics for ENA. These metrics are collected in addition to the metrics enabled by default on EC2 instances. For more information about the metrics, see [Metrics collected by the CloudWatch agent](#) in the *Amazon CloudWatch User Guide*.

---

#### Note

Performance metrics are available for ENA driver versions 2.4.0 and later (also for version 2.2.3). ENA driver version 2.2.4 was rolled back due to potential performance degradation on the sixth generation EC2 instances. We recommend that you upgrade to the current version of the driver to ensure that you have the latest updates.
Some of the ways that you can use performance metrics include:

- Troubleshoot instance performance issues.
- Choose the right instance size for a workload.
- Proactively plan scaling activities.
- Benchmark applications to determine if they maximize the performance available on an instance.

**Refresh rate**

By default, the driver refreshes metrics using a 1-second interval. However, the application that retrieves the metrics might use a different interval for polling. You can change the refresh interval in Device Manager, using the advanced properties for the driver.

To change the metrics refresh interval for the ENA Windows driver, follow these steps:

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.
6. Open the **Advanced** tab in the pop-up window.
7. From the **Property** list, choose **Metrics Refresh Interval** to change the value.
8. When you are done, choose **OK**.

**Investigate sub-optimal configuration notifications**

The ENA device detects sub-optimal configuration settings in the driver that you can change. The device notifies the ENA driver and logs an event notification. To review sub-optimal events in the Windows Event Viewer

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Event Viewer, enter `eventvwr.msc` in the **Run** box.
3. Choose **OK**. This opens the Event Viewer window.
4. Expand the **Windows Logs** menu, and then choose **System**.
5. Under **Actions**, in the top-right panel, choose **Filter Current Log**. This displays the filtering dialog.

6. In the **Event sources** box, enter ena. This limits results to events that were generated by the ENA Windows driver.

7. Choose **OK**. This shows filtered event log results in the detail sections of the window.

Events with ID 59000 notify you of sub-optimal configuration findings. Right-click an event and choose **Event Properties** to open a detailed view, or select **Preview Pane** from the **View** menu to see the same detail.

![Event Properties - Event 59000, ena](image)

Open the **Details** tab to see the event code. In the **Binary Data: In words** section, the last word is the code.
The following list shows notification code details and recommended actions for sub-optimal configuration findings.

- **Code 1: ENA Express with wide LLQ configuration is not recommended**
ENA Express ENI is configured with wide LLQ. This configuration is sub-optimal and could impact performance for ENA Express. We recommend that you disable wide LLQ settings when you use ENA Express ENIs as follows.

1. To open the Windows Device Manager, enter `devmgmt.msc` in the Run box.
2. Choose OK. This opens the Device Manager window.
3. Select the arrow to the left of Network adapters to expand the list.
4. Open the device properties for the Amazon Elastic Network Adapter.
5. From there, open the Advanced tab to make your changes.
6. Select the LLQ Header Size Policy property, and set its value to Normal (128 Bytes).
7. Choose OK to save your changes.

**Code 2: ENA Express ENI with sub-optimal Tx queue depth is not recommended**

ENA Express ENI is configured with sub-optimal Tx queue depth. This configuration could impact performance for ENA Express. We recommend that you enlarge all Tx queues to the maximum value for the network interface when you use ENA Express ENIs as follows.

Follow these steps to enlarge the Tx queues to the maximum depth:

1. To open the Windows Device Manager, enter `devmgmt.msc` in the Run box.
2. Choose OK. This opens the Device Manager window.
3. Select the arrow to the left of Network adapters to expand the list.
4. Open the device properties for the Amazon Elastic Network Adapter.
5. From there, open the Advanced tab to make your changes.
6. Select the Transmit Buffers property, and set its value to the maximum supported.
7. Choose OK to save your changes.

**ENA adapter reset**

The reset process starts when the ENA Windows driver detects an error on an adapter, and marks the adapter as unhealthy. The driver cannot reset itself, so it depends on the operating system to check the adapter health status, and call the reset handle for the ENA Windows driver. The reset process might result in a brief period of time where traffic loss occurs. However, TCP connections should be able to recover.
The ENA adapter might also indirectly request a device reset procedure, by failing to send a keep-alive notification. For example, if the ENA adapter reaches an unknown state after loading an irrecoverable configuration, it might stop sending keep-alive notifications.

**Common causes for ENA adapter reset**

- **Keep-alive messages are missing**

  The ENA adapter posts keep-alive events at a fixed rate (usually once every second). The ENA Windows driver implements a watchdog mechanism, which periodically checks for the presence of these keep-alive messages. If it detects one or more new messages since the last time it checked, it records a successful outcome. Otherwise, the driver concludes that the device experienced a failure, and initiates a reset sequence.

- **Packets are stuck in transmit queues**

  The ENA adapter verifies that packets are flowing through the transmit queues as expected. The ENA Windows driver detects if packets are getting stuck, and initiates a reset sequence if they are.

- **Read timeout for Memory Mapped I/O (MMIO) registers**

  To limit memory mapped I/O (MMIO) read operations, the ENA Windows driver accesses MMIO registers only during initialization and reset processes. If the driver detects a timeout, it takes one of the following actions, depending on what process was running:

  - If a timeout is detected during initialization, it fails the flow, which results in the driver displaying a yellow exclamation mark by the ENA adapter in Windows Device Manager.
  
  - If a timeout is detected during reset, it fails the flow. The OS then initiates a surprise removal of the ENA adapter, and recovers it by stopping and starting the adapter that was removed. For more information about surprise removal of a network interface card (NIC), see [Handling the Surprise Removal of a NIC](#) in the *Microsoft Windows Hardware Developer* documentation.

**Troubleshooting scenarios**

The following scenarios can help you troubleshoot issues that you might experience with the ENA Windows driver. We recommend that you start with upgrading your ENA driver, if you don’t have the latest version. To find the latest driver for your Windows OS version, see [Track ENA Windows driver version releases](#).
Unexpected ENA driver version installed

Description

After you go through the steps to install a specific version of the ENA driver, the Windows Device Manager shows that Windows installed a different version of the ENA driver.

Cause

When you run the install for a driver package, Windows ranks all of the driver packages that are valid for the given device in the local Driver Store before it begins. Then it selects the package with the lowest rank value as the best match. This can be different from the package that you intended to install. For more information about the device driver package selection process, see How Windows selects a driver package for a device on the Microsoft documentation website.

Solution

To ensure that Windows installs your chosen driver package version, you can remove lower ranked driver packages from the Driver Store with the PnPUtil command line tool.

Follow these steps to update the ENA driver:

1. Connect to your instance and log in as the local administrator.
2. Open the Device Manager properties window, as described in the Check ENA device status section. This opens the General tab of the Amazon Elastic Network Adapter Properties window.
3. Open the Driver tab.
4. Choose Update Driver. This opens the Update Driver Software – Amazon Elastic Network Adapter dialog box.
   a. On the How do you want to search for driver software? page, choose Browse my computer for driver software.
   b. On the Browse for driver software on your computer page, choose Let me pick from a list of device drivers on my computer, located below the search bar.
   c. On the Select the device driver you want to install for this hardware page, choose Have Disk....
   d. In the Install from Disk window, choose Browse..., next to the file location from the dropdown list.
e. Navigate to the location where you downloaded the target ENA driver package. Select the file named ena.inf and choose Open.

f. To start the install, choose OK, and then choose Next.

5. If the installer doesn’t automatically reboot your instance, run the Restart-Computer PowerShell cmdlet.

```
PShell C:\> Restart-Computer
```

### Device warning for ENA driver

#### Description

The ENA adapter icon in the Device Manager **Network adapters** section displays a warning sign (a yellow triangle with an exclamation mark inside).

The following example shows an ENA adapter with the warning icon in Windows Device Manager:

```
+ Network adapters
  - Amazon Elastic Network Adapter
  - Amazon Elastic Network Adapter #2
```

#### Cause

This device warning is commonly caused by environment issues, which might require more research, and often require a process of elimination to determine the underlying cause. For a full list of device errors, see [Device Manager Error Messages](#) in the *Microsoft Windows Hardware Developer* documentation.

#### Solution

The solution for this device warning depends on the root cause. The process of elimination described here includes a few basic steps to help identify and resolve the most common issues that might have a simple solution. Additional root cause analysis is required when these steps do not resolve the issue.

Follow these steps to help identify and resolve common issues:
1. **Stop and start the device**

   Open the Device Manager properties window, as described in the [Check ENA device status](#) section. This opens the **General** tab of the **Amazon Elastic Network Adapter Properties** window, where the **Device status** displays the error code and a short message.

   a. Open the **Driver** tab.
   b. Choose **Disable Device**, and respond **Yes** to the warning message that displays.
   c. Choose **Enable Device**.

2. **Stop and start the EC2 instance**

   If the adapter still shows the warning icon in Device Manager, the next step is to stop and start the EC2 instance. This relaunches the instance on different hardware in most cases.

3. **Investigate possible instance resource issue**

   If you have stopped and started your EC2 instance, and the problem persists, this might indicate a resource issue on your instance, such as insufficient memory.

**Connection timeout with adapter reset (error codes 5007, 5205)**

**Description**

The Windows Event Viewer shows adapter timeout and reset events occurring in combination for ENA adapters. Messages resemble the following examples:

- **Event ID 5007**: Amazon Elastic Network Adapter : Timed out during an operation.
- **Event ID 5205**: Amazon Elastic Network Adapter : Adapter reset has been started.

Adapter resets cause minimal traffic disruption. Even when there are multiple resets, it would be unusual for them to cause any severe network disruption.

**Cause**

This sequence of events indicates that the ENA Windows driver initiated a reset for an ENA adapter that was unresponsive. However, the mechanism that the device driver uses to detect this issue is subject to false positives resulting from CPU 0 starvation.
Solution

If this combination of errors happens frequently, check your resource allocations to see where adjustments might be helpful.

1. Open the Run dialog using one of the methods described in the preceding section.
2. To open the Windows Resource Monitor, enter `resmon` in the Run box.
3. Choose OK. This opens the Resource Monitor window.
4. Open the CPU tab. Per-CPU usage graphs are shown along the right side of the Resource Monitor window.
5. Check the usage levels for CPU 0 to see if they are too high.

We recommend that you configure RSS to exclude CPU 0 for the ENA adapter on larger instance types (more than 16 vCPU). For smaller instance types, configuring RSS might improve the experience, but due to the lower number of available cores, testing is necessary to ensure that constraining CPU cores does not negatively impact performance.

Use the `Set-NetAdapterRss` command to configure RSS for your ENA adapter, as shown in the following example.

```powershell
Set-NetAdapterRss -name (Get-NetAdapter | Where-Object {$_.InterfaceDescription -like "*Elastic*"}).Name -BaseProcessorgroup 0 -BaseProcessorNumber 1
```

Migrating to a sixth generation instance infrastructure impacts performance or attachment

Description

If you migrate to a sixth generation EC2 instance, you might experience reduced performance or ENA attachment failures if you haven't updated your ENA Windows driver version.

Cause

The sixth generation EC2 instance types require the following minimum version of the ENA Windows driver, based on the instance operating system (OS).

Minimum version

<table>
<thead>
<tr>
<th>Windows Server version</th>
<th>ENA driver version</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Solution

Before you upgrade to a sixth generation EC2 instance, make sure that the AMI you launch from has compatible drivers based on the instance OS as shown in the previous table. For more information, see [What do I need to do before migrating my EC2 instance to a sixth generation instance to make sure that I get maximum network performance?](https://aws.amazon.com/repost/knowledge-center/) in the *AWS re:Post Knowledge Center*.

### Suboptimal performance for the elastic network interface

#### Description

The ENA interface is not performing as expected.

#### Cause

Root cause analysis for performance issues is a process of elimination. There are too many variables involved to name a common cause.

#### Solution

The first step in your root cause analysis is to review the diagnostic information for the instance that is not performing as expected, to determine if there are errors that might be causing the issue. For more information, see the [Collect diagnostic information on the instance](https://aws.amazon.com/repost/knowledge-center/) section.

You might need to modify the default operating system configuration to achieve maximum network performance on instances with enhanced networking. Some optimizations, such as turning on checksum offloading and enabling RSS, are configured by default in official Windows AMIs. For other optimizations that you can apply to the ENA adapter, see the performance adjustments shown in [ENA adapter performance adjustments](https://aws.amazon.com/repost/knowledge-center/).
We recommend that you proceed with caution, and limit device property adjustments to those that are listed in this section, or to specific changes that are recommended by the AWS support team.

To change ENA adapter properties, follow these steps:

1. Open the Run dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the Run box.
3. Choose OK. This opens the Device Manager window.
4. Select the arrow to the left of Network adapters to expand the list.
5. Choose the name, or open the context menu for the Amazon Elastic Network Adapter, and then choose Properties. This opens the Amazon Elastic Network Adapter Properties dialog.
6. To make your changes, open the Advanced tab.
7. When you're done, choose OK to save your changes.

The following example shows an ENA adapter property in the Windows Device Manager:
ENA adapter performance adjustments

The following table includes properties that can be adjusted to improve performance for the ENA interface.

Input

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Default value</th>
<th>Adjustment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receive Buffers</td>
<td>Controls the number of entries in the software receive queues.</td>
<td>1024</td>
<td>Can be increased up to a maximum of 8192.</td>
</tr>
<tr>
<td>Receive Side Scaling (RSS)</td>
<td>Enables the efficient distribution of network receive processing across multiple CPUs in multiprocessor systems.</td>
<td>Enabled</td>
<td>You can spread the load across multiple processors. To learn more, see <a href="#">Optimize network performance on EC2 Windows instances</a>.</td>
</tr>
</tbody>
</table>
| Maximum Number of RSS Queues   | Sets the maximum number of RSS queues allowed when RSS is enabled. | 32            | The number of RSS queues is determined during driver initialization, and includes the following limitations (among others):  
|                                 |                                                              |               | • RSS queue limit set by this property  
|                                 |                                                              |               | • Instance limits (vCPU count)  
|                                 |                                                              |               |
### Property | Description | Default Value | Adjustment
--- | --- | --- | ---
Hardware generation limits (up to 8 RSS queues in ENAv1, and up to 32 RSS queues in ENAv2)

You can set the value from 1-32, depending on your instance and hardware generation limits. To learn more, see [Optimize network performance on EC2 Windows instances](#).

| Jumbo packet | Enables the use of jumbo ethernet frames (more than 1500 bytes of payload). | Disabled (this limits payload to 1500 bytes or less) | Value can be set up to 9015, which translates to 9001 bytes of payload. This is the maximum payload for jumbo ethernet frames. See [Considerations for using jumbo ethernet frames](#). |

#### Considerations for using jumbo ethernet frames

Jumbo frames allow more than 1500 bytes of data by increasing the payload size per packet, which increases the percentage of the packet that is not packet overhead. Fewer packets are needed to...
send the same amount of usable data. However, traffic is limited to a maximum MTU of 1500 in the following cases:

- Traffic outside of a given AWS Region for EC2 Classic.
- Traffic outside of a single VPC.
- Traffic over an inter-Region VPC peering connection.
- Traffic over VPN connections.
- Traffic over an internet gateway.

**Note**

Packets over 1500 bytes are fragmented. If you have the Don't Fragment flag set in the IP header, these packets are dropped.

Jumbo frames should be used with caution for internet-bound traffic, or any traffic that leaves a VPC. Packets are fragmented by intermediate systems, which slows down this traffic. To use jumbo frames inside of a VPC without impacting outbound traffic that's leaving the VPC, try one of the following options:

- Configure the MTU size by route.
- Use multiple network interfaces with different MTU sizes and different routes.

**Recommended use cases for jumbo frames**

Jumbo frames can be useful for traffic inside of and between VPCs. We recommend using jumbo frames for the following use cases:

- For instances that are collocated inside of a cluster placement group, jumbo frames help to achieve the maximum network throughput possible. For more information, see [Placement groups](#).
- You can use jumbo frames for traffic between your VPCs and your on-premises networks over AWS Direct Connect. For more information about using AWS Direct Connect, and verifying jumbo frame capability, see [Set network MTU for private virtual interfaces or transit virtual interfaces](#) in the [AWS Direct Connect User Guide](#).
- For more information about supported MTU sizes for transit gateways, see [Quotas for your transit gateways](#) in the [Amazon VPC Transit Gateways](#).
Improve network latency for Linux based EC2 instances

Network latency is the amount of time it takes for a packet of data to travel from its source to its destination. Applications that send data across the network depend on timely responses to provide a positive user experience. High network latency can lead to various issues, such as the following:

- Slow load times for web pages
- Video stream lag
- Difficulty accessing online resources

This section outlines steps that you can take to improve the network latency on Amazon EC2 instances that run on Linux. To achieve optimal latency, follow these steps to configure your instance, kernel, and ENA driver settings. For additional configuration guidance, see the ENA Linux Driver Best Practices and Performance Optimization Guide on GitHub.

⚠️ Note

Steps and settings may vary slightly, depending on your specific network hardware, the AMI that you launched your instance from, and your application use case. Before you make any changes, thoroughly test and monitor your network performance to ensure that you're getting the desired results.

Reduce the number of network hops for data packets

Each hop that a data packet takes as it moves from router to router increases network latency. Typically, traffic must take multiple hops to reach your destination. There are two ways to reduce network hops for your Amazon EC2 instances, as follows:

- **Cluster placement group** – When you specify a cluster placement group, Amazon EC2 launches instances that are in close proximity to each other, physically within the same Availability Zone (AZ) with tighter packing. The physical proximity of the instances in the group allows them to take advantage of high-speed connectivity, resulting in low latency and high single flow throughput.

- **Dedicated Host** – A Dedicated Host is a physical server that's dedicated for your use. With a Dedicated Host, you can launch your instances to run on the same physical server.
Communication between instances that run on the same Dedicated Host can happen without extra network hops.

**How Linux kernel configuration affects latency**

Linux kernel configuration can increase or decrease network latency. To achieve your latency optimization goals, it's important to fine-tune the Linux kernel configuration according to the specific requirements of your workload.

There are many configuration options for the Linux kernel that might help decrease network latency. The most impactful options are as follows.

- **Enable busy poll mode** – Busy poll mode reduces latency on the network receive path. When you enable busy poll mode, the socket layer code can directly poll the receive queue of a network device. The downside of busy polling is higher CPU usage in the host that comes from polling for new data in a tight loop. There are two global settings that control the number of microseconds to wait for packets for all interfaces.

  **busy_read**

  A low latency busy poll timeout for socket reads. This controls the number of microseconds to wait for the socket layer to read packets on the device queue. To enable the feature globally with the *sysctl* command, the Linux Kernel organization recommends a value of 50 microseconds. For more information, see *busy_read* in the *Linux kernel user's and administrator's guide*.

  ```
  $ C:\> sudo sysctl -w net.core.busy_read=50
  ```

  **busy_poll**

  A low latency busy poll timeout for poll and select. This controls the number of microseconds to wait for events. The recommended value is between 50-100 microseconds, depending on the number of sockets you're polling. The more sockets you add, the higher the number should be.

  ```
  $ C:\> sudo sysctl -w net.core.busy_poll=50
  ```
• **Configure CPU power states (C-states)** – C-states control the sleep levels that a core may enter when it's inactive. You might want to control C-states to tune your system for latency versus performance. In deeper C-states, the CPU is essentially "asleep" and can't respond to requests until it wakes up and transitions back to an active state. Putting cores to sleep takes time, and although a sleeping core allows more headroom for another core to boost to a higher frequency, it takes time for that sleeping core to wake back up and perform work.

For example, if a core that's assigned to handle network packet interrupts is asleep, there might be a delay in servicing that interrupt. You can configure the system so that it doesn't use deeper C-states. However, while this configuration reduces the processor reaction latency, it also reduces the headroom available to other cores for Turbo Boost.

To reduce the processor reaction latency, you can limit deeper C-states. For more information, see [High performance and low latency by limiting deeper C-states](#) in the *Amazon Linux 2 User Guide*.

**ENA network driver configuration**

The ENA network driver enables communication between an instance and a network. The driver processes network packets and passes them on to the network stack or to the Nitro card. When a network packet comes in, the Nitro card generates an interrupt for the CPU to notify the software of an event.

**Interrupt**

An interrupt is a signal that a device or application sends to the processor. The interrupt tells the processor that an event has occurred or a condition has been met that requires immediate attention. Interrupts can handle time-sensitive tasks such as receiving data from a network interface, handling hardware events, or servicing requests from other devices.

**Interrupt moderation**

Interrupt moderation is a technique that reduces the number of interrupts a device generates by aggregating or delaying them. The purpose of interrupt moderation is to improve system performance by reducing the overhead associated with handling a large number of interrupts. Too many interrupts increase CPU usage, impacting the throughput adversely, while too few interrupts increase the latency.
Dynamic interrupt moderation

Dynamic interrupt moderation is an enhanced form of interrupt moderation that dynamically adjusts the interrupt rate based on the current system load and traffic patterns. It aims to strike a balance between reducing interrupt overhead and packets per second, or bandwidth.

Note

Dynamic interrupt moderation is enabled by default in some AMIs (but can be enabled or disabled in all AMIs).

To minimize network latency, it might be necessary to disable interrupt moderation. However, this can also increase the overhead of interrupt processing. It's important to find the right balance between reducing latency and minimizing overhead. ethtool commands can help you configure interrupt moderation. By default, $rx$-usecs is set to 20, and $tx$-usecs is set to 64.

To get the current interrupt modification configuration, use the following command.

```
$ C:\> ethtool -c interface | grep "rx-usecs:|tx-usecs:|Adaptive RX"
Adaptive RX: on  TX: off
rx-usecs: 20
tx-usecs: 64
```

To disable interrupt modification and dynamic interrupt moderation, use the following command.

```
$ C:\> sudo ethtool -C interface adaptive-rx off rx-usecs 0 tx-usecs 0
```

Nitro system considerations for performance tuning

The Nitro System is a collection of hardware and software components built by AWS that enable high performance, high availability, and high security. The Nitro System provides bare metal-like capabilities that eliminate virtualization overhead and support workloads that require full access to host hardware. For more detailed information, see AWS Nitro System.

All current generation EC2 instance types perform network packet processing on EC2 Nitro Cards. This topic covers high level packet handling on the Nitro card, common aspects of network architecture and configuration that impact packet handling performance, and what actions you can take to achieve peak performance for your Nitro based instances.
Nitro Cards handle all input and output (I/O) interfaces, such as those needed for Virtual Private Clouds (VPCs). For all of the components that send or receive information over the network, the Nitro cards act as a self-contained computing device for I/O traffic that's physically separate from the system main board on which customer workloads run.

**Network packet flow on Nitro cards**

EC2 instances built on the Nitro system have hardware acceleration capabilities that enable faster packet processing, as measured by packets per second (PPS) throughput rates. When a Nitro card performs the initial evaluation for a new flow, it saves information that's the same for all packets in the flow, such as security groups, access control lists, and route table entries. When it processes additional packets for the same flow, it can use the saved information to reduce overhead for those packets.

Your connection rate is measured by the connections per second (CPS) metric. Each new connection requires additional processing overhead that must be factored into workload capability estimates. It's important to consider both the CPS and PPS metrics when you design your workloads.

**How a connection is established**

When a connection is established between a Nitro based instance and another endpoint, the Nitro card evaluates the full flow for the first packet that's sent or received between the two endpoints. For subsequent packets of the same flow, full reevaluation is usually not necessary. However, there are exceptions. For more information about the exceptions, see [Packets that don't use hardware acceleration](#).

The following properties define the two endpoints and the packet flow between them. These five properties together are known as a 5-tuple flow.

- Source IP
- Source port
- Destination IP
- Destination port
- Communication protocol

The direction of the packet flow is known as *ingress* (inbound) and *egress* (outbound). The following high level descriptions summarize end to end network packet flow.
• **Ingress** – When a Nitro card handles an inbound network packet, it evaluates the packet against stateful firewall rules and access control lists. It tracks the connection, meters it, and performs other actions as applicable. Then it forwards the packet to its destination on the host CPU.

• **Egress** – When a Nitro card handles an outbound network packet, it looks up the remote interface destination, evaluates various VPC functions, applies rate limits, and performs other actions that apply. Then it forwards the packet to its next hop destination on the network.

**Design your network for optimal performance**

To take advantage of your Nitro system's performance capabilities, you must understand what your network processing needs are and how those needs affect the workload for your Nitro resources. Then you can design for optimal performance for your network landscape. Your infrastructure settings and application workload design and configuration can impact both the packet processing and connection rates. For example, if your application has a high rate of connection establishment, such as a DNS service, firewall, or virtual router, it will have less opportunity to take advantage of the hardware acceleration that only occurs after the connection is established.

You can configure application and infrastructure settings to streamline workloads and improve network performance. However, not all packets are eligible for acceleration. The Nitro system uses the full network flow for new connections and for packets that aren't eligible for acceleration.

The remainder of this section will focus on application and infrastructure design considerations to help ensure that packets flow within the accelerated path as much as possible.

**Network design considerations for the Nitro system**

When you configure network traffic for your instance, there are many aspects to consider that can affect PPS performance. After a flow is established, the majority of packets that regularly come in or go out are eligible for acceleration. However, exceptions exist to ensure that infrastructure designs and packet flows continue to meet protocol standards.

To get the best performance from your Nitro card, you should carefully consider the pros and cons of the following configuration details for your infrastructure and applications.

**Infrastructure considerations**

Your infrastructure configuration can affect your packet flow and processing efficiency. The following list includes some important considerations.
Network interface configuration with asymmetry

Security groups use connection tracking to track information about traffic that flows to and from the instance. Asymmetric routing, where traffic comes into an instance through one network interface and leaves through a different network interface, can reduce the peak performance that an instance can achieve if flows are tracked. For more information about security group connection tracking, untracked connections, and automatically tracked connections, see Security group connection tracking.

Network drivers

Network drivers are updated and released on a regular basis. If your drivers are out of date, that can significantly impair performance. Keep your drivers up to date to ensure that you have the latest patches and can take advantage of performance improvements, such as the accelerated path feature that's only available for the latest generation of drivers. Earlier drivers don't support the accelerated path feature.

To take advantage of the accelerated path feature, we recommend that you install the latest ENA driver on your instances.

Linux instances – ENA Linux driver 2.2.9 or later. To install or update the ENA Linux driver from the Amazon Drivers GitHub repository, see the Driver compilation section of the readme file.

Windows instances – ENA Windows driver 2.0.0 or later. To install or update the ENA Windows driver, see Install the ENA driver on EC2 Windows instances.

Distance between endpoints

A connection between two instances in the same Availability Zone can process more packets per second than a connection across Regions as a result of TCP windowing at the application layer, which determines how much data can be in flight at any given time. Long distances between instances increase latency and decrease the number of packets that the endpoints can process.

Application design considerations

There are aspects of application design and configuration that can affect your processing efficiency. The following list includes some important considerations.
Packet size

Larger packet sizes can increase throughput for the data that an instance can send and receive on the network. Smaller packet sizes can increase the packet process rate, but this can reduce the maximum achieved bandwidth when the number of packets exceed PPS allowances.

If the size of a packet exceeds the Maximum Transmission Unit (MTU) of a network hop, a router along the path might fragment it. The resulting packet fragments are considered exceptions, and are processed at the standard rate (not accelerated). This can cause variations in your performance. Amazon EC2 supports jumbo frames of 9001 bytes, however not all services support it. We recommended that you evaluate your topology when you configure MTU.

Protocol trade-offs

Reliable protocols like TCP have more overhead than unreliable protocols like UDP. The lower overhead and simplified network processing for the UDP transport protocol can result in a higher PPS rate, but at the expense of reliable packet delivery. If reliable packet delivery isn’t critical for your application, UDP might be a good option.

Micro-bursting

Micro-bursting occurs when traffic exceeds allowances during brief periods of time rather than being evenly distributed. This typically happens on a microsecond scale.

For example, say that you have an instance that can send up to 10 Gbps, and your application sends the full 10 Gb in half a second. This micro-burst exceeds the allowance during the first half second and leaves nothing for the remainder of the second. Even though you sent 10Gb in the 1 second timeframe, allowances in the first half second can result in packets being queued or dropped.

You can use a network scheduler such as Linux Traffic Control to help pace your throughput and avoid causing queued or dropped packets as a result of micro-bursting.

Number of flows

A single flow is limited to 5 Gbps unless it's inside of a cluster placement group that supports up to 10 Gbps, or if it uses ENA Express, which supports up to 25 Gbps.

Similarly, a Nitro card can process more packets across multiple flows as opposed to using a single flow. To achieve the peak packet processing rate per instance, we recommend at least 100 flows on instances with 100 Gbps or higher aggregate bandwidth. As aggregate bandwidth capabilities increase, the number of flows needed to achieve peak processing rates
also increases. Benchmarking will help you determine what configuration you need to achieve peak rates on your network.

**Number of Elastic Network Adapter (ENA) queues**

By default, the maximum number of ENA queues are allocated to a network interface based on your instance size and type. Reducing the queue count can reduce the maximum PPS rate achievable. We recommend using the default queue allocation for best performance.

For Linux, a network interface is configured with the maximum by default. For applications based on the Data Plane Development Kit (DPDK), we recommend that you configure the maximum number of queues available.

**Feature process overhead**

Features like Traffic Mirroring and ENA Express can add more processing overhead, which can reduce absolute packet processing performance. You can limit feature use or disable features to increase packet processing rates.

**Connection tracking to maintain state**

Your security groups use connection tracking to store information about traffic to and from the instance. Connection tracking applies rules against each individual flow of network traffic to determine if the traffic is allowed or denied. The Nitro card uses flow tracking to maintain state for the flow. As more security group rules are applied, more work is required to evaluate the flow.

---

**Note**

Not all network traffic flows are tracked. If a security group rule is configured with Untracked connections, no additional work is required except for connections that are automatically tracked to ensure symmetric routing when there are multiple valid reply paths.

---

**Packets that don't use hardware acceleration**

Not all packets can take advantage of hardware acceleration. Handling these exceptions involves some processing overhead which is necessary to ensure the health of your network flows. Network flows must reliably meet protocol standards, conform to changes in the VPC design, and route packets only to allowed destinations. However, the overhead reduces your performance.
Packet fragments

As mentioned under Application considerations, packet fragments that result from packets that exceed network MTU are handled as exceptions, and can't take advantage of hardware acceleration.

Idle connections

When a connection has no activity for a while, even if the connection hasn't reached its timeout limit, the system can de-prioritize it. Then, if data comes in after the connection is de-prioritized, the system needs to handle it as an exception in order to reconnect.

To manage your connections, you can use connection tracking timeouts to close idle connections. You can also use TCP keepalives to keep idle connections open. For more information, see Idle connection tracking timeout.

VPC mutation

Updates to security groups, route tables, and access control lists all need to be reevaluated in the processing path to ensure that route entries and security group rules still apply as expected.

ICMP flows

Internet Control Message Protocol (ICMP) is a network layer protocol that network devices use to diagnose network communication issues. These packets always use the full flow.

Maximize network performance on your Nitro system

Before you make any design decisions or adjust any network settings on your instance, we recommend that you take the following steps to help ensure that you have the best outcome:

1. Understand the pros and cons of the actions that you can take to improve performance by reviewing Network design considerations for the Nitro system.

For more considerations and best practices for your instance configuration, see:

- Windows instances – Best practices for configuring network interfaces.

2. Benchmark your workloads with peak active flow count to determine a baseline for your application performance. With a performance baseline, you can test variations in your settings
or application design to understand which considerations will have the most impact, especially if you plan to scale up or scale out.

The following list contains actions that you can take to tune your PPS performance, depending on your system needs.

- Reduce the physical distance between two instances. When sending and receiving instances are located in same Availability Zone or use cluster placement groups, you can reduce the number of hops a packet needs to take to travel from one endpoint to another.

- Use Untracked connections.

- Use the UDP protocol for network traffic.

- For EC2 instances with aggregate bandwidth of 100 Gbps or more, distribute the workload over 100 or more individual flows to spread the work evenly across the Nitro card.

Monitor performance on Linux instances

You can use Ethtool metrics on Linux instances to monitor instance networking performance indicators such as bandwidth, packet rate, and connection tracking. For more information, see Monitor network performance for ENA settings on your EC2 instance.

Optimize network performance on EC2 Windows instances

To achieve the maximum network performance on your Windows instances with enhanced networking, you might need to modify the default operating system configuration. We recommend the following configuration changes for applications that require high network performance. Other optimizations (such as turning on checksum offloading and enabling RSS, for example) are already configured on official Windows AMIs.

Note

TCP chimney offloading should be disabled in most use cases, and has been deprecated as of Windows Server 2016.

In addition to these operating system optimizations, you should also consider the maximum transmission unit (MTU) of your network traffic, and adjust according to your workload and
network architecture. For more information, see [Network maximum transmission unit (MTU) for your EC2 instance](#).

AWS regularly measures average round trip latencies between instances launched in a cluster placement group of 50μs and tail latencies of 200μs at the 99.9 percentile. If your applications require consistently low latencies, we recommend using the latest version of the ENA drivers on fixed performance instances built on the Nitro System.

**Configure Receive side scaling CPU affinity**

Receive side scaling (RSS) is used to distribute network traffic CPU load across multiple processors. By default, the official Amazon Windows AMIs are configured with RSS enabled. ENA elastic network interfaces provide up to eight RSS queues. By defining CPU affinity for RSS queues, as well as for other system processes, it is possible to spread the CPU load out over multi-core systems, enabling more network traffic to be processed. On instance types with more than 16 vCPUs, we recommend that you use the `Set-NetAdapterRSS` PowerShell cmdlet, which manually excludes the boot processor (logical processor 0 and 1 when hyper-threading is enabled) from the RSS configuration for all elastic network interfaces, in order to prevent contention with various system components.

Windows is hyper-thread aware and ensures that the RSS queues of a single network interface card (NIC) are always placed on different physical cores. Therefore, unless hyper-threading is disabled, in order to completely prevent contention with other NICs, spread the RSS configuration of each NIC among a range of 16 logical processors. The `Set-NetAdapterRss` cmdlet allows you to define the per-NIC range of valid logical processors by defining the values of `BaseProcessorGroup`, `BaseProcessorNumber`, `MaxProcessingGroup`, `MaxProcessorNumber`, and `NumaNode` (optional). If there are not enough physical cores to completely eliminate inter-NIC contention, minimize the overlapping ranges or reduce the number of logical processors in the elastic network interface ranges depending on the expected workload of the interface (in other words, a low volume administrative network interface may not need as many RSS queues assigned). Also, as previously noted, various components must run on CPU 0, and therefore we recommend excluding it from all RSS configurations when sufficient vCPUs are available.

For example, when there are three elastic network interfaces on a 72 vCPU instance with 2 NUMA nodes with hyper-threading enabled, the following commands spread the network load between the two CPUs without overlap and prevent the use of core 0 completely.

```bash
Set-NetAdapterRSS -Name NIC1 -BaseProcessorGroup 0 -BaseProcessorNumber 2 -MaxProcessorNumber 16
```
| Set-NetAdapterRss -Name NIC2 -BaseProcessorGroup 1 -BaseProcessorNumber 0 -MaxProcessorNumber 14  
| Set-NetAdapterRss -Name NIC3 -BaseProcessorGroup 1 -BaseProcessorNumber 16 -MaxProcessorNumber 30 |

Note that these settings are persistent for each network adapter. If an instance is resized to one with a different number of vCPUs, you should reevaluate the RSS configuration for each enabled elastic network interface. The complete Microsoft documentation for the Set-NetAdapterRss cmdlet can be found here: [https://docs.microsoft.com/en-us/powershell/module/netadapter/set-netadapterrss](https://docs.microsoft.com/en-us/powershell/module/netadapter/set-netadapterrss).

Special note for SQL workloads: We also recommend that you review your I/O thread affinity settings along with your elastic network interface RSS configuration to minimize I/O and network contention for the same CPUs. See [affinity mask Server Configuration Option](https://docs.microsoft.com/en-us/powershell/module/netadapter/set-netadapterrss).

Elastic Fabric Adapter

An Elastic Fabric Adapter (EFA) is a network device that you can attach to your Amazon EC2 instance to accelerate High Performance Computing (HPC) and machine learning applications. EFA enables you to achieve the application performance of an on-premises HPC cluster, with the scalability, flexibility, and elasticity provided by the AWS Cloud.

EFAs provide lower and more consistent latency and higher throughput than the TCP transport traditionally used in cloud-based HPC systems. It enhances the performance of inter-instance communication that is critical for scaling HPC and machine learning applications. It is optimized to work on the existing AWS network infrastructure and it can scale depending on application requirements.

EFAs integrate with Libfabric 1.7.0 and later and it supports Open MPI 5 and later and Intel MPI 2019 Update 5 and later for HPC applications, and Nvidia Collective Communications Library (NCCL) for machine learning applications.

**Note**

The OS-bypass capabilities of EFAs are not supported on Windows instances. If you attach an EFA to a Windows instance, the instance functions as an Elastic Network Adapter, without the added EFA capabilities.
EFA basics

An EFA is an Elastic Network Adapter (ENA) with added capabilities. It provides all of the functionality of an ENA, with an additional OS-bypass functionality. OS-bypass is an access model that allows HPC and machine learning applications to communicate directly with the network interface hardware to provide low-latency, reliable transport functionality.
Traditionally, HPC applications use the Message Passing Interface (MPI) to interface with the system's network transport. In the AWS Cloud, this has meant that applications interface with MPI, which then uses the operating system's TCP/IP stack and the ENA device driver to enable network communication between instances.

With an EFA, HPC applications use MPI or NCCL to interface with the *Libfabric* API. The Libfabric API bypasses the operating system kernel and communicates directly with the EFA device to put packets on the network. This reduces overhead and enables the HPC application to run more efficiently.

**Note**

Libfabric is a core component of the OpenFabrics Interfaces (OFI) framework, which defines and exports the user-space API of OFI. For more information, see the [Libfabric OpenFabrics](#) website.

**Differences between EFAs and ENAs**

Elastic Network Adapters (ENAs) provide traditional IP networking features that are required to support VPC networking. EFAs provide all of the same traditional IP networking features as ENAs, and they also support OS-bypass capabilities. OS-bypass enables HPC and machine learning applications to bypass the operating system kernel and to communicate directly with the EFA device.

**Supported interfaces and libraries**

EFAs support the following interfaces and libraries:

- Open MPI 5 and later
- Open MPI 4.0 or newer is preferred for Graviton
- Intel MPI 2019 Update 5 and later
- NVIDIA Collective Communications Library (NCCL) 2.4.2 and later

**Supported instance types**

The following instance types support EFAs:
• General purpose: m5dn.24xlarge | m5dn.metal | m5n.24xlarge | m5n.metal | m5zn.12xlarge | m5zn.metal | m6a.48xlarge | m6a.metal | m6i.32xlarge | m6i.metal | m6id.32xlarge | m6id.metal | m6i.n.32xlarge | m6in.metal | m7a.48xlarge | m7a.metal-48xlarge | m7g.16xlarge | m7g.metal | m7gd.16xlarge | m7gd.metal | m7i.48xlarge | m7i.metal-48xlarge
• Compute optimized: c5n.9xlarge | c5n.18xlarge | c5n.metal | c6a.48xlarge | c6n.32xlarge | c6n.metal | c6i.32xlarge | c6i.metal | c6id.32xlarge | c6id.metal | c6in.32xlarge | c6in.metal | c7a.48xlarge | c7a.metal-48xlarge | c7g.16xlarge | c7g.metal | c7gd.16xlarge | c7gd.metal | c7i.48xlarge | c7i.metal-48xlarge
• Memory optimized: r5dn.24xlarge | r5dn.metal | r5n.24xlarge | r5n.metal | r6a.48xlarge | r6a.metal | r6i.32xlarge | r6i.metal | r6id.32xlarge | r6id.metal | r7a.48xlarge | r7a.metal-48xlarge | r7g.16xlarge | r7g.metal | r7gd.16xlarge | r7gd.metal | r7i.48xlarge | r7i.metal-48xlarge | r7iz.32xlarge | r7iz.metal-32xlarge | u7i-12tb.224xlarge | u7i-16tb.224xlarge | u7in-24tb.224xlarge | u7in-32tb.224xlarge | x2idn.32xlarge | x2idn.metal | x2iedn.32xlarge | x2iedn.metal
• Storage optimized: i3en.12xlarge | i3en.24xlarge | i3en.metal | i4g.16xlarge | i4i.32xlarge | i4i.metal | im4gn.16xlarge
• Accelerated computing: dl1.24xlarge | dl2q.24xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge | g5.48xlarge | g6.8xlarge | g6.12xlarge | g6.16xlarge | g6.24xlarge | g6.48xlarge | gr6.8xlarge | inf1.24xlarge | p3dn.24xlarge | p4d.24xlarge | p4de.24xlarge | p5.48xlarge | trn1.32xlarge | trn1n.32xlarge | vt1.24xlarge
• High-performance computing: hpc6a.48xlarge | hpc6id.32xlarge | hpc7a.12xlarge | hpc7a.24xlarge | hpc7a.48xlarge | hpc7a.96xlarge | hpc7g.4xlarge | hpc7g.8xlarge | hpc7g.16xlarge

To see the available instance types that support EFAs in a specific Region

The available instance types vary by Region. To see the available instance types that support EFAs in a Region, use the describe-instance-types command with the --region parameter. Include
the `--filters` parameter to scope the results to the instance types that support EFA and the `--query` parameter to scope the output to the value of `InstanceType`.

```
aws ec2 describe-instance-types --region us-east-1 --filters Name=network-info.efa-supported,Values=true --query "InstanceTypes[*].[InstanceType]" --output text | sort
```

## Supported operating systems

Operating system support differs depending on the processor type. The following table shows the supported operating systems.

<table>
<thead>
<tr>
<th>Operating system</th>
<th>Intel/AMD (x86_64) instance types</th>
<th>AWS Graviton (arm64) instance types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon Linux 2023</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Amazon Linux 2</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>CentOS 7</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>RHEL 7, 8, and 9</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Debian 10 and 11</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>Rocky Linux 8 and 9</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Ubuntu 20.04, 22.04, and 24.04</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>SUSE Linux Enterprise 15 SP2 and later</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>OpenSUSE Leap 15.5 and later</td>
<td>✓</td>
<td></td>
</tr>
</tbody>
</table>
Note
Ubuntu 20.04 supports peer direct support when used with dl1.24xlarge instances.

EFA limitations

EFAs have the following limitations:

- All P4d and P5 instance types support NVIDIA GPUDirect Remote Direct Memory Access (RDMA).
- EFA traffic between P4d/P4de/DL1 instances and other instance types is currently not supported.
- [Instance types that support multiple network cards](https://aws.amazon.com/ec2/instance-types/) can be configured with one EFA per network card. All other supported instance types support only one EFA per instance.
- For c7g.16xlarge, m7g.16xlarge and r7g.16xlarge Dedicated Instances and Dedicated Hosts are not supported when an EFA is attached.
- EFA OS-bypass traffic can't cross Availability Zones, VPCs, or AWS accounts. In other words, EFA OS-bypass traffic can't flow from one Availability Zone, VPC (with or without a VPC peering connection), or AWS account to another. This does not apply to normal IP traffic from the EFA.
- EFA OS-bypass traffic can't be sent across subnets in a Local Zone.
- EFA OS-bypass traffic is not routable. Normal IP traffic from the EFA remains routable.
- The EFA must be a member of a security group that allows all inbound and outbound traffic to and from the security group itself.
- EFA is not supported on Windows instances.
- EFA is not supported on AWS [Outposts](https://aws.amazon.com/outposts/).

EFA pricing

EFA is available as an optional Amazon EC2 networking feature that you can enable on any supported instance at no additional cost.

Get started with P5 instances and EFA

P5 instances deliver 3200 Gbps of networking bandwidth by using multiple EFA interfaces. P5 instances support 32 network cards. For more information about getting started with P5 instances, see [Get started with P5 instances for Linux](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EFAWindows.html).
We recommend that you define a single EFA network interface per network card. To configure these interfaces at launch we recommend the following settings:

- For network interface 0, specify device index 0
- For network interfaces 1 through 31, specify device index 1

If you are using the Amazon EC2 console, in the Launch Instance Wizard, choose Edit in the Network settings section. Expand Advanced network configuration and choose Add network interface to add the required number of network interfaces. For each network interface, for EFA, select Enable. For all network interfaces, except the primary network interface, for Device index, specify 1. Configure the remaining settings as needed.

If you are using the AWS CLI, use the run-instances command, for --network-interfaces, specify the required number of network interfaces. For each network interface, for InterfaceType, specify efa. For the primary network interface, for NetworkCardIndex and DeviceIndex specify 0. For the remaining network interfaces, for NetworkCardIndex specify a unique value from 1 to 31, and for DeviceIndex specify 1.

The following example command snippet shows a request with 32 EFA network interfaces.

```
$ aws --region $REGION ec2 run-instances \
   --instance-type p5.48xlarge \
   --count 1 \
   --key-name key_pair_name \
   --image-id ami_id \
   --network-interfaces "NetworkCardIndex=0,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa" \
\n   "NetworkCardIndex=1,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa" \
\n   "NetworkCardIndex=2,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa" \
\n   "NetworkCardIndex=3,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa" \
\n   "NetworkCardIndex=4,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa"
```
"NetworkCardIndex=5,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=6,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=7,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=8,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=9,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=10,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=11,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=12,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=13,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=14,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=15,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=16,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=17,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa, \
"NetworkCardIndex=18,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa,
"NetworkCardIndex=19,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=20,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=21,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=22,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=23,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=24,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=25,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=26,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=27,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=28,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=29,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=30,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\
"NetworkCardIndex=31,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
\n...

If you are using a launch template, specify the required number of network interfaces in the launch template. For each network interface, for InterfaceType, specify efa. For the primary network interface, for NetworkCardIndex and DeviceIndex specify 0. For the remaining network
interfaces, for NetworkCardIndex specify a unique value from 1 to 31, and for DeviceIndex specify 1. The following snippet shows an example with 3 network interfaces out of the possible 32 network interfaces.

```json
"NetworkInterfaces": [
    {
        "NetworkCardIndex": 0,
        "DeviceIndex": 0,
        "InterfaceType": "efa",
        "AssociatePublicIpAddress": false,
        "Groups": ["security_group_id"],
        "DeleteOnTermination": true
    },
    {
        "NetworkCardIndex": 1,
        "DeviceIndex": 1,
        "InterfaceType": "efa",
        "AssociatePublicIpAddress": false,
        "Groups": ["security_group_id"],
        "DeleteOnTermination": true
    },
    {
        "NetworkCardIndex": 2,
        "DeviceIndex": 1,
        "InterfaceType": "efa",
        "AssociatePublicIpAddress": false,
        "Groups": ["security_group_id"],
        "DeleteOnTermination": true
    }
    ...
]
```

When launching a P5 instance with more than one network interface, you cannot auto-assign public IP addresses. However, you can attach an Elastic IP address to the primary network interface (NetworkCardIndex=0, DeviceIndex=0) after launch for internet connectivity. Both Ubuntu 20.04 and later and Amazon Linux 2 and later are configured to use the primary network interface for internet traffic when the instance is launched as recommended above.
Get started with EFA and MPI

This tutorial helps you to launch an EFA and MPI-enabled instance cluster for HPC workloads. In this tutorial, you will perform the following steps:

Contents

- Step 1: Prepare an EFA-enabled security group
- Step 2: Launch a temporary instance
- Step 3: Install the EFA software
- Step 4: (Optional) Enable Open MPI 5
- Step 5: (Optional) Install Intel MPI
- Step 6: Disable ptrace protection
- Step 7: Confirm installation
- Step 8: Install your HPC application
- Step 9: Create an EFA-enabled AMI
- Step 10: Launch EFA-enabled instances into a cluster placement group
- Step 11: Terminate the temporary instance
- Step 12: Enable passwordless SSH

Step 1: Prepare an EFA-enabled security group

An EFA requires a security group that allows all inbound and outbound traffic to and from the security group itself. The following procedure creates a security group that allows all inbound and outbound traffic to and from itself, and that allows inbound SSH traffic from any IPv4 address for SSH connectivity.

⚠️ Important

This security group is intended for testing purposes only. For your production environments, we recommend that you create an inbound SSH rule that allows traffic only from the IP address from which you are connecting, such as the IP address of your computer, or a range of IP addresses in your local network.

For other scenarios, see Security group rules for different use cases.
To create an EFA-enabled security group

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Security Groups and then choose Create security group.
3. In the Create security group window, do the following:
   a. For Security group name, enter a descriptive name for the security group, such as EFA-enabled security group.
   b. (Optional) For Description, enter a brief description of the security group.
   c. For VPC, select the VPC into which you intend to launch your EFA-enabled instances.
   d. Choose Create security group.
4. Select the security group that you created, and on the Details tab, copy the Security group ID.
5. With the security group still selected, choose Actions, Edit inbound rules, and then do the following:
   a. Choose Add rule.
   b. For Type, choose All traffic.
   c. For Source type, choose Custom and paste the security group ID that you copied into the field.
   d. Choose Add rule.
   e. For Type, choose SSH.
   f. For Source type, choose Anywhere-IPv4.
   g. Choose Save rules.
6. With the security group still selected, choose Actions, Edit outbound rules, and then do the following:
   a. Choose Add rule.
   b. For Type, choose All traffic.
   c. For Destination type, choose Custom and paste the security group ID that you copied into the field.
   d. Choose Save rules.
Step 2: Launch a temporary instance

Launch a temporary instance that you can use to install and configure the EFA software components. You use this instance to create an EFA-enabled AMI from which you can launch your EFA-enabled instances.

To launch a temporary instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances, and then choose Launch Instances to open the new launch instance wizard.
3. (Optional) In the Name and tags section, provide a name for the instance, such as EFA-instance. The name is assigned to the instance as a resource tag (Name=EFA-instance).
4. In the Application and OS Images section, select an AMI for one of the supported operating systems.
5. In the Instance type section, select a supported instance type.
6. In the Key pair section, select the key pair to use for the instance.
7. In the Network settings section, choose Edit, and then do the following:
   a. For Subnet, choose the subnet in which to launch the instance. If you do not select a subnet, you can’t enable the instance for EFA.
   b. For Firewall (security groups), choose Select existing security group, and then select the security group that you created in the previous step.
   c. Expand the Advanced network configuration section, and for Elastic Fabric Adapter, select Enable.
8. In the Storage section, configure the volumes as needed.
9. In the Summary panel on the right, choose Launch instance.

⚠️ Note

Consider requiring the use of IMDSv2 for the temporary instance as well as the AMI that you will create in Step 9 unless you have already set IMDSv2 as the default for the account. For more information about IMDSv2 configuration steps, see Configure instance metadata options for new instances.
Step 3: Install the EFA software

Install the EFA-enabled kernel, EFA drivers, Libfabric, and Open MPI stack that is required to support EFA on your temporary instance.

The steps differ depending on whether you intend to use EFA with Open MPI, with Intel MPI, or with Open MPI and Intel MPI.

To install the EFA software

1. Connect to the instance you launched. For more information, see Connect to your Linux instance.
2. To ensure that all of your software packages are up to date, perform a quick software update on your instance. This process may take a few minutes.
   - Amazon Linux 2023, Amazon Linux 2, RHEL 7/8/9, CentOS 7, Rocky Linux 8/9
     
     $ sudo yum update -y
   - Ubuntu and Debian
     
     $ sudo apt-get update && sudo apt-get upgrade -y
   - SUSE Linux Enterprise
     
     $ sudo zypper update -y
3. Reboot the instance and reconnect to it.
4. Download the EFA software installation files. The software installation files are packaged into a compressed tarball (.tar.gz) file. To download the latest stable version, use the following command.

   $ C:\> curl -O https://efa-installer.amazonaws.com/aws-efa-installer-1.33.0.tar.gz

   You can also get the latest version by replacing the version number with latest in the preceding command.
5. (Optional) Verify the authenticity and integrity of the EFA tarball (.tar.gz) file.
We recommend that you do this to verify the identity of the software publisher and to check that the file has not been altered or corrupted since it was published. If you do not want to verify the tarball file, skip this step.

**Note**

Alternatively, if you prefer to verify the tarball file by using an MD5 or SHA256 checksum instead, see [Verify the EFA installer using a checksum](#).

a. Download the public GPG key and import it into your keyring.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer.key && gpg --import aws-efa-installer.key
```

The command should return a key value. Make a note of the key value, because you need it in the next step.

b. Verify the GPG key's fingerprint. Run the following command and specify the key value from the previous step.

```
$ gpg --fingerprint key_value
```

The command should return a fingerprint that is identical to 4E90 91BC BB97 A96B 26B1 5E59 A054 80B1 DD2D 3CCC. If the fingerprint does not match, don't run the EFA installation script, and contact AWS Support.

c. Download the signature file and verify the signature of the EFA tarball file.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer-1.33.0.tar.gz.sig && gpg --verify ./aws-efa-installer-1.33.0.tar.gz.sig
```

The following shows example output.

```
gpg: Signature made Wed 29 Jul 2020 12:50:13 AM UTC using RSA key ID DD2D3CCC
gpg: Good signature from "Amazon EC2 EFA <ec2-efa-maintainers@amazon.com>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg: There is no indication that the signature belongs to the owner.
```
If the result includes Good signature, and the fingerprint matches the fingerprint returned in the previous step, proceed to the next step. If not, don’t run the EFA installation script, and contact AWS Support.

6. Extract the files from the compressed .tar.gz file and navigate into the extracted directory.

   $ C:\> tar -xf aws-efa-installer-1.33.0.tar.gz && cd aws-efa-installer

7. Install the EFA software. Do one of the following depending on your use case.

   **Note**

   **EFA does not support NVIDIA GPUDirect with SUSE Linux.** If you are using SUSE Linux, you must additionally specify the --skip-kmod option to prevent kmod installation. By default, SUSE Linux does not allow out-of-tree kernel modules.

Open MPI and Intel MPI

If you intend to use EFA with Open MPI and Intel MPI, you must install the EFA software with Libfabric and Open MPI, and you **must complete Step 5: Install Intel MPI.**

To install the EFA software with Libfabric and Open MPI, run the following command.

   **Note**

   From EFA 1.30.0, both Open MPI 4 and Open MPI 5 are installed by default. You can optionally specify the version of Open MPI that you want to install. To install only Open MPI 4, include --mpi=openmpi4. To install only Open MPI 5, include --mpi=openmpi5. To install both, omit the --mpi option.

   $ sudo ./efa_installer.sh -y

Libfabric is installed to /opt/amazon/efa. Open MPI 4 is installed to /opt/amazon/openmpi. Open MPI 5 is installed to /opt/amazon/openmpi5.
Open MPI only

If you intend to use EFA with Open MPI only, you must install the EFA software with Libfabric and Open MPI, and you can skip Step 5: Install Intel MPI. To install the EFA software with Libfabric and Open MPI, run the following command.

```
$ sudo ./efa_installer.sh -y
```

Libfabric is installed to /opt/amazon/efa. Open MPI 4 is installed to /opt/amazon/openmpi. Open MPI 5 is installed to /opt/amazon/openmpi5.

Intel MPI only

If you intend to use EFA with Intel MPI only, you can install the EFA software without Libfabric and Open MPI. In this case, Intel MPI uses its embedded Libfabric. If you choose to do this, you must complete Step 5: Install Intel MPI.

To install the EFA software without Libfabric and Open MPI, run the following command.

```
$ sudo ./efa_installer.sh -y --minimal
```

8. If the EFA installer prompts you to reboot the instance, do so and then reconnect to the instance. Otherwise, log out of the instance and then log back in to complete the installation.

**Step 4: (Optional) Enable Open MPI 5**

**Note**

Perform this step only if you intend to use Open MPI 5.
From EFA 1.30.0, both Open MPI 4 and Open MPI 5 are installed by default. Alternatively, you can choose to install only Open MPI 4 or Open MPI 5.

If you chose to install Open MPI 5 in Step 3: Install the EFA software, and you intend to use it, you must perform the following steps to enable it.

**To enable Open MPI 5**

1. Add Open MPI 5 to the PATH environment variable.

   ```
   $ module load openmpi5
   ```

2. Verify that Open MPI 5 is enabled for use.

   ```
   $ which mpicc
   ```

   The command should return the Open MPI 5 installation directory - /opt/amazon/openmpi5.

3. *(Optional)* To ensure that Open MPI 5 is added to PATH environment variable each time the instance starts, do the following:

   **bash shell**

   Add `module load openmpi5` to `/home/username/.bashrc` and `/home/username/.bash_profile`.

   **csh and tcsh shells**

   Add `module load openmpi5` to `/home/username/.cshrc`.

If you need to remove Open MPI 5 from the PATH environment variable, run the following command and remove the command from the shell startup scripts.

```
$ module unload openmpi5
```
Step 5: *(Optional)* Install Intel MPI

⚠️ **Important**

Perform this step only if you intend to use Intel MPI. If you intend to only use Open MPI, skip this step.

Intel MPI requires an additional installation and environment variable configuration.

**Prerequisite**

Ensure that the user performing the following steps has sudo permissions.

**To install Intel MPI**

1. To download the Intel MPI installation script, do the following
   a. Visit the [Intel website](https://www.intel.com).
   b. In the **Intel MPI Library** section of the webpage, choose the link for the **Intel MPI Library for Linux Offline** installer.
2. Run the installation script that you downloaded in the previous step.
   
   ```bash
   $ sudo bash installation_script_name.sh
   ```
3. In the installer, choose **Accept & install**.
4. Read the Intel Improvement Program, choose the appropriate option, and then choose **Begin Installation**.
5. When the installation completes, choose **Close**.
6. By default, Intel MPI uses its embedded (internal) Libfabric. You can configure Intel MPI to use the Libfabric that ships with the EFA installer instead. Typically, the EFA installer ships with a later version of Libfabric than Intel MPI. In some cases, the Libfabric that ships with the EFA installer is more performant than that of Intel MPI. To configure Intel MPI to use the Libfabric that ships with the EFA installer, do one of the following depending on your shell.

   **bash shells**

   ```
   Add the following statement to /home/username/.bashrc and /
   home/username/.bash_profile.
   ```
export I_MPI_OFI_LIBRARY_INTERNAL=0

csh and tcsh shells

Add the following statement to /home/username/.cshrc.

setenv I_MPI_OFI_LIBRARY_INTERNAL 0

7. Add the following source command to your shell script to source the vars.sh script from the installation directory to set up the compiler environment each time the instance starts. Do one of the following depending on your shell.

bash shells

Add the following statement to /home/username/.bashrc and /home/username/.bash_profile.

source /opt/intel/oneapi/mpi/latest/env/vars.sh

csh and tcsh shells

Add the following statement to /home/username/.cshrc.

source /opt/intel/oneapi/mpi/latest/env/vars.csh

8. By default, if EFA is not available due to a misconfiguration, Intel MPI defaults to the TCP/IP network stack, which might result in slower application performance. You can prevent this by setting I_MPI_OFI_PROVIDER to efa. This causes Intel MPI to fail with the following error if EFA is not available:

Abort (XXXXXX) on node 0 (rank 0 in comm 0): Fatal error in PMPI_Init: OtherMPI error,
MPIR_Init_thread (XXX)........:
MPID_Init (XXX)..............:
MPIDI_OFI_mpi_init_hook (XXX):
open_fabric (XXX).............:
fnd_provider (XXX)..........:
OFI fi_getinfo() failed (ofi_init.c:2684:find_provider):
Do one of the following depending on your shell.

bash shells

Add the following statement to /home/username/.bashrc and /home/username/.bash_profile.

```bash
export I_MPI_OFI_PROVIDER=efa
```

csh and tcsh shells

Add the following statement to /home/username/.cshrc.

```csh
setenv I_MPI_OFI_PROVIDER efa
```

9. By default, Intel MPI doesn't print debugging information. You can specify different verbosity levels to control the debugging information. Possible values (in order of the amount of detail they provide) are: 0 (default), 1, 2, 3, 4, 5. Level 1 and higher prints the libfabric version and libfabric provider. Use `libfabric version` to check whether Intel MPI is using the internal Libfabric or the Libfabric that ships with the EFA installer. If it's using the internal Libfabric, the version is suffixed with `impi`. Use `libfabric provider` to check with Intel MPI is using EFA or the TCP/IP network. If it's using EFA, the value is `efa`. If it's using TCP/IP, the value is `tcp;ofi_rxm`.

To enable debugging information, do one of the following depending on your shell.

bash shells

Add the following statement to /home/username/.bashrc and /home/username/.bash_profile.

```bash
export I_MPI_DEBUG=value
```

csh and tcsh shells

Add the following statement to /home/username/.cshrc.

```csh
setenv I_MPI_DEBUG value
```
10. By default, Intel MPI uses the operating system's shared memory (shm) for intra-node communication, and it uses Libfabric (ofi) only for inter-node communication. Generally, this configuration provides the best performance. However, in some cases the Intel MPI shm fabric can cause certain applications to hang indefinitely.

To resolve this issue, you can force Intel MPI to use Libfabric for both intra-node and inter-node communication. To do this, do one of the following depending on your shell.

**bash shells**

Add the following statement to `/home/username/.bashrc` and `/home/username/.bash_profile`.

```
export I_MPI_FABRICS=ofi
```

**csh and tcsh shells**

Add the following statement to `/home/username/.cshrc`.

```
setenv I_MPI_FABRICS ofi
```

### Note

The EFA Libfabric provider uses the operating system's shared memory for intra-node communication. This means that setting `I_MPI_FABRICS` to ofi yields similar performance to the default shm:ofi configuration.

11. Log out of the instance and then log back in.

If you no longer want to use Intel MPI, remove the environment variables from the shell startup scripts.

**Step 6: Disable ptrace protection**

To improve your HPC application's performance, Libfabric uses the instance's local memory for interprocess communications when the processes are running on the same instance.
The shared memory feature uses Cross Memory Attach (CMA), which is not supported with *ptrace protection*. If you are using a Linux distribution that has ptrace protection enabled by default, such as Ubuntu, you must disable it. If your Linux distribution does not have ptrace protection enabled by default, skip this step.

**To disable ptrace protection**

Do one of the following:

- To temporarily disable ptrace protection for testing purposes, run the following command.

  ```
  $ sudo sysctl -w kernel.yama.ptrace_scope=0
  ```

- To permanently disable ptrace protection, add `kernel.yama.ptrace_scope = 0` to `/etc/sysctl.d/10-ptrace.conf` and reboot the instance.

**Step 7. Confirm installation**

**To confirm successful installation**

1. To confirm that MPI was successfully installed, run the following command:

   ```
   $ which mpicc
   ```

   - For Open MPI, the returned path should include `/opt/amazon/`
   - For Intel MPI, the returned path should include `/opt/intel/`. If you do not get the expected output, ensure that you have sourced the Intel MPI `vars.sh` script.

2. To confirm that the EFA software components and Libfabric were successfully installed, run the following command.

   ```
   $ fi_info -p efa -t FI_EP_RDM
   ```

   The command should return information about the Libfabric EFA interfaces. The following example shows the command output.

   ```
   provider: efa
   fabric: EFA-fe80::94:3dff:fe89:1b70
   domain: efa_0-rdm
   version: 2.0
   ```
Step 8: Install your HPC application

Install the HPC application on the temporary instance. The installation procedure varies depending on the specific HPC application. For more information, see Manage software on your AL2 instance in the Amazon Linux 2 User Guide.

Note
Refer to your HPC application’s documentation for installation instructions.

Step 9: Create an EFA-enabled AMI

After you have installed the required software components, you create an AMI that you can reuse to launch your EFA-enabled instances.

To create an AMI from your temporary instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the temporary instance that you created and choose Actions, Image, Create image.
4. For Create image, do the following:
   a. For Image name, enter a descriptive name for the AMI.
   b. (Optional) For Image description, enter a brief description of the purpose of the AMI.
   c. Choose Create image.
5. In the navigation pane, choose AMIs.
6. Locate the AMI that you created in the list. Wait for the status to change from pending to available before continuing to the next step.

Step 10: Launch EFA-enabled instances into a cluster placement group

Launch your EFA-enabled instances into a cluster placement group using the EFA-enabled AMI that you created in Step 7, and the EFA-enabled security group that you created in Step 1.
To launch an instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances, and then choose Launch Instances to open the new launch instance wizard.
3. (Optional) In the Name and tags section, provide a name for the instance, such as EFA-instance. The name is assigned to the instance as a resource tag (Name=EFA-instance).
4. In the Application and OS Images section, choose My AMIs, and then select the AMI that you created in the previous step.
5. In the Instance type section, select a supported instance type.
6. In the Key pair section, select the key pair to use for the instance.
7. In the Network settings section, choose Edit, and then do the following:
   a. For Subnet, choose the subnet in which to launch the instance. If you do not select a subnet, you can't enable the instance for EFA.
   b. For Firewall (security groups), choose Select existing security group, and then select the security group that you created in the previous step.
   c. Expand the Advanced network configuration section, and for Elastic Fabric Adapter, select Enable.
8. (Optional) In the Storage section, configure the volumes as needed.
9. In the Advanced details section, for Placement group name, select the cluster placement group into which to launch the instances. If you need to create a new cluster placement group, choose Create new placement group.
10. In the **Summary** panel on the right, for **Number of instances**, enter the number of EFA-enabled instances that you want to launch, and then choose **Launch instance**.

**Step 11: Terminate the temporary instance**

At this point, you no longer need the instance that you launched in **Step 2**. You can terminate the instance to stop incurring charges for it.

**To terminate the temporary instance**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and then choose **Actions, Instance state, Terminate instance**.
4. When prompted for confirmation, choose **Terminate**.

**Step 12: Enable passwordless SSH**

To enable your applications to run across all of the instances in your cluster, you must enable passwordless SSH access from the leader node to the member nodes. The leader node is the instance from which you run your applications. The remaining instances in the cluster are the member nodes.

**To enable passwordless SSH between the instances in the cluster**

1. Select one instance in the cluster as the leader node, and connect to it.
2. Disable **strictHostKeyChecking** and enable **ForwardAgent** on the leader node. Open ~/.ssh/config using your preferred text editor and add the following.

   ```
   Host *
   ForwardAgent yes
   Host *
   StrictHostKeyChecking no
   ```

3. Generate an RSA key pair.

   ```
   $ ssh-keygen -t rsa -N "" -f ~/.ssh/id_rsa
   ```
The key pair is created in the $HOME/.ssh/ directory.

4. Change the permissions of the private key on the leader node.

```
$ chmod 600 ~/.ssh/id_rsa
chmod 600 ~/.ssh/config
```

5. Open ~/.ssh/id_rsa.pub using your preferred text editor and copy the key.

6. For each member node in the cluster, do the following:
   a. Connect to the instance.
   b. Open ~/.ssh/authorized_keys using your preferred text editor and add the public key that you copied earlier.

7. To test that the passwordless SSH is functioning as expected, connect to your leader node and run the following command.

```
$ ssh member_node_private_ip
```

You should connect to the member node without being prompted for a key or password.

### Get started with EFA and NCCL

The NVIDIA Collective Communications Library (NCCL) is a library of standard collective communication routines for multiple GPUs across a single node or multiple nodes. NCCL can be used together with EFA, Libfabric, and MPI to support various machine learning workloads. For more information, see the [NCCL website](#).

The following steps help you to get started with EFA and NCCL using a base AMI for one of the supported operating systems.

#### Note
- Only the p3dn.24xlarge, p4d.24xlarge, p5.48xlarge instance types are supported.
- Only Amazon Linux 2 and Ubuntu 20.04/22.04 base AMIs are supported.
- Only NCCL 2.4.2 and later is supported with EFA.
For more information about running machine learning workloads with EFA and NCCL using an AWS Deep Learning AMI, see Using EFA on the DLAMI in the AWS Deep Learning AMI Developer Guide.

Steps

1. **Step 1: Prepare an EFA-enabled security group**
2. **Step 2: Launch a temporary instance**
3. **Step 3: Install Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN**
4. **Step 4: Install GDRCopy**
5. **Step 5: Install the EFA software**
6. **Step 6: Install NCCL**
7. **Step 7: Install the aws-ofi-nccl plugin**
8. **Step 8: Install the NCCL tests**
9. **Step 9: Test your EFA and NCCL configuration**
10. **Step 10: Install your machine learning applications**
11. **Step 11: Create an EFA and NCCL-enabled AMI**
12. **Step 12: Terminate the temporary instance**
13. **Step 13: Launch EFA and NCCL-enabled instances into a cluster placement group**
14. **Step 14: Enable passwordless SSH**

### Step 1: Prepare an EFA-enabled security group

An EFA requires a security group that allows all inbound and outbound traffic to and from the security group itself. The following procedure creates a security group that allows all inbound and outbound traffic to and from itself, and that allows inbound SSH traffic from any IPv4 address for SSH connectivity.

⚠️ **Important**

This security group is intended for testing purposes only. For your production environments, we recommend that you create an inbound SSH rule that allows traffic...
only from the IP address from which you are connecting, such as the IP address of your computer, or a range of IP addresses in your local network.

For other scenarios, see Security group rules for different use cases.

To create an EFA-enabled security group

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Security Groups and then choose Create security group.
3. In the Create security group window, do the following:
   a. For Security group name, enter a descriptive name for the security group, such as EFA-enabled security group.
   b. (Optional) For Description, enter a brief description of the security group.
   c. For VPC, select the VPC into which you intend to launch your EFA-enabled instances.
   d. Choose Create security group.
4. Select the security group that you created, and on the Details tab, copy the Security group ID.
5. With the security group still selected, choose Actions, Edit inbound rules, and then do the following:
   a. Choose Add rule.
   b. For Type, choose All traffic.
   c. For Source type, choose Custom and paste the security group ID that you copied into the field.
   d. Choose Add rule.
   e. For Type, choose SSH.
   f. For Source type, choose Anywhere-IPv4.
   g. Choose Save rules.
6. With the security group still selected, choose Actions, Edit outbound rules, and then do the following:
   a. Choose Add rule.
   b. For Type, choose All traffic.
c. For Destination type, choose Custom and paste the security group ID that you copied into the field.

d. Choose Save rules.

**Step 2: Launch a temporary instance**

Launch a temporary instance that you can use to install and configure the EFA software components. You use this instance to create an EFA-enabled AMI from which you can launch your EFA-enabled instances.

**To launch a temporary instance**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Instances, and then choose Launch Instances to open the new launch instance wizard.
3. *(Optional)* In the Name and tags section, provide a name for the instance, such as EFA-instance. The name is assigned to the instance as a resource tag (Name=EFA-instance).
4. In the Application and OS Images section, select an AMI for one of the supported operating systems. Only Amazon Linux 2, Ubuntu 20.04, and Ubuntu 22.04 are supported.
5. In the Instance type section, select either p3dn.24xlarge, p4d.24xlarge, or p5.48xlarge.
6. In the Key pair section, select the key pair to use for the instance.
7. In the Network settings section, choose Edit, and then do the following:
   a. For Subnet, choose the subnet in which to launch the instance. If you do not select a subnet, you can't enable the instance for EFA.
   b. For Firewall (security groups), choose Select existing security group, and then select the security group that you created in the previous step.
   c. Expand the Advanced network configuration section, and for Elastic Fabric Adapter, select Enable.
8. In the Storage section, configure the volumes as needed.
9. In the **Summary** panel on the right, choose **Launch instance**.

### Step 3: Install Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN

**Amazon Linux 2**

To install the Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN

1. To ensure that all of your software packages are up to date, perform a quick software update on your instance.

   ```bash
   $ sudo yum upgrade -y && sudo reboot
   ```

   After the instance has rebooted, reconnect to it.

2. Install the utilities that are needed to install the Nvidia GPU drivers and the Nvidia CUDA toolkit.

   ```bash
   $ sudo yum groupinstall 'Development Tools' -y
   ```

3. Disable the nouveau open source drivers.
   a. Install the required utilities and the kernel headers package for the version of the kernel that you are currently running.

      ```bash
      $ sudo yum install -y wget kernel-devel-$(uname -r) kernel-headers-$(uname -r)
      ```

   b. Add nouveau to the `/etc/modprobe.d/blacklist.conf` deny list file.

      ```bash
      $ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
      blacklist vga16fb
      blacklist nouveau
      EOF
      ```
blacklist rivafb
blacklist nvidiafb
blacklist rivatv
EOF

c. Append GRUB_CMDLINE_LINUX="rdblacklist=nouveau" to the grub file and rebuild the Grub configuration.

```bash
$ echo 'GRUB_CMDLINE_LINUX="rdblacklist=nouveau"' | sudo tee -a /etc/default/grub 
&& sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

4. Reboot the instance and reconnect to it.

5. Prepare the required repositories

   a. Install the EPEL repository for DKMS and enable any optional repos for your Linux distribution.

```bash
```

   b. Install the CUDA repository public GPG key.

```bash
$ distribution='rhel7'
```

   c. Set up the CUDA network repository and update the repository cache.

```bash
$ ARCH=$( /bin/arch ) 
&& sudo yum clean expire-cache
```

   d. *(Kernel version 5.10 only)* Perform these steps only if you are using Amazon Linux 2 with kernel version 5.10. If you are using Amazon Linux 2 with kernel version 4.12, skip these steps. To check your kernel version, run `uname -r`.

      i. Create the Nvidia driver configuration file named `/etc/dkms/nvidia.conf`.

```bash
$ sudo mkdir -p /etc/dkms 
```
ii. (p4d.24xlarge and p5.48xlarge only) Copy the Nvidia driver configuration file.

```bash
$ sudo cp /etc/dkms/nvidia.conf /etc/dkms/nvidia-open.conf
```

6. Install the Nvidia GPU drivers, NVIDIA CUDA toolkit, and cuDNN.

   - p3dn.24xlarge

```bash
$ sudo yum clean all \
&& sudo yum -y install kmod-nvidia-latest-dkms nvidia-driver-latest-dkms \
&& sudo yum -y install cuda-drivers-fabricmanager cuda libcudnn8-devel
```

   - p4d.24xlarge and p5.48xlarge

```bash
$ sudo yum clean all \
&& sudo yum -y install kmod-nvidia-open-dkms nvidia-driver-latest-dkms \
&& sudo yum -y install cuda-drivers-fabricmanager cuda libcudnn8-devel
```

7. Reboot the instance and reconnect to it.

8. (p4d.24xlarge and p5.48xlarge only) Start the Nvidia Fabric Manager service, and ensure that it starts automatically when the instance starts. Nvidia Fabric Manager is required for NV Switch Management.

```bash
$ sudo systemctl enable nvidia-fabricmanager && sudo systemctl start nvidia-fabricmanager
```

9. Ensure that the CUDA paths are set each time that the instance starts.

   - For *bash* shells, add the following statements to /home/username/.bashrc and /home/username/.bash_profile.

     ```bash
     export PATH=/usr/local/cuda/bin:$PATH
     export LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:$LD_LIBRARY_PATH
     ```

   - For *tcsh* shells, add the following statements to /home/username/.cshrc.

     ```bash
     setenv PATH /usr/local/cuda/bin:$PATH
     setenv LD_LIBRARY_PATH /usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:$LD_LIBRARY_PATH
     ```
10. To confirm that the Nvidia GPU drivers are functional, run the following command.

```
$ nvidia-smi -q | head
```

The command should return information about the Nvidia GPUs, Nvidia GPU drivers, and Nvidia CUDA toolkit.

**Ubuntu 20.04/22.04**

**To install the Nvidia GPU drivers, Nvidia CUDA toolkit, and cuDNN**

1. To ensure that all of your software packages are up to date, perform a quick software update on your instance.

```
$ sudo apt-get update && sudo apt-get upgrade -y
```

2. Install the utilities that are needed to install the Nvidia GPU drivers and the Nvidia CUDA toolkit.

```
$ sudo apt-get update && sudo apt-get install build-essential -y
```

3. To use the Nvidia GPU driver, you must first disable the *nouveau* open source drivers.
   a. Install the required utilities and the kernel headers package for the version of the kernel that you are currently running.

```
$ sudo apt-get install -y gcc make linux-headers-$(uname -r)
```

   b. Add *nouveau* to the `/etc/modprobe.d/blacklist.conf` deny list file.

```
$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
EOF
```
blacklist rivatv
EOF

c. Open /etc/default/grub using your preferred text editor and add the following.

GRUB_CMDLINE_LINUX="rdblacklist=nouveau"

d. Rebuild the Grub configuration.

$ sudo update-grub

4. Reboot the instance and reconnect to it.

5. Add the CUDA repository and install the Nvidia GPU drivers, NVIDIA CUDA toolkit, and cuDNN.

- p3dn.24xlarge

$ sudo apt-key adv --fetch-keys http://developer.download.nvidia.com/compute/machine-learning/repos/ubuntu2004/x86_64/7fa2af80.pub 
&& sudo dpkg -i /tmp/deeplearning.deb 
&& sudo mv /tmp/cuda.pin /etc/apt/preferences.d/cuda-repository-pin-600 
&& sudo apt update 
&& sudo apt install nvidia-dkms-535 
&& sudo apt install -o Dpkg::Options:='--force-overwrite' cuda-drivers-535 cuda-toolkit-12-3 libcudnn8 libcudnn8-dev -y

- p4d.24xlarge and p5.48xlarge

$ sudo apt-key adv --fetch-keys http://developer.download.nvidia.com/compute/machine-learning/repos/ubuntu2004/x86_64/7fa2af80.pub 

6. Reboot the instance and reconnect to it.

7. (p4d.24xlarge and p5.48xlarge only) Install the Nvidia Fabric Manager.
   a. You must install the version of the Nvidia Fabric Manager that matches the version of the Nvidia kernel module that you installed in the previous step.
      
      Run the following command to determine the version of the Nvidia kernel module.
      
      ```bash
      $ cat /proc/driver/nvidia/version | grep "Kernel Module"
      ```
      
      The following is example output.
      
      ```
      NVRM version: NVIDIA UNIX x86_64 Kernel Module 450.42.01 Tue Jun 15 21:26:37 UTC 2021
      ```
      
      In the example above, major version 450 of the kernel module was installed. This means that you need to install Nvidia Fabric Manager version 450.
      
      b. Install the Nvidia Fabric Manager. Run the following command and specify the major version identified in the previous step.
      
      ```bash
      $ sudo apt install -o Dpkg::Options::='--force-overwrite' nvidia-fabricmanager-major_version_number
      ```
      
      For example, if major version 450 of the kernel module was installed, use the following command to install the matching version of Nvidia Fabric Manager.
c. Start the service, and ensure that it starts automatically when the instance starts. Nvidia Fabric Manager is required for NV Switch Management.

```bash
$ sudo apt install -o Dpkg::Options::='--force-overwrite' nvidia-fabricmanager-450
```

8. Ensure that the CUDA paths are set each time that the instance starts.

- For `bash` shells, add the following statements to `/home/username/.bashrc` and `/home/username/.bash_profile`.

```bash
export PATH=/usr/local/cuda/bin:$PATH
export LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:$LD_LIBRARY_PATH
```

- For `tcsh` shells, add the following statements to `/home/username/.cshrc`.

```bash
setenv PATH=/usr/local/cuda/bin:$PATH
setenv LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:$LD_LIBRARY_PATH
```

9. To confirm that the Nvidia GPU drivers are functional, run the following command.

```bash
$ nvidia-smi -q | head
```

The command should return information about the Nvidia GPUs, Nvidia GPU drivers, and Nvidia CUDA toolkit.

**Step 4: Install GDRCopy**

Install GDRCopy to improve the performance of Libfabric. For more information about GDRCopy, see the [GDRCopy repository](#).
Amazon Linux 2

To install GDRCopy

1. Install the required dependencies.

   $ sudo yum -y install dkms rpm-build make check check-devel subunit subunit-devel

2. Download and extract the GDRCopy package.

   $ wget https://github.com/NVIDIA/gdrcopy/archive/refs/tags/v2.4.tar.gz \
   && tar xf v2.4.tar.gz ; cd gdrcopy-2.4/packages

3. Build the GDRCopy RPM package.

   $ CUDA=/usr/local/cuda ./build-rpm-packages.sh

4. Install the GDRCopy RPM package.

   $ sudo rpm -Uvh gdrcopy-kmod-2.4-1dkms.noarch*.rpm \
   && sudo rpm -Uvh gdrcopy-2.4-1.x86_64*.rpm \
   && sudo rpm -Uvh gdrcopy-devel-2.4-1.noarch*.rpm

Ubuntu 20.04/22.04

To install GDRCopy

1. Install the required dependencies.

   $ sudo apt -y install build-essential devscripts debhelper check libsubunit-dev \
   fakeroot pkg-config dkms

2. Download and extract the GDRCopy package.

   $ wget https://github.com/NVIDIA/gdrcopy/archive/refs/tags/v2.4.tar.gz \
   && tar xf v2.4.tar.gz \
   && cd gdrcopy-2.4/packages

3. Build the GDRCopy RPM package.
Step 5: Install the EFA software

Install the EFA-enabled kernel, EFA drivers, Libfabric, and Open MPI stack that is required to support EFA on your temporary instance.

To install the EFA software

1. Connect to the instance you launched. For more information, see Connect to your Linux instance.

2. Download the EFA software installation files. The software installation files are packaged into a compressed tarball (.tar.gz) file. To download the latest stable version, use the following command.

   $ C:\> curl -O https://efa-installer.amazonaws.com/aws-efa-installer-1.33.0.tar.gz

   You can also get the latest version by replacing the version number with latest in the preceding command.

3. (Optional) Verify the authenticity and integrity of the EFA tarball (.tar.gz) file.

   We recommend that you do this to verify the identity of the software publisher and to check that the file has not been altered or corrupted since it was published. If you do not want to verify the tarball file, skip this step.

   Alternative, if you prefer to verify the tarball file by using an MD5 or SHA256 checksum instead, see Verify the EFA installer using a checksum.
a. Download the public GPG key and import it into your keyring.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer.key && gpg --import aws-efa-installer.key
```

The command should return a key value. Make a note of the key value, because you need it in the next step.

b. Verify the GPG key's fingerprint. Run the following command and specify the key value from the previous step.

```
$ gpg --fingerprint key_value
```

The command should return a fingerprint that is identical to 4E90 91BC BB97 A96B 26B1 5E59 A054 80B1 DD2D 3CCC. If the fingerprint does not match, don't run the EFA installation script, and contact AWS Support.

c. Download the signature file and verify the signature of the EFA tarball file.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer-1.33.0.tar.gz.sig && gpg --verify .aws-efa-installer-1.33.0.tar.gz.sig
```

The following shows example output.

```
gpg: Signature made Wed 29 Jul 2020 12:50:13 AM UTC using RSA key ID DD2D3CCC
gpg: Good signature from "Amazon EC2 EFA <ec2-efa-maintainers@amazon.com>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg: There is no indication that the signature belongs to the owner.
Primary key fingerprint: 4E90 91BC BB97 A96B 26B1 5E59 A054 80B1 DD2D 3CCC
```

If the result includes Good signature, and the fingerprint matches the fingerprint returned in the previous step, proceed to the next step. If not, don't run the EFA installation script, and contact AWS Support.

4. Extract the files from the compressed .tar.gz file and navigate into the extracted directory.

```
$ C:\> tar -xf aws-efa-installer-1.33.0.tar.gz && cd aws-efa-installer
```

5. Run the EFA software installation script.
Note

From EFA 1.30.0, both Open MPI 4 and Open MPI 5 are installed by default. Unless you need Open MPI 5, we recommend that you install only Open MPI 4. The following command installs Open MPI 4 only. If you want to install Open MPI 4 and Open MPI 5, remove --mpi=openmpi4.

$ sudo ./efa_installer.sh -y --mpi=openmpi4

Libfabric is installed in the /opt/amazon/efa directory, while Open MPI is installed in the /opt/amazon/openmpi directory.

6. If the EFA installer prompts you to reboot the instance, do so and then reconnect to the instance. Otherwise, log out of the instance and then log back in to complete the installation.

7. Confirm that the EFA software components were successfully installed.

$ fi_info -p efa -t FI_EP_RDM

The command should return information about the Libfabric EFA interfaces. The following example shows the command output.

• p3dn.24xlarge with single network interface

  provider: efa
  fabric: EFA-fe80::94:3dff:fe89:1b70
  domain: efa_0-rdm
  version: 2.0
  type: FI_EP_RDM
  protocol: FI_PROTO_EFA

• p4d.24xlarge and p5.48xlarge with multiple network interfaces

  provider: efa
  fabric: EFA-fe80::c6e:8fff:fef6:e7ff
  domain: efa_0-rdm
  version: 111.0
  type: FI_EP_RDM
  protocol: FI_PROTO_EFA
Step 6: Install NCCL

Install NCCL. For more information about NCCL, see the [NCCL repository](https://github.com/NVIDIA/nccl).

To install NCCL

1. Navigate to the /opt directory.

   ```bash
   $ cd /opt
   ```

2. Clone the official NCCL repository to the instance and navigate into the local cloned repository.

   ```bash
   $ sudo git clone https://github.com/NVIDIA/nccl.git && cd nccl
   ```

3. Build and install NCCL and specify the CUDA installation directory.

   ```bash
   $ sudo make -j src.build CUDA_HOME=/usr/local/cuda
   ```
**Step 7: Install the aws-ofi-nccl plugin**

The aws-ofi-nccl plugin maps NCCL's connection-oriented transport APIs to Libfabric's connection-less reliable interface. This enables you to use Libfabric as a network provider while running NCCL-based applications. For more information about the aws-ofi-nccl plugin, see the [aws-ofi-nccl repository](https://github.com/aws/aws-ofi-nccl).

**To install the aws-ofi-nccl plugin**

1. Navigate to your home directory.
   
   ```
   $ cd $HOME
   ```

2. Install the required utilities.
   
   - **Amazon Linux 2**
     
     ```
     $ sudo yum install hwloc-devel
     ```
   
   - **Ubuntu**
     
     ```
     $ sudo apt-get install libhwloc-dev
     ```

3. Download the aws-ofi-nccl plugin files. The files are packaged into a compressed tarball (.tar.gz).
   
   ```
   $ wget https://github.com/aws/aws-ofi-nccl/releases/download/v1.9.2-aws/aws-ofi-nccl-1.9.2-aws.tar.gz
   ```

4. Extract the files from the compressed .tar.gz file and navigate into the extracted directory.
   
   ```
   $ tar -xf aws-ofi-nccl-1.9.2-aws.tar.gz && cd aws-ofi-nccl-1.9.2-aws
   ```

5. To generate the `make` files, run the `configure` script and specify the MPI, Libfabric, NCCL, and CUDA installation directories.
   
   ```
   $ ./configure --prefix=/opt/aws-ofi-nccl --with-mpi=/opt/amazon/openmpi --with-libfabric=/opt/amazon/efa --with-cuda=/usr/local/cuda --enable-platform-aws
   ```
6. Add the Open MPI directory to the PATH variable.

   $ export PATH=/opt/amazon/openmpi/bin/:$PATH

7. Install the aws-ofi-nccl plugin.

   $ make && sudo make install

**Step 8: Install the NCCL tests**

Install the NCCL tests. The NCCL tests enable you to confirm that NCCL is properly installed and that it is operating as expected. For more information about the NCCL tests, see the [nccl-tests repository](#).

**To install the NCCL tests**

1. Navigate to your home directory.

   $ cd $HOME

2. Clone the official nccl-tests repository to the instance and navigate into the local cloned repository.

   $ git clone https://github.com/NVIDIA/nccl-tests.git && cd nccl-tests

3. Add the Libfabric directory to the LD_LIBRARY_PATH variable.

   - Amazon Linux 2
     
     $ export LD_LIBRARY_PATH=/opt/amazon/efa/lib64:$LD_LIBRARY_PATH

   - Ubuntu
     
     $ export LD_LIBRARY_PATH=/opt/amazon/efa/lib:$LD_LIBRARY_PATH

4. Install the NCCL tests and specify the MPI, NCCL, and CUDA installation directories.

   $ make MPI=1 MPI_HOME=/opt/amazon/openmpi NCCL_HOME=/opt/nccl/build CUDA_HOME=/usr/local/cuda
Step 9: Test your EFA and NCCL configuration

Run a test to ensure that your temporary instance is properly configured for EFA and NCCL.

To test your EFA and NCCL configuration

1. Create a host file that specifies the hosts on which to run the tests. The following command creates a host file named `my-hosts` that includes a reference to the instance itself.

   IMDSv2

   ```
   ```

   IMDSv1

   ```
   ```

2. Run the test and specify the host file (--hostfile) and the number of GPUs to use (-n). The following command runs the `all_reduce_perf` test on 8 GPUs on the instance itself, and specifies the following environment variables.

   • `FI_EFA_USE_DEVICE_RDMA=1`—(p4d.24xlarge only) uses the device's RDMA functionality for one-sided and two-sided transfer.
   
   • `NCCL_DEBUG=INFO`—enables detailed debugging output. You can also specify `VERSION` to print only the NCCL version at the start of the test, or `WARN` to receive only error messages.

   For more information about the NCCL test arguments, see the NCCL Tests README in the official nccl-tests repository.

   • `p3dn.24xlarge`

   ```
   $ /opt/amazon/openmpi/bin/mpirun \
   -x LD_LIBRARY_PATH=/opt/nccl/build/lib:/usr/local/cuda/lib64:/opt/amazon/efa/\ 
   lib:/opt/amazon/openmpi/lib:/opt/aws-ofi-nccl/lib:$LD_LIBRARY_PATH \
   -x NCCL_DEBUG=INFO \ 
   --hostfile my-hosts -n 8 -N 8 \
   ```
```bash
--mca pml ^cm --mca btl tcp,self --mca btl_tcp_if_exclude lo,docker0 --bind-to none \
$HOME/nccl-tests/build/all_reduce_perf -b 8 -e 1G -f 2 -g 1 -c 1 -n 100
```

- p4d.24xlarge and p5.48xlarge

```bash
$ /opt/amazon/openmpi/bin/mpiexec -x FI_EFA_USE_DEVICE_RDMA=1 -x LD_LIBRARY_PATH=/opt/nccl/build/lib:/usr/local/cuda/lib64:/opt/amazon/efa/lib:/opt/amazon/openmpi/lib:/opt/aws-ofi-nccl/lib:$LD_LIBRARY_PATH -x NCCL_DEBUG=INFO -x NCCL_DIST=NCCL --hostfile my-hosts -n 8 -N 8 --mca pml ^cm --mca btl tcp,self --mca btl_tcp_if_exclude lo,docker0 --bind-to none \
$HOME/nccl-tests/build/all_reduce_perf -b 8 -e 1G -f 2 -g 1 -c 1 -n 100
```

3. You can confirm that EFA is active as the underlying provider for NCCL when the NCCL_DEBUG log is printed.

```
ip-192-168-2-54:14:14 [0] NCCL INFO NET/OFI Selected Provider is efa*
```

The following additional information is displayed when using a p4d.24xlarge instance.

```
```

**Step 10: Install your machine learning applications**

Install the machine learning applications on the temporary instance. The installation procedure varies depending on the specific machine learning application. For more information about installing software on your Linux instance, see [Manage software on your Amazon Linux 2 instance](#)

**Note**

Refer to your machine learning application's documentation for installation instructions.
Step 11: Create an EFA and NCCL-enabled AMI

After you have installed the required software components, you create an AMI that you can reuse to launch your EFA-enabled instances.

To create an AMI from your temporary instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the temporary instance that you created and choose Actions, Image, Create image.
4. For Create image, do the following:
   a. For Image name, enter a descriptive name for the AMI.
   b. (Optional) For Image description, enter a brief description of the purpose of the AMI.
   c. Choose Create image.
5. In the navigation pane, choose AMIs.
6. Locate the AMI that you created in the list. Wait for the status to change from pending to available before continuing to the next step.

Step 12: Terminate the temporary instance

At this point, you no longer need the temporary instance that you launched. You can terminate the instance to stop incurring charges for it.

To terminate the temporary instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the temporary instance that you created and then choose Actions, Instance state, Terminate instance.
4. When prompted for confirmation, choose Terminate.

Step 13: Launch EFA and NCCL-enabled instances into a cluster placement group

Launch your EFA and NCCL-enabled instances into a cluster placement group using the EFA-enabled AMI and the EFA-enabled security group that you created earlier.
Note

- It is not an absolute requirement to launch your EFA-enabled instances into a cluster placement group. However, we do recommend running your EFA-enabled instances in a cluster placement group as it launches the instances into a low-latency group in a single Availability Zone.

- To ensure that capacity is available as you scale your cluster's instances, you can create a Capacity Reservation for your cluster placement group. For more information, seeCapacity Reservations in cluster placement groups.

New console

To launch a temporary instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances, and then choose Launch Instances to open the new launch instance wizard.
3. (Optional) In the Name and tags section, provide a name for the instance, such as EFA-instance. The name is assigned to the instance as a resource tag (Name=EFA-instance).
4. In the Application and OS Images section, choose My AMIs, and then select the AMI that you created in the previous step.
5. In the Instance type section, select either p3dn.24xlarge or p4d.24xlarge.
6. In the Key pair section, select the key pair to use for the instance.
7. In the Network settings section, choose Edit, and then do the following:
   a. For Subnet, choose the subnet in which to launch the instance. If you do not select a subnet, you can't enable the instance for EFA.
   b. For Firewall (security groups), choose Select existing security group, and then select the security group that you created in the previous step.
   c. Expand the Advanced network configuration section, and for Elastic Fabric Adapter, select Enable.
8. (Optional) In the Storage section, configure the volumes as needed.
9. In the **Advanced details** section, for **Placement group name**, select the cluster placement group into which to launch the instance. If you need to create a new cluster placement group, choose **Create new placement group**.

10. In the **Summary** panel on the right, for **Number of instances**, enter the number of EFA-enabled instances that you want to launch, and then choose **Launch instance**.

**Old console**

**To launch your EFA and NCCL-enabled instances into a cluster placement group**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. Choose **Launch Instance**.
3. On the **Choose an AMI** page, choose **My AMIs**, find the AMI that you created earlier, and then choose **Select**.
4. On the **Choose an Instance Type** page, select **p3dn.24xlarge** and then choose **Next: Configure Instance Details**.
5. On the **Configure Instance Details** page, do the following:
   
a. For **Number of instances**, enter the number of EFA and NCCL-enabled instances that you want to launch.
   
b. For **Network** and **Subnet**, select the VPC and subnet into which to launch the instances.
   
c. For **Placement group**, select **Add instance to placement group**.
   
d. For **Placement group name**, select **Add to a new placement group**, and then enter a descriptive name for the placement group. Then for **Placement group strategy**, select **cluster**.
   
e. For **EFA**, choose **Enable**.
   
f. In the **Network Interfaces** section, for device **eth0**, choose **New network interface**. You can optionally specify a primary IPv4 address and one or more secondary IPv4 addresses. If you are launching the instance into a subnet that has an associated IPv6 CIDR block, you can optionally specify a primary IPv6 address and one or more secondary IPv6 addresses.
   
g. Choose **Next: Add Storage**.
6. On the **Add Storage** page, specify the volumes to attach to the instances in addition to the volumes specified by the AMI (such as the root device volume). Then choose **Next: Add Tags**.

7. On the **Add Tags** page, specify tags for the instances, such as a user-friendly name, and then choose **Next: Configure Security Group**.

8. On the **Configure Security Group** page, for **Assign a security group**, select **Select an existing security group**, and then select the security group that you created earlier.

9. Choose **Review and Launch**.

10. On the **Review Instance Launch** page, review the settings, and then choose **Launch** to choose a key pair and to launch your instances.

### Step 14: Enable passwordless SSH

To enable your applications to run across all of the instances in your cluster, you must enable passwordless SSH access from the leader node to the member nodes. The leader node is the instance from which you run your applications. The remaining instances in the cluster are the member nodes.

**To enable passwordless SSH between the instances in the cluster**

1. Select one instance in the cluster as the leader node, and connect to it.

2. Disable **StrictHostKeyChecking** and enable **ForwardAgent** on the leader node. Open `~/.ssh/config` using your preferred text editor and add the following.

   ```
   Host *
     ForwardAgent yes
   Host *
     StrictHostKeyChecking no
   ```

3. Generate an RSA key pair.

   ```
   $ ssh-keygen -t rsa -N "" -f ~/.ssh/id_rsa
   ```

   The key pair is created in the `$HOME/.ssh/` directory.

4. Change the permissions of the private key on the leader node.

   ```
   $ chmod 600 ~/.ssh/id_rsa
   ```
5. Open ~/.ssh/id_rsa.pub using your preferred text editor and copy the key.

6. For each member node in the cluster, do the following:
   a. Connect to the instance.
   b. Open ~/.ssh/authorized_keys using your preferred text editor and add the public key that you copied earlier.

7. To test that the passwordless SSH is functioning as expected, connect to your leader node and run the following command.

   $ ssh member_node_private_ip

   You should connect to the member node without being prompted for a key or password.

## Work with EFA

You can create, use, and manage an EFA much like any other elastic network interface in Amazon EC2. However, unlike elastic network interfaces, EFAs cannot be attached to or detached from an instance in a running state.

### EFA requirements

To use an EFA, you must do the following:

- Choose one of the supported instance types.
- Use an AMI for one of the supported operating systems.
- Install the EFA software components. For more information, see Step 3: Install the EFA software and Step 5: (Optional) Install Intel MPI.
- Use a security group that allows all inbound and outbound traffic to and from the security group itself. For more information, see Step 1: Prepare an EFA-enabled security group.

## Contents

- Create an EFA
- Attach an EFA to a stopped instance
- Attach an EFA when launching an instance
Create an EFA

You can create an EFA in a subnet in a VPC. You can't move the EFA to another subnet after it's created, and you can only attach it to stopped instances in the same Availability Zone.

To create a new EFA using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Network Interfaces.
3. Choose Create Network Interface.
4. For Description, enter a descriptive name for the EFA.
5. For Subnet, select the subnet in which to create the EFA.
6. For Private IP, enter the primary private IPv4 address. If you don't specify an IPv4 address, we select an available private IPv4 address from the selected subnet.
7. (IPv6 only) If you selected a subnet that has an associated IPv6 CIDR block, you can optionally specify an IPv6 address in the IPv6 IP field.
8. For Security groups, select one or more security groups.
9. For EFA, choose Enabled.
10. Choose Yes, Create.

To create a new EFA using the AWS CLI

Use the create-network-interface command and for interface-type, specify efa, as shown in the following example.

```
aws ec2 create-network-interface --subnet-id subnet-01234567890 --description example_efa --interface-type efa
```
Attach an EFA to a stopped instance

You can attach an EFA to any supported instance that is in the stopped state. You cannot attach an EFA to an instance that is in the running state. For more information about the supported instance types, see Supported instance types.

You attach an EFA to an instance in the same way that you attach a network interface to an instance. For more information, see Attach a network interface to an instance.

Attach an EFA when launching an instance

To attach an existing EFA when launching an instance (AWS CLI)

Use the run-instances command and for NetworkInterfaceId, specify the ID of the EFA, as shown in the following example.

```
aws ec2 run-instances --image-id ami_id --count 1 --instance-type c5n.18xlarge --key-name my_key_pair --network-interfaces DeviceIndex=0,NetworkInterfaceId=efa_id,Groups=sg_id,SubnetId=subnet_id
```

To attach a new EFA when launching an instance (AWS CLI)

Use the run-instances command and for InterfaceType, specify efa, as shown in the following example.

```
aws ec2 run-instances --image-id ami_id --count 1 --instance-type c5n.18xlarge --key-name my_key_pair --network-interfaces DeviceIndex=0,InterfaceType=efa,Groups=sg_id,SubnetId=subnet_id
```

Add an EFA to a launch template

You can create a launch template that contains the configuration information needed to launch EFA-enabled instances. To create an EFA-enabled launch template, create a new launch template and specify a supported instance type, your EFA-enabled AMI, and an EFA-enabled security group. For more information, see Get started with EFA and MPI.

You can leverage launch templates to launch EFA-enabled instances with other AWS services, such as AWS Batch or AWS ParallelCluster.

For more information about creating launch templates, see Create a launch template.
Manage IP addresses for an EFA

You can change the IP addresses associated with an EFA. If you have an Elastic IP address, you can associate it with an EFA. If your EFA is provisioned in a subnet that has an associated IPv6 CIDR block, you can assign one or more IPv6 addresses to the EFA.

You assign an Elastic IP (IPv4) and IPv6 address to an EFA in the same way that you assign an IP address to an elastic network interface. For more information, see Managing IP addresses.

Change the security group for an EFA

You can change the security group that is associated with an EFA. To enable OS-bypass functionality, the EFA must be a member of a security group that allows all inbound and outbound traffic to and from the security group itself.

You change the security group that is associated with an EFA in the same way that you change the security group that is associated with an elastic network interface. For more information, see Changing the security group.

Detach an EFA

To detach an EFA from an instance, you must first stop the instance. You cannot detach an EFA from an instance that is in the running state.

You detach an EFA from an instance in the same way that you detach an elastic network interface from an instance. For more information, see Detach a network interface from an instance.

View EFAs

You can view all of the EFAs in your account.

You view EFAs in the same way that you view elastic network interfaces. For more information, see View details about a network interface.

Delete an EFA

To delete an EFA, you must first detach it from the instance. You cannot delete an EFA while it is attached to an instance.

You delete EFAs in the same way that you delete elastic network interfaces. For more information, see Delete a network interface.
Monitor an EFA

You can use the following features to monitor the performance of your Elastic Fabric Adapters.

Amazon VPC flow logs

You can create an Amazon VPC Flow Log to capture information about the traffic going to and from an EFA. Flow log data can be published to Amazon CloudWatch Logs and Amazon S3. After you create a flow log, you can retrieve and view its data in the chosen destination. For more information, see VPC Flow Logs in the Amazon VPC User Guide.

You create a flow log for an EFA in the same way that you create a flow log for an elastic network interface. For more information, see Create a flow log in the Amazon VPC User Guide.

In the flow log entries, EFA traffic is identified by the srcAddress and destAddress, which are both formatted as MAC addresses, as shown in the following example.

<table>
<thead>
<tr>
<th>version</th>
<th>accountId</th>
<th>eniId</th>
<th>srcAddress</th>
<th>destAddress</th>
<th>sourcePort</th>
<th>destPort</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2</td>
<td>3794735123</td>
<td>eni-10000001</td>
<td>01:23:45:67:89:ab</td>
<td>05:23:45:67:89:ab</td>
<td>-</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>9</td>
<td>5689</td>
<td>1521232534</td>
<td>1524512343</td>
</tr>
</tbody>
</table>

Amazon CloudWatch

Amazon CloudWatch provides metrics that enable you to monitor your EFAs in real time. You can collect and track metrics, create customized dashboards, and set alarms that notify you or take actions when a specified metric reaches a threshold that you specify. For more information, see Monitor your instances using CloudWatch.

Verify the EFA installer using a checksum

You can optionally verify the EFA tarball (.tar.gz file) using an MD5 or SHA256 checksum. We recommend that you do this to verify the identity of the software publisher and to check that the application has not been altered or corrupted since it was published.

To verify the tarball

Use the md5sum utility for the MD5 checksum, or the sha256sum utility for the SHA256 checksum, and specify the tarball filename. You must run the command from the directory in which you saved the tarball file.
The commands should return a checksum value in the following format.

```
checksum_value  tarball_filename.tar.gz
```

Compare the checksum value returned by the command with the checksum value provided in the table below. If the checksums match, then it is safe to run the installation script. If the checksums do not match, do not run the installation script, and contact AWS Support.

For example, the following command verifies the EFA 1.9.4 tarball using the SHA256 checksum.

```
$ sha256sum aws-efa-installer-1.9.4.tar.gz
```

Example output:

```
1009b5182693490d908ef0ed2c1dd4f813cc310a5d2062ce9619c4c12b5a7f14  aws-efa- installer-1.9.4.tar.gz
```

The following table lists the checksums for recent versions of EFA.

<table>

Amazon EC2 instance topology

Describing your instance topology provides a hierarchical view of the relative proximity between instances. You can use this information to manage high performance computing (HPC) and machine learning (ML) compute infrastructure at scale, while optimizing job placement. HPC and ML jobs are sensitive to latency and throughput. You can use the instance topology to detect the location of your instances, and then use this information to optimize HPC and ML jobs by running them on instances that are physically closer to each other.

You can use instance topology to detect the location of your existing instances, but you can't use it to choose to launch a new instance physically close to an existing instance. To influence instance placement, you can use Capacity Reservations in cluster placement groups.

Pricing

There is no additional cost to describe your instance topology.

Contents

- Prerequisites for instance topology
- Amazon EC2 instance topology examples

How instance topology works

Every EC2 instance connects to a node set. A node set comprises three network nodes, with each node representing a different layer in the AWS network. The network layers are arranged in a
hierarchy of 3 or more layers. The node set provides the top-down view of this hierarchy, with the bottom layer connected closest to an instance.

The information about the node set is called the *instance topology*.

The following diagram provides a visual representation that you can use to understand the instance topology. The network nodes are identified as NN1 – NN7. The numerals i, ii, and iii identify the network layers. The numbers 1, 2, 3, and 4 identify the EC2 instances. Instances connect to a node in the bottom layer, identified by iii. More than one instance can connect to the same node.

In this example:

- Instance 1 connects to network node 4 (NN4) in layer iii. NN4 connects to network node 2 (NN2) in layer ii, and NN2 connects to network node 1 (NN1) in layer i, which is the top of the network hierarchy in this example. The network node set comprises NN1, NN2, and NN4, expressed hierarchically from the upper layers to the bottom layer.
• Instance 2 also connects to network node 4 (NN4). Instance 1 and instance 2 share the same network node set: NN1, NN2, and NN4.

• Instance 3 connects to network node 5 (NN5). NN5 connects to NN2, and NN2 connects to NN1. The network node set for instance 3 is NN1, NN2, and NN5.

• Instance 4 connects to network node 6 (NN6). Its network node set is NN1, NN3, and NN6.

When considering the proximity of instances 1, 2, and 3, instances 1 and 2 are closer to each other because they connect to the same network node (NN4), while instance 3 is further away because it connects to a different network node (NN5).

When considering the proximity of all the instances in this diagram, instances 1, 2, and 3 are closer to each other than they are to instance 4 because they share NN2 in their network node set.

As a general rule, if the network node connected to any two instances is the same, these instances are physically close to each other, as is the case with instances 1 and 2. Furthermore, the fewer the number of hops between network nodes, the closer the instances are to each other. For example, instances 1 and 3 have fewer hops to a common network node (NN2) than they have to the network node (NN1) they have in common with instance 4, and are therefore closer to each other than they are to instance 4.

There are no instances running under network node 7 (NN7) in this example, and therefore the API output won't include NN7.

**How to interpret the output**

You get the instance topology information using the `DescribeInstanceTopology` API. The output provides a hierarchical view of the underlying network topology for an instance.

The following example output corresponds to the network topology information of the four instances in the preceding diagram. Comments are included in the example output for the purposes of this example.

The following information in the output is important to note:

• `NetworkNodes` describes the network node set of an instance.

• In each network node set, the network nodes are listed in hierarchical order from top to bottom.

• The network node that is connected to the instance is the last network node in the list (the bottom layer).
To work out which instances are close to each other, first find common network nodes in the bottom layer. If there are no common network nodes in the bottom layer, then find common network nodes in the upper layers.

In the following example output, `i-1111111111example` and `i-2222222222example` are located closest to each other compared to the other instances in this example because they have the network node `nn-4444444444example` in common in the bottom layer.

```json
{
  "Instances": [
    {
      "InstanceId": "i-1111111111example", //Corresponds to instance 1

      "nn-6666666666example"           //Corresponds to NN6 - layer iii - connected to instance
    ],
    "ZoneId": "usw2-az2",
    "AvailabilityZone": "us-west-2a"
  }
],
  "NextToken": "SomeEncryptedToken"
}

Limitations

The following limitations apply:

- The instances must be in the running state.
- Each instance topology view is unique per account.
- The AWS Management Console does not support viewing the instance topology.

Prerequisites for instance topology

Before you describe the instance topology for your instances, ensure that your instances meet the following requirements.

Requirements to describe the topology of your instances

- **AWS Regions**
- **Instance types**
- **Instance state**
- **IAM permission**
**AWS Regions**

Supported AWS Regions:

- US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon)
- Asia Pacific (Seoul), Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt), Europe (Ireland), Europe (Stockholm)

**Instance types**

Supported instance types:

- hpc6a.48xlarge | hpc6id.32xlarge | hpc7a.12xlarge | hpc7a.24xlarge | hpc7a.48xlarge | hpc7a.96xlarge | hpc7g.4xlarge | hpc7g.8xlarge | hpc7g.16xlarge
- p3dn.24xlarge | p4d.24xlarge | p4de.24xlarge | p5.48xlarge
- trn1.2xlarge | trn1.32xlarge | trn1n.32xlarge

To see the available instance types in a specific Region

The available instance types vary by Region. To see if an instance type is available in a Region, use the `describe-instance-types-offerings` command with the `--region` parameter. Include the `--filters` parameter to scope the results to the instance family or instance type that you're interested in and the `--query` parameter to scope the output to the value of `InstanceType`.

```
aws ec2 describe-instance-type-offerings \
  --region us-east-2 \
  --filters 'Name=instance-type, Values=trn1*' \
  --query 'InstanceTypeOfferings[].InstanceType'
```

Expected output

```
[
  "trn1.2xlarge",
  "trn1.32xlarge",
  "trn1n.32xlarge"
]
```
Instance state

Instances must be in the running state. You can't get instance topology information for instances that are in another state.

IAM permission

Your IAM identity (user, user group, or role) requires the following IAM permission:

- ec2:DescribeInstanceTopology

Amazon EC2 instance topology examples

You can use the describe-instance-topology CLI command to describe the instance topology for your EC2 instances.

When you use the describe-instance-topology command without parameters or filters, the response includes all your instances that match the supported instance types for this command in the specified Region. You can specify the Region by including the --region parameter, or by setting a default Region. For more information about setting a default Region, see Specify the Region for a resource.

You can include parameters to return instances that match specified instance IDs or placement group names. You can also include filters to return instances that match a specified instance type or instance family, or instances in a specified Availability Zone or Local Zone. You can include a single parameter or filter, or a combination of parameters and filters.

The output is paginated, with up to 20 instances per page by default. You can specify up to 100 instances per page using the --max-results parameter.

For more information, see describe-instance-topology in the AWS CLI Command Reference.

Required permissions

The following permission is required to describe instance topology:

- ec2:DescribeInstanceTopology

Examples

- Example 1 - No parameters or filters
• **Example 2 – instance-type filter**
  • **Example 2a – Exact match filter for a specified instance type**
  • **Example 2b – Wild card filter for an instance family**
  • **Example 2c – Combined instance family and exact match filters**

• **Example 3 – zone-id filter**
  • **Example 3a – Availability Zone filter**
  • **Example 3b – Local Zone filter**
  • **Example 3c – Combined Availability Zone and Local Zone filters**

• **Example 4 – Combined instance-type and zone-id filters**

• **Example 5 – Placement group name parameter**

• **Example 6 – Instance IDs**

### Example 1 - No parameters or filters

**To describe the instance topology of all your instances**

Use the [describe-instance-topology](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-topology.html) CLI command without specifying any parameters or filters.

```bash
aws ec2 describe-instance-topology --region us-west-2
```

The response returns only the instances that match the supported instance types for this API. The instances can be in different Availability Zones, Local Zones (`ZoneId`), and placement groups (`GroupName`). If an instance is not in a placement group, the `GroupName` field does not appear in the output. In the following example output, only one instance is in a placement group.

**Example output**

```json
{
  "Instances": [
    {
      "InstanceId": "i-1111111111example",
      "InstanceType": "p4d.24xlarge",
      "GroupName": "my-ml-cpg",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-2222222222example",
        "nn-3333333333example"
      ]
    }
  ]
}
```
"ZoneId": "usw2-az2",
"AvailabilityZone": "us-west-2a"
},
{
"InstanceId": "i-2222222222example",
"InstanceType": "p4d.24xlarge",
"NetworkNodes": [
  "nn-1111111111example",
  "nn-2222222222example",
  "nn-3333333333example"
],
"ZoneId": "usw2-az2",
"AvailabilityZone": "us-west-2a"
},
{
"InstanceId": "i-3333333333example",
"InstanceType": "trn1.32xlarge",
"NetworkNodes": [
  "nn-1212121212example",
  "nn-1211122211example",
  "nn-1311133311example"
],
"ZoneId": "usw2-az4",
"AvailabilityZone": "us-west-2d"
},
{
"InstanceId": "i-4444444444example",

Example 2 – instance-type filter

You can filter by a specified instance type (exact match) or filter by an instance family (using a wildcard). You can also combine a specified instance type filter and instance family filter.

Example 2a – Exact match filter for a specified instance type

To describe the instance topology of all your instances that match a specified instance type

Example 2a – Exact match filter for a specified instance type

To describe the instance topology of all your instances that match a specified instance type

Use the describe-instance-topology CLI command with the instance-type filter. In this example, the output is filtered for trn1n.32xlarge instances. The response will return only the instances that match the specified instance type.

```
aws ec2 describe-instance-topology \
   --region us-west-2 \
   --filters Name=instance-type,Values=trn1n.32xlarge
```

Example output

```
{
   "Instances": [
      {
         "InstanceId": "i-2222222222example",
         "InstanceType": "trn1n.32xlarge",
         "NetworkNodes": [
            "nn-1111111111example",
            "nn-2222222222example",
            "nn-3333333333example"
         ],
         "ZoneId": "usw2-az2",
         "AvailabilityZone": "us-west-2a"
      }
   ],
   "NextToken": "SomeEncryptedToken"
}
```

Example 2b – Wild card filter for an instance family

Example 2b – Wild card filter for an instance family

To describe the instance topology of all your instances that match an instance family

```
Use the `describe-instance-topology` CLI command with the `instance-type` filter. In this example, the output is filtered for `trn1*` instances. The response will return only the instances that match the specified instance family.

```
aws ec2 describe-instance-topology \
  --region us-west-2 \
  --filters Name=instance-type,Values=trn1*
```

Example output

```
{
   "Instances": [
   {
      "InstanceId": "i-2222222222example",
      "InstanceType": "trn1n.32xlarge",
      "NetworkNodes": [
         "nn-1111111111example",
         "nn-2222222222example",
         "nn-3333333333example"
      ],
      "ZoneId": "usw2-az2",
      "AvailabilityZone": "us-west-2a"
   },
   {
      "InstanceId": "i-3333333333example",
      "InstanceType": "trn1.32xlarge",
      "NetworkNodes": [
         "nn-1212121212example",
         "nn-1211122211example",
         "nn-1311133311example"
      ],
      "ZoneId": "usw2-az4",
      "AvailabilityZone": "us-west-2d"
   },
   {
      "InstanceId": "i-4444444444example",
      "InstanceType": "trn1.2xlarge",
      "NetworkNodes": [
         "nn-1111111111example",
         "nn-543434334example",
         "nn-1235301234example"
      ],
      "ZoneId": "usw2-az2",
```
"AvailabilityZone": "us-west-2a"
],
"NextToken": "SomeEncryptedToken"
}

**Example 2c – Combined instance family and exact match filters**

**To describe the instance topology of all your instances that match an instance family or specified instance type**

Use the [describe-instance-topology](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-topology.html) CLI command with the `instance-type` filter. In this example, the output is filtered for `pd4d*` or `trn1n.32xlarge` instances. The response will return the instances that match any of the specified filters.

```bash
aws ec2 describe-instance-topology \
  --region us-west-2 \
  --filters "Name=instance-type,Values=p4d*,trn1n.32xlarge"
```

**Example output**

```json
{
  "Instances": [
    {
      "InstanceId": "i-1111111111example",
      "InstanceType": "p4d.24xlarge",
      "GroupName": "ML-group",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-2222222222example",
        "nn-3333333333example"
      ],
      "ZoneId": "usw2-az2",
      "AvailabilityZone": "us-west-2a"
    },
    {
      "InstanceId": "i-2222222222example",
      "InstanceType": "trn1n.32xlarge",
      "NetworkNodes": [
        "nn-1111111111example",
        "nn-2222222222example",
        "nn-4343434343example"
      ],
```
Example 3 – zone-id filter

You can use the zone-id filter to filter by an Availability Zone or Local Zone. You can also combine an Availability Zone filter and Local Zone filter.

Example 3a – Availability Zone filter

To describe the instance topology of all your instances that match a specified Availability Zone

Use the describe-instance-topology CLI command with the zone-id filter. In this example, the output is filtered using the Availability Zone ID use1-az1. The response will return only the instances that match the specified Availability Zone.

```bash
aws ec2 describe-instance-topology \
    --region us-east-1 \
    --filters Name=zone-id,Values=use1-az1
```

Example output

```json
{
    "Instances": [
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3214313214example"
            ],
            "ZoneId": "use1-az1",
            "AvailabilityZone": "us-east-1a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```
Example 3b – Local Zone filter

To describe the instance topology of all your instances that match a specified Local Zone

Use the `describe-instance-topology` CLI command with the `zone-id` filter. In this example, the output is filtered using the Local Zone ID `use1-atl2-az1`. The response will return only the instances that match the specified Local Zone.

```
aws ec2 describe-instance-topology \
  --region us-east-1 \
  --filters Name=zone-id,Values=use1-atl2-az1
```

Example output

```
{
   "Instances": [
   {
      "InstanceId": "i-1111111111example",
      "InstanceType": "p4d.24xlarge",
      "GroupName": "ML-group",
      "NetworkNodes": [
         "nn-1111111111example",
         "nn-2222222222example",
         "nn-3333333333example"
      ],
      "ZoneId": "use1-atl2-az1",
      "AvailabilityZone": "us-east-1-atl-2a"
   }
   ],
   "NextToken": "SomeEncryptedToken"
}
```

Example 3c – Combined Availability Zone and Local Zone filters

To describe the instance topology of all your instances that match a specified Availability Zone or Local Zone

Use the `describe-instance-topology` CLI command with the `zone-id` filter. In this example, the output is filtered using the Availability Zone ID `use1-az1` and the Local Zone ID `use1-atl2-az1`. The response will return the instances that match any of the specified filters.

```
aws ec2 describe-instance-topology \
```

Examples
Example 4 – Combined instance-type and zone-id filters

You can combine all the filters in a single command.

To describe the instance topology of all your instances that match a specified instance type, instance family, Availability Zone, or Local Zone

Use the describe-instance-topology CLI command with the instance-type and zone-id filters. In this example, the output is filtered for the p4d* instance family, trn1n.32xlarge instance
type, use1-az1 Availability Zone ID, and use1-atl2-az1 Local Zone ID. The response will return
the instances that match p4d* or trn1n.32xlarge instances in the us-east-1a or us-east-1-atl2-az1 zones.

```
aws ec2 describe-instance-topology \
   --region us-east-1 \
   --filters "Name=instance-type,Values=p4d*,trn1n.32xlarge" "Name=zone-id,Values=use1-az1,use1-atl2-az1"
```

Example output

```
{
   "Instances": [
      {
         "InstanceId": "i-1111111111example",
         "InstanceType": "p4d.24xlarge",
         "GroupName": "ML-group",
         "NetworkNodes": [
            "nn-1111111111example",
            "nn-2222222222example",
            "nn-3333333333example"
         ],
         "ZoneId": "use1-atl2-az1",
         "AvailabilityZone": "us-east-1-atl2-az1"
      },
      {
         "InstanceId": "i-2222222222example",
         "InstanceType": "trn1n.32xlarge",
         "NetworkNodes": [
            "nn-1111111111example",
            "nn-2222222222example",
            "nn-3214313214example"
         ],
         "ZoneId": "use1-az1",
         "AvailabilityZone": "us-east-1a"
      }
   ],
   "NextToken": "SomeEncryptedToken"
}
```
Example 5 – Placement group name parameter

To describe the instance topology of all your instances in a specified placement group

Use the `describe-instance-topology` CLI command with the `group-names` parameter. In the following example, the instances can be in the ML-group or HPC-group placement group. The response will return instances that are in either of the placement groups.

```bash
aws ec2 describe-instance-topology \
  --region us-west-2 \
  --group-names ML-group HPC-group
```

Example output

```json
{
   "Instances": [
      {
         "InstanceId": "i-1111111111example",
         "InstanceType": "p4d.24xlarge",
         "GroupName": "ML-group",
         "NetworkNodes": [
            "nn-1111111111example",
            "nn-2222222222example",
            "nn-3333333333example"
         ],
         "ZoneId": "usw2-az2",
         "AvailabilityZone": "us-west-2a"
      },
      {
         "InstanceId": "i-2222222222example",
         "InstanceType": "trn1n.32xlarge",
         "GroupName": "HPC-group",
         "NetworkNodes": [
            "nn-1111111111example",
            "nn-2222222222example",
            "nn-3214313214example"
         ],
         "ZoneId": "usw2-az2",
         "AvailabilityZone": "us-west-2a"
      }
   ],
   "NextToken": "SomeEncryptedToken"
}
```
Example 6 – Instance IDs

To describe the instance topology of specified instances

Use the `describe-instance-topology` CLI command with the `--instance-ids` parameter. The response will return the instances that match the specified instance IDs.

```
aws ec2 describe-instance-topology \
    --region us-west-2 \
    --instance-ids i-1111111111example i-2222222222example
```

Example output

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "GroupName": "HPC-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3214313214example"
            ],
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        }
    ]
}
```
Placement groups

To meet the needs of your workload, you can launch a group of *interdependent* EC2 instances into a *placement group* to influence their placement.

Depending on the type of workload, you can create a placement group using one of the following placement strategies:

- **Cluster** – Packs instances close together inside an Availability Zone. This strategy enables workloads to achieve the low-latency network performance necessary for tightly-coupled node-to-node communication that is typical of high-performance computing (HPC) applications.

- **Partition** – Spreads your instances across logical partitions such that groups of instances in one partition do not share the underlying hardware with groups of instances in different partitions. This strategy is typically used by large distributed and replicated workloads, such as Hadoop, Cassandra, and Kafka.

- **Spread** – Strictly places a small group of instances across distinct underlying hardware to reduce correlated failures.

Placement groups are optional. If you don't launch your instances into a placement group, EC2 tries to place the instances in such a way that all of your instances are spread out across the underlying hardware to minimize correlated failures.

There is no charge for creating a placement group.

Placement strategies

You can create a placement group using one of the following placement strategies.

**Placement strategies:**

- [Cluster placement groups](#)
- [Partition placement groups](#)
- [Spread placement groups](#)
Cluster placement groups

A cluster placement group is a logical grouping of instances within a single Availability Zone. Instances are not isolated to a single rack. A cluster placement group can span peered virtual private networks (VPCs) in the same Region. Instances in the same cluster placement group enjoy a higher per-flow throughput limit for TCP/IP traffic and are placed in the same high-bisection bandwidth segment of the network.

The following image shows instances that are placed into a cluster placement group.

Cluster placement groups are recommended for applications that benefit from low network latency, high network throughput, or both. They are also recommended when the majority of the network traffic is between the instances in the group. To provide the lowest latency and the highest packet-per-second network performance for your placement group, choose an instance type that supports enhanced networking. For more information, see Enhanced Networking.

We recommend that you launch your instances in the following way:

- Use a single launch request to launch the number of instances that you need in the placement group.
- Use the same instance type for all instances in the placement group.

If you try to add more instances to the placement group later, or if you try to launch more than one instance type in the placement group, you increase your chances of getting an insufficient capacity error.

If you stop an instance in a placement group and then start it again, it still runs in the placement group. However, the start fails if there isn't enough capacity for the instance.
If you receive a capacity error when launching an instance in a placement group that already has running instances, stop and start all of the instances in the placement group, and try the launch again. Starting the instances may migrate them to hardware that has capacity for all of the requested instances.

**Partition placement groups**

Partition placement groups help reduce the likelihood of correlated hardware failures for your application. When using partition placement groups, Amazon EC2 divides each group into logical segments called partitions. Amazon EC2 ensures that each partition within a placement group has its own set of racks. Each rack has its own network and power source. No two partitions within a placement group share the same racks, allowing you to isolate the impact of hardware failure within your application.

The following image is a simple visual representation of a partition placement group in a single Availability Zone. It shows instances that are placed into a partition placement group with three partitions—**Partition 1**, **Partition 2**, and **Partition 3**. Each partition comprises multiple instances. The instances in a partition do not share racks with the instances in the other partitions, allowing you to contain the impact of a single hardware failure to only the associated partition.

![Partition placement group diagram](image)

Partition placement groups can be used to deploy large distributed and replicated workloads, such as HDFS, HBase, and Cassandra, across distinct racks. When you launch instances into a partition placement group, Amazon EC2 tries to distribute the instances evenly across the number of partitions that you specify. You can also launch instances into a specific partition to have more control over where the instances are placed.

A partition placement group can have partitions in multiple Availability Zones in the same Region. A partition placement group can have a maximum of seven partitions per Availability Zone. The
number of instances that can be launched into a partition placement group is limited only by the limits of your account.

In addition, partition placement groups offer visibility into the partitions — you can see which instances are in which partitions. You can share this information with topology-aware applications, such as HDFS, HBase, and Cassandra. These applications use this information to make intelligent data replication decisions for increasing data availability and durability.

If you start or launch an instance in a partition placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later.

**Spread placement groups**

A spread placement group is a group of instances that are each placed on distinct hardware.

Spread placement groups are recommended for applications that have a small number of critical instances that should be kept separate from each other. Launching instances in a spread level placement group reduces the risk of simultaneous failures that might occur when instances share the same equipment. Spread level placement groups provide access to distinct hardware, and are therefore suitable for mixing instance types or launching instances over time.

If you start or launch an instance in a spread placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later. Placement groups can spread instances across racks or hosts. Rack level spread placement groups can be used in AWS Regions and on AWS Outposts. Host level spread placement groups can be used with AWS Outposts only.

**Rack level spread placement groups**

The following image shows seven instances in a single Availability Zone that are placed into a spread placement group. The seven instances are placed on seven different racks, each rack has its own network and power source.
A rack level spread placement group can span multiple Availability Zones in the same Region. In a Region, a rack level spread placement group can have a maximum of seven running instances per Availability Zone per group. With Outposts, a rack level spread placement group can hold as many instances as you have racks in your Outpost deployment.

**Host level spread placement groups**

Host level spread placement groups are only available with AWS Outposts. A host spread level placement group can hold as many instances as you have hosts in your Outpost deployment. For more information, see the section called “Placement groups on AWS Outposts”.

**Placement group rules and limitations**

**Topics**

- General rules and limitations
- Cluster placement group rules and limitations
- Partition placement group rules and limitations
- Spread placement group rules and limitations

**General rules and limitations**

Before you use placement groups, be aware of the following rules:

- You can create a maximum of 500 placement groups per account in each Region.
- The name that you specify for a placement group must be unique within your AWS account for the Region.
• You can't merge placement groups.

• An instance can be launched in one placement group at a time; it cannot span multiple placement groups.

• **On-Demand Capacity Reservations** and **zonal Reserved Instances** allow you to reserve capacity for EC2 instances in Availability Zones. When you launch an instance, if the instance attributes match those specified by an On-Demand Capacity Reservation or a zonal Reserved Instance, then the reserved capacity is automatically used by the instance. This is also true if you launch the instance into a placement group.

If you plan to launch instances into a *cluster* placement group, we recommend that you reserve capacity explicitly in the cluster placement group. You can do this by creating an **On-Demand Capacity Reservation in a specified cluster placement group**. Note that while you can reserve capacity in this way using On-Demand Capacity Reservations, the same can't be done with zonal Reserved Instances as they can't reserve capacity explicitly in a placement group.

• You can't launch Dedicated Hosts in placement groups.

• You can't launch a Spot Instance that is configured to stop or hibernate on interruption in a placement group.

### Cluster placement group rules and limitations

The following rules apply to cluster placement groups:

• The following instance types are supported:
  
  • Current generation instances, except for **burstable performance** instances (for example, T2), **Mac1 instances**, and M7i-flex instances.
  
  • The following previous generation instances: A1, C3, C4, I2, M4, R3, and R4.

• A cluster placement group can't span multiple Availability Zones.

• The maximum network throughput speed of traffic between two instances in a cluster placement group is limited by the slower of the two instances. For applications with high-throughput requirements, choose an instance type with network connectivity that meets your requirements.

• For instances that are enabled for enhanced networking, the following rules apply:
  
  • Instances within a cluster placement group can use up to 10 Gbps for single-flow traffic. Instances that are not within a cluster placement group can use up to 5 Gbps for single-flow traffic.
• Traffic to and from Amazon S3 buckets within the same Region over the public IP address space or through a VPC endpoint can use all available instance aggregate bandwidth.

• You can launch multiple instance types into a cluster placement group. However, this reduces the likelihood that the required capacity will be available for your launch to succeed. We recommend using the same instance type for all instances in a cluster placement group.

• Network traffic to the internet and over an AWS Direct Connect connection to on-premises resources is limited to 5 Gbps for cluster placement groups.

### Partition placement group rules and limitations

The following rules apply to partition placement groups:

• A partition placement group supports a maximum of seven partitions per Availability Zone. The number of instances that you can launch in a partition placement group is limited only by your account limits.

• When instances are launched into a partition placement group, Amazon EC2 tries to evenly distribute the instances across all partitions. Amazon EC2 doesn’t guarantee an even distribution of instances across all partitions.

• A partition placement group with Dedicated Instances can have a maximum of two partitions.

• Capacity Reservations do not reserve capacity in a partition placement group.

### Spread placement group rules and limitations

The following rules apply to spread placement groups:

• A rack spread placement group supports a maximum of seven running instances per Availability Zone. For example, in a Region with three Availability Zones, you can run a total of 21 instances in the group, with seven instances in each Availability Zone. If you try to start an eighth instance in the same Availability Zone and in the same spread placement group, the instance will not launch. If you need more than seven instances in an Availability Zone, we recommend that you use multiple spread placement groups. Using multiple spread placement groups does not provide guarantees about the spread of instances between groups, but it does help ensure the spread for each group, thus limiting the impact from certain classes of failures.

• Spread placement groups are not supported for Dedicated Instances.
• Host level spread placement groups are only supported for placement groups on AWS Outposts. A host level spread placement group can hold as many instances as you have hosts in your Outpost deployment.

• In a Region, a rack level spread placement group can have a maximum of seven running instances per Availability Zone per group. With AWS Outposts, a rack level spread placement group can hold as many instances as you have racks in your Outpost deployment.

• Capacity Reservations do not reserve capacity in a spread placement group.

Work with placement groups

Contents

• Create a placement group
• View placement group information
• Tag a placement group
• Launch instances in a placement group
• Describe instances in a placement group
• Change the placement group for an instance
• Remove an instance from a placement group
• Delete a placement group

Create a placement group

You can create a placement group using one of the following methods.

Console

To create a placement group using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Placement Groups.
3. Choose Create placement group.
4. Specify a name for the group.
5. Choose the placement strategy for the group.
6. If you choose Spread, choose the spread level.
- **Rack** - no restrictions
- **Host** - only for Outposts
- If you choose **Partition**, choose the number of partitions within the group.

6. To tag the placement group, choose **Add tag**, and then enter a key and value. Choose **Add tag** for each tag that you want to add.

7. Choose **Create group**.

**AWS CLI**

**To create a placement group using the AWS CLI**

Use the `create-placement-group` command. The following example creates a placement group named `my-cluster` that uses the `cluster` placement strategy, and it applies a tag with a key of `purpose` and a value of `production`.

```bash
aws ec2 create-placement-group \
  --group-name my-cluster \
  --strategy cluster \
  --tag-specifications 'ResourceType=placement-group,Tags={Key=purpose,Value=production}'
```

**To create a partition placement group using the AWS CLI**

Use the `create-placement-group` command. Specify the `--strategy` parameter with the value `partition`, and specify the `--partition-count` parameter with the desired number of partitions. In this example, the partition placement group is named `HDFS-Group-A` and is created with five partitions.

```bash
aws ec2 create-placement-group \
  --group-name HDFS-Group-A \
  --strategy partition \
  --partition-count 5
```

**PowerShell**

**To create a placement group using the AWS Tools for Windows PowerShell**

Use the `New-EC2PlacementGroup` command.
View placement group information

You can view all your placement groups and the information about them using one of the following methods.

Console

To view information about one or more placement groups

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, under Network & Security, choose Placement Groups.
3. In the Placement groups table, for each placement group, you can view the following information:

   - Group name – The name that you gave to the placement group.
   - Group Id – The ID of the placement group.
   - Strategy – The placement strategy for the placement group.
   - State – The state of the placement group.
   - Partition – The number of partitions. Valid only if the strategy is partition.
   - Group ARN – The Amazon Resource Name (ARN) of the placement group.

AWS CLI

To describe all your placement groups

Use the describe-placement-groups AWS CLI command.

```
aws ec2 describe-placement-groups
```

Example response

```
{
   "PlacementGroups": [
       {
           "GroupName": "my-cluster-pg",
           "State": "available",
           "Strategy": "cluster",
           "GroupId": "pg-0123456789example",
```

Work with placement groups
To describe a specified placement group

Use the `describe-placement-groups` AWS CLI command. You can specify either the `--group-id` or the `--group-name` parameter.

Specify placement group ID:

```
aws ec2 describe-placement-groups --group-id pg-0123456789example
```

Specify placement group name:

```
aws ec2 describe-placement-groups --group-name my-cluster-pg
```

Example response

```
{
   "PlacementGroups": [
   {
      "GroupName": "my-cluster-pg",
      "State": "available",
      "Strategy": "cluster",
      "GroupId": "pg-0123456789example",
      "GroupArn": "arn:aws:ec2:eu-west-1:111111111111:placement-group/my-cluster-pg"
   }
   ]
}
```

Tag a placement group

To help categorize and manage your existing placement groups, you can tag them with custom metadata. For more information about how tags work, see [Tag your Amazon EC2 resources](#).
When you tag a placement group, the instances that are launched into the placement group are not automatically tagged. You need to explicitly tag the instances that are launched into the placement group.

You can view, add, and delete tags using one of the following methods.

**Console**

**To view, add, or delete a tag for an existing placement group**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Placement Groups.
3. Select a placement group, and then choose Actions, Manage tags.
4. The Manage tags screen displays any tags that are assigned to the placement group.
   - To add a tag, choose Add tag, and then enter the tag key and value. You can add up to 50 tags per placement group. For more information, see Tag restrictions.
   - To delete a tag, choose Remove next to the tag that you want to delete.
5. Choose Save.

**AWS CLI**

**To view placement group tags**

Use the describe-tags command to view the tags for the specified resource. In the following example, you describe the tags for all of your placement groups.

```
aws ec2 describe-tags \
   --filters Name=resource-type,Values=placement-group
```

```
{
   "Tags": [
   {
      "Key": "Environment",
      "ResourceId": "pg-0123456789EXAMPLE",
      "ResourceType": "placement-group",
      "Value": "Production"
   },
   {
   ...
```
You can also use the `describe-tags` command to view the tags for a placement group by specifying its ID. In the following example, you describe the tags for `pg-0123456789EXAMPLE`.

```
aws ec2 describe-tags \
   --filters Name=resource-id,Values=pg-0123456789EXAMPLE
```

```
{
   "Tags": [
   {
      "Key": "Environment",
      "ResourceId": "pg-0123456789EXAMPLE",
      "ResourceType": "placement-group",
      "Value": "Production"
   }
   ]
}
```

You can also view the tags of a placement group by describing the placement group.

Use the `describe-placement-groups` command to view the configuration of the specified placement group, which includes any tags that were specified for the placement group.

```
aws ec2 describe-placement-groups \
   --group-name my-cluster
```

```
{
   "PlacementGroups": [
   {
      "GroupName": "my-cluster",
      "State": "available",
      "Strategy": "cluster",
      "Tags": [
      {
         "Key": "Environment",
         "ResourceId": "pg-0123456789EXAMPLE",
         "ResourceType": "placement-group",
         "Value": "Production"
      }
      ]
   }
   ]
}
```
To tag an existing placement group using the AWS CLI

You can use the `create-tags` command to tag existing resources. In the following example, the existing placement group is tagged with `Key=Cost-Center` and `Value=CC-123`.

```bash
aws ec2 create-tags \
  --resources pg-0123456789EXAMPLE \
  --tags Key=Cost-Center,Value=CC-123
```

To delete a tag from a placement group using the AWS CLI

You can use the `delete-tags` command to delete tags from existing resources. For examples, see `Examples` in the `AWS CLI Command Reference`.

PowerShell

To view placement group tags

Use the `Get-EC2Tag` command.

To describe the tags for a specific placement group

Use the `Get-EC2PlacementGroup` command.

To tag an existing placement group

Use the `New-EC2Tag` command.

To delete a tag from a placement group

Use the `Remove-EC2Tag` command.
Launch instances in a placement group

You can launch an instance into a placement group if the placement group rules and limitations are met using one of the following methods.

Console

To launch instances into a placement group

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. From the EC2 console dashboard, in the Launch instance box, choose Launch instance. Complete the form as directed, taking care to do the following:
   - Under Instance type, select an instance type that can be launched into a placement group.
   - In the Summary box, under Number of instances, enter the total number of instances that you need in this placement group, because you might not be able to add instances to the placement group later.
   - Under Advanced details, for Placement group name, you can choose to add the instances to a new or existing placement group. If you choose a placement group with a partition strategy, for Target partition, choose the partition in which to launch the instances.

AWS CLI

To launch instances into a placement group

Use the run-instances command and specify the placement group name using the --placement "GroupName = my-cluster" parameter. In this example, the placement group is named my-cluster.

aws ec2 run-instances --placement "GroupName = my-cluster"

To launch instances into a specific partition of a partition placement group using the AWS CLI

Use the run-instances command and specify the placement group name and partition using the --placement "GroupName = HDFS-Group-A, PartitionNumber = 3" parameter. In this example, the placement group is named HDFS-Group-A and the partition number is 3.
PowerShell

To launch instances into a placement group using AWS Tools for Windows PowerShell

Use the `New-EC2Instance` command and specify the placement group name using the `-Placement_GroupName` parameter.

Describe instances in a placement group

You can view the placement information of your instances using one of the following methods. You can also filter partition placement groups by the partition number using the AWS CLI.

Console

To view the placement group and partition number of an instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance.
4. On the Details tab, under Host and placement group, find Placement group. If the instance is not in a placement group, the field is empty. Otherwise, it contains the name of the placement group name. If the placement group is a partition placement group, Partition number contains the partition number for the instance.

AWS CLI

To view the partition number for an instance in a partition placement group

Use the `describe-instances` command and specify the --instance-id parameter.

The response contains the placement information, which includes the placement group name and the partition number for the instance.
To filter instances for a specific partition placement group and partition number

Use the `describe-instances` command and specify the `--filters` parameter with the `placement-group-name` and `placement-partition-number` filters. In this example, the placement group is named `HDFS-Group-A` and the partition number is 7.

```
aws ec2 describe-instances --filters "Name = placement-group-name, Values = HDFS-Group-A" "Name = placement-partition-number, Values = 7"
```

The response lists all the instances that are in the specified partition within the specified placement group. The following is example output showing only the instance ID, instance type, and placement information for the returned instances.

```
"Instances": [
    {
      "InstanceId": "i-0a1bc23d4567e8f90",
      "InstanceType": "r4.large",
    },
    {
      "Placement": {
        "AvailabilityZone": "us-east-1c",
        "GroupName": "HDFS-Group-A",
        "PartitionNumber": 7,
        "Tenancy": "default"
      }
    },
    {
      "InstanceId": "i-0a9b876cd5d4ef321",
      "InstanceType": "r4.large",
    },
    {
      "Placement": {
        "AvailabilityZone": "us-east-1c",
        "GroupName": "HDFS-Group-A",
        "PartitionNumber": 7,
        "Tenancy": "default"
      }
    }
  ]
```
Change the placement group for an instance

You can change the placement group for an instance as follows:

- Move an existing instance to a placement group
- Move an instance from one placement group to another

Before you can move the instance, the instance must be in the stopped state.

Console

**To move an instance to a placement group**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instance, and then choose **Instance state, Stop instance**.
4. With the instance selected, choose **Actions, Instance settings, Modify instance placement**.
5. For **Placement group**, choose the placement group to move the instance to.
6. Choose **Save**.

AWS CLI

**To move an instance to a placement group**

1. Stop the instance using the **stop-instances** command.
2. Use the **modify-instance-placement** command and specify the name of the placement group to move the instance to.

   ```bash
   aws ec2 modify-instance-placement \
   --instance-id i-0123a456700123456 \
   --group-name MySpreadGroup
   ```
3. Start the instance using the **start-instances** command.
PowerShell

**To move an instance to a placement group using the AWS Tools for Windows PowerShell**

1. Stop the instance using the `Stop-EC2Instance` command.
2. Use the `Edit-EC2InstancePlacement` command and specify the name of the placement group to which to move the instance.
3. Start the instance using the `Start-EC2Instance` command.

**Remove an instance from a placement group**

You can remove an instance from a placement group using one of the following methods.

Before you can remove an instance from a placement group, the instance must be in the stopped state.

**Console**

**To remove an instance from a placement group**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instance, and then choose **Instance state, Stop instance**.
4. With the instance selected, choose **Actions, Instance settings, Modify instance placement**.
5. For **Placement group**, choose **None**.
6. Choose **Save**.

**AWS CLI**

**To remove an instance from a placement group**

1. Stop the instance using the `stop-instances` command.
2. Use the `modify-instance-placement` command and specify an empty string for the placement group name.

```bash
aws ec2 modify-instance-placement \
--instance-id i-0123a456700123456 \
```
3. Start the instance using the `start-instances` command.

**PowerShell**

**To remove an instance from a placement group using the AWS Tools for Windows PowerShell**

1. Stop the instance using the `Stop-EC2Instance` command.
2. Use the `Edit-EC2InstancePlacement` command and specify an empty string for the placement group name.
3. Start the instance using the `Start-EC2Instance` command.

**Delete a placement group**

If you need to replace a placement group or no longer need one, you can delete it. You can delete a placement group using one of the following methods.

**Prerequisite**

Before you can delete a placement group, it must contain no instances. You can **terminate** all instances that you launched in the placement group, **move** instances to another placement group, or **remove** instances from the placement group.

**Console**

**To delete a placement group**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Placement Groups**.
3. Select the placement group and choose **Actions, Delete**.
4. When prompted for confirmation, enter **Delete** and then choose **Delete**.

**AWS CLI**

**To delete a placement group**
Use the `delete-placement-group` command and specify the placement group name to delete the placement group. In this example, the placement group name is `my-cluster`.

```
aws ec2 delete-placement-group --group-name my-cluster
```

**PowerShell**

**To delete a placement group using the AWS Tools for Windows PowerShell**

Use the `Remove-EC2PlacementGroup` command to delete the placement group.

**Share a placement group**

Placement group sharing allows you to influence the placement of interdependent instances that are owned by separate AWS accounts. You can share a placement group across multiple AWS accounts or within your organizations. You can launch instances in a shared placement group.

A placement group owner can share a placement group with:

- Specific AWS accounts inside or outside of its organization
- An organizational unit inside its organization
- Its entire organization

**Note**

The AWS account from which you want to share a placement group must have the following permissions in the IAM policy.

- `ec2:PutResourcePolicy`
- `ec2:DeleteResourcePolicy`

**Topics**

- **Rules and limitations**
- **Share across Availability Zones**
- **Share a placement group**
• **Identify a shared placement group**
• **Launch an instance in a shared placement group**
• **Unshare a shared placement group**

**Rules and limitations**

The following rules and limitations apply when you share a placement group or when a placement group is shared with you.

- To share a placement group, you must own it in your AWS account. You cannot share a placement group that has been shared with you.
- When you share a partition or spread placement group, the placement group limits do not change. A shared partition placement group supports a maximum of seven partitions per Availability Zone, and a shared spread placement group supports a maximum of seven running instances per Availability Zone.
- To share a placement group with your organization or an organizational unit in your organization, you must enable sharing with AWS Organizations. For more information, see [Sharing your AWS resources](#).
- You are responsible for managing the instances owned by you in a shared placement group.
- You cannot view or modify instances and capacity reservations that are associated with a shared placement group but not owned by you.

**Share across Availability Zones**

To ensure that resources are distributed across the Availability Zones for a Region, we independently map Availability Zones to names for each account. This could lead to Availability Zone naming differences across accounts. For example, the Availability Zone `us-east-1a` for your AWS account might not have the same location as `us-east-1a` for another AWS account.

To identify the location of your Dedicated Hosts relative to your accounts, you must use the Availability Zone ID (AZ ID). The Availability Zone ID is a unique and consistent identifier for an Availability Zone across all AWS accounts. For example, `use1-az1` is an Availability Zone ID for the `us-east-1` Region and it is the same location in every AWS account.

To view the Availability Zone IDs for the Availability Zones in your account

2. The Availability Zone IDs for the current Region are displayed under **Your AZ ID** in the right panel.

**Share a placement group**

To share a placement group, you must add it to a resource share. A resource share is an AWS RAM resource that lets you share your resources across AWS accounts. A resource share specifies the resources to share, and the consumers with whom they are shared.

If you are part of an organization in AWS Organizations sharing within your organization is enabled, consumers in your organization are granted access to the shared placement group.

If the placement group is shared with an AWS account outside of your organization, the AWS account owner will receive an invitation to join the resource share. They can access the shared placement group after accepting the invitation.

You can share a placement group across AWS accounts using [https://console.aws.amazon.com/ram](https://console.aws.amazon.com/ram) or AWS CLI.

**AWS RAM console**

To **share a placement group** you own using [https://console.aws.amazon.com/ram](https://console.aws.amazon.com/ram), see [Creating a resource share](#).  

**AWS CLI**

To **share a placement group** you own, use the `create-resource-share` command.

**Identify a shared placement group**

The Amazon Resource Name (ARN) of a placement group contains the 12-digit account ID of the account that owns the placement group. You can use the account ID to identify the owner of a placement group that is shared with you.

You can find the placement group ARN using one of the following methods. For more information, see [View placement group information](#).
Amazon EC2 console

To identify a shared placement group

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, under Network & Security, choose Placement Groups.
3. The Placement groups table lists all the placement groups that are owned by you and shared with you. The Group ARN column displays the placement group ARN.

   If the Group ARN column isn't visible, choose settings ( ) in the top-right corner, turn on Group ARN, and choose Confirm.

AWS CLI

To identify a shared placement group

Use describe-placement-groups command to list all the placement groups that are owned by you and shared with you. In the response, the GroupId parameter displays the ARN of a placement group.

Launch an instance in a shared placement group

⚠️ Important

When using the AWS CLI to launch an instance in a shared placement group, you must specify the placement group ID by using the GroupId parameter.

You can use the placement group name only if you're the owner of the placement group being shared. We recommend using the placement group ID to avoid potential placement group name collisions between AWS accounts.

You can find the ID of a placement group in the Amazon EC2 console on the Placement Groups screen or by using the describe-placement-groups AWS CLI command. For more information, see View placement group information.
To launch instances into a shared placement group

1. Follow the procedure to launch an instance, but don't launch the instance until you've completed the following steps to specify the settings for the placement group.

2. Under Instance type, select a supported instance type. For more information, see Placement group rules and limitations.

3. Expand Advanced details, and configure the placement group settings as follows:
   a. For Placement group, select the placement group that was shared with you.
      
      Note
      If there are placement groups with the same name, check the placement group ID to make sure that you select the correct placement group.
      
   b. If you choose a placement group with a partition strategy, for Target partition, choose the partition in which to launch the instance.

4. In the Summary panel, do the following:
   a. For Number of instances, enter the total number of instances that you need in this placement group, because you might not be able to add instances to the placement group later.
   b. Review your instance configuration, and then choose Launch instance.

For more information, see Launch an instance using the new launch instance wizard.

AWS CLI

To launch instances in a shared placement group

Use the run-instances command and specify the placement group ID of the shared placement group.

aws ec2 run-instances --placement "GroupId = pg-0123456789example"

To launch instances into a specific partition of a shared partition placement group
Use the `run-instances` command and specify the placement group ID and the partition number of the shared placement group.

```bash
aws ec2 run-instances --placement "GroupId = pg-0123456789example, PartitionNumber = 3"
```

**Tip**

Use VPC peering to connect instances owned by separate AWS accounts and get the full latency benefits offered by shared cluster placement groups. For more information, see [What is VPC peering?](#).

## Unshare a shared placement group

The placement group owner can unshare a shared placement group at any time.

When you unshare a shared placement group, the following changes will take effect.

- The AWS accounts with which a placement group was shared will no longer be able to launch instances or reserve capacity.
- If your instances were running in a shared placement group, they will be disassociated from the placement group but continue to run normally in your AWS account.
- If you had capacity reservations in a shared placement group, they will be disassociated from the placement group but you will continue to have access to them in your AWS account.

You can unshare a shared placement group using one of the following methods.

**AWS RAM console**

To unshare a shared placement group using [https://console.aws.amazon.com/ram](https://console.aws.amazon.com/ram), see [Deleting a resource share](#).

**AWS CLI**

To unshare a shared placement group using AWS Command Line Interface, use the [disassociate-resource-share](#) command.
Placement groups on AWS Outposts

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming interfaces as in AWS Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region.

You can create placement groups on Outposts that you have created in your account. This allows you to spread out instances across underlying hardware on an Outpost at your site. You create and use placement groups on Outposts in the same way that you create and use placement groups in regular Availability Zones. When you create a placement group with a spread strategy on an Outpost, you can choose to have the placement group spread instances across hosts or racks. Spreading instances across hosts allows you to use a spread strategy with a single rack Outpost.

Considerations

- A rack level spread placement group can hold as many instances as you have racks in your Outpost deployment.
- A host level spread placement group can hold as many instances as you have hosts in your Outpost deployment.

Prerequisite

You must have an Outpost installed at your site. For more information, see Create an Outpost and order Outpost capacity in the AWS Outposts User Guide.

To use a placement group on an Outpost

1. Create a subnet on the Outpost. For more information, see Create a subnet in the AWS Outposts User Guide.

2. Create a placement group in the associated Region of the Outpost. If you create a placement group with a spread strategy, you can choose host or rack level spread to determine how the group will spread instances across the underlying hardware on your Outpost. For more information, see the section called “Create a placement group”.
3. Launch an instance into the placement group. For **Subnet** choose the subnet that you created in Step 1, and for **Placement group name**, select the placement group that you created in Step 2. For more information, see [Launch an instance on the Outpost](#) in the *AWS Outposts User Guide*.

**Network maximum transmission unit (MTU) for your EC2 instance**

The maximum transmission unit (MTU) of a network connection is the size, in bytes, of the largest permissible packet that can be passed over the connection. The larger the MTU of a connection, the more data that can be passed in a single packet. Ethernet frames consist of the packet, or the actual data you are sending, and the network overhead information that surrounds it.

Ethernet frames can come in different formats, and the most common format is the standard Ethernet v2 frame format. It supports 1500 MTU, which is the largest Ethernet packet size supported over most of the internet. The maximum supported MTU for an instance depends on its instance type.

The following rules apply to instances that are in Wavelength Zones:

- Traffic that goes from one instance to another within a VPC in the same Wavelength Zone has an MTU of 1300.
- Traffic that goes from one instance to another that uses the carrier IP within a Wavelength Zone has an MTU of 1500.
- Traffic that goes from one instance to another between a Wavelength Zone and the Region that uses a public IP address has an MTU of 1500.
- Traffic that goes from one instance to another between a Wavelength Zone and the Region that uses a private IP address has an MTU of 1300.

The following rules apply to instances that are in Outposts:

- Traffic that goes from an instance in Outposts to an instance in the Region has an MTU of 1300.

**Contents**

- [Jumbo frames (9001 MTU)](#)
- [Path MTU Discovery](#)
Jumbo frames (9001 MTU)

Jumbo frames allow more than 1500 bytes of data by increasing the payload size per packet, and thus increasing the percentage of the packet that is not packet overhead. Fewer packets are needed to send the same amount of usable data. However, traffic is limited to a maximum MTU of 1500 in the following cases:

- Traffic over an internet gateway
- Traffic over an inter-region VPC peering connection
- Traffic over VPN connections
- Traffic outside of a given AWS Region

If packets are over 1500 bytes, they are fragmented, or they are dropped if the Don’t Fragment flag is set in the IP header.

Jumbo frames should be used with caution for internet-bound traffic or any traffic that leaves a VPC. Packets are fragmented by intermediate systems, which slows down this traffic. To use jumbo frames inside a VPC and not slow traffic that’s bound for outside the VPC, you can configure the MTU size by route, or use multiple elastic network interfaces with different MTU sizes and different routes.

For instances that are collocated inside a cluster placement group, jumbo frames help to achieve the maximum network throughput possible, and they are recommended in this case. For more information, see Placement groups.

You can use jumbo frames for traffic between your VPCs and your on-premises networks over AWS Direct Connect. For more information, and for how to verify Jumbo Frame capability, see Setting Network MTU in the AWS Direct Connect User Guide.

All Amazon EC2 instance types support 1500 MTU and all current generation instance types support jumbo frames. The following previous generation instance types support jumbo frames: A1, C3, I2, M3, and R3.
For more information about supported MTU sizes:

- For NAT gateways, see [NAT gateway basics](#) in the *Amazon VPC User Guide*.
- For transit gateways, see [MTU](#) in the *Amazon VPC Transit Gateways User Guide*.
- For Local Zones, see [Considerations](#) in the *AWS Local Zones User Guide*.

**Path MTU Discovery**

Path MTU Discovery (PMTUD) is used to determine the path MTU between two devices. The path MTU is the maximum packet size that's supported on the path between the originating host and the receiving host. When there is a difference in the MTU size in the network between two hosts, PMTUD enables the receiving host to respond to the originating host with an ICMP message. This ICMP message instructs the originating host to use the lowest MTU size along the network path and to resend the request. Without this negotiation, packet drop can occur because the request is too large for the receiving host to accept.

For IPv4, when a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: **Destination Unreachable: Fragmentation Needed and Don't Fragment was Set** (Type 3, Code 4). This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

The IPv6 protocol does not support fragmentation in the network. When a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: **ICMPv6 Packet Too Big (PTB)** (Type 2). This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

Connections made through some components, like NAT gateways and load balancers, are automatically tracked. This means that security group tracking is automatically enabled for your outbound connection attempts. If connections are automatically tracked or if your security group rules allow inbound ICMP traffic, you can receive PMTUD responses.

Note that ICMP traffic can be blocked even if the traffic is allowed at the security group level, such as if you have a network access control list entry that denies ICMP traffic to the subnet.
Important

Path MTU Discovery does not guarantee that jumbo frames will not be dropped by some routers. An internet gateway in your VPC will forward packets up to 1500 bytes only. 1500 MTU packets are recommended for internet traffic.

Check the path MTU between two hosts

You can check the path MTU between your EC2 instance and another host. You can specify a DNS name or an IP address as the destination. If the destination is another EC2 instance, verify that its security group allows inbound UDP traffic.

The procedure that you use depends on the operating system of the instance.

Linux instances

Run the `tracepath` command on your instance to check the path MTU between your EC2 instance and the specified destination. This command is part of the `iputils` package, which is available by default in many Linux distributions.

This example checks the path MTU between the EC2 instance and `amazon.com`.

```bash
[ec2-user ~]$ tracepath amazon.com
```

In this example output, the path MTU is 1500.
Too many hops: pmtu 1500
Resume: pmtu 1500

Windows instances

To check path MTU using mturoute

2. Open a Command Prompt window and change to the directory where you downloaded mturoute.exe.
3. Use the following command to check the path MTU between your EC2 instance and the specified destination. This example checks the path MTU between the EC2 instance and www.elifulkerson.com.

   \mturoute.exe www.elifulkerson.com

   In this example output, the path MTU is 1500.

   * ICMP Fragmentation is not permitted. *
   * Speed optimization is enabled. *
   * Maximum payload is 10000 bytes. *
   + ICMP payload of 1472 bytes succeeded.
   - ICMP payload of 1473 bytes is too big.
   Path MTU: 1500 bytes.

Check the MTU for your instance

You can check the MTU value for your instance. Some instances are configured to use jumbo frames, and others are configured to use standard frame sizes.

The procedure that you use depends on the operating system of the instance.

Linux instances

To check the MTU setting on a Linux instance

Run the following ip command on your EC2 instance. If the primary network interface is not eth0, replace eth0 with your network interface.
In this example output, \texttt{mtu 9001} indicates that the instance uses jumbo frames.

```
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 9001 qdisc pfifo_fast state UP mode
    DEFAULT group default qlen 1000
    link/ether 02:90:c0:b7:9e:d1 brd ff:ff:ff:ff:ff:ff
```

**Windows instances**

The procedure that you use depends on the driver on your instance.

**ENA driver**

**Version 2.1.0 and later**

To get the MTU value, use the following \texttt{Get-NetAdapterAdvancedProperty} command on your EC2 instance. Use the wildcard (asterisk) to get all Ethernet names. Check the output for the interface name *JumboPacket*. A value of 9015 indicates that Jumbo frames are enabled. Jumbo frames are disabled by default.

```powershell
Get-NetAdapterAdvancedProperty -Name "Ethernet*"
```

**Version 1.5 and earlier**

To get the MTU value, use the following \texttt{Get-NetAdapterAdvancedProperty} command on your EC2 instance. Check the output for the interface name MTU. A value of 9001 indicates that Jumbo frames are enabled. Jumbo frames are disabled by default.

```powershell
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

**Intel SRIOV 82599 driver**

To get the MTU value, use the following \texttt{Get-NetAdapterAdvancedProperty} command on your EC2 instance. Check the entry for the interface name *JumboPacket*. A value of 9014 indicates that Jumbo frames are enabled. (Note that the MTU size includes the header and the payload.) Jumbo frames are disabled by default.

```powershell
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```
AWS PV driver

To get the MTU value, use the following command on your EC2 instance. The name of the interface can vary. In the output, look for an entry with the name "Ethernet," "Ethernet 2," or "Local Area Connection." You'll need the interface name to enable or disable jumbo frames. A value of 9001 indicates that Jumbo frames are enabled.

```
netsh interface ipv4 show subinterface
```

**Set the MTU for your instance**

You might want to use jumbo frames for network traffic within your VPC and standard frames for internet traffic. Whatever your use case, we recommend that you verify that your instance behaves as expected.

The procedure that you use depends on the operating system of the instance.

**Linux instances**

**To set the MTU value on a Linux instance**

1. Run the following `ip` command on your instance. It sets the desired MTU value to 1500, but you could use 9001 instead.

   `[ec2-user ~]$
   sudo ip link set dev eth0 mtu 1500

2. (Optional) To persist your network MTU setting after a reboot, modify the following configuration files, based on your operating system type.

   - For Amazon Linux 2, add the following line to the `/etc/sysconfig/network-scripts/ifcfg-eth0` file:

     `MTU=1500`

   Add the following line to the `/etc/dhcp/dhclient.conf` file:

   ```
   request subnet-mask, broadcast-address, time-offset, routers, domain-name, domain-search, domain-name-servers, host-name, nis-domain, nis-servers, ntp-servers;
   ```
• For Amazon Linux AMI, add the following lines to your `/etc/dhcp/dhclient-eth0.conf` file.

```bash
interface "eth0" {
  supersede interface-mtu 1500;
}
```

• For other Linux distributions, consult their specific documentation.

3. (Optional) Reboot your instance and verify that the MTU setting is correct.

**Windows instances**

The procedure that you use depends on the driver on your instance.

**ENA driver**

You can change the MTU using Device Manager or the `Set-NetAdapterAdvancedProperty` command on your instance.

**Version 2.1.0 and later**

Use the following command to enable jumbo frames.

```powershell
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -RegistryValue 9015
```

Use the following command to disable jumbo frames.

```powershell
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -RegistryValue 1514
```

**Version 1.5 and earlier**

Use the following command to enable jumbo frames.

```powershell
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "MTU" -RegistryValue 9001
```

Use the following command to disable jumbo frames.
Intel SRIOV 82599 driver

You can change the MTU using Device Manager or the **Set-NetAdapterAdvancedProperty** command on your instance.

Use the following command to enable jumbo frames.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -RegistryValue 9014
```

Use the following command to disable jumbo frames.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -RegistryValue 1514
```

AWS PV driver

You can change the MTU using the **netsh** command on your instance. You can't change the MTU using Device Manager.

Use the following command to enable jumbo frames.

```
netsh interface ipv4 set subinterface "Ethernet" mtu=9001
```

Use the following command to disable jumbo frames.

```
netsh interface ipv4 set subinterface "Ethernet" mtu=1500
```

**Troubleshoot**

If you experience connectivity issues between your EC2 instance and an Amazon Redshift cluster when using jumbo frames, see [Queries Appear to Hang](#) in the *Amazon Redshift Management Guide*. 
Virtual private clouds for your EC2 instances

Amazon Virtual Private Cloud (Amazon VPC) enables you to define a virtual network in your own logically isolated area within the AWS cloud, known as a virtual private cloud or VPC. You can create AWS resources, such as Amazon EC2 instances, into the subnets of your VPC. Your VPC closely resembles a traditional network that you might operate in your own data center, with the benefits of using scalable infrastructure from AWS. You can configure your VPC; you can select its IP address range, create subnets, and configure route tables, network gateways, and security settings. You can connect instances in your VPC to the internet or to your own data center.

Your default VPCs

When you create your AWS account, we create a default VPC in each Region. A default VPC is a VPC that is already configured and ready for you to use. For example, there is a default subnet for each Availability Zone in each default VPC, an internet gateway attached to the VPC, and there's a route in the main route table that sends all traffic (0.0.0.0/0) to the internet gateway. Alternatively, you can create your own VPC and configure it to meet your needs.
Create additional VPCs

Use the following procedure to create a VPC with the subnets, gateways, and routing configuration that you need.

To create a VPC

1. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
2. Choose Create VPC.
3. Under Resources to create, choose VPC and more.
4. For Name tag auto-generation, enter a name for the VPC.
5. For IPv4 CIDR block, either keep the default suggestion, enter the CIDR block required by your application or network.

6. For Number of Availability Zones, choose 2, so that you can launch instances in multiple Availability Zones to ensure high availability.

7. If your instances must be accessible from the internet, do one of the following:
   - If your instances can be in a public subnet, select a nonzero value for Number of public subnets. Keep both options under DNS options selected. You can optionally add private subnets now or later on.
   - If your instances must be in a private subnet, select 0 for Number of public subnets. For Number of private subnets, select a number depending on your needs (the possible values correspond to 1 or 2 private subnets per Availability Zone). For NAT gateways, if your instances in both Availability Zones send or receive a significant volume of traffic across Availability Zones, select 1 per AZ. Otherwise, select In 1 AZ and launch instances that send or receive cross-zone traffic in the same Availability Zone as the NAT gateway.

8. Expand Customize subnet CIDR blocks. Either keep the default suggestions, or enter a CIDR block for each subnet. For more information, see Subnet CIDR blocks in the Amazon VPC User Guide.

9. Review the Preview pane, which shows the VPC resources that will be created based on your selections.

10. Choose Create VPC.

Access the internet from your instances

Instances launched into a default subnet in a default VPC have access to the internet, as default VPCs are configured to assign public IP addresses and DNS hostnames, and the main route table is configured with a route to an internet gateway attached to the VPC.

For instances that you launch in nondefault subnets and VPCs, you can use one of the following options to ensure that the instances that you launch in these subnets have access to the internet:

- Configure an internet gateway. For more information, see Connect to the internet using an internet gateway in the Amazon VPC User Guide.
- Configure a public NAT gateway. For more information, see Access the internet from a private subnet in the Amazon VPC User Guide.
Shared subnets

When launching EC2 instances into shared VPC subnets, note the following:

- Participants can run instances in a shared subnet by specifying the ID of the shared subnet. Participants must own any security groups or network interfaces that they specify.
- Participants can start, stop, terminate, and describe instances that they've created in a shared subnet. Participants can't start, stop, terminate, or describe instances that the VPC owner created in the shared subnet.
- VPC owners can't start, stop, terminate, or describe instances created by participants in a shared subnet.
- Participants can connect to an instance in a shared subnet using EC2 Instance Connect Endpoint. The participant must create the EC2 Instance Connect Endpoint in the shared subnet. Participants can't use an EC2 Instance Connect Endpoint that the VPC owner created in the shared subnet.

For more information see, [Share your VPC with other accounts](https://docs.aws.amazon.com/vpc/latest/userguide/amazon-vpc-share-with-other-accounts.html) in the *Amazon VPC User Guide*.

IPv6-only subnets

An EC2 instance launched in an IPv6-only subnet receives an IPv6 address but not an IPv4 address. Any instances that you launch into an IPv6-only subnet must be [instances built on the AWS Nitro System](https://docs.aws.amazon.com/nitro/latest/userguide/).
Security in Amazon EC2

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The shared responsibility model describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the [AWS Compliance Programs](https://aws.amazon.com/compliance/). To learn about the compliance programs that apply to Amazon EC2, see [AWS Services in Scope by Compliance Program](https://aws.amazon.com/compliance/).  

- **Security in the cloud** – Your responsibility includes the following areas:
  
  - Controlling network access to your instances, for example, through configuring your VPC and security groups. For more information, see [Controlling network traffic](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/vpc-network-access-control.html).
  
  - Managing the credentials used to connect to your instances.
  
  - Managing the guest operating system and software deployed to the guest operating system, including updates and security patches. For more information, see [Update management for Amazon EC2 Windows instances](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/AmazonEC2_Update_Management.html).
  
  - Configuring the IAM roles that are attached to the instance and the permissions associated with those roles. For more information, see [IAM roles for Amazon EC2](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles_for_amazon_resources.html).

This documentation helps you understand how to apply the shared responsibility model when using Amazon EC2. It shows you how to configure Amazon EC2 to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Amazon EC2 resources.

**Contents**

- Data protection in Amazon EC2
- Infrastructure security in Amazon EC2
- Resilience in Amazon EC2
- Compliance validation for Amazon EC2
The AWS shared responsibility model applies to data protection in Amazon Elastic Compute Cloud. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see the Data Privacy FAQ. For information about data protection in Europe, see the AWS Shared Responsibility Model and GDPR blog post on the AWS Security Blog.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-2 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-2.
We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a Name field. This includes when you work with Amazon EC2 or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

- Amazon EBS data security
- Encryption at rest
- Encryption in transit

Amazon EBS data security

Amazon EBS volumes are presented to you as raw, unformatted block devices. These devices are logical devices that are created on the EBS infrastructure and the Amazon EBS service ensures that the devices are logically empty (that is, the raw blocks are zeroed or they contain cryptographically pseudorandom data) prior to any use or re-use by a customer.

If you have procedures that require that all data be erased using a specific method, either after or before use (or both), such as those detailed in DoD 5220.22-M (National Industrial Security Program Operating Manual) or NIST 800-88 (Guidelines for Media Sanitization), you have the ability to do so on Amazon EBS. That block-level activity will be reflected down to the underlying storage media within the Amazon EBS service.

Encryption at rest

EBS volumes

Amazon EBS encryption is an encryption solution for your EBS volumes and snapshots. It uses AWS KMS keys. For more information, see Amazon EBS encryption in the Amazon EBS User Guide.

[Windows instances] You can also use Microsoft EFS and NTFS permissions for folder- and file-level encryption.

Instance store volumes

The data on NVMe instance store volumes is encrypted using an XTS-AES-256 cipher, implemented on a hardware module on the instance. The keys used to encrypt data that's written to locally-
attached NVMe storage devices are per-customer, and per volume. The keys are generated by, and only reside within, the hardware module, which is inaccessible to AWS personnel. The encryption keys are destroyed when the instance is stopped or terminated and cannot be recovered. You cannot disable this encryption and you cannot provide your own encryption key.

The data on HDD instance store volumes on H1, D3, and D3en instances is encrypted using XTS-AES-256 and one-time keys.

When you stop, hibernate, or terminate an instance, every block of storage in the instance store volume is reset. Therefore, your data cannot be accessed through the instance store of another instance.

Memory

Memory encryption is enabled on the following instances:

- Instances with AWS Graviton processors. AWS Graviton2, AWS Graviton3, and AWS Graviton3E support always-on memory encryption. The encryption keys are securely generated within the host system, do not leave the host system, and are destroyed when the host is rebooted or powered down. For more information, see [AWS Graviton Processors](#).

- Instances with 3rd generation Intel Xeon Scalable processors (Ice Lake), such as M6i instances, and 4th generation Intel Xeon Scalable processors (Sapphire Rapids), such as M7i instances. These processors support always-on memory encryption using Intel Total Memory Encryption (TME).

- Instances with 3rd generation AMD EPYC processors (Milan), such as M6a instances, and 4th generation AMD EPYC processors (Genoa), such as M7a instances. These processors support always-on memory encryption using AMD Secure Memory Encryption (SME). Instances with 3rd generation AMD EPYC processors (Milan) also support AMD Secure Encrypted Virtualization-Secure Nested Paging (SEV-SNP).

Encryption in transit

Encryption at the physical layer

All data flowing across AWS Regions over the AWS global network is automatically encrypted at the physical layer before it leaves AWS secured facilities. All traffic between AZs is encrypted. Additional layers of encryption, including those listed in this section, may provide additional protections.
Encryption provided by Amazon VPC peering and Transit Gateway cross-Region peering

All cross-Region traffic that uses Amazon VPC peering and Transit Gateway peering is automatically bulk-encrypted when it exits a Region. An additional layer of encryption is automatically provided at the physical layer for all traffic before it leaves AWS secured facilities, as previously noted in this section.

Encryption between instances

AWS provides secure and private connectivity between EC2 instances of all types. In addition, some instance types use the offload capabilities of the underlying Nitro System hardware to automatically encrypt in-transit traffic between instances. This encryption uses Authenticated Encryption with Associated Data (AEAD) algorithms, with 256-bit encryption. There is no impact on network performance. To support this additional in-transit traffic encryption between instances, the following requirements must be met:

- The instances use the following instance types:
  - **General purpose**: M5dn, M5n, M5zn, M6a, M6i, M6idn, M6in, M7a, M7g, M7gd, M7i, M7i-flex
  - **Compute optimized**: C5a, C5ad, C5n, C6a, C6gn, C6i, C6id, C6in, C7a, C7g, C7gd, C7gn, C7i, C7i-flex
  - **Memory optimized**: R5dn, R5n, R6a, R6i, R6idn, R6in, R6id, R7a, R7g, R7gd, R7i, R7iz, R8g, U-3tb1, U-6tb1, U-9tb1, U-12tb1, U-18tb1, U-24tb1, U7i-12tb, U7in-16tb, U7in-24tb, U7in-32tb, X2idn, X2iedn, X2iezn
  - **Storage optimized**: D3, D3en, I3en, I4g, I4i, Im4gn, Is4gen
  - **Accelerated computing**: DL1, DL2q, G4ad, G4dn, G5, G6, Gr6, Inf1, Inf2, P3dn, P4d, P4de, P5, Trn1, Trn1n, VT1
  - **High-performance computing**: Hpc6a, Hpc6id, Hpc7a, Hpc7g
- The instances are in the same Region.
- The instances are in the same VPC or peered VPCs, and the traffic does not pass through a virtual network device or service, such as a load balancer or a transit gateway.

An additional layer of encryption is automatically provided at the physical layer for all traffic before it leaves AWS secured facilities, as previously noted in this section.

To view the instance types that encrypt in-transit traffic between instances using the AWS CLI
Use the following `describe-instance-types` command.

```bash
aws ec2 describe-instance-types \
  --filters Name=network-info.encryption-in-transit-supported,Values=true \
  --query "InstanceTypes[*].[InstanceType]" \
  --output text | sort
```

**Encryption to and from AWS Outposts**

An Outpost creates special network connections called *service links* to its AWS home Region and, optionally, private connectivity to a VPC subnet that you specify. All traffic over those connections is fully encrypted. For more information, see Connectivity through service links and Encryption in transit in the *AWS Outposts User Guide*.

**Remote access encryption**

The SSH and RDP protocols provide secure communications channels for remote access to your instances, whether directly or through EC2 Instance Connect. Remote access to your instances using AWS Systems Manager Session Manager or the Run Command is encrypted using TLS 1.2, and requests to create a connection are signed using SigV4, and authenticated and authorized by AWS Identity and Access Management.

It is your responsibility to use an encryption protocol, such as Transport Layer Security (TLS), to encrypt sensitive data in transit between clients and your Amazon EC2 instances.

(Windows instances) Make sure to allow only encrypted connections between EC2 instances and the AWS API endpoints or other sensitive remote network services. You can enforce this through an outbound security group or Windows Firewall rules.

**Infrastructure security in Amazon EC2**

As a managed service, Amazon Elastic Compute Cloud is protected by AWS global network security. For information about AWS security services and how AWS protects infrastructure, see AWS Cloud Security. To design your AWS environment using the best practices for infrastructure security, see Infrastructure Protection in Security Pillar AWS Well-Architected Framework.

You use AWS published API calls to access Amazon EC2 through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
• Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

Additionally, requests must be signed by using an access key ID and a secret access key that is associated with an IAM principal. Or you can use the AWS Security Token Service (AWS STS) to generate temporary security credentials to sign requests.

For more information, see Infrastructure Protection in the Security Pillar – AWS Well-Architected Framework.

**Network isolation**

A virtual private cloud (VPC) is a virtual network in your own logically isolated area in the AWS Cloud. Use separate VPCs to isolate infrastructure by workload or organizational entity.

A subnet is a range of IP addresses in a VPC. When you launch an instance, you launch it into a subnet in your VPC. Use subnets to isolate the tiers of your application (for example, web, application, and database) within a single VPC. Use private subnets for your instances if they should not be accessed directly from the internet.

To call the Amazon EC2 API from your VPC using private IP addresses, use AWS PrivateLink. For more information, see Access Amazon EC2 using an interface VPC endpoint.

**Isolation on physical hosts**

Different EC2 instances on the same physical host are isolated from each other as though they are on separate physical hosts. The hypervisor isolates CPU and memory, and the instances are provided virtualized disks instead of access to the raw disk devices.

When you stop or terminate an instance, the memory allocated to it is scrubbed (set to zero) by the hypervisor before it is allocated to a new instance, and every block of storage is reset. This ensures that your data is not unintentionally exposed to another instance.

Network MAC addresses are dynamically assigned to instances by the AWS network infrastructure. IP addresses are either dynamically assigned to instances by the AWS network infrastructure, or assigned by an EC2 administrator through authenticated API requests. The AWS network allows instances to send traffic only from the MAC and IP addresses assigned to them. Otherwise, the traffic is dropped.
By default, an instance cannot receive traffic that is not specifically addressed to it. If you need to run network address translation (NAT), routing, or firewall services on your instance, you can disable source/destination checking for the network interface.

**Controlling network traffic**

Consider the following options for controlling network traffic to your EC2 instances:

- **Restrict access to your instances using security groups.** Configure rules that allow the minimum required network traffic. For example, you can allow traffic only from the address ranges for your corporate network or only for specific protocols, such as HTTPS. For Windows instances, allow Windows management traffic and minimal outbound connections.

- **Leverage security groups as the primary mechanism for controlling network access to Amazon EC2 instances.** When necessary, use network ACLs sparingly to provide stateless, coarse-grain network control. Security groups are more versatile than network ACLs due to their ability to perform stateful packet filtering and create rules that reference other security groups. However, network ACLs can be effective as a secondary control for denying a specific subset of traffic or providing high-level subnet guard rails. Also, because network ACLs apply to an entire subnet, they can be used as defense-in-depth in case an instance is ever launched unintentionally without a correct security group.

- **[Windows instances] Centrally manage Windows Firewall settings with Group Policy Objects (GPO) to further enhance network controls.** Customers often use the Windows Firewall for further visibility into network traffic and to complement security group filters, creating advanced rules to block specific applications from accessing the network or to filter traffic from a subset IP addresses. For example, the Windows Firewall can limit access to the EC2 metadata service IP address to specific users or applications. Alternatively, a public-facing service might use security groups to restrict traffic to specific ports and the Windows Firewall to maintain a list of explicitly blocked IP addresses.

- **Use private subnets for your instances if they should not be accessed directly from the internet.** Use a bastion host or NAT gateway for internet access from an instance in a private subnet.

- **[Windows instances] Use secure administration protocols like RDP encapsulation over SSL/TLS.** The Remote Desktop Gateway Quick Start provides best practices for deploying remote desktop gateway, including configuring RDP to use SSL/TLS.

- **[Windows instances] Use Active Directory or AWS Directory Service to tightly and centrally control and monitor interactive user and group access to Windows instances, and avoid local user permissions.** Also avoid using Domain Administrators and instead create more granular,
application-specific role-based accounts. Just Enough Administration (JEA) allows changes to Windows instances to be managed without interactive or administrator access. In addition, JEA enables organizations to lock down administrative access to the subset of Windows PowerShell commands required for instance administration. For additional information, see the section on "Managing OS-level Access to Amazon EC2" in the AWS Security Best Practices whitepaper.

- [Windows instances] System Administrators should use Windows accounts with limited access to perform daily activities, and only elevate access when necessary to perform specific configuration changes. Additionally, only access Windows instances directly when absolutely necessary. Instead, leverage central configuration management systems such as EC2 Run Command, Systems Center Configuration Manager (SCCM), Windows PowerShell DSC, or Amazon EC2 Systems Manager (SSM) to push changes to Windows servers.

- Configure Amazon VPC subnet route tables with the minimal required network routes. For example, place only Amazon EC2 instances that require direct Internet access into subnets with routes to an internet gateway, and place only Amazon EC2 instances that need direct access to internal networks into subnets with routes to a virtual private gateway.

- Consider using additional security groups or network interfaces to control and audit Amazon EC2 instance management traffic separately from regular application traffic. This approach allows customers to implement special IAM policies for change control, making it easier to audit changes to security group rules or automated rule-verification scripts. Using multiple network interfaces also provides additional options for controlling network traffic, including the ability to create host-based routing policies or leverage different VPC subnet routing rules based on the assigned subnet of the network interface.

- Use AWS Virtual Private Network or AWS Direct Connect to establish private connections from your remote networks to your VPCs. For more information, see Network-to-Amazon VPC Connectivity Options.

- Use VPC Flow Logs to monitor the traffic that reaches your instances.

- Use GuardDuty Malware Protection to identify suspicious behavior indicative of malicious software on your instances that might compromise your workload, repurpose resources for malicious use, and gain unauthorized access to your data.

- Use GuardDuty Runtime Monitoring to identify and respond to potential threats to your instances. For more information, see How Runtime Monitoring works with Amazon EC2 instances.

- Use AWS Security Hub, Reachability Analyzer, or Network Access Analyzer to check for unintended network accessibility from your instances.

- Use EC2 Instance Connect to connect to your instances using Secure Shell (SSH) without the need to share and manage SSH keys.
• Use **AWS Systems Manager Session Manager** to access your instances remotely instead of opening inbound SSH or RDP ports and managing key pairs.

• Use **AWS Systems Manager Run Command** to automate common administrative tasks instead of connecting to your instances.

• [Windows instances] Many of the Windows OS roles and Microsoft business applications also provide enhanced functionality such as IP Address Range restrictions within IIS, TCP/IP filtering policies in Microsoft SQL Server, and connection filter policies in Microsoft Exchange. Network restriction functionality within the application layer can provide additional layers of defense for critical business application servers.

Amazon VPC supports additional network security controls, such as gateways, proxy servers, and network monitoring options. For more information, see Control network traffic in the Amazon VPC User Guide.

**Resilience in Amazon EC2**

The AWS global infrastructure is built around AWS Regions and Availability Zones. Regions provide multiple physically separated and isolated Availability Zones, which are connected through low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

If you need to replicate your data or applications over greater geographic distances, use AWS Local Zones. An AWS Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support AWS Direct Connect. Like all AWS Regions, AWS Local Zones are completely isolated from other AWS Zones.

If you need to replicate your data or applications in an AWS Local Zone, AWS recommends that you use one of the following zones as the failover zone:

• Another Local Zone
• An Availability Zone in the Region that is not the parent zone. You can use the `describe-availability-zones` command to view the parent zone.

For more information about AWS Regions and Availability Zones, see **AWS Global Infrastructure**.
In addition to the AWS global infrastructure, Amazon EC2 offers the following features to support your data resiliency:

- Copying AMIs across Regions
- Copying EBS snapshots across Regions
- Automating EBS-backed AMIs using Amazon Data Lifecycle Manager
- Automating EBS snapshots using Amazon Data Lifecycle Manager
- Maintaining the health and availability of your fleet using Amazon EC2 Auto Scaling
- Distributing incoming traffic across multiple instances in a single Availability Zone or multiple Availability Zones using Elastic Load Balancing

### Compliance validation for Amazon EC2

To learn whether an AWS service is within the scope of specific compliance programs, see [AWS services in Scope by Compliance Program](#) and choose the compliance program that you are interested in. For general information, see [AWS Compliance Programs](#).

You can download third-party audit reports using AWS Artifact. For more information, see [Downloading Reports in AWS Artifact](#).

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company’s compliance objectives, and applicable laws and regulations. AWS provides the following resources to help with compliance:

- **Security and Compliance Quick Start Guides** – These deployment guides discuss architectural considerations and provide steps for deploying baseline environments on AWS that are security and compliance focused.
- **Architecting for HIPAA Security and Compliance on Amazon Web Services** – This whitepaper describes how companies can use AWS to create HIPAA-eligible applications.

**Note**

Not all AWS services are HIPAA eligible. For more information, see the [HIPAA Eligible Services Reference](#).

- **AWS Compliance Resources** – This collection of workbooks and guides might apply to your industry and location.
Identity and access management for Amazon EC2

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be authenticated (signed in) and authorized (have permissions) to use Amazon EC2 resources. IAM is an AWS service that you can use with no additional charge.

Your security credentials identify you to services in AWS and grant you access to AWS resources, such as your Amazon EC2 resources. You can use features of Amazon EC2 and IAM to allow other users, services, and applications to use your Amazon EC2 resources without sharing your security credentials. You can use IAM to control how other users use resources in your AWS account, and you can use security groups to control access to your Amazon EC2 instances. You can choose to allow full or limited use of your Amazon EC2 resources.

For best practices for securing your AWS resources using IAM, see Security best practices in IAM in the IAM User Guide.

Contents
Identity-based policies for Amazon EC2

By default, users don't have permission to create or modify Amazon EC2 resources, or perform tasks using the Amazon EC2 API, Amazon EC2 console, or CLI. To allow users to create or modify resources and perform tasks, you must create IAM policies that grant users permission to use the specific resources and API actions they'll need, and then attach those policies to the users, groups, or IAM roles that require those permissions.

When you attach a policy to a user, group of users, or role it allows or denies the users permission to perform the specified tasks on the specified resources. For more general information about IAM policies, see Policies and permissions in IAM in the IAM User Guide. For more information about managing and creating custom IAM policies, see Managing IAM policies.

An IAM policy must grant or deny permissions to use one or more Amazon EC2 actions. It must also specify the resources that can be used with the action, which can be all resources, or in some cases, specific resources. The policy can also include conditions that you apply to the resource.

To get started, you can check whether the AWS managed policies for Amazon EC2 meet your needs. Otherwise, you can create your own custom policies. For more information, see the section called “AWS managed policies”.

Contents

- Policy syntax
- Actions for Amazon EC2
- Supported resource-level permissions for Amazon EC2 API actions
- Amazon Resource Names (ARNs) for Amazon EC2
- Condition keys for Amazon EC2
- Control access using attribute-based access
- Grant permissions to users, groups, and roles
- Check that users have the required permissions
Policy syntax

An IAM policy is a JSON document that consists of one or more statements. Each statement is structured as follows.

```
{
  "Statement" : [
    {
      "Effect" : "effect",
      "Action" : "action",
      "Resource" : "arn",
      "Condition" : {
        "condition" : {
          "key" : "value"
        }
      }
    }
  ]
}
```

There are various elements that make up a statement:

- **Effect**: The `effect` can be **Allow** or **Deny**. By default, users don't have permission to use resources and API actions, so all requests are denied. An explicit allow overrides the default. An explicit deny overrides any allows.

- **Action**: The `action` is the specific API action for which you are granting or denying permission. To learn about specifying `action`, see [Actions for Amazon EC2](#).

- **Resource**: The resource that's affected by the action. Some Amazon EC2 API actions allow you to include specific resources in your policy that can be created or modified by the action. You specify a resource using an Amazon Resource Name (ARN) or using the wildcard (*) to indicate that the statement applies to all resources. For more information, see [Supported resource-level permissions for Amazon EC2 API actions](#).

- **Condition**: Conditions are optional. They can be used to control when your policy is in effect. For more information about specifying conditions for Amazon EC2, see [Condition keys for Amazon EC2](#).

For more information about policy requirements, see the [IAM JSON policy reference](#) in the [IAM User Guide](#). For example IAM policy statements for Amazon EC2, see [Example policies to control access the Amazon EC2 API](#).
Actions for Amazon EC2

In an IAM policy statement, you can specify any API action from any service that supports IAM. For Amazon EC2, use the following prefix with the name of the API action: ec2:. For example: ec2:RunInstances and ec2:CreateImage.

To specify multiple actions in a single statement, separate them with commas as follows:

"Action": ["ec2:action1", "ec2:action2"]

You can also specify multiple actions using wildcards. For example, you can specify all actions whose name begins with the word "Describe" as follows:

"Action": "ec2:Describe*"

**Note**

Currently, the Amazon EC2 Describe* API actions do not support resource-level permissions. For more information about resource-level permissions for Amazon EC2, see [Identity-based policies for Amazon EC2](#).

To specify all Amazon EC2 API actions, use the * wildcard as follows:

"Action": "ec2:*"

For a list of Amazon EC2 actions, see [Actions defined by Amazon EC2](#) in the *Service Authorization Reference*.

**Supported resource-level permissions for Amazon EC2 API actions**

*Resource-level permissions* refers to the ability to specify which resources users are allowed to perform actions on. Amazon EC2 has partial support for resource-level permissions. This means that for certain Amazon EC2 actions, you can control when users are allowed to use those actions based on conditions that have to be fulfilled, or specific resources that users are allowed to use. For example, you can grant users permissions to launch instances, but only of a specific type, and only using a specific AMI.
To specify a resource in an IAM policy statement, use its Amazon Resource Name (ARN). For more information about specifying the ARN value, see Amazon Resource Names (ARNs) for Amazon EC2. If an API action does not support individual ARNs, you must use a wildcard (*) to specify that all resources can be affected by the action.

To see tables that identify which Amazon EC2 API actions support resource-level permissions, and the ARNs and condition keys that you can use in a policy, see Actions, resources, and condition keys for Amazon EC2.

Keep in mind that you can apply tag-based resource-level permissions in the IAM policies you use for Amazon EC2 API actions. This gives you better control over which resources a user can create, modify, or use. For more information, see Grant permission to tag Amazon EC2 resources during creation.

**Amazon Resource Names (ARNs) for Amazon EC2**

Each IAM policy statement applies to the resources that you specify using their ARNs.

An ARN has the following general syntax:

```
arn:aws:[service]:[region]:[account-id]:resourceType/resourcePath
```

- **service**
  - The service (for example, ec2).
- **region**
  - The Region for the resource (for example, us-east-1).
- **account-id**
  - The AWS account ID, with no hyphens (for example, 123456789012).
- **resourceType**
  - The type of resource (for example, instance).
- **resourcePath**
  - A path that identifies the resource. You can use the * wildcard in your paths.

For example, you can indicate a specific instance (i-1234567890abcdef0) in your statement using its ARN as follows.
"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/i-1234567890abcdef0"

You can specify all instances that belong to a specific account by using the * wildcard as follows.

"Resource": "arn:aws:ec2:us-east-1:123456789012:instance/*"

You can also specify all Amazon EC2 resources that belong to a specific account by using the * wildcard as follows.

"Resource": "arn:aws:ec2:us-east-1:123456789012:*"

To specify all resources, or if a specific API action does not support ARNs, use the * wildcard in the Resource element as follows.

"Resource": "*"

Many Amazon EC2 API actions involve multiple resources. For example, AttachVolume attaches an Amazon EBS volume to an instance, so a user must have permissions to use the volume and the instance. To specify multiple resources in a single statement, separate their ARNs with commas, as follows.

"Resource": ["arn1", "arn2"]

For a list of ARNs for Amazon EC2 resources, see Resource types defined by Amazon EC2.

**Condition keys for Amazon EC2**

In a policy statement, you can optionally specify conditions that control when it is in effect. Each condition contains one or more key-value pairs. Condition keys are not case-sensitive. We've defined AWS global condition keys, plus additional service-specific condition keys.

For a list of service-specific condition keys for Amazon EC2, see Condition keys for Amazon EC2. Amazon EC2 also implements the AWS global condition keys. For more information, see Information available in all requests in the IAM User Guide.

All Amazon EC2 actions support the aws:RequestedRegion and ec2:Region condition keys. For more information, see Example: Restrict access to a specific Region.
To use a condition key in your IAM policy, use the Condition statement. For example, the following policy grants users permission to add and remove inbound and outbound rules for any security group. It uses the ec2:Vpc condition key to specify that these actions can only be performed on security groups in a specific VPC.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:AuthorizeSecurityGroupIngress",
                "ec2:AuthorizeSecurityGroupEgress",
                "ec2:RevokeSecurityGroupIngress",
                "ec2:RevokeSecurityGroupEgress"
            ],
            "Condition": {
                "StringEquals": {
                }
            }
        }
    ]
}
```

If you specify multiple conditions, or multiple keys in a single condition, we evaluate them using a logical AND operation. If you specify a single condition with multiple values for one key, we evaluate the condition using a logical OR operation. For permissions to be granted, all conditions must be met.

You can also use placeholders when you specify conditions. For more information, see IAM policy elements: Variables and tags in the IAM User Guide.

⚠️ **Important**

Many condition keys are specific to a resource, and some API actions use multiple resources. If you write a policy with a condition key, use the Resource element of the statement to specify the resource to which the condition key applies. If not, the policy may prevent users from performing the action at all, because the condition check fails for the resources to which the condition key does not apply. If you do not want to specify a resource, or if you've written the Action element of your policy to include multiple API actions, then you...
must use the ...IfExists condition type to ensure that the condition key is ignored for resources that do not use it. For more information, see ...IfExists Conditions in the IAM User Guide.

Condition keys

- **ec2:Attribute condition key**
- **ec2:ResourceID condition keys**
- **ec2:SourceInstanceARN condition key**

**ec2:Attribute condition key**

The ec2:Attribute condition key can be used for conditions that filter access by an attribute of a resource.

This condition key supports only properties that are of a primitive data type (such as strings or integers), or complex **AttributeValue** objects that contain only a **Value** property (such as the **Description** or **ImdsSupport** objects of the **ModifyImageAttribute** API action). The condition key can't be used with complex objects that contain multiple properties, such as the **LaunchPermission** object of **ModifyImageAttribute**.

For example, the following policy uses the ec2:Attribute/Description condition key to filter access by the complex **Description** object of the **ModifyImageAttribute** API action. The condition key allows only requests that modify an image's description to either Production or Development.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:ModifyImageAttribute",
      "Resource": "arn:aws:ec2:us-east-1::image/ami-*",
      "Condition": {
        "StringEquals": {
          "ec2:Attribute/Description": ["Production", "Development"]
        }
      }
    }
  ]
}
```
The following example policy uses the `ec2:Attribute` condition key to filter access by the primitive `Attribute` property of the `ModifyImageAttribute` API action. The condition key denies all requests that attempt to modify an image's description.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Deny",
         "Action": "ec2:ModifyImageAttribute",
         "Resource": "arn:aws:ec2:us-east-1::image/ami-*",
         "Condition": {
            "StringEquals": {
               "ec2:Attribute": "Description"
            }
         }
      }
   ]
}
```

**ec2:ResourceId condition keys**

When using the following `ec2:ResourceId` condition keys with the specified API actions, the condition key value is used to specify the resulting resource that is created by the API action. `ec2:ResourceId` condition keys can’t be used to specify a source resource that is specified in the API request. If you use one of the following `ec2:ResourceId` condition keys with a specified API, then you must always specify the wildcard (*). If you specify a different value, the condition always resolves to * during runtime. For example, to use the `ec2:ImageId` condition key with the `CopyImage` API, then you must specify the condition key as follows:

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
```
"Effect": "Allow",
"Action": "ec2:CopyImage",
"Resource": "arn:aws:ec2:us-east-1::image/ami-*",
"Condition": {
  "StringEquals": {
    "ec2:ImageID": "*"
  }
}
]
]

We recommend that you avoid using these condition keys with these API actions:

- ec2:DhcpOptionsID – CreateDhcpOptions
- ec2:ImageID – CopyImage, CreateImage, ImportImage, and RegisterImage
- ec2:InstanceId – RunInstances and ImportInstance
- ec2:InternetGatewayID – CreateInternetGateway
- ec2:NetworkAclID – CreateNetworkAcl
- ec2:NetworkInterfaceID – CreateNetworkInterface
- ec2:PlacementGroupName – CreatePlacementGroup
- ec2:RouteTableId – CreateRouteTable
- ec2:SecurityGroupId – CreateSecurityGroup
- ec2:SnapshotId – CopySnapshot, CreateSnapshot, CreateSnapshots, and ImportSnapshots
- ec2:SubnetId – CreateSubnet
- ec2:VolumeId – CreateVolume and ImportVolume
- ec2:VpcId – CreateVpc
- ec2:VpcPeeringConnectionId – CreateVpcPeeringConnection

To filter access based on specific resource IDs, we recommend that you use the Resource policy element as follows.

{
  "Version": "2012-10-17",

"Statement": [  
    {  
        "Effect": "Allow",  
        "Action": "ec2:CopyImage",  
        "Resource": "arn:aws:ec2:us-east-1::image/ami-0123456789abcdef"  
    }  
]  
}

**ec2:SourceInstanceARN condition key**

Use `ec2:SourceInstanceARN` to specify the ARN of the instance from which a request is made. This is an [AWS global condition key](https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_condition-keys.html#Condition-key-ec2:SourceInstanceARN), which means that you can use it with services other than Amazon EC2. For a policy example, see [Example: Allow a specific instance to view resources in other AWS services](https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_policies_examples.html).

**Control access using attribute-based access**

When you create an IAM policy that grants users permission to use EC2 resources, you can include tag information in the `Condition` element of the policy to control access based on tags. This is known as attribute-based access control (ABAC). ABAC provides better control over which resources a user can modify, use, or delete. For more information, see [What is ABAC for AWS?](https://docs.aws.amazon.com/IAM/latest/UserGuide/concepts-abac.html).

For example, you can create a policy that allows users to terminate an instance, but denies the action if the instance has the tag `environment=production`. To do this, you use the `aws:ResourceTag` condition key to allow or deny access to the resource based on the tags that are attached to the resource.

```json
"StringEquals": { "aws:ResourceTag/environment": "production" }
```

To learn whether an Amazon EC2 API action supports controlling access using the `aws:ResourceTag` condition key, see [Actions, resources, and condition keys for Amazon EC2](https://docs.aws.amazon.com/vpc/latest/userguide/iam-vpc-resource-policy.html). Note that the Describe actions do not support resource-level permissions, so you must specify them in a separate statement without conditions.

For example IAM policies, see [Example policies to control access the Amazon EC2 API](https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_policies_examples.html).

If you allow or deny users access to resources based on tags, you must consider explicitly denying users the ability to add those tags to or remove them from the same resources. Otherwise, it's...
possible for a user to circumvent your restrictions and gain access to a resource by modifying its tags.

**Grant permissions to users, groups, and roles**

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in [Create a permission set](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_groups.html) in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in [Creating a role for a third-party identity provider (federation)](https://docs.aws.amazon.com/IAM/latest/userguide/creating-an-iam-role-for-third-party-identity-providers.html) in the *IAM User Guide*.

- IAM users:

  - Create a role that your user can assume. Follow the instructions in [Creating a role for an IAM user](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_groups.html) in the *IAM User Guide*.
  
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in [Adding permissions to a user (console)](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_users_groups.html) in the *IAM User Guide*.

**Check that users have the required permissions**

After you've created an IAM policy, we recommend that you check whether it grants users the permissions to use the particular API actions and resources they need before you put the policy into production.

First, create a user for testing purposes, and then attach the IAM policy that you created to the test user. Then, make a request as the test user.

If the Amazon EC2 action that you are testing creates or modifies a resource, you should make the request using the *DryRun* parameter (or run the AWS CLI command with the *--dry-run* option). In this case, the call completes the authorization check, but does not complete the operation. For example, you can check whether the user can terminate a particular instance without actually terminating it. If the test user has the required permissions, the request returns *DryRunOperation*; otherwise, it returns *UnauthorizedOperation*.

If the policy doesn't grant the user the permissions that you expected, or is overly permissive, you can adjust the policy as needed and retest until you get the desired results.
Important

It can take several minutes for policy changes to propagate before they take effect. Therefore, we recommend that you allow five minutes to pass before you test your policy updates.

If an authorization check fails, the request returns an encoded message with diagnostic information. You can decode the message using the DecodeAuthorizationMessage action. For more information, see DecodeAuthorizationMessage in the AWS Security Token Service API Reference, and decode-authorization-message in the AWS CLI Command Reference.

Example policies to control access the Amazon EC2 API

You can use IAM policies to grant users the permissions required to work with Amazon EC2. For step-by-step directions, see Creating IAM policies in the IAM User Guide.

The following examples show policy statements that you could use to grant users permissions to use Amazon EC2. These policies are designed for requests that are made using the AWS CLI or an AWS SDK. In the following examples, replace each user input placeholder with your own information.

Examples

• Example: Read-only access
• Example: Restrict access to a specific Region
• Work with instances
• Launch instances (RunInstances)
• Work with Spot Instances
• Example: Work with Reserved Instances
• Example: Tag resources
• Example: Work with IAM roles
• Example: Work with route tables
• Example: Allow a specific instance to view resources in other AWS services
• Example: Work with launch templates
• Work with instance metadata
• Work with Amazon EBS volumes and snapshots

For example policies for working in the Amazon EC2 console, see Example policies to control access to the Amazon EC2 console.

Example: Read-only access

The following policy grants users permissions to use all Amazon EC2 API actions whose names begin with Describe. The Resource element uses a wildcard to indicate that users can specify all resources with these API actions. The * wildcard is also necessary in cases where the API action does not support resource-level permissions. For more information about which ARNs you can use with which Amazon EC2 API actions, see Actions, resources, and condition keys for Amazon EC2.

Users don't have permission to perform any actions on the resources (unless another statement grants them permission to do so) because they're denied permission to use API actions by default.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": "ec2:Describe*",
         "Resource": "*
      }
   ]
}
```

Example: Restrict access to a specific Region

The following policy denies users permission to use all Amazon EC2 API actions unless the Region is Europe (Frankfurt). It uses the global condition key aws:RequestedRegion, which is supported by all Amazon EC2 API actions.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Deny",
         "Action": "ec2:*",
      }
   ]
}
```
Alternatively, you can use the condition key ec2:Region, which is specific to Amazon EC2 and is supported by all Amazon EC2 API actions.

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:*",
            "Resource": "*",
            "Condition": {
                "StringNotEquals": {
                    "ec2:Region": "eu-central-1"
                }
            }
        }
    ]
}
```

Work with instances

Examples

- **Example: Describe, launch, stop, start, and terminate all instances**
- **Example: Describe all instances, and stop, start, and terminate only particular instances**

**Example: Describe, launch, stop, start, and terminate all instances**

The following policy grants users permissions to use the API actions specified in the Action element. The Resource element uses a * wildcard to indicate that users can specify all resources with these API actions. The * wildcard is also necessary in cases where the API action does not
support resource-level permissions. For more information about which ARNs you can use with
which Amazon EC2 API actions, see Actions, resources, and condition keys for Amazon EC2.

The users don't have permission to use any other API actions (unless another statement grants
them permission to do so) because users are denied permission to use API actions by default.

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeInstances",
                "ec2:DescribeImages",
                "ec2:DescribeKeyPairs",
                "ec2:DescribeSecurityGroups",
                "ec2:DescribeAvailabilityZones",
                "ec2:RunInstances",
                "ec2:TerminateInstances",
                "ec2:StopInstances",
                "ec2:StartInstances"
            ],
            "Resource": "*
        }
    ]
}
```

**Example: Describe all instances, and stop, start, and terminate only particular instances**

The following policy allows users to describe all instances, to start and stop only instances
i-1234567890abcdef0 and i-0598c7d356eba48d7, and to terminate only instances in the US East
(N. Virginia) Region (us-east-1) with the resource tag "purpose=test".

The first statement uses a * wildcard for the Resource element to indicate that users can
specify all resources with the action; in this case, they can list all instances. The * wildcard is also
necessary in cases where the API action does not support resource-level permissions (in this case,
ec2:DescribeInstances). For more information about which ARNs you can use with which
Amazon EC2 API actions, see Actions, resources, and condition keys for Amazon EC2.

The second statement uses resource-level permissions for the StopInstances and
StartInstances actions. The specific instances are indicated by their ARNs in the Resource
element.
The third statement allows users to terminate all instances in the US East (N. Virginia) Region (us-east-1) that belong to the specified AWS account, but only where the instance has the tag "purpose=test". The Condition element qualifies when the policy statement is in effect.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:DescribeInstances",
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [
        "ec2:StopInstances",
        "ec2:StartInstances"
      ],
      "Resource": [
        "arn:aws:ec2:us-east-1:account-id:instance/i-1234567890abcdef0",
        "arn:aws:ec2:us-east-1:account-id:instance/i-0598c7d356eba48d7"
      ]
    },
    {
      "Effect": "Allow",
      "Action": "ec2:TerminateInstances",
      "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/purpose": "test"
        }
      }
    }
  ]
}
```

**Launch instances (RunInstances)**

The RunInstances API action launches one or more On-Demand Instances or one or more Spot Instances. RunInstances requires an AMI and creates an instance. Users can specify a key pair and security group in the request. Launching into a VPC requires a subnet, and creates a network
interface. Launching from an Amazon EBS-backed AMI creates a volume. Therefore, the user must have permissions to use these Amazon EC2 resources. You can create a policy statement that requires users to specify an optional parameter on RunInstances, or restricts users to particular values for a parameter.

For more information about the resource-level permissions that are required to launch an instance, see Actions, resources, and condition keys for Amazon EC2.

By default, users don't have permissions to describe, start, stop, or terminate the resulting instances. One way to grant the users permission to manage the resulting instances is to create a specific tag for each instance, and then create a statement that enables them to manage instances with that tag. For more information, see Work with instances.

Resources

- AMIs
- Instance types
- Subnets
- EBS volumes

- Launch templates

AMIs

The following policy allows users to launch instances using only the specified AMIs, ami-9e1670f7 and ami-45cf5c3c. The users can't launch an instance using other AMIs (unless another statement grants the users permission to do so).

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2::image/ami-9e1670f7",
                "arn:aws:ec2::image/ami-45cf5c3c"
            ]
        }
    ]
}
```
Alternatively, the following policy allows users to launch instances from all AMIs owned by Amazon, or certain trusted and verified partners. The Condition element of the first statement tests whether `ec2:Owner` is `amazon`. The users can't launch an instance using other AMIs (unless another statement grants the users permission to do so).
Instance types

The following policy allows users to launch instances using only the t2.micro or t2.small instance type, which you might do to control costs. The users can't launch larger instances because the Condition element of the first statement tests whether ec2:InstanceType is either t2.micro or t2.small.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Condition": {
                "StringEquals": {
                    "ec2:InstanceType": ["t2.micro", "t2.small"]
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:image/ami-*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:key-pair/*",
            ]
        }
    ]
}
```

Alternatively, you can create a policy that denies users permissions to launch any instances except t2.micro and t2.small instance types.
Subnets

The following policy allows users to launch instances using only the specified subnet, subnet-12345678. The group can't launch instances into any another subnet (unless another statement grants the users permission to do so).

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": "ec2:RunInstances",
      "Resource": [
        "arn:aws:ec2:region:account-id:instance/*"
      ],
      "Condition": {
        "StringNotEquals": {
          "ec2:InstanceType": ["t2.micro", "t2.small"]
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
      "Resource": [
        "arn:aws:ec2:region:image/ami-*",
        "arn:aws:ec2:region:account-id:instance/*",
        "arn:aws:ec2:region:account-id:subnet/*",
        "arn:aws:ec2:region:account-id:security-group/*
      ]
    }
  ]
}
```
Alternatively, you could create a policy that denies users permissions to launch an instance into any other subnet. The statement does this by denying permission to create a network interface, except where subnet subnet-12345678 is specified. This denial overrides any other policies that are created to allow launching instances into other subnets.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Deny",
            "Action": "ec2:RunInstances",
            "Resource": [
            ],
            "Condition": {
                "ArnNotEquals": {
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": [
                "arn:aws:ec2:region:account-id:instance/*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:key-pair/*",
            ]
        }
    ]
}
```
The following policy allows users to launch instances only if the EBS volumes for the instance are encrypted. The user must launch an instance from an AMI that was created with encrypted snapshots, to ensure that the root volume is encrypted. Any additional volume that the user attaches to the instance during launch must also be encrypted.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
      "Resource": [
        "arn:aws:ec2:::image/ami-*",
        "arn:aws:ec2:::network-interface/*",
        "arn:aws:ec2:::instance/*",
        "arn:aws:ec2:::subnet/*",
        "arn:aws:ec2:::key-pair/*",
        "arn:aws:ec2:::security-group/*"
      ],
      "Condition": {
        "Bool": {
          "ec2:Encrypted": "true"
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
      "Resource": [
        "arn:aws:ec2:::volume/*"
      ],
      "Condition": {
        "Bool": {
          "ec2:Encrypted": "true"
        }
      }
    }
  ]
}
```
Tags

Tag instances on creation

The following policy allows users to launch instances and tag the instances during creation. For resource-creating actions that apply tags, users must have permissions to use the CreateTags action. The second statement uses the ec2:CreateAction condition key to allow users to create tags only in the context of RunInstances, and only for instances. Users cannot tag existing resources, and users cannot tag volumes using the RunInstances request.

For more information, see Grant permission to tag Amazon EC2 resources during creation.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["ec2:RunInstances"],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": ["ec2:CreateTags"],
      "Resource": "arn:aws:ec2:us-east-1:account-id:instance/*",
      "Condition": {
        "StringEquals": {
          "ec2:CreateAction": "RunInstances"
        }
      }
    }
  ]
}
```

Tag instances and volumes on creation with specific tags

The following policy includes the aws:RequestTag condition key that requires users to tag any instances and volumes that are created by RunInstances with the tags

Example policies for the API
environment=production and purpose=webserver. If users don't pass these specific tags, or if they don't specify tags at all, the request fails.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["ec2:RunInstances"],
            "Resource": [
                "arn:aws:ec2:region::image/*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:key-pair/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": ["ec2:RunInstances"],
            "Resource": [
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/environment": "production",
                    "aws:RequestTag/purpose": "webserver"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": ["ec2:CreateTags"],
            "Resource": "arn:aws:ec2:region:account-id:*/*",
            "Condition": {
                "StringEquals": {

```
Tag instances and volumes on creation with at least one specific tag

The following policy uses the ForAnyValue modifier on the aws:TagKeys condition to indicate that at least one tag must be specified in the request, and it must contain the key environment or webserver. The tag must be applied to both instances and volumes. Any tag values can be specified in the request.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["ec2:RunInstances"],
            "Resource": [
                "arn:aws:ec2:region:image/*",
                "arn:aws:ec2:region:account-id:subnet/*",
                "arn:aws:ec2:region:account-id:key-pair/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": ["ec2:RunInstances"],
            "Resource": [
                "arn:aws:ec2:region:account-id:instance/*"
            ],
            "Condition": {
                "ForAnyValue:StringEquals": {
                    "aws:TagKeys": ["environment","webserver"]
                }
            }
        }
    ]
}
```
If instances are tagged on creation, they must be tagged with a specific tag

In the following policy, users do not have to specify tags in the request, but if they do, the tag must be purpose=test. No other tags are allowed. Users can apply the tags to any taggable resource in the RunInstances request.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["ec2:RunInstances"],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": ["ec2:CreateTags"],
            "Resource": "arn:aws:ec2:region:account-id:*/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/purpose": "test",
                    "ec2:CreateAction" : "RunInstances"
                }
            }
        }
    ]
}
```
To disallow anyone called tag on create for RunInstances

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "AllowRun",
         "Effect": "Allow",
         "Action": ["ec2:RunInstances"],
         "Resource": [
            "arn:aws:ec2:us-east-1::image/*",
            "arn:aws:ec2:us-east-1::*:subnet/*",
            "arn:aws:ec2:us-east-1::*:network-interface/*",
            "arn:aws:ec2:us-east-1::*:security-group/*",
            "arn:aws:ec2:us-east-1::*:key-pair/*",
            "arn:aws:ec2:us-east-1::*:volume/*",
            "arn:aws:ec2:us-east-1::*:instance/*",
            "arn:aws:ec2:us-east-1::*:spot-instances-request/*"
         ]
      },
      {
         "Sid": "VisualEditor0",
         "Effect": "Deny",
         "Action": "ec2:CreateTags",
         "Resource": "*"
      }
   ]
}
```

Only allow specific tags for spot-instances-request. Surprise inconsistency number 2 comes into play here. Under normal circumstances, specifying no tags will result in Unauthenticated. In the
In the case of spot-instances-request, this policy will not be evaluated if there are no spot-instances-request tags, so a non-tag Spot on Run request will succeed.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": ["ec2:RunInstances"],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::*:subnet/*",
                "arn:aws:ec2:us-east-1::*:network-interface/*",
                "arn:aws:ec2:us-east-1::*:security-group/*",
                "arn:aws:ec2:us-east-1::*:key-pair/*",
                "arn:aws:ec2:us-east-1::*:volume/*",
                "arn:aws:ec2:us-east-1::*:instance/*",
            ]
        },
        {
            "Sid": "VisualEditor0",
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": "arn:aws:ec2:us-east-1::*:spot-instances-request/*",
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/environment": "production"
                }
            }
        }
    ]
}
```

**Tags in a launch template**

In the following example, users can launch instances, but only if they use a specific launch template (lt-09477bcd97b0d310e). The ec2:IsLaunchTemplateResource condition key prevents users from overriding any of the resources specified in the launch template. The second
part of the statement allows users to tag instances on creation—this part of the statement is necessary if tags are specified for the instance in the launch template.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:RunInstances",
            "Resource": "*",
            "Condition": {
                "ArnLike": {
                    "ec2:LaunchTemplate": "arn:aws:ec2:region:account-id:launch-template/lt-09477bcd97b0d310e"
                },
                "Bool": {
                    "ec2:IsLaunchTemplateResource": "true"
                }
            }
        },
        {
            "Effect": "Allow",
            "Action": ["ec2:CreateTags"],
            "Condition": {
                "StringEquals": {
                    "ec2:CreateAction": "RunInstances"
                }
            }
        }
    ]
}
```

### Elastic GPUs

In the following policy, users can launch an instance and specify an elastic GPU to attach to the instance. Users can launch instances in any Region, but they can only attach an elastic GPU during a launch in the us-east-2 Region.

The `ec2:ElasticGpuType` condition key ensures that instances use either the `eg1.medium` or `eg1.large` elastic GPU type.
Launch templates

In the following example, users can launch instances, but only if they use a specific launch template (lt-09477bcd97b0d310e). Users can override any parameters in the launch template by specifying the parameters in the RunInstances action.
In this example, users can launch instances only if they use a launch template. The policy uses the ec2:IsLaunchTemplateResource condition key to prevent users from overriding any pre-existing ARNs in the launch template.

The following example policy allows user to launch instances, but only if they use a launch template. Users cannot override the subnet and network interface parameters in the request; these
parameters can only be specified in the launch template. The first part of the statement uses the `NotResource` element to allow all other resources except subnets and network interfaces. The second part of the statement allows the subnet and network interface resources, but only if they are sourced from the launch template.

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
                      "arn:aws:ec2:region:account-id:network-interface/*" ],
      "Condition": {
        "ArnLike": {
        }
      }
    },
    {
      "Effect": "Allow",
      "Action": "ec2:RunInstances",
                    "arn:aws:ec2:region:account-id:network-interface/*" ],
      "Condition": {
        "ArnLike": {
        },
        "Bool": {
          "ec2:IsLaunchTemplateResource": "true"
        }
      }
    }
  ]
}
```

The following example allows users to launch instances only if they use a launch template, and only if the launch template has the tag `Purpose=WebServers`. Users cannot override any of the launch template parameters in the `RunInstances` action.

```
{
  "Version": "2012-10-17",
```

Example policies for the API
Work with Spot Instances

You can use the RunInstances action to create Spot Instance requests, and tag the Spot Instance requests on create. The resource to specify for RunInstances is `spot-instances-request`.

The `spot-instances-request` resource is evaluated in the IAM policy as follows:

- If you don't tag a Spot Instance request on create, Amazon EC2 does not evaluate the `spot-instances-request` resource in the RunInstances statement.
- If you tag a Spot Instance request on create, Amazon EC2 evaluates the `spot-instances-request` resource in the RunInstances statement.

Therefore, for the `spot-instances-request` resource, the following rules apply to the IAM policy:

```json
"Statement": [
    {
        "Effect": "Allow",
        "Action": "ec2:RunInstances",
        "Condition": {
            "ArnLike": {
            },
            "Bool": {
                "ec2:IsLaunchTemplateResource": "true"
            }
        }
    },
    {
        "Effect": "Allow",
        "Action": "ec2:RunInstances",
        "Condition": {
            "StringEquals": {
                "aws:ResourceTag/Purpose": "Webservers"
            }
        }
    }
]
```
If you use RunInstances to create a Spot Instance request and you don't intend to tag the Spot Instance request on create, you don't need to explicitly allow the `spot-instances-request` resource; the call will succeed.

If you use RunInstances to create a Spot Instance request and intend to tag the Spot Instance request on create, you must include the `spot-instances-request` resource in the RunInstances allow statement, otherwise the call will fail.

If you use RunInstances to create a Spot Instance request and intend to tag the Spot Instance request on create, you must specify the `spot-instances-request` resource or * wildcard in the CreateTags allow statement, otherwise the call will fail.

You can request Spot Instances using RunInstances or RequestSpotInstances. The following example IAM policies apply only when requesting Spot Instances using RunInstances.

**Example: Request Spot Instances using RunInstances**

The following policy allows users to request Spot Instances by using the RunInstances action. The `spot-instances-request` resource, which is created by RunInstances, requests Spot Instances.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "AllowRun",
         "Effect": "Allow",
         "Action": [
            "ec2:RunInstances"
         ],
         "Resource": [
            "arn:aws:ec2:us-east-1::image/**",
            "arn:aws:ec2:us-east-1::*:subnet/**",
        ]
      }
   ]
}
```

**Important Note**

To use RunInstances to create Spot Instance requests, you can omit `spot-instances-request` from the Resource list if you do not intend to tag the Spot Instance requests on create. This is because Amazon EC2 does not evaluate the `spot-instances-request` resource in the RunInstances statement if the Spot Instance request is not tagged on create.
Warning

NOT SUPPORTED – Example: Deny users permission to request Spot Instances using RunInstances

The following policy is not supported for the spot-instances-request resource.

The following policy is meant to give users the permission to launch On-Demand Instances, but deny users the permission to request Spot Instances. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement is meant to deny the RunInstances action for the spot-instances-request resource. However, this condition is not supported because Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement if the Spot Instance request is not tagged on create.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowRun",
            "Effect": "Allow",
            "Action": ["ec2:RunInstances"],
            "Resource": [
                "arn:aws:ec2:us-east-1::image/*",
                "arn:aws:ec2:us-east-1::*:subnet/*",
                "arn:aws:ec2:us-east-1::*:network-interface/*",
                "arn:aws:ec2:us-east-1::*:security-group/*",
                "arn:aws:ec2:us-east-1::*:key-pair/*",
                "arn:aws:ec2:us-east-1::*:volume/*",
                "arn:aws:ec2:us-east-1::*:instance/*"
            ]
        }
    ]
}
```
Example policies for the API

Example: Tag Spot Instance requests on create

The following policy allows users to tag all resources that are created during instance launch. The first statement allows RunInstances to create the listed resources. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement provides a * wildcard to allow all resources to be tagged when they are created at instance launch.

Note

If you tag a Spot Instance request on create, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement. Therefore, you must explicitly allow the spot-instances-request resource for the RunInstances action, otherwise the call will fail.
Example: Deny tag on create for Spot Instance requests

The following policy denies users the permission to tag the resources that are created during instance launch.

The first statement allows RunInstances to create the listed resources. The spot-instances-request resource, which is created by RunInstances, is the resource that requests Spot Instances. The second statement provides a * wildcard to deny all resources being tagged when they are created at instance launch. If spot-instances-request or any other resource is tagged on create, the RunInstances call will fail.
Warning

NOT SUPPORTED – Example: Allow creating a Spot Instance request only if it is assigned a specific tag

The following policy is not supported for the spot-instances-request resource. The following policy is meant to grant RunInstances the permission to create a Spot Instance request only if the request is tagged with a specific tag. The first statement allows RunInstances to create the listed resources. The second statement is meant to grant users the permission to create a Spot Instance request only if the request has the tag environment=production. If this condition is applied to other resources created by RunInstances, specifying no tags results in an Unauthenticated error. However, if no tags are specified for the Spot Instance request, Amazon EC2 does not evaluate the spot-instances-request resource in the RunInstances statement, which results in non-tagged Spot Instance requests being created by RunInstances.

Note that specifying another tag other than environment=production results in an Unauthenticated error, because if a user tags a Spot Instance request, Amazon EC2 evaluates the spot-instances-request resource in the RunInstances statement.

```
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "AllowRun",
         "Effect": "Allow",
         "Action": "*"
      }
   ]
}
```
Example policies for the API

Example: Deny creating a Spot Instance request if it is assigned a specific tag

The following policy denies RunInstances the permission to create a Spot Instance request if the request is tagged with environment=production.

The first statement allows RunInstances to create the listed resources.
The second statement denies users the permission to create a Spot Instance request if the request has the tag environment=production. Specifying environment=production as a tag results in an Unauthenticated error. Specifying other tags or specifying no tags will result in the creation of a Spot Instance request.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "AllowRun",
         "Effect": "Allow",
         "Action": ["ec2:RunInstances"],
         "Resource": [
            "arn:aws:ec2:us-east-1::image/**",
            "arn:aws:ec2:us-east-1::*:subnet/**",
            "arn:aws:ec2:us-east-1::*:network-interface/**",
            "arn:aws:ec2:us-east-1::*:security-group/**",
            "arn:aws:ec2:us-east-1::*:key-pair/**",
            "arn:aws:ec2:us-east-1::*:volume/**",
            "arn:aws:ec2:us-east-1::*:instance/**",
            "arn:aws:ec2:us-east-1::*:spot-instances-request/**"
        ]
      },
      {
         "Sid": "DenySpotInstancesRequests",
         "Effect": "Deny",
         "Action": "ec2:RunInstances",
         "Resource": "arn:aws:ec2:us-east-1::*:spot-instances-request/**",
         "Condition": {
            "StringEquals": {
               "aws:RequestTag/environment": "production"
            }
         }
      },
      {
         "Sid": "TagResources",
         "Effect": "Allow",
         "Action": "ec2:CreateTags",
         "Resource": "*"
      }
   ]
}
```
Example: Work with Reserved Instances

The following policy gives users permission to view, modify, and purchase Reserved Instances in your account.

It is not possible to set resource-level permissions for individual Reserved Instances. This policy means that users have access to all the Reserved Instances in the account.

The Resource element uses a * wildcard to indicate that users can specify all resources with the action; in this case, they can list and modify all Reserved Instances in the account. They can also purchase Reserved Instances using the account credentials. The * wildcard is also necessary in cases where the API action does not support resource-level permissions.

```json
{
   "Version": "2012-10-17",
   "Statement": [ 
      {
         "Effect": "Allow",
         "Action": [ "ec2:DescribeReservedInstances", "ec2:ModifyReservedInstances", "ec2:PurchaseReservedInstancesOffering", "ec2:DescribeAvailabilityZones", "ec2:DescribeReservedInstancesOfferings" ],
         "Resource": "*"
      }
   ]
}
```

To allow users to view and modify the Reserved Instances in your account, but not purchase new Reserved Instances.

```json
{
   "Version": "2012-10-17",
   "Statement": [ 
      {
         "Effect": "Allow",
         "Action": [ "ec2:DescribeReservedInstances", "ec2:Mod..." 
      }
   ]
}
```
Example: Tag resources

The following policy allows users to use the CreateTags action to apply tags to an instance only if the tag contains the key environment and the value production. No other tags are allowed and the user cannot tag any other resource types.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["ec2:CreateTags"],
            "Condition": {
                "StringEquals": {
                    "aws:RequestTag/environment": "production"
                }
            }
        }
    ]
}
```

The following policy allows users to tag any taggable resource that already has a tag with a key of owner and a value of the username. In addition, users must specify a tag with a key of anycompany:environment-type and a value of either test or prod in the request. Users can specify additional tags in the request.

```json
{
    "Version": "2012-10-17",
```
You can create an IAM policy that allows users to delete specific tags for a resource. For example, the following policy allows users to delete tags for a volume if the tag keys specified in the request are environment or cost-center. Any value can be specified for the tag but the tag key must match either of the specified keys.

### Note

If you delete a resource, all tags associated with the resource are also deleted. Users do not need permissions to use the ec2:DeleteTags action to delete a resource that has tags; they only need permissions to perform the deleting action.
This policy allows users to delete only the environment=prod tag on any resource, and only if the resource is already tagged with a key of owner and a value of the username. Users can't delete any other tags for a resource.

{  
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": ["ec2:DeleteTags"],
      "Resource": "arn:aws:ec2:region:account-id:*/*",
      "Condition": {
        "StringEquals": {
          "aws:RequestTag/environment": "prod",
          "aws:ResourceTag/owner": "${aws:username}"},
        "ForAllValues:StringEquals": {
          "aws:TagKeys": ["environment"]}
      }
    }
  ]
}

Example: Work with IAM roles

The following policy allows users to attach, replace, and detach an IAM role to instances that have the tag department=test. Replacing or detaching an IAM role requires an association ID, therefore the policy also grants users permission to use the ec2:DescribeIamInstanceProfileAssociations action.

Users must have permission to use the iam:PassRole action in order to pass the role to the instance.

{  
}

Example policies for the API 2382
The following policy allows users to attach or replace an IAM role for any instance. Users can only attach or replace IAM roles with names that begin with TestRole-. For the `iam:PassRole` action, ensure that you specify the name of the IAM role and not the instance profile (if the names are different). For more information, see Instance profiles.

```json
{
   "Version": "2012-10-17",
   "Statement": [
   {
      "Effect": "Allow",
      "Action": [
         "ec2:AssociateIamInstanceProfile",
         "ec2:ReplaceIamInstanceProfileAssociation",
         "ec2:DisassociateIamInstanceProfile"
      ],
      "Resource": "arn:aws:ec2:us-east-1:account-id:instance/\***",
      "Condition": {
         "StringEquals": {
            "aws:ResourceTag/department": "test"
         }
      }
   },
   {
      "Effect": "Allow",
      "Action": "ec2:DescribeIamInstanceProfileAssociations",
      "Resource": "\***"
   },
   {
      "Effect": "Allow",
      "Action": "iam:PassRole",
      "Resource": "arn:aws:iam::account-id:role/DevTeam\***"
   }
   ]
}
```
Example: Work with route tables

The following policy allows users to add, remove, and replace routes for route tables that are associated with VPC vpc-ec43eb89 only. To specify a VPC for the ec2:Vpc condition key, you must specify the full ARN of the VPC.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": ["ec2:DeleteRoute", "ec2:CreateRoute", "ec2:ReplaceRoute"],
            "Condition": {
                "StringEquals": {
                    "ec2:Vpc": "arn:aws:ec2:region:account-id:vpc/vpc-ec43eb89"
                }
            }
        }
    ]
}
```
Example: Allow a specific instance to view resources in other AWS services

The following is an example of a policy that you might attach to an IAM role. The policy allows an instance to view resources in various AWS services. It uses the `ec2:SourceInstanceARN` global condition key to specify that the instance from which the request is made must be instance `i-093452212644b0dd6`. If the same IAM role is associated with another instance, the other instance cannot perform any of these actions.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeVolumes",
                "s3:ListAllMyBuckets",
                "dynamodb:ListTables",
                "rds:DescribeDBInstances"
            ],
            "Resource": ["*"],
            "Condition": {
                "ArnEquals": {
                    "ec2:SourceInstanceARN": "arn:aws:ec2:region:account-id:instance/i-093452212644b0dd6"
                }
            }
        }
    ]
}
```

Example: Work with launch templates

The following policy allows users to create a launch template version and modify a launch template, but only for a specific launch template (`lt-09477bcd97b0d3abc`). Users cannot work with other launch templates.

```json
{
    "Version": "2012-10-17",
    "Statement": [
```

Example policies for the API
The following policy allows users to delete any launch template and launch template version, provided that the launch template has the tag `Purpose=Testing`.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Action": [
        "ec2:DeleteLaunchTemplate",
        "ec2:DeleteLaunchTemplateVersions"
      ],
      "Effect": "Allow",
      "Condition": {
        "StringEquals": {
          "aws:ResourceTag/Purpose": "Testing"
        }
      }
    }
  ]
}
```

**Work with instance metadata**

The following policies ensure that users can only retrieve instance metadata using Instance Metadata Service Version 2 (IMDSv2). You can combine the following four policies into one policy with four statements. When combined as one policy, you can use the policy as a service control policy (SCP). It can work equally well as a deny policy that you apply to an existing IAM policy (taking away and limiting existing permission), or as an SCP that is applied globally across an account, an organizational unit (OU), or an entire organization.
**Note**

The following RunInstances metadata options policies must be used in conjunction with a policy that gives the principal permissions to launch an instance with RunInstances. If the principal does not also have RunInstances permissions, it will not be able to launch an instance. For more information, see the policies in [Work with instances](#) and [Launch instances (RunInstances)](#).

**Important**

If you use Auto Scaling groups and you need to require the use of IMDSv2 on all new instances, your Auto Scaling groups must use launch templates.

When an Auto Scaling group uses a launch template, the ec2:RunInstances permissions of the IAM principal are checked when a new Auto Scaling group is created. They are also checked when an existing Auto Scaling group is updated to use a new launch template or a new version of a launch template.

Restrictions on the use of IMDSv1 on IAM principals for RunInstances are only checked when an Auto Scaling group that is using a launch template, is created or updated. For an Auto Scaling group that is configured to use the Latest or Default launch template, the permissions are not checked when a new version of the launch template is created.

For permissions to be checked, you must configure the Auto Scaling group to use a specific version of the launch template.

**To enforce the use of IMDSv2 on instances launched by Auto Scaling groups, the following additional steps are required:**

1. Disable the use of launch configurations for all accounts in your organization by using either service control policies (SCPs) or IAM permissions boundaries for new principals that are created. For existing IAM principals with Auto Scaling group permissions, update their associated policies with this condition key. To disable the use of launch configurations, create or modify the relevant SCP, permissions boundary, or IAM policy with the "autoscaling:LaunchConfigurationName" condition key with the value specified as null.

2. For new launch templates, configure the instance metadata options in the launch template. For existing launch templates, create a new version of the launch template and configure the instance metadata options in the new version.
3. In the policy that gives any principal the permission to use a launch
template, restrict association of $latest and $default by specifying
"autoscaling:LaunchTemplateVersionSpecified": "true". By restricting the
use to a specific version of a launch template, you can ensure that new instances will be
launched using the version in which the instance metadata options are configured. For
more information, see LaunchTemplateSpecification in the Amazon EC2 Auto Scaling API
Reference, specifically the Version parameter.

4. For an Auto Scaling group that uses a launch configuration, replace the launch
configuration with a launch template. For more information, see Replacing a Launch
Configuration with a Launch Template in the Amazon EC2 Auto Scaling User Guide.

5. For an Auto Scaling group that uses a launch template, make sure that it uses a new
launch template with the instance metadata options configured, or uses a new version
of the current launch template with the instance metadata options configured. For more
information, see update-auto-scaling-group in the AWS CLI Command Reference.

Examples

- **Require the use of IMDSv2**
- **Deny opt-out of IMDSv2**
- **Specify maximum hop limit**
- **Limit who can modify the instance metadata options**
- **Require role credentials to be retrieved from IMDSv2**

### Require the use of IMDSv2

The following policy specifies that you can’t call the RunInstances API unless the instance is
also opted in to require the use of IMDSv2 (indicated by "ec2:MetadataHttpTokens": "required"). If you do not specify that the instance requires IMDSv2, you get an
UnauthorizedOperation error when you call the RunInstances API.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "RequireImdsV2",
         "Effect": "Deny",
      }
   ]
}
```
**Deny opt-out of IMDSv2**

The following policy specifies that you cannot call the ModifyInstanceMetadataOptions API and allow the option of IMDSv1 or IMDSv2. If you call the ModifyInstanceMetadataOptions API, the HttpTokens attribute must be set to required.

```json
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "DenyIMDSv1HttpTokensModification",
      "Effect": "Deny",
      "Action": "ec2:ModifyInstanceMetadataOptions",
      "Resource": "arn:aws:ec2:*:*:instance/*",
      "Condition": {
        "StringNotEquals": {
          "ec2:Attribute/HttpTokens": "required"
        },
        "Null": {
          "ec2:Attribute/HttpTokens": false
        }
      }
    }
  ]
}
```

**Specify maximum hop limit**

The following policy specifies that you can’t call the RunInstances API unless you also specify a hop limit, and the hop limit can’t be more than 3. If you fail to do that, you get an UnauthorizedOperation error when you call the RunInstances API.

```json
{
  "Action": "ec2:RunInstances",
  "Resource": "arn:aws:ec2:*:*:instance/*",
  "Condition": {
    "StringNotEquals": {
      "ec2:MetadataHttpTokens": "required"
    }
  }
}
```
Limit who can modify the instance metadata options

The following policy permits only users with the role ec2-imds-admins to make changes to the instance metadata options. If any principal other than the ec2-imds-admins role tries to call the ModifyInstanceMetadataOptions API, it will get an UnauthorizedOperation error. This statement could be used to control the use of the ModifyInstanceMetadataOptions API; there are currently no fine-grained access controls (conditions) for the ModifyInstanceMetadataOptions API.

```
{  
  "Version": "2012-10-17",
  "Statement": [
    {
      "Sid": "AllowOnlyImdsAdminsToModifySettings",
      "Effect": "Deny",
      "Action": "ec2:ModifyInstanceMetadataOptions",
      "Resource": "*",
      "Condition": {
        "StringNotLike": {
          "aws:PrincipalARN": "arn:aws:iam::*:role/ec2-imds-admins"
        }
      }
    }
  ]
}
```
Require role credentials to be retrieved from IMDSv2

The following policy specifies that if this policy is applied to a role, and the role is assumed by the EC2 service and the resulting credentials are used to sign a request, then the request must be signed by EC2 role credentials retrieved from IMDSv2. Otherwise, all of its API calls will get an UnauthorizedOperation error. This statement/policy can be applied generally because, if the request is not signed by EC2 role credentials, it has no effect.

```
{
   "Version": "2012-10-17",
   "Statement": [
       {
           "Sid": "RequireAllEc2RolesToUseV2",
           "Effect": "Deny",
           "Action": "*",
           "Resource": "*",
           "Condition": {
               "NumericLessThan": {
                   "ec2:RoleDelivery": "2.0"
               }
           }
       }
   ]
}
```

Work with Amazon EBS volumes and snapshots

For example policies for working with Amazon EBS volumes and snapshots, see Identity-based policy examples for Amazon EBS.

Example policies to control access to the Amazon EC2 console

You can use IAM policies to grant users the permissions required to work with Amazon EC2. For step-by-step directions, see Creating IAM policies in the IAM User Guide.

The console uses additional API actions for its features, so these policies may not work as expected. For example, a user that has permission to use only the DescribeVolumes API action will encounter errors when trying to view volumes in the console. This section demonstrates policies that enable users to work with specific parts of the console. For additional information about creating policies for the Amazon EC2 console, see the following AWS Security Blog post: Granting Users Permission to Work in the Amazon EC2 Console.
The following examples show policy statements that you could use to grant users permissions to use Amazon EC2. Replace each *user input placeholder* with your own information. These policies are designed for requests that are made using the AWS Management Console. The Amazon EC2 console might call multiple API actions to display a single resource, and it might not be obvious until the user attempts a task and the console displays an error. For more information, see the following AWS Security Blog post: [Granting Users Permission to Work in the Amazon EC2 Console](#).

**Examples**

- **Example: Read-only access**
- **Example: Use the EC2 launch instance wizard**
- **Example: Work with security groups**
- **Example: Work with Elastic IP addresses**
- **Example: Work with Reserved Instances**

To help you work out which API actions are required to perform tasks in the console, you can use a service that logs calls, such as AWS CloudTrail. If your policy does not grant permission to create or modify a specific resource, the console displays an encoded message with diagnostic information. You can decode the message using the `DecodeAuthorizationMessage` API action for AWS STS, or the `decode-authorization-message` command in the AWS CLI.

**Example: Read-only access**

To allow users to view all resources in the Amazon EC2 console, you can use the same policy as the following example: [Example: Read-only access](#). Users cannot perform any actions on those resources or create new resources, unless another statement grants them permission to do so.

**View instances, AMIs, and snapshots**

Alternatively, you can provide read-only access to a subset of resources. To do this, replace the * wildcard in the `ec2:Describe` API action with specific `ec2:Describe` actions for each resource. The following policy allows users to view all instances, AMIs, and snapshots in the Amazon EC2 console. The `ec2:DescribeTags` action allows users to view public AMIs. The console requires the tagging information to display public AMIs; however, you can remove this action to allow users to view only private AMIs.

```bash
{

```
The Amazon EC2 ec2:Describe* API actions do not support resource-level permissions, so you cannot control which individual resources users can view in the console. Therefore, the * wildcard is necessary in the Resource element of the above statement. For more information about which ARNs you can use with which Amazon EC2 API actions, see Actions, resources, and condition keys for Amazon EC2.

View instances and CloudWatch metrics

The following policy allows users to view instances in the Amazon EC2 console, as well as CloudWatch alarms and metrics in the Monitoring tab of the Instances page. The Amazon EC2 console uses the CloudWatch API to display the alarms and metrics, so you must grant users permission to use the cloudwatch:DescribeAlarms, cloudwatch:DescribeAlarmsForMetric, cloudwatch:ListMetrics, cloudwatch:GetMetricStatistics, and cloudwatch:GetMetricData actions.
Example: Use the EC2 launch instance wizard

The Amazon EC2 launch instance wizard is a screen with options to configure and launch an instance. Your policy must include permission to use the API actions that allow users to work with the wizard's options. If your policy does not include permission to use those actions, some items in the wizard cannot load properly, and users cannot complete a launch.

Basic launch instance wizard access

To complete a launch successfully, users must be given permission to use the `ec2:RunInstances` API action, and at least the following API actions:

- `ec2:DescribeImages`: To view and select an AMI.
- `ec2:DescribeInstanceTypes`: To view and select an instance type.
- `ec2:DescribeVpcs`: To view the available network options.
- `ec2:DescribeSubnets`: To view all available subnets for the chosen VPC.
- `ec2:DescribeSecurityGroups` or `ec2:CreateSecurityGroup`: To view and select an existing security group, or to create a new one.
- `ec2:DescribeKeyPairs` or `ec2:CreateKeyPair`: To select an existing key pair, or to create a new one.
- `ec2:AuthorizeSecurityGroupIngress`: To add inbound rules.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeInstances",
                "cloudwatch:ListMetrics",
                "cloudwatch:GetMetricStatistics",
                "cloudwatch:GetMetricData"
            ],
            "Resource": "*"
        }
    ]
}
```
You can add API actions to your policy to provide more options for users, for example:

- **ec2:DescribeAvailabilityZones**: To view and select a specific Availability Zone.
- **ec2:DescribeNetworkInterfaces**: To view and select existing network interfaces for the selected subnet.
- To add outbound rules to VPC security groups, users must be granted permission to use the **ec2:AuthorizeSecurityGroupEgress** API action. To modify or delete existing rules, users must be granted permission to use the relevant **ec2:RevokeSecurityGroup*** API action.
- **ec2:CreateTags**: To tag the resources that are created by RunInstances. For more information, see [Grant permission to tag Amazon EC2 resources during creation](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/creating-resource-tags.html). If users do not have permission to use this action and they attempt to apply tags on the tagging page of the launch instance wizard, the launch fails.

⚠️ **Important**

Specifying a **Name** while launching an instance creates a tag and requires the **ec2:CreateTags** action. Be careful about granting users permission to use the **ec2:CreateTags** action, because doing so limits your ability to use the **aws:ResourceTag** condition key to restrict their use of other resources. If you grant users permission to use the **ec2:CreateTags** action, they can change a resource's tag.
in order to bypass those restrictions. For more information, see Control access using attribute-based access.

- To use Systems Manager parameters when selecting an AMI, you must add ssm:DescribeParameters and ssm:GetParameters to your policy. ssm:DescribeParameters grants your users the permission to view and select Systems Manager parameters. ssm:GetParameters grants your users the permission to get the values of the Systems Manager parameters. You can also restrict access to specific Systems Manager parameters. For more information, see Restrict access to specific Systems Manager parameters later in this section.

Currently, the Amazon EC2 Describe* API actions do not support resource-level permissions, so you cannot restrict which individual resources users can view in the launch instance wizard. However, you can apply resource-level permissions on the ec2:RunInstances API action to restrict which resources users can use to launch an instance. The launch fails if users select options that they are not authorized to use.

**Restrict access to a specific instance type, subnet, and Region**

The following policy allows users to launch t2.micro instances using AMIs owned by Amazon, and only into a specific subnet (subnet-1a2b3c4d). Users can only launch in the specified Region. If users select a different Region, or select a different instance type, AMI, or subnet in the launch instance wizard, the launch fails.

The first statement grants users permission to view the options in the launch instance wizard or to create new ones, as explained in the example above. The second statement grants users permission to use the network interface, volume, key pair, security group, and subnet resources for the ec2:RunInstances action, which are required to launch an instance into a VPC. For more information about using the ec2:RunInstances action, see Launch instances (RunInstances). The third and fourth statements grant users permission to use the instance and AMI resources respectively, but only if the instance is a t2.micro instance, and only if the AMI is owned by Amazon, or certain trusted and verified partners.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeInstances",
```
"ec2:DescribeImages",
"ec2:DescribeInstanceTypes",
"ec2:DescribeKeyPairs",
"ec2:CreateKeyPair",
"ec2:DescribeVpcs",
"ec2:DescribeSubnets", "ec2:DescribeSecurityGroups",
"ec2:CreateSecurityGroup",
"ec2:AuthorizeSecurityGroupIngress"
],
"Resource": "*
},
{
  "Effect": "Allow",
  "Action":"ec2:RunInstances",
  "Resource": [
    "arn:aws:ec2:region:111122223333:key-pair/*",
    "arn:aws:ec2:region:111122223333:subnet/subnet-1a2b3c4d"
  ]
},
{
  "Effect": "Allow",
  "Action": "ec2:RunInstances",
  "Resource": [
  ],
  "Condition": {
    "StringEquals": {
      "ec2:InstanceType": "t2.micro"
    }
  }
},
{
  "Effect": "Allow",
  "Action": "ec2:RunInstances",
  "Resource": [
    "arn:aws:ec2:region::image/ami-*"
  ],
  "Condition": {
    "StringEquals": {
      "ec2:Owner": "amazon"
    }
  }
Restrict access to specific Systems Manager parameters

The following policy grants access to use Systems Manager parameters with a specific name.

The first statement grants users the permission to view Systems Manager parameters when selecting an AMI in the launch instance wizard. The second statement grants users the permission to only use parameters that are named prod-*.

```json
{
   "Version": "2012-10-17",
   "Statement": [{
      "Effect": "Allow",
      "Action": [
         "ssm:DescribeParameters"
      ],
      "Resource": "*
   },
   {
      "Effect": "Allow",
      "Action": [
         "ssm:GetParameters"
      ],
   }
}
```

Example: Work with security groups

View security groups and add and remove rules

The following policy grants users permission to view security groups in the Amazon EC2 console, to add and remove inbound and outbound rules, and to list and modify rule descriptions for existing security groups that have the tag Department=Test.

In the first statement, the ec2:DescribeTags action allows users to view tags in the console, which makes it easier for users to identify the security groups that they are allowed to modify.
Work with the Create Security Group dialog box

Example policies for the console
You can create a policy that allows users to work with the **Create Security Group** dialog box in the Amazon EC2 console. To use this dialog box, users must be granted permission to use at least the following API actions:

- `ec2:CreateSecurityGroup`: To create a new security group.
- `ec2:DescribeVpcs`: To view a list of existing VPCs in the **VPC** list.

With these permissions, users can create a new security group successfully, but they cannot add any rules to it. To work with rules in the **Create Security Group** dialog box, you can add the following API actions to your policy:

- `ec2:AuthorizeSecurityGroupIngress`: To add inbound rules.
- `ec2:AuthorizeSecurityGroupEgress`: To add outbound rules to VPC security groups.
- `ec2:RevokeSecurityGroupIngress`: To modify or delete existing inbound rules. This is useful to allow users to use the **Copy to new** feature in the console. This feature opens the **Create Security Group** dialog box and populates it with the same rules as the security group that was selected.
- `ec2:RevokeSecurityGroupEgress`: To modify or delete outbound rules for VPC security groups. This is useful to allow users to modify or delete the default outbound rule that allows all outbound traffic.
- `ec2:DeleteSecurityGroup`: To cater for when invalid rules cannot be saved. The console first creates the security group, and then adds the specified rules. If the rules are invalid, the action fails, and the console attempts to delete the security group. The user remains in the **Create Security Group** dialog box so that they can correct the invalid rule and try to create the security group again. This API action is not required, but if a user is not granted permission to use it and attempts to create a security group with invalid rules, the security group is created without any rules, and the user must add them afterward.
- `ec2:UpdateSecurityGroupRuleDescriptionsIngress`: To add or update descriptions of ingress (inbound) security group rules.
- `ec2:UpdateSecurityGroupRuleDescriptionsEgress`: To add or update descriptions of egress (outbound) security group rules.
- `ec2:ModifySecurityGroupRules`: To modify security group rules.
- `ec2:DescribeSecurityGroupRules`: To list security group rules.

**Example policies for the console**

2400
The following policy grants users permission to use the Create Security Group dialog box, and to create inbound and outbound rules for security groups that are associated with a specific VPC (vpc-1a2b3c4d). Users can create security groups for a VPC, but they cannot add any rules to them. Similarly, users cannot add any rules to any existing security group that's not associated with VPC vpc-1a2b3c4d. Users are also granted permission to view all security groups in the console. This makes it easier for users to identify the security groups to which they can add inbound rules. This policy also grants users permission to delete security groups that are associated with VPC vpc-1a2b3c4d.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Condition": {
                "ArnEquals": {
                    "ec2:Vpc": "arn:aws:ec2:region:111122223333:vpc/vpc-1a2b3c4d"
                }
            }
        }
    ]
}
```

Example: Work with Elastic IP addresses

To allow users to view Elastic IP addresses in the Amazon EC2 console, you must grant users permission to use the ec2:DescribeAddresses action.
To allow users to work with Elastic IP addresses, you can add the following actions to your policy.

- `ec2:AllocateAddress`: To allocate an Elastic IP address.
- `ec2:ReleaseAddress`: To release an Elastic IP address.
- `ec2:AssociateAddress`: To associate an Elastic IP address with an instance or a network interface.
- `ec2:DescribeNetworkInterfaces` and `ec2:DescribeInstances`: To work with the Associate address screen. The screen displays the available instances or network interfaces to which you can associate an Elastic IP address.
- `ec2:DisassociateAddress`: To disassociate an Elastic IP address from an instance or a network interface.

The following policy allows users to view, allocate, and associate Elastic IP addresses with instances. Users cannot associate Elastic IP addresses with network interfaces, disassociate Elastic IP addresses, or release them.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "ec2:DescribeAddresses",
            "ec2:AllocateAddress",
            "ec2:DescribeInstances",
            "ec2:AssociateAddress"
         ],
         "Resource": "*
      }
   ]
}
```

**Example: Work with Reserved Instances**

The following policy allows users to view and modify Reserved Instances in your account, as well as purchase new Reserved Instances in the AWS Management Console.

This policy allows users to view all the Reserved Instances, as well as On-Demand Instances, in the account. It's not possible to set resource-level permissions for individual Reserved Instances.
The `ec2:DescribeAvailabilityZones` action is necessary to ensure that the Amazon EC2 console can display information about the Availability Zones in which you can purchase Reserved Instances. The `ec2:DescribeInstances` action is not required, but ensures that the user can view the instances in the account and purchase reservations to match the correct specifications.

You can adjust the API actions to limit user access, for example removing `ec2:DescribeInstances` and `ec2:DescribeAvailabilityZones` means the user has read-only access.

**AWS managed policies for Amazon EC2**

To add permissions to users, groups, and roles, it is easier to use AWS managed policies than to write policies yourself. It takes time and expertise to create IAM customer managed policies that provide your team with only the permissions they need. To get started quickly, you can use our AWS managed policies. These policies cover common use cases and are available in your AWS account. For more information about AWS managed policies, see [AWS managed policies](#) in the IAM User Guide.

AWS services maintain and update AWS managed policies. You can't change the permissions in AWS managed policies. Services occasionally add additional permissions to an AWS managed policy to support new features. This type of update affects all identities (users, groups, and roles) where the policy is attached. Services are most likely to update an AWS managed policy when
a new feature is launched or when new operations become available. Services do not remove permissions from an AWS managed policy, so policy updates won't break your existing permissions.

Additionally, AWS supports managed policies for job functions that span multiple services. For example, the **ReadOnlyAccess** AWS managed policy provides read-only access to all AWS services and resources. When a service launches a new feature, AWS adds read-only permissions for new operations and resources. For a list and descriptions of job function policies, see [AWS managed policies for job functions](https://docs.aws.amazon.com/IAM/latest/UserGuide/managed-policies-for-job-function.html) in the *IAM User Guide*.

**AWS managed policy: AmazonEC2FullAccess**

You can attach the AmazonEC2FullAccess policy to your IAM identities. This policy grants permissions that allow full access to Amazon EC2.

To view the permissions for this policy, see [AmazonEC2FullAccess](https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_policies-managed_policy.html) in the *AWS Managed Policy Reference*.

**AWS managed policy: AmazonEC2ReadOnlyAccess**

You can attach the AmazonEC2ReadOnlyAccess policy to your IAM identities. This policy grants permissions that allow read-only access to Amazon EC2.

To view the permissions for this policy, see [AmazonEC2ReadOnlyAccess](https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_policies-managed_policy.html) in the *AWS Managed Policy Reference*.

**AWS managed policy: AWSEC2CapacityReservationFleetRolePolicy**

This policy is attached to the service-linked role named **AWSServiceRoleForEC2CapacityReservationFleet** to allow Capacity Reservations to create, modify, and cancel Capacity Reservations on your behalf. For more information, see [Service-linked role for Capacity Reservation Fleet](https://docs.aws.amazon.com/AWSEC2/UserGuide/capacity-reservation-fleet.html).

To view the permissions for this policy, see [AWSEC2CapacityReservationFleetRolePolicy](https://docs.aws.amazon.com/AWSEC2/UserGuide/capacity-reservation-fleet.html) in the *AWS Managed Policy Reference*.

**AWS managed policy: AWSEC2FleetServiceRolePolicy**

This policy is attached to the service-linked role named **AWSServiceRoleForEC2Fleet** to allow EC2 Fleet to request, launch, terminate, and tag instances on your behalf. For more information, see [Service-linked role for EC2 Fleet](https://docs.aws.amazon.com/AWSEC2/UserGuide/ec2-fleet.html).
To view the permissions for this policy, see [AWSEC2FleetServiceRolePolicy](https://aws.amazon.com) in the *AWS Managed Policy Reference*.

**AWS managed policy: AWSEC2SpotFleetServiceRolePolicy**

This policy is attached to the service-linked role named [AWSServiceRoleForEC2SpotFleet](https://aws.amazon.com) to allow Spot Fleet to launch and manage instances on your behalf. For more information, see [Service-linked role for Spot Fleet](https://aws.amazon.com).

To view the permissions for this policy, see [AWSEC2SpotFleetServiceRolePolicy](https://aws.amazon.com) in the *AWS Managed Policy Reference*.

**AWS managed policy: AWSEC2SpotServiceRolePolicy**

This policy is attached to the service-linked role named [AWSServiceRoleForEC2Spot](https://aws.amazon.com) to allow Amazon EC2 to launch and manage Spot Instances on your behalf. For more information, see [Service-linked role for Spot Instance requests](https://aws.amazon.com).

To view the permissions for this policy, see [AWSEC2SpotServiceRolePolicy](https://aws.amazon.com) in the *AWS Managed Policy Reference*.

**AWS managed policy: AWSEC2VssSnapshotPolicy**

You can attach this managed policy to the IAM instance profile role that you use for your Amazon EC2 Windows instances. The policy grants permissions to allow Amazon EC2 to create and manage VSS snapshots on your behalf.

To view the permissions for this policy, see [AWSEC2VssSnapshotPolicy](https://aws.amazon.com) in the *AWS Managed Policy Reference*.

**AWS managed policy: EC2FastLaunchFullAccess**

You can attach the EC2FastLaunchFullAccess policy to your instance profile or other IAM role. This policy grants full access to EC2 Fast Launch actions, and targeted permissions as follows.

**Permissions details**

- **EC2 Fast Launch** – Administrative access is granted, so that the role can enable or disable EC2 Fast Launch, and describe EC2 Fast Launch images.
- **Amazon EC2** – Access is granted for Amazon EC2 RunInstances, CreateTags and Describe actions that are needed to verify resource permissions.
- **IAM** – Access is granted to get and use instance profiles whose name contains `ec2fastlaunch` to create the `EC2FastLaunchServiceRolePolicy` service-linked role.

To view the permissions for this policy, see [EC2FastLaunchFullAccess](https://aws.amazon.com/documentation/aws_managed_policies/) in the *AWS Managed Policy Reference*.

**AWS managed policy: EC2FastLaunchServiceRolePolicy**

This policy is attached to the service-linked role named `AWSServiceRoleForEC2FastLaunch` to allow Amazon EC2 to create and manage a set of pre-provisioned snapshots that reduce the time it takes to launch instances from your EC2 Fast Launch-enabled AMI. For more information, see the section called “Service-linked role”.

To view the permissions for this policy, see [EC2FastLaunchServiceRolePolicy](https://aws.amazon.com/documentation/aws_managed_policies/) in the *AWS Managed Policy Reference*.

**AWS managed policy: Ec2InstanceConnectEndpoint**

This policy is attached to a service-linked role named `AWSServiceRoleForEC2InstanceConnect` to allow EC2 Instance Connect Endpoint to perform actions on your behalf. For more information, see [Service-linked role for EC2 Instance Connect Endpoint](https://aws.amazon.com/documentation/aws_managed_policies/).

To view the permissions for this policy, see [Ec2InstanceConnectEndpoint](https://aws.amazon.com/documentation/aws_managed_policies/) in the *AWS Managed Policy Reference*.

**Amazon EC2 updates to AWS managed policies**

**IAM roles for Amazon EC2**

Applications must sign their API requests with AWS credentials. Therefore, if you are an application developer, you need a strategy for managing credentials for your applications that run on EC2 instances. For example, you can securely distribute your AWS credentials to the instances, enabling the applications on those instances to use your credentials to sign requests, while protecting your credentials from other users. However, it's challenging to securely distribute credentials to each instance, especially those that AWS creates on your behalf, such as Spot Instances or instances in Auto Scaling groups. You must also be able to update the credentials on each instance when you rotate your AWS credentials.
Note

For your Amazon EC2 workloads, we recommend that you retrieve session credentials using the method described below. These credentials should enable your workload to make AWS API requests, without needing to use `sts:AssumeRole` to assume the same role that is already associated with the instance. Unless you need to pass session tags for attribute-based access control (ABAC) or pass a session policy to further restrict permissions of the role, such role assumption calls are unnecessary as they create a new set of the same temporary role session credentials.

If your workload uses a role to assume itself, you must create a trust policy that explicitly allows that role to assume itself. If you do not create the trust policy, you get the `AccessDenied` error. For more information, see [Modifying a role trust policy](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles的信任_policy.html) in the IAM User Guide.

We designed IAM roles so that your applications can securely make API requests from your instances, without requiring you to manage the security credentials that the applications use. Instead of creating and distributing your AWS credentials, you can delegate permission to make API requests using IAM roles as follows:

1. Create an IAM role.
2. Define which accounts or AWS services can assume the role.
3. Define which API actions and resources the application can use after assuming the role.
4. Specify the role when you launch your instance, or attach the role to an existing instance.
5. Have the application retrieve a set of temporary credentials and use them.

For example, you can use IAM roles to grant permissions to applications running on your instances that need to use a bucket in Amazon S3. You can specify permissions for IAM roles by creating a policy in JSON format. These are similar to the policies that you create for users. If you change a role, the change is propagated to all instances.

Note

Amazon EC2 IAM role credentials are not subject to maximum session durations configured in the role. For more information, see [Using IAM roles](https://docs.aws.amazon.com/IAM/latest/UserGuide/id_roles.using.html) in the IAM User Guide.
When creating IAM roles, associate least privilege IAM policies that restrict access to the specific API calls the application requires. For Windows-to-Windows communication, use well-defined and well-documented Windows groups and roles to grant application-level access between Windows instances. Groups and roles allow customers to define least privilege application and NTFS folder-level permissions to limit access to application-specific requirements.

You can only attach one IAM role to an instance, but you can attach the same role to many instances. For more information about creating and using IAM roles, see Roles in the IAM User Guide.

You can apply resource-level permissions to your IAM policies to control the users' ability to attach, replace, or detach IAM roles for an instance. For more information, see Supported resource-level permissions for Amazon EC2 API actions and the following example: Example: Work with IAM roles.

Contents

- Instance profiles
- Retrieve security credentials from instance metadata
- Grant a user permission to pass an IAM role to an instance
- Work with IAM roles

Instance profiles

Amazon EC2 uses an instance profile as a container for an IAM role. When you create an IAM role using the IAM console, the console creates an instance profile automatically and gives it the same name as the role to which it corresponds. If you use the Amazon EC2 console to launch an instance with an IAM role or to attach an IAM role to an instance, you choose the role based on a list of instance profile names.

If you use the AWS CLI, API, or an AWS SDK to create a role, you create the role and instance profile as separate actions, with potentially different names. If you then use the AWS CLI, API, or an AWS SDK to launch an instance with an IAM role or to attach an IAM role to an instance, specify the instance profile name.

An instance profile can contain only one IAM role. This limit cannot be increased.

For more information, see Instance Profiles in the IAM User Guide.
Retrieve security credentials from instance metadata

An application on the instance retrieves the security credentials provided by the role from the instance metadata item `iam/security-credentials/role-name`. The application is granted the permissions for the actions and resources that you've defined for the role through the security credentials associated with the role. These security credentials are temporary and we rotate them automatically. We make new credentials available at least five minutes before the expiration of the old credentials.

⚠️ Warning

If you use services that use instance metadata with IAM roles, ensure that you don’t expose your credentials when the services make HTTP calls on your behalf. The types of services that could expose your credentials include HTTP proxies, HTML/CSS validator services, and XML processors that support XML inclusion.

The following command retrieves the security credentials for an IAM role named `s3access`.

Linux

IMDSv2

```
```

IMDSv1

```
```

Windows

IMDSv2

```
```
For applications, AWS CLI, and Tools for Windows PowerShell commands that run on the instance, you do not have to explicitly get the temporary security credentials—the AWS SDKs, AWS CLI, and Tools for Windows PowerShell automatically get the credentials from the EC2 instance metadata service and use them. To make a call outside of the instance using temporary security credentials (for example, to test IAM policies), you must provide the access key, secret key, and the session token. For more information, see Using Temporary Security Credentials to Request Access to AWS Resources in the IAM User Guide.

For more information about instance metadata, see Work with instance metadata. For information about the instance metadata IP address, see Retrieve instance metadata.

Grant a user permission to pass an IAM role to an instance

To enable a user to launch an instance with an IAM role or to attach or replace an IAM role for an existing instance, you must grant the user permission to use the following API actions:

- iam:PassRole
- ec2:AssociateIamInstanceProfile
- ec2:ReplaceIamInstanceProfileAssociation
For example, the following IAM policy grants users permission to launch instances with an IAM role, or to attach or replace an IAM role for an existing instance using the AWS CLI.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": [
            "ec2:RunInstances",
            "ec2:AssociateIamInstanceProfile",
            "ec2:ReplaceIamInstanceProfileAssociation"
         ],
         "Resource": "*"
      },
      {
         "Effect": "Allow",
         "Action": "iam:PassRole",
         "Resource": "arn:aws:iam::123456789012:role/DevTeam*"
      }
   ]
}
```

To grant users permission to launch instances with an IAM role, or to attach or replace an IAM role for an existing instance using the Amazon EC2 console, you must grant them permission to use `iam:ListInstanceProfiles`, `iam:PassRole`, `ec2:AssociateIamInstanceProfile`, and `ec2:ReplaceIamInstanceProfileAssociation` in addition to any other permissions they might need. For example policies, see [Example policies to control access to the Amazon EC2 console](#).

**Work with IAM roles**

You can create an IAM role and attach it to an instance during or after launch. You can also replace or detach an IAM role for an instance.
Contents

- Create an IAM role
- Launch an instance with an IAM role
- Attach an IAM role to an instance
- Replace an IAM role
- Detach an IAM role
- Generate a policy for your IAM role based on access activity

Create an IAM role

You must create an IAM role before you can launch an instance with that role or attach it to an instance.

Console

To create an IAM role using the IAM console

1. Open the IAM console at https://console.aws.amazon.com/iam/.
2. In the navigation pane, choose Roles then choose Create role.
3. On the Select trusted entity page, choose AWS service, and then select the EC2 use case. Choose Next.
4. On the Add permissions page, select the policies that grants your instances access to the resources that they need. Choose Next.
5. On the Name, review, and create page, enter a name and description for the role. Optionally, add tags to the role. Choose Create role.

Command line

The following example creates an IAM role with a policy that allows the role to use an Amazon S3 bucket.

To create an IAM role and instance profile (AWS CLI)

1. Create the following trust policy and save it in a text file named ec2-role-trust-policy.json.

   ```json
   {
   ```
2. Create the \texttt{s3access} role and specify the trust policy that you created using the \texttt{create-role} command.

\begin{verbatim}
aws iam create-role \\
   --role-name s3access \\
   --assume-role-policy-document file://ec2-role-trust-policy.json
\end{verbatim}

Example response

\begin{verbatim}
{
   "Role": {
      "AssumeRolePolicyDocument": {
         "Version": "2012-10-17",
         "Statement": [
            {
               "Action": "sts:AssumeRole",
               "Effect": "Allow",
               "Principal": {
                  "Service": "ec2.amazonaws.com"
               }
            }
         ]
      },
      "RoleId": "AROAIIZKPBS2LEXAMPLE",
      "CreateDate": "2013-12-12T23:46:37.247Z",
      "RoleName": "s3access",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:role/s3access"
   }
}
\end{verbatim}
3. Create an access policy and save it in a text file named `ec2-role-access-policy.json`. For example, this policy grants administrative permissions for Amazon S3 to applications running on the instance.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Effect": "Allow",
         "Action": ["s3:*"],
         "Resource": ["*"]
      }
   ]
}
```

4. Attach the access policy to the role using the `put-role-policy` command.

```
aws iam put-role-policy \
   --role-name s3access \
   --policy-name S3-Permissions \
   --policy-document file://ec2-role-access-policy.json
```

5. Create an instance profile named `s3access-profile` using the `create-instance-profile` command.

```
aws iam create-instance-profile --instance-profile-name s3access-profile
```

Example response

```json
{
   "InstanceProfile": {
      "InstanceProfileId": "AIPAJTLBPJLEGEXAMPLE",
      "Roles": [],
      "CreateDate": "2013-12-12T23:53:34.093Z",
      "InstanceProfileName": "s3access-profile",
      "Path": "/",
      "Arn": "arn:aws:iam::123456789012:instance-profile/s3access-profile"
   }
}
```

6. Add the `s3access` role to the `s3access-profile` instance profile.
Alternatively, you can use the following AWS Tools for Windows PowerShell commands:

- **New-IAMRole**
- **Register-IAMRolePolicy**
- **New-IAMInstanceProfile**

### Launch an instance with an IAM role

After you’ve created an IAM role, you can launch an instance, and associate that role with the instance during launch.

**Important**

After you create an IAM role, it might take several seconds for the permissions to propagate. If your first attempt to launch an instance with a role fails, wait a few seconds before trying again. For more information, see [Troubleshooting IAM roles](#) in the [IAM User Guide](#).

### New console

**To launch an instance with an IAM role (console)**

1. Follow the procedure to [launch an instance](#).
2. Expand **Advanced details**, and for **IAM instance profile**, select the IAM role that you created.

**Note**

The **IAM instance profile** list displays the name of the instance profile that you created when you created your IAM role. If you created your IAM role using the console, the instance profile was created for you and given the same name as the
3. Configure any other details that you require for your instance or accept the defaults, and select a key pair. For information about the fields in the launch instance wizard, see Launch an instance using defined parameters.

4. In the Summary panel, review your instance configuration, and then choose Launch instance.

5. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

**IMDSv2**

For Linux instances, see the following example:

```
```

For Windows instances, see the following example:

```
```

```
PS C:\> Invoke-RestMethod -Headers @"X-aws-ec2-metadata-token" = $token} 
```

**IMDSv1**

For Linux instances, see the following example:

```
```

For Windows instances, see the following example:
Old console

To launch an instance with an IAM role (console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. On the dashboard, choose Launch instance.
3. Select an AMI and instance type and then choose Next: Configure Instance Details.
4. On the Configure Instance Details page, for IAM role, select the IAM role that you created.

   Note

   The IAM role list displays the name of the instance profile that you created when you created your IAM role. If you created your IAM role using the console, the instance profile was created for you and given the same name as the role. If you created your IAM role using the AWS CLI, API, or an AWS SDK, you may have named your instance profile differently.

5. Configure any other details, then follow the instructions through the rest of the wizard, or choose Review and Launch to accept default settings and go directly to the Review Instance Launch page.
6. Review your settings, then choose Launch to choose a key pair and launch your instance.
7. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

IMDSv2

For Linux instances, see the following example:

```bash
```
For Windows instances, see the following example:

```
```

**IMDSv1**

For Linux instances, see the following example:

```
```

For Windows instances, see the following example:

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/meta-data/iam/security-credentials\role_name
```

**Command line**

You can use the AWS CLI to associate a role with an instance during launch. You must specify the instance profile in the command.

**To launch an instance with an IAM role (AWS CLI)**

1. Use the `run-instances` command to launch an instance using the instance profile. The following example shows how to launch an instance with the instance profile.

```
aws ec2 run-instances
   --image-id ami-11aa22bb
   --iam-instance-profile Name="s3access-profile"
   --key-name my-key-pair
   --security-groups my-security-group
   --subnet-id subnet-1a2b3c4d
```
Alternatively, use the New-EC2Instance Tools for Windows PowerShell command.

2. If you are using the Amazon EC2 API actions in your application, retrieve the AWS security credentials made available on the instance and use them to sign the requests. The AWS SDK does this for you.

```
```

Attach an IAM role to an instance

To attach an IAM role to an instance that has no role, the instance can be in the stopped or running state.

Console

**To attach an IAM role to an instance**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. Select the IAM role to attach to your instance, and choose **Save**.

Command line

**To attach an IAM role to an instance (AWS CLI)**

1. If required, describe your instances to get the ID of the instance to which to attach the role.

   ```
   aws ec2 describe-instances
   ```

2. Use the **associate-iam-instance-profile** command to attach the IAM role to the instance by specifying the instance profile. You can use the Amazon Resource Name (ARN) of the instance profile, or you can use its name.

   ```
   aws ec2 associate-iam-instance-profile \
   --instance-id i-1234567890abcdef0 \
   --iam-instance-profile Name="TestRole-1"
   ```
Example response

```json
{
   "IamInstanceProfileAssociation": {
      "InstanceId": "i-1234567890abcdef0",
      "State": "associating",
      "AssociationId": "iip-assoc-0dbd8529a48294120",
      "IamInstanceProfile": {
         "Id": "AIPAJLNLDX3AMYZNWYYAY",
         "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-1"
      }
   }
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- **Get-EC2Instance**
- **Register-EC2IamInstanceProfile**

**Replace an IAM role**

To replace the IAM role on an instance that already has an attached IAM role, the instance must be in the running state. You can do this if you want to change the IAM role for an instance without detaching the existing one first. For example, you can do this to ensure that API actions performed by applications running on the instance are not interrupted.

**Console**

**To replace an IAM role for an instance**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions**, **Security**, **Modify IAM role**.
4. Select the IAM role to attach to your instance, and choose **Save**.
To replace an IAM role for an instance (AWS CLI)

1. If required, describe your IAM instance profile associations to get the association ID for the IAM instance profile to replace.

   ```bash
   aws ec2 describe-iam-instance-profile-associations
   ```

2. Use the `replace-iam-instance-profile-association` command to replace the IAM instance profile by specifying the association ID for the existing instance profile and the ARN or name of the instance profile that should replace it.

   ```bash
   aws ec2 replace-iam-instance-profile-association \
   --association-id iip-assoc-0044d817db6c0a4ba \
   --iam-instance-profile Name="TestRole-2"
   ```

Example response

```json
{
   "IamInstanceProfileAssociation": {
       "InstanceId": "i-087711ddaf98f9489",
       "State": "associating",
       "AssociationId": "iip-assoc-09654be48e33b91e0",
       "IamInstanceProfile": {
           "Id": "AIPAJCJEDKX7QYHWYK7GS",
           "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"
       }
   }
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- `Get-EC2IamInstanceProfileAssociation`
- `Set-EC2IamInstanceProfileAssociation`

Detach an IAM role

You can detach an IAM role from a running or stopped instance.
**Console**

**To detach an IAM role from an instance**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose **Actions, Security, Modify IAM role**.
4. For **IAM role**, choose **No IAM Role**. Choose **Save**.
5. In the confirmation dialog box, enter **Detach**, and then choose **Detach**.

**Command line**

**To detach an IAM role from an instance (AWS CLI)**

1. If required, use `describe-iam-instance-profile-associations` to describe your IAM instance profile associations and get the association ID for the IAM instance profile to detach.

   ```
   aws ec2 describe-iam-instance-profile-associations
   ```

   **Example response**

   ```
   {
     "IamInstanceProfileAssociations": [
       {
         "InstanceId": "i-088ce778fbfeb4361",
         "State": "associated",
         "AssociationId": "iip-assoc-0044d817db6c0a4ba",
         "IamInstanceProfile": {
           "Id": "AIPAJEDNCAA6455D265D6",
           "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"
         }
       }
     ]
   }
   ```

2. Use the `disassociate-iam-instance-profile` command to detach the IAM instance profile using its association ID.
aws ec2 disassociate-iam-instance-profile --association-id iip-assoc-0044d817db6c0a4ba

Example response

```
{
    "IamInstanceProfileAssociation": {
        "InstanceId": "i-087711ddaf98f9489",
        "State": "disassociating",
        "AssociationId": "iip-assoc-0044d817db6c0a4ba",
        "IamInstanceProfile": {
            "Id": "AIPAJEDNCAA64SSD265D6",
            "Arn": "arn:aws:iam::123456789012:instance-profile/TestRole-2"
        }
    }
}
```

Alternatively, use the following Tools for Windows PowerShell commands:

- [Get-EC2IamInstanceProfileAssociation](#)
- [Unregister-EC2IamInstanceProfile](#)

Generate a policy for your IAM role based on access activity

When you first create an IAM role for your applications, you might sometimes grant permissions beyond what is required. Before launching your application in your production environment, you can generate an IAM policy that is based on the access activity for an IAM role. IAM Access Analyzer reviews your AWS CloudTrail logs and generates a policy template that contains the permissions that have been used by the role in your specified date range. You can use the template to create a managed policy with fine-grained permissions and then attach it to the IAM role. That way, you grant only the permissions that the role needs to interact with AWS resources for your specific use case. This helps you adhere to the best practice of granting least privilege. To learn more, see [Generate policies based on access activity](#) in the [IAM User Guide](#).
Update management for Amazon EC2 Windows instances

We recommend that you regularly patch, update, and secure the operating system and applications on your EC2 instances. You can use AWS Systems Manager Patch Manager to automate the process of installing security-related updates for both the operating system and applications.

For EC2 instances in an Auto Scaling group, you can use the AWS-PatchAsgInstance runbook to help avoid instances that are undergoing patching from being replaced. Alternatively, you can use any automatic update services or recommended processes for installing updates that are provided by the application vendor.

Resources

- **AL2023** – Updating AL2023 in the Amazon Linux 2023 User Guide.
- **AL2** – Manage software on your Amazon Linux 2 instance in the Amazon Linux 2 User Guide.
- **Windows instances** – the section called “Update management”.

Security best practices for Windows instances

We recommend that you follow these security best practices for your Windows instances.

Contents

- High-level security best practices
- Update management
- Configuration management
- Change management
- Audit and accountability for Amazon EC2 Windows instances

High-level security best practices

You should adhere to the following high-level security best practices for your Windows instances:

- **Least access** – Grant access only to systems and locations that are trusted and expected. This applies to all Microsoft products such as Active Directory, Microsoft business productivity servers, and infrastructure services such as Remote Desktop Services, reverse proxy servers, IIS web
servers, and more. Use AWS capabilities such as Amazon EC2 instance security groups, network access control lists (ACLs), and Amazon VPC public/private subnets to layer security across multiple locations in an architecture. Within a Windows instance, customers can use Windows Firewall to further layer a defense-in-depth strategy within their deployment. Install only the OS components and applications that are necessary for the system to function as designed. Configure infrastructure services such as IIS to run under service accounts, or to use features such as application pool identities to access resources locally and remotely across your infrastructure.

- **Least privilege** – Determine the minimum set of privileges that instances and accounts need in order to perform their functions. Restrict these servers and users to only allow these defined permissions. Use techniques such as Role Based Access Controls to reduce the surface area of administrative accounts, and create the most limited roles to accomplish a task. Use OS features such as Encrypting File System (EFS) within NTFS to encrypt sensitive data at rest, and control application and user access to it.

- **Configuration management** – Create a baseline server configuration that incorporates up-to-date security patches and host-based protection suites that include anti-virus, anti-malware, intrusion detection/prevention, and file integrity monitoring. Assess each server against the current recorded baseline to identify and flag any deviations. Ensure each server is configured to generate and securely store appropriate log and audit data.

- **Change management** – Create processes to control changes to server configuration baselines and work toward fully automated change processes. Also, leverage Just Enough Administration (JEA) with Windows PowerShell DSC to limit administrative access to the minimum required functions.

- **Patch management** – Implement processes that regularly patch, update, and secure the operating system and applications on your EC2 instances.

- **Audit logs** – Audit access and all changes to Amazon EC2 instances to verify server integrity and ensure only authorized changes are made. Leverage features such as Enhanced Logging for IIS to enhance default logging capabilities. AWS capabilities such as VPC Flow Logs and AWS CloudTrail are also available to audit network access, including allowed/denied requests and API calls, respectively.

**Update management**

To ensure the best results when you run Windows Server on Amazon EC2, we recommend that you implement the following best practices:

- **Configure Windows Update**
• Update drivers

• Use the latest Windows AMIs

• Test performance before migration

• Update launch agents

• Reboot your Windows instance after you install updates. For more information, see Reboot your instance.

For information about how to upgrade or migrate a Windows instance to a newer version of Windows Server, see Upgrade an Amazon EC2 Windows instance to a newer version of Windows Server.

Configure Windows Update

By default, instances that are launched from AWS Windows Server AMIs don't receive updates through Windows Update.

Update Windows drivers

Maintain the latest drivers on all Windows EC2 instances to ensure that the latest issue fixes and performance enhancements are applied across your fleet. Depending on your instance type, you should update the AWS PV, Amazon ENA, and AWS NVMe drivers.

• Use SNS topics to receive updates for new driver releases.

• Use the AWS Systems Manager Automation runbook AWSSupport-UpgradeWindowsAWSDrivers to easily apply the updates across your instances.

Launch instances using the latest Windows AMIs

AWS releases new Windows AMIs each month, which contain the latest OS patches, drivers, and launch agents. You should leverage the latest AMI when you launch new instances or when you build your own custom images.

• To view updates to each release of the AWS Windows AMIs, see AWS Windows AMI version history.

• To build with the latest available AMIs, see Query for the Latest Windows AMI Using Systems Manager Parameter Store.
• For more information about specialized Windows AMIs that you can use to launch instances for your database and compliance hardening use cases, see Specialized Windows AMIs in the AWS Windows AMI Reference.

Test system/application performance before migration

Migrating enterprise applications to AWS can involve many variables and configurations. Always performance test the EC2 solution to ensure that:

• Instance types are properly configured, including instance size, enhanced networking, and tenancy (shared or dedicated).
• Instance topology is appropriate for the workload and leverages high-performance features when necessary, such as dedicated tenancy, placement groups, instance store volumes, and bare metal.

Update launch agents

Update to the latest EC2Launch v2 agent to ensure that the latest enhancements are applied across your fleet. For more information, see the section called “Migrate”.

If you have a mixed fleet, or if you want to continue to use the EC2Launch (Windows Server 2016 and 2019) or EC2 Config (legacy OS only) agents, update to the latest versions of the respective agents.

Automatic updates are supported on the following combinations of Windows Server version and launch agents. You can opt in to automatic updates in the SSM Quick Setup Host Management console under Amazon EC2 Launch Agents.

<table>
<thead>
<tr>
<th>Windows Version</th>
<th>EC2Launch v1</th>
<th>EC2Launch v2</th>
</tr>
</thead>
<tbody>
<tr>
<td>2016</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>2019</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>2022</td>
<td>✓</td>
<td></td>
</tr>
</tbody>
</table>

• For more information about updating to EC2Launch v2, see the section called “Install”.

Update management
• For information to manually update EC2Config, see the section called “Install EC2Config”.
• For information to manually update EC2Launch, see the section called “Install EC2Launch”.

Configuration management

Amazon Machine Images (AMIs) provide an initial configuration for an Amazon EC2 instance, which includes the Windows OS and optional customer-specific customizations, such as applications and security controls. Create an AMI catalog containing customized security configuration baselines to ensure that all Windows instances are launched with standard security controls. Security baselines can be baked into an AMI, bootstrapped dynamically when an EC2 instance is launched, or packaged as a product for uniform distribution through AWS Service Catalog portfolios. For more information on securing an AMI, see Best Practices for Building an AMI.

Each Amazon EC2 instance should adhere to organizational security standards. Do not install any Windows roles and features that are not required, and do install software to protect against malicious code (antivirus, antimalware, exploit mitigation), monitor host-integrity, and perform intrusion detection. Configure security software to monitor and maintain OS security settings, protect the integrity of critical OS files, and alert on deviations from the security baseline. Consider implementing recommended security configuration benchmarks published by Microsoft, the Center for Internet Security (CIS), or the National Institute of Standards and Technology (NIST). Consider using other Microsoft tools for particular application servers, such as the Best Practice Analyzer for SQL Server.

AWS customers can also run Amazon Inspector assessments to improve the security and compliance of applications deployed on Amazon EC2 instances. Amazon Inspector automatically assesses applications for vulnerabilities or deviations from best practices and includes a knowledge base of hundreds of rules mapped to common security compliance standards (for example, PCI DSS) and vulnerability definitions. Examples of built-in rules include checking if remote root login is enabled, or if vulnerable software versions are installed. These rules are regularly updated by AWS security researchers.

When securing Windows instances, we recommend that you implement Active Directory Domain Services to enable a scalable, secure, and manageable infrastructure for distributed locations. Additionally, after launching instances from the Amazon EC2 console or by using an Amazon EC2 provisioning tool, such as AWS CloudFormation, it is good practice to utilize native OS features, such as Microsoft Windows PowerShell DSC to maintain configuration state in the event that configuration drift occurs.
Change management

After initial security baselines are applied to Amazon EC2 instances at launch, control ongoing Amazon EC2 changes to maintain the security of your virtual machines. Establish a change management process to authorize and incorporate changes to AWS resources (such as security groups, route tables, and network ACLs) as well as to OS and application configurations (such as Windows or application patching, software upgrades, or configuration file updates).

AWS provides several tools to help manage changes to AWS resources, including AWS CloudTrail, AWS Config, AWS CloudFormation, AWS Elastic Beanstalk, and AWS OpsWorks, and management packs for Systems Center Operations Manager and System Center Virtual Machine Manager. Note that Microsoft releases Windows patches the second Tuesday of each month (or as needed) and AWS updates all Windows AMIs managed by AWS within five days after Microsoft releases a patch. Therefore it is important to continually patch all baseline AMIs, update AWS CloudFormation templates and Auto Scaling group configurations with the latest AMI IDs, and implement tools to automate running instance patch management.

Microsoft provides several options for managing Windows OS and application changes. SCCM, for example, provides full lifecycle coverage of environment modifications. Select tools that address business requirements and control how changes will affect application SLAs, capacity, security, and disaster recovery procedures. Avoid manual changes and instead leverage automated configuration management software or command line tools such as the EC2 Run Command or Windows PowerShell to implement scripted, repeatable change processes. To assist with this requirement, use bastion hosts with enhanced logging for all interactions with your Windows instances to ensure that all events and tasks are automatically recorded.

Audit and accountability for Amazon EC2 Windows instances

AWS CloudTrail, AWS Config, and AWS Config Rules provide audit and change tracking features for auditing AWS resource changes. Configure Windows event logs to send local log files to a centralized log management system to preserve log data for security and operational behavior analysis. Microsoft System Center Operations Manager (SCOM) aggregates information about Microsoft applications deployed to Windows instances and applies preconfigured and custom rulesets based on application roles and services. System Center Management Packs build on SCOM to provide application-specific monitoring and configuration guidance. These Management Packs support Windows Server Active Directory, SharePoint Server 2013, Exchange Server 2013, Lync Server 2013, SQL Server 2014, and many more servers and technologies.
In addition to Microsoft systems management tools, customers can use Amazon CloudWatch to monitor instance CPU utilization, disk performance, network I/O, and perform host and instance status checks. The EC2Config, EC2Launch, and EC2Launch v2 launch agents provide access to additional, advanced features for Windows instances. For example, they can export Windows system, security, application, and Internet Information Services (IIS) logs to CloudWatch Logs which can then be integrated with Amazon CloudWatch metrics and alarms. Customers can also create scripts that export Windows performance counters to Amazon CloudWatch custom metrics.

**Amazon EC2 key pairs and Amazon EC2 instances**

A key pair, consisting of a public key and a private key, is a set of security credentials that you use to prove your identity when connecting to an Amazon EC2 instance. For Linux instances, the private key allows you to securely SSH into your instance. For Windows instances, the private key is required to decrypt the administrator password, which you then use to connect to your instance.

Amazon EC2 stores the public key on your instance, and you store the private key, as shown in the following diagram. It's important that you store your private key in a secure place because anyone who possesses your private key can connect to your instances that use the key pair.

When you launch an instance, you can specify a key pair, so that you can connect to your instance using a method that requires a key pair. Depending on how you manage your security, you can specify the same key pair for all your instances or you can specify different key pairs.
For Linux instances, when your instance boots for the first time, the public key that you specified at launch is placed on your Linux instance in an entry within `~/.ssh/authorized_keys`. When you connect to your Linux instance using SSH, to log in you must specify the private key that corresponds to the public key.

For more information about connecting to your EC2 instance, see [Connect to your EC2 instance](#).

⚠️ **Important**

Because Amazon EC2 doesn't keep a copy of your private key, there is no way to recover a private key if you lose it. However, there can still be a way to connect to instances for which you've lost the private key. For more information, see [I've lost my private key. How can I connect to my Linux instance?](#).

As an alternative to key pairs, you can use [AWS Systems Manager Session Manager](#) to connect to your instance with an interactive one-click browser-based shell or the AWS Command Line Interface (AWS CLI).

### Contents

- [Create a key pair for your Amazon EC2 instance](#)
- [Tag a key pair](#)
- [Describe your key pairs](#)
- [Delete your key pair](#)
- [Add or remove a public key on your Linux instance](#)
- [Verify the fingerprint of your key pair](#)

### Create a key pair for your Amazon EC2 instance

You can use Amazon EC2 to create your key pairs, or you can use a third-party tool to create your key pairs, and then import them to Amazon EC2.

Amazon EC2 supports 2048-bit SSH-2 RSA keys for Linux and Windows instances. Amazon EC2 also supports ED25519 keys for Linux instances.

For steps to connect to your Linux instance using SSH after you have created a key pair, see [the section called “Connect to your Linux instance”](#).
For steps to connect to your Windows instance using RDP after you have created a key pair, see the section called “Connect to your Windows instance”.

Contents

- Create a key pair using Amazon EC2
- Create a key pair using AWS CloudFormation
- Create a key pair using a third-party tool and import the public key to Amazon EC2

Create a key pair using Amazon EC2

When you create a key pair using Amazon EC2, the public key is stored in Amazon EC2, and you store the private key.

You can create up to 5,000 key pairs per Region. To request an increase, create a support case. For more information, see Creating a support case in the AWS Support User Guide.

Console

To create a key pair using Amazon EC2

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, under Network & Security, choose Key Pairs.
3. Choose Create key pair.
4. For Name, enter a descriptive name for the key pair. Amazon EC2 associates the public key with the name that you specify as the key name. A key name can include up to 255 ASCII characters. It can’t include leading or trailing spaces.
5. Select a key pair type appropriate for your operating system:
   (Linux instances) For Key pair type, choose either RSA or ED25519.
   (Windows instances) For Key pair type, choose RSA. ED25519 keys are not supported for Windows instances.
6. For Private key file format, choose the format in which to save the private key. To save the private key in a format that can be used with OpenSSH, choose pem. To save the private key in a format that can be used with PuTTY, choose ppk.
7. To add a tag to the public key, choose Add tag, and enter the key and value for the tag. Repeat for each tag.
8. Choose **Create key pair**.

9. The private key file is automatically downloaded by your browser. The base file name is the name that you specified as the name of your key pair, and the file name extension is determined by the file format that you chose. Save the private key file in a safe place.

✿ **Important**

This is the only chance for you to save the private key file.

10. (Linux instances) If you plan to use an SSH client on a macOS or Linux computer to connect to your Linux instance, use the following command to set the permissions of your private key file so that only you can read it.

```bash
chmod 400 key-pair-name.pem
```

If you do not set these permissions, then you cannot connect to your instance using this key pair. For more information, see Error: Unprotected private key file.

AWS CLI

**To create a key pair using Amazon EC2**

1. Use the `create-key-pair` command as follows to generate the key pair and to save the private key to a .pem file.

   For `--key-name`, specify a name for the public key. The name can be up to 255 ASCII characters.

   For `--key-type`, specify either *rsa* or *ed25519*. If you do not include the `--key-type` parameter, an *rsa* key is created by default. Note that ED25519 keys are not supported for Windows instances.

   For `--key-format`, specify either *pem* or *ppk*. If you do not include the `--key-format` parameter, a *pem* file is created by default.

   `--query "KeyMaterial"` prints the private key material to the output.
--output text > my-key-pair.pem saves the private key material in a file with the specified extension. The extension can be either .pem or .ppk. The private key can have a name that's different from the public key name, but for ease of use, use the same name.

```
aws ec2 create-key-pair \
   --key-name my-key-pair \
   --key-type rsa \
   --key-format pem \
   --query "KeyMaterial" \
   --output text > my-key-pair.pem
```

2. (Linux instances) If you plan to use an SSH client on a macOS or Linux computer to connect to your Linux instance, use the following command to set the permissions of your private key file so that only you can read it.

```
chmod 400 key-pair-name.pem
```

If you do not set these permissions, then you cannot connect to your instance using this key pair. For more information, see Error: Unprotected private key file.

PowerShell

To create a key pair using Amazon EC2

Use the New-EC2KeyPair AWS Tools for Windows PowerShell command as follows to generate the key and save it to a .pem or .ppk file.

For -KeyName, specify a name for the public key. The name can be up to 255 ASCII characters.

For -KeyType, specify either rsa or ed25519. If you do not include the -KeyType parameter, an rsa key is created by default. Note that ED25519 keys are not supported for Windows instances.

For -KeyFormat, specify either pem or ppk. If you do not include the -KeyFormat parameter, a pem file is created by default.

KeyMaterial prints the private key material to the output.

Out-File -Encoding ascii -FilePath C:\path\my-key-pair.pem saves the private key material in a file with the the specified extension. The extension can be .pem or .ppk. The
private key can have a name that’s different from the public key name, but for ease of use, use the same name.

```powershell
PS C:\> (New-EC2KeyPair -KeyName "my-key-pair" -KeyType "rsa" -KeyFormat "pem").KeyMaterial | Out-File -Encoding ascii -FilePath C:\path\my-key-pair.pem
```

Create a key pair using AWS CloudFormation

When you create a new key pair using AWS CloudFormation, the private key is saved to AWS Systems Manager Parameter Store. The parameter name has the following format:

```
/ec2/keypair/key_pair_id
```

For more information, see [AWS Systems Manager Parameter Store](https://docs.aws.amazon.com/systems-manager/latest/userguide/parameters.html) in the [AWS Systems Manager User Guide](https://docs.aws.amazon.com/systems-manager/latest/userguide/).  

To create a key pair using AWS CloudFormation

1. Specify the `AWS::EC2::KeyPair` resource in your template.

   ```yaml
   Resources:
   NewKeyPair:
     Type: 'AWS::EC2::KeyPair'
     Properties:
       KeyName: new-key-pair
   ```

2. Use the `describe-key-pairs` command as follows to get the ID of the key pair.

   ```bash
   aws ec2 describe-key-pairs --filters Name=key-name,Values=new-key-pair --query KeyPairs[*].KeyId --output text
   ```

   The following is example output.

   ```
   key-05abb699beEXAMPLE
   ```

3. Use the `get-parameter` command as follows to get the parameter for your key and save the key material in a .pem file.
aws ssm get-parameter --name /ec2/keypair/key-05abb699beEXAMPLE --with-decryption --query Parameter.Value --output text > new-key-pair.pem

**Required IAM permissions**

To enable AWS CloudFormation to manage Parameter Store parameters on your behalf, the IAM role assumed by AWS CloudFormation or your user must have the following permissions:

- `ssm:PutParameter` – Grants permission to create a parameter for the private key material.
- `ssm:DeleteParameter` – Grants permission to delete the parameter that stored the private key material. This permission is required whether the key pair was imported or created by AWS CloudFormation.

When AWS CloudFormation deletes a key pair that was created or imported by a stack, it performs a permissions check to determine whether you have permission to delete parameters, even though AWS CloudFormation creates a parameter only when it creates a key pair, not when it imports a key pair. AWS CloudFormation tests for the required permission using a fabricated parameter name that does not match any parameter in your account. Therefore, you might see a fabricated parameter name in the `AccessDeniedException` error message.

**Create a key pair using a third-party tool and import the public key to Amazon EC2**

**Linux instances**

Instead of using Amazon EC2 to create a key pair, you can create an RSA or ED25519 key pair by using a third-party tool, and then import the public key to Amazon EC2.

**Requirements for key pairs**

- Supported types: RSA and ED25519. Amazon EC2 does not accept DSA keys.
- Supported formats:
  - OpenSSH public key format (the format in `~/.ssh/authorized_keys`). If you connect using SSH while using the EC2 Instance Connect API, the SSH2 format is also supported.
  - SSH private key file format must be PEM or PPK
  - (RSA only) Base64 encoded DER format
• (RSA only) SSH public key file format as specified in RFC 4716
• Supported lengths: 1024, 2048, and 4096. If you connect using SSH while using the EC2 Instance Connect API, the supported lengths are 2048 and 4096.

To create a key pair using a third-party tool

1. Generate a key pair with a third-party tool of your choice. For example, you can use ssh-keygen (a tool provided with the standard OpenSSH installation). Alternatively, Java, Ruby, Python, and many other programming languages provide standard libraries that you can use to create an RSA or ED25519 key pair.

   ▶ Important
   The private key must be in the PEM or PPK format. For example, use ssh-keygen -m PEM to generate the OpenSSH key in the PEM format.

2. Save the public key to a local file. For example, ~/.ssh/my-key-pair.pub. The file name extension for this file is not important.

3. Save the private key to a local file that has the .pem or .ppk extension. For example, ~/.ssh/my-key-pair.pem or ~/.ssh/my-key-pair.ppk.

   ▶ Important
   Save the private key file in a safe place. You'll need to provide the name of your public key when you launch an instance, and the corresponding private key each time you connect to the instance.

Windows instances

Instead of using Amazon EC2 to create your key pair, you can create an RSA key pair by using a third-party tool, and then import the public key to Amazon EC2.

Requirements for key pairs

• Supported types: RSA. Amazon EC2 does not accept DSA keys.
**Note**

ED25519 keys are not supported for Windows instances.

- Supported formats:
  - OpenSSH public key format
  - SSH private key file format must be PEM or PPK
  - (RSA only) Base64 encoded DER format
  - (RSA only) SSH public key file format as specified in [RFC 4716](https://tools.ietf.org/html/rfc4716)
- Supported lengths: 1024, 2048, and 4096.

**To create a key pair using a third-party tool**

1. Generate a key pair with a third-party tool of your choice. For example, you can use `ssh-keygen` (a tool provided with the standard OpenSSH installation). Alternatively, Java, Ruby, Python, and many other programming languages provide standard libraries that you can use to create an RSA key pair.

   **Important**

   The private key must be in the PEM or PPK format. For example, use `ssh-keygen -m PEM` to generate the OpenSSH key in the PEM format.

2. Save the public key to a local file. For example, `C:\keys\my-key-pair.pub`. The file name extension for this file is not important.

3. Save the private key to a local file that has the .pem or .ppk extension. For example, `C:\keys\my-key-pair.pem` or `C:\keys\my-key-pair.ppk`. The file name extension for this file is important because only .pem files can be selected when connecting to your Windows instance from the EC2 console.

   **Important**

   Save the private key file in a safe place. You'll need to provide the name of your public key when you launch an instance, and the corresponding private key each time you connect to the instance.
After you have created the key pair, use one of the following methods to import your public key to Amazon EC2.

**Console**

**To import the public key to Amazon EC2**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Key Pairs**.
3. Choose **Import key pair**.
4. For **Name**, enter a descriptive name for the public key. The name can include up to 255 ASCII characters. It can't include leading or trailing spaces.

   **Note**

   When you connect to your instance from the EC2 console, the console suggests this name for the name of your private key file.

5. Either choose **Browse** to navigate to and select your public key, or paste the contents of your public key into the **Public key contents** field.
6. Choose **Import key pair**.
7. Verify that the public key that you imported appears in the list of key pairs.

**AWS CLI**

**To import the public key to Amazon EC2**

Use the **import-key-pair** AWS CLI command.

**To verify that the key pair was imported successfully**

Use the **describe-key-pairs** AWS CLI command.

**PowerShell**

**To import the public key to Amazon EC2**

Use the **Import-EC2KeyPair** AWS Tools for Windows PowerShell command.

**To verify that the key pair was imported successfully**
Use the Get-EC2KeyPair AWS Tools for Windows PowerShell command.

Tag a key pair

To help categorize and manage the key pairs that you’ve either created using Amazon EC2 or imported to Amazon EC2, you can tag them with custom metadata. For more information about how tags work, see Tag your Amazon EC2 resources.

Console

To view, add, or delete a tag for a key pair

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Key Pairs.
3. Select a public key, and then choose Actions, Manage tags.
4. The Manage tags page displays any tags that are assigned to the public key.
   - To add a tag, choose Add tag, and then enter the tag key and value. You can add up to 50 tags per key. For more information, see Tag restrictions.
   - To delete a tag, choose Remove next to the tag to delete.
5. Choose Save.

AWS CLI

To view the tags for your key pairs

Use the describe-tags AWS CLI command. In the following example, you describe the tags for all of your public keys.

```bash
aws ec2 describe-tags --filters "Name=resource-type,Values=key-pair"
```

```json
{
    "Tags": [
        {
            "Key": "Environment",
            "ResourceId": "key-0123456789EXAMPLE",
            "ResourceType": "key-pair",
            "Value": "Production"
        }
    ]
}
```
To describe the tags for a key pair

Use the `describe-key-pairs` AWS CLI command.

```bash
aws ec2 describe-key-pairs --key-pair-ids key-0123456789EXAMPLE
```

```
{
  "KeyPairs": [
    {
      "KeyName": "MyKeyPair",
      "KeyPairId": "key-0123456789EXAMPLE",
      "Tags": [
        {
          "Key": "Environment",
          "Value": "Production"
        }
      ]
    }
  ]
}
```

To tag a key pair

Use the `create-tags` AWS CLI command. In the following example, the public key is tagged with Key=Cost-Center and Value=CC-123.

```bash
aws ec2 create-tags --resources key-0123456789EXAMPLE --tags Key=Cost-Center,Value=CC-123
```

To delete a tag from a key pair

Use the `delete-tags` AWS CLI command. For examples, see Examples in the AWS CLI Command Reference.
PowerShell

To view tags for your key pairs
Use the Get-EC2Tag command.

To describe the tags for a key pair
Use the Get-EC2KeyPair command.

To tag a key pair
Use the New-EC2Tag command.

To delete a tag from a key pair
Use the Remove-EC2Tag command.

Describe your key pairs

You can describe the key pairs that you stored in Amazon EC2. You can also retrieve the public key material and identify the public key that was specified at launch.

Topics

- Describe your key pairs
- Retrieve the public key material
- Identify the public key specified at launch

Describe your key pairs

You can view the following information about your public keys that are stored in Amazon EC2: public key name, ID, key type, fingerprint, public key material, the date and time (in the UTC time zone) the key was created by Amazon EC2 (if the key was created by a third-party tool, then it's the date and time the key was imported to Amazon EC2), and any tags that are associated with the public key.

You can use the Amazon EC2 console or AWS CLI to view information about your public keys.
Console

To view information about your public keys

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the left navigator, choose Key Pairs.
3. You can view the information about each public key in the Key pairs table.

AWS CLI

To describe a public key

Use the describe-key-pairs command and specify the --key-names parameter.

aws ec2 describe-key-pairs --key-names key-pair-name

Example output

```json
{
   "KeyPairs": [
      {
         "KeyPairId": "key-0123456789example",
         "KeyName": "key-pair-name",
         "KeyType": "rsa",
         "Tags": [],
         "CreateTime": "2022-04-28T11:37:26.000Z"
      }
   ]
}
```
Alternatively, instead of `--key-names`, you can specify the `--key-pair-ids` parameter to identify the public key.

```
aws ec2 describe-key-pairs --key-pair-ids key-0123456789example
```

To view the public key material in the output, you must specify the `--include-public-key` parameter.

```
aws ec2 describe-key-pairs --key-names key-pair-name --include-public-key
```

Example output – In the output, the `PublicKey` field contains the public key material.

```
{
   "KeyPairs": [
   
   
   "KeyPairId": "key-0123456789example",
   "KeyName": "key-pair-name",
   "KeyType": "rsa",
   "Tags": [],
   "PublicKey": "ssh-ed25519
AAAAC3NzaC1lZDI1NTE5AAAAIAij7az1DjVHAsSxgcpCRZ3oWnTm0nAFM64y9jd22ioI/ my-key-pair",
   "CreateTime": "2022-04-28T11:37:26.000Z"
   
   ]
"
}
```

## Retrieve the public key material

You can use various methods to get access to the public key material. You can retrieve the public key material from the matching private key on your local computer, from the instance metadata on the instance that was launched with the public key, or by using the `describe-key-pairs` AWS CLI command. For Linux instances, the public key material can also be retrieved from the `authorized_keys` file on the instance.

Use one of the following methods to retrieve the public key material.
Linux instances

From the private key

To retrieve the public key material from the private key

On your local Linux or macOS computer, you can use the `ssh-keygen` command to retrieve the public key for your key pair. Specify the path where you downloaded your private key (the `.pem` file).

```
ssh-keygen -y -f /path_to_key_pair/my-key-pair.pem
```

The command returns the public key, as shown in the following example.

```
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706V
hz2ItxcIH+PnDSUaw+WNQn/mZphTk/a/gU8jEzo0WbkM4yxyb/wB96xbiFveSFJu0p/d6RJjh0I0iBXir
lsLn8ItntckiJ7FbtxJMXLvwwJryDUilBMTjYtwB+QhYXUM0zce5Pjz5/i8SeJtjnV3iAoG/cQk+0FzZ
qaeJAAHco+CY/SWrUBkrHMfJr6Hcv3kW3dWPkYQ53xqC0+FmUZofz221CBt5IMucxXPkX4rWi+i7wB3Rb
BQoQzd8v7yeb70z1PnWOyN0qFU0XA246RA8QFYiCNYwI3f05p6KLxEXAMPLE
```

If the command fails, run the following command to ensure that you've changed the permissions on your private key pair file so that only you can view it.

```
chmod 400 key-pair-name.pem
```

From the instance metadata

You can use Instance Metadata Service Version 2 or Instance Metadata Service Version 1 to retrieve the public key from the instance metadata.

**Note**

If you change the key pair that you use to connect to the instance, Amazon EC2 does not update the instance metadata to show the new public key. The instance metadata continues to show the public key for the key pair that you specified when you launched the instance.

To retrieve the public key material from the instance metadata
Use one of the following commands from your instance.

**IMDSv2**

```bash
```

**IMDSv1**

```bash
```

Example output

```
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAABAAABAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706Vhz2ItxCi+PnDSUaw+wNQn/mZphTk/a/gUGjesOwbkM4yxyb/wB96xbiFveSFJu0p/d6RJhJ0I0iBxrLsLbITnttck1J7FbtXJMXLvvwJryDUIlBTjYtW8+tQhYXUM0zceb5Pjz5/i8SeJtjnV3iAOG/cQk+0FzZqaeJAAHco+CY/SWtwBkV6hmF5r6Xk75i/7WQ3xqC0+FmUZofz221CBt5IcucxXPkX4iWi+z7wB3RbBQoQzd8v7yeb70z1PnW0yN0qFU0XA246RA8QFYiCNYwI3f05p6KLxEXAMPLE key-pair-name
```

For more information about instance metadata, see [Retrieve instance metadata](#).

**From the instance**

If you specify a key pair when launching a Linux instance, when the instance boots for the first time, the content of the public key is placed on the instance in an entry within `~/.ssh/authorized_keys`.

**To retrieve the public key material from an instance**

1. **Connect to your instance.**
2. In the terminal window, open the `authorized_keys` file using your favorite text editor (such as `vim` or `nano`).

```bash
[ec2-user ~]$ nano ~/.ssh/authorized_keys
```

The `authorized_keys` file opens, displaying the public key followed by the name of the key pair. The following is an example entry for the key pair named `key-pair-name`. 
From describe-key-pairs

**To retrieve the public key material from the describe-key-pairs AWS CLI command**

Use the `describe-key-pairs` command and specify the `--key-names` parameter to identify the public key. To include the public key material in the output, specify the `--include-public-key` parameter.

```sh
aws ec2 describe-key-pairs --key-names key-pair-name --include-public-key
```

Example output – In the output, the `PublicKey` field contains the public key material.

```
{
    "KeyPairs": [
        {
            "KeyId": "key-0123456789example",
            "KeyName": "key-pair-name",
            "KeyType": "rsa",
            "Tags": [],
            "PublicKey": "ssh-ed25519 AAAAC3NzaC1lZDI1NTE5AAAIAIj7azLdjVHAsSxgcpCRZ3oWnTm0nAFM64y9jd22ioI/ my-key-pair",
            "CreateTime": "2022-04-28T11:37:26.000Z"
        }
    ]
}
```

Alternatively, instead of `--key-names`, you can specify the `--key-pair-ids` parameter to identify the public key.

```sh
aws ec2 describe-key-pairs --key-pair-ids key-0123456789example --include-public-key
```
Windows instances

From the private key

To retrieve the public key material from the private key

On your local Windows computer, you can use PuTTYgen to get the public key for your key pair.

Start PuTTYgen and choose Load. Select the .ppk or .pem private key file. PuTTYgen displays the public key under Public key for pasting into OpenSSH authorized_keys file. You can also view the public key by choosing Save public key, specifying a name for the file, saving the file, and then opening the file.

From the instance metadata

You can use Instance Metadata Service Version 2 or Instance Metadata Service Version 1 to retrieve the public key from the instance metadata.

Note

If you change the key pair that you use to connect to the instance, Amazon EC2 does not update the instance metadata to show the new public key. The instance metadata continues to show the public key for the key pair that you specified when you launched the instance.

To retrieve the public key material from the instance metadata

Use one of the following commands from your instance.

IMDSv2

```
```

```
```

IMDSv1

Describe your key pairs
Example output

```
ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQClKsfkNkuSevGj3eYhCe53pcjqP3maAhDFcvBS706V
hz2Itxcih+PnDSUaw+WNQn/mZphTk/a/gU8jEzo0WbkM4yxyb/wB96xbFveSFJu0p/d6RJhjO1iBXl
lsLnBItntckiJ7FbtxJMXLvvwJryDUilBMTjYtwB+QhYXM0zce5Pjz5/i8SeJtjnV3iAoG/cQk+0FzZ
qaeJAAHco+CY/SWzUBkrHmFJr6HcXkv3dWPkYQS3xqC0+FmUZofz221CBt5IMucxXPkX4rWii+z7wB3Rb
BQoQzd8v7yeb70z1PnWo0yr0qFU0XA246RA8QFYiTNYwI3f05p6KLxEXAMPLE_key-pair-name
```

For more information about instance metadata, see [Retrieve instance metadata](#).

From describe-key-pairs

**To retrieve the public key material from the describe-key-pairs AWS CLI command**

Use the [describe-key-pairs](#) command and specify the `--key-names` parameter to identify the public key. To include the public key material in the output, specify the `--include-public-key` parameter.

```
aws ec2 describe-key-pairs --key-names key-pair-name --include-public-key
```

Example output – In the output, the PublicKey field contains the public key material.

```
{
  "KeyPairs": [
    {
      "KeyPairId": "key-0123456789example",
      "KeyName": "key-pair-name",
      "KeyType": "rsa",
      "Tags": [],
      "PublicKey": "ssh-ed25519
AAAAC3NzaC1lZDI1NTE5AAAAAIIj7az1DjvHAsSxgcpCRZ3oWnTm0nAFM64y9jd22ioI/ my-key-pair",
      "CreateTime": "2022-04-28T11:37:26.000Z"
    }
  ]
}
```
Alternatively, instead of `--key-names`, you can specify the `--key-pair-ids` parameter to identify the public key.

```bash
aws ec2 describe-key-pairs --key-pair-ids key-0123456789example --include-public-key
```

### Identify the public key specified at launch

If you specify a public key when you launch an instance, the public key name is recorded by the instance.

**To identify the public key that was specified at launch**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**, and then select your instance.
3. On the **Details** tab, under **Instance details**, the **Key pair assigned at launch** field displays the name of the public key that you specified when you launched the instance.

**Note**

The value of the **Key pair assigned at launch** field does not change even if you change the public key on the instance, or add public keys.

### Delete your key pair

You can delete a key pair, which removes the public key that is stored in Amazon EC2. Deleting a key pair does not delete the matching private key.

When you delete a public key using the following methods, you're only deleting the public key that you stored in Amazon EC2 when you created or imported the key pair. Deleting a public key doesn't remove the public key from any instances to which you've added it, either when you launched the instance or later. It also doesn't delete the private key on your local computer. You can continue to connect to instances that you launched using a public key that you've deleted from Amazon EC2 as long as you still have the private key (.pem) file.
Important

If you're using an Auto Scaling group (for example, in an Elastic Beanstalk environment), ensure that the public key you're deleting is not specified in an associated launch template or launch configuration. If Amazon EC2 Auto Scaling detects an unhealthy instance, it launches a replacement instance. However, the instance launch fails if the public key cannot be found. For more information, see Launch templates in the Amazon EC2 Auto Scaling User Guide.

Console

To delete your public key on Amazon EC2

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Key Pairs.
3. Select the key pair to delete and choose Actions, Delete.
4. In the confirmation field, enter Delete and then choose Delete.

AWS CLI

To delete your public key on Amazon EC2

Use the delete-key-pair AWS CLI command.

PowerShell

To delete your public key on Amazon EC2

Use the Remove-EC2KeyPair AWS Tools for Windows PowerShell command.

Add or remove a public key on your Linux instance

If you lose a private key, you lose access to any instances that use the key pair. For more information about connecting to an instance using a different key pair than the one that you specified at launch, see I've lost my private key.
When you launch an instance, you can specify a key pair. If you specify a key pair at launch, when your instance boots for the first time, the public key material is placed on your Linux instance in an entry within ~/.ssh/authorized_keys.

You can change the key pair that is used to access the default system account of your instance by adding a new public key on the instance, or by replacing the public key (deleting the existing public key and adding a new one) on the instance. You can also remove all public keys from an instance. To add or replace a key pair, you must be able to connect to your instance.

You might add or replace a key pair for the following reasons:

- If a user in your organization requires access to the system user using a separate key pair, you can add the public key to your instance.

- If someone has a copy of the private key (.pem file) and you want to prevent them from connecting to your instance (for example, if they've left your organization), you can delete the public key on the instance and replace it with a new one.

- If you create a Linux AMI from an instance, the public key material is copied from the instance to the AMI. If you launch an instance from the AMI, the new instance includes the public key from the original instance. To prevent someone who has the private key from connecting to the new instance, you can remove the public key from the original instance before creating the AMI.

Use the following procedures to modify the key pair for the default user, such as ec2-user. For information about adding users to your instance, see the documentation for the operating system on your instance.

**To add or replace a key pair**

1. Create a new key pair using the Amazon EC2 console or a third-party tool.
2. Retrieve the public key from your new key pair. For more information, see Retrieve the public key material.
3. Connect to your instance using your existing private key.
4. Using a text editor of your choice, open the .ssh/authorized_keys file on the instance. Paste the public key information from your new key pair underneath the existing public key information. Save the file.
5. Disconnect from your instance, and test that you can connect to your instance using the new private key file.
6. (Optional) If you're replacing an existing key pair, connect to your instance and delete the public key information for the original key pair from the .ssh/authorized_keys file.

⚠️ **Important**

If you're using an Auto Scaling group, ensure that the key pair you're replacing is not specified in your launch template or launch configuration. If Amazon EC2 Auto Scaling detects an unhealthy instance, it launches a replacement instance. However, the instance launch fails if the key pair cannot be found. For more information, see [Launch templates](#) in the Amazon EC2 Auto Scaling User Guide.

---

**To remove a public key from an instance**

1. Connect to your instance.

2. Using a text editor of your choice, open the .ssh/authorized_keys file on the instance. Delete the public key information, and then save the file.

⚠️ **Warning**

After you remove all the public keys from an instance and disconnect from the instance, you can't connect to it again unless the AMI provides another way of logging in.

---

**Verify the fingerprint of your key pair**

To verify the fingerprint of your key pair, compare the fingerprint displayed on the Key pairs page in the Amazon EC2 console, or returned by the `describe-key-pairs` command, with the fingerprint that you generate using the private key on your local computer. These fingerprints should match.

When Amazon EC2 calculates a fingerprint, Amazon EC2 might append padding to the fingerprint with = characters. Other tools, such as `ssh-keygen`, might omit this padding.

If you're trying to verify the fingerprint of your Linux EC2 instance, not the fingerprint of your key pair, see [Get the instance fingerprint](#).
How the fingerprints are calculated

Amazon EC2 uses different hash functions to calculate the fingerprints for RSA and ED25519 key pairs. Furthermore, for RSA key pairs, Amazon EC2 calculates the fingerprints differently using different hash functions depending on whether the key pair was created by Amazon EC2 or imported to Amazon EC2.

The following table lists the hash functions that are used to calculate the fingerprints for RSA and ED25519 key pairs that are created by Amazon EC2 and imported to Amazon EC2.

(\textit{Linux instances}) Hash functions used to calculate fingerprints

<table>
<thead>
<tr>
<th>Key pair source</th>
<th>RSA key pairs (Windows and Linux)</th>
<th>ED25519 key pairs (Linux)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created by Amazon EC2</td>
<td>SHA-1</td>
<td>SHA-256</td>
</tr>
<tr>
<td>Imported to Amazon EC2</td>
<td>MD5$^1$</td>
<td>SHA-256</td>
</tr>
</tbody>
</table>

$^1$ If you import a public RSA key to Amazon EC2, the fingerprint is calculated using an MD5 hash function. This is true regardless of how you created the key pair, for example, by using a third-party tool or by generating a new public key from an existing private key created using Amazon EC2.

When using the same key pair in different Regions

If you plan to use the same key pair to connect to instances in different AWS Regions, you must import the public key to all of the Regions in which you'll use it. If you use Amazon EC2 to create the key pair, you can \textit{Retrieve the public key material} so that you can import the public key to the other Regions.

\begin{itemize}
  \item If you create an RSA key pair using Amazon EC2, and then you generate a public key from the Amazon EC2 private key, the imported public keys will have a different fingerprint than the original public key. This is because the fingerprint of the original RSA key created using Amazon EC2 is calculated using a SHA-1 hash function, while the fingerprint of the imported RSA keys is calculated using an MD5 hash function.
\end{itemize}
For ED25519 key pairs, the fingerprints will be same regardless of whether they’re created by Amazon EC2 or imported to Amazon EC2, because the same SHA-256 hash function is used to calculate the fingerprint.

Generate a fingerprint from the private key

Use one of the following commands to generate a fingerprint from the private key on your local machine.

If you're using a Windows local machine, you can run the following commands using the Windows Subsystem for Linux (WSL). Install the WSL and a Linux distribution using the instructions in the Windows 10 Installation Guide. The example in the instructions installs the Ubuntu distribution of Linux, but you can install any distribution. You are prompted to restart your computer for the changes to take effect.

- **If you created the key pair using Amazon EC2**

  Use the OpenSSL tools to generate a fingerprint as shown in the following examples.

  For RSA key pairs:

  ```
  openssl pkcs8 -in path_to_private_key -inform PEM -outform DER -topk8 -nocrypt | openssl sha1 -c
  ```

  (Linux instances) For ED25519 key pairs:

  ```
  ssh-keygen -l -f path_to_private_key
  ```

- **(RSA key pairs only) If you imported the public key to Amazon EC2**

  You can follow this procedure regardless of how you created the key pair, for example, by using a third-party tool or by generating a new public key from an existing private key created using Amazon EC2.

  Use the OpenSSL tools to generate the fingerprint as shown in the following example.

  ```
  openssl rsa -in path_to_private_key -pubout -outform DER | openssl md5 -c
  ```

Verify the fingerprint
• If you created an OpenSSH key pair using OpenSSH 7.8 or later and imported the public key to Amazon EC2

Use `ssh-keygen` to generate the fingerprint as shown in the following examples.

For RSA key pairs:

```bash
ssh-keygen -ef path_to_private_key -m PEM | openssl rsa -RSAPublicKey_in -outform DER | openssl md5 -c
```

(Linux instances) For ED25519 key pairs:

```bash
ssh-keygen -l -f path_to_private_key
```

Amazon EC2 security groups for your EC2 instances

A security group acts as a virtual firewall for your EC2 instances to control incoming and outgoing traffic. Inbound rules control the incoming traffic to your instance, and outbound rules control the outgoing traffic from your instance. When you launch an instance, you can specify one or more security groups. If you don't specify a security group, Amazon EC2 uses the default security group for the VPC. You can add rules to each security group that allow traffic to or from its associated instances. You can modify the rules for a security group at any time. New and modified rules are automatically applied to all instances that are associated with the security group. When Amazon EC2 decides whether to allow traffic to reach an instance, it evaluates all of the rules from all of the security groups that are associated with the instance.

The following diagram shows a VPC with a subnet, an internet gateway, and a security group. The subnet contains EC2 instances. The security group is assigned to the instances. The only traffic that reaches the instance is the traffic allowed by the security group rules. For example, if the security group contains a rule that allows SSH traffic from your network, then you can connect to your instance from your computer using SSH. If the security group contains a rule that allows all traffic from the resources assigned to it, then each instance can receive any traffic sent from the other instances.
After you launch an instance, you can change its security groups. Security groups are associated with network interfaces. Changing an instance's security groups changes the security groups associated with the primary network interface (eth0). For more information, see Change an instance's security group. You can also change the security groups associated with any other network interface. For more information, see Modify network interface attributes.

Security is a shared responsibility between AWS and you. For more information, see Security in Amazon EC2. AWS provides security groups as one of the tools for securing your instances, and you need to configure them to meet your security needs. If you have requirements that aren't fully met by security groups, you can maintain your own firewall on any of your instances in addition to using security groups.

There is no additional charge for using security groups.

Security group rules

The rules of a security group control the inbound traffic that's allowed to reach the instances that are associated with the security group. The rules also control the outbound traffic that's allowed to leave them.

The following are the characteristics of security group rules:

- By default, security groups contain outbound rules that allow all outbound traffic. You can delete these rules. Note that Amazon EC2 blocks traffic on port 25 by default. For more information, see Restriction on email sent using port 25.
- Security group rules are always permissive; you can't create rules that deny access.
- Security group rules enable you to filter traffic based on protocols and port numbers.
- Security groups are stateful—if you send a request from your instance, the response traffic for that request is allowed to flow in regardless of inbound security group rules. For VPC security groups, this also means that responses to allowed inbound traffic are allowed to flow out, regardless of outbound rules. For more information, see Security group connection tracking.
- You can add and remove rules at any time. Your changes are automatically applied to the instances that are associated with the security group.

The effect of some rule changes can depend on how the traffic is tracked. For more information, see Security group connection tracking.

- When you associate multiple security groups with an instance, the rules from each security group are effectively aggregated to create one set of rules. Amazon EC2 uses this set of rules to determine whether to allow access.

You can assign multiple security groups to an instance. Therefore, an instance can have hundreds of rules that apply. This might cause problems when you access the instance. We recommend that you condense your rules as much as possible.

Security groups cannot block DNS requests to or from the Route 53 Resolver, sometimes referred to as the 'VPC+2 IP address' (see What is Amazon Route 53 Resolver? in the Amazon Route 53 Developer Guide), or the ‘AmazonProvidedDNS’ (see Work with DHCP option sets in the Amazon Virtual Private Cloud User Guide). If you wish to filter DNS
requests through the Route 53 Resolver, you can enable Route 53 Resolver DNS Firewall (see Route 53 Resolver DNS Firewall in the Amazon Route 53 Developer Guide).

For each rule, you specify the following:

- **Name:** The name for the security group (for example, "my-security-group").

  A name can be up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and _-:/@[]+=;@!$*. When the name contains trailing spaces, we trim the spaces when we save the name. For example, if you enter "Test Security Group " for the name, we store it as "Test Security Group".

- **Protocol:** The protocol to allow. The most common protocols are 6 (TCP), 17 (UDP), and 1 (ICMP).

- **Port range:** For TCP, UDP, or a custom protocol, the range of ports to allow. You can specify a single port number (for example, 22), or range of port numbers (for example, 7000-8000).

- **ICMP type and code:** For ICMP, the ICMP type and code. For example, use type 8 for ICMP Echo Request or type 128 for ICMPv6 Echo Request.

- **Source or destination:** The source (inbound rules) or destination (outbound rules) for the traffic to allow. Specify one of the following:
  - A single IPv4 address. You must use the /32 prefix length. For example, 203.0.113.1/32.
  - A single IPv6 address. You must use the /128 prefix length. For example, 2001:db8:1234:1a00::123/128.
  - A range of IPv4 addresses, in CIDR block notation. For example, 203.0.113.0/24.
  - A range of IPv6 addresses, in CIDR block notation. For example, 2001:db8:1234:1a00::/64.
  - The ID of a prefix list. For example, pl-1234abc1234abc123. For more information, see Prefix lists in the Amazon VPC User Guide.
  - The ID of a security group (referred to here as the specified security group). For example, the current security group, a security group from the same VPC, or a security group for a peered VPC. This allows traffic based on the private IP addresses of the resources associated with the specified security group. This does not add rules from the specified security group to the current security group.

- **(Optional) Description:** You can add a description for the rule, which can help you identify it later. A description can be up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and _-:/@[]+=;@!$*. 

Security group rules
When you create a security group rule, AWS assigns a unique ID to the rule. You can use the ID of a rule when you use the API or CLI to modify or delete the rule.

When you specify a security group as the source or destination for a rule, the rule affects all instances that are associated with the security group. Incoming traffic is allowed based on the private IP addresses of the instances that are associated with the source security group (and not the public IP or Elastic IP addresses). For more information about IP addresses, see Amazon EC2 instance IP addressing. If your security group rule references a deleted security group in the same VPC or in a peer VPC, or if it references a security group in a peer VPC for which the VPC peering connection has been deleted, the rule is marked as stale. For more information, see Working with Stale Security Group Rules in the Amazon VPC Peering Guide.

If there is more than one rule for a specific port, Amazon EC2 applies the most permissive rule. For example, if you have a rule that allows access to TCP port 22 (SSH) from IP address 203.0.113.1, and another rule that allows access to TCP port 22 from everyone, then everyone has access to TCP port 22.

When you add, update, or remove rules, the changes are automatically applied to all instances associated with the security group.

**Security group connection tracking**

Your security groups use connection tracking to track information about traffic to and from the instance. Rules are applied based on the connection state of the traffic to determine if the traffic is allowed or denied. With this approach, security groups are stateful. This means that responses to inbound traffic are allowed to flow out of the instance regardless of outbound security group rules, and vice versa.

As an example, suppose that you initiate a command such as netcat or similar to your instances from your home computer, and your inbound security group rules allow ICMP traffic. Information about the connection (including the port information) is tracked. Response traffic from the instance for the command is not tracked as a new request, but rather as an established connection, and is allowed to flow out of the instance, even if your outbound security group rules restrict outbound ICMP traffic.

For protocols other than TCP, UDP, or ICMP, only the IP address and protocol number is tracked. If your instance sends traffic to another host, and the host sends the same type of traffic to your instance within 600 seconds, the security group for your instance accepts it regardless of inbound
security group rules. The security group accepts it because it's regarded as response traffic for the original traffic.

When you change a security group rule, its tracked connections are not immediately interrupted. The security group continues to allow packets until existing connections time out. To ensure that traffic is immediately interrupted, or that all traffic is subject to firewall rules regardless of the tracking state, you can use a network ACL for your subnet. Network ACLs are stateless and therefore do not automatically allow response traffic. Adding a network ACL that blocks traffic in either direction breaks existing connections. For more information, see Network ACLs in the Amazon VPC User Guide.

**Note**

Security groups have no effect on DNS traffic to or from the Route 53 Resolver, sometimes referred to as the 'VPC+2 IP address' (see What is Amazon Route 53 Resolver? in the Amazon Route 53 Developer Guide), or the ‘AmazonProvidedDNS’ (see Work with DHCP option sets in the Amazon Virtual Private Cloud User Guide). If you wish to filter DNS requests through the Route 53 Resolver, you can enable Route 53 Resolver DNS Firewall (see Route 53 Resolver DNS Firewall in the Amazon Route 53 Developer Guide).

### Untracked connections

Not all flows of traffic are tracked. If a security group rule permits TCP or UDP flows for all traffic (0.0.0.0/0 or ::/0) and there is a corresponding rule in the other direction that permits all response traffic (0.0.0.0/0 or ::/0) for any port (0-65535), then that flow of traffic is not tracked, unless it is part of an automatically tracked connection. The response traffic for an untracked flow is allowed based on the inbound or outbound rule that permits the response traffic, not based on tracking information.

An untracked flow of traffic is immediately interrupted if the rule that enables the flow is removed or modified. For example, if you have an open (0.0.0.0/0) outbound rule, and you remove a rule that allows all (0.0.0.0/0) inbound SSH (TCP port 22) traffic to the instance (or modify it such that the connection would no longer be permitted), your existing SSH connections to the instance are immediately dropped. The connection was not previously being tracked, so the change will break the connection. On the other hand, if you have a narrower inbound rule that initially allows an SSH connection (meaning that the connection was tracked), but change that rule to no longer allow
new connections from the address of the current SSH client, the existing SSH connection is not
interrupted because it is tracked.

Automatically tracked connections

Connections made through the following are automatically tracked, even if the security group
configuration does not otherwise require tracking:

- Egress-only internet gateways
- Global Accelerator accelerators
- NAT gateways
- Network Firewall firewall endpoints
- Network Load Balancers
- AWS PrivateLink (interface VPC endpoints)
- AWS Lambda (Hyperplane elastic network interfaces)

Connection tracking allowances

Amazon EC2 defines the maximum number of connections that can be tracked per instance.
After the maximum is reached, any packets that are sent or received are dropped because a
new connection cannot be established. When this happens, applications that send and receive
packets cannot communicate properly. Use the conntrack_allowance_available network
performance metric to determine the number of tracked connections still available for that
instance type.

To determine whether packets were dropped because the network traffic for your
instance exceeded the maximum number of connections that can be tracked, use the
conntrack_allowance_exceeded network performance metric. For more information, see
Monitor network performance for ENA settings on your EC2 instance.

With Elastic Load Balancing, if you exceed the maximum number of connections that can be
tracked per instance, we recommend that you scale either the number of instances registered with
the load balancer or the size of the instances registered with the load balancer.
Connection tracking performance considerations

Asymmetric routing, where traffic comes into an instance through one network interface and leaves through a different network interface, can reduce the peak performance that an instance can achieve if flows are tracked.

To maintain peak performance when connection tracking is enabled for your security groups, we recommend the following configuration:

- Avoid asymmetric routing topologies, if possible.
- Instead of using security groups for filtering, use network ACLs.
- If you must use security groups with connection tracking, configure the shortest connection timeout possible.

For more information about performance tuning on the Nitro system, see Nitro system considerations for performance tuning.

Idle connection tracking timeout

The security group tracks each connection established to ensure that return packets are delivered as expected. There is a maximum number of connections that can be tracked per instance. Connections that remain idle can lead to connection tracking exhaustion and cause connections not to be tracked and packets to be dropped. You can set the timeout for idle connection tracking on an Elastic network interface.

Note
This feature is only available for instances built on the AWS Nitro System.

There are three configurable timeouts:

- **TCP established timeout**: Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 432000 seconds. Recommended: Less than 432000 seconds.

- **UDP timeout**: Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.
• **UDP stream timeout**: Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

You may want to modify the default timeouts for any of the following cases:

• If you are monitoring tracked connections using Amazon EC2 network performance metrics, the `conntrack_allowance_exceeded` and `conntrack_allowance_available` metrics enable you to monitor dropped packets and tracked connection utilization to proactively manage EC2 instance capacity with scale up or out actions to help meet network connections demand before dropping packets. If you are observing `conntrack_allowance_exceeded` drops on your EC2 instances, you may benefit from setting a lower TCP established timeout to account for stale TCP/UDP sessions resulting from improper clients or network middle boxes.

• Typically, load balancers or firewalls have TCP Established idle timeout in the range of 60 to 90 minutes. If you are running workloads that are expected to handle a very high number of connections (greater than 100k) from appliances like network firewalls, configuring a similar timeout on an EC2 network interface is advised.

• If you are running a workload that utilizes an asymmetric routing topology, we recommend that you configure a TCP Established idle timeout of 60 seconds.

• If you are running workloads with high numbers of connections like DNS, SIP, SNMP, Syslog, Radius and other services that primarily use UDP to serve requests, setting the ‘UDP-stream’ timeout to 60s provides higher scale/performance for existing capacity and to prevent gray failures.

• For TCP/UDP connections through network load balancers (NLBs) and elastic load balancers (ELB), all connections are tracked. Idle timeout value for TCP flows is 350secs and UDP flows is 120 secs, and varies from interface level timeout values. You may want to configure timeouts at the network interface level to allow for more flexibility for timeout than the defaults for ELB/NLB.

You have the option to configure the connection tracking timeouts when you do the following:

• [Create a network interface](#)
• [Modify network interface attributes](#)
• [Launch an EC2 instance](#)
• [Create an EC2 instance launch template](#)
Example

In the following example, the security group has inbound rules that allow TCP and ICMP traffic, and outbound rules that allow all outbound traffic.

Inbound

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Port number</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>22 (SSH)</td>
<td>203.0.113.1/32</td>
</tr>
<tr>
<td>TCP</td>
<td>80 (HTTP)</td>
<td>0.0.0.0/0</td>
</tr>
<tr>
<td>TCP</td>
<td>80 (HTTP)</td>
<td>::/0</td>
</tr>
<tr>
<td>ICMP</td>
<td>All</td>
<td>0.0.0.0/0</td>
</tr>
</tbody>
</table>

Outbound

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Port number</th>
<th>Destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>All</td>
<td>All</td>
<td>0.0.0.0/0</td>
</tr>
<tr>
<td>All</td>
<td>All</td>
<td>::/0</td>
</tr>
</tbody>
</table>

With a direct network connection to the instance or network interface, the tracking behavior is as follows:

- Inbound and outbound TCP traffic on port 22 (SSH) is tracked, because the inbound rule allows traffic from 203.0.113.1/32 only, and not all IP addresses (0.0.0.0/0).
- Inbound and outbound TCP traffic on port 80 (HTTP) is not tracked, because the inbound and outbound rules allow traffic from all IP addresses.
- ICMP traffic is always tracked.

If you remove the outbound rule for IPv4 traffic, all inbound and outbound IPv4 traffic is tracked, including traffic on port 80 (HTTP). The same applies for IPv6 traffic if you remove the outbound rule for IPv6 traffic.
Default and custom security groups

Your AWS account automatically has a default security group for the default VPC in each Region. If you don't specify a security group when you launch an instance, the instance is automatically associated with the default security group for the VPC. If you don't want your instances to use the default security group, you can create your own custom security groups and specify them when you launch your instances.

Contents

• Default security groups
• Custom security groups

Default security groups

Each VPC comes with a default security group. We recommend that you create security groups for specific instances or groups of instances instead of using the default security group. However, if you don't specify a security group when you launch an instance, we associate the instance with the default security group for the VPC.

The name of a default security group is "default". The following are the default rules for a default security group.

Inbound

<table>
<thead>
<tr>
<th>Source</th>
<th>Protocol</th>
<th>Port range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sg-1234567890abcdef0</td>
<td>All</td>
<td>All</td>
<td>Allows inbound traffic from all resources that are assigned to this security group. The source is the ID of this security group.</td>
</tr>
</tbody>
</table>

Outbound

<table>
<thead>
<tr>
<th>Destination</th>
<th>Protocol</th>
<th>Port range</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.0.0.0/0</td>
<td>All</td>
<td>All</td>
<td>Allows all outbound IPv4 traffic.</td>
</tr>
<tr>
<td>Destination</td>
<td>Protocol</td>
<td>Port range</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>----------</td>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>::/0</td>
<td>All</td>
<td>All</td>
<td>Allows all outbound IPv6 traffic. This rule is added only if your VPC has an associated IPv6 CIDR block.</td>
</tr>
</tbody>
</table>

**Default security group basics**

- You can change the rules for a default security group.
- You can't delete a default security group. If you try to delete a default security group, we return the following error code: `Client.CannotDelete`.

**Custom security groups**

You can create multiple security groups to reflect the different roles that your instances play; for example, web servers or database servers.

When you create a security group, you must provide it with a name and a description. Security group names and descriptions can be up to 255 characters in length, and are limited to the following characters:

a-z, A-Z, 0-9, spaces, and .-_:/(),@[]+=&{!}$*

A security group name cannot start with the following: `sg-`. A security group name must be unique for the VPC.

The following are the default rules for a security group that you create:

- Allows no inbound traffic
- Allows all outbound traffic

After you've created a security group, you can change its inbound rules to reflect the type of inbound traffic that you want to reach the associated instances. You can also change its outbound rules.

For more information about the rules you can add to a security group, see [Security group rules for different use cases](#).
Work with security groups

You can assign a security group to an instance when you launch the instance. When you add or remove rules, those changes are automatically applied to all instances to which you've assigned the security group. For more information, see Assign a security group to an instance.

After you launch an instance, you can change its security groups. For more information, see Change an instance's security group.

You can create, view, update, and delete security groups and security group rules using the Amazon EC2 console and the command line tools.

Tasks

- Create a security group
- Copy a security group
- View your security groups
- Add rules to a security group
- Update security group rules
- Delete rules from a security group
- Delete a security group
- Assign a security group to an instance
- Change an instance's security group

Create a security group

Although you can use the default security group for your instances, you might want to create your own groups to reflect the different roles that instances play in your system.

By default, new security groups start with only an outbound rule that allows all traffic to leave the instances. You must add rules to enable any inbound traffic or to restrict the outbound traffic.

A security group can be used only in the VPC for which it is created.

Console

To create a security group

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Security Groups**.

3. Choose **Create security group**.

4. In the **Basic details** section, do the following.
   
   a. Enter a descriptive name and brief description for the security group. They can’t be edited after the security group is created. The name and description can be up to 255 characters long. The valid characters are a-z, A-Z, 0-9, spaces, and ._-:/()#,@+=&;{}!$*.  
   
   b. For **VPC**, choose the VPC.

5. You can add security group rules now, or you can add them later. For more information, see **Add rules to a security group**.

6. You can add tags now, or you can add them later. To add a tag, choose **Add new tag** and enter the tag key and value.

7. Choose **Create security group**.

**Command line**

**To create a security group**

Use one of the following commands:

- `create-security-group` (AWS CLI)

**Copy a security group**

You can create a new security group by creating a copy of an existing one. When you copy a security group, the copy is created with the same inbound and outbound rules as the original security group. If the original security group is in a VPC, the copy is created in the same VPC unless you specify a different one.

The copy receives a new unique security group ID and you must give it a name. You can also add a description.

You can’t copy a security group from one Region to another Region.

You can create a copy of a security group using the Amazon EC2 console.
To copy a security group

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Security Groups.
3. Select the security group to copy and choose Actions, Copy to new security group.
4. Specify a name and optional description, and change the VPC and security group rules if needed.
5. Choose Create.

View your security groups

You can view information about your security groups using one of the following methods.

Console

To view your security groups

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Security Groups.
3. Your security groups are listed. To view the details for a specific security group, including its inbound and outbound rules, choose its ID in the Security group ID column.

Command line

To view your security groups

Use one of the following commands.

- describe-security-groups (AWS CLI)
- describe-security-group-rules (AWS CLI)

Amazon EC2 Global View

You can use Amazon EC2 Global View to view your security groups across all Regions for which your AWS account is enabled. For more information, see Amazon EC2 Global View.
Add rules to a security group

When you add a rule to a security group, the new rule is automatically applied to any instances that are associated with the security group. There might be a short delay before the rule is applied. For more information, see Security group rules for different use cases and Security group rules.

Console

To add an inbound rule to a security group

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Security Groups.
3. Select the security group, and choose Actions, Edit inbound rules.
4. For each rule, choose Add rule and do the following.
   a. For Type, choose the type of protocol to allow.
      • For Custom TCP or Custom UDP, you must enter the port range to allow. For example, 0–99.
      • For Custom ICMP, you must choose the ICMP type from Protocol. The port range is configured for you. For example, to allow ping commands, choose Echo Request from Protocol.
      • For any other type, the protocol and port range are configured for you.
   b. For Source, do one of the following to allow traffic.
      • Choose Custom and then enter an IP address in CIDR notation, a CIDR block, another security group, or a prefix list.
      • Choose Anywhere to allow all traffic for the specified protocol to reach your instance. This option automatically adds the 0.0.0.0/0 IPv4 CIDR block as the source. If your security group is in a VPC that's enabled for IPv6, this option automatically adds a rule for the ::/0 IPv6 CIDR block.

⚠️ Warning
If you choose Anywhere, you enable all IPv4 and IPv6 addresses to access your instance the specified protocol. If you are adding rules for ports 22
(SSH) or 3389 (RDP), you should authorize only a specific IP address or range of addresses to access your instance.

- Choose **My IP** to allow inbound traffic from only your local computer's public IPv4 address.

  c. For **Description**, optionally specify a brief description for the rule.

5. Choose **Preview changes, Save rules**.

### To add an outbound rule to a security group

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Security Groups**.
3. Select the security group, and choose **Actions, Edit outbound rules**.
4. For each rule, choose **Add rule** and do the following.

   a. For **Type**, choose the type of protocol to allow.

      - For **Custom TCP** or **Custom UDP**, you must enter the port range to allow. For example, 0-99.

      - For **Custom ICMP**, you must choose the ICMP type from **Protocol**. The port range is configured for you.

      - For any other type, the protocol and port range are configured automatically.

   b. For **Destination**, do one of the following.

      - Choose **Custom** and then enter an IP address in CIDR notation, a CIDR block, another security group, or a prefix list for which to allow outbound traffic.

      - Choose **Anywhere** to allow outbound traffic to all IP addresses. This option automatically adds the 0.0.0.0/0 IPv4 CIDR block as the destination.

      If your security group is in a VPC that's enabled for IPv6, this option automatically adds a rule for the ::/0 IPv6 CIDR block.

      - Choose **My IP** to allow outbound traffic only to your local computer's public IPv4 address.

   c. (Optional) For **Description**, specify a brief description for the rule.

5. Choose **Preview changes, Confirm**.
Command line

**To add rules to a security group**

Use one of the following commands.

- `authorize-security-group-ingress` (AWS CLI)
- `Grant-EC2SecurityGroupIngress` (AWS Tools for Windows PowerShell)

**To add one or more egress rules to a security group**

Use one of the following commands.

- `authorize-security-group-egress` (AWS CLI)
- `Grant-EC2SecurityGroupEgress` (AWS Tools for Windows PowerShell)

**Update security group rules**

You can update a security group rule using one of the following methods. The updated rule is automatically applied to any instances that are associated with the security group.

**Console**

When you modify the protocol, port range, or source or destination of an existing security group rule using the console, the console deletes the existing rule and adds a new one for you.

**To update a security group rule**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Security Groups.
3. Select the security group.
4. Choose Actions, Edit inbound rules to update a rule for inbound traffic or Actions, Edit outbound rules to update a rule for outbound traffic.
5. Update the rule as required.
6. Choose Preview changes, Confirm.
To tag a security group rule

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Security Groups.
3. Select the security group.
4. On the Inbound rules or Outbound rules tab, select the check box for the rule and then choose Manage tags.
5. The Manage tags page displays any tags that are assigned to the rule. To add a tag, choose Add tag and enter the tag key and value. To delete a tag, choose Remove next to the tag that you want to delete.
6. Choose Save changes.

Command line

You cannot modify the protocol, port range, or source or destination of an existing rule using the Amazon EC2 API or a command line tools. Instead, you must delete the existing rule and add a new rule. You can, however, update the description of an existing rule.

To update a rule

Use one the following command.

- modify-security-group-rules (AWS CLI)

To update the description for an existing inbound rule

Use one of the following commands.

- update-security-group-rule-descriptions-ingress (AWS CLI)
- Update-EC2SecurityGroupRuleIngressDescription (AWS Tools for Windows PowerShell)

To update the description for an existing outbound rule

Use one of the following commands.

- update-security-group-rule-descriptions-egress (AWS CLI)
- Update-EC2SecurityGroupRuleEgressDescription (AWS Tools for Windows PowerShell)
To tag a security group rule

Use one of the following commands.

- `create-tags` (AWS CLI)
- `New-EC2Tag` (AWS Tools for Windows PowerShell)

Delete rules from a security group

When you delete a rule from a security group, the change is automatically applied to any instances associated with the security group.

You can delete rules from a security group using one of the following methods.

Console

To delete a security group rule

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Security Groups.
3. Select the security group to update, choose Actions, and then choose Edit inbound rules to remove an inbound rule or Edit outbound rules to remove an outbound rule.
4. Choose the Delete button to the right of the rule to delete.
5. Choose Save rules. Alternatively, choose Preview changes, review your changes, and choose Confirm.

Command line

To remove one or more ingress rules from a security group

Use one of the following commands.

- `revoke-security-group-ingress` (AWS CLI)
- `Revoke-EC2SecurityGroupIngress` (AWS Tools for Windows PowerShell)

To remove one or more egress rules from a security group

Use one of the following commands.
Delete a security group

You can't delete a security group that is associated with an instance. You can't delete the default security group. You can't delete a security group that is referenced by a rule in another security group in the same VPC. If your security group is referenced by one of its own rules, you must delete the rule before you can delete the security group.

Console

To delete a security group

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Security Groups.
3. Select the security group and choose Actions, Delete security groups.
4. When prompted for confirmation, choose Delete.

Command line

To delete a security group

Use one of the following commands.

- **delete-security-group** (AWS CLI)

Assign a security group to an instance

You can assign one or more security groups to an instance when you launch the instance. You can also specify one or more security groups in a launch template. The security groups are assigned to all instances that are launched using the launch template.

- To assign a security group to an instance when you launch the instance, see Network settings of Launch an instance using defined parameters (new console) or Step 6: Configure Security Group (old console).
• To specify a security group in a launch template, see Network settings of Create a launch template from parameters.

Change an instance's security group

After you launch an instance, you can change its security groups by adding or removing security groups.

Requirements

• The instance must be in the running or stopped state.
• A security group is specific to a VPC. You can assign a security group to one or more instances launched in the VPC for which you created the security group.

Console

To change the security groups for an instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select your instance, and then choose Actions, Security, Change security groups.
4. For Associated security groups, select a security group from the list and choose Add security group.
   To remove an already associated security group, choose Remove for that security group.
5. Choose Save.

Command line

To change the security groups for an instance

Use one of the following commands.

• modify-instance-attribute (AWS CLI)
• Edit-EC2InstanceAttribute (AWS Tools for Windows PowerShell)
Security group rules for different use cases

You can create a security group and add rules that reflect the role of the instance that's associated with the security group. For example, an instance that's configured as a web server needs security group rules that allow inbound HTTP and HTTPS access. Likewise, a database instance needs rules that allow access for the type of database, such as access over port 3306 for MySQL.

The following are examples of the kinds of rules that you can add to security groups for specific kinds of access.

Examples

- Web server rules
- Database server rules
- Rules to connect to instances from your computer
- Rules to connect to instances from an instance with the same security group
- Rules for ping/ICMP
- DNS server rules
- Amazon EFS rules
- Elastic Load Balancing rules
- VPC peering rules

Web server rules

The following inbound rules allow HTTP and HTTPS access from any IP address. If your VPC is enabled for IPv6, you can add rules to control inbound HTTP and HTTPS traffic from IPv6 addresses.

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Protocol number</th>
<th>Port</th>
<th>Source IP</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>6</td>
<td>80 (HTTP)</td>
<td>0.0.0.0/0</td>
<td>Allows inbound HTTP access from any IPv4 address</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>443 (HTTPS)</td>
<td>0.0.0.0/0</td>
<td>Allows inbound HTTPS access from any IPv4 address</td>
</tr>
</tbody>
</table>
## Protocol type

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Protocol number</th>
<th>Port</th>
<th>Source IP</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>6</td>
<td>80 (HTTP)</td>
<td>::/0</td>
<td>Allows inbound HTTP access from any IPv6 address</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>443 (HTTPS)</td>
<td>::/0</td>
<td>Allows inbound HTTPS access from any IPv6 address</td>
</tr>
</tbody>
</table>

## Database server rules

The following inbound rules are examples of rules you might add for database access, depending on what type of database you’re running on your instance. For more information about Amazon RDS instances, see the [Amazon RDS User Guide](#).

For the source IP, specify one of the following:

- A specific IP address or range of IP addresses (in CIDR block notation) in your local network
- A security group ID for a group of instances that access the database

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Protocol number</th>
<th>Port</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>6</td>
<td>1433 (MS SQL)</td>
<td>The default port to access a Microsoft SQL Server database, for example, on an Amazon RDS instance</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>3306 (MySQL/Aurora)</td>
<td>The default port to access a MySQL or Aurora database, for example, on an Amazon RDS instance</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>5439 (Redshift)</td>
<td>The default port to access an Amazon Redshift cluster database.</td>
</tr>
<tr>
<td>Protocol type</td>
<td>Protocol number</td>
<td>Port</td>
<td>Notes</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------</td>
<td>--------</td>
<td>----------------------------------------------------------------------</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>5432</td>
<td>The default port to access a PostgreSQL database, for example, on an Amazon RDS instance</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>1521</td>
<td>The default port to access an Oracle database, for example, on an Amazon RDS instance</td>
</tr>
</tbody>
</table>

You can optionally restrict outbound traffic from your database servers. For example, you might want to allow access to the internet for software updates, but restrict all other kinds of traffic. You must first remove the default outbound rule that allows all outbound traffic.

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Protocol number</th>
<th>Port</th>
<th>Destination IP</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>6</td>
<td>80</td>
<td>0.0.0.0/0</td>
<td>Allows outbound HTTP access to any IPv4 address</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>443</td>
<td>0.0.0.0/0</td>
<td>Allows outbound HTTPS access to any IPv4 address</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>80</td>
<td>::/0</td>
<td>(IPv6-enabled VPC only) Allows outbound HTTP access to any IPv6 address</td>
</tr>
<tr>
<td>TCP</td>
<td>6</td>
<td>443</td>
<td>::/0</td>
<td>(IPv6-enabled VPC only) Allows outbound HTTPS access to any IPv6 address</td>
</tr>
</tbody>
</table>

**Rules to connect to instances from your computer**

To connect to your instance, your security group must have inbound rules that allow SSH access (for Linux instances) or RDP access (for Windows instances).
### Protocol type | Protocol number | Port | Source IP
--- | --- | --- | ---
TCP | 6 | 22 (SSH) | The public IPv4 address of your computer, or a range of IP addresses in your local network. If your VPC is enabled for IPv6 and your instance has an IPv6 address, you can enter an IPv6 address or range.
TCP | 6 | 3389 (RDP) | The public IPv4 address of your computer, or a range of IP addresses in your local network. If your VPC is enabled for IPv6 and your instance has an IPv6 address, you can enter an IPv6 address or range.

### Rules to connect to instances from an instance with the same security group

To allow instances that are associated with the same security group to communicate with each other, you must explicitly add rules for this.

#### Note

If you configure routes to forward the traffic between two instances in different subnets through a middlebox appliance, you must ensure that the security groups for both instances allow traffic to flow between the instances. The security group for each instance must reference the private IP address of the other instance, or the CIDR range of the subnet that contains the other instance, as the source. If you reference the security group of the other instance as the source, this does not allow traffic to flow between the instances.

The following table describes the inbound rule for a security group that enables associated instances to communicate with each other. The rule allows all types of traffic.
<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Protocol number</th>
<th>Ports</th>
<th>Source IP</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1 (All)</td>
<td>-1 (All)</td>
<td>-1 (All)</td>
<td>The ID of the security group, or the CIDR range of the subnet that contains the other instance (see note).</td>
</tr>
</tbody>
</table>

### Rules for ping/ICMP

The **ping** command is a type of ICMP traffic. To ping your instance, you must add one of the following inbound ICMP rules.

<table>
<thead>
<tr>
<th>Type</th>
<th>Protocol</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom ICMP - IPv4</td>
<td>Echo request</td>
<td>The public IPv4 address of your computer, a specific IPv4 address, or an IPv4 or IPv6 address from anywhere.</td>
</tr>
<tr>
<td>All ICMP - IPv4</td>
<td>IPv4 ICMP (1)</td>
<td>The public IPv4 address of your computer, a specific IPv4 address, or an IPv4 or IPv6 address from anywhere.</td>
</tr>
</tbody>
</table>

To use the **ping6** command to ping the IPv6 address for your instance, you must add the following inbound ICMPv6 rule.
### Security group rules for different use cases

<table>
<thead>
<tr>
<th>Type</th>
<th>Protocol</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>All ICMP - IPv6</td>
<td>IPv6 ICMP (58)</td>
<td>The IPv6 address of your computer, a specific IPv4 address, or an IPv4 or IPv6 address from anywhere.</td>
</tr>
</tbody>
</table>

#### DNS server rules

If you've set up your EC2 instance as a DNS server, you must ensure that TCP and UDP traffic can reach your DNS server over port 53.

For the source IP, specify one of the following:

- An IP address or range of IP addresses (in CIDR block notation) in a network
- The ID of a security group for the set of instances in your network that require access to the DNS server

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Protocol number</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP</td>
<td>6</td>
<td>53</td>
</tr>
<tr>
<td>UDP</td>
<td>17</td>
<td>53</td>
</tr>
</tbody>
</table>

#### Amazon EFS rules

If you're using an Amazon EFS file system with your Amazon EC2 instances, the security group that you associate with your Amazon EFS mount targets must allow traffic over the NFS protocol.
### Elastic Load Balancing rules

If you're using a load balancer, the security group associated with your load balancer must have rules that allow communication with your instances or targets. For more information, see [Configure security groups for your Classic Load Balancer](https://docs.aws.amazon.com/elasticloadbalancing/latest/classic/configure-security-group.html) in the User Guide for Classic Load Balancers, and [Security groups for your Application Load Balancer](https://docs.aws.amazon.com/elasticloadbalancing/latest/application/configure-security-group.html) in the User Guide for Application Load Balancers.

### VPC peering rules

You can update the inbound or outbound rules for your VPC security groups to reference security groups in the peered VPC. Doing so allows traffic to flow to and from instances that are associated with the referenced security group in the peered VPC. For more information about how to
configure security groups for VPC peering, see Updating your security groups to reference peer VPC groups.

NitroTPM

Nitro Trusted Platform Module (NitroTPM) is a virtual device that is provided by the AWS Nitro System and conforms to the TPM 2.0 specification. It securely stores artifacts (such as passwords, certificates, or encryption keys) that are used to authenticate the instance. NitroTPM can generate keys and use them for cryptographic functions (such as hashing, signing, encryption, and decryption).

NitroTPM provides measured boot, a process where the bootloader and operating system create cryptographic hashes of every boot binary and combine them with the previous values in NitroTPM internal Platform Configuration Registers (PCRs). With measured boot, you can obtain signed PCR values from NitroTPM and use them to prove to remote entities the integrity of the instance's boot software. This is known as remote attestation.

With NitroTPM, keys and secrets can be tagged with a specific PCR value so that they can never be accessed if the value of the PCR, and thus the instance integrity, changes. This special form of conditional access is referred to as sealing and unsealing. Operating system technologies, like BitLocker, can use NitroTPM to seal a drive decryption key so that the drive can only be decrypted when the operating system has booted correctly and is in a known good state.

To use NitroTPM, you must select an Amazon Machine Image (AMI) that has been configured for NitroTPM support, and then use the AMI to launch instances built on the AWS Nitro System. You can select one of Amazon's prebuilt AMIs or create one yourself.

Costs

There is no additional cost for using NitroTPM. You pay only for the underlying resources that you use.

Topics

- Considerations
- Prerequisites for enabling at launch
- Create a Linux AMI for NitroTPM support
- Verify whether an AMI is enabled for NitroTPM
• Enable or stop using NitroTPM on an instance
• Retrieve the public endorsement key for an instance

Considerations

The following considerations apply when using NitroTPM:

• BitLocker volumes that are encrypted with NitroTPM-based keys can only be used on the original instance.
• The NitroTPM state is not included in Amazon EBS snapshots.
• The NitroTPM state is not included in VM Import/Export images.
• NitroTPM support is enabled by specifying a value of v2.0 for the tpm-support parameter when creating an AMI. After you launch an instance with the AMI, you can't modify the attributes on the instance. Instances with NitroTPM do not support the ModifyInstanceAttribute API.
• You can only create an AMI with NitroTPM configured by using the RegisterImage API by using the AWS CLI and not with the Amazon EC2 console.
• NitroTPM is not supported on Outposts.
• NitroTPM is not supported in Local Zones or Wavelength Zones.

Prerequisites for enabling at launch

To launch an instance with NitroTPM enabled, the following prerequisites must be in place.

Linux instances

AMI

  Requires an AMI with NitroTPM enabled.

  Currently, there are no NitroTPM-enabled Amazon Linux AMIs. To use a supported AMI, you must perform a number of configuration steps on your own Linux AMI. For more information, see Create a Linux AMI for NitroTPM support.

Operating system

  The AMI must include an operating system with a TPM 2.0 Command Response Buffer (CRB) driver. Most current operating systems, such as Amazon Linux 2, contain a TPM 2.0 CRB driver.
**UEFI boot mode**

NitroTPM requires that an instance runs in UEFI boot mode, which requires that the AMI must be configured for UEFI boot mode. For more information, see [UEFI Secure Boot](#).

**Windows instances**

**AMI**

Requires an AMI with NitroTPM enabled.

The following Windows AMIs are preconfigured to enable NitroTPM and UEFI Secure Boot with Microsoft keys:

- TPM-Windows_Server-2022-English-Core-Base
- TPM-Windows_Server-2022-English-Full-Base
- TPM-Windows_Server-2022-English-Full-SQL_2022_Enterprise
- TPM-Windows_Server-2019-English-Core-Base
- TPM-Windows_Server-2019-English-Full-Base
- TPM-Windows_Server-2016-English-Core-Base
- TPM-Windows_Server-2016-English-Full-Base

Currently, we do not support importing Windows with NitroTPM by using the `import-image` command.

**Operating system**

The AMI must include an operating system with a TPM 2.0 Command Response Buffer (CRB) driver. Most current operating systems, such as TPM-Windows_Server-2022-English-Full-Base, contain a TPM 2.0 CRB driver.

**UEFI boot mode**

NitroTPM requires that an instance runs in UEFI boot mode, which requires that the AMI must be configured for UEFI boot mode. For more information, see [UEFI Secure Boot](#).

**Instance types**
You must use one of the following virtualized instance types:

- **General purpose:** M5, M5a, M5ad, M5d, M5dn, M5n, M5zn, M6a, M6i, M6id, M6idn, M6in, M7a, M7i, M7i-flex, T3, T3a
- **Compute optimized:** C5, C5a, C5ad, C5d, C5n, C6a, C6i, C6id, C6in, C7a, C7i, C7i-flex
- **Memory optimized:** R5, R5a, R5ad, R5b, R5d, R5dn, R5n, R6a, R6i, R6idn, R6in, R6id, R7a, R7i, R7iz, U7i-12tb, U7in-16tb, U7in-24tb, U7in-32tb, X2idn, X2iedn, X2iezn, z1d
- **Storage optimized:** D3, D3en, I3en, I4i
- **Accelerated computing:** G4dn, G5, G6, Gr6, Inf1, Inf2
- **High-performance computing:** Hpc6a, Hpc6id

**Note**

Graviton-based instances, Xen instances, Mac instances, and bare metal instances aren't supported.

---

**Create a Linux AMI for NitroTPM support**

You configure your Linux AMI for NitroTPM support when you register the AMI. You can’t configure NitroTPM support later.

For the list of Windows AMIs that are preconfigured for NitroTPM support, see [Prerequisites for enabling at launch](#).

**To register a Linux AMI for NitroTPM support**

1. Launch a temporary instance with your required Linux AMI.
2. After the instance reaches the `running` state, create a snapshot of the instance's root volume.
3. Register the new AMI. Use the `register-image` command. For `--tpm-support`, specify `v2.0`. For `--boot-mode`, specify `uefi`. And specify a block device mapping for the root volume using the snapshot you created in the previous step.

```shell
aws ec2 register-image \
  --name my-image \
  --boot-mode uefi \
  --architecture x86_64 \
```
Expected output

```
{
  "ImageId": "ami-0123456789example"
}
```

4. Terminate the temporary instance you launched in step 1, if it is no longer needed.

**Verify whether an AMI is enabled for NitroTPM**

You can use either `describe-images` or `describe-image-attributes` to verify whether an AMI is enabled for NitroTPM.

**To verify whether an AMI is enabled for NitroTPM using `describe-images`**

Use the `describe-images` command and specify the AMI ID.

```
aws ec2 describe-images --image-ids ami-0123456789example
```

If NitroTPM is enabled for the AMI, "TpmSupport": "v2.0" appears in the output.

```
{
  "Images": [
    {
      ...
      "BootMode": "uefi",
      ...
      "TpmSupport": "v2.0"
    }
  ]
}
```

**To verify whether an AMI is enabled for NitroTPM using `describe-image-attribute`**

Use the `describe-image-attribute` command and specify the attribute parameter with the `tpmSupport` value.
You must be the AMI owner to call describe-image-attribute.

```
aws ec2 describe-image-attribute
   --region us-east-1
   --image-id ami-0123456789example
   --attribute tpmSupport
```

If NitroTPM is enabled for the AMI, the value for TpmSupport is "v2.0". Note that describe-image-attribute only returns the attributes that are specified in the request.

```
{
   "ImageId": "ami-0123456789example",
   "TpmSupport": {
      "Value": "v2.0"
   }
}
```

Enable or stop using NitroTPM on an instance

When you launch an instance from an AMI that has NitroTPM support enabled, the instance launches with NitroTPM enabled. You can configure the instance to stop using NitroTPM. You can verify whether an instance is enabled for NitroTPM.

Topics

- Launch an instance with NitroTPM enabled
- Stop using NitroTPM on an instance
- Verify whether NitroTPM is accessible inside the instance

Launch an instance with NitroTPM enabled

When you launch an instance with the prerequisites, NitroTPM is automatically enabled on the instance. You can only enable NitroTPM on an instance at launch. For information about launching an instance, see Launch your instance.
Stop using NitroTPM on an instance

After launching an instance with NitroTPM enabled, you can’t disable NitroTPM for the instance. However, you can configure the operating system to stop using NitroTPM by disabling the TPM 2.0 device driver on the instance by using the following tools:

- [Linux instances] Use tpm-tools.
- [Windows instances] Use the TPM management console, tpm.msc.

For more information about disabling the device driver, see the documentation for your operating system.

Verify whether NitroTPM is accessible inside the instance

To verify whether an instance is enabled for NitroTPM support using the AWS CLI

Use the describe-instances AWS CLI command and specify the instance ID. Currently, the Amazon EC2 console does not display the TpmSupport field.

```bash
aws ec2 describe-instances --instance-ids i-0123456789example
```

If NitroTPM support is enabled on the instance, "TpmSupport": "v2.0" appears in the output.

```
"Instances": {
    "InstanceId": "0123456789example",
    "InstanceType": "c5.large",
    ...
    "BootMode": "uefi",
    "TpmSupport": "v2.0"
    ...
}
```

(Windows instances) To verify whether NitroTPM is accessible inside an Amazon EC2 Windows instance

1. Connect to your EC2 Windows instance.
2. On the instance, run the tpm.msc program.

   The TPM Management on Local Computer window opens.
3. Check the **TPM Manufacturer Information** field. It contains the manufacturer's name and the version of the NitroTPM on the instance.

![TPM Management on Local Computer](image)

**Retrieve the public endorsement key for an instance**

You can securely retrieve the public endorsement key for an instance at any time using the AWS CLI.

**To retrieve the public endorsement key for an instance**

Use the `get-instance-tpm-ek-pub` AWS CLI command.

**Example 1**

The following example command gets the `rsa-2048` public endorsement key in `tpmt` format for instance `i-01234567890abcdef`.

```bash
$ aws ec2 get-instance-tpm-ek-pub \
  --instance-id i-01234567890abcdef \
  --key-format tpmt \
  --key-type rsa-2048
```

The following is the example output.

```json
{

}
```
Example 2

The following example command gets the rsa-2048 public endorsement key in der format for instance i-01234567890abcdef.

```
$ aws ec2 get-instance-tpm-ek-pub
   --instance-id i-01234567890abcdef
   --key-format der
   --key-type rsa-2048
```

The following is the example output.

```
{
   "InstanceId": "i-01234567890abcdef",
   "KeyFormat": "der",
   "KeyType": "rsa-2048",
   "KeyValue": "MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEA6JF3taEXAMPLEG8Rio3hnuMowP+6xuGxBoAHWAoD1Gbo6Fj1MdEXAMPLEyHvMO2GLvSc0a5if/1buqc/md1FxxqRM6I3FPwe9/REXAMPLE0yzinhT7ppTbwxP8lmQ4qxch0x6tjcZ1Zs1DP0EXAMPLERUYLQ/Id/OBU7RBNM1UZ0PGG/G1cI670Zh/Rytu0dx9iEXAMPLEtZ0N2A4pYX1+PMPK01lOgssA5ry03Mc8J3/3aXn0D2/ASRP4gUBKznQLT/zTZEXAMPLEREJUe8Ij2VgKIB/Ep+9gqi8AAQIDAQAB"
}
```

Credential Guard for Windows instances

The AWS Nitro System supports Credential Guard for Amazon Elastic Compute Cloud (Amazon EC2) Windows instances. Credential Guard is a Windows virtualization-based security (VBS) feature that enables the creation of isolated environments to protect security assets, such as Windows user...
credentials and code integrity enforcement, beyond Windows kernel protections. When you run EC2 Windows instances, Credential Guard uses the AWS Nitro System to protect Windows login credentials from being extracted from the operating system's memory.

Contents

- Prerequisites
- Launch a supported instance
- Disable memory integrity
- Turn on Credential Guard
- Verify that Credential Guard is running

Prerequisites

Your Windows instance must meet the following prerequisites to utilize Credential Guard.

Amazon Machine Images (AMIs)

The AMI must be preconfigured to enable NitroTPM and UEFI Secure Boot. For more information on supported AMIs, see the section called “Prerequisites”.

Memory integrity

Memory integrity, also known as hypervisor-protected code integrity (HVCI) or hypervisor enforced code integrity, isn't supported. Before you turn on Credential Guard, you must ensure this feature is disabled. For more information, see Disable memory integrity.

Instance types

The following instance types support Credential Guard across all sizes unless noted otherwise: C5, C5d, C5n, C6i, C6id, C6in, C7i, C7i-f1ex, M5, M5d, M5dn, M5n, M5zn, M6i, M6id, M6idn, M6in, M7i, M7i-f1ex, R5, R5b, R5d, R5dn, R5n, R6i, R6id, R6idn, R6in R7i, R7iz, T3.

Note

- Though NitroTPM has some required instance types in common, the instance type must be one of the preceding instance types to support Credential Guard.
- Credential Guard isn't supported for:
  - Bare metal instances.
The following instance types: C7i.48xlarge, M7i.48xlarge, and R7i.48xlarge.

For more information about instance types, see the Amazon EC2 Instance Types Guide.

Launch a supported instance

You can use the Amazon EC2 console or AWS Command Line Interface (AWS CLI) to launch an instance which can support Credential Guard. You will need a compatible AMI ID for launching your instance which is unique for each AWS Region.

Tip

You can use the following link to discover and launch instances with compatible Amazon provided AMIs in the Amazon EC2 console:
https://console.aws.amazon.com/ec2/v2/home?#Images:visibility=public-images;v=3;search=:TPM-Windows_Server;ownerAlias=amazon

Amazon EC2 console

To launch an instance using the Amazon EC2 console

Follow the steps to launch an instance, specifying a supported instance type and a preconfigured Windows AMI.

AWS CLI

To launch an instance using the AWS CLI

Use the run-instances command to launch an instance using a supported instance type and preconfigured Windows AMI.

aws ec2 run-instances \
  --image-id resolve:ssm:/aws/service/ami-windows-latest/TPM-Windows_Server-2022-English-Full-Base \
  --instance-type c6i.large \
  --region us-east-1 \
  --subnet-id subnet-id
To launch an instance using the AWS Tools for PowerShell

Use the `New-EC2Instance` command to launch an instance using a supported instance type and preconfigured Windows AMI.

```
New-EC2Instance ` `-ImageId resolve:ssm:/aws/service/ami-windows-latest/TPM-Windows_Server-2022-English-Full-Base` `-InstanceType c6i.large` `-Region us-east-1` `-SubnetId subnet-id` `-KeyName key-name`
```

Disable memory integrity

You can use the Local Group Policy Editor to disable memory integrity in supported scenarios. The following guidance can be applied for each configuration setting under **Virtualization Based Protection of Code Integrity**:

- **Enabled without lock** – Modify the setting to **Disabled** to disable memory integrity.
- **Enabled with UEFI lock** – Memory integrity has been enabled with UEFI lock. Memory integrity can't be disabled once it has been enabled with UEFI lock. We recommend creating a new instance with memory integrity disabled and terminating the unsupported instance if it's not in use.

To disable memory integrity with the Local Group Policy Editor

1. Connect to your instance as a user account with administrator privileges using the Remote Desktop Protocol (RDP). For more information, see **the section called “Connect to your Windows instance using an RDP client”**.
2. Open the Start menu and search for `cmd` to start a command prompt.
3. Run the following command to open the Local Group Policy Editor: `gpmmit.msc`
4. In the Local Group Policy Editor, choose **Computer Configuration, Administrative Templates, System, Device Guard**.
5. Select **Turn On Virtualization Based Security**, then select **Edit policy setting**.

6. Open the settings drop-down for **Virtualization Based Protection of Code Integrity**, choose **Disabled**, then choose **Apply**.

7. Reboot the instance to apply the changes.

---

**Turn on Credential Guard**

After you have launched a Windows instance with a supported instance type and compatible AMI, and confirmed that memory integrity is disabled, you can turn on Credential Guard.

---

⚠️ **Important**

Administrator privileges are required to perform the following steps to turn on Credential Guard.

---

**To turn on Credential Guard**

1. Connect to your instance as a user account with administrator privileges using the Remote Desktop Protocol (RDP). For more information, see the [section called “Connect to your Windows instance using an RDP client”](#).

2. Open the Start menu and search for **cmd** to start a command prompt.

3. Run the following command to open the Local Group Policy Editor: `gpedit.msc`

4. In the Local Group Policy Editor, choose **Computer Configuration, Administrative Templates, System, Device Guard**.

5. Select **Turn On Virtualization Based Security**, then select **Edit policy setting**.

6. Choose **Enabled** within the **Turn On Virtualization Based Security** menu.

7. For **Select Platform Security Level**, choose **Secure Boot and DMA Protection**.

8. For **Credential Guard Configuration**, choose **Enabled with UEFI lock**.

---

💡 **Note**

The remaining policy settings are not required to enable Credential Guard and can be left as **Not Configured**.
The following image displays the VBS settings configured as described previously:

9. Reboot the instance to apply the settings.

**Verify that Credential Guard is running**

You can use the Microsoft System Information (Msinfo32.exe) tool to confirm that Credential Guard is running.
Important

You must first reboot the instance to finish applying the policy settings required to enable Credential Guard.

To verify Credential Guard is running

1. Connect to your instance using the Remote Desktop Protocol (RDP). For more information, see the section called “Connect to your Windows instance using an RDP client”.
2. Within the RDP session to your instance, open the Start menu and search for cmd to start a command prompt.
3. Open System Information by running the following command: msinfo32.exe
4. The Microsoft System Information tool lists the details for VBS configuration. Next to Virtualization-based security Services, confirm that Credential Guard appears as Running.

The following image displays VBS is running as described previously:

Access Amazon EC2 using an interface VPC endpoint

You can improve the security posture of your VPC by creating a private connection between your VPC and Amazon EC2. You can access Amazon EC2 as if it were in your VPC, without the use of an internet gateway, NAT device, VPN connection, or AWS Direct Connect connection. Instances in your VPC don't need public IP addresses to access Amazon EC2.

For more information, see Access AWS services through AWS PrivateLink in the AWS PrivateLink Guide.

Contents

- Create an interface VPC endpoint
- Create an endpoint policy
Create an interface VPC endpoint

Create an interface endpoint for Amazon EC2 using the following service name:

- `com.amazonaws.region.ec2` — Creates an endpoint for the Amazon EC2 API actions.

For more information, see [Access an AWS service using an interface VPC endpoint](#) in the [AWS PrivateLink Guide](#).

Create an endpoint policy

An endpoint policy is an IAM resource that you can attach to your interface endpoint. The default endpoint policy allows full access to the Amazon EC2 API through the interface endpoint. To control the access allowed to the Amazon EC2 API from your VPC, attach a custom endpoint policy to the interface endpoint.

An endpoint policy specifies the following information:

- The principals that can perform actions.
- The actions that can be performed.
- The resource on which the actions can be performed.

⚠️ **Important**

When a non-default policy is applied to an interface VPC endpoint for Amazon EC2, certain failed API requests, such as those failing from `RequestLimitExceeded`, might not be logged to AWS CloudTrail or Amazon CloudWatch.

For more information, see [Control access to services using endpoint policies](#) in the [AWS PrivateLink Guide](#).

The following example shows a VPC endpoint policy that denies permission to create unencrypted volumes or to launch instances with unencrypted volumes. The example policy also grants permission to perform all other Amazon EC2 actions.

```json
{
    "Version": "2012-10-17",
```
"Statement": [ 
{
   "Action": "ec2:*",
   "Effect": "Allow",
   "Resource": "*",
   "Principal": "*
},
{
   "Action": [
       "ec2:CreateVolume"
   ],
   "Effect": "Deny",
   "Resource": "*",
   "Principal": "*",
   "Condition": {
       "Bool": {
           "ec2:Encrypted": "false"
       }
   }
},
{
   "Action": [
       "ec2:RunInstances"
   ],
   "Effect": "Deny",
   "Resource": "*",
   "Principal": "*",
   "Condition": {
       "Bool": {
           "ec2:Encrypted": "false"
       }
   }
}]]
Storage options for your Amazon EC2 instances

Amazon EC2 provides you with flexible, cost effective, and easy-to-use data storage options for your instances. Each option has a unique combination of performance and durability. These storage options can be used independently or in combination to suit your requirements.

Block storage

- **Amazon EBS** — Amazon EBS provides durable, block-level storage volumes that you can attach and detach from your instances. You can attach multiple EBS volumes to an instance. An EBS volume persists independently from the life of its associated instance. You can encrypt your EBS volumes. To keep a backup copy of your data, you can create snapshots from your EBS volumes. Snapshots are stored in Amazon S3. You can create an EBS volume from a snapshot.

- **Amazon EC2 instance store temporary block storage for Amazon EC2 instances** — Instance store provides temporary block-level storage for instances. The number, size, and type of instance store volumes are determined by the instance type and instance size. The data on an instance store volume persists only during the life of the associated instance; if you stop, hibernate, or terminate an instance, any data on instance store volumes is lost.

Object storage

- **Amazon S3** — Amazon S3 provides access to reliable and inexpensive data storage infrastructure. It is designed to make web-scale computing easier by enabling you to store and retrieve any amount of data, at any time, from within Amazon EC2 or anywhere on the web. For example, you can use Amazon S3 to store backup copies of your data and applications. Amazon EC2 uses Amazon S3 to store EBS snapshots and instance store-backed AMIs.

File storage

- **Amazon EFS** (Linux instances only) — Amazon EFS provides scalable file storage for use with Amazon EC2. You can create an EFS file system and configure your instances to mount the file system. You can use an EFS file system as a common data source for workloads and applications running on multiple instances.

- **Amazon FSx** — With Amazon FSx, you can launch, run, and scale feature-rich, high-performance file systems in the cloud. Amazon FSx is a fully-managed service that supports a wide range of workloads. You can choose between these widely-used file systems: Lustre, NetApp ONTAP, OpenZFS, and Windows File Server.
File caching

- **Use Amazon File Cache with Amazon EC2 instances** — Amazon File Cache provides temporary, high-performance cache on AWS for processing file data. The cache provides read and write data access to compute workloads on Amazon EC2 with sub-millisecond latencies, up to hundreds of GB/s of throughput, and up to millions of IOPS.

The following figure shows the relationship between these storage options and your instance.

![Diagram showing storage options and their relationship to an instance](image)

Storage pricing

Open [AWS Pricing](https://aws.amazon.com/pricing/?region=us-east-1), scroll to **Pricing for AWS products** and select **Storage**. Choose the storage product to open its pricing page.

Amazon EBS persistent block storage for Amazon EC2 instances

Amazon Elastic Block Store (Amazon EBS) provides scalable, high-performance block storage resources that can be used with Amazon Elastic Compute Cloud (Amazon EC2) instances. With Amazon EBS, you can create and manage the following block storage resources:

- **Amazon EBS volumes** — These are storage volumes that you attach to Amazon EC2 instances. After you attach a volume to an instance, you can use it in the same way you would use block storage. The instance can interact with the volume just as it would with a local drive.
Amazon EBS snapshots — These are point-in-time backups of Amazon EBS volumes that persist independently from the volume itself. You can create snapshots to back up the data on your Amazon EBS volumes. You can then restore new volumes from those snapshots at any time.

You can create and attach Amazon EBS volumes to an instance during launch, and you can create and attach EBS volumes to an instance at any time after launch. And you can create snapshots from a volume at any time after creation.

For more information about working with volumes and snapshots, see the Amazon EBS User Guide.

Amazon EBS volume limits for Amazon EC2 instances

The maximum number of Amazon EBS volumes that you can attach to an instance depends on the instance type and instance size. When considering how many volumes to attach to your instance, you should consider whether you need increased I/O bandwidth or increased storage capacity.

Bandwidth versus capacity

For consistent and predictable bandwidth use cases, use Amazon EBS-optimized instances with General Purpose SSD volumes or Provisioned IOPS SSD volumes. For maximum performance, match the IOPS you have provisioned for your volumes with the bandwidth available for your instance type.

For RAID configurations, you might find that arrays larger than 8 volumes have diminished performance returns due to increased I/O overhead. Test your individual application performance and tune it as required.

- Volume limits for instances built on the Nitro System
- Volume limits for Xen-based instances

Volume limits for instances built on the Nitro System

Topics

- Dedicated Amazon EBS volume limit
- Shared Amazon EBS volume limit
Dedicated Amazon EBS volume limit

The following Nitro instance types have a dedicated Amazon EBS volume limit that varies depending on instance size. The limit is not shared with other device attachments. In other words, you can attach any number of Amazon EBS volumes up to the volume attachment limit, regardless of the number of attached devices, such as NVMe instance store volumes and network interfaces.

- General purpose: M7a, M7i, M7i-flex
- Compute optimized: C7a, C7i, C7i-flex
- Memory optimized: R7a, R7i, R7iz, R8g, U7i
- Accelerated computing: G6, Gr6

For these instance types that support dedicated volume limits, the volume limits depend on the instance size. The following table shows the limit for each instance size.

<table>
<thead>
<tr>
<th>Instance size</th>
<th>Volume limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>medium</td>
<td>large</td>
</tr>
<tr>
<td>2xlarge</td>
<td>4xlarge</td>
</tr>
<tr>
<td>16xlarge</td>
<td>48</td>
</tr>
<tr>
<td>24xlarge</td>
<td>64</td>
</tr>
<tr>
<td>32xlarge</td>
<td>88</td>
</tr>
<tr>
<td>48xlarge</td>
<td>128</td>
</tr>
<tr>
<td>metal-16x1</td>
<td>metal-24x1</td>
</tr>
<tr>
<td>metal-32x1</td>
<td>metal-48x1</td>
</tr>
</tbody>
</table>
Shared Amazon EBS volume limit

All other Nitro instance types (not listed in Dedicated Amazon EBS volume limit) have a volume attachment limit that is shared between Amazon EBS volumes, network interfaces, and NVMe instance store volumes. You can attach any number of Amazon EBS volumes up to that limit, less the number of attached network interfaces and NVMe instance store volumes. Keep in mind that every instance must have at least one network interface, and that NVMe instance store volumes are automatically attached at launch.

Most of these instances support a maximum of 28 attachments. For example, if you have no additional network interface attachments on an m5.xlarge instance, you can attach up to 27 EBS volumes (28 volume limit - 1 network interface). If you have two additional network interfaces on an m5.xlarge instance, you can attach up to 25 EBS volumes (28 volume limit - 3 network interfaces). Similarly, if you have two additional network interfaces on an m5d.xlarge instance, which has 1 NVMe instance store volume, you can attach up to 24 EBS volumes (28 volume limit - 3 network interfaces - 1 NVMe instance store volume).

The following exceptions for instance types that have shared volume limits:

- DL2q instances support a maximum of 19 EBS volumes.
- Most bare metal instances support a maximum of 31 EBS volumes.
- U-\*tb1 virtualized instances support a maximum of 27 EBS volumes.
- U-\*tb1 bare metal instances support a maximum of 19 EBS volumes.
- inf1.xlarge and inf1.2xlarge instances support a maximum of 26 EBS volumes.
- inf1.6xlarge instances support a maximum of 23 EBS volumes.
- mac1.metal instances support a maximum of 16 EBS volumes.
- Mac2, Mac2-m2, Mac2-m2pro, and Mac2-m1ultra instances support a maximum of 10 EBS volumes.
- inf1.24xlarge instances support a maximum of 11 EBS volumes.
- g5.48xlarge instances support a maximum of 9 EBS volumes.
- d3.8xlarge and d3en.12xlarge instances support a maximum of 3 EBS volumes.
- For accelerated computing instances, the attached accelerators count towards the shared volume limit. For example, for p4d.24xlarge instances, which have a shared volume limit of 28, 8 GPUs, and 8 NVMe instance store volumes, you can attach up to 11 Amazon EBS volumes (28 volume limit - 1 network interface - 8 GPUs - 8 NVMe instance store volumes).
Volume limits for Xen-based instances

Linux instances

Attaching more than 40 volumes to a Xen-based Linux instance can cause boot failures. This number includes the root volume, plus any attached instance store volumes and Amazon EBS volumes.

If you experience boot problems on an instance with a large number of volumes, stop the instance, detach any volumes that are not essential to the boot process, start the instance, and then reattach the volumes after the instance is running.

⚠️ Important

Attaching more than 40 volumes to a Xen-based Linux instance is supported on a best effort basis only and is not guaranteed.

Windows instances

The following table shows the volume limits for Xen-based Windows instances based on the driver used. That these numbers include the root volume, plus any attached instance store volumes and Amazon EBS volumes.

⚠️ Important

Attaching more than the following number of volumes to a Xen-based Windows instance is supported on a best effort basis only and is not guaranteed.

<table>
<thead>
<tr>
<th>Driver</th>
<th>Volume Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWS PV</td>
<td>26</td>
</tr>
<tr>
<td>Citrix PV</td>
<td>26</td>
</tr>
<tr>
<td>Red Hat PV</td>
<td>17</td>
</tr>
</tbody>
</table>

EBS volume limits
We recommend that you do not attach more than 26 volumes to a Xen-based Windows instance with AWS PV or Citrix PV drivers, as it is likely to cause performance issues. To determine which PV drivers your instance is using, or to upgrade your Windows instance from Red Hat to Citrix PV drivers, see the section called “Upgrade PV drivers”.

For more information about how device names are related to volumes, see Map disks to Amazon EBS and instance store volumes on your Amazon EC2 Windows instance.

Amazon EC2 instance store temporary block storage for Amazon EC2 instances

An instance store provides temporary block-level storage for your instance. This storage is located on disks that are physically attached to the host computer. Instance store is ideal for temporary storage of information that changes frequently, such as buffers, caches, scratch data, and other temporary content. It can also be used to store temporary data that you replicate across a fleet of instances, such as a load-balanced pool of web servers.

An instance store consists of one or more instance store volumes exposed as block devices. The size of an instance store as well as the number of devices available varies by instance type and instance size. For more information, see Instance store volume limits for Amazon EC2 instances.

The virtual devices for instance store volumes are ephemeral\[0-23]. Instance types that support one instance store volume have ephemeral0. Instance types that support two or more instance store volumes have ephemeral0, ephemeral1, and so on.
Instance store pricing

Instance store volumes are included as part of the instance's usage cost.

Contents

- Data persistence for Amazon EC2 instance store volumes
- Instance store volume limits for Amazon EC2 instances
- SSD instance store volumes for Amazon EC2 instances
- Add instance store volumes to an Amazon EC2 instance
- Use instance store swap volumes for Linux instances that have limited physical memory
- Initialize instance store volumes on Linux instances to optimize disk performance

Data persistence for Amazon EC2 instance store volumes

Instance store volumes are attached only at instance launch. You can't attach instance store volumes after launch. You can't detach an instance store volume from one instance and attach it to a different instance.

An instance store volume exists only during the lifetime of the instance to which it is attached. You can't configure an instance store volume to persist beyond the lifetime of its associated instance.
The data on an instance store volume persists even if the instance is rebooted. However, the data does not persist if the instance is stopped, hibernated, or terminated. When the instance is stopped, hibernated, or terminated, every block of the instance store volume is cryptographically erased.

Therefore, do not rely on instance store volumes for valuable, long-term data. If you need to retain the data stored on an instance store volume beyond the lifetime of the instance, you need to manually copy that data to more persistent storage, such as an Amazon EBS volume, an Amazon S3 bucket, or an Amazon EFS file system.

There are some events that can result in your data not persisting throughout the lifetime of the instance. The following table indicates whether data on instance store volumes is persisted during specific events, for both virtualized and bare metal instances.

<table>
<thead>
<tr>
<th>Event</th>
<th>What happens to your data?</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>User-initiated instance lifecycle events</strong></td>
<td></td>

<td>The data persists upon reboot</td>
</tr>
</tbody>
</table>

* If the new instance type supports instance store, the instance gets the number of instance store volumes supported by the new instance type, but the data does not transfer to the new instance. If the new instance type does not support instance store, the instance does not get the instance store volumes.

** The data is not included in the EBS-backed AMI, and it is not included on instance store volumes attached to instances launched from that AMI.

*** The data is included in the AMI bundle that is uploaded to Amazon S3. When you launch an instance from that AMI, the instance gets the instance store volumes bundled in the AMI with the data they contained at the time the AMI was created.

† Termination protection and stop protection do not protect instances against instance stops or terminations as a result of shutdowns initiated through the operating system on the instance. Data stored on instance store volumes does not persist in both instance stop and termination events.

### Instance store volume limits for Amazon EC2 instances

The number, size, and type of instance store volumes are determined by the instance type. Some instance types, such as M6, C6, and R6, do not support instance store volumes, while other instance
types, such as M5d, C6gd, and R6gd, do support instance store volumes. You can't attach more instance store volumes to an instance than is supported by its instance type. For the instance types that do support instance store volumes, the number and size of the instance store volumes vary by instance size. For example, m5d.1xlarge supports 1 x 75 GB instance store volume, while m5d.24xlarge supports 4 x 900 GB instance store volumes.

For instance types with **NVMe instance store volumes**, all of the supported instance store volumes are automatically attached to the instance at launch. For instance types with **non-NVMe instance store volumes**, such as C1, C3, M1, M2, M3, R3, D2, H1, I2, X1, and X1e, you must manually specify the block device mappings for the instance store volumes that you want to attach at launch. Then, after the instance has launched, you must **format and mount the attached instance store volumes** before you can use them. You can't attach an instance store volume after you launch the instance.

Some instance types use NVMe or SATA-based solid state drives (SSD), while others use SATA-based hard disk drives (HDD). SSDs deliver high random I/O performance with very low latency, but you don't need the data to persist when the instance terminates or you can take advantage of fault-tolerant architectures. For more information, see **SSD instance store volumes for Amazon EC2 instances**.

The data on NVMe instance store volumes and some HDD instance store volumes is encrypted at rest. For more information, see **Data protection in Amazon EC2**.

**Available instance store volumes**

The *Amazon EC2 Instance Types Guide* provides the quantity, size, type, and performance optimizations of instance store volumes available on each supported instance type. For more information, see the following:

- **Instance store specifications – General purpose**
- **Instance store specifications – Compute optimized**
- **Instance store specifications – Memory optimized**
- **Instance store specifications – Storage optimized**
- **Instance store specifications – Accelerated computing**
- **Instance store specifications – High-performance computing**
- **Instance store specifications – Previous generation**

**To retrieve instance store volume information using the AWS CLI**
You can use the `describe-instance-types` AWS CLI command to display information about an instance type, such as its instance store volumes. The following example displays the total size of instance storage for all R5 instances with instance store volumes.

```bash
aws ec2 describe-instance-types \
  --filters "Name=instance-type,Values=r5*" "Name=instance-storage-supported,Values=true" \
  --query "InstanceTypes[].[InstanceType, InstanceStorageInfo.TotalSizeInGB]" \
  --output table
```

**Example output**

```
----------------------------------------
<table>
<thead>
<tr>
<th>DescribeInstanceTypes</th>
</tr>
</thead>
</table>
+-----------------------+
| r5ad.24xlarge | 3600 |
| r5ad.12xlarge | 1800 |
| r5dn.8xlarge | 1200 |
| r5ad.8xlarge | 1200 |
| r5ad.large | 75 |
| r5d.4xlarge | 600 |
  . . .
| r5dn.2xlarge | 300 |
| r5d.12xlarge | 1800 |
+-----------------------+
```

The following example displays the complete instance storage details for the specified instance type.

```bash
aws ec2 describe-instance-types \
  --filters "Name=instance-type,Values=r5d.4xlarge" \
  --query "InstanceTypes[].InstanceStorageInfo"
```

The example output shows that this instance type has two 300 GB NVMe SSD volumes, for a total of 600 GB of instance storage.

```json
[
  {
    "TotalSizeInGB": 600,
    "Disks": [
```
SSD instance store volumes for Amazon EC2 instances

Like other instance store volumes, you must map the SSD instance store volumes for your instance when you launch it. The data on an SSD instance volume persists only for the life of its associated instance. For more information, see Add instance store volumes to an Amazon EC2 instance.

NVMe SSD volumes

Some instances offer non-volatile memory express (NVMe) solid state drives (SSD) instance store volumes. For more information about the type of instance store volume supported by each instance type, see Instance store volume limits for Amazon EC2 instances.

The data on NVMe instance storage is encrypted using an XTS-AES-256 block cipher implemented in a hardware module on the instance. The encryption keys are generated using the hardware module and are unique to each NVMe instance storage device. All encryption keys are destroyed when the instance is stopped or terminated and cannot be recovered. You cannot disable this encryption and you cannot provide your own encryption key.

Linux instances

To access NVMe volumes, the NVMe drivers must be installed. The following AMIs meet this requirement:

- AL2023
- Amazon Linux 2
- Amazon Linux AMI 2018.03 and later
- Ubuntu 14.04 or later with linux-aws kernel
Note

AWS Graviton-based instance types require Ubuntu 18.04 or later with `linux-aws` kernel

- Red Hat Enterprise Linux 7.4 or later
- SUSE Linux Enterprise Server 12 SP2 or later
- CentOS 7.4.1708 or later
- FreeBSD 11.1 or later
- Debian GNU/Linux 9 or later

- Bottlerocket

After you connect to your instance, you can list the NVMe devices using the `lspci` command. The following is example output for an `i3.8xlarge` instance, which supports four NVMe devices.

```
[ec2-user ~]$ lspci
00:00.0 Host bridge: Intel Corporation 440FX - 82441FX PMC [Natoma] (rev 02)
00:01.0 ISA bridge: Intel Corporation 82371SB PIIX3 ISA [Natoma/Triton II]
00:01.1 IDE interface: Intel Corporation 82371SB PIIX3 IDE [Natoma/Triton II]
00:01.3 Bridge: Intel Corporation 82371AB/EB/MB PIIX4 ACPI (rev 01)

00:1a.0 Non-Volatile memory controller: Device 1d0f:cd01
00:1f.0 Unassigned class [ff80]: XenSource, Inc. Xen Platform Device (rev 01)
```

If you are using a supported operating system but you do not see the NVMe devices, verify that the NVMe module is loaded using the following command.

```
Amazon Linux, Amazon Linux 2, Ubuntu 14/16, Red Hat Enterprise Linux, SUSE Linux Enterprise Server, CentOS 7
```

```
$ lsmod | grep nvme
nvme        48813    0
```

SSD instance store volumes
Ubuntu 18

```
$ cat /lib/modules/$(uname -r)/modules.builtin | grep nvme
s/nvme/host/nvme-core.ko
kernel/drivers/nvme/host/nvme.ko
kernel/drivers/nvmem/nvmem_core.ko
```

The NVMe volumes are compliant with the NVMe 1.0e specification. You can use the NVMe commands with your NVMe volumes. With Amazon Linux, you can install the `nvme-cli` package from the repo using the `yum install` command. With other supported versions of Linux, you can download the `nvme-cli` package if it's not available in the image.

**Windows instances**

The latest AWS Windows AMIs for the following operating systems contain the AWS NVMe drivers used to interact with SSD instance store volumes that are exposed as NVMe block devices for better performance:

- Windows Server 2022
- Windows Server 2019
- Windows Server 2016
- Windows Server 2012 R2

After you connect to your instance, you can verify that you see the NVMe volumes in Disk Manager. On the taskbar, open the context (right-click) menu for the Windows logo and choose **Disk Management**.

The AWS Windows AMIs provided by Amazon include the AWS NVMe driver. If you are not using the latest AWS Windows AMIs, you can install the current AWS NVMe driver.

**Non-NVMe SSD volumes**

The following instances support instance store volumes that use non-NVMe SSDs to deliver high random I/O performance: C3, I2, M3, R3, and X1. For more information about the instance store volumes supported by each instance type, see [Instance store volume limits for Amazon EC2 instances](#).
SSD-based instance store volume I/O performance

As you fill the SSD-based instance store volumes for your instance, the number of write IOPS that you can achieve decreases. This is due to the extra work the SSD controller must do to find available space, rewrite existing data, and erase unused space so that it can be rewritten. This process of garbage collection results in internal write amplification to the SSD, expressed as the ratio of SSD write operations to user write operations. This decrease in performance is even larger if the write operations are not in multiples of 4,096 bytes or not aligned to a 4,096-byte boundary. If you write a smaller amount of bytes or bytes that are not aligned, the SSD controller must read the surrounding data and store the result in a new location. This pattern results in significantly increased write amplification, increased latency, and dramatically reduced I/O performance.

SSD controllers can use several strategies to reduce the impact of write amplification. One such strategy is to reserve space in the SSD instance storage so that the controller can more efficiently manage the space available for write operations. This is called over-provisioning. The SSD-based instance store volumes provided to an instance do not have any space reserved for over-provisioning. To reduce write amplification, we recommend that you leave 10 percent of the volume unpartitioned so that the SSD controller can use it for over-provisioning. This decreases the storage that you can use, but increases performance even if the disk is close to full capacity.

For instance store volumes that support TRIM, you can use the TRIM command to notify the SSD controller whenever you no longer need data that you have written. This provides the controller with more free space, which can reduce write amplification and increase performance. For more information, see Instance store volume TRIM support.

Instance store volume TRIM support

Some instance types support SSD volumes with TRIM. For more information, see Instance store volume limits for Amazon EC2 instances.

ℹ️ Note

(Windows instances only) Instances running Windows Server 2012 R2 support TRIM as of AWS PV Driver version 7.3.0. Instances running earlier versions of Windows Server do not support TRIM.

Instance store volumes that support TRIM are fully trimmed before they are allocated to your instance. These volumes are not formatted with a file system when an instance launches, so you
must format them before they can be mounted and used. For faster access to these volumes, you should skip the TRIM operation when you format them.

(Windows instances) To temporarily disable TRIM support during initial formatting, use the `fsutil` behavior set DisableDeleteNotify 1 command. After formatting is complete, re-enable TRIM support by using `fsutil` behavior set DisableDeleteNotify 0.

With instance store volumes that support TRIM, you can use the TRIM command to notify the SSD controller when you no longer need data that you’ve written. This provides the controller with more free space, which can reduce write amplification and increase performance. On Linux instances, use the `fstrim` command to enable periodic TRIM. On Windows instances, use the `fsutil` behavior set DisableDeleteNotify 0 command to ensure TRIM support is enabled during normal operation.

**Add instance store volumes to an Amazon EC2 instance**

For instance types with **NVMe instance store volumes**, all of the supported instance store volumes are automatically attached to the instance at launch. They are automatically enumerated and assigned a device name on instance launch.

For instance types with **non-NVMe instance store volumes**, such as C1, C3, M1, M2, M3, R3, D2, H1, I2, X1, and X1e, you must manually specify the block device mappings for the instance store volumes that you want to attach at launch. Block device mappings can be specified in the instance launch request or in the AMI used to launch the instance. The block device mapping includes a device name and the volume that it maps to. For more information, see [Block device mappings for Amazon EBS and instance store volumes on Amazon EC2 instances](#)

⚠️ **Important**

Instance store volumes can be attached to an instance only when you launch it. You can’t attach instance store volumes to an instance after you’ve launched it.

After you launch an instance, you must ensure that the instance store volumes for your instance are formatted and mounted before you can use them. The root volume of an instance store-backed instance is mounted automatically.

**Consideration for root volumes**
A block device mapping always specifies the root volume for the instance. The root volume is always mounted automatically.

**Linux instances** – The root volume is either an Amazon EBS volume or an instance store volume. For instances with an instance store volume for the root volume, the size of this volume varies by AMI, but the maximum size is 10 GB. For more information, see [Storage for the root device](#).

**Windows instances** – The root volume must be an Amazon EBS volume. Instance store is not supported for the root volume.

### Contents

- [Add instance store volumes to an AMI](#)
- [Add non-NVME instance store volumes to an instance](#)
- [Make instance store volumes available on your instance](#)

#### Add instance store volumes to an AMI

You can create an AMI with a block device mapping that includes instance store volumes.

If you launch an instance that supports **non-NVMe instance store volumes** using an AMI that specifies instance store volume block device mappings, the instance includes the instance store volumes. If the number of instance store volume block device mappings in the AMI exceeds the number of instance store volumes available to the instance, the additional instance store volume block device mappings are ignored.

If you launch an instance that supports **NVMe instance store volumes** using an AMI that specifies instance store volume block device mappings, the instance store volume block device mappings are ignored. Instances that support NVMe instance store volumes get all of their supported instance store volumes, regardless of the block device mappings specified in the instance launch request and the AMI.

#### Considerations

- For M3 instances, specify instance store volumes in the block device mapping of the instance, not the AMI. Amazon EC2 might ignore instance store volume block device mappings in the AMI.
- When you launch an instance, you can omit non-NVMe instance store volumes specified in the AMI block device mapping or add instance store volumes.
To add instance store volumes to an Amazon EBS-backed AMI using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances and select the instance.
3. Choose Actions, Image and templates, Create image.
4. On the Create image page, enter a meaningful name and description for your image.
5. For each instance store volume to add, choose Add volume, from Volume type select an instance store volume, and from Device select a device name. (For more information, see Device names for Amazon EBS and instance store volumes on Amazon EC2 instances.) The number of available instance store volumes depends on the instance type. For instances with NVMe instance store volumes, the device mapping of these volumes depends on the order in which the operating system enumerates the volumes.
6. Choose Create image.

AWS CLI

To add instance store volumes to an AMI using the command line

You can use one of the following commands. For more information about these command line interfaces, see Access Amazon EC2.

- create-image or register-image (AWS CLI)
- New-EC2Image and Register-EC2Image (AWS Tools for Windows PowerShell)

Add non-NVME instance store volumes to an instance

When you launch an instance that supports non-NVMe instance store volumes you must specify block device mappings for the instance store volumes to attach. The block device mappings must be specified in the instance launch request or in the AMI used to launch the instance.

If the AMI includes block device mappings for the instance store volumes, you do not need to specify block device mappings in the instance launch request, unless you need more instance store volumes than is included in the AMI.

If the AMI does not include block device mappings for instance store volumes, then you must specify the block device mappings in the instance launch request.
Considerations

- For M3 instances, you might receive instance store volumes even if you do not specify them in the block device mapping for the instance.

To specify block device mappings in the instance launch request, use one of the following methods.

Amazon EC2 console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. From the dashboard, choose Launch instance.
3. In the Application and OS Images section, select the AMI to use.
4. In the Configure storage section, the Instance store volumes section lists the instance store volumes that can be attached to the instance. The number of available instance store volumes depends on the instance type.
5. For each instance store volume to attach, for Device name, select the device name to use.
6. Configure the remaining instance settings as needed, and then choose Launch instance.

Command line

You can use one of the following options commands with the corresponding option.

- --block-device-mappings with run-instances (AWS CLI)
- -BlockDeviceMapping with New-EC2Instance (AWS Tools for Windows PowerShell)

Make instance store volumes available on your instance

After you launch an instance with attached instance store volumes, you must mount the volumes before you can access them.

Linux instances

You can format volumes with the file system of your choice after you launch your instance.

You can view and mount the instance store volumes as described in the following procedure.
To make an instance store volume available on Linux

1. Connect to the instance using an SSH client. For more information, see Connect to your Linux instance.

2. Use the `df -h` command to view the volumes that are formatted and mounted.

```bash
$ df -h
Filesystem      Size  Used  Avail  Use%  Mounted on
/devtmpfs        3.8G   72K   3.8G   1%   /dev
/tmpfs           3.8G     0   3.8G   0%   /dev/shm
/dev/nvme0n1p1  7.9G  1.2G   6.6G  15%   /
```

3. Use the `lsblk` to view any volumes that were mapped at launch but not formatted and mounted.

```bash
$ lsblk
NAME          MAJ:MIN   RM  SIZE RO TYPE MOUNTPOINT
nvme0n1       259:1    0    8G 0  disk   
##nvme0n1p1   259:2    0    8G 0  part  /
##nvme0n1p128 259:3    0    1M 0  part  
nvme1n1       259:0    0  69.9G 0  disk  
```

4. To format and mount an instance store volume that was mapped only, do the following:
   a. Create a file system on the device using the `mkfs` command.

```bash
$ sudo mkfs -t xfs /dev/nvme1n1
```

   b. Create a directory on which to mount the device using the `mkdir` command.

```bash
$ sudo mkdir /data
```

   c. Mount the device on the newly created directory using the `mount` command.

```bash
$ sudo mount /dev/nvme1n1 /data
```

Windows instances

For Windows instances, we reformat the instance store volumes with the NTFS file system.
You can view the instance store volumes using Windows Disk Management. For more information, see List disks using Disk Management.

To manually mount an instance store volume

1. Choose Start, enter Computer Management, and then press Enter.
2. In left-hand panel, choose Disk Management.
3. If you are prompted to initialize the volume, choose the volume to initialize, select the required partition type depending on your use case, and then choose OK.
4. In the list of volumes, right-click the volume to mount, and then choose New Simple Volume.
5. On the wizard, choose Next.
6. On the Specify Volume Size screen, choose Next to use the maximum volume size. Alternatively, choose a volume size that is between the minimum and maximum disk space.
7. On the Assign a Drive Letter or Path screen, do one of the following, and choose Next.
   - To mount the volume with a drive letter, choose Assign the following drive letter and then choose the drive letter to use.
   - To mount the volume as a folder, choose Mount in the following empty NTFS folder and then choose Browse to create or select the folder to use.
   - To mount the volume without a drive letter or path, choose Do not assign a drive letter or drive path.
8. On the Format Partition screen, specify whether or not to format the volume. If you choose to format the volume, choose the required file system and unit size, and specify a volume label.

For instructions on how to mount an attached volume automatically after reboot, see Automatically mount an attached volume after reboot in the Amazon EBS User Guide.

Use instance store swap volumes for Linux instances that have limited physical memory

Note
This topic applies to Linux instances only.
Swap space in Linux can be used when a system requires more memory than it has been physically allocated. When swap space is enabled, Linux systems can swap infrequently used memory pages from physical memory to swap space (either a dedicated partition or a swap file in an existing file system) and free up that space for memory pages that require high-speed access.

**Note**

Using swap space for memory paging is not as fast or efficient as using RAM. If your workload is regularly paging memory into swap space, you should consider migrating to a larger instance type with more RAM. For more information, see [Change the instance type](#).

The `c1.medium` and `m1.small` instance types have a limited amount of physical memory to work with, and they are given a 900 MiB swap volume at launch time to act as virtual memory for Linux AMIs. Although the Linux kernel sees this swap space as a partition on the root device, it is actually a separate instance store volume, regardless of your root device type.

Amazon Linux automatically enables and uses this swap space, but your AMI may require some additional steps to recognize and use this swap space. To see if your instance is using swap space, you can use the `swapon -s` command.

```
[ec2-user ~]$ swapon -s
Filename                                Type          Size  Used  Priority
/dev/xvda3                              partition     917500  0      -1
```

The above instance has a 900 MiB swap volume attached and enabled. If you don't see a swap volume listed with this command, you may need to enable swap space for the device. Check your available disks using the `lsblk` command.

```
[ec2-user ~]$ lsblk
NAME  MAJ:MIN   RM  SIZE RO TYPE MOUNTPOINT
xvda1 202:1    0   8G  0 disk /
xvda3 202:3    0 896M  0 disk
```

Here, the swap volume `xvda3` is available to the instance, but it is not enabled (notice that the `MOUNTPOINT` field is empty). You can enable the swap volume with the `swapon` command.
Note

You must prepend /dev/ to the device name listed by lsblk. Your device may be named differently, such as sda3, sde3, or xvde3. Use the device name for your system in the command below.

[ec2-user ~]$ sudo swapon /dev/xvda3

Now the swap space should show up in lsblk and swapon -s output.

[ec2-user ~]$ lsblk
NAME   MAJ:MIN  RM  SIZE  RO TYPE MOUNTPOINT
xvda1  202:1    0   8G   0  disk  /
xvda3  202:3    0  896M  0  disk  [SWAP]
[ec2-user ~]$ swapon -s
Filename                Type      Size  Used Priority
/dev/xvda3              partition  917500 0       -1

You also need to edit your /etc/fstab file so that this swap space is automatically enabled at every system boot.

[ec2-user ~]$ sudo vim /etc/fstab

Append the following line to your /etc/fstab file (using the swap device name for your system):

/dev/xvda3 none swap sw 0 0

To use an instance store volume as swap space

Any instance store volume can be used as swap space. For example, the m3.medium instance type includes a 4 GB SSD instance store volume that is appropriate for swap space. If your instance store volume is much larger (for example, 350 GB), you may consider partitioning the volume with a smaller swap partition of 4-8 GB and the rest for a data volume.
**Note**

This procedure applies only to instance types that support instance storage. For a list of supported instance types, see Instance store volume limits for Amazon EC2 instances.

1. List the block devices attached to your instance to get the device name for your instance store volume.

   ```bash
   [ec2-user ~]$ lsblk -p
   NAME       MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
   /dev/xvdb  202:16   0   4G  0 disk /media/ephemeral0
   /dev/xvda1 202:1    0   8G  0 disk /
   ```

   In this example, the instance store volume is /dev/xvdb. Because this is an Amazon Linux instance, the instance store volume is formatted and mounted at /media/ephemeral0; not all Linux operating systems do this automatically.

2. (Optional) If your instance store volume is mounted (it lists a MOUNTPOINT in the `lsblk` command output), unmount it with the following command.

   ```bash
   [ec2-user ~]$ sudo umount /dev/xvdb
   ```

3. Set up a Linux swap area on the device with the `mkswap` command.

   ```bash
   [ec2-user ~]$ sudo mkswap /dev/xvdb
   mkswap: /dev/xvdb: warning: wiping old ext3 signature.
   Setting up swapspace version 1, size = 4188668 KiB
   no label, UUID=b4f63d28-67ed-46f0-b5e5-6928319e620b
   ```

4. Enable the new swap space.

   ```bash
   [ec2-user ~]$ sudo swapon /dev/xvdb
   ```

5. Verify that the new swap space is being used.

   ```bash
   [ec2-user ~]$ swapon -s
   Filename  Type    Size  Used  Priority
   /dev/xvdb  partition 4188668 0 -1
   ```
6. Edit your /etc/fstab file so that this swap space is automatically enabled at every system boot.

```
[ec2-user ~]$ sudo vim /etc/fstab
```

If your /etc/fstab file has an entry for /dev/xvdb (or /dev/sdb) change it to match the line below; if it does not have an entry for this device, append the following line to your /etc/fstab file (using the swap device name for your system):

```
/dev/xvdb none swap sw 0 0
```

**Important**

Instance store volume data is lost when an instance is stopped or hibernated; this includes the instance store swap space formatting created in Step 3. If you stop and restart an instance that has been configured to use instance store swap space, you must repeat Step 1 through Step 5 on the new instance store volume.

### Initialize instance store volumes on Linux instances to optimize disk performance

**Note**

This topic applies to Linux instances only.

Because of the way that Amazon EC2 virtualizes disks, the first write to any location on some instance store volumes performs more slowly than subsequent writes. For most applications, amortizing this cost over the lifetime of the instance is acceptable. However, if you require high disk performance, we recommend that you initialize your drives by writing once to every drive location before production use.

**Note**

Some instance types with direct-attached solid state drives (SSD) and TRIM support provide maximum performance at launch time, without initialization. For information about the
instance store for each instance type, see Instance store volume limits for Amazon EC2 instances.

If you require greater flexibility in latency or throughput, we recommend using Amazon EBS.

To initialize the instance store volumes, use the following dd commands, depending on the store to initialize (for example, /dev/sdb or /dev/nvme1n1).

**Note**

Make sure to unmount the drive before performing this command.
Initialization can take a long time (about 8 hours for an extra large instance).

To initialize the instance store volumes, use the following commands on the m1.large, m1.xlarge, c1.xlarge, m2.xlarge, m2.2xlarge, and m2.4xlarge instance types:

```
dd if=/dev/zero of=/dev/sdb bs=1M
dd if=/dev/zero of=/dev/sdc bs=1M
dd if=/dev/zero of=/dev/sdd bs=1M
dd if=/dev/zero of=/dev/sde bs=1M
```

To perform initialization on all instance store volumes at the same time, use the following command:

```
dd if=/dev/zero bs=1M|tee /dev/sdb|tee /dev/sdc|tee /dev/sde > /dev/sdd
```

Configuring drives for RAID initializes them by writing to every drive location. When configuring software-based RAID, make sure to change the minimum reconstruction speed:

```
echo $((30*1024)) > /proc/sys/dev/raid/speed_limit_min
```

**Root volumes for your Amazon EC2 instances**

When you launch an instance, we create a *root volume* for the instance. The root volume contains the image used to boot the instance. Each instance has a single root volume. You can add storage volumes to your instances during or after launch.
The AMI that you use to launch an instance determines the type of root volume. You can launch an instance from either an Amazon EBS-backed AMI (Linux and Windows instances) or an instance store-backed AMI (Linux instances only). There are significant differences between what you can do with each type of AMI. For more information about these differences, see Storage for the root device.

We recommend that you use AMIs backed by Amazon EBS, because these instances launch faster and use persistent storage.

We reserve specific device names for root volumes. For more information, see Device names for Amazon EBS and instance store volumes on Amazon EC2 instances.

Contents
- Amazon EBS-backed instances
- Instance store-backed instances (Linux instances only)
- Configure an Amazon EBS root volume to persist after terminating an Amazon EC2 instance
- Replace the root volume for an Amazon EC2 instance without stopping it

Amazon EBS-backed instances

Instances that use Amazon EBS for the root volume automatically have an Amazon EBS volume attached. When you launch an Amazon EBS-backed instance, we create an Amazon EBS volume for each Amazon EBS snapshot referenced by the AMI you use. You can optionally use other Amazon EBS volumes or instance store volumes, depending on the instance type.

An Amazon EBS-backed instance can be stopped and later restarted without affecting data stored in the attached volumes. There are various instance– and volume-related tasks you can do when an Amazon EBS-backed instance is in a stopped state. For example, you can modify the properties of the instance, change its size, or update the kernel it is using, or you can attach your root volume to a different running instance for debugging or any other purpose. For more information, see Amazon EBS volumes.
Limitation

You can't use st1 or sc1 EBS volumes as root volumes.

Instance failure

If an Amazon EBS-backed instance fails, you can restore your session by following one of these methods:

• Stop and then start again (try this method first).
• Automatically snapshot all relevant volumes and create a new AMI. For more information, see Create an Amazon EBS-backed AMI.
• Attach the volume to the new instance by following these steps:
  1. Create a snapshot of the root volume.
  2. Register a new AMI using the snapshot.
  3. Launch a new instance from the new AMI.
  4. Detach the remaining Amazon EBS volumes from the old instance.
  5. Reattach the Amazon EBS volumes to the new instance.
Instance store-backed instances (Linux instances only)

Note
Windows instances do not support instance-store backed root volumes.

Instances that use instance stores for the root volume automatically have one or more instance store volumes available, with one volume serving as the root volume. When an instance is launched, the image that is used to boot the instance is copied to the root volume. Note that you can optionally use additional instance store volumes, depending on the instance type.

Any data on the instance store volumes persists as long as the instance is running, but this data is deleted when the instance is terminated (instance store-backed instances do not support the Stop action) or if it fails (such as if an underlying drive has issues). For more information, see Amazon EC2 instance store temporary block storage for Amazon EC2 instances.

Supported instance types

Only the following instance types support an instance store volume as the root volume: C3, D2, I2, M3, and R3.

Instance failure
After an instance store-backed instance fails or terminates, it cannot be restored. If you plan to use Amazon EC2 instance store-backed instances, we highly recommend that you distribute the data on your instance stores across multiple Availability Zones. You should also back up critical data from your instance store volumes to persistent storage on a regular basis.

**Configure an Amazon EBS root volume to persist after terminating an Amazon EC2 instance**

By default, the Amazon EBS root volume for an instance is deleted when the instance terminates. You can change the default behavior to ensure that an Amazon EBS root volume persists after the instance terminates. To change the default behavior, set the `DeleteOnTermination` attribute to `false`. You can do so either at instance launch or later on.

**Tasks**

- Configure the root volume to persist during instance launch
- Configure the root volume to persist for an existing instance
- Confirm that a root volume is configured to persist

**Configure the root volume to persist during instance launch**

You can configure the root volume to persist when you launch an instance.

**Console**

**To configure the root volume to persist when you launch an instance using the console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Instances and then choose Launch instances.
3. Choose an Amazon Machine Image (AMI), choose and instance type, choose a key pair, and configure your network settings.
4. For Configure storage, choose Advanced.
5. Expand the root volume.
6. For Delete on termination, choose No.
7. When you are finished configuring your instance, choose Launch instance.
AWS CLI

To configure the root volume to persist when you launch an instance using the AWS CLI

Use the `run-instances` command and include a block device mapping that sets the `DeleteOnTermination` attribute to false.

```
aws ec2 run-instances --block-device-mappings file://mapping.json ...other parameters...
```

Specify the following in `mapping.json`.

```
[
  {
    "DeviceName": "/dev/sda1",
    "Ebs": {
      "DeleteOnTermination": false
    }
  }
]
```

Tools for Windows PowerShell

To configure the root volume to persist when you launch an instance using the Tools for Windows PowerShell

Use the `New-EC2Instance` command and include a block device mapping that sets the `DeleteOnTermination` attribute to false.

```
C:\> $ebs = New-Object Amazon.EC2.Model.EbsBlockDevice
C:\> $ebs.DeleteOnTermination = $false
C:\> $bdm = New-Object Amazon.EC2.Model.BlockDeviceMapping
C:\> $bdm.DeviceName = "dev/xvda"
C:\> $bdm.Ebs = $ebs
C:\> New-EC2Instance -ImageId ami-0abcdef1234567890 -BlockDeviceMapping $bdm ...other parameters...
```

Configure the root volume to persist for an existing instance

You can configure the root volume to persist for a running instance. Note that you can't complete this task using the Amazon EC2 console.
To configure the root volume to persist for an existing instance using the AWS CLI

Use the `modify-instance-attribute` command with a block device mapping that sets the `DeleteOnTermination` attribute to false.

```bash
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --block-device-mappings file://mapping.json
```

Specify the following in `mapping.json`.

```json
[
  {
    "DeviceName": "/dev/xvda",
    "Ebs": {
      "DeleteOnTermination": false
    }
  }
]
```

Tools for Windows PowerShell

To configure the root volume to persist for an existing instance using the AWS Tools for Windows PowerShell

Use the `Edit-EC2InstanceAttribute` command with a block device mapping that sets the `DeleteOnTermination` attribute to false.

```powershell
C:\> $ebs = New-Object Amazon.EC2.Model.EbsInstanceBlockDeviceSpecification
C:\> $ebs.DeleteOnTermination = $false
C:\> $bdm = New-Object Amazon.EC2.Model.InstanceBlockDeviceMappingSpecification
C:\> $bdm.DeviceName = "/dev/xvda"
C:\> $bdm.Ebs = $ebs
C:\> Edit-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -BlockDeviceMapping $bdm
```

Confirm that a root volume is configured to persist

You can confirm that a root volume is configured to persist using the Amazon EC2 console or the command line tools.
Console

To confirm that a root volume is configured to persist using the Amazon EC2 console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances and then select the instance.
3. In the Storage tab, under Block devices, locate the entry for the root volume. If Delete on termination is No, the volume is configured to persist.

AWS CLI

To confirm that a root volume is configured to persist using the AWS CLI

Use the describe-instances command and verify that the DeleteOnTermination attribute in the BlockDeviceMappings response element is set to false.

```
aws ec2 describe-instances --instance-id i-1234567890abcdef0
```

Tools for Windows PowerShell

To confirm that a root volume is configured to persist using the AWS Tools for Windows PowerShell

Use the Get-EC2Instance and verify that the DeleteOnTermination attribute in the BlockDeviceMappings response element is set to false.
Replace the root volume for an Amazon EC2 instance without stopping it

Amazon EC2 enables you to replace the root Amazon EBS volume for a running instance while retaining the following:

- Data stored on instance store volumes — Instance store volumes remain attached to the instance after the root volume has been restored.
- Data stored on data (non-root) Amazon EBS volumes — Non-root Amazon EBS volumes remain attached to the instance after the root volume has been restored.
- Network configuration — All network interfaces remain attached to the instance and they retain their IP addresses, identifiers, and attachment IDs. When the instance becomes available, all pending network traffic is flushed. Additionally, the instance remains on the same physical host, so it retains its public and private IP addresses and DNS name.
- IAM policies — IAM profiles and policies (such as tag-based policies) that are associated with the instance are retained and enforced.

- Replace a root volume

How root volume replacement works

When you replace the root volume for an instance, we create root volume replacement task. The original root volume is detached from the instance, and the new root volume is attached to the instance in its place. The instance's block device mapping is updated to reflect the ID of the replacement root volume.

When you replace the root volume for an instance, you must specify the source of the snapshot for the new volume. The following are the possible options.
**Restore a root volume to its original state**

This option replaces the current root volume with a volume that is based on the snapshot that was used to create it.

**Considerations for using the launch state**

The replacement root volume gets the same type, size, and delete on termination attributes as the original root volume.

**Replace the root volume using a snapshot**

This option replaces the current root volume with a replacement volume that is based on the snapshot that you specify. For example, a specific snapshot that you previously created from this root volume. This is useful if you need to recover from issues caused by corruption of the root volume or network configuration errors in the guest operating system.

The replacement root volume gets the same type, size, and delete on termination attributes as the original root volume.

**Considerations for using a snapshot**

- You can only use snapshots that belong to the same lineage as the current root volume.
- You can't use snapshot copies created from snapshots that were taken from the root volume.
- After successfully replacing the root volume, you can still use snapshots taken from the original root volume to replace the new (replacement) root volume.

**Replace the root volume using an AMI**

This option replaces the current root volume using an AMI that you specify. This is useful if you need to perform operating system and application patching or upgrades. The AMI must have the same product code, billing information, architecture type, and virtualization type as the instance.

If the instance is enabled for ENA or sriov-net, then you must use an AMI that supports those features. If the instance is not enabled for ENA or sriov-net, then you can either select an AMI that doesn't include support for those features, or you can automatically add support if you select an AMI that supports ENA or sriov-net.

If the instance is enabled for NitroTPM, then you must use an AMI that has NitroTPM enabled. NitroTPM support is not enabled if the instance was not configured for it, regardless of the AMI that you select.
You can select an AMI with a different boot mode than that of the instance, as long as the instance supports the boot mode of the AMI. If the instance does not support the boot mode, the request fails. If the instance supports the boot mode, the new boot mode is propagated to the instance and its UEFI data is updated accordingly. If you manually modified the boot order or added a private UEFI Secure Boot key to load private kernel modules, the changes are lost during root volume replacement.

The replacement root volume gets the same volume type and delete on termination attribute as the original root volume, and it gets the size of the AMI root volume block device mapping.

**Note**
The size of the AMI root volume block device mapping must be equal to or greater than the size of the original root volume. If the size of the AMI root volume block device mapping is smaller than the size of the original root volume, the request fails.

After the root volume replacement task completes, the following new and updated information is reflected when you describe the instance using the console, AWS CLI or AWS SDKs:

- New AMI ID
- New volume ID for the root volume
- Updated boot mode configuration (if changed by the AMI)
- Updated NitroTPM configuration (if enabled by the AMI)
- Updated ENA configuration (if enabled by the AMI)
- Updated sriov-net configuration (if enabled by the AMI)

The new AMI ID is also reflected in the instance metadata.

**Considerations for using an AMI:**

- If you use an AMI that has multiple block device mappings, only the root volume of the AMI is used. The other (non-root) volumes are ignored.
- You can only use this feature if you have permissions to the AMI and its associated root volume snapshot. You cannot use this feature with AWS Marketplace AMIs.
- You can only use an AMI without a product code only if the instance does not have a product code.
• The size of the AMI root volume block device mapping must be equal to or greater than the size of the original root volume. If the size of the AMI root volume block device mapping is smaller than the size of the original root volume, the request fails.

• The instance identity documents for the instance are automatically updated.

• If the instance supports NitroTPM, the NitroTPM data for the instance is reset and new keys are generated.

You can choose whether to keep the original root volume after the root volume replacement process has completed. If you choose delete the original root volume after the replacement process completes, the original root volume is automatically deleted and becomes unrecoverable. If you choose to keep the original root volume after the process completes, the volume remains provisioned in your account; you must manually delete the volume when you no longer need it.

The root volume replacement task transitions through the following states:

• pending — The replacement volume is being created.

• in-progress — The original volume is being detached and the replacement volume is being attached.

• succeeded — The replacement volume has been successfully attached to the instance and the instance is available.

• failing — The replacement task is in the process of failing.

• failed — The replacement task has failed, but the root volume is still attached.

• failing-detached — The replacement task is in the process of failing and the instance might not have a root volume attached.

• failed-detached — The replacement task has failed and the instance doesn't have a root volume attached.

If the root volume replacement task fails, the instance is rebooted and the original root volume remains attached to the instance.

Considerations

Before you begin, consider the following.
Requirements

- The instance must be in the running state.
- The instance is automatically rebooted during the process. The contents of the memory (RAM) is erased during the reboot. No manual reboots are required.
- You can't replace the root volume if it is an instance store volume. Only instances with Amazon EBS root volumes are supported.
- You can replace the root volume for all virtualized instance types and EC2 Mac bare metal instances. No other bare metal instance types are supported.
- You can use any snapshot that belongs to the same lineage as any of the instance's previous root volumes.
- If your account is enabled for Amazon EBS encryption by default in the current Region, the replacement root volume created by the root volume replacement task is always encrypted, regardless of the encryption status of the specified snapshot or the root volume of the specified AMI.

Encryption outcomes

The following table summarizes the possible encryption outcomes.

<table>

</tbody>
</table>

**Replace a root volume**

When you replace the root volume for an instance, a *root volume replacement task* is created. You can use the root volume replacement task to monitor the progress and outcome of the replacement process.
To replace the root volume

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance for which to replace the root volume and choose Actions, Monitor and troubleshoot, Replace root volume.

   **Note**
   
   The Replace root volume action is disabled if the selected instance is not in the running state.

4. In the Replace root volume screen, for Restore, choose one of the following options:
   
   - **Launch state** – Restore the replacement root volume from the snapshot that was used to create the current root volume.
   - **Snapshot** – Restore the replacement root volume to the snapshot that you specify. For Snapshot, select the snapshot to use.
   - **Image** – Restore the replacement root volume using the AMI that you specify. For Image, select the AMI to use.

5. (Optional) To delete the root volume that you are replacing, select Delete replaced root volume.

6. Choose Create replacement task.

7. To monitor the replacement task, choose the Storage tab for the instance and expand Recent root volume replacement tasks.

AWS CLI

To restore the replacement root volume to the launch state

Use the create-replace-root-volume-task command. For --instance-id, specify the ID of the instance for which to replace the root volume. Omit the --snapshot-id and --image-id parameters. To delete the original root volume after it has been replaced, include --delete-replaced-root-volume and specify true.
To restore the replacement root volume to a specific snapshot

Use the `create-replace-root-volume-task` command. For `--instance-id`, specify the ID of the instance for which to replace the root volume. For `--snapshot-id`, specify the ID of the snapshot to use. To delete the original root volume after it has been replaced, include `--delete-replaced-root-volume` and specify `true`.

```bash
$ aws ec2 create-replace-root-volume-task \
  --instance-id i-1234567890abcdef0 \
  --snapshot-id snap-9876543210abcdef0 \
  --delete-replaced-root-volume true
```

To restore the replacement root volume using an AMI

Use the `create-replace-root-volume-task` command. For `--instance-id`, specify the ID of the instance for which to replace the root volume. For `--image-id`, specify the ID of the AMI to use. To delete the original root volume after it has been replaced, include `--delete-replaced-root-volume` and specify `true`.

```bash
$ aws ec2 create-replace-root-volume-task \
  --instance-id i-01234567890abcdef \
  --image-id ami-09876543210abcdef \
  --delete-replaced-root-volume true
```

To view the status of a root volume replacement task

Use the `describe-replace-root-volume-tasks` command and specify the IDs of the root volume replacement tasks to view.

```bash
$ aws ec2 describe-replace-root-volume-tasks \
  --replace-root-volume-task-ids replacevol-1234567890abcdef0
```

```
{
  "ReplaceRootVolumeTasks": [
  {
    "ReplaceRootVolumeTaskId": "replacevol-1234567890abcdef0",
```
"InstanceId": "i-1234567890abcdef0",
"TaskState": "succeeded",
"StartTime": "2020-11-06 13:09:54.0",
"CompleteTime": "2020-11-06 13:10:14.0",
"SnapshotId": "snap-01234567890abcdef",
"DeleteReplacedRootVolume": "True"
}
}

Alternatively, specify the instance-id filter to filter the results by instance.

```
$ aws ec2 describe-replace-root-volume-tasks \
 --filters Name=instance-id,Values=i-1234567890abcdef0
```

Tools for Windows PowerShell

**To restore the replacement root volume to the launch state**

Use the [New-EC2ReplaceRootVolumeTask](https://docs.aws.amazon.com/powershell/latest/ug/replace-root-volume-task-ps.html) command. For -InstanceId, specify the ID of the instance for which to replace the root volume. Omit the -SnapshotId and -ImageId parameters. To delete the original root volume after it has been replaced, include -DeleteReplacedRootVolume and specify $true.

```
PS C:\> New-EC2ReplaceRootVolumeTask -InstanceId i-1234567890abcdef0 -DeleteReplacedRootVolume $true
```

**To restore the replacement root volume to a specific snapshot**

Use the [New-EC2ReplaceRootVolumeTask](https://docs.aws.amazon.com/powershell/latest/ug/replace-root-volume-task-ps.html) command. For --InstanceId, specify the ID of the instance for which to replace the root volume. For -SnapshotId, specify the ID of the snapshot to use. To delete the original root volume after it has been replaced, include -DeleteReplacedRootVolume and specify $true.

```
PS C:\> New-EC2ReplaceRootVolumeTask --InstanceId i-1234567890abcdef0 -SnapshotId snap-9876543210abcdef0 -DeleteReplacedRootVolume $true
```

**To restore the replacement root volume using an AMI**

Use the [New-EC2ReplaceRootVolumeTask](https://docs.aws.amazon.com/powershell/latest/ug/replace-root-volume-task-ps.html) command. For -InstanceId, specify the ID of the instance for which to replace the root volume. For -ImageId, specify the ID of
the AMI to use. To delete the original root volume after it has been replaced, include -DeleteReplacedRootVolume and specify $true.

```
PS C:\> New-EC2ReplaceRootVolumeTask -InstanceId i-1234567890abcdef0 -ImageId ami-09876543210abcdef -DeleteReplacedRootVolume $true
```

**To view the status of a root volume replacement task**

Use the `Get-EC2ReplaceRootVolumeTask` command and specify the IDs of the root volume replacement tasks to view.

```
PS C:\> Get-EC2ReplaceRootVolumeTask -ReplaceRootVolumeTaskIds replacevol-1234567890abcdef0
```

Alternatively, specify the `instance-id` filter to filter the results by instance.

```
PS C:\> Get-EC2ReplaceRootVolumeTask -Filters @{Name = 'instance-id'; Values = 'i-1234567890abcdef0'} | Format-Table
```

**Device names for Amazon EBS and instance store volumes on Amazon EC2 instances**

When you attach a volume to your instance, you include a device name for the volume. This device name is used by Amazon EC2. The block device driver for the instance assigns the actual volume name when mounting the volume, and the name assigned can be different from the name that Amazon EC2 uses.

The number of volumes that your instance can support is determined by the operating system. For more information, see [Amazon EBS volume limits for Amazon EC2 instances](#).

**Contents**

- Available device names
- Device name considerations
Available device names

Linux instances

There are two types of virtualization available for Linux instances: paravirtual (PV) and hardware virtual machine (HVM). The virtualization type of an instance is determined by the AMI used to launch the instance. All instance types support HVM AMIs. Some previous generation instance types support PV AMIs. Be sure to note the virtualization type of your AMI because the recommended and available device names that you can use depend on the virtualization type of your instance. For more information, see AMI virtualization types.

The following table lists the available device names that you can specify in a block device mapping or when attaching an EBS volume.

<table>
<thead>
<tr>
<th>Virtualization type</th>
<th>Available</th>
<th>Reserved for root volume</th>
<th>Recommended for EBS volumes</th>
<th>Instance store volumes</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>/dev/sd[a-z] [1-15]</td>
<td></td>
<td>/dev/sd[f-p] [1-6]</td>
<td></td>
</tr>
<tr>
<td></td>
<td>/dev/hd[a-z]</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>/dev/hd[a-z] [1-15]</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>HVM</td>
<td>/dev/sd[a-z]</td>
<td>Differs by AMI /dev/sda1 or /dev/xvda</td>
<td>/dev/sd[f-p] *</td>
<td>/dev/sd[b-e]</td>
</tr>
<tr>
<td></td>
<td>/dev/xvd[a-d][a-x]</td>
<td></td>
<td>/dev/sd[b-h] (h1.16xlarge)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>/dev/xvd[e-z]</td>
<td></td>
<td>/dev/sd[b-y] (d2.8xlarge)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>/dev/sd[b-i] (i2.8xlarge)</td>
<td>**</td>
</tr>
</tbody>
</table>
* The device names that you specify for NVMe EBS volumes in a block device mapping are renamed using NVMe device names (/dev/nvme[0-26]n1). The block device driver can assign NVMe device names in a different order than you specified for the volumes in the block device mapping.

** NVMe instance store volumes are automatically enumerated and assigned an NVMe device name.

Windows instances

Windows AMIs use one of the following sets of drivers to permit access to virtualized hardware: AWS PV, Citrix PV, and RedHat PV. For more information, see the section called “Windows PV drivers”.

The following table lists the available device names that you can specify in a block device mapping or when attaching an EBS volume.

<table>
<thead>
<tr>
<th>Driver type</th>
<th>Available</th>
<th>Reserved for root volume</th>
<th>Recommended for EBS volumes</th>
<th>Instance store volumes</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWS PV, Citrix PV</td>
<td>xvd[b-z]</td>
<td>/dev/sda1</td>
<td>xvd[f-z] *</td>
<td>xvdc[a-x]</td>
</tr>
<tr>
<td></td>
<td>xvd[b-c][a-z]</td>
<td></td>
<td></td>
<td>xvdc[a-e]</td>
</tr>
<tr>
<td></td>
<td>/dev/sda1</td>
<td></td>
<td></td>
<td>**</td>
</tr>
<tr>
<td></td>
<td>/dev/sd[b-e]</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Red Hat PV</td>
<td>xvd[a-z]</td>
<td>/dev/sda1</td>
<td>xvd[f-p]</td>
<td>xvdc[a-x]</td>
</tr>
<tr>
<td></td>
<td>xvd[b-c][a-z]</td>
<td></td>
<td></td>
<td>xvdc[a-e]</td>
</tr>
<tr>
<td></td>
<td>/dev/sda1</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>/dev/sd[b-e]</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

* For Citrix PV and Red Hat PV, if you map an EBS volume with the name xvda, Windows does not recognize the volume (the volume is visible for AWS PV or AWS NVMe).

** NVMe instance store volumes are automatically enumerated and assigned a Windows drive letter.
For more information about instance store volumes, see Amazon EC2 instance store temporary block storage for Amazon EC2 instances. For more information about NVMe EBS volumes (Nitro-based instances), including how to identify the EBS device, see Amazon EBS and NVMe in the Amazon EBS User Guide.

Device name considerations

Keep the following in mind when selecting a device name:

- The ending portion of device names that you use shouldn’t overlap as it can cause issues when you start your instance. For example, avoid using combinations such as /dev/xvd f and xvd f for volumes attached to the same instance.
- Although you can attach your EBS volumes using the device names used to attach instance store volumes, we strongly recommend that you don’t because the behavior can be unpredictable.
- The number of NVMe instance store volumes for an instance depends on the size of the instance. NVMe instance store volumes are automatically enumerated and assigned an NVMe device name (Linux instances) or a Windows drive letter (Windows instances).
- (Windows instances) AWS Windows AMIs come with additional software that prepares an instance when it first boots up. This is either the EC2Config service (Windows AMIs prior to Windows Server 2016) or EC2Launch (Windows Server 2016 and later). After the devices have been mapped to drives, they are initialized and mounted. The root drive is initialized and mounted as C:\. By default, when an EBS volume is attached to a Windows instance, it can show up as any drive letter on the instance. You can change the settings to set the drive letters of the volumes per your specifications. For instance store volumes, the default depends on the driver. AWS PV drivers and Citrix PV drivers assign instance store volumes drive letters going from Z: to A:. Red Hat drivers assign instance store volumes drive letters going from D: to Z:. For more information, see Configure launch settings for Amazon EC2 Windows instances, and Map disks to Amazon EBS and instance store volumes on your Amazon EC2 Windows instance.
- (Linux instances) Depending on the block device driver of the kernel, the device could be attached with a different name than you specified. For example, if you specify a device name of /dev/sdh, your device could be renamed /dev/xv dh or /dev/hdh. In most cases, the trailing letter remains the same. In some versions of Red Hat Enterprise Linux (and its variants, such as CentOS), the trailing letter could change (/dev/sda could become /dev/xv de). In these cases, the trailing letter of each device name is incremented the same number of times. For example, if /dev/s db is renamed /dev/xvd f, then /dev/sdc is renamed /dev/xvdg. Amazon Linux creates a symbolic link for the name you specified to the renamed device. Other operating systems could behave differently.
(Linux instances) HVM AMIs do not support the use of trailing numbers on device names, except for /dev/sda1, which is reserved for the root device, and /dev/sda2. While using /dev/sda2 is possible, we do not recommend using this device mapping with HVM instances.

(Linux instances) When using PV AMIs, you cannot attach volumes that share the same device letters both with and without trailing digits. For example, if you attach a volume as /dev/sdc and another volume as /dev/sdc1, only /dev/sdc is visible to the instance. To use trailing digits in device names, you must use trailing digits on all device names that share the same base letters (such as /dev/sdc1, /dev/sdc2, /dev/sdc3).

(Linux instances) Some custom kernels might have restrictions that limit use to /dev/sd[f-p] or /dev/sd[f-p][1-6]. If you're having trouble using /dev/sd[q-z] or /dev/sd[q-z][1-6], try switching to /dev/sd[f-p] or /dev/sd[f-p][1-6].

Before you specify the device name that you've selected, verify that it is available. Otherwise, you'll get an error that the device name is already in use. To view the disk devices and their mount points, use the `lsblk` command (Linux instances), or the Disk Management utility or the `diskpart` command (Windows instances).

**Block device mappings for Amazon EBS and instance store volumes on Amazon EC2 instances**

Each instance that you launch has an associated root device volume, which is either an Amazon EBS volume or an instance store volume. You can use block device mapping to specify additional EBS volumes or instance store volumes to attach to an instance when it's launched. You can also attach additional EBS volumes to a running instance. However, the only way to attach instance store volumes to an instance is to use block device mapping to attach the volumes as the instance is launched.

- [Add block device mappings to Amazon EC2 instance](#)
Block device mapping concepts

A block device is a storage device that moves data in sequences of bytes or bits (blocks). These devices support random access and generally use buffered I/O. Examples include hard disks, CD-ROM drives, and flash drives. A block device can be physically attached to a computer or accessed remotely as if it were physically attached to the computer.

Amazon EC2 supports two types of block devices:

- Instance store volumes (virtual devices whose underlying hardware is physically attached to the host computer for the instance)
- EBS volumes (remote storage devices)

A block device mapping defines the block devices (instance store volumes and EBS volumes) to attach to an instance. You can specify a block device mapping as part of creating an AMI so that the mapping is used by all instances launched from the AMI. Alternatively, you can specify a block device mapping when you launch an instance, so this mapping overrides the one specified in the AMI from which you launched the instance. Note that all NVMe instance store volumes supported by an instance type are automatically enumerated and assigned a device name on instance launch; including them in your block device mapping has no effect.

Contents

- Block device mapping instance store caveats
- Example block device mapping
- How devices are made available in the operating system

Block device mapping entries

When you create a block device mapping, you specify the following information for each block device that you need to attach to the instance:

- The device name used within Amazon EC2. The block device driver for the instance assigns the actual volume name when mounting the volume. The name assigned can be different from the name that Amazon EC2 recommends. For more information, see Device names for Amazon EBS and instance store volumes on Amazon EC2 instances.
For Instance store volumes, you also specify the following information:

- The virtual device: ephemeral[0-23]. Note that the number and size of available instance store volumes for your instance varies by instance type.

For NVMe instance store volumes, the following information also applies:

- These volumes are automatically enumerated and assigned a device name; including them in your block device mapping has no effect.

For EBS volumes, you also specify the following information:

- The ID of the snapshot to use to create the block device (snap-xxxxxxx). This value is optional as long as you specify a volume size. You can't specify the ID of an archived snapshot.
- The size of the volume, in GiB. The specified size must be greater than or equal to the size of the specified snapshot.
- Whether to delete the volume on instance termination (true or false). The default value is true for the root device volume and false for attached volumes. When you create an AMI, its block device mapping inherits this setting from the instance. When you launch an instance, it inherits this setting from the AMI.
- The volume type, which can be gp2 and gp3 for General Purpose SSD, io1 and io2 for Provisioned IOPS SSD, st1 for Throughput Optimized HDD, sc1 for Cold HDD, or standard for Magnetic.
- The number of input/output operations per second (IOPS) that the volume supports. (Used only with io1 and io2 volumes.)

**Block device mapping instance store caveats**

There are several caveats to consider when launching instances with AMIs that have instance store volumes in their block device mappings.

- Some instance types include more instance store volumes than others, and some instance types contain no instance store volumes at all. If your instance type supports one instance store volume, and your AMI has mappings for two instance store volumes, then the instance launches with one instance store volume.
• Instance store volumes can only be mapped at launch time. You cannot stop an instance without instance store volumes (such as the t2.micro), change the instance to a type that supports instance store volumes, and then restart the instance with instance store volumes. However, you can create an AMI from the instance and launch it on an instance type that supports instance store volumes, and map those instance store volumes to the instance.

• If you launch an instance with instance store volumes mapped, and then stop the instance and change it to an instance type with fewer instance store volumes and restart it, the instance store volume mappings from the initial launch still show up in the instance metadata. However, only the maximum number of supported instance store volumes for that instance type are available to the instance.

Note

When an instance is stopped, all data on the instance store volumes is lost.

• Depending on instance store capacity at launch time, M3 instances may ignore AMI instance store block device mappings at launch unless they are specified at launch. You should specify instance store block device mappings at launch time, even if the AMI you are launching has the instance store volumes mapped in the AMI, to ensure that the instance store volumes are available when the instance launches.

Example block device mapping

This figure shows an example block device mapping for an EBS-backed instance. It maps /dev/sdb to ephemeral0 and maps two EBS volumes, one to /dev/sdh and the other to /dev/sdj. It also shows the EBS volume that is the root device volume, /dev/sda1.
Note that this example block device mapping is used in the example commands and APIs in this topic. You can find example commands and APIs that create block device mappings in Specify a block device mapping for an AMI and Update the block device mapping when launching an instance.

**How devices are made available in the operating system**

Device names like /dev/sdh and xvdh are used by Amazon EC2 to describe block devices. The block device mapping is used by Amazon EC2 to specify the block devices to attach to an EC2 instance. After a block device is attached to an instance, it must be mounted by the operating system before you can access the storage device. When a block device is detached from an instance, it is unmounted by the operating system and you can no longer access the storage device.

**Linux instances** – The device names specified in the block device mapping are mapped to their corresponding block devices when the instance first boots. The instance type determines which instance store volumes are formatted and mounted by default. You can mount additional instance store volumes at launch, as long as you don’t exceed the number of instance store volumes available for your instance type. For more information, see Amazon EC2 instance store temporary block storage for Amazon EC2 instances. The block device driver for the instance determines which devices are used when the volumes are formatted and mounted.
**Windows instances** – The device names specified in the block device mapping are mapped to their corresponding block devices when the instance first boots, and then the Ec2Config service initializes and mounts the drives. The root device volume is mounted as C:\. The instance store volumes are mounted as Z:\, Y:\, and so on. When an EBS volume is mounted, it can be mounted using any available drive letter. However, you can configure how drive letters are assigned to EBS volumes; for more information, see the section called “Configure Windows launch agents”.

**Add block device mappings to an AMI**

Each AMI has a block device mapping that specifies the block devices to attach to an instance when it is launched from the AMI. To add more block devices to an AMI, you must create your own AMI.

**Contents**

- Specify a block device mapping for an AMI
- View the EBS volumes in an AMI block device mapping

**Specify a block device mapping for an AMI**

There are two ways to specify volumes in addition to the root volume when you create an AMI. If you've already attached volumes to a running instance before you create an AMI from the instance, the block device mapping for the AMI includes those same volumes. For EBS volumes, the existing data is saved to a new snapshot, and it's this new snapshot that's specified in the block device mapping. For instance store volumes, the data is not preserved.

For an EBS-backed AMI, you can add EBS volumes and instance store volumes using a block device mapping. For an instance store-backed AMI, you can add instance store volumes only by modifying the block device mapping entries in the image manifest file when registering the image.

**Note**

For M3 instances, you must specify instance store volumes in the block device mapping for the instance when you launch it. When you launch an M3 instance, instance store volumes specified in the block device mapping for the AMI may be ignored if they are not specified as part of the instance block device mapping.
To add volumes to an AMI using the console

1. Open the Amazon EC2 console.
2. In the navigation pane, choose Instances.
3. Select an instance and choose Actions, Image and templates, Create image.
4. Enter a name and a description for the image.
5. The instance volumes appear under Instance volumes. To add another volume, choose Add volume.
6. For Volume type, choose the volume type. For Device choose the device name. For an EBS volume, you can specify additional details, such as a snapshot, volume size, volume type, IOPS, and encryption state.
7. Choose Create image.

Command line

To add volumes to an AMI using the command line

Use the create-image AWS CLI command to specify a block device mapping for an EBS-backed AMI. Use the register-image AWS CLI command to specify a block device mapping for an instance store-backed AMI.

Specify the block device mapping using the --block-device-mappings parameter. Arguments encoded in JSON can be supplied either directly on the command line or by reference to a file:

```
--block-device-mappings [mapping, ...]
--block-device-mappings [file://mapping.json]
```

To add an instance store volume, use the following mapping.

```
{
   "DeviceName": "device_name",
   "VirtualName": "ephemeral0"
}
```
To add an empty 100 GiB gp2 volume, use the following mapping.

```json
{
    "DeviceName": "device_name",
    "Ebs": {
        "VolumeSize": 100
    }
}
```

To add an EBS volume based on a snapshot, use the following mapping.

```json
{
    "DeviceName": "device_name",
    "Ebs": {
        "SnapshotId": "snap-xxxxxxxx"
    }
}
```

To omit a mapping for a device, use the following mapping.

```json
{
    "DeviceName": "device_name",
    "NoDevice": ""
}
```

Alternatively, you can use the -BlockDeviceMapping parameter with the following commands (AWS Tools for Windows PowerShell):

- New-EC2Image
- Register-EC2Image

**View the EBS volumes in an AMI block device mapping**

You can easily enumerate the EBS volumes in the block device mapping for an AMI.

**Console**

  **To view the EBS volumes for an AMI using the console**

  1. Open the Amazon EC2 console.
2. In the navigation pane, choose **AMIs**.

3. Choose **EBS images** from the **Filter** list to get a list of EBS-backed AMIs.

4. Select the desired AMI, and look at the **Details** tab. At a minimum, the following information is available for the root device:

   - **Root Device Type** (ebs)
   - **Root Device Name** (for example, /dev/sda1)
   - **Block Devices** (for example, /dev/sda1=snap-1234567890abcdef0:8:true)

   If the AMI was created with additional EBS volumes using a block device mapping, the **Block Devices** field displays the mapping for those additional volumes as well. (This screen doesn't display instance store volumes.)

**Command line**

**To view the EBS volumes for an AMI using the command line**

Use the **describe-images** (AWS CLI) command or **Get-EC2Image** (AWS Tools for Windows PowerShell) command to enumerate the EBS volumes in the block device mapping for an AMI.

**Add block device mappings to Amazon EC2 instance**

By default, an instance that you launch includes any storage devices specified in the block device mapping of the AMI from which you launched the instance. You can specify changes to the block device mapping for an instance when you launch it, and these updates overwrite or merge with the block device mapping of the AMI.

**Limitations**

- For the root volume, you can only modify the following: volume size, volume type, and the **Delete on Termination** flag.
- When you modify an EBS volume, you can't decrease its size. Therefore, you must specify a snapshot whose size is equal to or greater than the size of the snapshot specified in the block device mapping of the AMI.

**Contents**
Update the block device mapping when launching an instance

You can add EBS volumes and instance store volumes to an instance when you launch it. Note that updating the block device mapping for an instance doesn't make a permanent change to the block device mapping of the AMI from which it was launched.

Console

To add volumes to an instance using the console

1. Open the Amazon EC2 console.
2. From the dashboard, choose Launch Instance.
3. On the Choose an Amazon Machine Image (AMI) page, select the AMI to use and choose Select.
4. Follow the wizard to complete the Choose an Instance Type and Configure Instance Details pages.
5. On the Add Storage page, you can modify the root volume, EBS volumes, and instance store volumes as follows:
   - To change the size of the root volume, locate the Root volume under the Type column, and change its Size field.
   - To suppress an EBS volume specified by the block device mapping of the AMI used to launch the instance, locate the volume and click its Delete icon.
   - To add an EBS volume, choose Add New Volume, choose EBS from the Type list, and fill in the fields (Device, Snapshot, and so on).
   - To suppress an instance store volume specified by the block device mapping of the AMI used to launch the instance, locate the volume, and choose its Delete icon.
   - To add an instance store volume, choose Add New Volume, select Instance Store from the Type list, and select a device name from Device.
6. Complete the remaining wizard pages, and choose Launch.
Command line

To add volumes to an instance using the AWS CLI

Use the run-instances AWS CLI command with the --block-device-mappings option to specify a block device mapping for an instance at launch.

For example, suppose that an EBS-backed AMI specifies the following block device mapping for a Linux instance:

- /dev/sdb = ephemeral0
- /dev/sdh = snap-1234567890abcdef0
- /dev/sdj = 100

To prevent /dev/sdj from attaching to an instance launched from this AMI, use the following mapping.

```
{
    "DeviceName": "/dev/sdj",
    "NoDevice": ""
}
```

To increase the size of /dev/sdh to 300 GiB, specify the following mapping. Notice that you don't need to specify the snapshot ID for /dev/sdh, because specifying the device name is enough to identify the volume.

```
{
    "DeviceName": "/dev/sdh",
    "Ebs": {
        "VolumeSize": 300
    }
}
```

To increase the size of the root volume at instance launch, first call describe-images with the ID of the AMI to verify the device name of the root volume. For example, "RootDeviceName": "/dev/xvda". To override the size of the root volume, specify the device name of the root device used by the AMI and the new volume size.

```
{
}
```
To attach an additional instance store volume, /dev/sdc, specify the following mapping. If the instance type doesn't support multiple instance store volumes, this mapping has no effect. If the instance supports NVMe instance store volumes, they are automatically enumerated and assigned an NVMe device name.

```json
{
    "DeviceName": "/dev/sdc",
    "VirtualName": "ephemeral1"
}
```

To add volumes to an instance using the AWS Tools for Windows PowerShell

Use the -BlockDeviceMapping parameter with the `New-EC2Instance` command (AWS Tools for Windows PowerShell).

**Update the block device mapping of a running instance**

You can use the `modify-instance-attribute` AWS CLI command to update the block device mapping of a running instance. You do not need to stop the instance before changing this attribute.

```bash
aws ec2 modify-instance-attribute --instance-id i-1a2b3c4d --block-device-mappings file://mapping.json
```

For example, to preserve the root volume at instance termination, specify the following in `mapping.json`.

```json
[
    {
        "DeviceName": "/dev/sdal",
        "Ebs": {
            "DeleteOnTermination": false
        }
    }
]
```
Alternatively, you can use the `-BlockDeviceMapping` parameter with the `Edit-EC2InstanceAttribute` command (AWS Tools for Windows PowerShell).

**View the EBS volumes in an instance block device mapping**

You can easily enumerate the EBS volumes mapped to an instance.

![Note]

For instances launched before the release of the 2009-10-31 API, AWS can't display the block device mapping. You must detach and reattach the volumes so that AWS can display the block device mapping.

**Console**

**To view the EBS volumes for an instance using the console**

1. Open the Amazon EC2 console.
2. In the navigation pane, choose **Instances**.
3. In the search box, enter **Root device type**, and then choose **EBS**. This displays a list of EBS-backed instances.
4. Select the desired instance and look at the details displayed in the **Storage** tab. At a minimum, the following information is available for the root device:

   - **Root device type** (for example, **EBS**)
   - **Root device name** (for example, `/dev/xvda`)
   - **Block devices** (for example, `/dev/xvda`, `/dev/sdf`, and `/dev/sdj`)

   If the instance was launched with additional EBS volumes using a block device mapping, they appear under **Block devices**. Any instance store volumes do not appear on this tab.
5. To display additional information about an EBS volume, choose its volume ID to go to the volume page.

**Command line**

**To view the EBS volumes for an instance using the command line**
Use the `describe-instances` (AWS CLI) command or `Get-EC2Instance` (AWS Tools for Windows PowerShell) command to enumerate the EBS volumes in the block device mapping for an instance.

**View the instance block device mapping for instance store volumes**

The instance type determines the number and type of instance store volumes that are available to the instance. If the number of instance store volumes in a block device mapping exceeds the number of instance store volumes available to an instance, the additional volumes are ignored. To view the instance store volumes for your instance, run the `lsblk` command (Linux instances) or open **Windows Disk Management** (Windows instances). To learn how many instance store volumes are supported by each instance type, see [Amazon EC2 instance type specifications](#).

When you view the block device mapping for your instance, you can see only the EBS volumes, not the instance store volumes. The method you use to view the instance store volumes for your instance depends on the volume type.

**NVMe instance store volumes**

**Linux instances**

You can use the NVMe command line package, `nvme-cli`, to query the NVMe instance store volumes in the block device mapping. Download and install the package on your instance, and then run the following command.

```
[ec2-user ~]$ sudo nvme list
```

The following is example output for an instance. The text in the Model column indicates whether the volume is an EBS volume or an instance store volume. In this example, both `/dev/nvme1n1` and `/dev/nvme2n1` are instance store volumes.

<table>
<thead>
<tr>
<th>Node Namespace</th>
<th>SN</th>
<th>Model</th>
</tr>
</thead>
<tbody>
<tr>
<td>/dev/nvme0n1</td>
<td>vol06afc3f8715b7a597</td>
<td>Amazon Elastic Block Store</td>
</tr>
<tr>
<td>/dev/nvme1n1</td>
<td>AWS2C1436F5159EB6614</td>
<td>Amazon EC2 NVMe Instance Storage</td>
</tr>
</tbody>
</table>
Windows instances

You can use Disk Management or PowerShell to list both EBS and instance store NVMe volumes. For more information, see the section called “List NVMe volumes”.

HDD or SSD instance store volumes

You can use instance metadata to query the HDD or SSD instance store volumes in the block device mapping. NVMe instance store volumes are not included.

The base URI for all requests for instance metadata is http://169.254.169.254/latest/. For more information, see Work with instance metadata.

Linux instances

First, connect to your running instance. From the instance, use this query to get its block device mapping.

IMDSv2

```
```

IMDSv1

```
```

The response includes the names of the block devices for the instance. For example, the output for an instance store–backed m1.small instance looks like this.

```
ami
ephemeral0
root
swap
```
The *ami* device is the root device as seen by the instance. The instance store volumes are named `ephemeral[0-23]`. The swap device is for the page file. If you've also mapped EBS volumes, they appear as `ebs1`, `ebs2`, and so on.

To get details about an individual block device in the block device mapping, append its name to the previous query, as shown here.

**IMDSv2**

```bash
```

**IMDSv1**

```bash
```

**Windows instances**

First, connect to your running instance. From the instance, use this query to get its block device mapping.

```bash
```

The response includes the names of the block devices for the instance. For example, the output for an instance store–backed `m1.small` instance looks like this.

```
ami
ephemeral0
root
swap
```

The *ami* device is the root device as seen by the instance. The instance store volumes are named `ephemeral[0-23]`. The swap device is for the page file. If you've also mapped EBS volumes, they appear as `ebs1`, `ebs2`, and so on.
To get details about an individual block device in the block device mapping, append its name to the previous query, as shown here.

```
```

## Map disks to Amazon EBS and instance store volumes on your Amazon EC2 Windows instance

### Note

This topic applies to Windows instances only.

Your Windows instance comes with an EBS volume that serves as the root volume. If your Windows instance uses AWS PV or Citrix PV drivers, you can optionally add up to 25 volumes, making a total of 26 volumes. For more information, see [Amazon EBS volume limits for Amazon EC2 instances](#).

Depending on the instance type of your instance, you'll have from 0 to 24 possible instance store volumes available to the instance. To use any of the instance store volumes that are available to your instance, you must specify them when you create your AMI or launch your instance. You can also add EBS volumes when you create your AMI or launch your instance, or attach them while your instance is running.

When you add a volume to your instance, you specify the device name that Amazon EC2 uses. For more information, see [Device names for Amazon EBS and instance store volumes on Amazon EC2 instances](#). AWS Windows Amazon Machine Images (AMIs) contain a set of drivers that are used by Amazon EC2 to map instance store and EBS volumes to Windows disks and drive letters. If you launch an instance from a Windows AMI that uses AWS PV or Citrix PV drivers, you can use the relationships described on this page to map your Windows disks to your instance store and EBS volumes. If your Windows AMI uses Red Hat PV drivers, you can update your instance to use the Citrix drivers. For more information, see [the section called “Upgrade PV drivers”](#).

List NVMe volumes

You can find the disks on your Windows instance using Disk Management or Powershell.

List NVMe disks using Disk Management

You can find the disks on your Windows instance using Disk Management.

To find the disks on your Windows instance

1. Log in to your Windows instance using Remote Desktop. For more information, see Connect to your Windows instance.
2. Start the Disk Management utility.
3. Review the disks. The root volume is an EBS volume mounted as C:\. If there are no other disks shown, then you didn't specify additional volumes when you created the AMI or launched the instance.

The following is an example that shows the disks that are available if you launch an r5d.4xlarge instance with two additional EBS volumes.
List NVMe volumes

C: - Simple Basic NTFS Healthy (System, Boot, Page File, Active, Crash Dump, Primary Partition) 30.00 GB 13.22 GB 44%

D: - Simple Basic NTFS Healthy (Primary Partition) 8.00 GB 7.97 GB 100%

E: - Simple Basic NTFS Healthy (Primary Partition) 8.00 GB 7.97 GB 100%

F: - Simple Basic NTFS Healthy (Primary Partition) 279.39 GB 279.28 GB 100%

G: - Simple Basic NTFS Healthy (Primary Partition) 279.39 GB 279.28 GB 100%
List NVMe disks using PowerShell

The following PowerShell script lists each disk and its corresponding device name and volume. It is intended for use with instances built on the AWS Nitro System, which use NVMe EBS and instance store volumes.

Connect to your Windows instance and run the following command to enable PowerShell script execution.

```
Set-ExecutionPolicy RemoteSigned
```

Copy the following script and save it as mapping.ps1 on your Windows instance.

```powershell
# List the disks for NVMe volumes

function Get-EC2InstanceMetadata {  
    param([string]$Path)  
    (Invoke-WebRequest -Uri "http://169.254.169.254/latest/$Path").Content  
}

function GetEBSVolumeId {  
    param($Path)  
    $SerialNumber = (Get-Disk -Path $Path).SerialNumber  
    if($SerialNumber -clike 'vol*'){  
        $EbsVolumeId = $SerialNumber.Substring(0,20).Replace("vol","vol-")  
    }  
    else {  
        $EbsVolumeId = $SerialNumber.Substring(0,20).Replace("AWS","AWS-")  
    }  
    return $EbsVolumeId  
}

function GetDeviceName{  
    param($EbsVolumeId)  
    if($EbsVolumeId -clike 'vol*'){  
        $VolumeName = ""  
    }  
    else {  
        $Device = "Ephemeral"  
        $VolumeName = "Temporary Storage"  
    }
```

List NVMe volumes
Return $Device,$VolumeName
}

function GetDriveLetter{
    param($Path)
    $DiskNumber = (Get-Disk -Path $Path).Number
    if($DiskNumber -eq 0){
        $VirtualDevice = "root"
        $DriveLetter = "C"
        $PartitionNumber = (Get-Partition -DriveLetter C).PartitionNumber
    } else {
        $VirtualDevice = "N/A"
        $DriveLetter = (Get-Partition -DiskNumber $DiskNumber).DriveLetter
        if(!$DriveLetter)
        {
            $DriveLetter = ((Get-Partition -DiskId $Path).AccessPaths).Split(',',$)[0]
        }
        $PartitionNumber = (Get-Partition -DiskId $Path).PartitionNumber
    }
    return $DriveLetter,$VirtualDevice,$PartitionNumber
}

$Report = @()
foreach($Path in (Get-Disk).Path)
{
    $Disk_ID = ( Get-Partition -DiskId $Path).DiskId
    $Disk = ( Get-Disk -Path $Path).Number
    $EbsVolumeId  = GetEBSVolumeId($Path)
    $Size =(Get-Disk -Path $Path).Size
    $DriveLetter,$VirtualDevice, $Partition = (GetDriveLetter($Path))
    $Device,$VolumeName = GetDeviceName($EbsVolumeId)
    $Disk = New-Object PSObject -Property @{
        Disk          = $Disk
        Partitions    = $Partition
        DriveLetter   = $DriveLetter
        EbsVolumeId   = $EbsVolumeId
        Device        = $Device
        VirtualDevice = $VirtualDevice
        VolumeName= $VolumeName
    }
}
$Report += $Disk
}

$Report | Sort-Object Disk | Format-Table -AutoSize -Property Disk, Partitions, DriveLetter, EbsVolumeId, Device, VirtualDevice, VolumeName

Run the script as follows:

PS C:\> .\mapping.ps1

The following is example output for an instance with a root volume, two EBS volumes, and two instance store volumes.

<table>
<thead>
<tr>
<th>Disk</th>
<th>Partitions</th>
<th>DriveLetter</th>
<th>EbsVolumeId</th>
<th>Device</th>
<th>VirtualDevice</th>
<th>VolumeName</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>C</td>
<td>vol-03683f1d861744bc7</td>
<td>/dev/sda1</td>
<td>root</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>D</td>
<td>vol-082b07051043174b9</td>
<td>xvdb</td>
<td>N/A</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>E</td>
<td>vol-0a4064b39e5f534a2</td>
<td>xvdc</td>
<td>N/A</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>1</td>
<td>F</td>
<td>AWS-6AAD8C2AAE1193F0</td>
<td>Ephemeral</td>
<td>N/A</td>
<td>Temporary</td>
</tr>
<tr>
<td>Storage</td>
<td></td>
<td></td>
<td>AWS-13E7299C2BD031A28</td>
<td>Ephemeral</td>
<td>N/A</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

If you did not configure your credentials for Tools for Windows PowerShell on the Windows instance, the script cannot get the EBS volume ID and uses N/A in the EbsVolumeId column.

Map NVMe EBS volumes

With instances built on the AWS Nitro System, EBS volumes are exposed as NVMe devices. You can use the Get-Disk command to map Windows disk numbers to EBS volume IDs.

PS C:\> Get-Disk

<table>
<thead>
<tr>
<th>Number</th>
<th>Friendly Name</th>
<th>Serial Number</th>
<th>HealthStatus</th>
<th>OperationalStatus</th>
<th>Total Size</th>
<th>Partition</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>NVMe Amazo...</td>
<td>AWS6AAD8C2AAE1193F0_00000001.</td>
<td>Healthy</td>
<td>Online</td>
<td>279.4 GB</td>
<td>MBR</td>
</tr>
<tr>
<td>4</td>
<td>NVMe Amazo...</td>
<td>AWS13E7299C2BD031A28_00000001.</td>
<td>Healthy</td>
<td>Online</td>
<td>279.4 GB</td>
<td>MBR</td>
</tr>
</tbody>
</table>
You can also run the `ebsnvme-id` command to map NVMe disk numbers to EBS volume IDs and device names.

```
PS C:\> C:\PROGRAMDATA\Amazon\Tools\ebsnvme-id.exe
Disk Number: 0
  Volume ID: vol-03683f1d861744bc7
  Device Name: sda1

Disk Number: 1
  Volume ID: vol-082b07051043174b9
  Device Name: xvdb

Disk Number: 2
  Volume ID: vol-0a4064b39e5f534a2
  Device Name: xvdc
```

**List volumes**

You can find the disks on your Windows instance using Disk Management or Powershell.

**List disks using Disk Management**

You can find the disks on your Windows instance using Disk Management.

**To find the disks on your Windows instance**

1. Log in to your Windows instance using Remote Desktop. For more information, see [Connect to your Windows instance](#).
2. Start the Disk Management utility.
   
   On the taskbar, right-click the Windows logo, and then choose **Disk Management**.
3. Review the disks. The root volume is an EBS volume mounted as C:\. If there are no other disks shown, then you didn't specify additional volumes when you created the AMI or launched the instance.
The following is an example that shows the disks that are available if you launch an m3.medium instance with an instance store volume (Disk 2) and an additional EBS volume (Disk 1).

4. Right-click the gray pane labeled Disk 1, and then select Properties. Note the value of Location and look it up in the tables in Map disk devices to device names. For example, the following disk has the location Bus Number 0, Target Id 9, LUN 0. According to the table for EBS volumes, the device name for this location is xvdj.
Map disk devices to device names

The block device driver for the instance assigns the actual volume names when mounting volumes.

Mappings

- Instance store volumes
- EBS volumes

Instance store volumes

The following table describes how the Citrix PV and AWS PV drivers map non-NVMe instance store volumes to Windows volumes. The number of available instance store volumes is determined by the instance type. For more information, see Instance store volume limits for Amazon EC2 instances.
### Location

<table>
<thead>
<tr>
<th>Location</th>
<th>Device name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bus Number 0, Target ID 78, LUN 0</td>
<td>xvdc</td>
</tr>
<tr>
<td>Bus Number 0, Target ID 79, LUN 0</td>
<td>xvdcb</td>
</tr>
<tr>
<td>Bus Number 0, Target ID 80, LUN 0</td>
<td>xvdc</td>
</tr>
<tr>
<td>Bus Number 0, Target ID 81, LUN 0</td>
<td>xvdc</td>

### List disks using PowerShell

The following PowerShell script lists each disk and its corresponding device name and volume.

#### Requirements and limitations

- Requires Windows Server 2012 or later.
- Requires credentials to get the EBS volume ID. You can configure a profile using the Tools for PowerShell, or attach an IAM role to the instance.
- Does not support NVMe volumes.
- Does not support dynamic disks.

Connect to your Windows instance and run the following command to enable PowerShell script execution.

```
Set-ExecutionPolicy RemoteSigned
```

Copy the following script and save it as `mapping.ps1` on your Windows instance.

```powershell
# List the disks
function Convert-SCSITargetIdToDeviceName {
    param([int]$SCSITargetId)
    If ($SCSITargetId -eq 0) {
        return "sda1"
    }
    $deviceName = "xvd"
    If ($SCSITargetId -gt 25) {
        $deviceName += [char](0x60 + [int]($SCSITargetId / 26))
    }
    $deviceName += [char](0x61 + $SCSITargetId % 26)
    return $deviceName
}
```

<table>

</table>

If you did not provide your credentials on the Windows instance, the script cannot get the EBS volume ID and uses N/A in the EbsVolumeId column.

**Use torn write prevention with Amazon EC2 Linux instances**

� **Note**

Torn write prevention is supported with Linux instances only.

Torn write prevention is a block storage feature designed by AWS to improve the performance of your I/O-intensive relational database workloads and reduce latency without negatively impacting data resiliency. Relational databases that use InnoDB or XtraDB as the database engine, such as MySQL and MariaDB, will benefit from torn write prevention.

Typically, relational databases that use pages larger than the *power fail atomicity* of the storage device use *data logging* mechanisms to protect against torn writes. MariaDB and MySQL use a *doublewrite buffer* file to log data before writing it to data tables. In the event of incomplete or torn writes, as a result of operating system crashes or power loss during write transactions, the database can recover the data from the doublewrite buffer. The additional I/O overhead associated with writing to the doublewrite buffer impacts database performance and application latency, and it reduces the number transactions that can be processed per second. For more information about doublewrite buffer, see the [MariaDB](https://mariadb.com) and [MySQL](https://www.mysql.com) documentation.
With torn write prevention, data is written to storage in all-or-nothing write transactions, which eliminates the need for using the doublewrite buffer. This prevents partial, or torn, data from being written to storage in the event of operating system crashes or power loss during write transactions. The number of transactions processed per second can be increased by up to 30 percent, and write latency can be decreased by up to 50 percent, without compromising the resiliency of your workloads.

**Pricing**

There are no additional costs for using torn write prevention.

**Supported block sizes and block boundary alignments**

Torn write prevention supports write operations for 4 KiB, 8 KiB, and 16 KiB blocks of data. The data block start logical block address (LBA) must be aligned to the respective block boundary size of 4 KiB, 8 KiB, or 16 KiB. For example, for 16 KiB write operations, the data block start LBA must be aligned to a block boundary size of 16 KiB.

The following table shows support across storage and instance types.

<table>
<thead>
<tr>
<th>Instance store volumes</th>
<th>4 KiB blocks</th>
<th>8 KiB blocks</th>
<th>16 KiB blocks</th>
</tr>
</thead>
<tbody>
<tr>
<td>All NVMe instance store volumes attached to current generation I-family instances.</td>
<td></td>
<td>ALL 4i, Im4gn, and Is4gen instances supported by AWS Nitro SSD.</td>
<td></td>
</tr>
<tr>
<td>Amazon EBS volumes</td>
<td>All Amazon EBS volumes attached to instances built on the AWS Nitro System.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To confirm whether your instance and volume support torn write prevention, query to check if the instance supports torn write prevention and other details, like supported block and boundary sizes. For more information, see Check torn write prevention support and configuration.

**Requirements**

For torn write prevention to work properly, an I/O operation must meet size, alignment, and boundary requirements, as specified in the NTWPU, NTWGU, NTWBU fields. You must configure your
operating system to ensure that the specific storage subsystem (file system, LVM, RAID, etc) does not modify I/O properties down the storage stack, including block merges, splits, or block address relocation, before being submitted to the device.

Torn write prevent has been tested with the following configuration:

- An instance type and storage type that supports the required block size.
- Amazon Linux 2 with kernel version 5.10 or later.
- ext4 with bigalloc enabled and a cluster size of 16 KiB, and the most recent ext4 utilities (e2fsprogs 1.46.5 or later).
- O_DIRECT file access mode to bypass Linux kernel buffer cache.

⚠️ Note
You do not need to disable I/O merging for MySQL and MariaDB workloads.

### Check torn write prevention support and configuration

To confirm whether your instance and volume supports torn write prevention, and to view the NVMe namespace vendor specific data that contains torn write prevention information, use the following command.

```bash
$ sudo nvme id-ns -v device_name
```

⚠️ Note
The command returns the vendor-specific information in hex with ASCII interpretation. You might need to build a tool, similar to ebsnvme-id, into your applications that can read and parse the output.

For example, the following command returns the NVMe namespace vendor specific data that contains torn write prevention information for /dev/nvme1n1.

```bash
$ sudo nvme id-ns -v /dev/nvme1n1
```
If your instance and volume support torn write prevention, it returns the following AWS torn write prevention information in the NVMe namespace vendor specific data.

**Note**
The bytes in the following table represent the offset in bytes from the beginning of the NVMe namespace vendor specific data.

<table>
<thead>
<tr>
<th>Bytes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0:31</td>
<td>The name of the device attachment mount point, for example /dev/xvda. You provide this during volume attachment request and it can be used by the Amazon EC2 instance to create a symlink to the NVMe block device(nvmeXn1).</td>
</tr>
<tr>
<td>32:63</td>
<td>The volume ID. For example, vol1234567890abcdef. This field can be used to map the NVMe device to the attached volume.</td>
</tr>
<tr>
<td>64:255</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>256:257</td>
<td>Namespace Torn Write Prevention Unit size (NTWPU). This field indicates the namespace specific size of the write operation guaranteed to be written atomically to the NVM during a power failure or error condition. This field is specified in logical blocks represented in zero based values.</td>
</tr>
<tr>
<td>258:259</td>
<td>Namespace Torn Write Prevention Granularity size (NTWPG). This field indicates the namespace specific size increments below NTWPU of the write operation guaranteed to be written atomically to the NVM during a power failure or error condition. That is, size should be NTWPG * n &lt;= NTWPU where n is positive integer. The write operation LBA offset also must be aligned to this field. This field is specified in logical blocks represented in zero based values.</td>
</tr>
<tr>
<td>260:263</td>
<td>Namespace Torn Write Prevention Boundary size (NTWPB). This field indicates the atomic boundary size for this namespace for the NTWPU value. Writes to this namespace that cross atomic boundaries are not</td>
</tr>
</tbody>
</table>
Configure your software stack for torn write prevention

Torn write prevention is enabled by default on supported instance types with supported volumes. You do not need to enabled any additional settings to enable your volume or instance for torn write prevention.

Note
There is no performance impact on workloads that do not support torn write prevention. You do not need to make any changes for these workloads. Workloads that do support torn write prevention, but are not configured to use it, continue to use the doublewrite buffer and do not receive any performance benefits.

To configure your MySQL or MariaDB software stack to disable the doublewrite buffer and use torn write prevention, complete the following steps:

1. Configure your volume to use ext4 file system with the BigAlloc option and set the cluster size to 4 KiB, 8 KiB, or 16 KiB. Using BigAlloc with a cluster size of 4 KiB, 8 KiB, or 16 KiB ensures that the file system allocates files that align with the respective boundary.

   $ mkfs.ext4 -O bigalloc -C 4096|8192|16384 device_name

   Note
   For MySQL and MariaDB, you must use -C 16384 to match the database page size. Setting allocation granularity to a value other than a multiple of the page size can...
result in allocations that might be mismatched with torn write prevention boundaries of the storage device.

For example:

```bash
$ mkfs.ext4 -O bigalloc -C 16384 /dev/nvme1n1
```

2. Configure InnoDB to use the `O_DIRECT` flushing method and turn off InnoDB doublewrite. Use your preferred text editor to open `/etc/my.cnf`, and update the `innodb_flush_method` and `innodb_doublewrite` parameters as follows:

```ini
innodb_flush_method=O_DIRECT
innodb_doublewrite=0
```

⚠️ **Important**

If you are using Logical Volume Manager (LVM) or other storage virtualization layer, make sure that the starting offsets of the volumes are aligned on 16 KiB multiples. This is relative to the underlying NVMe storage to account for the metadata headers and superblocks used by the storage virtualization layer. If you add an offset to the LVM physical volume, it can cause misalignment between the file system allocations and the NVMe device's offsets, which would invalidate torn write prevention. For more information, see `--dataalignmentoffset` in the [Linux manual page](https://man7.org/linux/man-pages/man7/lvm.7.html).

---

**Application consistent Windows VSS based Amazon EBS snapshots**

ℹ️ **Note**

Application consistent Windows VSS based snapshots are supported with Windows instances only.
You can take application-consistent snapshots of all Amazon EBS volumes attached to your Amazon EC2 Windows instances using AWS Systems Manager Run Command. The snapshot process uses the Windows Volume Shadow Copy Service (VSS) to take EBS volume level backups of VSS-aware applications. The snapshots include data from pending transactions between these applications and the disk. You don't have to shut down your instances or disconnect them when you need to back up all attached volumes.

There is no additional cost to use VSS based EBS snapshots. You only pay for EBS snapshots created by the backup process. For more information, see How am I billed for my Amazon EBS EBS snapshots?

Contents

- What is VSS?
- Prerequisites
- Create VSS-enabled EBS snapshots
- Troubleshoot Windows VSS based EBS snapshots
- Restore EBS volumes from VSS-enabled EBS snapshots
- AWS VSS solution version history

What is VSS?

Volume Snapshot Copy Service (VSS) is a backup and recovery technology included in Microsoft Windows. It can create backup copies, or snapshots, of computer files or volumes while they are in use. For more information, see Volume Shadow Copy Service.

To create an application-consistent snapshot, the following software components are involved.

- VSS service — Part of the Windows operating system
- VSS requester — The software that requests the creation of shadow copies
- VSS writer — Typically provided as part of an application, such as SQL Server, to ensure a consistent data set to back up
- VSS provider — The component that creates the shadow copies of the underlying volumes

The Windows VSS based Amazon EBS snapshot solution consists of multiple Systems Manager (SSM) Run Command documents that facilitate backup creation, and a Systems Manager.
Distributor package, called AwsVssComponents, that includes an EC2 VSS requester and an EC2 VSS provider. The AwsVssComponents package must be installed on EC2 Windows instances to take application-consistent snapshots of EBS volumes. The following diagram illustrates the relationship between these software components.

How the VSS based Amazon EBS snapshot solution works

The process for taking application-consistent, VSS based EBS snapshot scripts consists of the following steps.

1. Complete the Prerequisites.
2. Enter parameters for the AWSEC2-VssInstallAndSnapshot SSM document and run this document by using Run Command. For more information, see Run the AWSEC2-VssInstallAndSnapshot command document (recommended).
3. The Windows VSS service on your instance coordinates all ongoing I/O operations for running applications.
4. The system flushes all I/O buffers and temporarily pauses all I/O operations. The pause lasts, at most, ten seconds.
5. During the pause, the system creates snapshots of all volumes attached to the instance.
6. The pause is lifted and I/O resumes operation.
7. The system adds all newly-created snapshots to the list of EBS snapshots. The system tags all VSS-enabled EBS snapshots successfully created by this process with **AppConsistent:true**.

8. If you need to restore from a snapshot, you can use the standard EBS process of creating a volume from a snapshot, or you can restore all volumes to an instance by using a sample script, as described in [Restore EBS volumes from VSS-enabled EBS snapshots](#).

**Prerequisites**

You can create VSS based EBS snapshots with Systems Manager Run Command, AWS Backup, or Amazon Data Lifecycle Manager. The following prerequisites apply for all solutions.

**Prerequisites**

- **System requirements**
- **IAM permissions**
- **VSS components**

**System requirements**

**Install the Systems Manager Agent**

VSS is orchestrated by the AWS Systems Manager (Systems Manager) using PowerShell. Ensure that you have installed SSM Agent version 3.0.502.0 or later on your EC2 instance. If you are already using an older version of the SSM Agent, update it using Run Command. For more information, see [Setting up Systems Manager for Amazon EC2 instances](#) and [Working with SSM Agent on Amazon EC2 instances for Windows Server](#) in the *AWS Systems Manager User Guide*.

**Amazon EC2 Windows instance requirements**

VSS based EBS snapshots are supported for instances running Windows Server 2012 and later. For older versions of Windows, see Windows version support table in [AWS VSS solution version history](#).

**.NET Framework version**

The AwsVssComponents package requires .NET Framework version 4.6 or later. Windows operating system versions prior to Windows Server 2016 default to an earlier version of the .NET Framework. If your instance uses an earlier version of the .NET Framework, you must install version 4.6 or later using Windows Update.
AWS Tools for Windows PowerShell version

Ensure that your instance is running AWS Tools for Windows PowerShell version 3.3.48.0 or later. To check your version, run the following command in the PowerShell terminal on the instance.

```
C:\> Get-AWSPowerShellVersion
```

Windows PowerShell version

Ensure that your instance is running Windows PowerShell major version 3, 4, or 5. To check your version, run the following command in a PowerShell terminal on the instance.

```
C:\> $PSVersionTable.PSVersion
```

PowerShell language mode

Ensure that your instance has the PowerShell language mode set to FullLanguage. For more information, see [about_Language_Modes](#) in the Microsoft documentation.

IAM permissions

The IAM role that's attached to your Amazon EC2 Windows instance must have permission to create application-consistent snapshots with VSS. To grant the necessary permissions, you can attach the AWSEC2VssSnapshotPolicy policy to your instance profile.

The policy enables Systems Manager to perform the following actions:

- Create and tag EBS snapshots
- Create and tag Amazon Machine Images (AMIs)
- Attach metadata, such as the device ID, to the default snapshot tags that VSS creates.

Topics

- [Attach the VSS-enabled snapshot policy to your instance profile](#)
- [Managed policy to create VSS snapshots](#)
- [Legacy policy (no longer supported)](#)
Attach the VSS-enabled snapshot policy to your instance profile

To grant permissions for VSS-enabled snapshots for your instance, you attach the AWSEC2VssSnapshotPolicy managed policy to your instance profile role as follows. It's important to ensure that your instance meets all System requirements.

**Note**
To use the managed policy, your instance must have the AwsVssComponents package version 2.3.1 or later installed. For version history, see [AwsVssComponents package versions](#). If you have a prior version of the AwsVssComponents package installed on your instance, see [Legacy policy](#).

2. In the navigation pane, choose Roles to see a list of IAM roles that you have access to.
3. Select the Role name link for the role that's attached to your instance. This opens the role detail page.
4. To attach the managed policy, choose Add permissions, located in the upper right corner of the list panel. Then select Attach policies from the dropdown list.
5. To streamline results, enter the policy name in the search bar (AWSEC2VssSnapshotPolicy).
6. Select the checkbox next to the name of the policy to attach, and choose Add permissions.

**Managed policy to create VSS snapshots**

An AWS managed policy is a standalone policy that Amazon provides for AWS customers. AWS managed policies are designed to grant permissions for common use cases. You can't change the permissions that are defined in AWS managed policies. However, you can copy the policy and use it as a baseline for a customer managed policy that is specific to your use case.

For more information about AWS managed policies, see [AWS managed policies](#) in the [IAM User Guide](#).

To use the AWSEC2VssSnapshotPolicy policy, managed policy, you can attach it to the IAM role that's attached to your EC2 Windows Instances. This policy enables the EC2 VSS solution to create and add tags to Amazon Machine Images (AMIs) and EBS Snapshots. To attach the policy, see [Attach the VSS-enabled snapshot policy to your instance profile](#).
Permissions granted by AWSEC2VssSnapshotPolicy

The **AWSEC2VssSnapshotPolicy** policy includes the following Amazon EC2 permissions:

- **ec2:CreateTags** – Add tags to EBS snapshots and AMIs to help identify and categorize the resources.
- **ec2:DescribeInstanceAttribute** – Retrieve the EBS volumes and corresponding block device mappings that are attached to the target instance.
- **ec2:CreateSnapshots** – Create snapshots of EBS volumes.
- **ec2:CreateImage** – Create an AMI from a running EC2 instance.
- **ec2:DescribeImages** – Retrieve the information for EC2 AMIs and snapshots.
- **ec2:DescribeSnapshots** – Determine the create time and status of snapshots to verify application consistency.

Policy example

The following is an example of the AWSEC2VssSnapshotPolicy policy.

```json
{

    "arn:aws:ec2:*:*:snapshot/*",
    "arn:aws:ec2:*:*:image/*"
  ],
  "Condition": {
    "StringEquals": {
      "ec2/CreateAction": [
        "CreateImage",
        "CreateSnapshots"
      ]
    }
  }
},
{
  "Sid": "CreateTagsAfterResourceCreation",
  "Effect": "Allow",
  "Action": "ec2:CreateTags",
  "Resource": ["arn:aws:ec2:*:*:image/*"]
}
Streamline permissions for specific use cases (advanced)

The AWSEC2VssSnapshotPolicy managed policy includes permissions for all of the ways that you can create VSS-enabled snapshots. You can create a custom policy that includes only the permissions that you need.

**Use case: Create AMI, Use case: Use AWS Backup service**

If you exclusively use the CreateAmi option, or if you create VSS-enabled snapshots only through the AWS Backup service, then you can streamline the policy statements as follows.

- Omit policy statements identified by the following statement IDs (SIDs):
  - CreateSnapshotsWithTag
  - CreateSnapshotsAccessInstance
• CreateSnapshotsAccessVolume

• Adjust the CreateTagsOnResourceCreation statement as follows:
  • Remove arn:aws:ec2:*::*:snapshot/* from the resources.
  • Remove CreateSnapshots from the ec2:CreateAction condition.

• Adjust the CreateTagsAfterResourceCreation statement to remove
  arn:aws:ec2:*::*:snapshot/* from the resources.

• Adjust the DescribeImagesAndSnapshots statement to remove
  ec2:DescribeSnapshots from the statement action.

Use case: Snapshot only

If you don’t use the CreateAmi option, then you can streamline the policy statements as follows.

• Omit policy statements identified by the following statement IDs (SIDs):
  • CreateImageAccessInstance
  • CreateImageWithTag

• Adjust the CreateTagsOnResourceCreation statement as follows:
  • Remove arn:aws:ec2:*::*:image/* from the resources.
  • Remove CreateImage from the ec2:CreateAction condition.

• Adjust the CreateTagsAfterResourceCreation statement to remove
  arn:aws:ec2:*::*:image/* from the resources.

• Adjust the DescribeImagesAndSnapshots statement to remove
  ec2:DescribeImages from the statement action.

⚠️ Note

To ensure that your customized policy performs as expected, we recommend that you regularly review and incorporate updates to the managed policy.

Legacy policy (no longer supported)

The legacy policy that grants permission for VSS-enabled snapshots includes the IAM permissions that were recommended prior to the release of the AWSEC2VssSnapshotPolicy managed policy.
If you've configured an instance role with the legacy policy, you can continue using it. However, to ensure that your policy stays current with the latest IAM best practices and scopes policy statements accordingly, we recommend that you replace the legacy policy with the AWSEC2VssSnapshotPolicy managed policy.

**Policy example**

The following policy example uses the `ec2:DescribeInstanceAttribute` that's supported in AwsVssComponents package versions 2.2.1 and later. If you have an older version of the AwsVssComponents package installed, you should replace that with the `ec2:DescribeInstances` action.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": "ec2:CreateTags",
            "Resource": [
                "arn:aws:ec2::*:snapshot/*",
                "arn:aws:ec2::*:image/*"
            ]
        },
        {
            "Effect": "Allow",
            "Action": [
                "ec2:DescribeInstanceAttribute",
                "ec2:CreateSnapshot",
                "ec2:CreateSnapshots",
                "ec2:CreateImage",
                "ec2:DescribeImages",
                "ec2:DescribeSnapshots"
            ],
            "Resource": "*"
        }
    ]
}
```

For more information about IAM managed policies, see [AWS managed policies](https://docs.aws.amazon.com/IAM/latest/UserGuide/reference_policies-managed.html) in the *IAM User Guide*. 
VSS components

To create application-consistent snapshots on Windows operating systems, the `AwsVssComponents` package must be installed on the instance. The package contains an on-instance EC2 VSS Agent that functions as the VSS requester, and an EC2 VSS provider for EBS volumes.

There are several ways that you can install the component onto an existing instance:

- (Recommended) Run the `AWSEC2-VssInstallAndSnapshot` command document (recommended). This automatically installs or updates if needed every time it runs.
- Manually install VSS components on an instance.
- Update VSS components on your instances on a schedule.

You can also create an AMI with EC2 Image Builder that uses the `aws-vss-components-windows` managed component to install the `AwsVssComponents` package for the image. The managed component uses AWS Systems Manager Distributor to install the package. After Image Builder creates the image, every instance that you launch from the associated AMI will have the VSS package installed on it. For more information about how you can create an AMI with the VSS package installed, see Distributor package managed components for Windows in the EC2 Image Builder User Guide.

Contents

- Manually install VSS components on an instance
- Update VSS components on your instances on a schedule

Manually install VSS components on an instance

Your EC2 Windows instance must have VSS components installed before you can create application-consistent snapshots with Systems Manager. If you don't run the `AWSEC2-VssInstallAndSnapshot` command document to automatically install or update the package every time you create application-consistent snapshots, you must manually install the package.

You must also install manually if you plan to use one of the following methods to create application-consistent snapshots from your EC2 instance.

- Create VSS snapshots using AWS Backup
Create VSS snapshots using Amazon Data Lifecycle Manager

If you need to perform a manual install, we recommend that you use the latest AWS VSS component package to improve the reliability and performance of application-consistent snapshots on your EC2 Windows instances.

Note

To automatically install or update the AwsVssComponents package whenever you create application-consistent snapshots, we recommend that you use Systems Manager to run the AWSEC2-VssInstallAndSnapshot document. For more information, see Run the AWSEC2-VssInstallAndSnapshot command document (recommended).

To install the VSS components on an Amazon EC2 Windows instance, follow the steps for your preferred environment.

Console

To install the VSS components using SSM Distributor

2. In the navigation pane, choose Run Command.
3. Choose Run command.
4. For Command document, choose the button next to AWS-ConfigureAWSPackage.
5. For Command parameters, do the following:
   a. Verify that Action is set to Install.
   b. For Name, enter AwsVssComponents.
   c. For Version, enter a version or leave the field empty so that Systems Manager installs the latest version.
6. For Targets, identify the instances on which you want to run this operation by specifying tags or selecting instances manually.
Note

If you choose to select instances manually, and an instance you expect to see is not included in the list, see Where Are My Instances? in the AWS Systems Manager User Guide for troubleshooting tips.

7. For Other parameters:

- (Optional) For Comment, type information about this command.
- For Timeout (seconds), specify the number of seconds for the system to wait before failing the overall command execution.

8. (Optional) For Rate control:

- For Concurrency, specify either a number or a percentage of instances on which to run the command at the same time.

Note

If you selected targets by choosing Amazon EC2 tags, and you are not certain how many instances use the selected tags, then limit the number of instances that can run the document at the same time by specifying a percentage.

- For Error threshold, specify when to stop running the command on other instances after it fails on either a number or a percentage of instances. For example, if you specify three errors, then Systems Manager stops sending the command when the fourth error is received. Instances still processing the command might also send errors.

9. (Optional) For Output options section, if you want to save the command output to a file, select the box next to Enable writing to an S3 bucket. Specify the bucket and (optional) prefix (folder) names.

Note

The S3 permissions that grant the ability to write the data to an S3 bucket are those of the instance profile assigned to the instance, not those of the user performing this task. For more information, see Create an IAM Instance Profile for Systems Manager in the AWS Systems Manager User Guide.
10. (Optional) Specify options for **SNS notifications**.

   For information about configuring Amazon SNS notifications for Run Command, see [Configuring Amazon SNS Notifications for AWS Systems Manager](#).

11. Choose **Run**.

AWS CLI

Use the following procedure to download and install the AwsVssComponents package on your instances by using Run Command from the AWS CLI. The package installs two components: a VSS requester and a VSS provider. The system copies these components to a directory on the instance, and then registers the provider DLL as a VSS provider.

**To install the VSS package by using the AWS CLI**

- Run the following command to download and install the required VSS components for Systems Manager.

```bash
aws ssm send-command "--document-name "AWS-ConfigureAWSPackage" " --instance-ids "i-01234567890abcdef" " --parameters '{"action":['"Install"'],"name":['"AwsVssComponents"]}'
```

PowerShell

Use the following procedure to download and install the AwsVssComponents package on your instances by using Run Command from the Tools for Windows PowerShell. The package installs two components: a VSS requester and a VSS provider. The system copies these components to a directory on the instance, and then registers the provider DLL as a VSS provider.

**To install the VSS package using the AWS Tools for Windows PowerShell**

- Run the following command to download and install the required VSS components for Systems Manager.

```powershell
Send-SSMCommand -DocumentName AWS-ConfigureAWSPackage -InstanceId "i-01234567890abcdef" -Parameter @{"action"="Install";'name'="AwsVssComponents"}
```
Verify the signature on AWS VSS components

Use the following procedure to verify the signature on the AwsVssComponents package.

1. Connect to your Windows instance. For more information, see Connect to your Windows instance.
2. Navigate to C:\Program Files\Amazon\AwsVssComponents.
3. Open the context (right-click) menu for ec2-vss-agent.exe, and then choose Properties.
4. Navigate to the Digital Signatures tab and verify that the name of the signer is Amazon Web Services Inc.
5. Use the preceding steps to verify the signature on Ec2VssInstaller and Ec2VssProvider.dll.

Update VSS components on your instances on a schedule

We recommend that you keep the VSS components updated with the latest recommended version. There are several different ways that you can update components when a new version of the AwsVssComponents package is released.

Update methods

- You can repeat the steps described in Manually install VSS components on an instance when a new version of the AWS VSS components is released.
- You can configure a Systems Manager State Manager association to automatically download and install new or updated VSS components when the AwsVssComponents package becomes available.
- You can automatically install or update the AwsVssComponents package whenever you create application-consistent snapshots, when you use Systems Manager to run the AWSEC2-VssInstallAndSnapshot document.

Note

We recommend that you use Systems Manager to run the AWSEC2-VssInstallAndSnapshot command document, which automatically installs or updates the AwsVssComponents package before it creates the application-consistent snapshots.
To create a Systems Manager State Manager association, follow the steps for your preferred environment.

**Console**

**To create a State Manager association using the console**

2. In the navigation pane, choose **State Manager**.
   
   Or, if the Systems Manager homepage opens first, open the navigation pane and then choose **State Manager**.
3. Choose **Create association**.
4. In the **Name** field, enter a descriptive name.
5. In the **Document** list, choose **AWS-ConfigureAWSPackage**.
6. In the **Parameters** section, choose **Install** from the **Action** list.
7. For **Installation type**, choose **Uninstall and reinstall**.
8. In the **Name** field, enter **AwsVssComponents**. You can keep the **Version** and **Additional Arguments** fields empty.
9. In the **Targets** section, choose an option.

   **Note**
   
   If you choose to target instances by using tags, and you specify tags that map to Linux instances, the association succeeds on the Windows instance but fails on the Linux instances. The overall status of the association shows **Failed**.

10. In the **Specify schedule** section, choose an option.
11. In the **Advanced options** section, for **Compliance severity**, choose a severity level for the association. For more information, see [About State Manager association compliance](#). For **Change Calendars**, select a preconfigured change calendar. For more information, see about [AWS Systems Manager Change Calendar](#).
12. For **Rate control**, do the following:

- For **Concurrency**, specify either a number or a percentage of managed nodes on which to run the command at the same time.

- For **Error threshold**, specify when to stop running the command on other managed nodes after it fails on either a number or a percentage of nodes.

13. (Optional) For **Output options**, to save the command output to a file, select **Enable writing output to S3**. Enter the bucket and prefix (folder) names in the boxes.

14. Choose **Create association**, and then choose **Close**. The system attempts to create the association on the instances and immediately apply the state.

---

**Note**

If EC2 instances for Windows Server show a status of **Failed**, verify that the SSM Agent is running on the instance, and verify that the instance is configured with an AWS Identity and Access Management (IAM) role for Systems Manager. For more information, see [Setting up AWS Systems Manager](#).

---

**AWS CLI**

You can run **create-association** AWS CLI command to update a Distributor package on a schedule without taking the associated application offline. Only new or updated files in the package are replaced.

**To create a State Manager association using the AWS CLI**

1. Install and configure the AWS CLI, if you haven't already. For information, see [Install or update the latest version of the AWS CLI](#).

2. Run the following command to create an association. The value of **--name**, the document name, is always AWS-ConfigureAWSPackage. The following command uses the key InstanceIds to specify target instances.

    ```bash
    aws ssm create-association \
    --name "AWS-ConfigureAWSPackage" \
    --parameters '{"action":"Install","installationType":"Uninstall and reinstall","name":"AwsVssComponents"}' \
    ```

---

**Prerequisites** 2605
Create VSS-enabled EBS snapshots

This section includes the steps to create VSS-enabled EBS snapshots.

You can create VSS-enabled EBS snapshots of EBS volumes attached to your EC2 instances. Before you attempt to create a VSS-enabled snapshot, ensure that the Prerequisites are met.

Topics

- Create VSS snapshots with AWS Systems Manager command documents
- Create VSS snapshots using AWS Backup
- Create VSS snapshots using Amazon Data Lifecycle Manager

Create VSS snapshots with AWS Systems Manager command documents

You can use AWS Systems Manager command documents to create VSS-enabled snapshots. The following content introduces the command documents that are available, and the runtime parameters that the documents use to create your snapshots.

Before you use any of the Systems Manager command documents, ensure that you've met all Prerequisites.

Topics

- Parameters for Systems Manager VSS snapshot documents
- Run Systems Manager VSS snapshot command documents

Parameters for Systems Manager VSS snapshot documents

The Systems Manager documents that create VSS snapshots all use the following parameters, except where noted:

```
--targets [{{"Key":"InstanceIds","Values":["i-01234567890abcdef","i-000011112222abcde"]}}]
```
ExcludeBootVolume (string, optional)

This setting excludes boot volumes from the backup process if you create snapshots. To exclude boot volumes from your snapshots, set **ExcludeBootVolume** to **True**, and **CreateAmi** to **False**.

If you create an AMI for your backup, this parameter should be set to **False**. The default value for this parameter is **False**.

NoWriters (string, optional)

To exclude application VSS writers from the snapshot process, set this parameter to **True**. Excluding application VSS writers can help you resolve conflicts with third-party VSS backup components. The default value for this parameter is **False**.

CopyOnly (string, optional)

If you use the native SQL Server backup in addition to AWS VSS, performing a Copy-only backup prevents AWS VSS from breaking the native differential backup chain. To perform a Copy-only backup operation, set this parameter to **True**.

The default value for this parameter is **False**, which causes AWS VSS to perform a full backup operation.

CreateAmi (string, optional)

To create a VSS-enabled Amazon Machine Image (AMI) to back up your instance, set this parameter to **True**. The default value for this parameter is **False**, which backs up your instance with an EBS snapshot instead.

For more information about creating an AMI from an instance, see [Create an Amazon EBS-backed AMI](#).

AmiName (string, optional)

If the **CreateAmi** option is set to **True**, specify the name of the AMI that the backup creates.

description (string, optional)

Specify a description for the snapshots or image that this process creates.

tags (string, optional)

We recommend that you tag your snapshots and images to help you locate and manage your resources, for example, to restore volumes from a list of snapshots. The system adds the Name key, with a blank value where you can specify the name that you want to apply to your output snapshots or images.
If you want to specify additional tags, separate tags with a semicolon in between. For example, Key=Environment,Value=Test;Key=User,Value=TestUser1.

By default, the system adds the following reserved tags for VSS-enabled snapshots and images.

- **Device** – For VSS-enabled snapshots, this is the device name of the EBS volume that the snapshot captures.
- **AppConsistent** – This tag indicates the successful creation of a VSS-enabled snapshot or AMI.
- **AwsVssConfig** – This identifies snapshots and AMIs that are created with VSS enabled. The tag includes meta information such as the AwsVssComponents version.

⚠️ **Warning**
Specifying any of these reserved tags in your parameter list will cause an error.

**executionTimeout** (string, optional)

Specify the maximum time in seconds to run the snapshot creation process on the instance, or to create an AMI from the instance. Increasing this timeout allows the command to wait longer for VSS to start its freeze and complete tagging of the resources it creates. This timeout only applies to the snapshot or AMI creation steps. The initial step to install or update the AwsVssComponents package is not included in the timeout.

**CollectDiagnosticLogs** (string, optional)

To collect more information during snapshot and AMI creation steps, set this parameter to "True". The default value for this parameter is "False". Consolidated diagnostic logs are saved as a .zip format archive at the following location on your instance:

C:\ProgramData\Amazon\AwsVss\Logs\timestamp.zip

**VssVersion** (string, optional)

For the AWSEC2-VssInstallAndSnapshot document only, you can specify the VssVersion parameter to install a specific version of AwsVssComponents package on your instance. Leave this parameter blank to install the recommended default version.

If the specified version of the AwsVssComponents package is already installed, the script skips the install step and moves on to the backup step. For a list of AwsVssComponents package versions and operating support, see [AWS VSS solution version history](#).
Run Systems Manager VSS snapshot command documents

You can create VSS-enabled EBS snapshots with AWS Systems Manager command documents as follows.

Run the AWSEC2-VssInstallAndSnapshot command document (recommended)

When you use AWS Systems Manager to run the AWSEC2-VssInstallAndSnapshot document, the script runs the following steps.

1. The script first installs or updates the AwsVssComponents package on your instance, depending on whether it's already installed.
2. The script creates the application-consistent snapshots after the first step completes.

To run the AWSEC2-VssInstallAndSnapshot document, follow the steps for your preferred environment.

Console

Create VSS-enabled EBS snapshots from the console

2. Select Run Command from the navigation pane. This shows a list of commands that are currently running in your account, if applicable.
3. Choose Run command. This opens a list of command documents that you have access to.
4. Select AWSEC2-VssInstallAndSnapshot from the list of command documents. To streamline results, you can enter all or part of the document name. You can also filter by the owner, by platform types, or by tags.

When you select a command document, details populate below the list.
5. Select Default version at runtime from the Document version list.
6. Configure the Command parameters to define how AWSEC2-VssInstallAndSnapshot will install the AwsVssComponents package and back up with VSS snapshots or an AMI. For parameter details, see Parameters for Systems Manager VSS snapshot documents.
7. For Target selection, specify tags or select instances manually to identify the instances on which to run this operation.
Note

If you select instances manually, and an instance you expect to see is not included in the list, see Where Are My Instances? for troubleshooting tips.

8. For additional parameters to define Systems Manager Run Command behavior such as Rate control, enter values as described in Running commands from the console.

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the Systems Manager command output for details about why the execution failed. If the command successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS volumes.

AWS CLI

You can run the following commands in the AWS CLI to create VSS-enabled EBS snapshots and get the status of your snapshot creation.

Create VSS-enabled EBS snapshots

Run the following command to create VSS-enabled EBS snapshots. To create the snapshots, you must identify the instances with the --instance-ids parameter. For more information about other parameters that you can use, see Parameters for Systems Manager VSS snapshot documents.

```
aws ssm send-command \
    --document-name "AWSEC2-VssInstallAndSnapshot" \
    --instance-ids "i-0123456789abcdef" \
    --parameters '{"ExcludeBootVolume":false,"description":Description,"tags":\
    ["Key=key_name,Value=tag_value"],"VssVersion":[]}'
```

If successful, the command document populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed.
Get command status

To get the current status of the snapshots, run the following command using the command ID returned from `send-command`.

```bash
aws ssm get-command-invocation
--instance-ids "i-01234567890abcdef" \
--command-id "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" \
--plugin-name "CreateVssSnapshot"
```

PowerShell

Run the following commands with AWS Tools for Windows PowerShell to create VSS-enabled EBS snapshots and get the current runtime status for the creation of your output. Specify parameters described in the prior list to modify the behavior of the snapshot process.

**Create VSS-enabled EBS snapshots with Tools for Windows PowerShell**

Run the following command to create VSS-enabled EBS snapshots or AMIs.

```powershell
Send-SSMCommand -DocumentName "AWSEC2-VssInstallAndSnapshot" -InstanceId "i-01234567890abcdef" -Parameter @{'ExcludeBootVolume'='False';'description'='a_description' ;'tags'='Key=key_name,Value=tag_value';'VssVersion'=''}
```

Get command status

To get the current status of the snapshots, run the following command using the command ID returned from `Send-SSMCommand`.

```powershell
Get-SSMCommandInvocationDetail -InstanceId "i-01234567890abcdef" -CommandId "a1b2c3d4-5678-90ab-cdef-EXAMPLE11111" -PluginName "CreateVssSnapshot"
```

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for `AppConsistent`. If the command execution failed, view the command output for details about why the execution failed.
Run the AWSEC2-CreateVssSnapshot command document

To run the AWSEC2-CreateVssSnapshot document, follow the steps for your preferred environment.

Console

Create VSS-enabled EBS snapshots from the console

2. Select Run Command from the navigation pane. This shows a list of commands that are currently running in your account, if applicable.
3. Choose Run command. This opens a list of command documents that you have access to.
4. Select AWSEC2-CreateVssSnapshot from the list of command documents. To streamline results, you can enter all or part of the document name. You can also filter by the owner, by platform types, or by tags.

   When you select a command document, details populate below the list.

5. Select Default version at runtime from the Document version list.
6. Configure the Command parameters to define how AWSEC2-CreateVssSnapshot will back up with VSS snapshots or an AMI. For parameter details, see Parameters for Systems Manager VSS snapshot documents.
7. For Target selection, specify tags or select instances manually to identify the instances on which to run this operation.

   Note
   
   If you select instances manually, and an instance you expect to see is not included in the list, see Where Are My Instances? for troubleshooting tips.

8. For additional parameters to define Systems Manager Run Command behavior such as Rate control, enter values as described in Running commands from the console.

   If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed,
view the Systems Manager command output for details about why the execution failed. If the command successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS volumes.

AWS CLI

You can run the following command in the AWS CLI to create VSS-enabled EBS snapshots.

**Create VSS-enabled EBS snapshots**

Run the following command to create VSS-enabled EBS snapshots. To create the snapshots, you must identify the instances with the `--instance-ids` parameter. For more information about other parameters that you can use, see Parameters for Systems Manager VSS snapshot documents.

```
aws ssm send-command \
   --document-name "AWSEC2-CreateVssSnapshot" \
   --instance-ids "i-01234567890abcdef" \
   --parameters '{"ExcludeBootVolume":["False"],"description":["Description"],"tags": ["Key=key_name,Value=tag_value"]}'
```

If successful, the command document populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed.

PowerShell

Run the following command with AWS Tools for Windows PowerShell to create VSS-enabled EBS snapshots.

**Create VSS-enabled EBS snapshots with Tools for Windows PowerShell**

Run the following command to create VSS-enabled EBS snapshots. To create the snapshots, you must identify the instances with the `InstanceId` parameter. You can specify more than one instance to create snapshots for. For more information about other parameters that you can use, see Parameters for Systems Manager VSS snapshot documents.

```
Send-SSMCommand -DocumentName AWSEC2-CreateVssSnapshot -InstanceId "i-01234567890abcdef" -Parameter @{"ExcludeBootVolume"='False';"description"='a_description'}
```
If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed. If the command successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS snapshots.

Run command documents for a Windows Failover Cluster with shared EBS storage

You can use any of the command line procedures described in the previous section to create a VSS-enabled snapshot. The command document (AWSEC2-VssInstallAndSnapshot or AWSEC2-CreateVssSnapshot) must run on the primary node in your cluster. The document will fail on the secondary nodes as they don't have access to the shared disks. If your primary and secondary change dynamically, you can run the AWS Systems Manager Run Command document on multiple nodes with the expectation that the command will succeed on the primary node and fail on secondary nodes.

Run the AWSEC2-ManageVssIO SSM command document

You can use the following script and the pre-defined AWSEC2-ManageVssIO SSM document to temporarily pause I/O, create VSS-enabled EBS snapshots, and restart I/O. This process runs in the context of the user who runs the command. If the user has sufficient permission to create and tag snapshots, then AWS Systems Manager can create and tag VSS-enabled EBS snapshots without the need for the additional IAM snapshot role on the instance.

In contrast, the command document (AWSEC2-VssInstallAndSnapshot or AWSEC2-CreateVssSnapshot) requires that you assign the IAM snapshot role to each instance for which you want to create EBS snapshots. If you don’t want to provide additional IAM permissions to your instances for policy or compliance reasons, then you can use the following script.

Before you begin

Note the following important details about this process:

- This process uses a PowerShell script (CreateVssSnapshotAdvancedScript.ps1) to take snapshots of all volumes on the instances you specify, except root volumes. If you need to take snapshots of root volumes, then you must use the AWSEC2-CreateVssSnapshot SSM document.
• The script calls the AWSEC2-ManageVssIO document twice. The first time with the Action parameter set to Freeze, which pauses all I/O on the instances. The second time, the Action parameter is set to Thaw, which forces I/O to resume.

• Don't attempt to use the AWSEC2-ManageVssIO document without using the CreateVssSnapshotAdvancedScript.ps1 script. Microsoft's VSS framework requires that the Freeze and Thaw actions be called no more than ten seconds apart, and manually calling these actions without the script could result in errors.

**To create VSS-enabled EBS snapshots by using the AWSEC2-ManageVssIO SSM document**

1. Download the CreateVssSnapshotAdvancedScript.zip file and extract the file contents.
2. Open CreateVssSnapshotAdvancedScript.ps1 in a text editor, edit the sample call at the bottom of the script with a valid EC2 instance ID, snapshot description, and desired tag values, and then run the script from PowerShell.

If successful, the command populates the list of EBS snapshots with the new snapshots. You can locate these snapshots in the list of EBS snapshots by searching for the tags you specified, or by searching for AppConsistent. If the command execution failed, view the command output for details about why the execution failed. If the command was successfully completed, but a specific volume backup failed, you can troubleshoot the failure in the list of EBS volumes.

⚠️ **Note**

To automate backups, you can create an AWS Systems Manager maintenance window task that uses the AWSEC2-VssInstallAndSnapshot document. For more information, see [Working with Maintenance Windows (Console)](https://docs.aws.amazon.com/solutions-manager/latest/userguide/working-with-maintenance-windows-console.html) in the [AWS Systems Manager User Guide](https://docs.aws.amazon.com/solutions-manager/latest/userguide/).  

**Create VSS snapshots using AWS Backup**

You can create a VSS backup when using AWS Backup by enabling VSS in the console or CLI. Ensure that you have met the [prerequisites](https://docs.aws.amazon.com/backup/latest/guide/prerequisites.html) before you create the VSS-enabled backup plan. For more information, see [Creating Windows VSS backups](https://docs.aws.amazon.com/backup/latest/guide/creating-windows-vss-backups.html) in the [AWS Backup Developer Guide](https://docs.aws.amazon.com/backup/latest/guide).
Create VSS snapshots using Amazon Data Lifecycle Manager

You can create VSS snapshots using Amazon Data Lifecycle Manager by enabling pre and post scripts in your snapshot lifecycle policies. For more information, see https://docs.aws.amazon.com/ebs/latest/userguide/automate-app-consistent-backups.html.

Troubleshoot Windows VSS based EBS snapshots

Before you try any other troubleshooting steps, we recommend that you verify the following details.

- Ensure that you've met all Prerequisites.
- Verify that you're using the latest Windows OS version support of the AwsVssComponents package for your operating system. The issue that you've observed might have been addressed in newer versions.

Topics

- Check log files
- Collect additional diagnostic logs
- Use VSS on instances with proxy configured
- Error: Thaw pipe connection timed out, error on thaw, timeout waiting for VSS Freeze, or other timeout errors
**Error:** Cannot invoke method. Method invocation is supported only on core types in this language mode

## Check log files

If you experience problems or receive error messages when you create VSS-enabled EBS snapshots, you can view the command output in the Systems Manager console.

For Systems Manager documents that create VSS snapshots, you can set the `CollectDiagnosticLogs` parameter to "True" at runtime. When the `CollectDiagnosticLogs` parameter is set to "True", VSS collects additional logs to aid in debugging. For more information, see [Collect additional diagnostic logs](#).

If you collect diagnostic logs, the Systems Manager document stores them on your instance at the following location: `C:\ProgramData\Amazon\AwsVss\Logs\timestamp.zip`. The default for the `CollectDiagnosticLogs` parameter is "False".

![Note]

For additional debugging help, you can send the `.zip` file to AWS Support.

The following additional logs are available, whether you collect diagnostic logs or not:

- `%ProgramData%\Amazon\SSM\InstanceData\InstanceID\document\orchestration\SSMCommandID\awsrunPowerShellScript\runPowerShellScript\stdout`
- `%ProgramData%\Amazon\SSM\InstanceData\InstanceID\document\orchestration\SSMCommandID\awsrunPowerShellScript\runPowerShellScript\stderr`

You can also open the Event Viewer Windows application and choose Windows Logs, Application to view additional logs. To see events specifically from the EC2 Windows VSS Provider and the Volume Shadow Copy Service, filter by Source on the terms Ec2VssSoftwareProvider and VSS.

If you're using Systems Manager with VPC endpoints, and the Systems Manager SendCommand API action (Run Command in the console) failed, verify that you configured the following endpoint correctly: `com.amazonaws.region.ec2`.

Without the Amazon EC2 endpoint defined, the call to enumerate attached EBS volumes fails, which causes the Systems Manager command to fail. For more information about setting up VPC
endpoints with Systems Manager, see Create a Virtual Private Cloud Endpoint in the AWS Systems Manager User Guide.

**Collect additional diagnostic logs**

To collect additional diagnostic logs when you use the Systems Manager send command to run the VSS snapshot document, set the `CollectDiagnosticLogs` input parameter to "True" at runtime. We recommend that you set this parameter to "True" when you troubleshoot.

To see a command line example, select one of the following tabs.

**AWS CLI**

The following example runs the AWSEC2-CreateVssSnapshot Systems Manager document in the AWS CLI:

```
aws ssm send-command \
   --document-name "AWSEC2-CreateVssSnapshot" \
   --instance-ids "i-1234567890abcdef0" \
   --parameters '{"description":"Example - create diagnostic logs at runtime.","tags":{"Key=tag_name,Value=tag_value"},"CollectDiagnosticLogs": ["True"]}'
```

**PowerShell**

The following example runs the AWSEC2-CreateVssSnapshot Systems Manager document in PowerShell:

```
Send-SSMCommand -DocumentName AWSEC2-CreateVssSnapshot -InstanceId "i-1234567890abcdef0" -Parameter @{'description'='Example - create diagnostic logs at runtime.';'tags'='Key=tag_name,Value=tag_value';'CollectDiagnosticLogs'='True'}
```

**Use VSS on instances with proxy configured**

If you experience problems when creating VSS-enabled EBS snapshots on instances that use a proxy to reach EC2 endpoints, make sure of the following:

- The proxy is configured so that the EC2 service endpoints in the instance’s Region and IMDS are reachable by AWS Tools for Windows PowerShell running as SYSTEM.
• AwsVssComponents version 2.0.1 or later is installed. Starting with AwsVssComponents version 2.0.1, the EC2 VSS provider supports using the system's configured WinHTTP proxy. For more information about configuring WinHTTP proxy, see Netsh Commands for Windows Hypertext Transfer Protocol (WINHTTP) on the Microsoft website.

Error: Thaw pipe connection timed out, error on thaw, timeout waiting for VSS Freeze, or other timeout errors

The EC2 Windows VSS Provider might time out due to activity or services on the instance preventing VSS-enabled snapshots from proceeding in a timely manner. The Windows VSS Framework provides a non-configurable 10-second window during which communication to the file system is paused. During this time, AWSEC2-CreateVssSnapshot snapshots your volumes.

The following issues can cause the EC2 Windows VSS Provider to run into time limits during a snapshot:

• Excessive I/O to a volume
• Slow responsiveness of the EC2 API on the instance
• Fragmented volumes
• Incompatibility with some antivirus software
• Issues with a VSS Application writer
• When Module Logging is enabled for a large number of PowerShell modules, that can cause PowerShell scripts to run slowly

Most timeout issues that occur when you run the AWSEC2-CreateVssSnapshot command document are related to the workload on the instance being too high at the time of the backup. The following actions can help you take a successful snapshot:

• Retry the AWSEC2-CreateVssSnapshot command to see if the snapshot attempt is successful. If retrying succeeds in some cases, reducing the instance load might make snapshots more successful.
• Wait a while for the workload on the instance to decrease, and retry the AWSEC2-CreateVssSnapshot command. Alternatively, you can attempt snapshots when the instance is known to be under low stress.
• Attempt VSS snapshots when the antivirus software on the system is turned off. If this resolves the issue, refer to the antivirus software instructions and configure it to allow VSS snapshots.
• If there is a high volume of Amazon EC2 API calls in your account within the same Region where you're running a snapshot, API throttling might delay snapshot operations. To reduce throttling impact, use the latest AwsVssComponents package (version 2.1.0 and above, with the prerequisite permissions). This package utilizes the EC2 CreateSnapshots API action to reduce the number of mutating actions like per-volume snapshot creation and tagging.

• If you have multiple AWSEC2-CreateVssSnapshot command scripts running at the same time, you can take the following steps to reduce concurrency issues.
  - Consider scheduling snapshots during periods of lower API activity.
  - If you use Run Command in the Systems Manager console (or SendCommand in the API) to run the command script, you can use Systems Manager rate controls to reduce concurrency.

    You can also use Systems Manager rate controls to reduce concurrency for services like AWS Backup that use Systems Manager to run the command script.

  - Run the command vssadmin list writers in a shell and see if it reports any errors in the Last error field for any writers on the system. If any writers report a time out error, consider retrying snapshots when the instance is under less load.

  - When you use smaller instance types like t2 | t3 | t3a.nano or t2 | t3 | t3a.micro, timeouts due to memory and CPU constraints can occur. The following actions might help reduce timeout issues.
    - Try closing memory or CPU intensive applications before taking snapshots.
    - Try taking snapshots during periods of lower instance activity.

**Error: Cannot invoke method. Method invocation is supported only on core types in this language mode**

You will encounter this error when the PowerShell language mode is not set to FullLanguage. The AWSEC2-CreateVssSnapshot and AWSEC2-ManageVssIo SSM documents require PowerShell to be configured to FullLanguage mode.

To verify the language mode, run the following command on the instance in a PowerShell console:

```powershell
$ExecutionContext.SessionState.LanguageMode
```

For more information about language modes, see [about_Language_Modes](https://docs.microsoft.com/en-us/powershell/module/microsoft.powershell.core/about/about_Language_Modes) in the Microsoft documentation.
Restore EBS volumes from VSS-enabled EBS snapshots

You can use the `RestoreVssSnapshotSampleScript.ps1` script to restore volumes on an instance from VSS-enabled EBS snapshots. This script performs the following tasks:

- Stops an instance
- Removes all existing drives from the instance (except the boot volume, if it was excluded)
- Creates new volumes from the snapshots
- Attaches the volumes to the instance by using the device ID tag on the snapshot
- Restarts the instance

⚠️ Important

The following script detaches all volumes attached to an instance, and then creates new volumes from a snapshot. Make sure that you have properly backed-up the instance. The old volumes are not deleted. If you want, you can edit the script to delete the old volumes.

To restore volumes from VSS-enabled EBS snapshots

1. Download the `RestoreVssSnapshotSampleScript.zip` file and extract the file contents.
2. Open `RestoreVssSnapshotSampleScript.ps1` in a text editor and edit the sample call at the bottom of the script with a valid EC2 instance ID and EBS snapshot ID, and then run the script from PowerShell.

AWS VSS solution version history

**AwsVssComponents package versions**

The following table describes the released versions of the AWS VSS component package.
<table>
<thead>
<tr>
<th>Version</th>
<th>Details</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.3.3</td>
<td>Updated the VSS agent to ensure that the Ec2VssProvider is used during snapshot creation.</td>
<td>June 25, 2024</td>
</tr>
<tr>
<td>2.3.2</td>
<td>Fixed a case where VSS provider registration is not removed on uninstallation.</td>
<td>May 9, 2024</td>
</tr>
<tr>
<td>2.3.1</td>
<td>Added new default tag AwsVssConfig to identify snapshots and AMIs created by AWS VSS.</td>
<td>March 7, 2024</td>
</tr>
<tr>
<td>2.2.1</td>
<td>• Added support for using the DescribeInstanceAttribute API.</td>
<td>January 18, 2024</td>
</tr>
<tr>
<td></td>
<td>• Bug fixes and reliability improvements.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Deprecated support for Windows Server 2012 and 2012 R2. AWS VSS components version 2.2.1 installation on Windows Server 2012 and 2012 R2 will fail. AWS VSS components version 2.1.0 is the last version to support Windows Server 2012 and 2012 R2.</td>
<td></td>
</tr>
<tr>
<td>2.1.0</td>
<td>Added support for using the CreateSnapshots API.</td>
<td>November 6, 2023</td>
</tr>
<tr>
<td>2.0.1</td>
<td>Added support for using the WinHTTP proxy settings.</td>
<td>October 26, 2023</td>
</tr>
<tr>
<td>2.0.0</td>
<td>Added capability to the AWS VSS component to create snapshots and AMIs, which enables compatibility with PowerShell module logging, script block logging, and transcription features.</td>
<td>April 28, 2023</td>
</tr>
<tr>
<td>1.3.2.0</td>
<td>Fixed a case where installation failure is not reported correctly.</td>
<td>May 10, 2022</td>
</tr>
<tr>
<td>Version</td>
<td>Details</td>
<td>Release date</td>
</tr>
<tr>
<td>---------</td>
<td>---------</td>
<td>--------------</td>
</tr>
</tbody>
</table>
| 1.3.1.0 | • Fixed snapshots failing on domain controllers in relation to an NTDS VSS writer logging error.  
• Fixed VSS agent error when uninstalling version 1.0 VSS provider. | February 6, 2020 |
| 1.3.00 | • Improved logging by reducing unwanted verbosity.  
• Fixed regionalization issues during installation.  
• Fixed return codes for some provider registration error conditions.  
• Fixed various installation issues. | March 19, 2019 |
| 1.2.00 | • Added command line parameters `-nw` (no-writers) and `-copy` (copy-only) to agent.  
• Fixed EventLog errors caused by improper memory allocation calls. | November 15, 2018 |
| 1.1 | Fixed AWS VSS components that were being used incorrectly as the default Windows Backup and Restore provider. | December 12, 2017 |
| 1.0 | Initial release. | November 20, 2017 |

**Windows OS version support**

The following table shows which AWS VSS solution versions you should run on each version of Windows Server on Amazon EC2.
<table>
<thead>
<tr>
<th>Windows Server version</th>
<th>AwsVssComponents version</th>
<th>AWSEC2-VsInstallAndSnapshot version name</th>
<th>AWSEC2-CreoteVssSnapshot version name</th>
<th>AWSEC2-ManageVssIO version name</th>

**Object storage, file storage, and file caching on Amazon EC2**

Cloud file storage is a method for storing data in the cloud that provides servers and applications access to data through shared file systems. This compatibility makes cloud file storage ideal for workloads that rely on shared file systems and provides simple integration without code changes.
There are many file storage solutions that exist, ranging from a single node file server on a compute instance using block storage as the underpinnings with no scalability or few redundancies to protect the data, to a do-it-yourself clustered solution, to a fully-managed solution. The following content introduces some of the storage services provided by AWS for use with Amazon EC2 instances.

Contents
- Use Amazon S3 with Amazon EC2 instances
- Use Amazon EFS with Amazon EC2 Linux instances
- Use Amazon FSx with Amazon EC2 instances
- Use Amazon File Cache with Amazon EC2 instances

Use Amazon S3 with Amazon EC2 instances

Amazon Simple Storage Service (Amazon S3) is an object storage service that offers industry-leading scalability, data availability, security, and performance. You can use Amazon S3 to store and retrieve any amount of data for a range of use cases, such as data lakes, websites, backups, and big data analytics, from an Amazon EC2 instance or from anywhere over the internet. For more information, see [What is Amazon S3?](#).

Objects are the fundamental entities stored in Amazon S3. Every object stored in Amazon S3 is contained in a bucket. Buckets organize the Amazon S3 namespace at the highest level and identify the account responsible for that storage. Amazon S3 buckets are similar to internet domain names. Objects stored in the buckets have a unique key value and are retrieved using a URL. For example, if an object with a key value `/photos/mygarden.jpg` is stored in the `DOC-EXAMPLE-BUCKET1` bucket, then it is addressable using the URL `https://DOC-EXAMPLE-BUCKET1.s3.amazonaws.com/photos/mygarden.jpg`. For more information, see [How Amazon S3 works](#).

Usage examples

Given the benefits of Amazon S3 for storage, you might decide to use this service to store files and data sets for use with EC2 instances. There are several ways to move data to and from Amazon S3 to your instances. In addition to the examples discussed below, there are a variety of tools that people have written that you can use to access your data in Amazon S3 from your computer or your instance. Some of the common ones are discussed in the AWS forums.
If you have permission, you can copy a file to or from Amazon S3 and your instance using one of the following methods.

**GET or wget (Linux)**

*Note*

This method works for public objects only. If the object is not public, you receive an ERROR 403: Forbidden message. If you receive this error, you must use either the Amazon S3 console, AWS CLI, AWS API, AWS SDK, or AWS Tools for Windows PowerShell, and you must have the required permissions. For more information, see *Identity and access management in Amazon S3* and *Downloading an object* in the *Amazon S3 User Guide*.

The `wget` utility is an HTTP and FTP client that allows you to download public objects from Amazon S3. It is installed by default in Amazon Linux and most other distributions, and available for download on Windows. To download an Amazon S3 object, use the following command, substituting the URL of the object to download.

```
[ec2-user ~]$ wget https://my_bucket.s3.amazonaws.com/path-to-file
```

**AWS Tools for Windows PowerShell (Windows)**

Windows instances have the benefit of a graphical browser that you can use to access the Amazon S3 console directly; however, for scripting purposes, Windows users can also use the AWS Tools for Windows PowerShell to move objects to and from Amazon S3.

Use the following command to copy an Amazon S3 object to your Windows instance.

```
PS C:\> Copy-S3Object -BucketName my_bucket -Key path-to-file -LocalFile my_copied_file.ext
```

**AWS CLI (Linux and Windows)**

The AWS Command Line Interface (AWS CLI) is a unified tool to manage your AWS services. The AWS CLI enables users to authenticate themselves and download restricted items from Amazon S3 and also to upload items. For more information, such as how to install and configure the tools, see the *AWS Command Line Interface detail page*. 
The `aws s3 cp` command is similar to the Unix `cp` command. You can copy files from Amazon S3 to your instance, copy files from your instance to Amazon S3, and copy files from one Amazon S3 location to another.

Use the following command to copy an object from Amazon S3 to your instance.

```
aws s3 cp s3://my_bucket/my_folder/my_file.ext my_copied_file.ext
```

Use the following command to copy an object from your instance back into Amazon S3.

```
aws s3 cp my_copied_file.ext s3://my_bucket/my_folder/my_file.ext
```

The `aws s3 sync` command can synchronize an entire Amazon S3 bucket to a local directory location. This can be helpful for downloading a data set and keeping the local copy up-to-date with the remote set. If you have the proper permissions on the Amazon S3 bucket, you can push your local directory back up to the cloud when you are finished by reversing the source and destination locations in the command.

Use the following command to download an entire Amazon S3 bucket to a local directory on your instance.

```
aws s3 sync s3://remote_S3_bucket local_directory
```

Amazon S3 API

If you are a developer, you can use an API to access data in Amazon S3. You can use this API to help develop your application and integrate it with other APIs and SDKs. For more information, see Code examples for Amazon S3 using AWS SDKs in the Amazon S3 User Guide.

Use Amazon EFS with Amazon EC2 Linux instances

Note

Amazon EFS is not supported on Windows instances.

Amazon EFS provides scalable file storage for use with Amazon EC2. You can use an EFS file system as a common data source for workloads and applications running on multiple instances. For more information, see the Amazon Elastic File System product page.
This tutorial shows you how to create and attach an Amazon EFS file system using the Amazon EFS Quick Create wizard during instance launch. For a tutorial on how to create a file system using the Amazon EFS console, see Getting started with Amazon Elastic File System in the Amazon Elastic File System User Guide.

⚠️ Note

When you create an EFS file system using EFS Quick Create, the file system is created with the following service recommended settings:

- **Automatic backups enabled.**
- **Mount targets in each default subnet** in the selected VPC.
- **General Purpose performance mode.**
- **Bursting throughput mode.**
- **Encryption of data at rest enabled** using your default key for Amazon EFS (aws/elasticfilesystem).
- **Amazon EFS lifecycle management enabled** with a 30-day policy.

**Tasks**

- Create an EFS file system using Amazon EFS Quick Create
- Test the EFS file system
- Delete the EFS file system

Create an EFS file system using Amazon EFS Quick Create

You can create an EFS file system and mount it to your instance when you launch your instance using the Amazon EFS Quick Create feature of the Amazon EC2 launch instance wizard.

**To create an EFS file system using Amazon EFS Quick Create**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. Choose Launch instance.
3. (Optional) Under Name and tags, for Name, enter a name to identify your instance.
4. Under Application and OS Images (Amazon Machine Image), choose a Linux operating system, and then for Amazon Machine Image (AMI), select a Linux AMI.
5. Under **Instance type**, for **Instance type**, select an instance type or keep the default.

6. Under **Key pair (login)**, for **Key pair name**, choose an existing key pair or create a new one.

7. Under **Network settings**, choose **Edit** (at right), and then for **Subnet**, select a subnet.

   **Note**
   You must select a subnet before you can add an EFS file system.

8. Under **Configure storage**, choose **Edit** (at bottom right), and then do the following:

   a. For **File systems**, ensure that **EFS** is selected, and then choose **Create new shared file system**.

   b. For **File system name** enter a name for the Amazon EFS file system, and then choose **Create file system**.

   c. For **Mount point**, specify a custom mount point or keep the default.

   d. To enable access to the file system, select **Automatically create and attach security groups**. By selecting this check box, the following security groups will be automatically created and attached to the instance and the mount targets of the file system:

      • Instance security group – Includes an outbound rule that allows traffic over the NFS 2049 port, but includes no inbound rules.

      • File system mount targets security group – Includes an inbound rule that allows traffic over the NFS 2049 port from the instance security group (described above), and an outbound rule that allows traffic over the NFS 2049 port.

   **Note**
   Alternatively, you can manually create and attach the security groups. If you want to manually create and attach the security groups, clear **Automatically create and attach the required security groups**.

   e. To automatically mount the shared file system when the instance launches, select **Automatically mount shared file system by attaching required user data script**. To view the user data that is automatically generated, expand **Advanced details**, and scroll down to **User data**.
Note

If you added user data before selecting this check box, the original user data is overwritten by the automatically generated user data.

9. Configure any other instance configuration settings as needed.

10. In the **Summary** panel, review your instance configuration, and then choose **Launch instance**.
    
    For more information, see [Launch an instance using the new launch instance wizard](Launch an instance using the new launch instance wizard).

**Test the EFS file system**

You can connect to your instance and verify that the file system is mounted to the directory that you specified (for example, /mnt/efs).

**To verify that the file system is mounted**

1. Connect to your instance. For more information, see [Connect to your Linux instance](Connect to your Linux instance).

2. From the terminal window for the instance, run the **df -T** command to verify that the EFS file system is mounted.

   ```
   $ df -T
   Filesystem     Type          1K-blocks  Used      Available  Use% Mounted
   /dev/xvda1     ext4          8123812  1949800  6073764   25% /
   devtmpfs      devtmpfs       4078468      56  4078412    1% /dev
   tmpfs          tmpfs          4089312       0  4089312    0% /dev/shm
   efs-dns       nfs4        9007199254740992  0  9007199254740992 0% /mnt/efs
   ```

   Note that the name of the file system, shown in the example output as **efs-dns**, has the following form.

   ```
   file-system-id.efs.aws-region.amazonaws.com:
   ```

3. (Optional) Create a file in the file system from the instance, and then verify that you can view the file from another instance.

   a. From the instance, run the following command to create the file.
Delete the EFS file system

If you no longer need your file system, you can delete it.

To delete the file system

2. Select the file system to delete.
3. Choose Actions, Delete file system.
4. When prompted for confirmation, enter the file system ID and choose Delete file system.

Use Amazon FSx with Amazon EC2 instances

The Amazon FSx family of services makes it easy to launch, run, and scale shared storage powered by popular commercial and open-source file systems. You can use the new launch instance wizard to automatically attach the following types of Amazon FSx file systems to your Amazon EC2 instances at launch:

- Amazon FSx for NetApp ONTAP provides fully managed shared storage in the AWS Cloud with the popular data access and management capabilities of NetApp ONTAP.
- Amazon FSx for OpenZFS provides fully managed cost-effective shared storage powered by the popular OpenZFS file system.

Note

- This functionality is available in the new launch instance wizard only. For more information, see [Launch an instance using the new launch instance wizard](https://aws.amazon.com/efs/).
Amazon FSx for Windows File Server and Amazon FSx for Lustre file systems can't be mounted at launch. You must mount these file systems manually after launch.

You can choose to mount an existing file system that you created previously, or you can create a new file system to mount to an instance at launch.

Topics

- Security groups and user data script
- Mount an Amazon FSx file system at launch

Security groups and user data script

When you mount an Amazon FSx file system to an instance using the launch instance wizard, you can choose whether to automatically create and attach the security groups needed to enable access to the file system, and whether to automatically include the user data scripts needed to mount the file system and make it available for use.

Topics

- Security groups
- User data script

Security groups

If you choose to automatically create the security groups that are needed to enable access to the file system, the launch instance wizard creates and attaches two security groups - one security group is attached to the instance, and the other is attached to the file system. For more information about the security group requirements, see FSx for ONTAP file system access control with Amazon VPC and FSx for OpenZFS file system access control with Amazon VPC.

We add the tag Name=instance-sg-1 to the security group that is created and attached to the instance. The value in the tag is automatically incremented each time the launch instance wizard creates a security group for Amazon FSx file systems.

The security group includes the following output rules, but no inbound rules.
Outbound rules

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Port number</th>
<th>Destination</th>
</tr>
</thead>
<tbody>
<tr>
<td>UDP</td>
<td>111</td>
<td>file system security group</td>
</tr>
<tr>
<td>UDP</td>
<td>20001 - 20003</td>
<td>file system security group</td>
</tr>
<tr>
<td>UDP</td>
<td>4049</td>
<td>file system security group</td>
</tr>
<tr>
<td>UDP</td>
<td>2049</td>
<td>file system security group</td>
</tr>
<tr>
<td>UDP</td>
<td>635</td>
<td>file system security group</td>
</tr>
<tr>
<td>UDP</td>
<td>4045 - 4046</td>
<td>file system security group</td>
</tr>
<tr>
<td>TCP</td>
<td>4049</td>
<td>file system security group</td>
</tr>
<tr>
<td>TCP</td>
<td>635</td>
<td>file system security group</td>
</tr>
<tr>
<td>TCP</td>
<td>2049</td>
<td>file system security group</td>
</tr>
<tr>
<td>TCP</td>
<td>111</td>
<td>file system security group</td>
</tr>
<tr>
<td>TCP</td>
<td>4045 - 4046</td>
<td>file system security group</td>
</tr>
<tr>
<td>TCP</td>
<td>20001 - 20003</td>
<td>file system security group</td>
</tr>
<tr>
<td>All</td>
<td>All</td>
<td>file system security group</td>
</tr>
</tbody>
</table>

The security group that is created and attached to the file system is tagged with Name=fsx-sg-1. The value in the tag is automatically incremented each time the launch instance wizard creates a security group for Amazon FSx file systems.

The security group includes the following rules.

Inbound rules

<table>
<thead>
<tr>
<th>Protocol type</th>
<th>Port number</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>

**User data script**

If you choose to automatically attach user data scripts, the launch instance wizard adds the following user data to the instance. This script installs the necessary packages, mounts the file system, and updates your instance settings so that the file system will automatically re-mount whenever the instance restarts.

```bash
#cloud-config
package_update: true
package_upgrade: true
```

Amazon Elastic Compute Cloud

User Guide

Amazon FSx
Mount an Amazon FSx file system at launch

To mount a new or existing Amazon FSx file system at launch

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances and then choose Launch instance to open the launch instance wizard.
3. In the Application and OS Images section, select the AMI to use.
4. In the Instance type section, select the instance type.
5. In the Key pair section, select an existing key pair or create a new one.
6. In the Network settings section, do the following:

   a. Choose Edit.

   b. If you want to mount an existing file system, for Subnet, choose the file system's preferred subnet. We recommend that you launch the instance into the same Availability Zone as the file system's preferred subnet to optimize performance.

If you want to create a new file system to mount to an instance, for Subnet, choose the subnet into which to launch the instance.
Important

You must select a subnet to enable the Amazon FSx functionality in the new launch instance wizard. If you do not select a subnet, you will not be able to mount an existing file system or create a new one.

7. In the Storage section, do the following:
   a. Configure the volumes as needed.
   b. Expand the File systems section and select FSx.
   c. Choose Add shared file system.
   d. For File system, select the file system to mount.

   Note

   The list displays all Amazon FSx for NetApp ONTAP and Amazon FSx for OpenZFS file systems in your account in the selected Region.

   e. To automatically create and attach the security groups needed to enable access to the file system, select Automatically create and attach security groups. If you prefer to create the security groups manually, clear the check box. For more information, see Security groups.

   f. To automatically attach the user data scripts needed to mount the file system, select Automatically mount shared file system by attaching required user data script. If you prefer to provide the user data scripts manually, clear the check box. For more information, see User data script.

8. In the Advanced section, configure the additional instance settings as needed.

9. Choose Launch.

Use Amazon File Cache with Amazon EC2 instances

Amazon File Cache is a fully managed, high-speed cache on AWS that's used to process file data, regardless of where the data is stored. Amazon File Cache serves as a temporary, high-performance storage location for data that's stored in on-premises file systems, AWS file systems, and Amazon Simple Storage Service (Amazon S3) buckets. You can use this capability to make dispersed
datasets available to file-based applications on AWS with a unified view, and at high speeds—sub-
millisecond latencies and high throughput. For more information, see What is Amazon File Cache?.

You can access your cache from your Amazon EC2 instances using the open-source Lustre client. Amazon EC2 instances can access your cache from other Availability Zones within the same Amazon Virtual Private Cloud (Amazon VPC), provided that your networking allows access across subnets within the VPC. After your cache is mounted, you can work with its files and directories as you do when using a local file system.

To get started, see Getting started with Amazon File Cache.
Manage your Amazon EC2 resources

A resource is an entity that you can work with. Amazon EC2 creates resources as you use the features of the service. For example, Amazon EC2 resources include images, instances, fleets, key pairs, and security groups. All Amazon EC2 resource types include attributes that describe the resources. For example, names, descriptions, resource identifiers, and Amazon Resource Names (ARN).

Amazon EC2 resources are specific to the AWS Region or zone in which they reside. You can use a resource ID to find the corresponding resource. You can specify an Amazon EC2 resource in a permissions policy using its ARN.

Contents

- Find your Amazon EC2 resources
- Amazon EC2 Global View
- Tag your Amazon EC2 resources
- Amazon EC2 service quotas

Find your Amazon EC2 resources

You can get a list of some types of resources using the Amazon EC2 console. You can get a list of each type of resource using its corresponding command or API action. If you have many resources, you can filter the results to include, or exclude, only the resources that match certain criteria.

Contents

- List and filter resources using the console
- List and filter using the CLI and API
- View resources across Regions using Amazon EC2 Global View

List and filter resources using the console

Contents

- List resources using the console
- Filter resources using the console
• **Supported filters**

**List resources using the console**

You can view the most common Amazon EC2 resource types using the console. To view additional resources, use the command line interface or the API actions.

**To list EC2 resources using the console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose the option that corresponds to the resource type. For example, to list your instances, choose **Instances**.

   The page displays all resources of the selected resource type.

**Filter resources using the console**

**To filter a list of resources**

1. In the navigation pane, select a resource type (for example, **Instances**).
2. Choose the search field.
3. Select the filter from the list.
4. Select an operator, for example, **(Equals)**. Some attributes have more available operators to select. Note that not all screens support selecting an operator.
5. Select a filter value.
6. To edit a selected filter, choose the filter token (blue box), make the required edits, and then choose **Apply**. Note that not all screens support editing the selected filter.
7. When you are finished, remove the filter.

**Supported filters**

The Amazon EC2 console supports two types of filtering.

- *API filtering* happens on the server side. The filtering is applied on the API call, which reduces the number of resources returned by the server. It allows for quick filtering across large sets of resources, and it can reduce data transfer time and cost between the server and the browser. API filtering supports = (equals) and : (contains) operators, and is always case sensitive.

- *Client filtering* happens on the client side. It enables you to filter down on data that is already available in the browser (in other words, data that has already been returned by the API). Client filtering works well in conjunction with an API filter to filter down to smaller data sets in the browser. In addition to = (equals) and : (contains) operators, client filtering can also support range operators, such as >= (greater than or equal), and negation (inverse) operators, such as != (does not equal).

The Amazon EC2 console supports the following types of searches:

**Search by keyword**

Searching by keyword is a free text search that lets you search for a value across all of your resources' attributes or tags, without specifying an attribute or tag key to search.
Note

All keyword searches use *client filtering*.

To search by keyword, enter or paste what you're looking for in the search field, and then choose Enter. For example, searching for 123 matches all instances that have 123 in any of their attributes, such as an IP address, instance ID, VPC ID, or AMI ID, or in any of their tags, such as the Name. If your free text search returns unexpected matches, apply additional filters.

**Search by attribute**

Searching by an attribute lets you search a specific attribute across all of your resources.

Note

Attribute searches use either *API filtering* or *client filtering*, depending on the selected attribute. When performing an attribute search, the attributes are grouped accordingly.

For example, you can search the *Instance state* attribute for all of your instances to return only instances that are in the stopped state. To do this:

1. In the search field on the **Instances** screen, start entering **Instance state**. As you enter the characters, the two types of filters appear for **Instance state: API filters** and **Client filters**.

2. To search on the server side, choose **Instance state** under **API filters**. To search on the client side, choose **Instance state (client)** under **Client filters**.

   A list of possible operators for the selected attribute appears.

3. Choose the **= (Equals)** operator.

   A list of possible values for the selected attribute and operator appears.

4. Choose **stopped** from the list.

**Search by tag**

Searching by a tag lets you filter the resources in the currently displayed table by a tag key or a tag value.
Tag searches use either API filtering or client filtering, depending on the settings in the Preferences window.

To ensure API filtering for tags

1. Open the Preferences window.
2. Clear the Use regular expression matching check box. If this check box is selected, client filtering is performed.
3. Select the Use case sensitive matching check box. If this check box is cleared, client filtering is performed.
4. Choose Confirm.

When searching by tag, you can use the following values:

- **(empty)** – Find all resources with the specified tag key, but there must be no tag value.
- **All values** – Find all resources with the specified tag key and any tag value.
- **Not tagged** – Find all resources that do not have the specified tag key.
- **The displayed value** – Find all resources with the specified tag key and the specified tag value.

You can use the following techniques to enhance or refine your searches:

**Inverse search**

Inverse searches let you search for resources that do not match a specified value. In the Instances and AMIs screens, inverse searches are performed by selecting the != (Does not equal) or !: (Does not contain) operator and then selecting a value. In other screens, inverse searches are performed by prefixing the search keyword with the exclamation mark (!) character.

**Note**

Inverse search is supported with keyword searches and attribute searches on client filters only. It is not supported with attribute searches on API filters.

For example, you can search the **Instance state** attribute for all of your instances to exclude all instances that are in the terminated state. To do this:
1. In the search field on the **Instances** screen, start entering **Instance state**. As you enter the characters, the two types of filters appear for **Instance state**: **API filters** and **Client filters**.

2. Under **Client filters**, choose **Instance state (client)**. Inverse search is only supported on **client** filters.

   A list of possible operators for the selected attribute appears.

3. Choose != (Does not equal), and then choose **terminated**.

To filter instances based on an instance state attribute, you can also use the search icons (🔍) in the **Instance state** column. The search icon with a plus sign (+) displays all the instances that match that attribute. The search icon with a minus sign (-) excludes all instances that match that attribute.

Here is another example of using the inverse search: To list all instances that are not assigned the security group named `launch-wizard-1`, under **Client filters**, search by the **Security group name** attribute, choose !=, and in the search bar, enter `launch-wizard-1`.

**Partial search**

With partial searches, you can search for partial string values. To perform a partial search, enter only a part of the keyword that you want to search for. On the **Instances** and **AMIs** screens, partial searches can only be performed with the : (Contains) operator. On other screens, you can select the client filter attribute and immediately enter only a part of the keyword that you want to search for. For example, on the **Instance type** screen, to search for all `t2.micro`, `t2.small`, and `t2.medium` instances, search by the **Instance Type** attribute, and for the keyword, enter `t2`.

**Regular expression search**

To use regular expression searches, you must select the **Use regular expression matching** check box in the Preferences window.

Regular expressions are useful when you need to match the values in a field with a specific pattern. For example, to search for a value that starts with s, search for `^s`. To search for a value that ends with xyz, search for `xyz$`. Or to search for a value that starts with a number that is followed by one or more characters, search for `[0-9]+\.*`. 
Note
Regular expression search is supported with keyword searches and attribute searches on client filters only. It is not supported with attribute searches on API filters.

Case-sensitive search
To use case-sensitive searches, you must select the **Use case sensitive matching** check box in the Preferences window. The case-sensitive preference only applies to client and tag filters.

Note
API filters are always case-sensitive.

Wildcard search
Use the * wildcard to match zero or more characters. Use the ? wildcard to match zero or one character. For example, if you have a data set with the values prod, prods, and production, a search of prod* matches all values, whereas prod? matches only prod and prods. To use the literal values, escape them with a backslash (\). For example, "prod\*" would match prod*.

Note
Wildcard search is supported with attribute and tag searches on API filters only. It is not supported with keyword searches, and with attribute and tag searches on client filters.

Combining searches
In general, multiple filters with the same attribute are automatically joined with OR. For example, searching for **Instance State : Running** and **Instance State : Stopped** returns all instances that are either running OR stopped. To join search with AND, search across different attributes. For example, searching for **Instance State : Running** and **Instance Type : c4.large** returns only instances that are of type c4.large AND that are in the running state.
List and filter using the CLI and API

Each resource type has a corresponding CLI command and API action that you use to list resources of that type. The resulting lists of resources can be long, so it can be faster and more useful to filter the results to include only the resources that match specific criteria.

Filtering considerations

- You can specify up to 50 filters and up to 200 values per filter in a single request.
- Filter strings can be up to 255 characters in length.
- You can use wildcards with the filter values. An asterisk (*) matches zero or more characters, and a question mark (?) matches zero or one character.
- Filter values are case sensitive.
- Your search can include the literal values of the wildcard characters; you just need to escape them with a backslash before the character. For example, a value of \*amazon\?\ searches for the literal string *amazon?.

Supported filters

To see the supported filters for each Amazon EC2 resource, see the following documentation:

- AWS CLI: The describe commands in the AWS CLI Command Reference-Amazon EC2.
- Query API: The Describe API actions in the Amazon EC2 API Reference.

Example Example: Specify a single filter

You can list your Amazon EC2 instances using describe-instances. Without filters, the response contains information for all of your resources. You can use the following command to include only the running instances in your output.

```
aws ec2 describe-instances --filters Name=instance-state-name,Values=running
```

To list only the instance IDs for your running instances, add the --query parameter as follows.
aws ec2 describe-instances --filters Name=instance-state-name,Values=running --query "Reservations[*].Instances[*].InstanceId" --output text

The following is example output.

i-0ef1f57f78d4775a4
i-0626d4edd54f1286d
i-04a636d18e83cfacb

Example Example: Specify multiple filters or filter values

If you specify multiple filters or multiple filter values, the resource must match all filters to be included in the results.

You can use the following command to list all instances whose type is either m5.large or m5d.large.

aws ec2 describe-instances --filters Name=instance-type,Values=m5.large,m5d.large

You can use the following command to list all stopped instances whose type is t2.micro.

aws ec2 describe-instances --filters Name=instance-state-name,Values=stopped
Name=instance-type,Values=t2.micro

Example Example: Use wildcards in a filter value

If you specify database as the filter value for the description filter when describing EBS snapshots using `describe-snapshots`, the command returns only the snapshots whose description is "database".

aws ec2 describe-snapshots --filters Name=description,Values=database

The * wildcard matches zero or more characters. If you specify *database* as the filter value, the command returns only snapshots whose description includes the word database.

aws ec2 describe-snapshots --filters Name=description,Values=*database*

The ? wildcard matches exactly 1 character. If you specify database? as the filter value, the command returns only snapshots whose description is "database" or "database" followed by one character.
If you specify `database?????`, the command returns only snapshots whose description is "database" followed by up to four characters. It excludes descriptions with "database" followed by five or more characters.

Example Example: Filter based on date

With the AWS CLI, you can use JMESPath to filter results using expressions. For example, the following `describe-snapshots` command displays the IDs of all snapshots created by your AWS account (represented by `123456789012`) before the specified date (represented by `2020-03-31`). If you do not specify the owner, the results include all public snapshots.

The following command displays the IDs of all snapshots created in the specified date range.

Filter based on tags

For examples of how to filter a list of resources according to their tags, see Filter Amazon EC2 resources by tag.

View resources across Regions using Amazon EC2 Global View

Amazon EC2 Global View enables you to view and search for Amazon EC2 and Amazon VPC resources in a single AWS Region, or across multiple Regions simultaneously in a single console. For more information, see Amazon EC2 Global View.

Amazon EC2 Global View

Amazon EC2 Global View enables you to view some of your Amazon EC2 and Amazon VPC resources across a single AWS Region, or across multiple Regions in a single console. Amazon EC2
Global View also provides *global search* functionality that lets you search for specific resources or specific resource types across multiple Regions simultaneously.

Amazon EC2 Global View does not let you modify resources in any way.

**Supported resources**

Using Amazon EC2 Global View, you can view a global summary of the following resources across all of the Regions for which your AWS account is enabled.

- Auto Scaling groups
- DHCP option set
- Egress-only internet gateways
- Elastic IPs
- Endpoint services
- Instances
- Internet gateways
- Managed prefix lists
- NAT gateways
- Network ACLs
- Network interfaces
- Route tables
- Security groups
- Subnets
- Volumes
- VPCs
- VPC endpoints
- VPC peering connections

**Required permissions**

A user must have the following permissions to use Amazon EC2 Global View.

```
"Version": "2012-10-17",
"Statement": [
{
  "Effect": "Allow",
  "Action": [
    "autoscaling:DescribeAutoScalingGroups",
    "ec2:DescribeRegions",
    "ec2:DescribeDhcpOptions",
    "ec2:DescribeEgressOnlyInternetGateways",
    "ec2:DescribeAddresses",
    "ec2:DescribeVpcEndpointServices",
    "ec2:DescribeInstances",
    "ec2:DescribeInternetGateways",
    "ec2:DescribePrefixLists",
    "ec2:DescribeNatGateways",
    "ec2:DescribeNetworkAcls",
    "ec2:DescribeNetworkInterfaces",
    "ec2:DescribeRouteTables",
    "ec2:DescribeSecurityGroups",
    "ec2:DescribeSubnets",
    "ec2:DescribeVolumes",
    "ec2:DescribeVpcs",
    "ec2:DescribeVpcEndpoints",
    "ec2:DescribeVpcPeeringConnections"
  ],
  "Resource": "+"
}]
}

To use Amazon EC2 Global View

Open the Amazon EC2 Global View console at [https://console.aws.amazon.com/ec2globalview/home](https://console.aws.amazon.com/ec2globalview/home).

⚠️ Important

You cannot use a private window in Firefox to access Amazon EC2 Global View.

The console consists of the following:

- **Region explorer**—This tab includes the following sections:
• **Summary**—Provides a high-level overview of your resources across all Regions.

**Enabled Regions** indicates the number of Regions for which your AWS account is enabled. The remaining fields indicate the number of resources that you currently have in those Regions. Choose any of the links to view the resources of that type across all Regions. For example, if the link below the **Instances** label is **29 in 10 Regions**, it indicates that you currently have 29 instances across 10 Regions. Choose the link to view a list of all 29 instances.

• **Resource region counts**—Lists all of the AWS Regions (including those for which your account is not enabled) and provides totals for each resource type for each Region.

Choose a Region name to view all resources of all types for that specific Region. For example, choose **Africa (Cape Town) af-south-1** to view all VPCs, subnets, instances, security groups, volumes, and Auto Scaling groups in that Region. Alternatively, select a Region and choose **View resources for selected Region**.

Choose the value for a specific resource type in a specific Region to view only resources of that type in that Region. For example, choose the value for Instances for **Africa (Cape Town) af-south-1** to view only the instances in that Region.

• **Global search**—This tab enables you to search for specific resources or specific resource types across a single Region or across multiple Regions. It also enables you to view details for a specific resource.

To search for resources, enter the search criteria in the field preceding the grid. You can search by Region, by resource type, and by the tags assigned to resources.

To view the details for a specific resource, select it in the grid. You can also choose the resource ID of a resource to open it in its respective console. For example, choose an instance ID to open the instance in the Amazon EC2 console, or choose a subnet ID to open the subnet in the Amazon VPC console.

**Tip**

If you only use specific Regions or resource types, you can customize Amazon EC2 Global View to display only those Regions and resource types. To customize the displayed Regions and resource types, in the navigation panel, choose **Settings**, and then on the **Resources** and **Regions** tabs, select the Regions and resource types that you do not want to be displayed in Amazon EC2 Global View.
Tag your Amazon EC2 resources

To help you manage your instances, images, and other Amazon EC2 resources, you can assign your own metadata to each resource in the form of tags. Tags enable you to categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This is useful when you have many resources of the same type—you can quickly identify a specific resource based on the tags that you've assigned to it. This topic describes tags and shows you how to create them.

⚠️ Warning
Tag keys and their values are returned by many different API calls. Denying access to DescribeTags doesn’t automatically deny access to tags returned by other APIs. As a best practice, we recommend that you do not include sensitive data in your tags.

Contents

- Tag basics
- Tag your resources
- Tag restrictions
- Tags and access management
- Tag your resources for billing
- Grant permission to tag Amazon EC2 resources during creation
- Add and remove tags for Amazon EC2 resources
- Filter Amazon EC2 resources by tag
- View tags for your instances using instance metadata

Tag basics

A tag is a label that you assign to an AWS resource. Each tag consists of a key and an optional value, both of which you define.

Tags enable you to categorize your AWS resources in different ways, for example, by purpose, owner, or environment. For example, you could define a set of tags for your account's Amazon EC2 instances that helps you track each instance's owner and stack level.
The following diagram illustrates how tagging works. In this example, you've assigned two tags to each of your instances—one tag with the key `Owner` and another with the key `Stack`. Each tag also has an associated value.

We recommend that you devise a set of tag keys that meets your needs for each resource type. Using a consistent set of tag keys makes it easier for you to manage your resources. You can search and filter the resources based on the tags you add. For more information about how to implement an effective resource tagging strategy, see the Tagging Best Practices AWS Whitepaper.

Tags don't have any semantic meaning to Amazon EC2 and are interpreted strictly as a string of characters. Also, tags are not automatically assigned to your resources. You can edit tag keys and values, and you can remove tags from a resource at any time. You can set the value of a tag to an empty string, but you can't set the value of a tag to null. If you add a tag that has the same key as an existing tag on that resource, the new value overwrites the old value. If you delete a resource, any tags for the resource are also deleted.

**Note**

After you delete a resource, its tags might remain visible in the console, API, and CLI output for a short period. These tags will be gradually disassociated from the resource and be permanently deleted.
Tag your resources

When you use the Amazon EC2 console, you can apply tags to resources by using the **Tags** tab on the relevant resource screen, or you can use the **Tags Editor** in the AWS Resource Groups console. Some resource screens enable you to specify tags for a resource when you create the resource; for example, a tag with a key of **Name** and a value that you specify. In most cases, the console applies the tags immediately after the resource is created (rather than during resource creation). The console might organize resources according to the **Name** tag, but this tag doesn't have any semantic meaning to the Amazon EC2 service.

If you're using the Amazon EC2 API, the AWS CLI, or an AWS SDK, you can use the **CreateTags** EC2 API action to apply tags to existing resources. Additionally, some resource-creating actions enable you to specify tags for a resource when the resource is created. If tags cannot be applied during resource creation, we roll back the resource creation process. This ensures that resources are either created with tags or not created at all, and that no resources are left untagged at any time. By tagging resources at the time of creation, you can eliminate the need to run custom tagging scripts after resource creation. For more information about enabling users to tag resources on creation, see [Grant permission to tag Amazon EC2 resources during creation](#).

You can apply tag-based resource-level permissions in your IAM policies to the Amazon EC2 API actions that support tagging on creation to implement granular control over the users and groups that can tag resources on creation. Your resources are properly secured from creation—tags are applied immediately to your resources, therefore any tag-based resource-level permissions controlling the use of resources are immediately effective. Your resources can be tracked and reported on more accurately. You can enforce the use of tagging on new resources, and control which tag keys and values are set on your resources.

You can also apply resource-level permissions to the **CreateTags** and **DeleteTags** Amazon EC2 API actions in your IAM policies to control which tag keys and values are set on your existing resources. For more information, see [Example: Tag resources](#).

For more information about tagging your resources for billing, see [Using cost allocation tags](#) in the *AWS Billing User Guide*.

Tag restrictions

The following basic restrictions apply to tags:

- Maximum number of tags per resource – 50
For each resource, each tag key must be unique, and each tag key can have only one value.

- Maximum key length – 128 Unicode characters in UTF-8
- Maximum value length – 256 Unicode characters in UTF-8

**Allowed characters**

- Although EC2 allows for any character in its tags, other AWS services are more restrictive. The allowed characters across all AWS services are: letters (a-z, A-Z), numbers (0-9), and spaces representable in UTF-8, and the following characters: + - = . _ : / @.

- If you enable instance tags in instance metadata, instance tag keys can only use letters (a-z, A-Z), numbers (0-9), and the following characters: + - = . _ : @. Instance tag keys can't contain spaces or /, and can't comprise only . (one period), .. (two periods), or _index. For more information, see View tags for your instances using instance metadata.

- Tag keys and values are case-sensitive.

- The aws: prefix is reserved for AWS use. If a tag has a tag key with this prefix, then you can't edit or delete the tag's key or value. Tags with the aws: prefix do not count against your tags per resource limit.

You can't terminate, stop, or delete a resource based solely on its tags; you must specify the resource identifier. For example, to delete snapshots that you tagged with a tag key called DeleteMe, you must use the DeleteSnapshots action with the resource identifiers of the snapshots, such as snap-1234567890abcdef0.

When you tag public or shared resources, the tags you assign are available only to your AWS account; no other AWS account will have access to those tags. For tag-based access control to shared resources, each AWS account must assign its own set of tags to control access to the resource.

**Tags and access management**

If you're using AWS Identity and Access Management (IAM), you can control which users in your AWS account have permission to create, edit, or delete tags. For more information, see Grant permission to tag Amazon EC2 resources during creation.

You can also use resource tags to implement attribute-based control (ABAC). You can create IAM policies that allow operations based on the tags for the resource. For more information, see Control access using attribute-based access.
Tag your resources for billing

You can use tags to organize your AWS bill to reflect your own cost structure. To do this, sign up to get your AWS account bill with tag key values included. For more information about setting up a cost allocation report with tags, see Monthly cost allocation report in the AWS Billing User Guide. To see the cost of your combined resources, you can organize your billing information based on resources that have the same tag key values. For example, you can tag several resources with a specific application name, and then organize your billing information to see the total cost of that application across several services. For more information, see Using cost allocation tags in the AWS Billing User Guide.

Note

If you've just enabled reporting, data for the current month is available for viewing after 24 hours.

Cost allocation tags can indicate which resources are contributing to costs, but deleting or deactivating resources doesn't always reduce costs. For example, snapshot data that is referenced by another snapshot is preserved, even if the snapshot that contains the original data is deleted. For more information, see Amazon Elastic Block Store volumes and snapshots in the AWS Billing User Guide.

Note

Elastic IP addresses that are tagged do not appear on your cost allocation report.

Grant permission to tag Amazon EC2 resources during creation

Some resource-creating Amazon EC2 API actions enable you to specify tags when you create the resource. You can use resource tags to implement attribute-based control (ABAC). For more information, see Tag your resources and Control access using attribute-based access.

To enable users to tag resources on creation, they must have permissions to use the action that creates the resource, such as ec2:RunInstances or ec2:CreateVolume. If tags are specified in the resource-creating action, Amazon performs additional authorization on the ec2:CreateTags
action to verify if users have permissions to create tags. Therefore, users must also have explicit permissions to use the `ec2:CreateTags` action.

In the IAM policy definition for the `ec2:CreateTags` action, use the Condition element with the `ec2:CreateAction` condition key to give tagging permissions to the action that creates the resource.

The following example demonstrates a policy that allows users to launch instances and apply any tags to instances and volumes during launch. Users are not permitted to tag any existing resources (they cannot call the `ec2:CreateTags` action directly).

```json
{
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [ "ec2:RunInstances"
      ],
      "Resource": "*"
    },
    {
      "Effect": "Allow",
      "Action": [ "ec2:CreateTags"
      ],
      "Resource": "arn:aws:ec2:region:account:/*/*",
      "Condition": {
        "StringEquals": {
          "ec2:CreateAction" : "RunInstances"
        }
      }
    }
  ]
}
```

Similarly, the following policy allows users to create volumes and apply any tags to the volumes during volume creation. Users are not permitted to tag any existing resources (they cannot call the `ec2:CreateTags` action directly).

```json
{
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [ "ec2:CreateVolumes"
      ],
      "Resource": "arn:aws:ec2:region:account:/*/*",
      "Condition": {
        "StringEquals": {
          "ec2:CreateAction" : "CreateVolumes"
        }
      }
    }
  ]
}
```
The `ec2:CreateTags` action is only evaluated if tags are applied during the resource-creating action. Therefore, a user that has permissions to create a resource (assuming there are no tagging conditions) does not require permissions to use the `ec2:CreateTags` action if no tags are specified in the request. However, if the user attempts to create a resource with tags, the request fails if the user does not have permissions to use the `ec2:CreateTags` action.

The `ec2:CreateTags` action is also evaluated if tags are provided in a launch template. For an example policy, see [Tags in a launch template](#).

**Control access to specific tags**

You can use additional conditions in the `Condition` element of your IAM policies to control the tag keys and values that can be applied to resources.

The following condition keys can be used with the examples in the preceding section:

- `aws:RequestTag`: To indicate that a particular tag key or tag key and value must be present in a request. Other tags can also be specified in the request.
- Use with the `StringEquals` condition operator to enforce a specific tag key and value combination, for example, to enforce the tag `cost-center=cc123`:
"StringEquals": { "aws:RequestTag/cost-center": "cc123" }

- Use with the StringLike condition operator to enforce a specific tag key in the request; for example, to enforce the tag key purpose:

"StringLike": { "aws:RequestTag/purpose": "*" }

- aws:TagKeys: To enforce the tag keys that are used in the request.

  - Use with the ForAllValues modifier to enforce specific tag keys if they are provided in the request (if tags are specified in the request, only specific tag keys are allowed; no other tags are allowed). For example, the tag keys environment or cost-center are allowed:

"ForAllValues:StringEquals": { "aws:TagKeys": ["environment","cost-center"] }

  - Use with the ForAnyValue modifier to enforce the presence of at least one of the specified tag keys in the request. For example, at least one of the tag keys environment or webserver must be present in the request:

"ForAnyValue:StringEquals": { "aws:TagKeys": ["environment","webserver"] }

These condition keys can be applied to resource-creating actions that support tagging, as well as the ec2:CreateTags and ec2:DeleteTags actions. To learn whether an Amazon EC2 API action supports tagging, see Actions, resources, and condition keys for Amazon EC2.

To force users to specify tags when they create a resource, you must use the aws:RequestTag condition key or the aws:TagKeys condition key with the ForAnyValue modifier on the resource-creating action. The ec2:CreateTags action is not evaluated if a user does not specify tags for the resource-creating action.

For conditions, the condition key is not case-sensitive and the condition value is case-sensitive. Therefore, to enforce the case-sensitivity of a tag key, use the aws:TagKeys condition key, where the tag key is specified as a value in the condition.

For example IAM policies, see Example policies to control access the Amazon EC2 API. For more information about multi-value conditions, see Creating a Condition That Tests Multiple Key Values in the IAM User Guide.
Add and remove tags for Amazon EC2 resources

When you create an Amazon EC2 resource, such as an Amazon EC2 instance, you can specify the tags to add to the resource. You can also use the Amazon EC2 console to display the tags for a specific Amazon EC2 resource. You can also add or remove tags from an existing Amazon EC2 resource.

You can use the Tag Editor in the AWS Resource Groups console to view, add, or remove tags across all of your AWS resources across all Regions. You can apply or remove tags from multiple types of resources at the same time. For more information, see the Tagging AWS Resources User Guide.

Tasks

- Add and remove tags using the console
- Add tags using the AWS CLI
- Add tags using CloudFormation

Add and remove tags using the console

You can manage tags for an existing resource directly from the resource's page.

To manage tags for an existing resource

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. From the navigation bar, select the Region where the resource is located.
3. In the navigation pane, select a resource type (for example, Instances).
4. Select the resource from the list.
5. From the Tags tab, choose Manage tags.
6. To add a tag, choose Add new tag and enter a key and a value for the tag. To remove a tag, choose Remove.
7. Choose Save.

Add tags using the AWS CLI

The following examples demonstrate how to add tags to an existing resource using the create-tags command.
Example Example: Add a tag to a resource

The following command adds the tag **Stack=production** to the specified image, or overwrites an existing tag for the AMI where the tag key is **Stack**. If the command succeeds, no output is returned.

```
aws ec2 create-tags \
   --resources ami-78a54011 \ 
   --tags Key=Stack,Value=production
```

Example Example: Add tags to multiple resources

This example adds (or overwrites) two tags for an AMI and an instance. One of the tags contains just a key (**webserver**), with no value (we set the value to an empty string). The other tag consists of a key (**stack**) and value (**Production**). If the command succeeds, no output is returned.

```
aws ec2 create-tags \
   --resources ami-1a2b3c4d i-1234567890abcdef0 \ 
   --tags Key=webserver,Value= Key=stack,Value=Production
```

Example Example: Add tags with special characters

This example adds the tag `[Group]=test` to an instance. The square brackets ([ and ]) are special characters, which must be escaped.

If you are using Linux or OS X, to escape the special characters, enclose the element with the special character with double quotes ("), and then enclose the entire key and value structure with single quotes (').

```
aws ec2 create-tags \ 
   --resources i-1234567890abcdef0 \ 
   --tags 'Key="[Group]",Value=test'
```

If you are using Windows, to escape the special characters, enclose the element that has special characters with double quotes ("), and then precede each double quote character with a backslash (\) as follows:

```
aws ec2 create-tags ^ \
   --resources i-1234567890abcdef0 ^
```
If you are using Windows PowerShell, to escape the special characters, enclose the value that has special characters with double quotes ("), precede each double quote character with a backslash (\), and then enclose the entire key and value structure with single quotes (') as follows:

```bash
aws ec2 create-tags
   --resources i-1234567890abcdef0
   --tags 'Key="[Group\",Value=test'
```

### Add tags using CloudFormation

With Amazon EC2 resource types, you specify tags using either a Tags or TagSpecifications property.

The following examples add the tag `Stack=Production` to `AWS::EC2::Instance` using its Tags property.

#### Example Example: Tags in YAML

```
Tags:
  - Key: "Stack"
    Value: "Production"
```

#### Example Example: Tags in JSON

```
"Tags": [
  {
    "Key": "Stack",
    "Value": "Production"
  }
]
```

The following examples add the tag `Stack=Production` to `AWS::EC2::LaunchTemplate LaunchTemplateData` using its TagSpecifications property.

#### Example Example: TagSpecifications in YAML

```
TagSpecifications:
```
Example Example: TagSpecifications in JSON

"TagSpecifications": [
  {
    "ResourceType": "instance",
    "Tags": [
      {
        "Key": "Stack",
        "Value": "Production"
      }
    ]
  }
]

Filter Amazon EC2 resources by tag

After you add tags, you can filter your Amazon EC2 resources based on tag keys and tag values.

To filter resources by tag using the Amazon EC2 console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, select a resource type (for example, **Instances**).
3. Choose the search field.
4. In the list, under **Tags**, choose the tag key.
5. Choose the corresponding tag value from the list.
6. When you are finished, remove the filter.

For more information about using filters in the Amazon EC2 console, see Find your Amazon EC2 resources.

To filter resources by tag using the AWS CLI

The following examples show you how to use filters with the **describe-instances** to view instances with specific tags. All EC2 describe commands use this syntax to filter by tag across a single
resource type. Alternatively, you can use the `describe-tags` command to filter by tag across EC2 resource types.

**Example Example 1: Describe instances with the specified tag key**

The following command describes the instances with a `Stack` tag, regardless of the value of the tag.

```bash
aws ec2 describe-instances \
   --filters Name=tag-key,Values=Stack
```

**Example Example 2: Describe instances with the specified tag**

The following command describes the instances with the tag `Stack=production`.

```bash
aws ec2 describe-instances \
   --filters Name=tag:Stack,Values=production
```

**Example Example 3: Describe instances with the specified tag value**

The following command describes the instances with a tag with the value `production`, regardless of the tag key.

```bash
aws ec2 describe-instances \
   --filters Name=tag-value,Values=production
```

**Example Example 4: Describe all EC2 resources with the specified tag**

The following command describes all EC2 resources with the tag `Stack=Test`.

```bash
aws ec2 describe-tags \
   --filters Name=key,Values=Stack Name=value,Values=Test
```

**View tags for your instances using instance metadata**

You can access an instance's tags from the instance metadata. By accessing tags from the instance metadata, you no longer need to use the `DescribeInstances` or `DescribeTags` API calls to retrieve tag information, which reduces your API transactions per second, and lets your tag retrievals scale with the number of instances that you control. Furthermore, local processes that
are running on an instance can view the instance's tag information directly from the instance metadata.

By default, tags are not available from the instance metadata; you must explicitly allow access. You can allow access at instance launch, or after launch on a running or stopped instance. You can also allow access to tags by specifying this in a launch template. Instances that are launched by using the template allow access to tags in the instance metadata.

If you add or remove an instance tag, the instance metadata is updated while the instance is running, without needing to stop and then start the instance.

**Tasks**

- Allow access to tags in instance metadata
- Retrieve tags from instance metadata
- Turn off access to tags in instance metadata

## Allow access to tags in instance metadata

By default, there is no access to instance tags in the instance metadata. For each instance, you must explicitly allow access by using one of the following methods.

**To allow access to tags in instance metadata using the console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select an instance, and then choose **Actions, Instance settings, Allow tags in instance metadata**.
4. To allow access to tags in instance metadata, select the **Allow** check box.
5. Choose **Save**.

**To allow access to tags in instance metadata at launch using the AWS CLI**

Use the `run-instances` command and set `InstanceMetadataTags` to `enabled`.

```
aws ec2 run-instances \
  --image-idami-0abcdef1234567890 \
  --instance-typec3.large \
```

View tags using instance metadata
To allow access to tags in instance metadata on a running or stopped instance using the AWS CLI

Use the `modify-instance-metadata-options` command and set `--instance-metadata-tags` to enabled.

```
aws ec2 modify-instance-metadata-options \
   --instance-id i-123456789example \
   --instance-metadata-tags enabled
```

Retrieve tags from instance metadata

After you allow access to instance tags in the instance metadata, you can access the `tags/instance` category from the instance metadata. For more information, see Retrieve instance metadata.

Instance Metadata Service Version 2

Run the following examples on your Amazon EC2 instance to retrieve the instance metadata for IMDSv2.

cURL

This example gets all the tag keys for an instance.

```
Name
Environment
```

This example gets the value of the Name key that was obtained in the previous example. The IMDSv2 request uses the stored token that was created using the command in the previous example. The token must not be expired.

```
```

Turn off access to tags in instance metadata

To turn off access to instance tags in the instance metadata, use one of the following methods. You don't need to turn off access to instance tags on instance metadata at launch because it's turned off by default.

To turn off access to tags in instance metadata using the console

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Instances.
3. Select an instance, and then choose Actions, Instance settings, Allow tags in instance metadata.
4. To turn off access to tags in instance metadata, clear the Allow check box.
5. Choose Save.

To turn off access to tags in instance metadata using the AWS CLI

Use the `modify-instance-metadata-options` command and set `--instance-metadata-tags` to disabled.

```
aws ec2 modify-instance-metadata-options \
  --instance-id i-123456789example \
```
To view whether access to tags in instance metadata is allowed using the AWS CLI

Use the `describe-instances` command and specify the instance ID. Use the `--query` parameter to display only the instance metadata options in the results.

```
aws ec2 describe-instances \
  --instance-ids i-1234567890abcdef0 \
  --query "Reservations[*].Instances[*].MetadataOptions"
```

The following is example output. The value of `InstanceMetadataTags` indicates whether access to tags in instance metadata is allowed. If the value is `enabled`, it is allowed. If the value is `disabled`, it is not allowed.

```
[
  [
    {
      "State": "applied",
      "HttpTokens": "required",
      "HttpPutResponseHopLimit": 2,
      "HttpEndpoint": "enabled",
      "HttpProtocolIpv6": "disabled",
      "InstanceMetadataTags": "enabled"
    }
  ]
]
```

Amazon EC2 service quotas

When you create your AWS account, we set default quotas (also referred to as limits) on your AWS resources on a per-Region basis. If you attempt to exceed the quota for a resource, the request fails. For example, there is a maximum number of Amazon EC2 vCPUs that you can provision for On-Demand Instances in a Region. If you attempt to launch an instance in a Region and this request would cause your usage to exceed this quota, the request fails. If this happens, you can reduce your resource usage or request a quota increase.

The Service Quotas console is a central location where you can view and manage your quotas for AWS services, and request a quota increase for many of the resources that you use. Use the
quota information that we provide to manage your AWS infrastructure. Plan to request any quota increases in advance of the time that you'll need them.

For more information, see Amazon EC2 endpoints and quotas and Amazon EBS endpoints and quotas in the Amazon Web Services General Reference.

### View your current quotas

You can view your quotas for each Region using the Service Quotas console.

#### To view your current quotas using the Service Quotas console

2. From the navigation bar (at the top of the screen), select a Region.

<table>
<thead>
<tr>
<th>Region</th>
<th>Region Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>US East (N. Virginia)</td>
<td>us-east-1</td>
</tr>
<tr>
<td><strong>US East (Ohio)</strong></td>
<td><strong>us-east-2</strong></td>
</tr>
<tr>
<td>US West (N. California)</td>
<td>us-west-1</td>
</tr>
<tr>
<td>US West (Oregon)</td>
<td>us-west-2</td>
</tr>
<tr>
<td>Africa (Cape Town)</td>
<td>af-south-1</td>
</tr>
<tr>
<td>Asia Pacific (Hong Kong)</td>
<td>ap-east-1</td>
</tr>
<tr>
<td>Asia Pacific (Jakarta)</td>
<td>ap-southeast-3</td>
</tr>
</tbody>
</table>

3. Use the filter field to filter the list by resource name. For example, enter On-Demand to locate the quotas for On-Demand Instances.

4. To view more information, choose the quota name to open the details page for the quota.

### Request an increase

You can request a quota increase for each Region.
To request an increase using the Service Quotas console

2. From the navigation bar (at the top of the screen), select a Region.
3. Use the filter field to filter the list by resource name. For example, enter **On-Demand** to locate the quotas for On-Demand Instances.
4. If the quota is adjustable, choose the quota and then choose **Request quota increase**.
5. For **Change quota value**, enter the new quota value.
6. Choose **Request**.
7. To view any pending or recently resolved requests in the console, choose **Dashboard** from the navigation pane. For pending requests, choose the status of the request to open the request receipt. The initial status of a request is **Pending**. After the status changes to **Quota requested**, you'll see the case number with AWS Support. Choose the case number to open the ticket for your request.

For more information, including how to use the AWS CLI or SDKs to request a quota increase, see [Requesting a quota increase](https://docs.aws.amazon.com/service-quotas/latest/userguide/requesting-a-quota-increase.html) in the *Service Quotas User Guide*.

**Restriction on email sent using port 25**

On all instances, Amazon EC2 restricts outbound traffic to public IP addresses over port 25 by default. You can request that this restriction be removed. For more information, see [How do I remove the restriction on port 25 from my Amazon EC2 instance or Lambda function?](https://docs.aws.amazon.com/AmazonVPC/latest/UserGuide/VPC_Firewall.html)

**Note**

This restriction does not apply to outbound traffic sent over port 25 to:

- IP addresses in the primary CIDR block of the VPC in which the originating network interface exists.
Monitor Amazon EC2 resources

Monitoring is an important part of maintaining the reliability, availability, and performance of your Amazon Elastic Compute Cloud (Amazon EC2) instances and your AWS solutions. You should collect monitoring data from all of the parts in your AWS solutions so that you can more easily debug a multi-point failure if one occurs. Before you start monitoring Amazon EC2, however, you should create a monitoring plan that should include:

- What are your goals for monitoring?
- What resources will you monitor?
- How often will you monitor these resources?
- What monitoring tools will you use?
- Who will perform the monitoring tasks?
- Who should be notified when something goes wrong?

After you have defined your monitoring goals and have created your monitoring plan, the next step is to establish a baseline for normal Amazon EC2 performance in your environment. You should measure Amazon EC2 performance at various times and under different load conditions. As you monitor Amazon EC2, you should store a history of monitoring data that you collect. You can compare current Amazon EC2 performance to this historical data to help you to identify normal performance patterns and performance anomalies, and devise methods to address them. For example, you can monitor CPU utilization, disk I/O, and network utilization for your EC2 instances. When performance falls outside your established baseline, you might need to reconfigure or optimize the instance to reduce CPU utilization, improve disk I/O, or reduce network traffic.

To establish a baseline you should, at a minimum, monitor the following items:

<table>
<thead>
<tr>
<th>Item to monitor</th>
<th>Amazon EC2 metric</th>
<th>Monitoring agent/CloudWatch Logs</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU utilization</td>
<td>CPUUtilization</td>
<td></td>
</tr>
<tr>
<td>Network utilization</td>
<td>NetworkIn NetworkOut</td>
<td></td>
</tr>
</tbody>
</table>
### Automated and manual monitoring tools for Amazon EC2

AWS provides various tools that you can use to monitor Amazon EC2. You can configure some of these tools to do the monitoring for you, while some of the tools require manual intervention.

#### Monitoring tools

- **Automated monitoring tools**
- **Manual monitoring tools**

#### Item to monitor | Amazon EC2 metric | Monitoring agent/CloudWatch Logs

| Disk performance | DiskReadOps |  |
| Disk Reads/Writes | DiskWriteOps |  |
| Memory utilization, disk swap utilization, disk space utilization, page file utilization, log collection | DiskReadBytes |  |
|  | DiskWriteBytes |  |
|  |  | [Linux and Windows Server instances] Collect Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent |
|  |  | [Migration from previous CloudWatch Logs agent on Windows Server instances] Migrate Windows Server Instance Log Collection to the CloudWatch Agent |
Automated monitoring tools

You can use the following automated monitoring tools to watch Amazon EC2 and report back to you when something is wrong:

- **System status checks** – monitor the AWS systems required to use your instance to ensure that they are working properly. These checks detect problems with your instance that require AWS involvement to repair. When a system status check fails, you can choose to wait for AWS to fix the issue or you can resolve it yourself (for example, by stopping and restarting or terminating and replacing an instance). Examples of problems that cause system status checks to fail include:
  - Loss of network connectivity
  - Loss of system power
  - Software issues on the physical host
  - Hardware issues on the physical host that impact network reachability

  For more information, see [Status checks for Amazon EC2 instances](#).

- **Instance status checks** – monitor the software and network configuration of your individual instance. These checks detect problems that require your involvement to repair. When an instance status check fails, typically you will need to address the problem yourself (for example, by rebooting the instance or by making modifications in your operating system). Examples of problems that may cause instance status checks to fail include:
  - Failed system status checks
  - Misconfigured networking or startup configuration
  - Exhausted memory
  - Corrupted file system
  - Incompatible kernel

  For more information, see [Status checks for Amazon EC2 instances](#).

- **Amazon CloudWatch alarms** – watch a single metric over a time period you specify, and perform one or more actions based on the value of the metric relative to a given threshold over a number of time periods. The action is a notification sent to an Amazon Simple Notification Service (Amazon SNS) topic or Amazon EC2 Auto Scaling policy. Alarms invoke actions for sustained state changes only. CloudWatch alarms will not invoke actions simply because they are in a particular state; the state must have changed and been maintained for a specified number of periods. For more information, see [Monitor your instances using CloudWatch](#).
- **Amazon EventBridge** – automate your AWS services and respond automatically to system events. Events from AWS services are delivered to EventBridge in near real time, and you can specify automated actions to take when an event matches a rule you write. For more information, see [What is Amazon EventBridge?](#).

- **Amazon CloudWatch Logs** – monitor, store, and access your log files from Amazon EC2 instances, AWS CloudTrail, or other sources. For more information, see the [Amazon CloudWatch Logs User Guide](#).

- **CloudWatch agent** – collect logs and system-level metrics from both hosts and guests on your EC2 instances and on-premises servers. For more information, see [Collecting Metrics and Logs from Amazon EC2 Instances and On-Premises Servers with the CloudWatch Agent](#) in the [Amazon CloudWatch User Guide](#).

### Manual monitoring tools

Another important part of monitoring Amazon EC2 involves manually monitoring those items that the monitoring scripts, status checks, and CloudWatch alarms don't cover. The Amazon EC2 and CloudWatch console dashboards provide an at-a-glance view of the state of your Amazon EC2 environment.

- Amazon EC2 Dashboard shows:
  - Service Health and Scheduled Events by Region
  - Instance state
  - Status checks
  - Alarm status
  - Instance metric details (In the navigation pane choose **Instances**, select an instance, and choose the **Monitoring** tab)
  - Volume metric details (In the navigation pane choose **Volumes**, select a volume, and choose the **Monitoring** tab)

- Amazon CloudWatch Dashboard shows:
  - Current alarms and status
  - Graphs of alarms and resources
  - Service health status

In addition, you can use CloudWatch to do the following:
- Graph Amazon EC2 monitoring data to troubleshoot issues and discover trends
- Search and browse all your AWS resource metrics
- Create and edit alarms to be notified of problems
- See at-a-glance overviews of your alarms and AWS resources

### Monitor the status of your Amazon EC2 instances

You can monitor the status of your instances by viewing status checks and scheduled events for your instances.

A status check gives you the information that results from automated checks performed by Amazon EC2. These automated checks detect whether specific issues are affecting your instances. The status check information, together with the data provided by Amazon CloudWatch, gives you detailed operational visibility into each of your instances.

You can also see status of specific events that are scheduled for your instances. The status of events provides information about upcoming activities that are planned for your instances, such as rebooting or retirement. They also provide the scheduled start and end time of each event.

**Contents**
- Status checks for Amazon EC2 instances
- State change events for Amazon EC2 instances
- Scheduled events for Amazon EC2 instances

### Status checks for Amazon EC2 instances

With instance status monitoring, you can quickly determine whether Amazon EC2 has detected any problems that might prevent your instances from running applications. Amazon EC2 performs automated checks on every running EC2 instance to identify hardware and software issues. You can view the results of these status checks to identify specific and detectable problems. The event status data augments the information that Amazon EC2 already provides about the state of each instance (such as pending, running, stopping) and the utilization metrics that Amazon CloudWatch monitors (CPU utilization, network traffic, and disk activity).
Status checks are performed every minute, returning a pass or a fail status. If all checks pass, the overall status of the instance is **OK**. If one or more checks fail, the overall status is **impaired**. Status checks are built into Amazon EC2, so they cannot be disabled or deleted.

When a status check fails, the corresponding CloudWatch metric for status checks is incremented. For more information, see [Status check metrics](#). You can use these metrics to create CloudWatch alarms that are triggered based on the result of the status checks. For example, you can create an alarm to warn you if status checks fail on a specific instance. For more information, see [Create CloudWatch alarms for Amazon EC2 instances that fail status checks](#).

You can also create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically recovers the instance if it becomes impaired due to an underlying issue. For more information, see [Instance resiliency](#).

### Contents

- [Types of status checks](#)
- [View status checks for Amazon EC2 instances](#)
- [Create CloudWatch alarms for Amazon EC2 instances that fail status checks](#)

### Types of status checks

There are three types of status checks.

- [System status checks](#)
- [Instance status checks](#)
- [Attached EBS status checks](#)

### System status checks

System status checks monitor the AWS systems on which your instance runs. These checks detect underlying problems with your instance that require AWS involvement to repair. When a system status check fails, you can choose to wait for AWS to fix the issue, or you can resolve it yourself. For instances backed by Amazon EBS, you can stop and start the instance yourself, which in most cases results in the instance being migrated to a new host. For Linux instances backed by instance store, you can terminate and replace the instance. For Windows instances, the root volume must be an Amazon EBS volume; instance store is not supported for the root volume. Note that instance store volumes are ephemeral and all data is lost when the instance is stopped.
The following are examples of problems that can cause system status checks to fail:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

If a system status check fails, we increment the `StatusCheckFailed_System` metric.

**Bare metal instances**

If you perform a restart from the operating system on a bare metal instance, the system status check might temporarily return a fail status. When the instance becomes available, the system status check should return a pass status.

**Instance status checks**

Instance status checks monitor the software and network configuration of your individual instance. Amazon EC2 checks the health of the instance by sending an address resolution protocol (ARP) request to the network interface (NIC). These checks detect problems that require your involvement to repair. When an instance status check fails, you typically must address the problem yourself (for example, by rebooting the instance or by making instance configuration changes).

⚠️ **Note**

Recent Linux distributions that use `systemd-networkd` for network configuration might report on health checks differently from earlier distributions. During the boot process, this type of network can start earlier and potentially finish before other startup tasks that can also affect instance health. Status checks that depend on network availability can report a healthy status before other tasks complete.

The following are examples of problems that can cause instance status checks to fail:

- Failed system status checks
- Incorrect networking or startup configuration
- Exhausted memory
• Corrupted file system
• Incompatible kernel
• [Windows instances] During instance reboot or while a Windows instance store-backed instance is being bundled, an instance status check reports a failure until the instance becomes available again.

If an instance status check fails, we increment the `StatusCheckFailed_Instance` metric.

Bare metal instances

If you perform a restart from the operating system on a bare metal instance, the instance status check might temporarily return a fail status. When the instance becomes available, the instance status check should return a pass status.

Attached EBS status checks

Attached EBS status checks monitor if the Amazon EBS volumes attached to an instance are reachable and able to complete I/O operations. The `StatusCheckFailed_AttachedEBS` metric is a binary value that indicates impairment if one or more of the EBS volumes attached to the instance are unable to complete I/O operations. These status checks detect underlying issues with the compute or Amazon EBS infrastructure. When the attached EBS status check metric fails, you can either wait for AWS to resolve the issue, or you can take actions, such as replacing the affected volumes or stopping and restarting the instance.

The following are examples of issues that can cause attached EBS status checks to fail:

• Hardware or software issues on the storage subsystems underlying the EBS volumes
• Hardware issues on the physical host that impact reachability of the EBS volumes
• Connectivity issues between the instance and EBS volumes

You can use the `StatusCheckFailed_AttachedEBS` metric to help improve the resilience of your workload. You can use this metric to create Amazon CloudWatch alarms that are triggered based on the result of the status check. For example, you could fail over to a secondary instance or Availability Zone when you detect a prolonged impact. Alternatively, you can monitor the I/O performance of each attached volume using EBS CloudWatch metrics to detect and replace the impaired volume. If your workload is not driving I/O to any of the EBS volumes attached to your instance, and the attached EBS status check indicates an impairment, you can stop and start
the instance to address issues with the physical host that is impacting the reachability of the EBS volumes. For more information, see Amazon CloudWatch metrics for Amazon EBS

Note

- The attached EBS status check metric is available only for Nitro instances.
- You can monitor the attached EBS status check metric by creating a CloudWatch alarm based on the StatusCheckFailed_AttachedEBS metric. You can't view this status check by using the describe-instance-status AWS CLI command.

View status checks for Amazon EC2 instances

To view status checks, use one of the following methods.

Console

To view status checks

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. On the Instances page, the Status check column lists the operational status of each instance.
4. To view the status of a specific instance, select the instance, and then choose the Status and alarms tab.
If your instance has a failed status check, you typically must address the problem yourself (for example, by rebooting the instance or by making instance configuration changes). To troubleshoot system or instance status check failures on Linux instances, see [Troubleshoot Amazon EC2 Linux instances with failed status checks](#).

5. To review the CloudWatch metrics for status checks, on the **Status and alarms** tab, expand **Metrics** to see the graphs for the following metrics:

   - **Status check failed for system**
   - **Status check failed for instance**

   For more information, see [the section called “Status check metrics”](#).

Command line

You can view status checks for running instances by using the `describe-instance-status` (AWS CLI) command.

To view the status of all instances, use the following command.
To get the status of all instances with an instance status of impaired, use the following command:

```
aws ec2 describe-instance-status
--filters Name=instance-status.status,Values=impaired
```

To get the status of a single instance, use the following command:

```
aws ec2 describe-instance-status
--instance-ids i-1234567890abcdef0
```

Alternatively, use the following commands:

- [Get-EC2InstanceStatus](AWS Tools for Windows PowerShell)
- [DescribeInstanceStatus](Amazon EC2 Query API)

If you have a Linux instance with a failed status check, see [Troubleshoot Amazon EC2 Linux instances with failed status checks](#).

### Create CloudWatch alarms for Amazon EC2 instances that fail status checks

You can use the [status check metrics](#) to create CloudWatch alarms to notify you when an instance has a failed status check.

> **Important**

Status checks and status check alarms can temporarily enter an *insufficient data* state if there are missing metric data points. Although rare, this can happen when there is an interruption in the metric reporting systems, even when an instance is healthy. We recommend that you treat this state as missing data instead of a status check failure or alarm breach, especially when taking stop, terminate, reboot, or recover actions on the instance in response.

To create a status check alarm, use one of the following methods:
Use the following procedure to configure an alarm that sends you a notification by email, or stops, terminates, or recovers an instance when it fails a status check.

**To create a status check alarm**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instance, choose the **Status Checks** tab, and choose **Actions, Create status check alarm**.
4. On the **Manage CloudWatch alarms** page, under **Add or edit alarm**, choose **Create an alarm**.
5. For **Alarm notification**, turn the toggle on to configure Amazon Simple Notification Service (Amazon SNS) notifications. Select an existing Amazon SNS topic or enter a name to create a new topic.

If you add an email address to the list of recipients or created a new topic, Amazon SNS sends a subscription confirmation email message to each new address. Each recipient must confirm the subscription by choosing the link contained in that message. Alert notifications are sent only to confirmed addresses.

6. For **Alarm action**, turn the toggle on to specify an action to take when the alarm is triggered. Select the action.
7. For **Alarm thresholds**, specify the metric and criteria for the alarm.

You can leave the default settings for **Group samples by (Average)** and **Type of data to sample (Status check failed:either)**, or you can change them to suit your needs.

For **Consecutive period**, set the number of periods to evaluate and, in **Period**, enter the evaluation period duration before triggering the alarm and sending an email.

8. (Optional) For **Sample metric data**, choose **Add to dashboard**.
9. Choose **Create**.

If you need to make changes to an instance status alarm, you can edit it.
To edit a status check alarm

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance and choose Actions, Monitoring, Manage CloudWatch alarms.
4. On the Manage CloudWatch alarms page, under Add or edit alarm, choose Edit an alarm.
5. For Search for alarm, choose the alarm.
6. When you are finished making changes, choose Update.

Command line

In the following example, the alarm publishes a notification to an SNS topic, arn:aws:sns:us-west-2:111122223333:my-sns-topic, when the instance fails either the instance check or system status check for at least two consecutive periods. The CloudWatch metric used is StatusCheckFailed.

To create a status check alarm using the AWS CLI

1. Select an existing SNS topic or create a new one. For more information, see Using the AWS CLI with Amazon SNS in the AWS Command Line Interface User Guide.
2. Use the following list-metrics command to view the available Amazon CloudWatch metrics for Amazon EC2.

```
aws cloudwatch list-metrics --namespace AWS/EC2
```
3. Use the following put-metric-alarm command to create the alarm.

```
aws cloudwatch put-metric-alarm
--alarm-name StatusCheckFailed-Alarm-for-i-1234567890abcdef0
--metric-name StatusCheckFailed
--namespace AWS/EC2
--statistic Maximum
--dimensions Name=InstanceId,Value=i-1234567890abcdef0
--unit Count
--period 300
--evaluation-periods 2
--threshold 1
--comparison-operator GreaterThanOrEqualToThreshold
```
The period is the time frame, in seconds, in which Amazon CloudWatch metrics are collected. This example uses 300, which is 60 seconds multiplied by 5 minutes. The evaluation period is the number of consecutive periods for which the value of the metric must be compared to the threshold. This example uses 2. The alarm actions are the actions to perform when this alarm is triggered. This example configures the alarm to send an email using Amazon SNS.

**State change events for Amazon EC2 instances**

Amazon EC2 sends an EC2 Instance State-change Notification event to Amazon EventBridge when the state of an instance changes.

The following is example data for this event. In this example, the instance entered the pending state.

```json
{
  "id":"7bf3129-1428-4cd3-a780-95db273d1602",
  "detail-type":"EC2 Instance State-change Notification",
  "source":"aws.ec2",
  "account":"123456789012",
  "time":"2021-11-11T21:29:54Z",
  "region":"us-east-1",
  "resources": [
    "arn:aws:ec2:us-east-1:123456789012:instance/i-abcd1111"
  ],
  "detail":{
    "instance-id":"i-abcd1111",
    "state":"pending"
  }
}
```

The possible values for state are:

- pending
- running
- stopping
- stopped
• shutting-down
• terminated

When you launch or start an instance, it enters the pending state and then the running state. When you stop an instance, it enters the stopping state and then the stopped state. When you terminate an instance, it enters the shutting-down state and then the terminated state.

Create an alarm that sends an email when an Amazon EC2 instance changes state

To receive email notifications when your instance changes state, create an Amazon SNS topic and then create an EventBridge rule for the EC2 Instance State-change Notification event.

To create an SNS topic

2. In the navigation pane, choose Topics.
3. Choose Create topic.
4. For Type, choose Standard.
5. For Name, enter a name for your topic.
6. Choose Create topic.
7. Choose Create subscription.
8. For Protocol, choose Email.
9. For Endpoint, enter the email address that receives the notifications.
10. Choose Create subscription.
11. You'll receive an email message with the following subject line: AWS Notification - Subscription Confirmation. Follow the directions to confirm your subscription.

To create an EventBridge rule

1. Open the Amazon EventBridge console at https://console.aws.amazon.com/events/.
2. Choose Create rule.
3. For Name, enter a name for your rule.
4. For Rule type, choose Rule with an event pattern.
5. Choose **Next**.

6. For **Event pattern**, do the following:
   a. For **Event source**, choose **AWS services**.
   b. For **AWS service**, choose **EC2**.
   c. For **Event type**, choose **EC2 Instance State-change Notification**.
   d. By default, we send notifications for any state change for any instance. If you prefer, you can select specific states or specific instances.

7. Choose **Next**.

8. Specify a target as follows:
   a. For **Target types**, choose **AWS service**.
   b. For **Select a target**, choose **SNS topic**.
   c. For **Topic**, choose the SNS topic that you created in the previous procedure.

9. Choose **Next**.

10. (Optional) Add tags to your rule.

11. Choose **Next**.

12. Choose **Create rule**.

13. To test your rule, initiate a state change. For example, start a stopped instance, stop a running instance, or launch an instance. You'll receive email messages with the following subject line: **AWS Notification Message**. The body of the email contains the event data.

## Scheduled events for Amazon EC2 instances

AWS can schedule events for your instances, such as a reboot, stop/start, or retirement. These events do not occur frequently. If one of your instances will be affected by a scheduled event, AWS sends an email to the email address that's associated with your AWS account prior to the scheduled event. The email provides details about the event, including the start and end date. Depending on the event, you might be able to take action to control the timing of the event. AWS also sends an AWS Health event, which you can monitor and manage by using Amazon CloudWatch Events. For more information about monitoring AWS Health events with CloudWatch, see [Monitoring AWS Health events with CloudWatch Events](#).

Scheduled events are managed by AWS; you cannot schedule events for your instances. You can view the events scheduled by AWS, customize scheduled event notifications to include or remove...
tags from the email notification, and perform actions when an instance is scheduled to reboot, retire, or stop.

To update the contact information for your account so that you can be sure to be notified about scheduled events, go to the Account Settings page.

**Note**
When an instance is affected by a scheduled event, and it is part of an Auto Scaling group, Amazon EC2 Auto Scaling eventually replaces it as part of its health checks, with no further action necessary on your part. For more information about the health checks performed by Amazon EC2 Auto Scaling, see Health checks for Auto Scaling instances in the Amazon EC2 Auto Scaling User Guide.

Types of scheduled events

Amazon EC2 can create the following types of events for your instances, where the event occurs at a scheduled time:

- **Instance stop**: At the scheduled time, the instance is stopped. When you start it again, it's migrated to a new host. Applies only to instances backed by Amazon EBS.

- **Instance retirement**: At the scheduled time, the instance is stopped if it is backed by Amazon EBS, or terminated if it is backed by instance store.

- **Instance reboot**: At the scheduled time, the instance is rebooted.

- **System reboot**: At the scheduled time, the host for the instance is rebooted.

- **System maintenance**: At the scheduled time, the instance might be temporarily affected by network maintenance or power maintenance.

Contents

- Recommended actions for Amazon EC2 instances affected by scheduled events

- Reschedule scheduled events that affect your Amazon EC2 instances
- Create custom event windows for scheduled events that affect your Amazon EC2 instances

Scheduled events
Recommended actions for Amazon EC2 instances affected by scheduled events

The following topic explains the actions you should take when your Amazon EC2 instance is affected by a scheduled event.

Topics

• Actions for instances scheduled to stop or retire
• Actions for instances scheduled for reboot
• Actions for instances scheduled for maintenance

Actions for instances scheduled to stop or retire

When AWS detects irreparable failure of the underlying host for your instance, it schedules the instance to stop or terminate, depending on the type of root device for the instance. If the root device is an EBS volume, the instance is scheduled to stop. If the root device is an instance store volume, the instance is scheduled to terminate. For more information, see Instance retirement.

⚠️ Important

Any data stored on instance store volumes is lost when an instance is stopped, hibernated, or terminated. This includes instance store volumes that are attached to an instance that has an EBS volume as the root device. Be sure to save data from your instance store volumes that you might need later before the instance is stopped, hibernated, or terminated.

Actions for Instances Backed by Amazon EBS

You can wait for the instance to stop as scheduled. Alternatively, you can stop and start the instance yourself, which migrates it to a new host. For more information about stopping your instance, in addition to information about the changes to your instance configuration when it's stopped, see Stop and start Amazon EC2 instances.

You can automate an immediate stop and start in response to a scheduled instance stop event. For more information, see Automating actions for Amazon EC2 instances in the AWS Health User Guide.

Actions for Instances Backed by Instance Store
We recommend that you launch a replacement instance from your most recent AMI and migrate all necessary data to the replacement instance before the instance is scheduled to terminate. Then, you can terminate the original instance, or wait for it to terminate as scheduled.

**Actions for instances scheduled for reboot**

When AWS must perform tasks such as installing updates or maintaining the underlying host, it can schedule the instance or the underlying host for a reboot. You can reschedule most reboot events so that your instance is rebooted at a specific date and time that suits you.

**View the reboot event type**

You can view whether a reboot event is an instance reboot or a system reboot by using one of the following methods.

**Console**

**To view the type of scheduled reboot event**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Events.
3. Choose **Resource type: instance** from the filter list.
4. For each instance, view the value in the **Event type** column. The value is either system-reboot or instance-reboot.

**AWS CLI**

**To view the type of scheduled reboot event**

Use the `describe-instance-status` command.

```
aws ec2 describe-instance-status \
   --instance-id i-1234567890abcdef0
```

For scheduled reboot events, the value for Code is either system-reboot or instance-reboot. The following example output shows a system-reboot event.

```
[  
  "Events": [  
    
```
Actions for instance reboot

You can wait for the instance reboot to occur within its scheduled maintenance window, reschedule the instance reboot to a date and time that suits you, or reboot the instance yourself at a time that is convenient for you.

After your instance is rebooted, the scheduled event is cleared and the event's description is updated. The pending maintenance to the underlying host is completed, and you can begin using your instance again after it has fully booted.

Actions for system reboot

It is not possible for you to reboot the system yourself. You can wait for the system reboot to occur during its scheduled maintenance window, or you can reschedule the system reboot to a date and time that suits you. A system reboot typically completes in a matter of minutes. After the system reboot has occurred, the instance retains its IP address and DNS name, and any data on local instance store volumes is preserved. After the system reboot is complete, the scheduled event for the instance is cleared, and you can verify that the software on your instance is operating as expected.

Alternatively, if it is necessary to maintain the instance at a different time and you can't reschedule the system reboot, then you can stop and start an Amazon EBS-backed instance, which migrates it to a new host. However, the data on the local instance store volumes is not preserved. You can also automate an immediate instance stop and start in response to a scheduled system reboot event. For more information, see Automating Actions for EC2 Instances in the AWS Health User Guide. For an instance store-backed instance, if you can't reschedule the system reboot, then you can launch a replacement instance from your most recent AMI, migrate all necessary data to the replacement instance before the scheduled maintenance window, and then terminate the original instance.
Actions for instances scheduled for maintenance

When AWS must maintain the underlying host for an instance, it schedules the instance for maintenance. There are two types of maintenance events: network maintenance and power maintenance.

During network maintenance, scheduled instances lose network connectivity for a brief period of time. Normal network connectivity to your instance is restored after maintenance is complete.

During power maintenance, scheduled instances are taken offline for a brief period, and then rebooted. When a reboot is performed, all of your instance's configuration settings are retained.

After your instance has rebooted (this normally takes a few minutes), verify that your application is working as expected. At this point, your instance should no longer have a scheduled event associated with it, or if it does, the description of the scheduled event begins with [Completed]. It sometimes takes up to 1 hour for the instance status description to refresh. Completed maintenance events are displayed on the Amazon EC2 console dashboard for up to a week.

Actions for Instances Backed by Amazon EBS

You can wait for the maintenance to occur as scheduled. Alternatively, you can stop and start the instance, which migrates it to a new host. For more information about stopping your instance, in addition to information about the changes to your instance configuration when it's stopped, see Stop and start Amazon EC2 instances.

You can automate an immediate stop and start in response to a scheduled maintenance event. For more information, see Automating Actions for EC2 Instances in the AWS Health User Guide.

Actions for instances backed by instance store

You can wait for the maintenance to occur as scheduled. Alternatively, if you want to maintain normal operation during a scheduled maintenance window, you can launch a replacement instance from your most recent AMI, migrate all necessary data to the replacement instance before the scheduled maintenance window, and then terminate the original instance.

View scheduled events that affect your Amazon EC2 instances

In addition to receiving notification of scheduled events in email, you can check for scheduled events by using one of the following methods.
**Console**

To view scheduled events for your instances

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. The dashboard displays any resources with an associated event under **Scheduled events**.

   ![Scheduled events](image)

   **US East (N. Virginia)**
   - 7 instance(s) have scheduled events
   - 1 volume(s) are impaired

3. For more detail, choose **Events** in the navigation pane. Any resources with an associated event are displayed. You can filter by characteristics such as event type, resource type, and Availability Zone.

   ![Events](image)

**AWS CLI**

To view scheduled events for your instances

Use the `describe-instance-status` command.

```bash
aws ec2 describe-instance-status \
  --instance-id i-1234567890abcdef0 \
  --query "InstanceStatuses[].Events"
```

The following example output shows a reboot event.

```
[
```
"Events": [  
  {  
    "InstanceEventId": "instance-event-0d59937288b749b32",  
    "Code": "system-reboot",  
    "Description": "The instance is scheduled for a reboot",  
    "NotAfter": "2019-03-15T22:00:00.000Z",  
    "NotBefore": "2019-03-14T20:00:00.000Z",  
    "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"
  }
]

The following example output shows an instance retirement event.

[  
  "Events": [  
    {  
      "InstanceEventId": "instance-event-0e439355b779n26",  
      "Code": "instance-stop",  
      "Description": "The instance is running on degraded hardware",  
      "NotBefore": "2015-05-23T00:00:00.000Z"
    }
  ]
]

PowerShell

To view scheduled events for your instances using the AWS Tools for Windows PowerShell

Use the following `Get-EC2InstanceStatus` command.

```
PS C:\> (Get-EC2InstanceStatus -InstanceId i-1234567890abcdef0).Events
```

The following example output shows an instance retirement event.

<table>
<thead>
<tr>
<th>Code</th>
<th>instance-stop</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>The instance is running on degraded hardware</td>
</tr>
<tr>
<td>NotBefore</td>
<td>5/23/2015 12:00:00 AM</td>
</tr>
</tbody>
</table>
Instance metadata

To view scheduled events for your instances using instance metadata

You can retrieve information about active maintenance events for your instances from the instance metadata by using Instance Metadata Service Version 2 or Instance Metadata Service Version 1.

IMDSv2

```
```

IMDSv1

```
```

The following is example output with information about a scheduled system reboot event, in JSON format.

```
[
  {
    "NotBefore" : "21 Jan 2019 09:00:43 GMT",
    "Code" : "system-reboot",
    "Description" : "scheduled reboot",
    "EventId" : "instance-event-0d59937288b749b32",
    "NotAfter" : "21 Jan 2019 09:17:23 GMT",
    "State" : "active"
  }
]
```

To view event history about completed or canceled events for your instances using instance metadata

You can retrieve information about completed or canceled events for your instances from instance metadata by using Instance Metadata Service Version 2 or Instance Metadata Service Version 1.
IMDSv2

IMDSv1

The following is example output with information about a system reboot event that was canceled, and a system reboot event that was completed, in JSON format.

```
[
  {
    "NotBefore" : "21 Jan 2019 09:00:43 GMT",
    "Code" : "system-reboot",
    "Description" : "[Canceled] scheduled reboot",
    "EventId" : "instance-event-0d59937288b749b32",
    "NotAfter" : "21 Jan 2019 09:17:23 GMT",
    "State" : "canceled"
  },
  {
    "NotBefore" : "29 Jan 2019 09:00:43 GMT",
    "Code" : "system-reboot",
    "Description" : "[Completed] scheduled reboot",
    "EventId" : "instance-event-0d59937288b749b32",
    "NotAfter" : "29 Jan 2019 09:17:23 GMT",
    "State" : "completed"
  }
]
```

AWS Health

You can use the AWS Health Dashboard to learn about events that can affect your instance. The AWS Health Dashboard organizes issues in three groups: open issues, scheduled changes, and other notifications. The scheduled changes group contains items that are ongoing or upcoming.

For more information, see Getting started with your AWS Health Dashboard in the AWS Health User Guide.
Customize email notifications for scheduled events that affect Amazon EC2 instances

You can customize scheduled event notifications to include tags in the email notification. This makes it easier to identify the affected resource (instances or Dedicated Hosts) and to prioritize actions for the upcoming event.

When you customize event notifications to include tags, you can choose to include:

- All of the tags that are associated with the affected resource
- Only specific tags that are associated with the affected resource

For example, suppose that you assign application, costcenter, project, and owner tags to all of your instances. You can choose to include all of the tags in event notifications. Alternatively, if you'd like to see only the owner and project tags in event notifications, then you can choose to include only those tags.

After you select the tags to include, the event notifications will include the resource ID (instance ID or Dedicated Host ID) and the tag key and value pairs that are associated with the affected resource.

Tasks

- Include tags in event notifications
- Remove tags from event notifications
- View the tags to be included in event notifications

Include tags in event notifications

The tags that you choose to include apply to all resources (instances and Dedicated Hosts) in the selected Region. To customize event notifications in other Regions, first select the required Region and then perform the following steps.

You can include tags in event notifications by using one of the following methods.

Console

To include tags in event notifications

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Events**.

3. Choose **Actions, Manage event notifications**.

4. Turn on **Include tags in event notifications**.

5. Do one of the following, depending on the tags that you want to include in event notifications:
   - To include all tags associated with the affected instance or Dedicated Host, select **Include all tags**.
   - To select the tags to include, select **Choose the tags to include** and then select or enter the tag keys.

6. Choose **Save**.

AWS CLI

**To include all tags in event notifications**

Use the **register-instance-event-notification-attributes** AWS CLI command and set the **IncludeAllTagsOfInstance** parameter to `true`.

```
aws ec2 register-instance-event-notification-attributes \ 
--instance-tag-attribute "IncludeAllTagsOfInstance=true"
```

**To include specific tags in event notifications**

Use the **register-instance-event-notification-attribute** AWS CLI command and specify the tags to include by using the **InstanceTagKeys** parameter.

```
aws ec2 register-instance-event-notification-attributes \ 
--instance-tag-attribute 'InstanceTagKeys=["tag_key_1", "tag_key_2", "tag_key_3"]'
```

**Remove tags from event notifications**

You can remove tags from event notifications by using one of the following methods.
Console

**To remove tags from event notifications**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.
4. To remove all tags from event notifications, turn off **Include tags in event notifications**.
5. To remove specific tags from event notifications, choose the X) for the corresponding tag keys.
6. Choose **Save**.

AWS CLI

**To remove all tags from event notifications**

Use the `deregister-instance-event-notification-attributes` AWS CLI command and set the `IncludeAllTagsOfInstance` parameter to `false`.

```bash
aws ec2 deregister-instance-event-notification-attributes \
--instance-tag-attribute "IncludeAllTagsOfInstance=false"
```

**To remove specific tags from event notifications**

Use the `deregister-instance-event-notification-attributes` AWS CLI command and specify the tags to remove by using the `InstanceTagKeys` parameter.

```bash
aws ec2 deregister-instance-event-notification-attributes \
--instance-tag-attribute 'InstanceTagKeys="tag_key_1", "tag_key_2", "tag_key_3"'
```

**View the tags to be included in event notifications**

You can view the tags that are to be included in event notifications by using one of the following methods.
Console

**To view the tags that are to be included in event notifications**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event notifications**.

AWS CLI

**To view the tags that are to be included in event notifications**

Use the `describe-instance-event-notification-attributes` AWS CLI command.

```bash
aws ec2 describe-instance-event-notification-attributes
```

**Reschedule scheduled events that affect your Amazon EC2 instances**

You can reschedule an event so that it occurs at a specific date and time that suits you. Only events that have a deadline date can be rescheduled. There are other limitations for rescheduling an event.

You can reschedule an event by using one of the following methods.

Console

**To reschedule an event**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Events**.
3. Choose **Resource type: instance** from the filter list.
4. Select one or more instances, and then choose **Actions, Schedule event**.

   Only events that have an event deadline date, indicated by a value for **Deadline**, can be rescheduled. If one of the selected events does not have a deadline date, **Actions, Schedule event** is disabled.

5. For **New start time**, enter a new date and time for the event. The new date and time must occur before the **Event deadline**.
6. Choose **Save**.

It might take a minute or two for the updated event start time to be reflected in the console.

**AWS CLI**

**To reschedule an event**

1. Only events that have an event deadline date, indicated by a value for `NotBeforeDeadline`, can be rescheduled. Use the `describe-instance-status` command to view the `NotBeforeDeadline` parameter value.

```bash
aws ec2 describe-instance-status \
   --instance-id i-1234567890abcdef0
```

The following example output shows a system-reboot event that can be rescheduled because `NotBeforeDeadline` contains a value.

```
[
  "Events": [
    {
      "InstanceEventId": "instance-event-0d59937288b749b32",
      "Code": "system-reboot",
      "Description": "The instance is scheduled for a reboot",
      "NotAfter": "2019-03-14T22:00:00.000Z",
      "NotBefore": "2019-03-14T20:00:00.000Z",
      "NotBeforeDeadline": "2019-04-05T11:00:00.000Z"
    }
  ]
]
```

2. To reschedule the event, use the `modify-instance-event-start-time` command. Specify the new event start time by using the `not-before` parameter. The new event start time must fall before the `NotBeforeDeadline`.

```bash
aws ec2 modify-instance-event-start-time \
   --instance-id i-1234567890abcdef0 \
   --instance-event-id instance-event-0d59937288b749b32 \
   --not-before 2019-03-25T10:00:00.000
```
It might take a minute or two before the `describe-instance-status` command returns the updated `not-before` parameter value.

**Limitations**

- Only events with an event deadline date can be rescheduled. The event can be rescheduled up to the event deadline date. The **Deadline** column in the console and the **NotBeforeDeadline** field in the AWS CLI indicate if the event has a deadline date.

- Only events that have not yet started can be rescheduled. The **Start time** column in the console and the **NotBefore** field in the AWS CLI indicate the event start time. Events that are scheduled to start in the next 5 minutes cannot be rescheduled.

- The new event start time must be at least 60 minutes from the current time.

- If you reschedule multiple events using the console, the event deadline date is determined by the event with the earliest event deadline date.

**Create custom event windows for scheduled events that affect your Amazon EC2 instances**

You can define custom event windows that recur weekly for scheduled events that reboot, stop, or terminate your Amazon EC2 instances. You can associate one or more instances with an event window. If a scheduled event for those instances is planned, AWS will schedule the events within the associated event window.

You can use event windows to maximize workload availability by specifying event windows that occur during off-peak periods for your workload. You can also align the event windows with your internal maintenance schedules.

You define an event window by specifying a set of time ranges. The minimum time range is 2 hours. The combined time ranges must total at least 4 hours.

You can associate one or more instances with an event window by using either instance IDs or instance tags. You can also associate Dedicated Hosts with an event window by using the host ID.

⚠️ **Warning**

Event windows are applicable only for scheduled events that stop, reboot, or terminate instances.
Event windows are *not* applicable for:

- Expedited scheduled events and network maintenance events.
- Unscheduled maintenance such as AutoRecovery and unplanned reboots.

**Work with event windows**

- **Considerations**
- **Create event windows**
- **View event windows**
- **Modify event windows**
- **Delete event windows**
- **Tag event windows**

**Considerations**

- All event window times are in UTC.
- The minimum weekly event window duration is 4 hours.
- The time ranges within an event window must each be at least 2 hours.
- Only one target type (instance ID, Dedicated Host ID, or instance tag) can be associated with an event window.
- A target (instance ID, Dedicated Host ID, or instance tag) can only be associated with one event window.
- A maximum of 100 instance IDs, or 50 Dedicated Host IDs, or 50 instance tags can be associated with an event window. The instance tags can be associated with any number of instances.
- A maximum of 200 event windows can be created per AWS Region.
- Multiple instances that are associated with event windows can potentially have scheduled events occur at the same time.
- If AWS has already scheduled an event, modifying an event window won't change the time of the scheduled event. If the event has a deadline date, you can [reschedule the event](#).
- You can stop and start an instance prior to the scheduled event, which migrates the instance to a new host, and the scheduled event will no longer take place.
**Create event windows**

You can create one or more event windows. For each event window, you specify one or more blocks of time. For example, you can create an event window with blocks of time that occur every day at 4 AM for 2 hours. Or you can create an event window with blocks of time that occur on Sundays from 2 AM to 4 AM and on Wednesdays from 3 AM to 5 AM.

For the event window constraints, see Considerations earlier in this topic.

Event windows recur weekly until you delete them.

Use one of the following methods to create an event window.

**Console**

**To create an event window**

1. Open the Amazon EC2 console at `https://console.aws.amazon.com/ec2/`.
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Choose **Create instance event window**.
5. For **Event window name**, enter a descriptive name for the event window.
6. For **Event window schedule**, choose to specify the blocks of time in the event window by using the cron schedule builder or by specifying time ranges.
   - If you choose **Cron schedule builder**, specify the following:
     1. For **Days (UTC)**, specify the days of the week on which the event window occurs.
     2. For **Start time (UTC)**, specify the time when the event window begins.
     3. For **Duration**, specify the duration of the blocks of time in the event window. The minimum duration per block of time is 2 hours. The minimum duration of the event window must equal or exceed 4 hours in total. All times are in UTC.
   - If you choose **Time ranges**, choose **Add new time range** and specify the start day and time and the end day and time. Repeat for each time range. The minimum duration per time range is 2 hours. The minimum duration for all time ranges combined must equal or exceed 4 hours in total.
7. (Optional) For **Target details**, associate one or more instances with the event window so that if the instances are scheduled for maintenance, the scheduled event will occur
during the associated event window. You can associate one or more instances with an event window by using instance IDs or instance tags. You can associate Dedicated Hosts with an event window by using the host ID.

Note that you can create the event window without associating a target with the window. Later, you can modify the window to associate one or more targets.

8. (Optional) For **Event window tags**, choose **Add tag**, and enter the key and value for the tag. Repeat for each tag.

9. Choose **Create event window**.

**AWS CLI**

To create an event window using the AWS CLI, you first create the event window, and then you associate one or more targets with the event window.

**Create an event window**

You can define either a set of time ranges or a cron expression when creating the event window, but not both.

**To create an event window with a time range**

Use the **create-instance-event-window** command and specify the **--time-range** parameter. You can't also specify the **--cron-expression** parameter.

```
aws ec2 create-instance-event-window \
  --region us-east-1 \
  --time-range StartWeekDay=monday,StartHour=2,EndWeekDay=wednesday,EndHour=8 \
  --tag-specifications "ResourceType=instance-event-window,Tags=[{Key=K1,Value=V1}]" \
  --name myEventWindowName
```

**Expected output**

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "TimeRanges": [
      {
        "StartWeekDay": "monday",
        "EndWeekDay": "wednesday",
        "StartHour": "2",
        "EndHour": "8"
      }
    ],
    "TagSpecifications": {
      "ResourceType": "instance-event-window",
      "Tags": [{"Key": "K1", "Value": "V1"}]
    }
  }
}
```
To create an event window with a cron expression

Use the `create-instance-event-window` command and specify the `--cron-expression` parameter. You can't also specify the `--time-range` parameter.

```bash
aws ec2 create-instance-event-window \
  --region us-east-1 \
  --cron-expression "*/21-23 * * 2,3" \
  --tag-specifications "ResourceType=instance-event-window,Tags=[{Key=K1,Value=V1}]" \
  --name myEventWindowName
```

Expected output

```json
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "*/21-23 * * 2,3",
    "State": "creating",
    "Tags": [
      {
        "Key": "K1",
        "Value": "V1"
      }
    ]
  }
}
```
Associate a target with an event window

You can associate only one type of target (instance IDs, Dedicated Host IDs, or instance tags) with an event window.

To associate instance tags with an event window

Use the `associate-instance-event-window` command and specify the `instance-event-window-id` parameter to specify the event window. To associate instance tags, specify the `--association-target` parameter, and for the parameter values, specify one or more tags.

```bash
aws ec2 associate-instance-event-window
  --region us-east-1
  --instance-event-window-id iew-0abcdef1234567890
  --association-target "InstanceTags=[[Key=k2,Value=v2],[Key=k1,Value=v1]]"
```

Expected output

```
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [
        {
          "Key": "k2",
          "Value": "v2"
        },
        {
          "Key": "k1",
          "Value": "v1"
        }
      ],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```
To associate one or more instances with an event window

Use the `associate-instance-event-window` command and specify the `instance-event-window-id` parameter to specify the event window. To associate instances, specify the `--association-target` parameter, and for the parameter values, specify one or more instance IDs.

```bash
aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
    --association-target "InstanceIds=i-1234567890abcdef0,i-0598c7d356eba48d7"
```

Expected output

```json
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
               "i-1234567890abcdef0",
               "i-0598c7d356eba48d7"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating"
    }
}
```

To associate a Dedicated Host with an event window

Use the `associate-instance-event-window` command and specify the `instance-event-window-id` parameter to specify the event window. To associate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```bash
aws ec2 associate-instance-event-window \
    --region us-east-1 \
    --instance-event-window-id iew-0abcdef1234567890 \
```
Expected output

```json
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [],
            "Tags": [],
            "DedicatedHostIds": [
                "h-029fa35a02b99801d"
            ],
            "State": "creating"
        }
    }
}
```

View event windows

You can view event windows by using one of the following methods.

**Console**

To view event windows

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Events**.
3. Choose **Actions, Manage event windows**.
4. Select an event window to view its details.

**AWS CLI**

To describe all event windows

Use the [describe-instance-event-windows](https://docs.aws.amazon.com/cli/latest/reference/ec2/describe-instance-event-windows.html) command.

```
aws ec2 describe-instance-event-windows
```
To describe a specific event window

Use the `describe-instance-event-windows` command with the `--instance-event-window-id` parameter to describe a specific event window.

```
aws ec2 describe-instance-event-windows \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890
```

To describe event windows that match one or more filters

Use the `describe-instance-event-windows` command with the `--filters` parameter. In the following example, the `instance-id` filter is used to describe all of the event windows that are associated with the specified instance.
When a filter is used, it performs a direct match. However, the `instance-id` filter is different. If there is no direct match to the instance ID, then it falls back to indirect associations with the event window, such as the instance's tags or Dedicated Host ID (if the instance is on a Dedicated Host).

For the list of supported filters, see `describe-instance-event-windows` in the AWS CLI Reference.

```bash
aws ec2 describe-instance-event-windows \
--region us-east-1 \
--filters Name=instance-id,Values=i-1234567890abcdef0 \
--max-results 100 \
--next-token <next-token-value>
```

Expected output

In the following example, the instance is on a Dedicated Host, which is associated with the event window.

```
{
    "InstanceEventWindows": [
        {
            "InstanceEventWindowId": "iew-0dbc0adb66f235982",
            "TimeRanges": [
                {
                    "StartWeekDay": "sunday",
                    "StartHour": 2,
                    "EndWeekDay": "sunday",
                    "EndHour": 8
                }
            ],
            "Name": "myEventWindowName",
            "AssociationTarget": {
                "InstanceIds": [],
                "Tags": [],
                "DedicatedHostIds": [
                    "h-0140d9a7ecbd102dd"
                ],
                "State": "active",
                "Tags": []
            }
        }
    ]
}
```
Modify event windows

You can modify all of the fields of an event window except its ID. For example, when daylight savings begin, you might want to modify the event window schedule. For existing event windows, you might want to add or remove targets.

Use one of the following methods to modify an event window.

Console

To modify an event window

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Events.
3. Choose Actions, Manage event windows.
4. Select the event window to modify, and then choose Actions, Modify instance event window.
5. Modify the fields in the event window, and then choose Modify event window.

AWS CLI

To modify an event window using the AWS CLI, you can modify the time range or cron expression, and associate or disassociate one or more targets with the event window.

Modify the event window time

You can modify either a time range or a cron expression when modifying the event window, but not both.

To modify the time range of an event window

Use the modify-instance-event-window command and specify the event window to modify. Specify the --time-range parameter to modify the time range. You can’t also specify the --cron-expression parameter.

```
aws ec2 modify-instance-event-window \ 
   --region us-east-1 
```
To modify a set of time ranges for an event window

Use the `modify-instance-event-window` command and specify the event window to modify. Specify the `--time-range` parameter to modify the time range. You can't also specify the `--cron-expression` parameter in the same call.

```
aws ec2 modify-instance-event-window \\
--region us-east-1 \\
```
--instance-event-window-id iew-0abcdef1234567890 \
--time-range '([{"StartWeekDay": "monday", "StartHour": 2, "EndWeekDay": "wednesday", "EndHour": 8},
{"StartWeekDay": "thursday", "StartHour": 2, "EndWeekDay": "friday", "EndHour": 8}]'

**Expected output**

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "TimeRanges": [
         {
            "StartWeekDay": "monday",
            "StartHour": 2,
            "EndWeekDay": "wednesday",
            "EndHour": 8
         },
         {
            "StartWeekDay": "thursday",
            "StartHour": 2,
            "EndWeekDay": "friday",
            "EndHour": 8
         }
      ],
      "Name": "myEventWindowName",
      "AssociationTarget": {
         "InstanceIds": [
            "i-0abcdef1234567890",
            "i-0be35f9acb8ba01f0"
         ],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating",
      "Tags": [
         {
            "Key": "K1",
            "Value": "V1"
         }
      ]
   }
}
```
To modify the cron expression of an event window

Use the `modify-instance-event-window` command and specify the event window to modify. Specify the `--cron-expression` parameter to modify the cron expression. You can't also specify the `--time-range` parameter.

```bash
aws ec2 modify-instance-event-window \
  --region us-east-1 \
  --instance-event-window-id iew-0abcdef1234567890 \
  --cron-expression "* 21-23 * * 2,3"
```

Expected output

```
{
    "InstanceEventWindow": {
        "InstanceEventWindowId": "iew-0abcdef1234567890",
        "Name": "myEventWindowName",
        "CronExpression": "* 21-23 * * 2,3",
        "AssociationTarget": {
            "InstanceIds": [
                "i-0abcdef1234567890",
                "i-0be35f9ac8ba01f0"
            ],
            "Tags": [],
            "DedicatedHostIds": []
        },
        "State": "creating",
        "Tags": [
            {
                "Key": "K1",
                "Value": "V1"
            }
        ]
    }
}
```

Modify the targets associated with an event window

You can associate additional targets with an event window. You can also disassociate existing targets from an event window. However, only one type of target (instance IDs, Dedicated Host IDs, or instance tags) can be associated with an event window.
To associate additional targets with an event window

For the instructions on how to associate targets with an event window, see Associate a target with an event window.

To disassociate instance tags from an event window

Use the disassociate-instance-event-window command and specify the instance-event-window-id parameter to specify the event window. To disassociate instance tags, specify the --association-target parameter, and for the parameter values, specify one or more tags.

```bash
aws ec2 disassociate-instance-event-window \
   --region us-east-1 \
   --instance-event-window-id iew-0abcdef1234567890 \
   --association-target "InstanceTags=[{Key=k2,Value=v2},{Key=k1,Value=v1}]"
```

Expected output

```
{
   "InstanceEventWindow": {
      "InstanceEventWindowId": "iew-0abcdef1234567890",
      "Name": "myEventWindowName",
      "CronExpression": "* 21-23 * * 2,3",
      "AssociationTarget": {
         "InstanceIds": [],
         "Tags": [],
         "DedicatedHostIds": []
      },
      "State": "creating"
   }
}
```

To disassociate one or more instances from an event window

Use the disassociate-instance-event-window command and specify the instance-event-window-id parameter to specify the event window. To disassociate instances, specify the --association-target parameter, and for the parameter values, specify one or more instance IDs.

```bash
aws ec2 disassociate-instance-event-window \
   --region us-east-1 \
```
To disassociate a Dedicated Host from an event window

Use the `disassociate-instance-event-window` command and specify the `instance-event-window-id` parameter to specify the event window. To disassociate a Dedicated Host, specify the `--association-target` parameter, and for the parameter values, specify one or more Dedicated Host IDs.

```bash
aws ec2 disassociate-instance-event-window \\  --region us-east-1 \\  --instance-event-window-id iew-0abcdef1234567890 \\  --association-target DedicatedHostIds=h-029fa35a02b99801d
```

Expected output

```json
{
  "InstanceEventWindow": {
    "InstanceEventWindowId": "iew-0abcdef1234567890",
    "Name": "myEventWindowName",
    "CronExpression": "* 21-23 * * 2,3",
    "AssociationTarget": {
      "InstanceIds": [],
      "Tags": [],
      "DedicatedHostIds": []
    },
    "State": "creating"
  }
}
```
Delete event windows

You can delete one event window at a time by using one of the following methods.

Console

**To delete an event window**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Events.
3. Choose Actions, Manage event windows.
4. Select the event window to delete, and then choose Actions, Delete instance event window.
5. When prompted, enter delete, and then choose Delete.

AWS CLI

**To delete an event window**

Use the `delete-instance-event-window` command and specify the event window to delete.

```
aws ec2 delete-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890
```

**To force delete an event window**

Use the `--force-delete` parameter if the event window is currently associated with targets.

```
aws ec2 delete-instance-event-window \
--region us-east-1 \
--instance-event-window-id iew-0abcdef1234567890 \
--force-delete
```
Tag event windows

You can tag an event window when you create it, or afterwards.

To tag an event window when you create it, see Create event windows.

Use one of the following methods to tag an event window.

Console

**To tag an existing event window**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Events.
3. Choose Actions, Manage event windows.
4. Select the event window to tag, and then choose Actions, Manage instance event window tags.
5. Choose Add tag to add a tag. Repeat for each tag.
6. Choose Save.

AWS CLI

**To tag an existing event window**

Use the create-tags command to tag existing resources. In the following example, the existing event window is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
  --resources iew-0abcdef1234567890 \
  --tags Key=purpose,Value=test
```
Monitor your instances using CloudWatch

You can monitor your instances using Amazon CloudWatch, which collects and processes raw data from Amazon EC2 into readable, near real-time metrics. These statistics are recorded for a period of 15 months, so that you can access historical information and gain a better perspective on how your web application or service is performing.

By default, Amazon EC2 sends metric data to CloudWatch in 5-minute periods. To send metric data for your instance to CloudWatch in 1-minute periods, you can enable detailed monitoring on the instance. For more information, see Enable or turn off detailed monitoring for your instances.

The Amazon EC2 console displays a series of graphs based on the raw data from Amazon CloudWatch. Depending on your needs, you might prefer to get data for your instances from Amazon CloudWatch instead of the graphs in the console.

For Amazon CloudWatch billing and cost information, see CloudWatch billing and cost in the Amazon CloudWatch User Guide.

Contents

- Manage CloudWatch alarms for your EC2 instances in the EC2 console
- Enable or turn off detailed monitoring for your instances
- List the available CloudWatch metrics for your instances
- Install and configure the CloudWatch agent using the Amazon EC2 console to add additional metrics
- Get statistics for metrics for your instances
- Graph metrics for your instances
- Create a CloudWatch alarm for an instance
- Create alarms that stop, terminate, reboot, or recover an instance

Manage CloudWatch alarms for your EC2 instances in the EC2 console

From the Instances screen in the Amazon EC2 console, you can manage the Amazon CloudWatch alarms for your instances. In the Instances table, the Alarm status column provides two console controls: a control for viewing alarms, and another for creating or editing them. The following screenshot indicates these console controls, numbered 1 (View alarms) and 2 (a + sign for creating or editing an alarm).
View alarms from the Instances screen

You can view each instance's alarms from the Instances screen.

To view an instance's alarm from the Instances screen

1. Open the Amazon EC2 console at `https://console.aws.amazon.com/ec2/`.
2. In the navigation pane, choose Instances.
3. In the Instances table, for your chosen instance, choose View alarms (numbered 1 in the preceding screenshot).
4. In the Alarm details for `i-0123456789example` window, choose the alarm name to view the alarm in the CloudWatch console.

Create alarms from the Instances screen

You can create an alarm for each instance from the Instances screen.

To create an alarm for an instance from the Instances screen

1. Open the Amazon EC2 console at `https://console.aws.amazon.com/ec2/`.
2. In the navigation pane, choose Instances.
3. In the Instances table, for your chosen instance, choose the plus sign (numbered 2 in the preceding screenshot).
4. In the Manage CloudWatch alarms screen, create your alarm. For more information, see Create a CloudWatch alarm for an instance.

Edit alarms from the Instances screen

You can edit the alarm for an instance from the Instances screen.
To edit an alarm for an instance from the Instances screen

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. In the Instances table, for your chosen instance, choose the plus sign (numbered 2 in the preceding screenshot).
4. In the Manage CloudWatch alarms screen, edit your alarm. For more information, see Edit or delete a CloudWatch alarm in the Amazon CloudWatch User Guide.

Enable or turn off detailed monitoring for your instances

By default, your instance is enabled for basic monitoring. You can optionally enable detailed monitoring.

The following table highlights the differences between basic monitoring and detailed monitoring for instances.

<table>
<thead>
<tr>
<th>Monitoring type</th>
<th>Description</th>
<th>Charges</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic monitoring</td>
<td>Only status check metrics are available in 1-minute periods. All other metrics are available in 5-minute periods.</td>
<td>No charge.</td>
</tr>
<tr>
<td>Detailed monitoring</td>
<td>All metrics, including status check metrics, are available in 1-minute periods. To get this level of data, you must specifically enable it for the instance. For the instances where you've enabled detailed monitoring, you can also get aggregated data across groups of similar instances.</td>
<td>You are charged per metric that is sent to CloudWatch. You are not charged for data storage. For more information, see Paid tier and Example 1 - EC2 Detailed Monitoring on the Amazon CloudWatch pricing page.</td>
</tr>
</tbody>
</table>

Topics

- Required IAM permissions
• Enable detailed monitoring
• Turn off detailed monitoring

Required IAM permissions

To enable detailed monitoring for an instance, your user must have permission to use the MonitorInstances API action. To turn off detailed monitoring for an instance, your user must have permission to use the UnmonitorInstances API action.

Enable detailed monitoring

You can enable detailed monitoring on an instance as you launch it or after the instance is running or stopped. Enabling detailed monitoring on an instance does not affect the monitoring of the EBS volumes attached to the instance. For more information, see Amazon CloudWatch metrics for Amazon EBS.

Console

To enable detailed monitoring for an existing instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance and choose Actions, Monitor and troubleshoot, Manage detailed monitoring.
4. On the Detailed monitoring detail page, for Detailed monitoring, select the Enable check box.
5. Choose Save.

To enable detailed monitoring when launching an instance

When launching an instance using the Amazon EC2 console, under Advanced details, select the Detailed CloudWatch monitoring check box.

AWS CLI

To enable detailed monitoring for an existing instance
Use the following `monitor-instances` command to enable detailed monitoring for the specified instances.

```bash
aws ec2 monitor-instances --instance-ids i-1234567890abcdef0
```

**To enable detailed monitoring when launching an instance**

Use the `run-instances` command with the `--monitoring` flag to enable detailed monitoring.

```bash
aws ec2 run-instances --image-id ami-09092360 --monitoring Enabled=true...
```

**Turn off detailed monitoring**

You can turn off detailed monitoring on an instance as you launch it or after the instance is running or stopped.

**Console**

**To turn off detailed monitoring**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage detailed monitoring**.
4. On the **Detailed monitoring** detail page, for **Detailed monitoring**, clear the **Enable** check box.
5. Choose **Save**.

**AWS CLI**

**To turn off detailed monitoring**

Use the following `unmonitor-instances` command to turn off detailed monitoring for the specified instances.

```bash
aws ec2 unmonitor-instances --instance-ids i-1234567890abcdef0
```
List the available CloudWatch metrics for your instances

Amazon EC2 sends metrics to Amazon CloudWatch. You can use the AWS Management Console, the AWS CLI, or an API to list the metrics that Amazon EC2 sends to CloudWatch. By default, each data point covers the 5 minutes that follow the start time of activity for the instance. If you've enabled detailed monitoring, each data point covers the next minute of activity from the start time. Note that for the Minimum, Maximum, and Average statistics, the minimum granularity for the metrics that EC2 provides is 1 minute.

For information about getting the statistics for these metrics, see Get statistics for metrics for your instances.

Instance metrics

The AWS/EC2 namespace includes the following instance metrics.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
<th>Unit</th>
<th>Meaningful statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPUUtilization</td>
<td>The percentage of physical CPU time that Amazon EC2 uses to run the EC2 instance,</td>
<td>Percent</td>
<td>• Average</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Minimum</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Maximum</td>
</tr>
</tbody>
</table>
which includes time spent to run both the user code and the Amazon EC2 code.

At a very high level, CPUUtilization is the sum of guest CPUUtilization and hypervisor CPUUtilization.

Tools in your operating system can show a different percentage than CloudWatch due to factors such as legacy device simulation, configuration of non-legacy devices, interrupt-heavy workloads, live migration, and live update.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
<th>Unit</th>
<th>Meaningful statistics</th>
</tr>
</thead>
</table>
| DiskReadOps | Completed read operations from all instance store volumes available to the instance in a specified period of time. | Count  | • Sum
                        | To calculate the average I/O operations per second (IOPS) for the period, divide the total operations in the period by the number of seconds in that period. |        | • Average
                        | If there are no instance store volumes, either the value is 0 or the metric is not reported. |        | • Minimum
<pre><code>                    |                                                                                               |        | • Maximum |

</tbody>
</table>
| DiskReadBytes  | Bytes read from all instance store volumes available to the instance. This metric is used to determine the volume of the data the application reads from the hard disk of the instance. This can be used to determine the speed of the application. The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring, divide it by 60. You can also use the CloudWatch metric math function DIFF_TIME to find the bytes per second. For example, if you have graphed DiskReadBytes in CloudWatch as m1, the metric math formula m1/(DIFF_TIME(m1)) returns the metric in bytes/second. For more information about DIFF_TIME and other metric math functions, see Use metric math in the Amazon CloudWatch User Guide. If there are no instance store volumes, either the value is 0 or the metric is not reported. | Bytes  | • Sum  
|               |                                                                                                                                                                                                             |        | • Average  
|               |                                                                                                                                                                                                             |        | • Minimum  
|               |                                                                                                                                                                                                             |        | • Maximum  |

</table>
| NetworkIn | The number of bytes received by the instance on all network interfaces. This metric identifies the volume of incoming network traffic to a single instance. The number reported is the number of bytes received during the period. If you are using basic (5-minute) monitoring and the statistic is Sum, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring and the statistic is Sum, divide it by 60. You can also use the CloudWatch metric math function `DIFF_TIME` to find the bytes per second. For example, if you have graphed `NetworkIn` in CloudWatch as `m1`, the metric math formula `m1/(DIFF_TIME(m1))` returns the metric in bytes/second. For more information about `DIFF_TIME` and other metric math functions, see [Use metric math](#) in the *Amazon CloudWatch User Guide*. | Bytes    | • Sum  
• Average  
• Minimum  
• Maximum |
### Network Out

The number of bytes sent out by the instance on all network interfaces. This metric identifies the volume of outgoing network traffic from a single instance.

The number reported is the number of bytes sent during the period. If you are using basic (5-minute) monitoring and the statistic is Sum, you can divide this number by 300 to find Bytes/second. If you have detailed (1-minute) monitoring and the statistic is Sum, divide it by 60. You can also use the CloudWatch metric math function `DIFF_TIME` to find the bytes per second. For example, if you have graphed `NetworkOut` in CloudWatch as `m1`, the metric math formula `m1/(DIFF_TIME(m1))` returns the metric in bytes/second. For more information about `DIFF_TIME` and other metric math functions, see [Use metric math](#) in the *Amazon CloudWatch User Guide*.

|              |                                                                                                                                                                                                           |          | • Maximum |

### CPU credit metrics

The AWS/EC2 namespace includes the following CPU credit metrics for your [burstable performance instances](https://docs.aws.amazon.com/AmazonEC2/latest/UserGuide/BurstablePerf.html).

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
<th>Unit</th>
<th>Meaningful statistics</th>
</tr>
</thead>
</table>
| CPUCreditUsage | The number of CPU credits spent by the instance for CPU utilization. One CPU credit equals one vCPU running at 100% utilization for one minute or an equivalent combination                                                                 | Credits (vCPU-minutes) | • Sum  
|              |                                                                                                                                                                                                           |          | • Average 
|              |                                                                                                                                                                                                           |          | • Minimum 
<p>|              |                                                                                                                                                                                                           |          | • Maximum |</p>

</table>
| EBSByteBalance% | Provides information about the percentage of throughput credits remaining in the burst bucket. This metric is available for basic monitoring only. This metric is available only for some *.*.4xlarge instance sizes and smaller that burst to their maximum performance for only 30 minutes at least once every 24 hours. The Sum statistic is not applicable to this metric. | Percent | • Minimum  
  • Maximum |

For information about the metrics provided for your EBS volumes, see [Metrics for Amazon EBS volumes](#) in the *Amazon EBS User Guide*. For information about the metrics provided for your Spot fleets, see [CloudWatch metrics for Spot Fleet](#).

### Status check metrics

By default, status check metrics are available at a 1-minute frequency at no charge. For a newly-launched instance, status check metric data is only available after the instance has completed the initialization state (within a few minutes of the instance entering the running state). For more information about EC2 status checks, see [Status checks for Amazon EC2 instances](#).

The AWS/EC2 namespace includes the following status check metrics.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
<th>Unit</th>
<th>Meaningful statistics</th>
</tr>
</thead>
</table>
| StatusCheckFailed | Reports whether the instance has passed both the instance status check and the system status check in the last minute. This metric can be either 0 (passed) or 1 (failed). | Count | • Sum  
  • Average |
<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
<th>Unit</th>
<th>Meaningful statistics</th>
</tr>
</thead>
<tbody>
<tr>
<td>StatusCheckFailed_Instance</td>
<td>Reports whether the instance has passed the instance status check in the last minute.</td>
<td>Count</td>
<td>• Sum</td>
</tr>
<tr>
<td></td>
<td>This metric can be either 0 (passed) or 1 (failed).</td>
<td></td>
<td>• Average</td>
</tr>
<tr>
<td></td>
<td>By default, this metric is available at a 1-minute frequency at no charge.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>StatusCheckFailed_System</td>
<td>Reports whether the instance has passed the system status check in the last minute.</td>
<td>Count</td>
<td>• Sum</td>
</tr>
<tr>
<td></td>
<td>This metric can be either 0 (passed) or 1 (failed).</td>
<td></td>
<td>• Average</td>
</tr>
<tr>
<td></td>
<td>By default, this metric is available at a 1-minute frequency at no charge.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>StatusCheckFailed_AttachedEBS</td>
<td>Reports whether the instance has passed the attached EBS status check in the last minute.</td>
<td>Count</td>
<td>• Sum</td>
</tr>
<tr>
<td></td>
<td>This metric can be either 0 (passed) or 1 (failed).</td>
<td></td>
<td>• Average</td>
</tr>
<tr>
<td></td>
<td>By default, this metric is available at a 1-minute frequency at no charge.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The AWS/EBS namespace includes the following status check metric.
### Traffic mirroring metrics

The AWS/EC2 namespace includes metrics for mirrored traffic. For more information, see [Monitor mirrored traffic using Amazon CloudWatch](https://aws.amazon.com/cloudwatch/mirror/) in the *Amazon VPC Traffic Mirroring Guide*.

### Auto Scaling group metrics

The AWS/AutoScaling namespace includes metrics for Auto Scaling groups. For more information, see [Monitor CloudWatch metrics for your Auto Scaling groups and instances](https://docs.aws.amazon.com/autoscaling/userguide/autoscaling-monitoring-cloudwatch.html) in the *Amazon EC2 Auto Scaling User Guide*.

### Amazon EC2 metric dimensions

You can use the following dimensions to refine the metrics listed in the previous tables.

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AutoScalingGroupName</td>
<td>This dimension filters the data you request for all instances in a specified capacity group. An Auto Scaling group is a collection of instances you define if you’re using Auto Scaling. This dimension is available only for Amazon EC2 metrics when the instances are in such an Auto Scaling group. Available for instances with Detailed or Basic Monitoring enabled.</td>
</tr>
<tr>
<td>ImageId</td>
<td>This dimension filters the data you request for all instances running this Amazon EC2 Amazon Machine Image (AMI). Available for instances with Detailed Monitoring enabled.</td>
</tr>
</tbody>
</table>
### Dimension Description

<table>
<thead>
<tr>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceId</td>
<td>This dimension filters the data you request for the identified instance only. This helps you pinpoint an exact instance from which to monitor data.</td>
</tr>
<tr>
<td>InstanceType</td>
<td>This dimension filters the data you request for all instances running with this specified instance type. This helps you categorize your data by the type of instance running. For example, you might compare data from an m1.small instance and an m1.large instance to determine which has the better business value for your application. Available for instances with Detailed Monitoring enabled.</td>
</tr>
</tbody>
</table>

### Amazon EC2 usage metrics

You can use CloudWatch usage metrics to provide visibility into your account's usage of resources. Use these metrics to visualize your current service usage on CloudWatch graphs and dashboards.

Amazon EC2 usage metrics correspond to AWS service quotas. You can configure alarms that alert you when your usage approaches a service quota. For more information about CloudWatch integration with service quotas, see [AWS usage metrics](https://docs.aws.amazon.com/AmazonCloudWatch/latest/usage/usage-metrics.html) in the *Amazon CloudWatch User Guide*.

Amazon EC2 publishes the following metrics in the AWS/Usage namespace.

<table>
<thead>
<tr>
<th>Metric</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResourceCount</td>
<td>The number of the specified resources running in your account. The resources are defined by the dimensions associated with the metric. The most useful statistic for this metric is MAXIMUM, which represents the maximum number of resources used during the 1-minute period.</td>
</tr>
</tbody>
</table>

The following dimensions are used to refine the usage metrics that are published by Amazon EC2.
### List metrics using the console

Metrics are grouped first by namespace, and then by the various dimension combinations within each namespace. For example, you can view all metrics provided by Amazon EC2, or metrics grouped by instance ID, instance type, image (AMI) ID, or Auto Scaling group.

**To view available metrics by category (console)**

2. In the navigation pane, expand **Metrics**, and then choose **All metrics**.
3. Choose the **EC2** metric namespace.
4. Select a metric dimension (for example, **Per-Instance Metrics**).

5. To sort the metrics, use the column heading. To graph a metric, select the check box next to the metric. To filter by resource, choose the resource ID and then choose **Add to search**. To filter by metric, choose the metric name and then choose **Add to search**.
List metrics using the AWS CLI

Use the `list-metrics` command to list the CloudWatch metrics for your instances.

**To list all the available metrics for Amazon EC2 (AWS CLI)**

The following example specifies the AWS/EC2 namespace to view all the metrics for Amazon EC2.

```bash
aws cloudwatch list-metrics --namespace AWS/EC2
```

The following is example output:

```json
{
  "Metrics": [
    {
      "Namespace": "AWS/EC2",
      "Dimensions": [
        {
          "Name": "InstanceId",
          "Value": "i-1234567890abcdef0"
        }
      ]
    }
  ]
}
```
[],
  "MetricName": "NetworkOut"
],

[{
  "Namespace": "AWS/EC2",
  "Dimensions": [
    {
      "Name": "InstanceId",
      "Value": "i-1234567890abcdef0"
    }
  ],
  "MetricName": "CPUUtilization"
},

[{
  "Namespace": "AWS/EC2",
  "Dimensions": [
    {
      "Name": "InstanceId",
      "Value": "i-1234567890abcdef0"
    }
  ],
  "MetricName": "NetworkIn"
},
...]

To list all the available metrics for an instance (AWS CLI)

The following example specifies the AWS/EC2 namespace and the InstanceId dimension to view the results for the specified instance only.

```bash
aws cloudwatch list-metrics --namespace AWS/EC2 --dimensions
Name=InstanceId,Value=i-1234567890abcdef0
```

To list a metric across all instances (AWS CLI)

The following example specifies the AWS/EC2 namespace and a metric name to view the results for the specified metric only.

```bash
aws cloudwatch list-metrics --namespace AWS/EC2 --metric-name CPUUtilization
```
Install and configure the CloudWatch agent using the Amazon EC2 console to add additional metrics

Installing and configuring the CloudWatch agent using the Amazon EC2 console is in beta for Amazon EC2 and is subject to change.

By default, Amazon CloudWatch provides basic metrics, such as CPUUtilization and NetworkIn, for monitoring your Amazon EC2 instances. To collect additional metrics, you can install the CloudWatch agent on your EC2 instances, and then configure the agent to emit selected metrics. Instead of manually installing and configuring the CloudWatch agent on every EC2 instance, you can use the Amazon EC2 console to do this for you.

This topic explains how you can use the Amazon EC2 console to install the CloudWatch agent on your instances and configure the agent to emit selected metrics.

For the manual steps for this process, see Installing the CloudWatch agent using AWS Systems Manager in the Amazon CloudWatch User Guide. For more information about the CloudWatch agent, see Collect metrics, logs, and traces with the CloudWatch agent.

Topics

- Prerequisites
- How it works
- Costs
- Install and configure the CloudWatch agent

Prerequisites

To use Amazon EC2 to install and configure the CloudWatch agent, you must meet the user and instance prerequisites described in this section.

User prerequisites

To use this feature, your IAM console user or role must have the permissions required for using Amazon EC2 and the following IAM permissions:
"Version": "2012-10-17",
"Statement": [
  {
    "Effect": "Allow",
    "Action": [
      "ssm:GetParameter",
      "ssm:PutParameter"
    ],
    "Resource": "arn:aws:ssm:*:*:parameter/EC2-Custom-Metrics-*"
  },
  {
    "Effect": "Allow",
    "Action": [
      "ssm:SendCommand",
      "ssm:ListCommandInvocations",
      "ssm:DescribeInstanceInformation"
    ],
    "Resource": ["*"]
  },
  {
    "Effect": "Allow",
    "Action": [
      "iam:GetInstanceProfile",
      "iam:SimulatePrincipalPolicy"
    ],
    "Resource": "*"
  }
]}

Instance prerequisites

- Instance state: running

- Supported operating system: Linux

- AWS Systems Manager Agent (SSM Agent): Installed. Two notes about SSM Agent:
  
  - SSM Agent is preinstalled on some Amazon Machine Images (AMIs) provided by AWS and trusted third-parties. For information about the supported AMIs and the instructions for installing SSM Agent, see Amazon Machine Images (AMIs) with SSM Agent preinstalled in the AWS Systems Manager User Guide.
• If you experience issues with the SSM Agent, see Troubleshooting SSM Agent in the AWS Systems Manager User Guide.

• IAM permissions for the instance: The following AWS managed policies must be added to an IAM role that is attached to the instance:
  - AmazonSSMManagedInstanceCore – Enables an instance to use Systems Manager to install and configure the CloudWatch agent.
  - CloudWatchAgentServerPolicy – Enables an instance to use the CloudWatch agent to write data to CloudWatch.

For information about how to add IAM permissions to your instance, see Using instance profiles in the IAM User Guide.

How it works

Before you can use the Amazon EC2 console to install and configure the CloudWatch agent, you must make sure that your IAM user or role, and the instances on which you want to add metrics, meet certain prerequisites. Then, you can use the Amazon EC2 console to install and configure the CloudWatch agent on your selected instances.

First meet the prerequisites

• You need the required IAM permissions – Before you get started, make sure that your console user or role has the required IAM permissions to use this feature.

• Instances – To use the feature, your EC2 instances must be Linux instances, have the SSM Agent installed, have the required IAM permissions, and be running.

Then you can use the feature

1. Select your instances – In the Amazon EC2 console, you select the instances on which to install and configure the CloudWatch agent. You then start the process by choosing Configure CloudWatch agent.

2. Validate SSM Agent – Amazon EC2 checks that the SSM Agent is installed and started on each instance. Any instances that fail this check are excluded from the process. The SSM Agent is used for performing actions on the instance during this process.

3. Validate IAM permissions – Amazon EC2 checks that each instance has the required IAM permissions for this process. Any instances that fail this check are excluded from the process.
The IAM permissions enable the CloudWatch agent to collect metrics from the instance and integrate with AWS Systems Manager to use the SSM Agent.

4. **Validate CloudWatch agent** – Amazon EC2 checks that the CloudWatch agent is installed and running on each instance. If any instances fail this check, Amazon EC2 offers to install and start the CloudWatch agent for you. The CloudWatch agent will collect the selected metrics on each instance once this process is completed.

5. **Select metric configuration** – You select the metrics for the CloudWatch agent to emit from your instances. Once selected, Amazon EC2 stores a configuration file in Parameter Store, where it remains until the process is completed. Amazon EC2 will delete the configuration file from Parameter Store unless the process is interrupted. Note that if you don't select a metric, but you previously added it to your instance, it will be removed from your instance when this process is completed.

6. **Update CloudWatch agent configuration** – Amazon EC2 sends the metric configuration to the CloudWatch agent. This is the last step in the process. If it succeeds, your instances can emit data for the selected metrics and Amazon EC2 deletes the configuration file from Parameter Store.

**Costs**

Additional metrics that you add during this process are billed as custom metrics. For more information about CloudWatch metrics pricing, see [Amazon CloudWatch Pricing](https://aws.amazon.com/cloudwatch/pricing/).

**Install and configure the CloudWatch agent**

You can use the Amazon EC2 console to install and configure the CloudWatch agent to add additional metrics.

⚠️ **Note**

Every time you perform this procedure, you overwrite the existing CloudWatch agent configuration. If you don't select a metric that was selected previously, it will be removed from the instance.

**To install and configure the CloudWatch agent using the Amazon EC2 console**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instances on which to install and configure the CloudWatch agent.

4. Choose Actions, Monitor and troubleshoot, Configure CloudWatch agent.

Tip
This feature is not available in all AWS Regions. If Configure CloudWatch agent is not available, try another Region.

5. For each step in the process, read the console text, and then choose Next.

6. To complete the process, in the final step, choose Complete.

Get statistics for metrics for your instances

You can get statistics for the CloudWatch metrics for your instances.

Contents

- Statistics overview
- Get statistics for a specific instance
- Aggregate statistics across instances
- Aggregate statistics by Auto Scaling group
- Aggregate statistics by AMI

Statistics overview

Statistics are metric data aggregations over specified periods of time. CloudWatch provides statistics based on the metric data points provided by your custom data or provided by other services in AWS to CloudWatch. Aggregations are made using the namespace, metric name, dimensions, and the data point unit of measure, within the time period you specify. The following table describes the available statistics.

<table>
<thead>
<tr>
<th>Statistic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum</td>
<td>The lowest value observed during the specified period. You can use this value to determine low volumes of activity for your application.</td>
</tr>
<tr>
<td>Statistic</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Maximum</td>
<td>The highest value observed during the specified period. You can use this value to determine high volumes of activity for your application.</td>
</tr>
<tr>
<td>Sum</td>
<td>All values submitted for the matching metric added together. This statistic can be useful for determining the total volume of a metric.</td>
</tr>
<tr>
<td>Average</td>
<td>The value of ( \frac{\text{Sum}}{\text{SampleCount}} ) during the specified period. By comparing this statistic with the Minimum and Maximum, you can determine the full scope of a metric and how close the average use is to the Minimum and Maximum. This comparison helps you to know when to increase or decrease your resources as needed.</td>
</tr>
<tr>
<td>SampleCount</td>
<td>The count (number) of data points used for the statistical calculation.</td>
</tr>
<tr>
<td>pNN.NN</td>
<td>The value of the specified percentile. You can specify any percentile, using up to two decimal places (for example, p95.45).</td>
</tr>
</tbody>
</table>

### Get statistics for a specific instance

The following examples show you how to use the AWS Management Console or the AWS CLI to determine the maximum CPU utilization of a specific EC2 instance.

**Requirements**

- You must have the ID of the instance. You can get the instance ID using the AWS Management Console or the `describe-instances` command.
- By default, basic monitoring is enabled, but you can enable detailed monitoring. For more information, see [Enable or turn off detailed monitoring for your instances](#).

**To display the CPU utilization for a specific instance (console)**

2. In the navigation pane, choose **Metrics**.
3. Choose the **EC2** metric namespace.
4. Choose the **Per-Instance Metrics** dimension.

5. In the search field, enter **CPUUtilization** and press Enter. Choose the row for the specific instance, which displays a graph for the **CPUUtilization** metric for the instance. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.
6. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

To get the CPU utilization for a specific instance (AWS CLI)
Use the following `get-metric-statistics` command to get the **CPUUtilization** metric for the specified instance, using the specified period and time interval:

```
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization --period 3600 \
--statistics Maximum --dimensions Name=InstanceId,Value=i-1234567890abcdef0 \
--start-time 2022-10-18T23:18:00 --end-time 2022-10-19T23:18:00
```

The following is example output. Each value represents the maximum CPU utilization percentage for a single EC2 instance.

```
{
  "Datapoints": [
    {
      "Timestamp": "2022-10-19T00:18:00Z",
      "Maximum": 0.33000000000000002,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2022-10-19T03:18:00Z",
      "Maximum": 99.670000000000002,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2022-10-19T07:18:00Z",
      "Maximum": 0.34000000000000002,
      "Unit": "Percent"
    },
    {
      "Timestamp": "2022-10-19T12:18:00Z",
      "Maximum": 0.34000000000000002,
      "Unit": "Percent"
    },
    ...
  ],
  "Label": "CPUUtilization"
}
```

**Aggregate statistics across instances**

Aggregate statistics are available for instances that have detailed monitoring enabled. Instances that use basic monitoring are not included in the aggregates. Before you can get statistics

---

Get statistics for metrics 2757
aggregated across instances, you must enable detailed monitoring (at an additional charge), which provides data in 1-minute periods.

Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to use detailed monitoring to get the average CPU usage for your EC2 instances. Because no dimension is specified, CloudWatch returns statistics for all dimensions in the AWS/EC2 namespace.

⚠️ Important

This technique for retrieving all dimensions across an AWS namespace does not work for custom namespaces that you publish to Amazon CloudWatch. With custom namespaces, you must specify the complete set of dimensions that are associated with any given data point to retrieve statistics that include the data point.

To display average CPU utilization across your instances (console)

2. In the navigation pane, choose Metrics.
3. Choose the EC2 namespace and then choose Across All Instances.
4. Choose the row that contains CPUUtilization, which displays a graph for the metric for all your EC2 instances. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose custom.
5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose
the column heading or an individual value, and then choose a different value.

**To get average CPU utilization across your instances (AWS CLI)**

Use the **get-metric-statistics** command as follows to get the average of the **CPUUtilization** metric
across your instances.

```
aws cloudwatch get-metric-statistics \
  --namespace AWS/EC2 \
  --metric-name CPUUtilization \
  --period 3600 --statistics "Average" "SampleCount" \ 
  --start-time 2022-10-11T23:18:00 \ 
  --end-time 2022-10-12T23:18:00
```

The following is example output:
Aggregate statistics by Auto Scaling group

You can aggregate statistics for the EC2 instances in an Auto Scaling group. Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to retrieve the total bytes written to disk for one Auto Scaling group. The total is computed for 1-minute periods for a 24-hour interval across all EC2 instances in the specified Auto Scaling group.

To display DiskWriteBytes for the instances in an Auto Scaling group (console)

2. In the navigation pane, choose Metrics.
3. Choose the EC2 namespace and then choose By Auto Scaling Group.
4. Choose the row for the **DiskWriteBytes** metric and the specific Auto Scaling group, which displays a graph for the metric for the instances in the Auto Scaling group. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose **custom**.

5. To change the statistic or the period for the metric, choose the **Graphed metrics** tab. Choose the column heading or an individual value, and then choose a different value.

**To display DiskWriteBytes for the instances in an Auto Scaling group (AWS CLI)**

Use the **get-metric-statistics** command as follows.

```bash
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name DiskWriteBytes --period 360 \  --statistics "Sum" "SampleCount" --dimensions Name=AutoScalingGroupName,Value=my-asg --start-time 2022-10-16T23:18:00 --end-time 2022-10-18T23:18:00
```

The following is example output:

```json
{
   "Datapoints": [
      {
         "SampleCount": 18.0,
         "Timestamp": "2022-10-19T21:36:00Z",
         "Sum": 0.0,
         "Unit": "Bytes"
      },
      {
         "SampleCount": 5.0,
         "Timestamp": "2022-10-19T21:42:00Z",
         "Sum": 0.0,
         "Unit": "Bytes"
      }
   ],
   "Label": "DiskWriteBytes"
}
```

**Aggregate statistics by AMI**

You can aggregate statistics for your instances that have detailed monitoring enabled. Instances that use basic monitoring are not included in the aggregates. Before you can get statistics
aggregated across instances, you must enable detailed monitoring (at an additional charge), which provides data in 1-minute periods.

Note that Amazon CloudWatch cannot aggregate data across AWS Regions. Metrics are completely separate between Regions.

This example shows you how to determine average CPU utilization for all instances that use a specific Amazon Machine Image (AMI). The average is over 60-second time intervals for a one-day period.

To display the average CPU utilization by AMI (console)

2. In the navigation pane, choose Metrics.
3. Choose the EC2 namespace and then choose By Image (AMI) Id.
4. Choose the row for the CPUUtilization metric and the specific AMI, which displays a graph for the metric for the specified AMI. To name the graph, choose the pencil icon. To change the time range, select one of the predefined values or choose custom.
5. To change the statistic or the period for the metric, choose the Graphed metrics tab. Choose the column heading or an individual value, and then choose a different value.

To get the average CPU utilization for an image ID (AWS CLI)

Use the get-metric-statistics command as follows.

```bash
aws cloudwatch get-metric-statistics --namespace AWS/EC2 --metric-name CPUUtilization --period 3600 --statistics Average --dimensions Name=ImageId,Value=ami-3c47a355 --start-time 2022-10-10T00:00:00 --end-time 2022-10-11T00:00:00
```

The following is example output. Each value represents an average CPU utilization percentage for the EC2 instances running the specified AMI.

```json
{
    "Datapoints": [
    {
        "Timestamp": "2022-10-10T07:00:00Z",
        "Average": 0.041000000000000009,
        "Unit": "Percent"
    }
    ]
}
```
Graph metrics for your instances

After you launch an instance, you can open the Amazon EC2 console and view the monitoring graphs for the instance on the Monitoring tab. Each graph is based on one of the available Amazon EC2 metrics.

The following graphs are available:

- Average CPU Utilization (Percent)
- Average Disk Reads (Bytes)
- Average Disk Writes (Bytes)
- Maximum Network In (Bytes)
- Maximum Network Out (Bytes)
- Summary Disk Read Operations (Count)
- Summary Disk Write Operations (Count)
- Summary Status (Any)
- Summary Status Instance (Count)
- Summary Status System (Count)

For more information about the metrics and the data they provide to the graphs, see List the available CloudWatch metrics for your instances.
Graph metrics using the CloudWatch console

You can also use the CloudWatch console to graph metric data generated by Amazon EC2 and other AWS services. For more information, see Graphing metrics in the Amazon CloudWatch User Guide.

Create a CloudWatch alarm for an instance

You can create a CloudWatch alarm that monitors CloudWatch metrics for one of your instances. CloudWatch will automatically send you a notification when the metric reaches a threshold you specify. You can create a CloudWatch alarm using the Amazon EC2 console, or using the more advanced options provided by the CloudWatch console.

To create an alarm using the CloudWatch console

For examples, see Creating Amazon CloudWatch Alarms in the Amazon CloudWatch User Guide.

To create an alarm using the Amazon EC2 console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance and choose Actions, Monitor and troubleshoot, Manage CloudWatch alarms.
4. On the Manage CloudWatch alarms detail page, under Add or edit alarm, select Create an alarm.
5. For Alarm notification, choose whether to configure Amazon Simple Notification Service (Amazon SNS) notifications. Enter an existing Amazon SNS topic or enter a name to create a new topic.
6. For Alarm action, choose whether to specify an action to take when the alarm is triggered. Choose an action from the list.
7. For Alarm thresholds, select the metric and criteria for the alarm. For example, to create an alarm that is triggered when CPU utilization reaches 80% for a 5 minute period, do the following:
   a. Keep the default setting for Group samples by (Average) and Type of data to sample (CPU utilization).
   b. Choose >= for Alarm when and enter 0.80 for Percent.
   c. Enter 1 for Consecutive period and select 5 minutes for Period.
8. (Optional) For Sample metric data, choose Add to dashboard.

9. Choose Create.

You can edit your CloudWatch alarm settings from the Amazon EC2 console or the CloudWatch console. If you want to delete your alarm, you can do so from the CloudWatch console. For more information, see Editing or deleting a CloudWatch alarm in the Amazon CloudWatch User Guide.

Create alarms that stop, terminate, reboot, or recover an instance

Using Amazon CloudWatch alarm actions, you can create alarms that automatically stop, terminate, reboot, or recover your instances. You can use the stop or terminate actions to help you save money when you no longer need an instance to be running. You can use the reboot and recover actions to automatically reboot those instances or recover them onto new hardware if a system impairment occurs.

Note

For Amazon CloudWatch alarms billing and pricing information, see CloudWatch billing and cost in the Amazon CloudWatch User Guide.

The AWSServiceRoleForCloudWatchEvents service-linked role enables AWS to perform alarm actions on your behalf. The first time you create an alarm in the AWS Management Console, the AWS CLI, or the IAM API, CloudWatch creates the service-linked role for you.

There are a number of scenarios in which you might want to automatically stop or terminate your instance. For example, you might have instances dedicated to batch payroll processing jobs or scientific computing tasks that run for a period of time and then complete their work. Rather than letting those instances sit idle (and accrue charges), you can stop or terminate them, which can help you to save money. The main difference between using the stop and the terminate alarm actions is that you can easily start a stopped instance if you need to run it again later, and you can keep the same instance ID and root volume. However, you cannot start a terminated instance. Instead, you must launch a new instance. When an instance is stopped or terminated, data on instance store volumes is lost.

You can add the stop, terminate, reboot, or recover actions to any alarm that is set on an Amazon EC2 per-instance metric, including basic and detailed monitoring metrics provided by Amazon
CloudWatch (in the AWS/EC2 namespace), as well as any custom metrics that include the InstanceId dimension, as long as its value refers to a valid running Amazon EC2 instance.

⚠️ Important

Status check alarms can temporarily enter the INSUFFICIENT_DATA state if there are missing metric data points. Although rare, this can happen when there is an interruption in the metric reporting systems, even when an instance is healthy. We recommend that you treat the INSUFFICIENT_DATA state as missing data instead of an alarm breach, especially when configuring the alarm to stop, terminate, reboot, or recover an instance.

Console support

You can create alarms using the Amazon EC2 console or the CloudWatch console. The procedures in this documentation use the Amazon EC2 console. For procedures that use the CloudWatch console, see Create alarms that stop, terminate, reboot, or recover an instance in the Amazon CloudWatch User Guide.

Permissions

You must have the iam:CreateServiceLinkedRole to create or modify an alarm that performs EC2 alarm actions. A service role is an IAM role that a service assumes to perform actions on your behalf. An IAM administrator can create, modify, and delete a service role from within IAM. For more information, see Creating a role to delegate permissions to an AWS service in the IAM User Guide.

Contents

- Add stop actions to Amazon CloudWatch alarms
- Add terminate actions to Amazon CloudWatch alarms
- Add reboot actions to Amazon CloudWatch alarms
- Add recover actions to Amazon CloudWatch alarms

- Amazon CloudWatch alarm action scenarios
Add stop actions to Amazon CloudWatch alarms

You can create an alarm that stops an Amazon EC2 instance when a certain threshold has been met. For example, you may run development or test instances and occasionally forget to shut them off. You can create an alarm that is triggered when the average CPU utilization percentage has been lower than 10 percent for 24 hours, signaling that it is idle and no longer in use. You can adjust the threshold, duration, and period to suit your needs, plus you can add an Amazon Simple Notification Service (Amazon SNS) notification so that you receive an email when the alarm is triggered.

Instances that use an Amazon EBS volume as the root device can be stopped or terminated, whereas instances that use the instance store as the root device can only be terminated. Data on instance store volumes is lost when the instance is terminated or stopped.

To create an alarm to stop an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance and choose Actions, Monitor and troubleshoot, Manage CloudWatch alarms.

   Alternatively, you can choose the plus sign (+) in the Alarm status column.
4. On the Manage CloudWatch alarms page, do the following:
   a. Choose Create an alarm.
   b. To receive an email when the alarm is triggered, for Alarm notification, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see Using Amazon SNS for application-to-person (A2P) messaging in the Amazon Simple Notification Service Developer Guide.
   c. Toggle on Alarm action, and choose Stop.
   d. For Group samples by and Type of data to sample, choose a statistic and a metric. In this example, choose Average and CPU utilization.
   e. For Alarm When and Percent, specify the metric threshold. In this example, specify \( \leq \) and 10 percent.
For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, specify 1 consecutive period of 5 Minutes.

Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

### Note

You can adjust the alarm configuration based on your own requirements before creating the alarm, or you can edit them later. This includes the metric, threshold, duration, action, and notification settings. However, after you create an alarm, you cannot edit its name later.

Choose **Create**.

### Add terminate actions to Amazon CloudWatch alarms

You can create an alarm that terminates an EC2 instance automatically when a certain threshold has been met (as long as termination protection is not enabled for the instance). For example, you might want to terminate an instance when it has completed its work, and you don’t need the instance again. If you might want to use the instance later, you should stop the instance instead of terminating it. Data on instance store volumes is lost when the instance is terminated. For information about enabling and disabling termination protection for an instance, see [Enable termination protection](#).

To create an alarm to terminate an idle instance (Amazon EC2 console)

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions, Monitor and troubleshoot, Manage CloudWatch alarms**.

   Alternatively, you can choose the plus sign ( + ) in the **Alarm status** column.

4. On the **Manage CloudWatch alarms** page, do the following:
   a. Choose **Create an alarm**.
b. To receive an email when the alarm is triggered, for **Alarm notification**, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see [Using Amazon SNS for application-to-person (A2P) messaging](https://docs.aws.amazon.com/AmazonSNS/latest/devguide/using-aws-console.html) in the *Amazon Simple Notification Service Developer Guide*.

c. Toggle on **Alarm action**, and choose **Terminate**.

d. For **Group samples by** and **Type of data to sample**, choose a statistic and a metric. In this example, choose **Average** and **CPU utilization**.

e. For **Alarm When** and **Percent**, specify the metric threshold. In this example, specify => and **10 percent**.

f. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, specify **24** consecutive periods of **1 Hour**.

g. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

h. Choose **Create**.

---

### Add reboot actions to Amazon CloudWatch alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically reboots the instance. The reboot alarm action is recommended for Instance Health Check failures (as opposed to the recover alarm action, which is suited for System Health Check failures). An instance reboot is equivalent to an operating system reboot. In most cases, it takes only a few minutes to reboot your instance. When you reboot an instance, it remains on the same physical host, so your instance keeps its public DNS name, private IP address, and any data on its instance store volumes.

Rebooting an instance doesn't start a new instance billing period (with a minimum one-minute charge), unlike stopping and restarting your instance. Data on instance store volumes is retained...
when the instance is rebooted. The instance store volumes must be re-mounted into the filesystem after a reboot. For more information, see Reboot your instance.

⚠️ **Important**

To avoid a race condition between the reboot and recover actions, avoid setting the same number of evaluation periods for a reboot alarm and a recover alarm. We recommend that you set reboot alarms to three evaluation periods of one minute each. For more information, see Evaluating an alarm in the Amazon CloudWatch User Guide.

**To create an alarm to reboot an instance (Amazon EC2 console)**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance and choose Actions, Monitor and troubleshoot, Manage CloudWatch alarms.

   Alternatively, you can choose the plus sign (+) in the Alarm status column.

4. On the Manage CloudWatch alarms page, do the following:
   a. Choose Create an alarm.
   b. To receive an email when the alarm is triggered, for Alarm notification, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see Using Amazon SNS for application-to-person (A2P) messaging in the Amazon Simple Notification Service Developer Guide.
   c. Toggle on Alarm action, and choose Reboot.
   d. For Group samples by and Type of data to sample, choose a statistic and a metric. In this example, choose Average and Status check failed: instance.
   e. For Consecutive period and Period, specify the evaluation period for the alarm. In this example, enter 3 consecutive periods of 1 Minute. If 1 Minute is disabled, you must enable detailed monitoring, or you can choose 5 Minutes instead.
   f. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for Alarm name, enter a new name. Alarm names must contain only ASCII characters.
g. Choose **Create**.

### Add recover actions to Amazon CloudWatch alarms

You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance. If the instance becomes impaired due to an underlying hardware failure or a problem that requires AWS involvement to repair, you can automatically recover the instance. Terminated instances cannot be recovered. A recovered instance is identical to the original instance, including the instance ID, private IP addresses, Elastic IP addresses, and all instance metadata.

CloudWatch prevents you from adding a recovery action to an alarm that is on an instance which does not support recovery actions.

When the `StatusCheckFailed_System` alarm is triggered, and the recover action is initiated, you are notified by the Amazon SNS topic that you chose when you created the alarm and associated the recover action. During instance recovery, the instance is migrated during an instance reboot, and any data that is in-memory is lost. When the process is complete, information is published to the SNS topic you've configured for the alarm. Anyone who is subscribed to this SNS topic receives an email notification that includes the status of the recovery attempt and any further instructions. You notice an instance reboot on the recovered instance.

**Note**

The recover action can be used only with `StatusCheckFailed_System`, not with `StatusCheckFailed_Instance`.

The following problems can cause system status checks to fail:

- Loss of network connectivity
- Loss of system power
- Software issues on the physical host
- Hardware issues on the physical host that impact network reachability

The recover action is supported only on instances that meet certain characteristics. For more information, see [Instance resiliency](#).

If your instance has a public IP address, it retains the public IP address after recovery.
Important

To avoid a race condition between the reboot and recover actions, avoid setting the same number of evaluation periods for a reboot alarm and a recover alarm. We recommend that you set recover alarms to two evaluation periods of one minute each. For more information, see Evaluating an alarm in the Amazon CloudWatch User Guide.

To create an alarm to recover an instance (Amazon EC2 console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance and choose Actions, Monitor and troubleshoot, Manage CloudWatch alarms.

   Alternatively, you can choose the plus sign (+) in the Alarm status column.
4. On the Manage CloudWatch alarms page, do the following:
   a. Choose Create an alarm.
   b. To receive an email when the alarm is triggered, for Alarm notification, choose an existing Amazon SNS topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see Using Amazon SNS for application-to-person (A2P) messaging in the Amazon Simple Notification Service Developer Guide.
   c. Toggle on Alarm action, and choose Recover.
   d. For Group samples by and Type of data to sample, choose a statistic and a metric. In this example, choose Average and Status check failed: system.
e. For **Consecutive period** and **Period**, specify the evaluation period for the alarm. In this example, enter **2** consecutive periods of **1 Minute**. If **1 Minute is disabled**, you must **enable detailed monitoring**, or you can choose **5 Minutes** instead.

f. Amazon CloudWatch automatically creates an alarm name for you. To change the name, for **Alarm name**, enter a new name. Alarm names must contain only ASCII characters.

g. Choose **Create**.

**Use the Amazon CloudWatch console to view alarm and action history**

You can view alarm and action history in the Amazon CloudWatch console. Amazon CloudWatch keeps the last two weeks' worth of alarm and action history.

**To view the history of triggered alarms and actions (CloudWatch console)**

2. In the navigation pane, choose **Alarms**.
3. Select an alarm.
4. The **Details** tab shows the most recent state transition along with the time and metric values.
5. Choose the **History** tab to view the most recent history entries.

**Amazon CloudWatch alarm action scenarios**

You can use the Amazon EC2 console to create alarm actions that stop or terminate an Amazon EC2 instance when certain conditions are met. In the following screen capture of the console page where you set the alarm actions, we've numbered the settings. We've also numbered the settings in the scenarios that follow, to help you create the appropriate actions.
New console

Create alarms that stop, terminate, reboot, or recover an instance.
Scenario 1: Stop idle development and test instances

Create an alarm that stops an instance used for software development or testing when it has been idle for at least an hour.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Stop</td>
</tr>
<tr>
<td>2</td>
<td>Maximum</td>
</tr>
<tr>
<td>3</td>
<td>CPU Utilization</td>
</tr>
<tr>
<td>4</td>
<td>&lt;=</td>
</tr>
<tr>
<td>5</td>
<td>10%</td>
</tr>
<tr>
<td>6</td>
<td>1</td>
</tr>
<tr>
<td>7</td>
<td>1 Hour</td>
</tr>
</tbody>
</table>
Scenario 2: Stop idle instances

Create an alarm that stops an instance and sends an email when the instance has been idle for 24 hours.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Stop and email</td>
</tr>
<tr>
<td>2</td>
<td>Average</td>
</tr>
<tr>

<tr>
<td>5</td>
<td>5%</td>
</tr>
<tr>
<td>6</td>
<td>24</td>
</tr>
<tr>
<td>7</td>
<td>1 Hour</td>
</tr>
</tbody>
</table>

Scenario 3: Send email about web servers with unusually high traffic

Create an alarm that sends email when an instance exceeds 10 GB of outbound network traffic per day.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Email</td>

</tr>
<tr>
<td>5</td>
<td>10 GB</td>
</tr>
<tr>
<td>6</td>
<td>24</td>
</tr>
</tbody>
</table>
Scenario 4: Stop web servers with unusually high traffic

Create an alarm that stops an instance and send a text message (SMS) if outbound traffic exceeds 1 GB per hour.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Stop and send SMS</td>
</tr>
<tr>

<td>5 Minutes</td>
</tr>
</tbody>
</table>

Automate Amazon EC2 using EventBridge

You can use Amazon EventBridge to automate your AWS services and respond automatically to system events, such as application availability issues or resource changes. Events from AWS services are delivered to EventBridge in near real time. You can create rules to indicate which events you're interested in, and the actions to take when an event matches a rule. The actions that can be automatically triggered include the following:

- Invoke an AWS Lambda function
• Invoke Amazon EC2 Run Command
• Relay the event to Amazon Kinesis Data Streams
• Activate an AWS Step Functions state machine
• Notify an Amazon SNS topic
• Notify an Amazon SQS queue

The following are examples of how you can use EventBridge with Amazon EC2:

• Activate a Lambda function whenever an instance enters the running state.
• Notify an Amazon SNS topic when an Amazon EBS volume is created or modified.
• Send a command to one or more Amazon EC2 instances using Amazon EC2 Run Command whenever a certain event in another AWS service occurs.

For more information, see the [Amazon EventBridge User Guide](https://docs.aws.amazon.com/events/latest/userguide/).

**Amazon EC2 event types**

Amazon EC2 supports the following event types:

• [EC2 AMI State Change](https://docs.aws.amazon.com/events/latest/userguide/)
• [EC2 Fast Launch State-change Notification](https://docs.aws.amazon.com/events/latest/userguide/)
• [EC2 Fleet Error](https://docs.aws.amazon.com/events/latest/userguide/)
• [EC2 Fleet Information](https://docs.aws.amazon.com/events/latest/userguide/)
• [EC2 Fleet Instance Change](https://docs.aws.amazon.com/events/latest/userguide/)

For information about the event types supported by Amazon EBS, see EventBridge for Amazon EBS.

Log Amazon EC2 API calls using AWS CloudTrail

The Amazon EC2 API is integrated with AWS CloudTrail, a service that provides a record of actions taken by a user, role, or an AWS service. CloudTrail captures all API calls for Amazon EC2 as events, including calls from the console and from code calls to the API operations. Using the information collected by CloudTrail, you can determine the request that was made to the Amazon EC2 API, the IP address from which the request was made, when it was made, and so on.

To learn more about CloudTrail, see the AWS CloudTrail User Guide.

Amazon EC2 API information in CloudTrail

CloudTrail is enabled on your AWS account when you create the account. When activity occurs in Amazon EC2 and Amazon EBS, that activity is recorded in a CloudTrail event along with other AWS service events in Event history. You can view, search, and download recent events in your AWS account. For more information, see Viewing events with CloudTrail Event history.

For an ongoing record of events in your AWS account, including events for Amazon EC2 and Amazon EBS, create a trail. A trail enables CloudTrail to deliver log files to an Amazon S3 bucket. By default, when you create a trail in the console, the trail applies to all AWS Regions. The trail logs events from all Regions in the AWS partition and delivers the log files to the Amazon S3 bucket that you specify. Additionally, you can configure other AWS services to further analyze and act upon the event data collected in CloudTrail logs. For more information, see:

- Creating a trail for your AWS account
- AWS service integrations with CloudTrail logs
- Configuring Amazon SNS notifications for CloudTrail
- Receiving CloudTrail log files from multiple Regions and Receiving CloudTrail log files from multiple accounts
All Amazon EC2 actions, and Amazon EBS management actions, are logged by CloudTrail and are documented in the Amazon EC2 API Reference. For example, calls to the RunInstances, DescribeInstances, or CreateImage actions generate entries in the CloudTrail log files.

Every event or log entry contains information about who generated the request. The identity information helps you determine the following:

- Whether the request was made with root user or IAM user credentials.
- Whether the request was made with temporary security credentials for a role or federated user.
- Whether the request was made by another AWS service.

For more information, see the CloudTrail userIdentity element.

**Understand Amazon EC2 API log file entries**

A trail is a configuration that enables delivery of events as log files to an Amazon S3 bucket that you specify. CloudTrail log files contain one or more log entries. An event represents a single request from any source and includes information about the requested action, the date and time of the action, request parameters, and so on. CloudTrail log files are not an ordered stack trace of the public API calls, so they do not appear in any specific order.

The following log file record shows that a user terminated an instance.

```json
{
   "Records": [
      {
         "eventVersion": "1.03",
         "userIdentity": {
            "type": "Root",
            "principalId": "123456789012",
            "arn": "arn:aws:iam::123456789012:root",
            "accountId": "123456789012",
            "accessKeyId": "AKIAIOSFODNN7EXAMPLE",
            "userName": "user"
         },
         "eventTime": "2016-05-20T08:27:45Z",
         "eventSource": "ec2.amazonaws.com",
         "eventName": "TerminateInstances",
         "awsRegion": "us-west-2",
         "sourceIPAddress": "198.51.100.1",
         "userAgent": "aws-cli/1.10.10 Python/2.7.9 Windows/7botocore/1.4.1",
      }
   ]
}
```
Use AWS CloudTrail to audit connections made using EC2 Instance Connect

Use AWS CloudTrail to audit the users that connect to your instances via EC2 Instance Connect.

To audit SSH activity via EC2 Instance Connect using the AWS CloudTrail console

2. Verify that you are in the correct Region.
3. In the navigation pane, choose Event history.

Audit connections through EC2 Instance Connect
5. (Optional) For **Time range**, select a time range.

6. Choose the **Refresh events** icon.

7. The page displays the events that correspond to the SendSSHPublicKey API calls. Expand an event using the arrow to view additional details, such as the user name and AWS access key that was used to make the SSH connection, and the source IP address.

8. To display the full event information in JSON format, choose **View event**. The **requestParameters** field contains the destination instance ID, OS user name, and public key that were used to make the SSH connection.

```json
{
   "eventVersion": "1.05",
   "userIdentity": {
      "type": "IAMUser",
      "principalId": "ABCDEFGONGNOMOOCB6XYTQEXAMPLE",
      "arn": "arn:aws:iam::1234567890120:user/IAM-friendly-name",
      "accountId": "123456789012",
      "accessKeyId": "ABCDEFGUKZHNAW4OSN2AEXAMPLE",
      "userName": "IAM-friendly-name",
      "sessionContext": {
         "attributes": {
            "mfaAuthenticated": "false",
            "creationDate": "2018-09-21T21:37:58Z"
         }
      }
   },
   "eventTime": "2018-09-21T21:38:00Z",
   "eventSource": "ec2-instance-connect.amazonaws.com",
   "eventName": "SendSSHPublicKey",
   "awsRegion": "us-west-2",
   "sourceIPAddress": "123.456.789.012",
   "userAgent": "aws-cli/1.15.61 Python/2.7.10 Darwin/16.7.0 botocore/1.10.60",
   "requestParameters": {
      "instanceId": "i-0123456789EXAMPLE",
      "osUser": "ec2-user",
      "SSHKey": {
         "publicKey": "ssh-rsa ABCDEFGHIJKLMNOPQRSTUVWXYZ01234567890EXAMPLE"
      }
   },
   "responseElements": null,
   "requestID": "1a2s3d4f-bde6-11e8-a892-f7ec64543add",
   "eventID": "1a2w3d4r5-a88f-4e28-b3bf-30161f75be34",
   "eventType": "AwsApiCall",
}
```
If you have configured your AWS account to collect CloudTrail events in an S3 bucket, you can download and audit the information programmatically. For more information, see Getting and viewing your CloudTrail log files in the AWS CloudTrail User Guide.

Monitor your .NET and SQL Server applications with CloudWatch Application Insights

CloudWatch Application Insights helps you monitor your .NET and SQL Server applications that use Amazon EC2 instances along with other AWS application resources. It identifies and sets up key metrics logs, and alarms across your application resources and technology stack (for example, your Microsoft SQL Server database, web (IIS) and application servers, OS, load balancers, and queues). It continuously monitors the metrics and logs to detect and correlate anomalies and errors. When errors and anomalies are detected, Application Insights generates CloudWatch Events that you can use to set up notifications or take actions. To aid with troubleshooting, it creates automated dashboards for the detected problems, which include correlated metric anomalies and log errors, along with additional insights to point you to the potential root cause. The automated dashboards help you to take swift remedial actions to keep your applications healthy and to prevent impact to the end users of your application.

To view a complete list of supported logs and metrics, see Logs and Metrics Supported by Amazon CloudWatch Application Insights.

Information provided about detected problems:

- A short summary of the problem
- The start time and date of the problem
- The problem severity: High/Medium/Low
- The status of the detected problem: In-progress/Resolved
- Insights: Automatically generated insights on the detected problem and possible root cause
- Feedback on insights: Feedback you have provided about the usefulness of the insights generated by CloudWatch Application Insights for .NET and SQL Server
- Related observations: A detailed view of the metric anomalies and error snippets of relevant logs related to the problem across various application components
Feedback

You can provide feedback on automatically generated insights on detected problems by designating them useful or not useful. Your feedback on the insights, along with your application diagnostics (metric anomalies and log exceptions), are used to improve the future detection of similar problems.

For more information, see the CloudWatch Application Insights documentation in the Amazon CloudWatch User Guide.

Track your Free Tier usage for Amazon EC2

You can use Amazon EC2 without incurring charges if you've been an AWS customer for less than 12 months and you stay within the AWS Free Tier usage limits. It's important to track your Free Tier usage to avoid billing surprises. If you exceed the Free Tier limits, you'll incur standard pay-as-you-go charges.

Note

If you've been an AWS customer for more than 12 months, you're no longer eligible for Free Tier usage and you won't see the EC2 Free Tier box that is described in the following procedure.

To track your Free Tier usage

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose EC2 Dashboard.
3. Find the EC2 Free Tier box (at top right).
4. In the **EC2 Free Tier** box, check your Free Tier usage, as follows:

- Under **EC2 Free Tier offers in use**, take note of the warnings:
  - **End of month forecast** – This warns that you will incur charges this month if you continue with your current usage pattern.
  - **Exceeds Free Tier** – This warns that you've exceeded your Free Tier limits and you're already incurring charges.
- Under **Offer usage (monthly)**, take note of your usage of Linux instances, Windows instances, and EBS storage. The percentage indicates how much of your Free Tier limits you've used this month. If you're at 100%, you will incur charges for further use.

**Note**

This information appears only after you've created an instance. However, usage information is not updated in real time; it's updated three times a day.

5. To avoid incurring further charges, delete any resources that are either incurring charges now, or will incur charges if you exceed your Free Tier limit usage.

- For the instructions to delete your instance, see [Terminate Amazon EC2 instances](#).
- To check if you have resources in other Regions that might be incurring charges, in the **EC2 Free Tier** box, choose **View Global EC2 resources** to open the **EC2 Global View**. For more information, see [Amazon EC2 Global View](#).

6. To view your resource usage for all AWS services under the AWS Free Tier, at the bottom of the **EC2 Free Tier** box, choose **View all AWS Free Tier offers**. For more information, see [Using the AWS Free Tier](#) in the **AWS Billing User Guide**.
Troubleshoot issues with Amazon EC2 instances

The following procedures and tips can help you troubleshoot issues with your Amazon EC2 instances.

Issues

- Troubleshoot Amazon EC2 instance launch issues
- Troubleshoot Amazon EC2 instance stop issues
- Troubleshoot Amazon EC2 instance termination issues
- Troubleshoot an unreachable Amazon EC2 instance
- Troubleshoot issues connecting to your Amazon EC2 Linux instance
- Troubleshoot Amazon EC2 Linux instances with failed status checks
- Troubleshoot an Amazon EC2 Linux instance booting from wrong volume
- Troubleshoot issues connecting to your Amazon EC2 Windows instance
- Troubleshoot Amazon EC2 Windows instance start issues
- Troubleshoot issues with Amazon EC2 Windows instances
- Reset the administrator password for an Amazon EC2 Windows instance
- Troubleshoot Sysprep issues with Amazon EC2 Windows instances
- Use EC2Rescue for Linux
- Use EC2Rescue for Windows Server
- EC2 Serial Console for Amazon EC2 instances
- Send a diagnostic interrupt to your Amazon EC2 instance

Troubleshoot Amazon EC2 instance launch issues

The following are troubleshooting tips to help you solve issues when launching an Amazon EC2 instance.

Launch Issues

- Invalid device name
- Instance limit exceeded
- Insufficient instance capacity
The requested configuration is currently not supported. Please check the documentation for supported configurations.

Instance terminates immediately

Insufficient permissions

High CPU usage shortly after Windows starts (Windows instances only)

Invalid device name

Description

You get the Invalid device name device_name error when you try to launch a new instance.

Cause

If you get this error when you try to launch an instance, the device name specified for one or more volumes in the request has an invalid device name. Possible causes include:

- The device name might be in use by the selected AMI.
- The device name might be reserved for root volumes.
- The device name might be used for another volume in the request.
- The device name might not be valid for the operating system.

Solution

To resolve the issue:

- Ensure that the device name is not used in the AMI that you selected. Run the following command to view the device names used by the AMI.

  ```bash
  aws ec2 describe-images --image-id ami_id --query 'Images[*].BlockDeviceMappings[].DeviceName'
  ```

- Ensure that you are not using a device name that is reserved for root volumes. For more information, see Available device names.

- Ensure that each volume specified in your request has a unique device name.

- Ensure that the device names that you specified are in the correct format. For more information, see Available device names.
Instance limit exceeded

Description

You get the InstanceLimitExceeded error when you try to launch a new instance or restart a stopped instance.

Cause

If you get an InstanceLimitExceeded error when you try to launch a new instance or restart a stopped instance, you have reached the limit on the number of instances that you can launch in a Region. When you create your AWS account, we set default limits on the number of instances you can run on a per-Region basis.

Solution

You can request an instance limit increase on a per-region basis. For more information, see Amazon EC2 service quotas.

Insufficient instance capacity

Description

You get the InsufficientInstanceCapacity error when you try to launch a new instance or restart a stopped instance.

Cause

If you get this error when you try to launch an instance or restart a stopped instance, AWS does not currently have enough available On-Demand capacity to fulfill your request.

Solution

To resolve the issue, try the following:

- Wait a few minutes and then submit your request again; capacity can shift frequently.
- Submit a new request with a reduced number of instances. For example, if you're making a single request to launch 15 instances, try making 3 requests for 5 instances, or 15 requests for 1 instance instead.
- If you're launching an instance, submit a new request without specifying an Availability Zone.
• If you're launching an instance, submit a new request using a different instance type (which you can resize at a later stage). For more information, see Change the instance type.

• If you are launching instances into a cluster placement group, you can get an insufficient capacity error. For more information, see Work with placement groups.

The requested configuration is currently not supported. Please check the documentation for supported configurations.

Description

You get the Unsupported error when you try to launch a new instance because the instance configuration is not supported.

Cause

The error message provides additional details. For example, an instance type or instance purchasing option might not be supported in the specified Region or Availability Zone.

Solution

Try a different instance configuration. To search for an instance type that meets your requirements, see Find an Amazon EC2 instance type.

Instance terminates immediately

Description

Your instance goes from the pending state to the terminated state.

Cause

The following are a few reasons why an instance might immediately terminate:

• You've exceeded your EBS volume limits. For more information, see Amazon EBS volume limits for Amazon EC2 instances.

• An EBS snapshot is corrupted.

• The root EBS volume is encrypted and you do not have permissions to access the KMS key for decryption.
• A snapshot specified in the block device mapping for the AMI is encrypted and you do not have permissions to access the KMS key for decryption or you do not have access to the KMS key to encrypt the restored volumes.

• The instance store-backed AMI that you used to launch the instance is missing a required part (an image.part.xx file).

For more information, get the termination reason using one of the following methods.

To get the termination reason using the Amazon EC2 console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances, and select the instance.
3. On the first tab, find the reason next to State transition reason.

To get the termination reason using the AWS Command Line Interface

1. Use the describe-instances command and specify the instance ID.

   ```bash
   aws ec2 describe-instances --instance-id instance_id
   ```

2. Review the JSON response returned by the command and note the values in the StateReason response element.

   The following code block shows an example of a StateReason response element.

   ```json
   "StateReason": {
      "Code": "Server.InternalError"
   },
   ```

To get the termination reason using AWS CloudTrail

For more information, see Viewing events with CloudTrail event history in the AWS CloudTrail User Guide.

Solution

Depending on the termination reason, take one of the following actions:
• **Client.VolumeLimitExceeded**: *Volume limit exceeded* — Delete unused volumes. You can submit a request to increase your volume limit.

• **Client.InternalError**: *Client error on launch* — Ensure that you have the permissions required to access the AWS KMS keys used to decrypt and encrypt volumes. For more information, see [Using key policies in AWS KMS](https://docs.aws.amazon.com/kms/latest/developerguide/using-key-policies.html) in the [AWS Key Management Service Developer Guide](https://docs.aws.amazon.com/kms/latest/developerguide/).

### Insufficient permissions

#### Description

You get the "**errorMessage**": "You are not authorized to perform this operation." error when you try to launch a new instance, and the launch fails.

#### Cause

If you get this error when you try to launch an instance, you don't have the required IAM permissions to launch the instance.

Possible missing permissions include:

- `ec2:RunInstances`
- `iam:PassRole`

Other permissions might also be missing. For the list of permissions required to launch an instance, see the example IAM policies under [Example: Use the EC2 launch instance wizard](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/launch-an-instance.html) and [Launch instances (RunInstances)](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/launch-an-instance.html).

#### Solution

To resolve the issue:

- If you are making requests as an IAM user, verify that you have the following permissions:
  - `ec2:RunInstances` with a wildcard resource ("*")
  - `iam:PassRole` with the resource matching the role ARN (for example, `arn:aws:iam::999999999999:role/ExampleRoleName`)
- If you don't have the preceding permissions, [edit the IAM policy](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/modify-iam-policy-examples.html) associated with the IAM role or user to add the missing required permissions.
If your issue is not resolved and you continue receiving a launch failure error, you can decode the authorization failure message included in the error. The decoded message includes the permissions that are missing from the IAM policy. For more information, see How do I decode an authorization failure message after I receive an "UnauthorizedOperation" error during an EC2 instance launch?

High CPU usage shortly after Windows starts (Windows instances only)

Note
This troubleshooting tip is for Windows instances only.

If Windows Update is set to Check for updates but let me choose whether to download and install them (the default instance setting) this check can consume anywhere from 50 - 99% of the CPU on the instance. If this CPU consumption causes problems for your applications, you can manually change Windows Update settings in Control Panel or you can use the following script in the Amazon EC2 user data field:

```reg add "HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\WindowsUpdate\Auto Update" /v AUOptions /t REG_DWORD /d 3 /f
net stop wuauserv
net start wuauserv```

When you run this script, specify a value for /d. The default value is 3. Possible values include the following:

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

After you modify the user data for your instance, you can run it. For more information, see Run commands on your Windows instance at launch.

Troubleshoot Amazon EC2 instance stop issues

If you have stopped your Amazon EBS-backed instance and it appears stuck in the stopping state, there may be an issue with the underlying host computer. First, try to force stop the instance. If the instance does not stop, you can request assistance with this issue.
There is no cost for instance usage while an instance is in the stopping state or in any other state except running. You are only charged for instance usage when an instance is in the running state.

Contents

- Force stop an instance
- (Optional) Create a replacement instance

Force stop an instance

Force the instance to stop using either the console or the AWS CLI.

Note

You can force an instance to stop using the console only while the instance is in the stopping state. You can force an instance to stop using the AWS CLI while the instance is in any state, except shutting-down and terminated.

Console

To force stop the instance using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances and select the stuck instance.
3. Choose Instance state, Force stop instance, Stop.

   Note that Force stop instance is only available in the console if your instance is in the stopping state. If your instance is in another state (except shutting-down and terminated) you can use the AWS CLI to force stop your instance.

AWS CLI

To force stop the instance using the AWS CLI

Use the stop-instances command and the --force option as follows:

aws ec2 stop-instances --instance-ids i-0123ab456c789d01e --force
If, after 10 minutes, the instance has not stopped, post a request for help on AWS re:Post. To help expedite a resolution, include the instance ID, and describe the steps that you've already taken. Alternatively, if you have a support plan, create a technical support case in the Support Center.

(Optional) Create a replacement instance

While you are waiting for assistance from AWS re:Post or the Support Center, you can create a replacement instance if needed. Create an AMI from the stuck instance, and launch a new instance using the new AMI.

⚠️ Important

You can create a replacement instance if the stuck instance produces system status checks only, as instance status checks will result in the AMI copying over an exact replica of the broken operating system. After you've confirmed the status message, create the AMI and launch a new instance using the new AMI.

Console

To create a replacement instance using the console

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances and select the stuck instance.
3. Choose Actions, Image and templates, Create image.
4. On the Create image page, do the following:
   a. Enter a name and description for the AMI.
   b. Choose No reboot.
   c. Choose Create image.

For more information, see the section called “Create an AMI from an instance”.

5. Launch a new instance from the AMI and verify that the new instance is working.
6. Select the stuck instance, and choose Actions, Instance state, Terminate instance. If the instance also gets stuck terminating, Amazon EC2 automatically forces it to terminate within a few hours.
AWS CLI

To create a replacement instance using the CLI

1. Create an AMI from the stuck instance using the `create-image` (AWS CLI) command and the `--no-reboot` option as follows:

   ```
   aws ec2 create-image --instance-id i-0123ab456c789d01e --name "AMI" --description "AMI for replacement instance" --no-reboot
   ```

2. Launch a new instance from the AMI using the `run-instances` (AWS CLI) command as follows:

   ```
   aws ec2 run-instances --image-id ami-1a2b3c4d --count 1 --instance-type c3.large --key-name MyKeyPair --security-groups MySecurityGroup
   ```

3. Verify that the new instance is working.

4. Terminate the stuck instance using the `terminate-instances` (AWS CLI) command as follows:

   ```
   aws ec2 terminate-instances --instance-ids i-1234567890abcdef0
   ```

If you are unable to create an AMI from the instance as described in the previous procedure, you can set up a replacement instance as follows:

(Alternate) To create a replacement instance using the console

1. Select the instance and choose Description, Block devices. Select each volume and make note of its volume ID. Be sure to note which volume is the root volume.

2. In the navigation pane, choose Volumes. Select each volume for the instance, and choose Actions, Create Snapshot.

3. In the navigation pane, choose Snapshots. Select the snapshot that you just created, and choose Actions, Create Volume.

4. Launch an instance with the same operating system as the stuck instance. Note the volume ID and device name of its root volume.

5. In the navigation pane, choose Instances, select the instance that you just launched, and choose Instance state, Stop instance.
6. In the navigation pane, choose Volumes, select the root volume of the stopped instance, and choose Actions, Detach Volume.

7. Select the root volume that you created from the stuck instance, choose Actions, Attach Volume, and attach it to the new instance as its root volume (using the device name that you made note of). Attach any additional non-root volumes to the instance.

8. In the navigation pane, choose Instances and select the replacement instance. Choose Instance state, Start instance. Verify that the instance is working.

9. Select the stuck instance, choose Instance state, Terminate instance. If the instance also gets stuck terminating, Amazon EC2 automatically forces it to terminate within a few hours.

Troubleshoot Amazon EC2 instance termination issues

Shutting down or deleting your instance is known as instance termination. The following information can help you troubleshoot issues when you terminate your instance.

You are not billed for any instance usage while an instance is not in the running state. In other words, when you terminate an instance, you stop incurring charges for that instance as soon as its state changes to shutting-down.

Instance terminates immediately

Several issues can cause your instance to terminate immediately on start-up. See Instance terminates immediately for more information.

Delayed instance termination

If your instance remains in the shutting-down state longer than a few minutes, it might be delayed due to shutdown scripts being run by the instance.

Another possible cause is a problem with the underlying host computer. If your instance remains in the shutting-down state for several hours, Amazon EC2 treats it as a stuck instance and forcibly terminates it.

If it appears that your instance is stuck terminating and it has been longer than several hours, post a request for help to AWS re:Post. To help expedite a resolution, include the instance ID and describe the steps that you've already taken. Alternatively, if you have a support plan, create a technical support case in the Support Center.
Terminated instance still displayed

After you terminate an instance, it remains visible for a short while before being deleted. The state shows as terminated. If the entry is not deleted after several hours, contact Support.

Error: The instance may not be terminated. Modify its 'disableApiTermination' instance attribute

If you try to terminate an instance and get the error, the instance `instance_id` may not be terminated. Modify its 'disableApiTermination' instance attribute error message, it indicates that the instance has been enabled for termination protection. Termination protection prevents the instance from being accidentally terminated. For more information, see Enable termination protection.

You must disable termination protection before you can terminate the instance.

To disable termination protection using the Amazon EC2 console, select the instance and then choose Actions, Instance Settings, Change Termination Protection.

To disable termination protection using the AWS CLI, use the following command.

```
aws ec2 modify-instance-attribute --instance-id instance_id --no-disable-api-termination
```

Instances automatically launched or terminated

Generally, the following behaviors mean that you've used Amazon EC2 Auto Scaling, EC2 Fleet, or Spot Fleet to scale your computing resources automatically based on criteria that you've defined:

- You terminate an instance and a new instance launches automatically.
- You launch an instance and one of your instances terminates automatically.
- You stop an instance and it terminates and a new instance launches automatically.

To stop automatic scaling, see the Amazon EC2 Auto Scaling User Guide, EC2 Fleet, or Create a Spot Fleet request.
Troubleshoot an unreachable Amazon EC2 instance

The following information can help you troubleshoot unreachable Amazon EC2 instances. You can capture screenshots or access console output to help diagnose problems and determine if you should reboot your instance. For unreachable Windows instances, troubleshoot by reviewing screenshots returned by the service.

Contents

- Instance reboot
- Instance console output
- Capture a screenshot of an unreachable instance
- Common screenshots to troubleshoot unreachable Windows instances
- Instance recovery when a host computer fails

Instance reboot

The ability to reboot instances that are otherwise unreachable is valuable for both troubleshooting and general instance management.

Just as you can reset a computer by pressing the reset button, you can reset EC2 instances using the Amazon EC2 console, CLI, or API. For more information, see Reboot your instance.

Instance console output

Console output is a valuable tool for problem diagnosis. It is especially useful for troubleshooting kernel problems and service configuration issues that could cause an instance to terminate or become unreachable before its SSH daemon can be started.

- Linux instances – The instance console output displays the exact console output that would normally be displayed on a physical monitor attached to a computer. The console output returns buffered information that was posted shortly after an instance transition state (start, stop, reboot, and terminate). The posted output is not continuously updated; only when it is likely to be of the most value.

- Windows instances – The instance console output includes the last three system event log errors.
Only the instance owner can access the console output.

You can retrieve the latest serial console output during the instance lifecycle. This option is only supported on instances built on the AWS Nitro System. It is not supported through the Amazon EC2 console.

**Console**

**To get console output**

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the left navigation pane, choose **Instances**.
3. Select the instance and then choose **Actions, Monitor and troubleshoot, Get system log**.

**Command line**

**To get console output**

You can use one of the following commands. For more information about these command line interfaces, see [Access Amazon EC2](#).

- `get-console-output` (AWS CLI)
- `Get-EC2ConsoleOutput` (AWS Tools for Windows PowerShell)

**Capture a screenshot of an unreachable instance**

If you are unable to connect to your instance, you can capture a screenshot of your instance and view it as an image. The image can provide visibility as to the status of the instance, and allows for quicker troubleshooting.

You can generate screenshots while the instance is running or after it has crashed. The image is generated in JPG format and is no larger than 100 kb. There is no data transfer cost for the screenshot.

**Limitations**

This feature is not supported for the following:

- Bare metal instances (instances of type *.metal*)
- Instance is using an NVIDIA GRID driver
Instances powered by Arm-based Graviton processors

Windows instances on AWS Outposts

Windows instances on AWS Local Zones

Supported Regions

This feature is available in the following Regions:

- US East (N. Virginia) Region
- US East (Ohio) Region
- US West (N. California) Region
- US West (Oregon) Region
- Africa (Cape Town) Region
- Asia Pacific (Hong Kong) Region
- Asia Pacific (Hyderabad) Region
- Asia Pacific (Jakarta) Region
- Asia Pacific (Melbourne) Region
- Asia Pacific (Mumbai) Region
- Asia Pacific (Osaka) Region
- Asia Pacific (Seoul) Region
- Asia Pacific (Singapore) Region
- Asia Pacific (Sydney) Region
- Asia Pacific (Tokyo) Region
- Canada (Central) Region
- Canada West (Calgary) Region
- China (Beijing) Region
- China (Ningxia) Region
- Europe (Frankfurt) Region
- Europe (Ireland) Region
- Europe (London) Region
- Europe (Milan) Region
- Europe (Paris) Region

Capture a screenshot of an unreachable instance
• Europe (Spain) Region
• Europe (Stockholm) Region
• Europe (Zurich) Region
• Israel (Tel Aviv) Region
• South America (São Paulo) Region
• Middle East (Bahrain) Region
• Middle East (UAE) Region

Console

To get a screenshot of an instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the left navigation pane, choose Instances.
3. Select the instance to capture.
4. Choose Actions, Monitor and troubleshoot, Get instance screenshot.
5. Choose Download, or right-click the image to download and save it.

Command line

To capture a screenshot of an instance

You can use one of the following commands. The returned content is base64-encoded. For more information about these command line interfaces, see Access Amazon EC2.

• get-console-screenshot (AWS CLI)
• GetConsoleScreenshot (Amazon EC2 Query API)

Common screenshots to troubleshoot unreachable Windows instances

You can use the following information to help you troubleshoot an unreachable Windows instance based on screenshots returned by the service.

• Log on screen (Ctrl+Alt+Delete)
• Recovery console screen
Log on screen (Ctrl+Alt+Delete)

Console Screenshot Service returned the following.

If an instance becomes unreachable during logon, there could be a problem with your network configuration or Windows Remote Desktop Services. An instance can also be unresponsive if a process is using large amounts of CPU.

Network configuration

Use the following information to verify that your AWS, Microsoft Windows, and local (or on-premises) network configurations aren’t blocking access to the instance.

AWS network configuration

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Verify</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security group configuration</td>
<td>Verify that port 3389 is open for your security group. Verify you are connecting to the right</td>
</tr>
</tbody>
</table>
## Configuration

<table>
<thead>
<tr>
<th>Verification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>public IP address. If the instance was not associated with an Elastic IP, the public IP changes after the instance stops/starts. For more information, see <a href="#">Remote Desktop can't connect to the remote computer</a>.</td>
<td></td>
</tr>
<tr>
<td>Verify that the access control list (ACL) for your Amazon VPC is not blocking access. For information, see <a href="#">Network ACLs</a> in the Amazon VPC User Guide.</td>
<td></td>
</tr>
<tr>
<td>If you are connecting to your VPC using a virtual private network (VPN), verify VPN tunnel connectivity. For more information, see <a href="#">How do I troubleshoot VPN tunnel connectivity to an Amazon VPC?</a>.</td>
<td></td>
</tr>
</tbody>
</table>

## Windows network configuration

<table>
<thead>
<tr>
<th>Verification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Verify that Windows Firewall isn't blocking connections to your instance. Disable Windows Firewall as described in bullet 7 of the remote desktop troubleshooting section, <a href="#">Remote Desktop can't connect to the remote computer</a>.</td>
<td></td>
</tr>
<tr>
<td>The instance may be unresponsive because you configured a static IP address. For a VPC, <a href="#">create a network interface</a> and <a href="#">attach it to the instance</a>.</td>
<td></td>
</tr>
</tbody>
</table>

## Local or on-premises network configuration
Verify that a local network configuration isn't blocking access. Try to connect to another instance in the same VPC as your unreachable instance. If you can't access another instance, work with your local network administrator to determine whether a local policy is restricting access.

**Remote Desktop Services issues**

If the instance can't be reached during logon, there could a problem with Remote Desktop Services (RDS) on the instance.

**Tip**

You can use the AWSSupport-TroubleshootRDP runbook to check and modify various settings that might affect Remote Desktop Protocol (RDP) connections. For more information, see [AWSSupport-TroubleshootRDP](#) in the *AWS Systems Manager Automation runbook reference*.

**Remote Desktop Services configuration**

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Verify</th>
</tr>
</thead>
<tbody>
<tr>
<td>RDS is running</td>
<td>Verify that RDS is running on the instance. Connect to the instance using the Microsoft Management Console (MMC) Services snap-in (<code>services.msc</code>). In the list of services, verify that <strong>Remote Desktop Services</strong> is <em>Running</em>. If it isn't, start it and then set the startup type to <strong>Automatic</strong>. If you can't connect to the instance by using the Services snap-in, detach the root volume from the instance, take a snapshot of the volume or create an AMI from it, attach the original volume to another instance in the same Availability Zone as a secondary volume, and modify the <strong>Start</strong> registry key. When you are finished, reattach the root volume to the original instance.</td>
</tr>
<tr>
<td>RDS is enabled</td>
<td>Even if the service is started, it might be disabled. Detach the root volume from the instance, take a snapshot of the volume or create an AMI from it, attach the original volume to another instance in the same Availability Zone as a secondary volume, and enable the service by modifying the <strong>Terminal Server</strong> <strong>Start</strong> registry key.</td>
</tr>
</tbody>
</table>

---

*Common screenshots for Windows instances*
High CPU usage

Check the **CPUUtilization (Maximum)** metric on your instance by using Amazon CloudWatch. If **CPUUtilization (Maximum)** is a high number, wait for the CPU to go down and try connecting again. High CPU usage can be caused by:

- Windows Update
- Security Software Scan
- Custom Startup Script
- Task Scheduler

For more information, see [Get Statistics for a Specific Resource](#) in the *Amazon CloudWatch User Guide*. For additional troubleshooting tips, see [High CPU usage shortly after Windows starts (Windows instances only)](#).

Recovery console screen

Console Screenshot Service returned the following.
The operating system might boot into the Recovery console and get stuck in this state if the `bootstatuspolicy` is not set to `ignoreallfailures`. Use the following procedure to change the `bootstatuspolicy` configuration to `ignoreallfailures`.

By default, the policy configuration for public Windows AMIs provided by AWS is set to `ignoreallfailures`.

1. Stop the unreachable instance.
2. Create a snapshot of the root volume. The root volume is attached to the instance as `/dev/sda1`.

   Detach the root volume from the unreachable instance, take a snapshot of the volume or create an AMI from it, and attach it to another instance in the same Availability Zone as a secondary volume.

   **Warning**

   If your temporary instance and the original instance were launched using the same AMI, you must complete additional steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision. If you must create a temporary instance using the same AMI, to avoid a disk signature collision, complete the steps in [Disk signature collision](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/disk-signature-collision.html).
Alternatively, select a different AMI for the temporary instance. For example, if the original instance uses an AMI for Windows Server 2016, launch the temporary instance using an AMI for Windows Server 2019.

3. Log in to the instance and run the following command from a command prompt to change the `bootstatuspolicy` configuration to `ignoreallfailures`.

   ```bash
   bcdedit /store Drive Letter:oot\bcd /set {default} bootstatuspolicy ignoreallfailures
   ```

4. Reattach the volume to the unreachable instance and start the instance again.

**Windows boot manager screen**

Console Screenshot Service returned the following.

The operating system experienced a fatal corruption in the system file and/or the registry. When the instance is stuck in this state, you should recover the instance from a recent backup AMI or launch a replacement instance. If you need to access data on the instance, detach any root volumes from the unreachable instance, take a snapshot of those volume or create an AMI from them, and attach them to another instance in the same Availability Zone as a secondary volume.

**Sysprep screen**

Console Screenshot Service returned the following.
You may see this screen if you did not use the EC2Config Service to call Sysprep or if the operating system failed while running Sysprep. You can reset the password using EC2Rescue. Otherwise, see Use EC2 launch agents to create an AMI with Windows Sysprep.

**Getting ready screen**

Console Screenshot Service returned the following.
Refresh the Instance Console Screenshot Service repeatedly to verify that the progress ring is spinning. If the ring is spinning, wait for the operating system to start up. You can also check the CPUUtilization (Maximum) metric on your instance by using Amazon CloudWatch to see if the operating system is active. If the progress ring is not spinning, the instance may be stuck at the boot process. Reboot the instance. If rebooting does not solve the problem, recover the instance from a recent backup AMI or launch a replacement instance. If you need to access data on the instance, detach the root volume from the unreachable instance, take a snapshot of the volume or create an AMI from it. Then attach it to another instance in the same Availability Zone as a secondary volume.

**Windows Update screen**

Console Screenshot Service returned the following.
The Windows Update process is updating the registry. Wait for the update to finish. Do not reboot or stop the instance as this may cause data corruption during the update.

**Note**

The Windows Update process can consume resources on the server during the update. If you experience this problem often, consider using faster instance types and faster EBS volumes.

---

**Chkdsk**

Console Screenshot Service returned the following.

Windows is running the chkdsk system tool on the drive to verify file system integrity and fix logical file system errors. Wait for process to complete.
Instance recovery when a host computer fails

If there is an unrecoverable issue with the hardware of an underlying host computer, AWS may schedule an instance stop event. You are notified of such an event ahead of time by email.

To recover an Amazon EBS-backed instance running on a host computer that failed

1. Back up any important data on your instance store volumes to Amazon EBS or Amazon S3.
2. Stop the instance.
3. Start the instance.
4. Restore any important data.

For more information, see Stop and start Amazon EC2 instances.

To recover an instance store-backed instance running on a host computer that failed

1. Create an AMI from the instance.
2. Upload the image to Amazon S3.
3. Back up important data to Amazon EBS or Amazon S3.
4. Terminate the instance.
5. Launch a new instance from the AMI.
6. Restore any important data to the new instance.

Troubleshoot issues connecting to your Amazon EC2 Linux instance

The following information and common errors can help you troubleshoot connecting to your Linux instance.

Connection issues

- Common causes for connection issues
- Error connecting to your instance: Connection timed out
- Error: unable to load key ... Expecting: ANY PRIVATE KEY
- Error: User key not recognized by server
• Error: Permission denied or connection closed by [instance] port 22
• Error: Unprotected private key file
• Error: Private key must begin with "-----BEGIN RSA PRIVATE KEY-----" and end with "-----END RSA PRIVATE KEY-----"
• Error: Server refused our key or No supported authentication methods available
• Cannot ping instance
• Error: Server unexpectedly closed network connection
• Error: Host key validation failed for EC2 Instance Connect
• Can't connect to Ubuntu instance using EC2 Instance Connect
• I've lost my private key. How can I connect to my Linux instance?

Common causes for connection issues

We recommend that you start to troubleshoot instance connection problems by verifying that you have accurately performed the following tasks.

Verify the username for your instance

You can connect to your instance using the username for your user account or the default username for the AMI that you used to launch your instance.

• Get the username for your user account.

For more information about how to create a user account, see Manage system users on your Linux instance.

• Get the default username for the AMI that you used to launch your instance:

<table>
<thead>
<tr>
<th>AMI used to launch instance</th>
<th>Default username</th>
</tr>
</thead>
<tbody>
<tr>
<td>AL2023</td>
<td>ec2-user</td>
</tr>
<tr>
<td>Amazon Linux 2</td>
<td></td>
</tr>
<tr>
<td>Amazon Linux</td>
<td></td>
</tr>
<tr>
<td>CentOS</td>
<td>centos or ec2-user</td>
</tr>
<tr>
<td>AMI used to launch instance</td>
<td>Default username</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>Debian</td>
<td>admin</td>
</tr>
<tr>
<td>Fedora</td>
<td>fedora or ec2-user</td>
</tr>
<tr>
<td>RHEL</td>
<td>ec2-user or root</td>
</tr>
<tr>
<td>SUSE</td>
<td>ec2-user or root</td>
</tr>
<tr>
<td>Ubuntu</td>
<td>ubuntu</td>
</tr>
<tr>
<td>Oracle</td>
<td>ec2-user</td>
</tr>
<tr>
<td>Bitnami</td>
<td>bitnami</td>
</tr>
<tr>
<td>Rocky Linux</td>
<td>rocky</td>
</tr>
<tr>
<td>Other</td>
<td>Check with the AMI provider</td>
</tr>
</tbody>
</table>

Verify that your security group rules allow traffic

Ensure that the security group associated with your instance allows incoming SSH traffic from your IP address. The default security group for the VPC does not allow incoming SSH traffic by default. The security group created by the launch instance wizard enables SSH traffic by default. For steps to add a rule for inbound SSH traffic to your Linux instance, see Rules to connect to instances from your computer. For steps to verify, see Error connecting to your instance: Connection timed out.

Verify that your instance is ready

After you launch an instance, it can take a few minutes for the instance to be ready so that you can connect to it. Check your instance to make sure it is running and has passed its status checks.

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Instances, and then select your instance.
3. Verify the following:
   a. In the Instance state column, verify that your instance is in the running state.
   b. In the Status check column, verify that your instance has passed the two status checks.
Verify that you've satisfied all prerequisites to connect

Ensure that you have all the information that you need to connect. For more information, see Connect to your Linux instance.

Connect from Linux or macOS X

If your local computer operating system is Linux or macOS X, check the following for specific prerequisites for connecting to a Linux instance:

- **SSH client**
- **EC2 Instance Connect**
- **AWS Systems Manager Session Manager**

Connect from Windows

If your local computer operating system is Windows, check the following for specific prerequisites for connecting to a Linux instance:

- **OpenSSH**
- **PuTTY**
- **AWS Systems Manager Session Manager**
- **Windows Subsystem for Linux**

Error connecting to your instance: Connection timed out

If you try to connect to your instance and get the error message Network error: Connection timed out or Error connecting to [instance], reason: -> Connection timed out: connect, try the following:

**Check your security group rules.**

You need a security group rule that allows inbound traffic from your local computer's public IPv4 address on the proper port.

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances**, and then select your instance.
3. On the **Security** tab at the bottom of the console page, under **Inbound rules**, check the list of rules that are in effect for the selected instance. Verify that there is a rule that allows traffic from your local computer to port 22 (SSH).
If your security group does not have a rule that allows inbound traffic from your local computer, add a rule to your security group. For more information, see Rules to connect to instances from your computer.

4. For the rule that allows inbound traffic, check the **Source** field. If the value is a single IP address, and if the IP address is not static, a new IP address will be assigned each time you restart your computer. This will result in the rule not including your computer's IP address traffic. The IP address might not be static if your computer is on a corporate network, or you're connecting through an internet service provider (ISP), or your computer IP address is dynamic and changes each time you restart your computer. To ensure that your security group rule allows inbound traffic from your local computer, instead of specifying a single IP address for **Source**, rather specify the range of IP addresses used by your client computers.

For more information about security group rules, see Security group rules in the Amazon VPC User Guide.

**Check the route table for the subnet.**

You need a route that sends all traffic destined outside the VPC to the internet gateway for the VPC.

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Instances**, and then select your instance.
3. On the **Networking** tab, make note of the values for **VPC ID** and **Subnet ID**.
4. Open the Amazon VPC console at https://console.aws.amazon.com/vpc/.
5. In the navigation pane, choose **Internet Gateways**. Verify that there is an internet gateway attached to your VPC. Otherwise, choose Create internet gateway, enter a name for the internet gateway, and choose Create internet gateway. Then, for the internet gateway you created, choose Actions, Attach to VPC, select your VPC, and then choose Attach internet gateway to attach it to your VPC.
6. In the navigation pane, choose **Subnets**, and then select your subnet.
7. On the **Route table** tab, verify that there is a route with 0.0.0.0/0 as the destination and the internet gateway for your VPC as the target. If you're connecting to your instance using its IPv6 address, verify that there is a route for all IPv6 traffic (::/0) that points to the internet gateway. Otherwise, do the following:

   a. Choose the ID of the route table (rtb-xxxxxxxx) to navigate to the route table.
b. On the **Routes** tab, choose **Edit routes**. Choose **Add route**, use `0.0.0.0/0` as the destination and the internet gateway as the target. For IPv6, choose **Add route**, use `::/0` as the destination and the internet gateway as the target.

c. Choose **Save routes**.

**Check the network access control list (ACL) for the subnet.**

The network ACLs must allow inbound SSH traffic from your local IP address on port 22. It must also allow outbound traffic to the ephemeral ports (1024-65535).

1. Open the Amazon VPC console at [https://console.aws.amazon.com/vpc/](https://console.aws.amazon.com/vpc/).
2. In the navigation pane, choose **Subnets**.
3. Select your subnet.
4. On the **Network ACL** tab, for **Inbound rules**, verify that the rules allow inbound traffic from your computer on the required port. Otherwise, delete or modify the rule that is blocking the traffic.
5. For **Outbound rules**, verify that the rules allow outbound traffic to your computer on the ephemeral ports. Otherwise, delete or modify the rule that is blocking the traffic.

**If your computer is on a corporate network**

Ask your network administrator whether the internal firewall allows inbound and outbound traffic from your computer on port 22.

If you have a firewall on your computer, verify that it allows inbound and outbound traffic from your computer on port 22.

**Check that your instance has a public IPv4 address.**

If not, you can associate an Elastic IP address with your instance. For more information, see [Elastic IP addresses](https://aws.amazon.com/documentation/elasticip/).

**Check the CPU load on your instance; the server may be overloaded.**

AWS automatically provides data such as Amazon CloudWatch metrics and instance status, which you can use to see how much CPU load is on your instance and, if necessary, adjust how your loads are handled. For more information, see [Monitor your instances using CloudWatch](https://aws.amazon.com/documentation/cloudwatch/).
• If your load is variable, you can automatically scale your instances up or down using **Auto Scaling** and **Elastic Load Balancing**.

• If your load is steadily growing, you can move to a larger instance type. For more information, see **Change the instance type**.

**To connect to your instance using an IPv6 address, check the following:**

• Your subnet must be associated with a route table that has a route for IPv6 traffic (: /0) to an internet gateway.

• Your security group rules must allow inbound traffic from your local IPv6 address on port 22.

• Your network ACL rules must allow inbound and outbound IPv6 traffic.

• If you launched your instance from an older AMI, it might not be configured for DHCPv6 (IPv6 addresses are not automatically recognized on the network interface). For more information, see **Configure IPv6 on your instances** in the *Amazon VPC User Guide*.

• Your local computer must have an IPv6 address, and must be configured to use IPv6.

**Error: unable to load key ... Expecting: ANY PRIVATE KEY**

If you try to connect to your instance and get the error message, `unable to load key ... Expecting: ANY PRIVATE KEY`, the file in which the private key is stored is incorrectly configured. If the private key file ends in `.pem`, it might still be incorrectly configured. A possible cause for an incorrectly configured private key file is a missing certificate.

**If the private key file is incorrectly configured, follow these steps to resolve the error**

1. Create a new key pair. For more information, see **Create a key pair using Amazon EC2**.

   **Note**
   Alternatively, you can create a new key pair using a third-party tool. For more information, see **Create a key pair using a third-party tool and import the public key to Amazon EC2**.

2. Add the new key pair to your instance. For more information, see **I've lost my private key. How can I connect to my Linux instance?**

3. Connect to your instance using the new key pair.
Error: User key not recognized by server

If you use SSH to connect to your instance

- Use `ssh -vvv` to get triple verbose debugging information while connecting:

  ```
  ssh -vvv -i path/key-pair-name.pem instance-user-name@ec2-203-0-113-25.compute-1.amazonaws.com
  ```

The following sample output demonstrates what you might see if you were trying to connect to your instance with a key that was not recognized by the server:

```
open/ANT/myusername/.ssh/known_hosts).
debg2: bits set: 504/1024
debg1: ssh_rsa_verify: signature correct
debg2: kex_derive_keys
debg2: set_newkeys: mode 1

debg1: expecting SSH2_MSG_NEWKEYS
debg2: set_newkeys: mode 0
debg1: SSH2_MSG_NEWKEYS received
debg1: Roaming not allowed by server
debg1: SSH2_MSG_SERVICE_REQUEST sent
debg2: service_accept: ssh-userauth
debg1: SSH2_MSG_SERVICE_ACCEPT received
debg2: key: boguspem.pem ((nil))
debg1: Authentications that can continue: publickey
debg3: start over, passed a different list publickey
debg3: preferred gssapi-keyex,gssapi-with-mic,publickey,keyboard-interactive,password
debg3: authmethod_lookup publickey
debg3: remaining preferred: keyboard-interactive,password
debg3: authmethod_is_enabled publickey
debg1: Next authentication method: publickey
debg1: Trying private key: boguspem.pem
debg1: read PEM private key done: type RSA
debg2: we sent a publickey packet, wait for reply
debg1: Authentications that can continue: publickey
debg2: we did not send a packet, disable method
debg1: No more authentication methods to try.
Permission denied (publickey).
```
If you use PuTTY to connect to your instance

- Verify that your private key (.pem) file has been converted to the format recognized by PuTTY (.ppk). For more information about converting your private key, see Connect to your Linux instance from Windows with PuTTY.

**Note**

In PuTTYgen, load your private key file and select **Save Private Key** rather than **Generate**.

- Verify that you are connecting with the appropriate user name for your AMI. Enter the user name in the **Host name** box in the **PuTTY Configuration** window.

<table>
<thead>
<tr>

**Error: User key not recognized by server**

2821
- Verify that you have an inbound security group rule to allow inbound traffic to the appropriate port. For more information, see [Rules to connect to instances from your computer](#).

### Error: Permission denied or connection closed by [instance] port 22

If you connect to your instance using SSH and get any of the following errors, Host key not found in directory, Permission denied (publickey), Authentication failed, permission denied, or Connection closed by [instance] port 22, verify that you are connecting with the appropriate user name for your AMI and that you have specified the proper private key (.pem) file for your instance.

The appropriate user names are as follows:

<table>
<thead>
<tr>
<th>AMI used to launch instance</th>
<th>Default username</th>
</tr>
</thead>
<tbody>
<tr>
<td>Other</td>
<td>Check with the AMI provider</td>
</tr>
<tr>
<td>AL2023</td>
<td>ec2-user</td>
</tr>
<tr>
<td>Amazon Linux 2</td>
<td></td>
</tr>
<tr>
<td>Amazon Linux</td>
<td></td>
</tr>
<tr>
<td>CentOS</td>
<td>centos or ec2-user</td>
</tr>
<tr>
<td>Debian</td>
<td>admin</td>
</tr>
<tr>
<td>Fedora</td>
<td>fedora or ec2-user</td>
</tr>
<tr>
<td>RHEL</td>
<td>ec2-user or root</td>
</tr>
<tr>
<td>SUSE</td>
<td>ec2-user or root</td>
</tr>
<tr>
<td>Ubuntu</td>
<td>ubuntu</td>
</tr>
<tr>
<td>Oracle</td>
<td>ec2-user</td>
</tr>
<tr>
<td>Bitnami</td>
<td>bitnami</td>
</tr>
</tbody>
</table>
AMI used to launch instance | Default username
--- | ---
Rocky Linux | rocky
Other | Check with the AMI provider

For example, to use an SSH client to connect to an Amazon Linux instance, use the following command:

```
ssh -i /path/key-pair-name.pem instance-user-name@ec2-203-0-113-25.compute-1.amazonaws.com
```

Confirm that you are using the private key file that corresponds to the key pair that you selected when you launched the instance.

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose **Instances** and then select your instance.
3. On the **Details** tab, under **Instance details**, verify the value of **Key pair name**.
4. If you did not specify a key pair when you launched the instance, you can terminate the instance and launch a new instance, ensuring that you specify a key pair. If this is an instance that you have been using but you no longer have the .pem file for your key pair, you can replace the key pair with a new one. For more information, see [I've lost my private key. How can I connect to my Linux instance?](#).

If you generated your own key pair, ensure that your key generator is set up to create RSA keys. DSA keys are not accepted.

If you get a **Permission denied (publickey)** error and none of the above applies (for example, you were able to connect previously), the permissions on the home directory of your instance may have been changed. Permissions for `/home/instance-user-name/.ssh/authorized_keys` must be limited to the owner only.

**To verify the permissions on your instance**

1. Stop your instance and detach the root volume. For more information, see [Stop and start Amazon EC2 instances](#).
2. Launch a temporary instance in the same Availability Zone as your current instance (use a similar or the same AMI as you used for your current instance), and attach the root volume to the temporary instance.

3. Connect to the temporary instance, create a mount point, and mount the volume that you attached.

4. From the temporary instance, check the permissions of the /home/instance-user-name/ directory of the attached volume. If necessary, adjust the permissions as follows:

   [ec2-user ~]$ chmod 600 mount_point/home/instance-user-name/.ssh/authorized_keys

   [ec2-user ~]$ chmod 700 mount_point/home/instance-user-name/.ssh

   [ec2-user ~]$ chmod 700 mount_point/home/instance-user-name

5. Unmount the volume, detach it from the temporary instance, and re-attach it to the original instance. Ensure that you specify the correct device name for the root volume; for example, /dev/xvda.

6. Start your instance. If you no longer require the temporary instance, you can terminate it.

**Error: Unprotected private key file**

Your private key file must be protected from read and write operations from any other users. If your private key can be read or written to by anyone but you, then SSH ignores your key and you see the following warning message below.

```
@ WARNING: UNPROTECTED PRIVATE KEY FILE! @
Permissions 0777 for './.ssh/my_private_key.pem' are too open.
It is required that your private key files are NOT accessible by others.
This private key will be ignored.
bad permissions: ignore key: .ssh/my_private_key.pem
Permission denied (publickey).
```

If you see a similar message when you try to log in to your instance, examine the first line of the error message to verify that you are using the correct public key for your instance. The above example uses the private key .ssh/my_private_key.pem with file permissions of 0777, which
allow anyone to read or write to this file. This permission level is very insecure, and so SSH ignores this key.

If you are connecting from macOS or Linux, run the following command to fix this error, substituting the path for your private key file.

```
[ec2-user ~]$ chmod 0400 .ssh/my_private_key.pem
```

If you are connecting to a Linux instance from Windows, perform the following steps on your local computer.

1. Navigate to your .pem file.
2. Right-click on the .pem file and select Properties.
3. Choose the Security tab.
4. Select Advanced.
5. Verify that you are the owner of the file. If not, change the owner to your username.
6. Select Disable inheritance and Remove all inherited permissions from this object.
7. Select Add, Select a principal, enter your username, and select OK.
8. From the Permission Entry window, grant Read permissions and select OK.
9. Click Apply to ensure all settings are saved.
10. Select OK to close the Advanced Security Settings window.
11. Select OK to close the Properties window.
12. You should be able to connect to your Linux instance from Windows using SSH.

From a Windows command prompt, run the following commands.

1. From the command prompt, navigate to the file path location of your .pem file.
2. Run the following command to reset and remove explicit permissions:

   ```
   icacls.exe $path /reset
   ```

3. Run the following command to grant Read permissions to the current user:

   ```
   icacls.exe $path /GRANT:R "($env:USERNAME):(R)"
   ```

Error: Unprotected private key file
4. Run the following command to disable inheritance and remove inherited permissions.

```
icacls.exe $path /inheritance:r
```

5. You should be able to connect to your Linux instance from Windows using SSH.

**Error: Private key must begin with "-----BEGIN RSA PRIVATE KEY-----" and end with "-----END RSA PRIVATE KEY-----"**

If you use a third-party tool, such as `ssh-keygen`, to create an RSA key pair, it generates the private key in the OpenSSH key format. When you connect to your instance, if you use the private key in the OpenSSH format to decrypt the password, you'll get the error `Private key must begin with "-----BEGIN RSA PRIVATE KEY-----" and end with "-----END RSA PRIVATE KEY-----"`.

To resolve the error, the private key must be in the PEM format. Use the following command to create the private key in the PEM format:

```
ssh-keygen -m PEM
```

**Error: Server refused our key or No supported authentication methods available**

If you use PuTTY to connect to your instance and get either of the following errors, `Error: Server refused our key` or `Error: No supported authentication methods available`, verify that you are connecting with the appropriate user name for your AMI. Type the user name in **User name** in the PuTTY Configuration window.

The appropriate user names are as follows:

<table>
<thead>
<tr>
<th>AMI used to launch instance</th>
<th>Default username</th>
</tr>
</thead>
<tbody>
<tr>
<td>AL2023</td>
<td>ec2-user</td>
</tr>
<tr>
<td>Amazon Linux 2</td>
<td></td>
</tr>
<tr>
<td>Amazon Linux</td>
<td></td>
</tr>
</tbody>
</table>
### AMI used to launch instance vs Default username

<table>
<thead>
<tr>
<th>AMI used to launch instance</th>
<th>Default username</th>
</tr>
</thead>
<tbody>
<tr>
<td>CentOS</td>
<td>centos or ec2-user</td>
</tr>
<tr>
<td>Debian</td>
<td>admin</td>
</tr>
<tr>
<td>Fedora</td>
<td>fedora or ec2-user</td>
</tr>
<tr>
<td>RHEL</td>
<td>ec2-user or root</td>
</tr>
<tr>
<td>SUSE</td>
<td>ec2-user or root</td>
</tr>
<tr>
<td>Ubuntu</td>
<td>ubuntu</td>
</tr>
<tr>
<td>Oracle</td>
<td>ec2-user</td>
</tr>
<tr>
<td>Bitnami</td>
<td>bitnami</td>
</tr>
<tr>
<td>Rocky Linux</td>
<td>rocky</td>
</tr>
<tr>
<td>Other</td>
<td>Check with the AMI provider</td>
</tr>
</tbody>
</table>

You should also verify that:

- You are using the latest version of PuTTY. For more information, see the [PuTTY web page](#).
- Your private key (.pem) file has been correctly converted to the format recognized by PuTTY (.ppk). For more information about converting your private key, see [Connect to your Linux instance from Windows with PuTTY](#).

## Cannot ping instance

The ping command is a type of ICMP traffic — if you are unable to ping your instance, ensure that your inbound security group rules allow ICMP traffic for the Echo Request message from all sources, or from the computer or instance from which you are issuing the command.

If you are unable to issue a ping command from your instance, ensure that your outbound security group rules allow ICMP traffic for the Echo Request message to all destinations, or to the host that you are attempting to ping.
Ping commands can also be blocked by a firewall or time out due to network latency or hardware issues. You should consult your local network or system administrator for help with further troubleshooting.

**Error: Server unexpectedly closed network connection**

If you are connecting to your instance with PuTTY and you receive the error "Server unexpectedly closed network connection," verify that you have enabled keepalives on the Connection page of the PuTTY Configuration to avoid being disconnected. Some servers disconnect clients when they do not receive any data within a specified period of time. Set the Seconds between keepalives to 59 seconds.

If you still experience issues after enabling keepalives, try to disable Nagle's algorithm on the Connection page of the PuTTY Configuration.

**Error: Host key validation failed for EC2 Instance Connect**

If you rotate your instance host keys, the new host keys are not automatically uploaded to the AWS trusted host keys database. This causes host key validation to fail when you try to connect to your instance using the EC2 Instance Connect browser-based client, and you're unable to connect to your instance.

To resolve the error, you must run the `eic_harvest_hostkeys` script on your instance, which uploads your new host key to EC2 Instance Connect. The script is located at `/opt/aws/bin/` on Amazon Linux 2 instances, and at `/usr/share/ec2-instance-connect/` on Ubuntu instances.

**Amazon Linux 2**

To resolve the host key validation failed error on an Amazon Linux 2 instance

1. Connect to your instance using SSH.

   You can connect by using the EC2 Instance Connect CLI or by using the SSH key pair that was assigned to your instance when you launched it and the default user name of the AMI that you used to launch your instance. For Amazon Linux 2, the default user name is `ec2-user`.

   For example, if your instance was launched using Amazon Linux 2, your instance's public DNS name is `ec2-a-b-c-d.us-west-2.compute.amazonaws.com`, and the key pair is `my_ec2_private_key.pem`, use the following command to SSH into your instance:
$ ssh -i my_ec2_private_key.pem ec2-user@ec2-a-b-c-d.us-west-2.compute.amazonaws.com

For more information about connecting to your instance, see Connect to your Linux instance from Linux or macOS using SSH.

2. Navigate to the following folder.

[ec2-user ~]$ cd /opt/aws/bin/

3. Run the following command on your instance.

[ec2-user ~]$ ./eic_harvest_hostkeys

Note that a successful call results in no output.

You can now use the EC2 Instance Connect browser-based client to connect to your instance.

Ubuntu

To resolve the host key validation failed error on an Ubuntu instance

1. Connect to your instance using SSH.

You can connect by using the EC2 Instance Connect CLI or by using the SSH key pair that was assigned to your instance when you launched it and the default user name of the AMI that you used to launch your instance. For Ubuntu, the default user name is ubuntu.

For example, if your instance was launched using Ubuntu, your instance's public DNS name is ec2-a-b-c-d.us-west-2.compute.amazonaws.com, and the key pair is my_ec2_private_key.pem, use the following command to SSH into your instance:

$ ssh -i my_ec2_private_key.pem ubuntu@ec2-a-b-c-d.us-west-2.compute.amazonaws.com

For more information about connecting to your instance, see Connect to your Linux instance from Linux or macOS using SSH.
2. Navigate to the following folder.

```
[ec2-user ~]$ cd /usr/share/ec2-instance-connect/
```

3. Run the following command on your instance.

```
[ec2-user ~]$ ./eic_harvest_hostkeys
```

Note that a successful call results in no output.

You can now use the EC2 Instance Connect browser-based client to connect to your instance.

**Can't connect to Ubuntu instance using EC2 Instance Connect**

If you use EC2 Instance Connect to connect to your Ubuntu instance and you get an error when attempting to connect, you can use the following information to try to fix the issue.

**Possible cause**

The `ec2-instance-connect` package on the instance is not the latest version.

**Solution**

Update the `ec2-instance-connect` package on the instance to the latest version, as follows:

1. **Connect** to your instance using a method other than EC2 Instance Connect.
2. Run the following command on your instance to update the `ec2-instance-connect` package to the latest version.

```
apt update && apt upgrade
```

**I've lost my private key. How can I connect to my Linux instance?**

If you lose the private key for an EBS-backed instance, you can regain access to your instance. You must stop the instance, detach its root volume and attach it to another instance as a data volume, modify the `authorized_keys` file with a new public key, move the volume back to the original instance, and restart the instance. For more information about launching, connecting to, and stopping instances, see [Instance lifecycle](#).
This procedure is only supported for instances with EBS root volumes. If the root device is an instance store volume, you cannot use this procedure to regain access to your instance; you must have the private key to connect to the instance. To determine the root device type of your instance, open the Amazon EC2 console, choose **Instances**, select the instance, choose the **Storage** tab, and in the **Root device details** section, check the value of **Root device type**.

The value is either EBS or INSTANCE-STORE.

In addition to the following steps, there are other ways to connect to your Linux instance if you lose your private key. For more information, see [How can I connect to my Amazon EC2 instance if I lost my SSH key pair after its initial launch?](#)

**Steps for connecting to an EBS-backed instance with a different key pair**

- **Step 1: Create a new key pair**
- **Step 2: Get information about the original instance and its root volume**
- **Step 3: Stop the original instance**
- **Step 4: Launch a temporary instance**
- **Step 5: Detach the root volume from the original instance and attach it to the temporary instance**
- **Step 6: Add the new public key to authorized_keys on the original volume mounted to the temporary instance**
- **Step 7: Unmount and detach the original volume from the temporary instance, and reattach it to the original instance**
- **Step 8: Connect to the original instance using the new key pair**
- **Step 9: Clean up**

**Step 1: Create a new key pair**

Create a new key pair using either the Amazon EC2 console or a third-party tool. If you want to name your new key pair exactly the same as the lost private key, you must first delete the existing key pair. For information about creating a new key pair, see [Create a key pair using Amazon EC2](#) or [Create a key pair using a third-party tool and import the public key to Amazon EC2](#).

**Step 2: Get information about the original instance and its root volume**

Make note of the following information because you'll need it to complete this procedure.
To get information about your original instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. Choose Instances in the navigation pane, and then select the instance that you'd like to connect to. (We'll refer to this as the original instance.)
3. On the Details tab, make note of the instance ID and AMI ID.
4. On the Networking tab, make note of the Availability Zone.
5. On the Storage tab, under Root device name, make note of the device name for the root volume (for example, /dev/xvda). Then, under Block devices, find this device name and make note of the volume ID (for example, vol-0a1234b5678c910de).

Step 3: Stop the original instance

Choose Instance state, Stop instance. If this option is disabled, either the instance is already stopped or its root device is an instance store volume.

⚠️ Warning
When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

Step 4: Launch a temporary instance

New console

To launch a temporary instance

1. In the navigation pane, choose Instances, and then choose Launch instances.
2. In the Name and tags section, for Name, enter Temporary.
3. In the Application and OS Images section, select the same AMI that you used to launch the original instance. If this AMI is unavailable, you can create an AMI that you can use from the stopped instance. For more information, see Create an Amazon EBS-backed AMI.
4. In the Instance type section, keep the default instance type.
5. In the Key pair section, for Key pair name, select the existing key pair to use or create a new one.
6. In the **Network settings** section, choose **Edit**, and then for **Subnet**, select a subnet in the same Availability Zone as the original instance.

7. In the **Summary** panel, choose **Launch**.

Old console

Choose **Launch instances**, and then use the launch wizard to launch a *temporary* instance with the following options:

- On the **Choose an AMI** page, select the same AMI that you used to launch the original instance. If this AMI is unavailable, you can create an AMI that you can use from the stopped instance. For more information, see [Create an Amazon EBS-backed AMI](#).

- On the **Choose an Instance Type** page, leave the default instance type that the wizard selects for you.

- On the **Configure Instance Details** page, specify the same Availability Zone as the original instance. If you're launching an instance in a VPC, select a subnet in this Availability Zone.

- On the **Add Tags** page, add the tag **Name=Temporary** to the instance to indicate that this is a temporary instance.

- On the **Review** page, choose **Launch**. Choose the key pair that you created in Step 1, then choose **Launch Instances**.

**Step 5: Detach the root volume from the original instance and attach it to the temporary instance**

1. In the navigation pane, choose **Volumes** and select the root device volume for the original instance (you made note of its volume ID in a previous step). Choose **Actions, Detach volume**, and then choose **Detach**. Wait for the state of the volume to become **available**. (You might need to choose the Refresh icon.)

2. With the volume still selected, choose **Actions**, and then choose **Attach volume**. Select the instance ID of the temporary instance, make note of the device name specified under **Device name** (for example, `/dev/sdf`), and then choose **Attach volume**.

I've lost my private key. How can I connect to my Linux instance?
Note

If you launched your original instance from an AWS Marketplace AMI and your volume contains AWS Marketplace codes, you must first stop the temporary instance before you can attach the volume.

Step 6: Add the new public key to authorized_keys on the original volume mounted to the temporary instance

1. Connect to the temporary instance.

2. From the temporary instance, mount the volume that you attached to the instance so that you can access its file system. For example, if the device name is /dev/sdf, use the following commands to mount the volume as /mnt/tempvol.

Note

The device name might appear differently on your instance. For example, devices mounted as /dev/sdf might show up as /dev/xvdf on the instance. Some versions of Red Hat (or its variants, such as CentOS) might even increment the trailing letter by 4 characters, where /dev/sdf becomes /dev/xvdk.

a. Use the lsblk command to determine if the volume is partitioned.

   [ec2-user ~]$ lsblk
   NAME   MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
   xvda   202:0   0   8G  0 disk
   ##xvda1 202:1   0   8G  0 part /
   xvdf   202:80  0  101G  0 disk
   ##xvdf1 202:81  0  101G  0 part
   xvdfg  202:96  0   30G  0 disk

   In the preceding example, /dev/xvda and /dev/xvdf are partitioned volumes, and /dev/xvdfg is not. If your volume is partitioned, you mount the partition (/dev/xvdf1) instead of the raw device (/dev/xvdf) in the next steps.

b. Create a temporary directory to mount the volume.
c. Mount the volume (or partition) at the temporary mount point, using the volume name or device name that you identified earlier. The required command depends on your operating system's file system. Note that the device name might appear differently on your instance. See the note in Step 6 for more information.

- Amazon Linux, Ubuntu, and Debian

```
[ec2-user ~]$ sudo mkdir /mnt/tempvol
```

```
[ec2-user ~]$ sudo mount /dev/xvdf1 /mnt/tempvol
```

- Amazon Linux 2, CentOS, SUSE Linux 12, and RHEL 7.x

```
[ec2-user ~]$ sudo mount -o nouuid /dev/xvdf1 /mnt/tempvol
```

⚠️ **Note**

If you get an error stating that the file system is corrupt, run the following command to use the `fsck` utility to check the file system and repair any issues:

```
[ec2-user ~]$ sudo fsck /dev/xvdf1
```

3. From the temporary instance, use the following command to update `authorized_keys` on the mounted volume with the new public key from the `authorized_keys` for the temporary instance.

⚠️ **Important**

The following examples use the Amazon Linux user name `ec2-user`. You might need to substitute a different user name, such as `ubuntu` for Ubuntu instances.

```
[ec2-user ~]$ cp .ssh/authorized_keys /mnt/tempvol/home/ec2-user/.ssh/authorized_keys
```

If this copy succeeded, you can go to the next step.
(Optional) Otherwise, if you don't have permission to edit files in `/mnt/tempvol`, you must update the file using `sudo` and then check the permissions on the file to verify that you are able to log into the original instance. Use the following command to check the permissions on the file.

```
[ec2-user ~]$ sudo ls -l /mnt/tempvol/home/ec2-user/.ssh
```

In this example output, `222` is the user ID and `500` is the group ID. Next, use `sudo` to re-run the copy command that failed.

```
[ec2-user ~]$ sudo cp .ssh/authorized_keys /mnt/tempvol/home/ec2-user/.ssh/authorized_keys
```

Run the following command again to determine whether the permissions changed.

```
[ec2-user ~]$ sudo ls -l /mnt/tempvol/home/ec2-user/.ssh
```

If the user ID and group ID have changed, use the following command to restore them.

```
[ec2-user ~]$ sudo chown 222:500 /mnt/tempvol/home/ec2-user/.ssh/authorized_keys
```

**Step 7: Unmount and detach the original volume from the temporary instance, and reattach it to the original instance**

1. From the temporary instance, unmount the volume that you attached so that you can reattach it to the original instance. For example, use the following command to unmount the volume at `/mnt/tempvol`.

```
[ec2-user ~]$ sudo umount /mnt/tempvol
```

2. Detach the volume from the temporary instance (you unmounted it in the previous step): From the Amazon EC2 console, choose **Volumes** in the navigation pane, select the root device volume for the original instance (you made note of the volume ID in a previous step), choose
Actions, Detach volume, and then choose Detach. Wait for the state of the volume to become available. (You might need to choose the Refresh icon.)

3. Reattach the volume to the original instance: With the volume still selected, choose Actions, Attach volume. Select the instance ID of the original instance, specify the device name that you noted earlier in Step 2 for the original root device attachment (/dev/sda1 or /dev/xvda), and then choose Attach volume.

⚠️ Important
If you don’t specify the same device name as the original attachment, you cannot start the original instance. Amazon EC2 expects the root device volume at sda1 or /dev/xvda.

Step 8: Connect to the original instance using the new key pair

Select the original instance, choose Instance state, Start instance. After the instance enters the running state, you can connect to it using the private key file for your new key pair.

⚠️ Note
If the name of your new key pair and corresponding private key file is different from the name of the original key pair, ensure that you specify the name of the new private key file when you connect to your instance.

Step 9: Clean up

(Optional) You can terminate the temporary instance if you have no further use for it. Select the temporary instance, and choose Instance state, Terminate instance.

Troubleshoot Amazon EC2 Linux instances with failed status checks

The following information can help you troubleshoot issues if your Linux instance fails a status check. First determine whether your applications are exhibiting any problems. If you verify that the
instance is not running your applications as expected, review the status check information and the system logs.

For examples of problems that can cause status checks to fail, see Status checks for Amazon EC2 instances.

Contents

- Review status check information
- Retrieve the system logs
- Troubleshoot system log errors for Linux instances
- Out of memory: kill process
- ERROR: mmu_update failed (Memory management update failed)
- I/O error (block device failure)
- I/O ERROR: neither local nor remote disk (Broken distributed block device)
- request_module: runaway loop modprobe (Looping legacy kernel modprobe on older Linux versions)
- "FATAL: kernel too old" and "fsck: No such file or directory while trying to open /dev" (Kernel and AMI mismatch)
- "FATAL: Could not load /lib/modules" or "BusyBox" (Missing kernel modules)
- ERROR Invalid kernel (EC2 incompatible kernel)
- fsck: No such file or directory while trying to open... (File system not found)
- General error mounting filesystems (failed mount)
- VFS: Unable to mount root fs on unknown-block (Root filesystem mismatch)
- Error: Unable to determine major/minor number of root device... (Root file system/device mismatch)
- XENBUS: Device with no driver...
- ... days without being checked, check forced (File system check required)
- fsck died with exit status... (Missing device)
- GRUB prompt (grubdom>)
- Bringing up interface eth0: Device eth0 has different MAC address than expected, ignoring. (Hard-coded MAC address)
- Unable to load SELinux Policy. Machine is in enforcing mode. Halting now. (SELinux misconfiguration)
• **XENBUS: Timeout connecting to devices (Xenbus timeout)**

### Review status check information

To investigate impaired instances using the Amazon EC2 console

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose *Instances*, and then select your instance.
3. In the details pane, choose **Status and alarms** to see the individual results for all **System status checks** and **Instance status checks**.

If a system status check has failed, you can try one of the following options:

- Create an instance recovery alarm. For more information, see [Create alarms that stop, terminate, reboot, or recover an instance](https://docs.aws.amazon.com/autoscaling/ec2/userguide/alarms-define.html).
- If you changed the instance type to an [instance built on the AWS Nitro System](https://aws.amazon.com/nitro/), status checks fail if you migrated from an instance that does not have the required ENA and NVMe drivers. For more information, see [Compatibility for changing the instance type](https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/compatibility-supported.html).
- For an instance using an Amazon EBS-backed AMI, stop and restart the instance.
- For an instance using an instance-store backed AMI, terminate the instance and launch a replacement.
- Wait for Amazon EC2 to resolve the issue.
- Post your issue to [AWS re:Post](https://aws.amazon.com/repost/).
- If your instance is in an Auto Scaling group, the Amazon EC2 Auto Scaling service automatically launches a replacement instance. For more information, see [Health Checks for Auto Scaling Instances](https://docs.aws.amazon.com/autoscaling/ec2/latest/userguide/health-checks.html) in the *Amazon EC2 Auto Scaling User Guide*.
- Retrieve the system log and look for errors.

### Retrieve the system logs

If an instance status check fails, you can reboot the instance and retrieve the system logs. The logs may reveal an error that can help you troubleshoot the issue. Rebooting clears unnecessary information from the logs.
To reboot an instance and retrieve the system log

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances, and select your instance.
3. Choose Instance state, Reboot instance. It might take a few minutes for your instance to reboot.
4. Verify that the problem still exists; in some cases, rebooting may resolve the problem.
5. When the instance is in the running state, choose Actions, Monitor and troubleshoot, Get system log.
6. Review the log that appears on the screen, and use the list of known system log error statements below to troubleshoot your issue.
7. If your issue is not resolved, you can post your issue to AWS re:Post.

Troubleshoot system log errors for Linux instances

For Linux instances that have failed an instance status check, such as the instance reachability check, verify that you followed the steps above to retrieve the system log. The following list contains some common system log errors and suggested actions you can take to resolve the issue for each error.

Memory Errors

- Out of memory: kill process
- ERROR: mmu_update failed (Memory management update failed)

Device Errors

- I/O error (block device failure)
- I/O ERROR: neither local nor remote disk (Broken distributed block device)

Kernel Errors

- request_module: runaway loop modprobe (Looping legacy kernel modprobe on older Linux versions)
- "FATAL: kernel too old" and "fsck: No such file or directory while trying to open /dev" (Kernel and AMI mismatch)
• "FATAL: Could not load /lib/modules" or "BusyBox" (Missing kernel modules)
• ERROR Invalid kernel (EC2 incompatible kernel)

File System Errors

• fsck: No such file or directory while trying to open... (File system not found)
• General error mounting filesystems (failed mount)
• VFS: Unable to mount root fs on unknown-block (Root filesystem mismatch)
• Error: Unable to determine major/minor number of root device... (Root file system/device mismatch)
• XENBUS: Device with no driver...
• ... days without being checked, check forced (File system check required)
• fsck died with exit status... (Missing device)

Operating System Errors

• GRUB prompt (grubdom>)
• Bringing up interface eth0: Device eth0 has different MAC address than expected, ignoring. (Hard-coded MAC address)
• Unable to load SELinux Policy. Machine is in enforcing mode. Halting now. (SELinux misconfiguration)
• XENBUS: Timeout connecting to devices (Xenbus timeout)

Out of memory: kill process

An out-of-memory error is indicated by a system log entry similar to the one shown below.

[115879.769795] Out of memory: kill process 20273 (httpd) score 1285879
or a child

Potential cause

Exhausted memory
## Suggested actions

<table>

initrd /boot/initramfs-2.6.35.14-95.38.amzn1.i686.img

ERROR: mmu_update failed with rc=-22

Potential cause

Issue with Amazon Linux

Suggested action

Post your issue to the Developer Forums or contact AWS Support.

I/O error (block device failure)

An input/output error is indicated by a system log entry similar to the following example:

```
[9943662.053217] end_request: I/O error, dev sde, sector 52428288
[9943664.191262] end_request: I/O error, dev sde, sector 52428168
[9943664.191285] Buffer I/O error on device md0, logical block 209713024
[9943664.191297] Buffer I/O error on device md0, logical block 209713025
[9943664.191304] Buffer I/O error on device md0, logical block 209713026

Potential causes

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Potential cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon EBS-backed</td>
<td>A failed Amazon EBS volume</td>
</tr>
<tr>
<td>Instance store-backed</td>
<td>A failed physical drive</td>
</tr>
</tbody>
</table>

Suggested actions

<table>
<thead>
<tr>
<th>For this instance type</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon EBS-backed</td>
<td>Use the following procedure:</td>
</tr>
<tr>
<td></td>
<td>1. Stop the instance.</td>
</tr>
<tr>
<td></td>
<td>2. Detach the volume.</td>
</tr>
<tr>
<td></td>
<td>3. Attempt to recover the volume.</td>
</tr>
<tr>
<td></td>
<td>4. Re-attach the volume to the instance.</td>
</tr>
<tr>
<td></td>
<td>5. Start the instance.</td>
</tr>
</tbody>
</table>

**Note**

It's good practice to snapshot your Amazon EBS volumes often. This dramatically decreases the risk of data loss as a result of failure.

<table>
<thead>
<tr>
<th>Instance store-backed</th>
<th>Terminate the instance and launch a new instance.</th>
</tr>
</thead>
</table>

**Note**

Data cannot be recovered. Recover from backups.
### I/O ERROR: neither local nor remote disk (Broken distributed block device)

An input/output error on the device is indicated by a system log entry similar to the following example:

```plaintext
... 
block drbd1: Local IO failed in request_timer_fn. Detaching... 
Aborting journal on device drbd1-8. 
block drbd1: I/O ERROR: neither local nor remote disk 
Buffer I/O error on device drbd1, logical block 557056 
lost page write due to I/O error on drbd1 
JBD2: I/O error detected when updating journal superblock for drbd1-8.
```

### Potential causes

<table>
<thead>
<tr>
<th>Instance type</th>
<th>Potential cause</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon EBS-backed</td>
<td>A failed Amazon EBS volume</td>
</tr>
<tr>
<td>Instance store-backed</td>
<td>A failed physical drive</td>
</tr>
</tbody>
</table>
**Suggested action**

Terminate the instance and launch a new instance.

For an Amazon EBS-backed instance you can recover data from a recent snapshot by creating an image from it. Any data added after the snapshot cannot be recovered.

**request_module: runaway loop modprobe (Looping legacy kernel modprobe on older Linux versions)**

This condition is indicated by a system log similar to the one shown below. Using an unstable or old Linux kernel (for example, 2.6.16-xenU) can cause an interminable loop condition at startup.

```
Linux version 2.6.16-xenU (builder@xenbat.amazonsa) (gcc version 4.0.1 20050727 (Red Hat 4.0.1-5)) #1 SMP Mon May 28 03:41:49 SAST 2007

BIOS-provided physical RAM map:

  Xen: 0000000000000000 - 0000000026700000 (usable)

0MB HIGHMEM available.
...

request_module: runaway loop modprobe binfmt-464c
request_module: runaway loop modprobe binfmt-464c
request_module: runaway loop modprobe binfmt-464c
request_module: runaway loop modprobe binfmt-464c
request_module: runaway loop modprobe binfmt-464c
```

**Suggested actions**

"FATAL: kernel too old" and "fsck: No such file or directory while trying to open /dev" (Kernel and AMI mismatch)

This condition is indicated by a system log similar to the one shown below.

```
FATAL: kernel too old
Kernel panic - not syncing: Attempted to kill init!
```

Potential causes

Incompatible kernel and userland

Suggested actions

For this instance type | Do this
---|---
Amazon EBS-backed | Use the following procedure:
For this instance type | Do this
---|---
| 1. Stop the instance.  
2. Modify the configuration to use a newer kernel.  
3. Start the instance.

Instance store-backed | Use the following procedure:  
1. Create an AMI that uses a newer kernel.  
2. Terminate the instance.  
3. Start a new instance from the AMI you created.

"FATAL: Could not load /lib/modules" or "BusyBox" (Missing kernel modules)

This condition is indicated by a system log similar to the one shown below.

```
[  0.370415] Freeing unused kernel memory: 1716k freed
Loading, please wait...
WARNING: Couldn't open directory /lib/modules/2.6.34-4-virtual: No such file or directory

```

"FATAL: Could not load /lib/modules" or "BusyBox" (Missing kernel modules)
Begin: Waiting for root file system...
Done.
Gave up waiting for root device. Common problems:
- Boot args (cat /proc/cmdline)
  - Check rootdelay= (did the system wait long enough?)
  - Check root= (did the system wait for the right device?)
- Missing modules (cat /proc/modules; ls /dev)
FATAL: Could not load /lib/modules/2.6.34-4-virtual/modules.dep: No such file or directory
FATAL: Could not load /lib/modules/2.6.34-4-virtual/modules.dep: No such file or directory
ALERT! /dev/sda1 does not exist. Dropping to a shell!

BusyBox v1.13.3 (Ubuntu 1:1.13.3-1ubuntu5) built-in shell (ash)
Enter 'help' for a list of built-in commands.

(initramfs)

Potential causes

One or more of the following conditions can cause this problem:

- Missing ramdisk
- Missing correct modules from ramdisk
- Amazon EBS root volume not correctly attached as /dev/sda1

Suggested actions

<table>
<thead>
<tr>
<th>For this instance type</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon EBS-backed</td>
<td>Use the following procedure:</td>
</tr>
<tr>
<td></td>
<td>1. Select corrected ramdisk for the Amazon EBS volume.</td>
</tr>
<tr>
<td></td>
<td>2. Stop the instance.</td>
</tr>
<tr>
<td></td>
<td>3. Detach the volume and repair it.</td>
</tr>
<tr>
<td></td>
<td>4. Attach the volume to the instance.</td>
</tr>
<tr>
<td></td>
<td>5. Start the instance.</td>
</tr>
<tr>
<td>For this instance type</td>
<td>Do this</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td>6. Modify the AMI to use the corrected ramdisk.</td>
</tr>
<tr>
<td>Instance store-backed</td>
<td>Use the following procedure:</td>
</tr>
<tr>
<td></td>
<td>1. Terminate the instance and launch a new instance with the correct ramdisk.</td>
</tr>
<tr>
<td></td>

</tr>
</tbody>
</table>

**ERROR Invalid kernel (EC2 incompatible kernel)**

This condition is indicated by a system log similar to the one shown below.

```plaintext
...  
root (hd0)

  Filesystem type is ext2fs, using whole disk

kernel /vmlinuz root=/dev/sda1 ro

initrd /initrd.img

  ERROR Invalid kernel: elf_xen_note_check: ERROR: Will only load images built for the generic loader or Linux images
  xc_dom_parse_image returned -1

Error 9: Unknown boot failure

  Booting 'Fallback'

root (hd0)

  Filesystem type is ext2fs, using whole disk

kernel /vmlinuz.old root=/dev/sda1 ro

Error 15: File not found
```
Potential causes

One or both of the following conditions can cause this problem:

- Supplied kernel is not supported by GRUB
- Fallback kernel does not exist

Suggested actions

<table>
<thead>
<tr>
<th>For this instance type</th>
<th>Do this</th>
</tr>
</thead>
<tbody>
<tr>
<td>Amazon EBS-backed</td>
<td>Use the following procedure:</td>
</tr>
<tr>
<td></td>
<td>1. Stop the instance.</td>

... days without being checked, check forced (File system check required)

This condition is indicated by a system log similar to the one shown below.

```
... Checking filesystems
Checking all file systems.
[/sbin/fsck.ext3 (1) -- /] fsck.ext3 -a /dev/sda1
/dev/sda1 has gone 361 days without being checked, check forced
```

**Potential causes**

Filesystem check time passed; a filesystem check is being forced.

**Suggested actions**

- Wait until the filesystem check completes. A filesystem check can take a long time depending on the size of the root filesystem.
- Modify your filesystems to remove the filesystem check (fsck) enforcement using tune2fs or tools appropriate for your filesystem.

fsck died with exit status... (Missing device)

This condition is indicated by a system log similar to the one shown below.

```
Cleaning up ifupdown....
Loading kernel modules...done.
...
Activating lvm and md swap...done.
Checking file systems...fsck from util-linux-ng 2.16.2
/sbin/fsck.xfs: /dev/sdh does not exist
fsck died with exit status 8
[31mfailed (code 8).[39;49m
```

Troubleshoot an Amazon EC2 Linux instance booting from wrong volume

In some situations, a volume other than the volume attached to /dev/xvda or /dev/sda becomes the root volume of a Linux instance. This can happen when you have attached the root volume of another instance, or a volume created from the snapshot of a root volume, to an instance with an existing root volume.

This is due to how the initial ramdisk in Linux works. It chooses the volume defined as / in the /etc/fstab, and in some distributions, this is determined by the label attached to the volume partition. Specifically, you find that your /etc/fstab looks something like the following:

```
LABEL=/ / ext4 defaults,noatime 1 1
tmpfs /dev/shm tmpfs defaults 0 0
devpts /dev/pts devpts gid=5,mode=620 0 0
```
If you check the label of both volumes, you see that they both contain the / label:

```
[ec2-user ~]$ sudo e2label /dev/xvda1 
/ 
[ec2-user ~]$ sudo e2label /dev/xvdf1 
/
```

In this example, you could end up having /dev/xvdf1 become the root device that your instance boots to after the initial ramdisk runs, instead of the /dev/xvda1 volume from which you had intended to boot. To solve this, use the same `e2label` command to change the label of the attached volume that you do not want to boot from.

In some cases, specifying a UUID in `/etc/fstab` can resolve this. However, if both volumes come from the same snapshot, or the secondary is created from a snapshot of the primary volume, they share a UUID.

```
[ec2-user ~]$ sudo blkid 
/dev/xvda1: LABEL="/" UUID=73947a77-ddbe-4dc7-bd8f-3fe0bc840778 TYPE="ext4" PARTLABEL="Linux" PARTUUID=d55925ee-72c8-41e7-b514-7084e28f7334 
/dev/xvdf1: LABEL="old/" UUID=73947a77-ddbe-4dc7-bd8f-3fe0bc840778 TYPE="ext4" PARTLABEL="Linux" PARTUUID=d55925ee-72c8-41e7-b514-7084e28f7334
```

**To change the label of an attached ext4 volume**

1. Use the `e2label` command to change the label of the volume to something other than `/`.

   ```
   [ec2-user ~]$ sudo e2label /dev/xvdf1 old/
   ```

2. Verify that the volume has the new label.

   ```
   [ec2-user ~]$ sudo e2label /dev/xvdf1 old/
   ```

**To change the label of an attached xfs volume**

- Use the `xfs_admin` command to change the label of the volume to something other than `/`. 
After changing the volume label as shown, you should be able to reboot the instance and have the proper volume selected by the initial ramdisk when the instance boots.

⚠ **Important**

If you intend to detach the volume with the new label and return it to another instance to use as the root volume, you must perform the above procedure again and change the volume label back to its original value. Otherwise, the other instance does not boot because the ramdisk is unable to find the volume with the label `/`.

### Troubleshoot issues connecting to your Amazon EC2 Windows instance

The following information and common errors can help you troubleshoot issues when connecting to your Windows instance.

#### Connection issues

- **Remote Desktop can't connect to the remote computer**
- **Error using the macOS RDP client**
- **RDP displays a black screen instead of the desktop**
- **Unable to remotely log on to an instance with a user that is not an administrator**
- **Troubleshooting Remote Desktop issues using AWS Systems Manager**
- **Enable Remote Desktop on an EC2 instance with remote registry**
- **I've lost my private key. How can I connect to my Windows instance?**

### Remote Desktop can't connect to the remote computer

Try the following to resolve issues related to connecting to your instance:
• Verify that you're using the correct public DNS hostname. (In the Amazon EC2 console, select the instance and check **Public DNS (IPv4)** in the details pane.) If your instance is in a VPC and you do not see a public DNS name, you must enable DNS hostnames. For more information, see **DNS attributes for your VPC** in the *Amazon VPC User Guide*.

• Verify that your instance has a public IPv4 address. If not, you can associate an Elastic IP address with your instance. For more information, see **Elastic IP addresses**.

• To connect to your instance using an IPv6 address, check that your local computer has an IPv6 address and is configured to use IPv6. For more information, see **Configure IPv6 on your instances** in the *Amazon VPC User Guide*.

• Verify that your security group has a rule that allows RDP access on port 3389.

• If you copied the password but get the error *Your credentials did not work*, try typing them manually when prompted. It's possible that you missed a character or got an extra white space character when you copied the password.

• Verify that the instance has passed status checks. For more information, see **Status checks for Amazon EC2 instances** and the section called “Linux instance failed status checks”.

• Verify that the route table for the subnet has a route that sends all traffic destined outside the VPC to the internet gateway for the VPC. For more information, see **Creating a custom route table** (Internet Gateways) in the *Amazon VPC User Guide*.

• Verify that Windows Firewall, or other firewall software, is not blocking RDP traffic to the instance. We recommend that you disable Windows Firewall and control access to your instance using security group rules. You can use **AWSSupport-TroubleshootRDP** to **disable the Windows Firewall profiles using SSM Agent**. To disable Windows Firewall on a Windows instance that is not configured for AWS Systems Manager, use **AWSSupport-ExecuteEC2Rescue**, or use the following manual steps:

### Manual steps

1. Stop the affected instance and detach its root volume.
2. Launch a temporary instance in the same Availability Zone as the affected instance.

**Warning**

If your temporary instance is based on the same AMI that the original instance is based on, you must complete additional steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision.
Alternatively, select a different AMI for the temporary instance. For example, if the original instance uses the AWS Windows AMI for Windows Server 2016, launch the temporary instance using the AWS Windows AMI for Windows Server 2019.

3. Attach the root volume from the affected instance to this temporary instance. Connect to the temporary instance, open the Disk Management utility, and bring the drive online.

4. Open Regedit and select HKEY_LOCAL_MACHINE. From the File menu, choose Load Hive. Select the drive, open the file Windows\System32\config\SYSTEM, and specify a key name when prompted (you can use any name).

5. Select the key you just loaded and navigate to ControlSet001\Services\SharedAccess\Parameters\FirewallPolicy. For each key with a name of the form xxxxProfile, select the key and change EnableFirewall from 1 to 0. Select the key again, and from the File menu, choose Unload Hive.

6. (Optional) If your temporary instance is based on the same AMI that the original instance is based on, you must complete the following steps or you won’t be able to boot the original instance after you restore its root volume because of a disk signature collision.

⚠️ Warning

The following procedure describes how to edit the Windows Registry using Registry Editor. If you are not familiar with the Windows Registry or how to safely make changes using Registry Editor, see Configure the Registry.

a. Open a command prompt, type regedit.exe, and press Enter.

b. In the Registry Editor, choose HKEY_LOCAL_MACHINE from the context menu (right-click), and then choose Find.

c. Type Windows Boot Manager and then choose Find Next.

d. Choose the key named 11000001. This key is a sibling of the key you found in the previous step.

e. In the right pane, choose Element and then choose Modify from the context menu (right-click).

f. Locate the four-byte disk signature at offset 0x38 in the data. Reverse the bytes to create the disk signature, and write it down. For example, the disk signature represented by the following data is E9EB3AA5:

Remote Desktop can't connect to the remote computer
g. In a Command Prompt window, run the following command to start Microsoft DiskPart.

```
diskpart
```

h. Run the following DiskPart command to select the volume. (You can verify that the disk number is 1 using the Disk Management utility.)

```
DISKPART> select disk 1

Disk 1 is now the selected disk.
```

i. Run the following DiskPart command to get the disk signature.

```
DISKPART> uniqueid disk

Disk ID: 0C764FA8
```

j. If the disk signature shown in the previous step doesn't match the disk signature from BCD that you wrote down earlier, use the following DiskPart command to change the disk signature so that it matches:

```
DISKPART> uniqueid disk id=E9EB3AA5
```

7. Using the Disk Management utility, bring the drive offline.

**Note**

The drive is automatically offline if the temporary instance is running the same operating system as the affected instance, so you won't need to bring it offline manually.

8. Detach the volume from the temporary instance. You can terminate the temporary instance if you have no further use for it.

9. Restore the root volume of the affected instance by attaching it as /dev/sda1.
10. Start the instance.

- Verify that Network Level Authentication is disabled on instances that are not part of an Active Directory domain (use AWSSupport-TroubleshootRDP to disable NLA).
- Verify that the Remote Desktop Service (TermService) Startup Type is Automatic and the service is started (use AWSSupport-TroubleshootRDP to enable and start the RDP service).
- Verify that you are connecting to the correct Remote Desktop Protocol port, which by default is 3389 (use AWSSupport-TroubleshootRDP to read the current RDP port and change it back to 3389).
- Verify that Remote Desktop connections are allowed on your instance (use AWSSupport-TroubleshootRDP to enable Remote Desktop connections).
- Verify that the password has not expired. If the password has expired, you can reset it. For more information, see Reset the administrator password for an Amazon EC2 Windows instance.
- If you attempt to connect using a user that you created on the instance and receive the error The user cannot connect to the server due to insufficient access privileges, verify that you granted the user the right to log on locally. For more information, see Grant a Member the Right to Logon Locally.
- If you attempt more than the maximum allowed concurrent RDP sessions, your session is terminated with the message Your Remote Desktop Services session has ended. Another user connected to the remote computer, so your connection was lost. By default, you are allowed two concurrent RDP sessions to your instance.

**Error using the macOS RDP client**

If you are connecting to a Windows Server instance using the Remote Desktop Connection client from the Microsoft website, you may get the following error:

Remote Desktop Connection cannot verify the identity of the computer that you want to connect to.

Download the Microsoft Remote Desktop app from the Mac App Store and use the app to connect to your instance.

**RDP displays a black screen instead of the desktop**

Try the following to resolve this issue:
• Check the console output for additional information. To get the console output for your instance using the Amazon EC2 console, select the instance, and then choose Actions, Monitor and troubleshoot, Get system log.

• Verify that you are running the latest version of your RDP client.

• Try the default settings for the RDP client. For more information, see Remote Session Environment.

• If you are using Remote Desktop Connection, try starting it with the /admin option as follows.

  mstsc /v:instance /admin

• If the server is running a full-screen application, it might have stopped responding. Use Ctrl +Shift+Esc to start Windows Task Manager, and then close the application.

• If the server is over-utilized, it might have stopped responding. To monitor the instance using the Amazon EC2 console, select the instance and then select the Monitoring tab. If you need to change the instance type to a larger size, see Change the instance type.

Unable to remotely log on to an instance with a user that is not an administrator

If you are not able to remotely log on to a Windows instance with a user that is not an administrator account, ensure that you have granted the user the right to log on locally. See Grant a user or group the right to log on locally to the domain controllers in the domain.

Troubleshooting Remote Desktop issues using AWS Systems Manager

You can use AWS Systems Manager to troubleshoot issues connecting to your Windows instance using RDP.

AWSSupport-TroubleshootRDP

The AWSSupport-TroubleshootRDP automation document allows the user to check or modify common settings on the target instance that can impact Remote Desktop Protocol (RDP) connections, such as the RDP Port, Network Layer Authentication (NLA), and Windows Firewall profiles. By default, the document reads and outputs the values of these settings.

The AWSSupport-TroubleshootRDP automation document can be used with EC2 instances, on-premises instances, and virtual machines (VMs) that are enabled for use with AWS Systems.
Manager (managed instances). In addition, it can also be used with EC2 instances for Windows Server that are not enabled for use with Systems Manager. For information about enabling instances for use with AWS Systems Manager, see Managed nodes in the AWS Systems Manager User Guide.

**To troubleshoot using the AWSSupport-TroubleshootRDP document**

1. Log in to the Systems Manager Console.
2. Verify that you are in the same Region as the impaired instance.
3. Choose Documents from the left navigation pane.
4. On the Owned by Amazon tab, enter AWSSupport-TroubleshootRDP in the search field. When the AWSSupport-TroubleshootRDP document appears, select it.
5. Choose Execute automation.
6. For Execution Mode, choose Simple execution.
7. For Input parameters, InstanceId, enable Show interactive instance picker.
8. Choose your Amazon EC2 instance.
9. Review the examples, then choose Execute.
10. To monitor the execution progress, for Execution status, wait for the status to change from Pending to Success. Expand Outputs to view the results. To view the output of individual steps, in Executed Steps, choose an item from Step ID.

**AWSSupport-TroubleshootRDP examples**

The following examples show you how to accomplish common troubleshooting tasks using AWSSupport-TroubleshootRDP. You can use either the example AWS CLI start-automation-execution command or the provided link to the AWS Management Console.

**Example Example: Check the current RDP status**

AWS CLI:

```
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom" --region region_code
```

AWS Systems Manager console:
Example Example: Disable the Windows Firewall

AWS CLI:

```bash
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom, Firewall=Disable" --region region_code
```

AWS Systems Manager console:

Example Example: Disable Network Level Authentication

AWS CLI:

```bash
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom, NLASettingAction=Disable" --region region_code
```

AWS Systems Manager console:

Example Example: Set RDP Service Startup Type to Automatic and start the RDP service

AWS CLI:

```bash
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP" --parameters "InstanceId=instance_id, Action=Custom, RDPServiceStartupType=Auto, RDPServiceAction=Start" --region region_code
```

AWS Systems Manager console:
Example Example: Restore the default RDP Port (3389)

AWS CLI:

```bash
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP"
   --parameters "InstanceId=instance_id, Action=Custom, RDPPortAction=Modify" --
   region region_code
```

AWS Systems Manager console:

https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-
TroubleshootRDP?region=region_code#documentVersion=$LATEST&RDPPortAction=Modify

Example Example: Allow remote connections

AWS CLI:

```bash
aws ssm start-automation-execution --document-name "AWSSupport-TroubleshootRDP"
   --parameters "InstanceId=instance_id, Action=Custom, RemoteConnections=Enable" --
   region region_code
```

AWS Systems Manager console:

https://console.aws.amazon.com/systems-manager/automation/execute/AWSSupport-
TroubleshootRDP?region=region_code#documentVersion=$LATEST&RemoteConnections=Enable

**AWSSupport-ExecuteEC2Rescue**

The AWSSupport-ExecuteEC2Rescue automation document uses EC2Rescue for Windows Server to automatically troubleshoot and restore EC2 instance connectivity and RDP issues. For more information, see [Run the EC2Rescue tool on unreachable instances](#).

The AWSSupport-ExecuteEC2Rescue automation document requires a stop and restart of the instance. Systems Manager Automation stops the instance and creates an Amazon Machine Image (AMI). Data stored in instance store volumes is lost. The public IP address changes if you are not
using an Elastic IP address. For more information, see Run the EC2Rescue tool on unreachable instances in the AWS Systems Manager User Guide.

To troubleshoot using the AWSSupport-ExecuteEC2Rescue document

1. Open the Systems Manager console.
2. Verify that you are in the same Region as the impaired Amazon EC2 instance.
3. In the navigation panel, choose Documents.
4. Search for and select the AWSSupport-ExecuteEC2Rescue document, and then choose Execute automation.
5. In Execution Mode, choose Simple execution.
6. In the Input parameters section, for UnreachableInstanceId, enter the Amazon EC2 instance ID of the unreachable instance.
7. (Optional) For LogDestination, enter the Amazon Simple Storage Service (Amazon S3) bucket name if you want to collect operating system logs for troubleshooting your Amazon EC2 instance. Logs are automatically uploaded to the specified bucket.
8. Choose Execute.
9. To monitor the execution progress, in Execution status, wait for the status to change from Pending to Success. Expand Outputs to view the results. To view the output of individual steps, in Executed Steps, choose the Step ID.

Enable Remote Desktop on an EC2 instance with remote registry

If your unreachable instance is not managed by AWS Systems Manager Session Manager, then you can use remote registry to enable Remote Desktop.

1. From the EC2 console, stop the unreachable instance.
2. Detach the root volume of the unreachable instance and attach it to a reachable instance in the same Availability Zone as a storage volume. If you don't have a reachable instance in the same Availability Zone, launch one. Note the device name of the root volume on the unreachable instance.
3. On the reachable instance, open Disk Management. You can do so by running the following command in the Command Prompt window.

   `diskmgmt.msc`
4. Right click the newly attached volume that came from the unreachable instance, and then choose **Online**.

5. Open the Windows Registry Editor. You can do so by running the following command in the Command Prompt window.

   ```
   regedit
   ```

6. In Registry Editor, choose **HKEY_LOCAL_MACHINE**, then select **File, Load Hive**.

7. Select the drive of the attached volume, navigate to `\Windows\System32\config\`, select **SYSTEM**, and then choose **Open**.

8. For **Key Name**, enter a unique name for the hive and choose **OK**.

9. Back up the registry hive before making any changes to the registry.
   a. In the Registry Editor console tree, select the hive that you loaded: `HKEY_LOCAL_MACHINE\your-key-name`.
   b. Choose **File, Export**.
   c. In the Export Registry File dialog box, choose the location to which you want to save the backup copy, and then type a name for the backup file in the **File name** field.
   d. Choose **Save**.

10. In Registry Editor, navigate to `HKEY_LOCAL_MACHINE\your-key-name\ControlSet001\Control\Terminal Server`, and then, in the details pane, double-click **fDenyTSConnections**.

11. In the **Edit DWORD** value box, enter 0 in the **Value data** field.

12. Choose **OK**.

   **Note**
   
   If the value in the **Value data** field is 1, then the instance will deny remote desktop connections. A value of 0 allows remote desktop connections.

13. In Registry Editor, choose **HKEY_LOCAL_MACHINE\your-key-name**, then select **File, Unload Hive**.

14. Close Registry Editor and Disk Management.
15. From the EC2 console, detach the volume from the reachable instance and then reattach it to the unreachable instance. When attaching the volume to the unreachable instance, enter the device name that you saved earlier in the device field.

16. Restart the unreachable instance.

I've lost my private key. How can I connect to my Windows instance?

When you connect to a newly-launched Windows instance, you decrypt the password for the Administrator account using the private key for the key pair that you specified when you launched the instance.

If you lose the Administrator password and you no longer have the private key, you must reset the password or create a new instance. For more information, see Reset the administrator password for an Amazon EC2 Windows instance. For steps to reset the password using an Systems Manager document, see Reset passwords and SSH keys on EC2 instances in the AWS Systems Manager User Guide.

Troubleshoot Amazon EC2 Windows instance start issues

The following are troubleshooting tips to help you solve password and activation issues with Amazon EC2 Windows instances.

Issues

- "Password is not available"
- "Password not available yet"
- "Cannot retrieve Windows password"
- "Waiting for the metadata service"
- "Unable to activate Windows"
- "Windows is not genuine (0x80070005)"
- "No Terminal Server License Servers available to provide a license"
- "Some settings are managed by your organization"
"Password is not available"

To connect to a Windows instance using Remote Desktop, you must specify an account and password. The accounts and passwords provided are based on the AMI that you used to launch the instance. You can either retrieve the auto-generated password for the Administrator account, or use the account and password that were in use in the original instance from which the AMI was created.

You can generate a password for the Administrator account for instances launched using a custom Windows AMI. To generate the password, you will need to configure some settings in the operating system before the AMI is created. For more information, see [Create an Amazon EBS-backed AMI](#).

If your Windows instance isn't configured to generate a random password, you'll receive the following message when you retrieve the auto-generated password using the console:

Password is not available.
The instance was launched from a custom AMI, or the default password has changed. A password cannot be retrieved for this instance. If you have forgotten your password, you can reset it using the Amazon EC2 configuration service. For more information, see [Passwords for a Windows Server instance](#).

Check the console output for the instance to see whether the AMI that you used to launch it was created with password generation disabled. If password generation is disabled, the console output contains the following:

Ec2SetPassword: Disabled

If password generation is disabled and you don't remember the password for the original instance, you can reset the password for this instance. For more information, see [Reset the administrator password for an Amazon EC2 Windows instance](#).

"Password not available yet"

To connect to a Windows instance using Remote Desktop, you must specify an account and password. The accounts and passwords provided are based on the AMI that you used to launch the instance. You can either retrieve the auto-generated password for the Administrator account, or use the account and password that were in use in the original instance from which the AMI was created.
Your password should be available within a few minutes. If the password isn't available, you'll receive the following message when you retrieve the auto-generated password using the console:

Password not available yet. Please wait at least 4 minutes after launching an instance before trying to retrieve the auto-generated password.

If it's been longer than four minutes and you still can't get the password, it's possible that the launch agent for your instance is not configured to generate a password. Verify by checking whether the console output is empty. For more information, see Unable to get console output.

Also verify that the AWS Identity and Access Management (IAM) account being used to access the Management Portal has the ec2:GetPasswordData action allowed. For more information about IAM permissions, see What is IAM?

"Cannot retrieve Windows password"

To retrieve the auto-generated password for the Administrator account, you must use the private key for the key pair that you specified when you launched the instance. If you didn't specify a key pair when you launched the instance, you'll receive the following message.

Cannot retrieve Windows password

You can terminate this instance and launch a new instance using the same AMI, making sure to specify a key pair.

"Waiting for the metadata service"

A Windows instance must obtain information from its instance metadata before it can activate itself. By default, the WaitForMetaDataAvailable setting ensures that the EC2Config service waits for the instance metadata to be accessible before continuing with the boot process. For more information, see Work with instance metadata.

If the instance is failing the instance reachability test, try the following to resolve this issue.

- Check the CIDR block for your VPC. A Windows instance cannot boot correctly if it's launched into a VPC that has an IP address range from 224.0.0.0 to 255.255.255.255 (Class D and Class E IP address ranges). These IP address ranges are reserved, and should not be assigned to
host devices. We recommend that you create a VPC with a CIDR block from the private (non-publicly routable) IP address ranges as specified in RFC 1918.

- It's possible that the system has been configured with a static IP address. Try creating a network interface and attaching it to the instance.

- To enable DHCP on a Windows instance that you can't connect to

  1. Stop the affected instance and detach its root volume.
  2. Launch a temporary instance in the same Availability Zone as the affected instance.

  > Warning

  If your temporary instance is based on the same AMI that the original instance is based on, you must complete additional steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision. Alternatively, select a different AMI for the temporary instance. For example, if the original instance uses the AWS Windows AMI for Windows Server 2016, launch the temporary instance using the AWS Windows AMI for Windows Server 2019.

  3. Attach the root volume from the affected instance to this temporary instance. Connect to the temporary instance, open the Disk Management utility, and bring the drive online.

  4. From the temporary instance, open Regedit and select HKEY_LOCAL_MACHINE. From the File menu, choose Load Hive. Select the drive, open the file Windows\System32\config\SYSTEM, and specify a key name when prompted (you can use any name).

  5. Select the key that you just loaded and navigate to ControlSet001\Services\Tcpip\Parameters\Interfaces. Each network interface is listed by a GUID. Select the correct network interface. If DHCP is disabled and a static IP address assigned, EnableDHCP is set to 0. To enable DHCP, set EnableDHCP to 1, and delete the following keys if they exist: NameServer, SubnetMask, IPAddress, and DefaultGateway. Select the key again, and from the File menu, choose Unload Hive.

  > Note

  If you have multiple network interfaces, you'll need to identify the correct interface to enable DHCP. To identify the correct network interface, review the following
key values NameServer, SubnetMask, IPAddress, and DefaultGateway. These values display the static configuration of the previous instance.

6. (Optional) If DHCP is already enabled, it's possible that you don't have a route to the metadata service. Updating EC2Config can resolve this issue.
   
a. Download and install the latest version of the EC2Config service. For more information about installing this service, see the section called “Install EC2Config”.
   
b. Extract the files from the .zip file to the Temp directory on the drive you attached.
   
c. Open Regedit and select HKEY_LOCAL_MACHINE. From the File menu, choose Load Hive. Select the drive, open the file Windows\System32\config\SOFTWARE, and specify a key name when prompted (you can use any name).
   
d. Select the key that you just loaded and navigate to Microsoft\Windows \CurrentVersion. Select the RunOnce key. (If this key doesn't exist, right-click CurrentVersion, point to New, select Key, and name the key RunOnce.) Right-click, point to New, and select String Value. Enter Ec2Install as the name and C:\Temp \Ec2Install.exe -q as the data.
   
e. Select the key again, and from the File menu, choose Unload Hive.

7. (Optional) If your temporary instance is based on the same AMI that the original instance is based on, you must complete the following steps or you won't be able to boot the original instance after you restore its root volume because of a disk signature collision.

⚠️ Warning

The following procedure describes how to edit the Windows Registry using Registry Editor. If you are not familiar with the Windows Registry or how to safely make changes using Registry Editor, see Configure the Registry.

a. Open a command prompt, type regedit.exe, and press Enter.
   
b. In the Registry Editor, choose HKEY_LOCAL_MACHINE from the context menu (right-click), and then choose Find.
   
c. Type Windows Boot Manager and then choose Find Next.
   
d. Choose the key named 11000001. This key is a sibling of the key you found in the previous step.
e. In the right pane, choose Element and then choose **Modify** from the context menu (right-click).

f. Locate the four-byte disk signature at offset 0x38 in the data. Reverse the bytes to create the disk signature, and write it down. For example, the disk signature represented by the following data is E9EB3AA5:

```plaintext
... 0030 00 00 00 00 01 00 00 00 0038 A5 3A EB E9 00 00 00 00 0040 00 00 00 00 00 00 00 00 ...
```

g. In a Command Prompt window, run the following command to start Microsoft DiskPart.

```
diskpart
```

h. Run the following DiskPart command to select the volume. (You can verify that the disk number is 1 using the **Disk Management** utility.)

```
DISKPART> select disk 1
Disk 1 is now the selected disk.
```

i. Run the following DiskPart command to get the disk signature.

```
DISKPART> uniqueld disk
Disk ID: 0C764FA8
```

j. If the disk signature shown in the previous step doesn't match the disk signature from BCD that you wrote down earlier, use the following DiskPart command to change the disk signature so that it matches:

```
DISKPART> uniqueld disk id=E9EB3AA5
```

8. Using the **Disk Management** utility, bring the drive offline.
Note

The drive is automatically offline if the temporary instance is running the same operating system as the affected instance, so you won't need to bring it offline manually.

9. Detach the volume from the temporary instance. You can terminate the temporary instance if you have no further use for it.

10. Restore the root volume of the affected instance by attaching the volume as /dev/sda1.

11. Start the affected instance.

If you are connected to the instance, open an Internet browser from the instance and enter the following URL for the metadata server:

If you can't contact the metadata server, try the following to resolve the issue:

- Download and install the latest version of the EC2Config service. For more information about installing this service, see the section called “Install EC2Config”.

- Check whether the Windows instance is running RedHat PV drivers. If so, update to Citrix PV drivers. For more information, see the section called “Upgrade PV drivers”.

- Verify that the firewall, IPSec, and proxy settings do not block outgoing traffic to the metadata service (169.254.169.254) or the AWS KMS servers (the addresses are specified in TargetKMSServer elements in C:\Program Files\Amazon\Ec2ConfigService\Settings\ActivationSettings.xml).

- Verify that you have a route to the metadata service (169.254.169.254) using the following command.

  route print

- Check for network issues that might affect the Availability Zone for your instance. Go to http://status.aws.amazon.com/.

"Waiting for the metadata service"
"Unable to activate Windows"

Windows instances use Windows AWS KMS activation. You can receive this message: A problem occurred when Windows tried to activate. Error Code 0xC004F074, if your instance can't reach the AWS KMS server. Windows must be activated every 180 days. EC2Config attempts to contact the AWS KMS server before the activation period expires to ensure that Windows remains activated.

If you encounter a Windows activation issue, use the following procedure to resolve the issue.

**For EC2Config (Windows Server 2012 R2 AMIs and earlier)**

1. Download and install the latest version of the EC2Config service. For more information about installing this service, see the section called “Install EC2Config”.
2. Log onto the instance and open the following file: \C:\Program Files\Amazon\Ec2ConfigService\Settings\config.xml.
3. Locate the Ec2WindowsActivate plugin in the config.xml file. Change the state to Enabled and save your changes.
4. In the Windows Services snap-in, restart the EC2Config service or reboot the instance.

If this does not resolve the activation issue, follow these additional steps.

1. Set the AWS KMS target: \C:\> slmgr.vbs /skms 169.254.169.250:1688
2. Activate Windows: \C:\> slmgr.vbs /ato

**For EC2Launch (Windows Server 2016 AMIs and later)**

1. From a PowerShell prompt with administrative rights, import the EC2Launch module:

```
PS C:\> Import-Module "C:\ProgramData\Amazon\EC2-Windows\Launch\Module\Ec2Launch.psd1"
```

2. Call the Add-Routes function to see the list of new routes:

```
PS C:\> Add-Routes
```

3. Call the Set-ActivationSettings function:
Then, run the following script to activate Windows:

```
PS C:\> cscript "${env:SYSTEMROOT}\system32\slmgr.vbs" /ato
```

For both EC2Config and EC2Launch, if you are still receiving an activation error, verify the following information.

- Verify that you have routes to the AWS KMS servers. Open `C:\Program Files \Amazon\Ec2ConfigService\Settings\ActivationSettings.xml` and locate the `TargetKMSServer` elements. Run the following command and check whether the addresses for these AWS KMS servers are listed.

  ```
  route print
  ```

- Verify that the AWS KMS client key is set. Run the following command and check the output.

  ```
  C:\Windows\System32\slmgr.vbs /dlv
  ```

  If the output contains Error: product key not found, the AWS KMS client key isn't set. If the AWS KMS client key isn't set, look up the client key as described in this Microsoft article: AWS KMS Client Setup Keys, and then run the following command to set the AWS KMS client key.

  ```
  C:\Windows\System32\slmgr.vbs /ipk client_key
  ```

- Verify that the system has the correct time and time zone. If you are using a time zone other than UTC, add the following registry key and set it to 1 to ensure that the time is correct:

  ```
  HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\TimeZoneInformation\RealTimeIsUniversal.
  ```

- If Windows Firewall is enabled, temporarily disable it using the following command.

  ```
  netsh advfirewall set allprofiles state off
  ```
"Windows is not genuine (0x80070005)"

Windows instances use Windows AWS KMS activation. If an instance is unable to complete the activation process, it reports that the copy of Windows is not genuine.

Try the suggestions for "Unable to activate Windows".

"No Terminal Server License Servers available to provide a license"

By default, Windows Server is licensed for two simultaneous users through Remote Desktop. If you need to provide more than two users with simultaneous access to your Windows instance through Remote Desktop, you can purchase a Remote Desktop Services client access license (CAL) and install the Remote Desktop Session Host and Remote Desktop Licensing Server roles.

Check for the following issues:

- You've exceeded the maximum number of concurrent RDP sessions.
- You've installed the Windows Remote Desktop Services role.
- Licensing has expired. If the licensing has expired, you can't connect to your Windows instance as a user. You can try the following:
  - Connect to the instance from the command line using an /admin parameter, for example:
    ```
    mstsc /v:instance /admin
    ```
  - For more information, see the following Microsoft article: [Access Remote Desktop Via Command Line](https://docs.microsoft.com/en-us/windows-server/administration/remote-server/access-remote-desktop-via-command-line).
  - Stop the instance, detach its Amazon EBS volumes, and attach them to another instance in the same Availability Zone to recover your data.

"Some settings are managed by your organization"

Instances launched from the latest Windows Server AMIs might show a Windows Update dialog message stating "Some settings are managed by your organization." This message appears as a result of changes in Windows Server and does not impact the behavior of Windows Update or your ability to manage update settings.
To remove the warning

1. Open gpedit.msc and navigate to **Computer Configuration, Administrative Templates, Windows Components, Windows updates.** Edit **Configure Automatic Update,** and set it to **enabled.**

2. In a command prompt, update group policy using **gpupdate /force.**

3. Close and reopen the Windows Update Settings. You will see the above message about your settings being managed by your organization, followed by "We'll automatically download updates, except on metered connections (where charges may apply). In that case, we'll automatically download those updates required to keep Windows running smoothly."

4. Return to gpedit.msc and set the group policy back to **not configured.** Run **gpupdate /force** again.

5. Close the command prompt and wait a few minutes.

6. Reopen the Windows Update Settings. You should not see the message "Some settings are managed by your organization."

**Troubleshoot issues with Amazon EC2 Windows instances**

The following are troubleshooting tips to help you solve the issues with Amazon EC2 Windows instances.

**Issues**

- [EBS volumes don't initialize on Windows Server 2016 and 2019](#)
- [Boot an EC2 Windows instance into Directory Services Restore Mode (DSRM)](#)
- [Instance loses network connectivity or scheduled tasks don't run when expected](#)
- [Unable to get console output](#)
- [Windows Server 2012 R2 not available on the network](#)
- [Disk signature collision](#)

**EBS volumes don't initialize on Windows Server 2016 and 2019**

Instances created from Amazon Machine Images (AMIs) for Windows Server 2016 and 2019 use the EC2Launch v1 agent for a variety of startup tasks, including initializing EBS volumes. By default,
EC2Launch v1 doesn't initialize secondary volumes. However, you can configure EC2Launch v1 to initialize these disks automatically, as follows.

**Map drive letters to volumes**

1. Connect to the instance to configure and open the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config\DriveLetterMappingConfig.json` file in a text editor.
2. Specify the volume settings as follows:

   ```json
   {
       "driveLetterMapping": [
       {
           "volumeName": "sample volume",
           "driveLetter": "H"
       }]
   }
   ```

3. Save your changes and close the file.
4. Open Windows PowerShell and use the following command to run the EC2Launch v1 script that initializes the disks:

   ```powershell
   PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeDisks.ps1
   ```

   To initialize the disks each time the instance boots, add the `-Schedule` flag as follows:

   ```powershell
   PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeDisks.ps1 -Schedule
   ```

   The EC2Launch v1 agent can run instance initialization scripts such as `initializeDisks.ps1` in parallel with the `InitializeInstance.ps1` script. If the `InitializeInstance.ps1` script reboots the instance, it might interrupt other scheduled tasks that run at instance startup. To avoid any potential conflicts, we recommend that you add logic to your `initializeDisks.ps1` script to ensure that instance initialization has finished first.

---

**Note**

If the EC2Launch script does not initialize the volumes, ensure that the volumes are online. If the volumes are offline, run the following command to bring all disks online.
Boot an EC2 Windows instance into Directory Services Restore Mode (DSRM)

If an instance running Microsoft Active Directory experiences a system failure or other critical issues you can troubleshoot the instance by booting into a special version of Safe Mode called Directory Services Restore Mode (DSRM). In DSRM you can repair or recover Active Directory.

Driver support for DSRM

How you enable DSRM and boot into the instance depends on the drivers the instance is running. In the EC2 console you can view driver version details for an instance from the System Log. The following table shows which drivers are supported for DSRM.

<table>
<thead>
<tr>
<th>Driver Versions</th>
<th>DSRM Supported?</th>
<th>Next Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Citrix PV 5.9</td>
<td>No</td>
<td>Restore the instance from a backup. You cannot enable DSRM.</td>
</tr>
<tr>
<td>AWS PV 7.2.0</td>
<td>No</td>
<td>Though DSRM is not supported for this driver, you can still detach the root volume from the instance, take a snapshot of the volume or create an AMI from it, and attach it to another instance in the same Availability Zone as a secondary volume. You can then enable DSRM (as described in this section).</td>
</tr>
<tr>
<td>AWS PV 7.2.2 and later</td>
<td>Yes</td>
<td>Detach the root volume, attach it to another instance, and enable DSRM (as described in this section).</td>
</tr>
<tr>
<td>Enhanced Networking</td>
<td>Yes</td>
<td>Detach the root volume, attach it to another instance, and enable DSRM (as described in this section).</td>
</tr>
</tbody>
</table>
For information about how to enable enhanced networking, see the section called “Elastic Network Adapter (ENA)”. For information about upgrading AWS PV drivers, see Upgrade PV drivers on Windows instances.

**Configure an instance to boot into DSRM**

EC2 Windows instances do not have network connectivity before the operating system is running. For this reason, you cannot press the F8 button on your keyboard to select a boot option. You must use one of the following procedures to boot an EC2 Windows Server instance into DSRM.

If you suspect that Active Directory has been corrupted and the instance is still running, you can configure the instance to boot into DSRM using either the System Configuration dialog box or the command prompt.

**To boot an online instance into DSRM using the System Configuration dialog box**

1. In the Run dialog box, type `msconfig` and press Enter.
2. Choose the Boot tab.
4. Choose Active Directory repair and then choose OK. The system prompts you to reboot the server.

**To boot an online instance into DSRM using the command line**

From a Command Prompt window, run the following command:

```
bcdedit /set safeboot dsrepair
```

If an instance is offline and unreachable, you must detach the root volume and attach it to another instance to enable DSRM mode.

**To boot an offline instance into DSRM**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. In the navigation pane, choose Instances.
3. Locate and select the affected instance. Choose Instance state, Stop instance.
4. Choose Launch instances and create a temporary instance in the same Availability Zone as the affected instance. Choose an instance type that uses a different version of Windows.
For example, if your instance is Windows Server 2016, then choose a Windows Server 2019 instance.

**Important**

If you do not create the instance in the same Availability Zone as the affected instance you will not be able to attach the root volume of the affected instance to the new instance.

5. In the navigation pane, choose **Volumes**.

6. Locate the root volume of the affected instance. **Detach** the volume and **attach** it to the temporary instance you created earlier. Attach it with the default device name (xvdf).

7. Use Remote Desktop to connect to the temporary instance, and then use the Disk Management utility to **make the volume available for use**.

8. Open a command prompt and run the following command. Replace `D` with the actual drive letter of the secondary volume you just attached:

   ```
   bcdedit /store D:\Boot\BCD /set {default} safeboot dsrepair
   ```

9. In the Disk Management Utility, choose the drive you attached earlier, open the context (right-click) menu, and choose **Offline**.

10. In the EC2 console, detach the affected volume from the temporary instance and reattach it to your original instance with the device name `/dev/sda1`. You must specify this device name to designate the volume as a root volume.

11. **Start** the instance.

12. After the instance passes the health checks in the EC2 console, connect to the instance using Remote Desktop and verify that it boots into DSRM mode.

13. (Optional) Delete or stop the temporary instance you created in this procedure.

**Instance loses network connectivity or scheduled tasks don't run when expected**

If you restart your instance and it loses network connectivity, it's possible that the instance has the wrong time.
By default, Windows instances use Coordinated Universal Time (UTC). If you set the time for your instance to a different time zone and then restart it, the time becomes offset and the instance temporarily loses its IP address. The instance regains network connectivity eventually, but this can take several hours. The amount of time that it takes for the instance to regain network connectivity depends on the difference between UTC and the other time zone.

This same time issue can also result in scheduled tasks not running when you expect them to. In this case, the scheduled tasks do not run when expected because the instance has the incorrect time.

To use a time zone other than UTC persistently, you must set the `RealTimeIsUniversal` registry key. Without this key, an instance uses UTC after you restart it.

**To resolve time issues that cause a loss of network connectivity**

1. Ensure that you are running the recommended PV drivers. For more information, see the section called “Upgrade PV drivers”.
2. Verify that the following registry key exists and is set to 1: `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\TimeZoneInformation\RealTimeIsUniversal`

**Unable to get console output**

For Windows instances, the instance console displays the output from tasks performed during the Windows boot process. If Windows boots successfully, the last message logged is `Windows is Ready to use`. You can also display event log messages in the console, but this feature might not be enabled by default depending on your version of Windows. For more information, see the section called “Configure Windows launch agents”.

To get the console output for your instance using the Amazon EC2 console, select the instance, and then choose **Actions, Monitor and troubleshoot, Get system log**. To get the console output using the command line, use one of the following commands: `get-console-output` (AWS CLI) or `Get-EC2ConsoleOutput` (AWS Tools for Windows PowerShell).

For instances running Windows Server 2012 R2 and earlier, if the console output is empty, it could indicate an issue with the EC2Config service, such as a misconfigured configuration file, or that Windows failed to boot properly. To fix the issue, download and install the latest version of EC2Config. For more information, see the section called “Install EC2Config”.

Unable to get console output
Windows Server 2012 R2 not available on the network

For information about troubleshooting a Windows Server 2012 R2 instance that is not available on the network, see [Windows Server 2012 R2 loses network and storage connectivity after an instance reboot](#).

**Disk signature collision**

You can check for and resolve disk signature collisions using [EC2Rescue for Windows Server](#). Or, you can manually resolve disk signature issues by performing the following steps.

⚠️ **Warning**

The following procedure describes how to edit the Windows Registry using Registry Editor. If you are not familiar with the Windows Registry or how to safely make changes using Registry Editor, see [Configure the Registry](#).

1. Open a command prompt, type `regedit.exe`, and press Enter.
2. In the Registry Editor, choose HKEY_LOCAL_MACHINE from the context menu (right-click), and then choose Find.
3. Type `Windows Boot Manager` and then choose Find Next.
4. Choose the key named `11000001`. This key is a sibling of the key you found in the previous step.
5. In the right pane, choose Element and then choose Modify from the context menu (right-click).
6. Locate the four-byte disk signature at offset 0x38 in the data. This is the Boot Configuration Database signature (BCD). Reverse the bytes to create the disk signature, and write it down. For example, the disk signature represented by the following data is E9EB3AA5:

```
... 0030 00 00 00 00 01 00 00 00 0038 A5 3A EB E9 00 00 00 00 0040 00 00 00 00 00 00 00 00 ...
```
7. In a Command Prompt window, run the following command to start Microsoft DiskPart.
8. Run the `select disk` DiskPart command and specify the disk number for the volume with the disk signature collision.

   **Tip**
   To check the disk number for the volume with the disk signature collision, use the Disk Management utility. Open a command prompt, type `compmgmt.msc` and press Enter. In the left-hand navigation panel, double-click Disk Management. In the Disk Management utility, check the disk number for the offline volume with the disk signature collision.

```
DISKPART> select disk 1
Disk 1 is now the selected disk.
```

9. Run the following DiskPart command to get the disk signature.

```
DISKPART> uniqueid disk
Disk ID: 0C764FA8
```

10. If the disk signature shown in the previous step doesn't match the disk signature that you wrote down earlier, use the following DiskPart command to change the disk signature so that it matches:

```
DISKPART> uniqueid disk id=E9EB3AA5
```

**Reset the administrator password for an Amazon EC2 Windows instance**

If you are no longer able to connect to your Amazon EC2 Windows instance because the Windows administrator password is lost or expired, you can reset the password.
Note

There is an AWS Systems Manager Automation document that automatically applies the manual steps necessary to reset the local administrator password. For more information, see Reset passwords and SSH keys on EC2 instances in the AWS Systems Manager User Guide.

The manual methods to reset the administrator password use EC2Launch v2, EC2Config, or EC2Launch.

- For all supported Windows AMIs that include the EC2Launch v2 agent, use EC2Launch v2.
- For Windows AMIs before Windows Server 2016, use the EC2Config service.
- For Windows Server 2016 and later AMIs, use the EC2Launch service.

These procedures also describe how to connect to an instance if you lost the key pair that was used to create the instance. Amazon EC2 uses a public key to encrypt a piece of data, such as a password, and a private key to decrypt the data. The public and private keys are known as a key pair. With Windows instances, you use a key pair to obtain the administrator password and then log in using RDP.

Note

If you have disabled the local administrator account on the instance and your instance is configured for Systems Manager, you can also re-enable and reset your local administrator password by using EC2Rescue and Run Command. For more information, see Use EC2Rescue for Windows Server with Systems Manager Run Command.

Contents

- Reset the Windows administrator password using EC2Launch v2
- Reset the Windows administrator password using EC2Config
- Reset the Windows administrator password using EC2Launch
Reset the Windows administrator password using EC2Launch v2

If you have lost your Windows administrator password and are using a supported Windows AMI that includes the EC2Launch v2 agent, you can use EC2Launch v2 to generate a new password.

If you are using a Windows Server 2016 or later AMI that does not include the EC2Launch v2 agent, see [Reset the Windows administrator password using EC2Launch](#).

If you are using a Windows Server AMI earlier than Windows Server 2016 that does not include the EC2Launch v2 agent, see [Reset the Windows administrator password using EC2Config](#).

**Note**

If you have disabled the local administrator account on the instance and your instance is configured for Systems Manager, you can also re-enable and reset your local administrator password by using EC2Rescue and Run Command. For more information, see [Use EC2Rescue for Windows Server with Systems Manager Run Command](#).

**Note**

There is an AWS Systems Manager Automation document that automatically applies the manual steps necessary to reset the local administrator password. For more information, see [Reset passwords and SSH keys on EC2 instances](#) in the AWS Systems Manager User Guide.

To reset your Windows administrator password using EC2Launch v2, you need to do the following:

- **Step 1**: Verify that the EC2Launch v2 agent is running
- **Step 2**: Detach the root volume from the instance
- **Step 3**: Attach the volume to a temporary instance
- **Step 4**: Delete the .run-once file
- **Step 5**: Restart the original instance
Step 1: Verify that the EC2Launch v2 agent is running

Before you attempt to reset the administrator password, verify that the EC2Launch v2 agent is installed and running. You use the EC2Launch v2 agent to reset the administrator password later in this section.

To verify that the EC2Launch v2 agent is running

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Instances** and then select the instance that requires a password reset. This instance is referred to as the *original* instance in this procedure.
3. Choose **Actions, Monitor and troubleshoot, Get system log**.
4. Locate the EC2 Launch entry, for example, **Launch: EC2Launch v2 service v2.0.124**. If you see this entry, the EC2Launch v2 service is running.

If the system log output is empty, or if the EC2Launch v2 agent is not running, troubleshoot the instance using the Instance Console Screenshot service. For more information, see [Capture a screenshot of an unreachable instance](#).

Step 2: Detach the root volume from the instance

You can't use EC2Launch v2 to reset an administrator password if the volume on which the password is stored is attached to an instance as the root volume. You must detach the volume from the original instance before you can attach it to a temporary instance as a secondary volume.

To detach the root volume from the instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance that requires a password reset and choose **Instance state, Stop instance**. After the status of the instance changes to **Stopped**, continue with the next step.
4. (Optional) If you have the private key that you specified when you launched this instance, continue with the next step. Otherwise, use the following steps to replace the instance with a new instance that you launch with a new key pair.
   a. Create a new key pair using the Amazon EC2 console. To give your new key pair the same name as the one for which you lost the private key, you must first delete the existing key pair.
b. Select the instance to replace. Note the instance type, VPC, subnet, security group, and IAM role of the instance.

c. With the instance selected, choose **Actions, Image and templates, Create image**. Type a name and a description for the image and choose **Create image**.

d. In the navigation pane, choose **AMIs**. Wait for the image status to change to available. Then, select the image and choose **Launch instance from AMI**.

e. Complete the fields to launch an instance, making sure to select the same instance type, VPC, subnet, security group, and IAM role as the instance to replace, and then choose **Launch instance**.

f. When prompted, choose the key pair that you created for the new instance, and then choose **Launch instance**.

g. (Optional) If the original instance has an associated Elastic IP address, transfer it to the new instance. If the original instance has EBS volumes in addition to the root volume, transfer them to the new instance.

5. Detach the root volume from the original instance as follows:

   a. Select the original instance and choose the **Storage** tab. Note the name of the root device under **Root device name**. Find the volume with this device name under **Block devices**, and note the volume ID.

   b. In the navigation pane, choose **Volumes**.

   c. In the list of volumes, select the volume that you noted as the root device, and choose **Actions, Detach Volume**. After the volume status changes to available, continue with the next step.

6. If you created a new instance to replace your original instance, you can terminate the original instance now. It's no longer needed. For the remainder of this procedure, all references to the original instance apply to the new instance that you created.

**Step 3: Attach the volume to a temporary instance**

Next, launch a temporary instance and attach the volume to it as a secondary volume. This is the instance you use to modify the configuration file.

**To launch a temporary instance and attach the volume**

1. Launch the temporary instance as follows:
a. In the navigation pane, choose **Instances**, choose **Launch instances**, and then select an AMI.

**Important**

To avoid disk signature collisions, you must select an AMI for a different version of Windows. For example, if the original instance runs Windows Server 2019, launch the temporary instance using the base AMI for Windows Server 2016.

b. Leave the default instance type and choose **Next: Configure Instance Details**.

c. On the **Configure Instance Details** page, for **Subnet**, select the same Availability Zone as the original instance and choose **Review and Launch**.

**Important**

The temporary instance must be in the same Availability Zone as the original instance. If your temporary instance is in a different Availability Zone, you can't attach the original instance's root volume to it.

d. On the **Review Instance Launch** page, choose **Launch**.

e. When prompted, create a new key pair, download it to a safe location on your computer, and then choose **Launch Instances**.

2. Attach the volume to the temporary instance as a secondary volume as follows:

a. In the navigation pane, choose **Volumes**, select the volume that you detached from the original instance, and then choose **Actions, Attach Volume**.

b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your temporary instance and select the instance from the list.

c. For **Device**, type `xvdf` (if it isn't already there), and choose **Attach**.

**Step 4: Delete the .run-once file**

You must now delete the .run-once file from the offline volume attached to the instance. This directs EC2Launch v2 to run all tasks with a frequency of once, which includes setting the administrator password. The file path in the secondary volume that you attached will be similar to `D:\ProgramData\Amazon\EC2Launch\state\.run-once`. 
**To delete the .run-once file**

1. Open the Disk Management utility, and bring the drive online using these instructions: [Make an Amazon EBS volume available for use.](#)
2. Locate the .run-once file in the disk you brought online.
3. Delete the .run-once file.

⚠️ **Important**

Any scripts set to run once will be triggered by this action.

**Step 5: Restart the original instance**

After you have deleted the .run-once file, reattach the volume to the original instance as the root volume and connect to the instance using its key pair to retrieve the administrator password.

1. Reattach the volume to the original instance as follows:
   a. In the navigation pane, choose Volumes, select the volume that you detached from the temporary instance, and then choose Actions, Attach Volume.
   b. In the Attach Volume dialog box, for Instances, start typing the name or ID of your original instance and then select the instance.
   c. For Device, type /dev/sda1.
   d. Choose Attach. After the volume status changes to in-use, continue to the next step.
2. In the navigation pane, choose Instances. Select the original instance and choose Instance state, Start instance. After the instance state changes to Running, continue to the next step.
3. Retrieve your new Windows administrator password using the private key for the new key pair and connect to the instance. For more information, see Connect to your Windows instance.

⚠️ **Important**

The instance gets a new public IP address after you stop and start it. Make sure to connect to the instance using its current public DNS name. For more information, see Instance lifecycle.
4. (Optional) If you have no further use for the temporary instance, you can terminate it. Select the temporary instance, and choose **Instance State, Terminate instance**.

### Reset the Windows administrator password using EC2Config

If you have lost your Windows administrator password and are using a Windows AMI before Windows Server 2016, you can use the EC2Config agent to generate a new password.

If you are using a Windows Server 2016 or later AMI, see [Reset the Windows administrator password using EC2Launch](#) or, you can use the [EC2Rescue tool](#), which uses the EC2Launch service to generate a new password.

**Note**

If you have disabled the local administrator account on the instance and your instance is configured for Systems Manager, you can also re-enable and reset your local administrator password by using EC2Rescue and Run Command. For more information, see [Use EC2Rescue for Windows Server with Systems Manager Run Command](#).

**Note**

There is an AWS Systems Manager Automation document that automatically applies the manual steps necessary to reset the local administrator password. For more information, see [Reset passwords and SSH keys on EC2 instances](#) in the *AWS Systems Manager User Guide*.

To reset your Windows administrator password using EC2Config, you need to do the following:

- **Step 1: Verify that the EC2Config service is running**
- **Step 2: Detach the root volume from the instance**
- **Step 3: Attach the volume to a temporary instance**
- **Step 4: Modify the configuration file**
- **Step 5: Restart the original instance**
Step 1: Verify that the EC2Config service is running

Before you attempt to reset the administrator password, verify that the EC2Config service is installed and running. You use the EC2Config service to reset the administrator password later in this section.

To verify that the EC2Config service is running

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances and then select the instance that requires a password reset. This instance is referred to as the original instance in this procedure.
3. (New console) Choose Actions, Monitor and troubleshoot, Get system log.
   (Old console) Choose Actions, System Settings, Get System Log.
4. Locate the EC2 Agent entry, for example, EC2 Agent: Ec2Config service v3.18.1118. If you see this entry, the EC2Config service is running.

   If the system log output is empty, or if the EC2Config service is not running, troubleshoot the instance using the Instance Console Screenshot service. For more information, see Capture a screenshot of an unreachable instance.

Step 2: Detach the root volume from the instance

You can't use EC2Config to reset an administrator password if the volume on which the password is stored is attached to an instance as the root volume. You must detach the volume from the original instance before you can attach it to a temporary instance as a secondary volume.

To detach the root volume from the instance

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance that requires a password reset and choose Instance state, Stop instance. After the status of the instance changes to Stopped, continue with the next step.
4. (Optional) If you have the private key that you specified when you launched this instance, continue with the next step. Otherwise, use the following steps to replace the instance with a new instance that you launch with a new key pair.
a. Create a new key pair using the Amazon EC2 console. To give your new key pair the same name as the one for which you lost the private key, you must first delete the existing key pair.

b. Select the instance to replace. Note the instance type, VPC, subnet, security group, and IAM role of the instance.

c. With the instance selected, choose Actions, Image and templates, Create image. Type a name and a description for the image and choose Create image.

d. In the navigation pane, choose AMIs. Wait for the image status to change to available. Then, select the image and choose Launch instance from AMI.

e. Complete the fields to launch an instance, making sure to select the same instance type, VPC, subnet, security group, and IAM role as the instance to replace, and then choose Launch instance.

f. When prompted, choose the key pair that you created for the new instance, and then choose Launch instance.

g. (Optional) If the original instance has an associated Elastic IP address, transfer it to the new instance. If the original instance has EBS volumes in addition to the root volume, transfer them to the new instance.

5. Detach the root volume from the original instance as follows:

   a. Select the original instance and choose the Storage tab. Note the name of the root device under Root device name. Find the volume with this device name under Block devices, and note the volume ID.

   b. In the navigation pane, choose Volumes.

   c. In the list of volumes, select the volume that you noted as the root device, and choose Actions, Detach Volume. After the volume status changes to available, continue with the next step.

6. If you created a new instance to replace your original instance, you can terminate the original instance now. It's no longer needed. For the remainder of this procedure, all references to the original instance apply to the new instance that you created.

**Step 3: Attach the volume to a temporary instance**

Next, launch a temporary instance and attach the volume to it as a secondary volume. This is the instance you use to modify the configuration file.
To launch a temporary instance and attach the volume

1. Launch the temporary instance as follows:
   a. In the navigation pane, choose **Instances**, choose **Launch instances**, and then select an AMI.

   ![Important]
   To avoid disk signature collisions, you must select an AMI for a different version of Windows. For example, if the original instance runs Windows Server 2019, launch the temporary instance using the base AMI for Windows Server 2016.

   b. Leave the default instance type and choose **Next: Configure Instance Details**.
   c. On the **Configure Instance Details** page, for **Subnet**, select the same Availability Zone as the original instance and choose **Review and Launch**.

   ![Important]
   The temporary instance must be in the same Availability Zone as the original instance. If your temporary instance is in a different Availability Zone, you can't attach the original instance's root volume to it.

   d. On the **Review Instance Launch** page, choose **Launch**.
   e. When prompted, create a new key pair, download it to a safe location on your computer, and then choose **Launch Instances**.

2. Attach the volume to the temporary instance as a secondary volume as follows:
   a. In the navigation pane, choose **Volumes**, select the volume that you detached from the original instance, and then choose **Actions, Attach Volume**.
   b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your temporary instance and select the instance from the list.
   c. For **Device**, type **xvdf** (if it isn't already there), and choose **Attach**.
Step 4: Modify the configuration file

After you have attached the volume to the temporary instance as a secondary volume, modify the Ec2SetPassword plugin in the configuration file.

To modify the configuration file

1. From the temporary instance, modify the configuration file on the secondary volume as follows:

   a. Launch and connect to the temporary instance.
   
   b. Use the following instructions to bring the drive online: Make an Amazon EBS volume available for use.
   
   c. Navigate to the secondary volume, and open \Program Files\Amazon \Ec2ConfigService\Settings\config.xml using a text editor, such as Notepad.
   
   d. At the top of the file, find the plugin with the name Ec2SetPassword, as shown in the screenshot. Change the state from Disabled to Enabled and save the file.
2. After you have modified the configuration file, detach the secondary volume from the temporary instance as follows:
   a. Using the Disk Management utility, bring the volume offline.
   b. Disconnect from the temporary instance and return to the Amazon EC2 console.
   c. In the navigation pane, choose Volumes, select the volume, and then choose Actions, Detach Volume. After the volume's status changes to available, continue with the next step.

Step 5: Restart the original instance

After you have modified the configuration file, reattach the volume to the original instance as the root volume and connect to the instance using its key pair to retrieve the administrator password.

1. Reattach the volume to the original instance as follows:
   a. In the navigation pane, choose Volumes, select the volume that you detached from the temporary instance, and then choose Actions, Attach Volume.
   b. In the Attach Volume dialog box, for Instances, start typing the name or ID of your original instance and then select the instance.
   c. For Device, type /dev/sda1.
   d. Choose Attach. After the volume status changes to in-use, continue to the next step.

2. In the navigation pane, choose Instances. Select the original instance and choose Instance state, Start instance. After the instance state changes to Running, continue to the next step.

3. Retrieve your new Windows administrator password using the private key for the new key pair and connect to the instance. For more information, see Connect to your Windows instance.

4. (Optional) If you have no further use for the temporary instance, you can terminate it. Select the temporary instance, and choose Instance State, Terminate instance.

⚠️ Important
The instance gets a new public IP address after you stop and start it. Make sure to connect to the instance using its current public DNS name. For more information, see Instance lifecycle.
Reset the Windows administrator password using EC2Launch

If you have lost your Windows administrator password and are using a Windows Server 2016 or later AMI, you can use the EC2Rescue tool, which uses the EC2Launch service to generate a new password.

If you are using a Windows Server 2016 or later AMI that does not include the EC2Launch v2 agent, you can use EC2Launch v2 to generate a new password.

If you are using a Windows Server AMI earlier than Windows Server 2016, see Reset the Windows administrator password using EC2Config.

⚠️ Warning
When you stop an instance, the data on any instance store volumes is erased. To keep data from instance store volumes, be sure to back it up to persistent storage.

ℹ️ Note
If you have disabled the local administrator account on the instance and your instance is configured for Systems Manager, you can also re-enable and reset your local administrator password by using EC2Rescue and Run Command. For more information, see Use EC2Rescue for Windows Server with Systems Manager Run Command.

ℹ️ Note
There is an AWS Systems Manager Automation document that automatically applies the manual steps necessary to reset the local administrator password. For more information, see Reset passwords and SSH keys on EC2 instances in the AWS Systems Manager User Guide.

To reset your Windows administrator password using EC2Launch, you need to do the following:

- **Step 1:** Detach the root volume from the instance
- **Step 2:** Attach the volume to a temporary instance
• **Step 3: Reset the administrator password**

• **Step 4: Restart the original instance**

**Step 1: Detach the root volume from the instance**

You can't use EC2Launch to reset an administrator password if the volume on which the password is stored is attached to an instance as the root volume. You must detach the volume from the original instance before you can attach it to a temporary instance as a secondary volume.

**To detach the root volume from the instance**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).

2. In the navigation pane, choose **Instances**.

3. Select the instance that requires a password reset and choose **Instance state, Stop instance**. After the status of the instance changes to **Stopped**, continue with the next step.

4. (Optional) If you have the private key that you specified when you launched this instance, continue with the next step. Otherwise, use the following steps to replace the instance with a new instance that you launch with a new key pair.

   a. Create a new key pair using the Amazon EC2 console. To give your new key pair the same name as the one for which you lost the private key, you must first delete the existing key pair.

   b. Select the instance to replace. Note the instance type, VPC, subnet, security group, and IAM role of the instance.

   c. With the instance selected, choose **Actions, Image and templates, Create image**. Type a name and a description for the image and choose **Create image**.

   d. In the navigation pane, choose **AMIs**. Wait for the image status to change to **available**. Then, select the image and choose **Launch instance from AMI**.

   e. Complete the fields to launch an instance, making sure to select the same instance type, VPC, subnet, security group, and IAM role as the instance to replace, and then choose **Launch instance**.

   f. When prompted, choose the key pair that you created for the new instance, and then choose **Launch instance**.
g. (Optional) If the original instance has an associated Elastic IP address, transfer it to the new instance. If the original instance has EBS volumes in addition to the root volume, transfer them to the new instance.

5. Detach the root volume from the original instance as follows:

   a. Select the original instance and choose the Storage tab. Note the name of the root device under Root device name. Find the volume with this device name under Block devices, and note the volume ID.
   
   b. In the navigation pane, choose Volumes.
   
   c. In the list of volumes, select the volume that you noted as the root device, and choose Actions, Detach Volume. After the volume status changes to available, continue with the next step.

6. If you created a new instance to replace your original instance, you can terminate the original instance now. It's no longer needed. For the remainder of this procedure, all references to the original instance apply to the new instance that you created.

**Step 2: Attach the volume to a temporary instance**

Next, launch a temporary instance and attach the volume to it as a secondary volume. This is the instance you use to run EC2Launch.

**To launch a temporary instance and attach the volume**

1. Launch the temporary instance as follows:

   a. In the navigation pane, choose Instances, choose Launch instances, and then select an AMI.

   ![Important](https://example.com)
   
   **Important**
   
   To avoid disk signature collisions, you must select an AMI for a different version of Windows. For example, if the original instance runs Windows Server 2019, launch the temporary instance using the base AMI for Windows Server 2016.

   b. Leave the default instance type and choose Next: Configure Instance Details.

   c. On the Configure Instance Details page, for Subnet, select the same Availability Zone as the original instance and choose Review and Launch.
d. On the **Review Instance Launch** page, choose **Launch**.

e. When prompted, create a new key pair, download it to a safe location on your computer, and then choose **Launch Instances**.

2. Attach the volume to the temporary instance as a secondary volume as follows:

   a. In the navigation pane, choose **Volumes**, select the volume that you detached from the original instance, and then choose **Actions, Attach Volume**.

   b. In the **Attach Volume** dialog box, for **Instances**, start typing the name or ID of your temporary instance and select the instance from the list.

   c. For **Device**, type `xvdf` (if it isn't already there), and choose **Attach**.

**Step 3: Reset the administrator password**

Next, connect to the temporary instance and use EC2Launch to reset the administrator password.

**To reset the administrator password**

1. Connect to the temporary instance and use the EC2Rescue for Windows Server tool on the instance to reset the administrator password as follows:

   a. Download the [EC2Rescue for Windows Server](#) zip file, extract the contents, and run `EC2Rescue.exe`.

   b. On the **License Agreement** screen, read the license agreement, and, if you accept the terms, choose **I Agree**.

   c. On the **Welcome to EC2Rescue for Windows Server** screen, choose **Next**.

   d. On the **Select mode** screen, choose **Offline instance**.

   e. On the **Select a disk** screen, select the `xvdf` device and choose **Next**.

   f. Confirm the disk selection and choose **Yes**.

   g. After the volume has loaded, choose **OK**.
h. On the Select Offline Instance Option screen, choose Diagnose and Rescue.

i. On the Summary screen, review the information and choose Next.

j. On the Detected possible issues screen, select Reset Administrator Password and choose Next.

k. On the Confirm screen, choose Rescue, OK.

l. On the Done screen, choose Finish.

m. Close the EC2Rescue for Windows Server tool, disconnect from the temporary instance, and then return to the Amazon EC2 console.

2. Detach the secondary (xvdf) volume from the temporary instance as follows:

   a. In the navigation pane, choose Instances and select the temporary instance.

   b. On the Storage tab for the temporary instance, note the ID of the EBS volume listed as xvdf.

   c. In the navigation pane, choose Volumes.

   d. In the list of volumes, select the volume noted in the previous step, and choose Actions, Detach Volume. After the volume status changes to available, continue with the next step.

Step 4: Restart the original instance

After you have reset the administrator password using EC2Launch, reattach the volume to the original instance as the root volume and connect to the instance using its key pair to retrieve the administrator password.

To restart the original instance

1. Reattach the volume to the original instance as follows:

   a. In the navigation pane, choose Volumes, select the volume that you detached from the temporary instance, and then choose Actions, Attach Volume.

   b. In the Attach Volume dialog box, for Instances, start typing the name or ID of your original instance and then select the instance.

   c. For Device, type /dev/sda1.

   d. Choose Attach. After the volume status changes to in-use, continue to the next step.
2. In the navigation pane, choose **Instances**. Select the original instance and choose **Instance state**, **Start instance**. After the instance state changes to Running, continue to the next step.

3. Retrieve your new Windows administrator password using the private key for the new key pair and connect to the instance. For more information, see [Connect to your Windows instance](#).

4. (Optional) If you have no further use for the temporary instance, you can terminate it. Select the temporary instance, and choose **Instance State**, **Terminate instance**.

**Troubleshoot Sysprep issues with Amazon EC2 Windows instances**

If you experience problems or receive error messages during image preparations, review the following logs. Log location varies depending on whether you are running EC2Config, EC2Launch v1, or EC2Launch v2 with Sysprep.

- `%WINDIR%\Panther\Unattendgc` (EC2Config, EC2Launch v1, and EC2Launch v2)
- `%WINDIR%\System32\Sysprep\Panther` (EC2Config, EC2Launch v1, and EC2Launch v2)
- `C:\Program Files\Amazon\Ec2ConfigService\Logs\Ec2ConfigLog.txt` (EC2Config only)
- `C:\ProgramData\Amazon\Ec2Config\Logs` (EC2Config only)
- `C:\ProgramData\Amazon\EC2-Windows\Launch\Log\EC2Launch.log` (EC2Launch v1 only)
- `%ProgramData%\Amazon\EC2Launch\log\agent.log` (EC2Launch v2 only)

If you receive an error message during image preparation with Sysprep, the OS might not be reachable. To review the log files, you must stop the instance, attach its root volume to another healthy instance as a secondary volume, and then review the logs mentioned earlier on the secondary volume. For more information about the purpose of the log files by name, see [Windows Setup-Related Log Files](#) in the Microsoft documentation.

If you locate errors in the Unattendgc log file, use the [Microsoft Error Lookup Tool](#) to get more details about the error. The following issue reported in the Unattendgc log file is typically the result of one or more corrupted user profiles on the instance:

```plaintext
Error [Shell Unattend] _FindLatestProfile failed (0x80070003) [gle=0x00000003]
```
Error [Shell Unattend] CopyProfile failed (0x80070003) [gle=0x00000003]

There are two options for resolving this issue:

Option 1

Use Regedit on the instance to search for the following key. Verify that there are no profile registry keys for a deleted user.

[HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\CurrentVersion \ProfileList]

Option 2

1. Edit the relevant file, as follows:

   - Windows Server 2012 R2 and earlier – Edit the EC2Config answer file (C:\Program Files \Amazon\Ec2ConfigService\sysprep2008.xml).
   - Windows Server 2016 and 2019 – Edit the unattend.xml answer file (C:\ProgramData \Amazon\EC2-Windows\Launch\Sysprep\Unattend.xml).
   - Windows Server 2022 – Edit the unattend.xml answer file (C:\ProgramData\Amazon \EC2Launch\sysprep\unattend.xml).

2. Change <CopyProfile>true</CopyProfile> to <CopyProfile>false</CopyProfile>.

3. Run Sysprep again. Note that this configuration change will delete the built-in administrator user profile after Sysprep completes.

Use EC2Rescue for Linux

EC2Rescue for Linux is an easy-to-use, open-source tool that can be run on an Amazon EC2 Linux instance to diagnose and troubleshoot common issues using its library of over 100 modules. A few generalized use cases for EC2Rescue for Linux include gathering syslog and package manager logs, collecting resource utilization data, and diagnosing/remediating known problematic kernel parameters and common OpenSSH issues.

The AWSSupport-TroubleshootSSH runbook installs EC2Rescue for Linux and then uses the tool to check or attempt to fix common issues that prevent a remote connection to a Linux machine via SSH. For more information, and to run this automation, see AWS Support-TroubleshootSSH.
If you are using a Windows instance, see the section called “EC2Rescue for Windows Server”.

Contents

- Install EC2Rescue for Linux
- Work with EC2Rescue for Linux
- Develop EC2Rescue modules

Install EC2Rescue for Linux

The EC2Rescue for Linux tool can be installed on an Amazon EC2 Linux instance that meets the following prerequisites.

Prerequisites

- Supported operating systems:
  - Amazon Linux 2
  - Amazon Linux 2016.09+
  - SUSE Linux Enterprise Server 12+
  - RHEL 7+
  - Ubuntu 16.04+
- Software requirements:
  - Python 2.7.9+ or 3.2+

The AWSSupport-TroubleshootSSH runbook installs EC2Rescue for Linux and then uses the tool to check or attempt to fix common issues that prevent a remote connection to a Linux machine via SSH. For more information, and to run this automation, see AWS Support-TroubleshootSSH.

If your system has the required Python version, you can install the standard build. Otherwise, you can install the bundled build, which includes a minimal copy of Python.

To install the standard build

1. From a working Linux instance, download the EC2Rescue for Linux tool:

   curl -O https://s3.amazonaws.com/ec2rescuelinux/ec2rl.tgz
2. (Optional) Before proceeding, you can optionally verify the signature of the EC2Rescue for Linux installation file. For more information, see (Optional) Verify the signature of EC2Rescue for Linux.

3. Download the sha256 hash file:

   ```bash
curl -O https://s3.amazonaws.com/ec2rescuelinux/ec2rl.tgz.sha256
   ```

4. Verify the integrity of the tarball:

   ```bash
   sha256sum -c ec2rl.tgz.sha256
   ```

5. Unpack the tarball:

   ```bash
tar -xzvf ec2rl.tgz
   ```

6. Verify the installation by listing out the help file:

   ```bash
cd ec2rl-<version_number>
   ./ec2rl help
   ```

To install the bundled build

For a link to the download and a list of limitations, see EC2Rescue for Linux on github.

(Optional) Verify the signature of EC2Rescue for Linux

The following is the recommended process of verifying the validity of the EC2Rescue for Linux package for Linux-based operating systems.

When you download an application from the internet, we recommend that you authenticate the identity of the software publisher and check that the application has not been altered or corrupted after it was published. This protects you from installing a version of the application that contains a virus or other malicious code.

If, after running the steps in this topic, you determine that the software for EC2Rescue for Linux is altered or corrupted, do not run the installation file. Instead, contact Amazon Web Services.

EC2Rescue for Linux files for Linux-based operating systems are signed using GnuPG, an open-source implementation of the Pretty Good Privacy (OpenPGP) standard for secure digital signatures. GnuPG (also known as GPG) provides authentication and integrity checking through
a digital signature. AWS publishes a public key and signatures that you can use to verify the downloaded EC2Rescue for Linux package. For more information about PGP and GnuPG (GPG), see http://www.gnupg.org.

The first step is to establish trust with the software publisher. Download the public key of the software publisher, check that the owner of the public key is who they claim to be, and then add the public key to your keyring. Your keyring is a collection of known public keys. After you establish the authenticity of the public key, you can use it to verify the signature of the application.

Tasks

- Install the GPG tools
- Authenticate and import the public key
- Verify the signature of the package

Install the GPG tools

If your operating system is Linux or Unix, the GPG tools may already be installed. To test whether the tools are installed on your system, enter `gpg2` at a command prompt. If the GPG tools are installed, you see a GPG command prompt. If the GPG tools are not installed, you see an error stating that the command cannot be found. You can install the GnuPG package from a repository.

To install GPG tools on Debian-based Linux

- From a terminal, run the following command:

  ```
  apt-get install gnupg2
  ```

To install GPG tools on Red Hat–based Linux

- From a terminal, run the following command:

  ```
  yum install gnupg2
  ```

Authenticate and import the public key

The next step in the process is to authenticate the EC2Rescue for Linux public key and add it as a trusted key in your GPG keyring.
To authenticate and import the EC2Rescue for Linux public key

1. At a command prompt, use the following command to obtain a copy of our public GPG build key:
   
   ```bash
curl -O https://s3.amazonaws.com/ec2rescuelinux/ec2rl.key
   ```

2. At a command prompt in the directory where you saved `ec2rl.key`, use the following command to import the EC2Rescue for Linux public key into your keyring:
   
   ```bash
gpg2 --import ec2rl.key
   ```

   The command returns results similar to the following:

   ```bash
   gpg: /home/ec2-user/.gnupg/trustdb.gpg: trustdb created
   gpg: key 2FAE2A1C: public key "ec2autodiag@amazon.com <EC2 Rescue for Linux>"
    imported
   gpg: Total number processed: 1
   gpg:               imported: 1  (RSA: 1)
   ```

Verify the signature of the package

After you've installed the GPG tools, authenticated and imported the EC2Rescue for Linux public key, and verified that the EC2Rescue for Linux public key is trusted, you are ready to verify the signature of the EC2Rescue for Linux installation script.

To verify the EC2Rescue for Linux installation script signature

1. At a command prompt, run the following command to download the signature file for the installation script:
   
   ```bash
curl -O https://s3.amazonaws.com/ec2rescuelinux/ec2rl.tgz.sig
   ```

2. Verify the signature by running the following command at a command prompt in the directory where you saved `ec2rl.tgz.sig` and the EC2Rescue for Linux installation file. Both files must be present.
   
   ```bash
gpg2 --verify ./ec2rl.tgz.sig
   ```
The output should look something like the following:

```
gpg: Signature made Thu 12 Jul 2018 01:57:51 AM UTC using RSA key ID 6991ED45
gpg: Good signature from "ec2autodiag@amazon.com <EC2 Rescue for Linux>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg: There is no indication that the signature belongs to the owner.
Primary key fingerprint: E528 BCC9 DBF 5AFA 0F6C  C36A F780 4843 2FAE 2A1C
Subkey fingerprint: 966B 0D27 85E9 AEEC 1146  7A9D 8851 1153 6991 ED45
```

If the output contains the phrase Good signature from "ec2autodiag@amazon.com <EC2 Rescue for Linux>", it means that the signature has successfully been verified, and you can proceed to run the EC2Rescue for Linux installation script.

If the output includes the phrase BAD signature, check whether you performed the procedure correctly. If you continue to get this response, contact Amazon Web Services and do not run the installation file that you downloaded previously.

The following are details about the warnings that you might see:

- **WARNING: This key is not certified with a trusted signature! There is no indication that the signature belongs to the owner.** This refers to your personal level of trust in your belief that you possess an authentic public key for EC2Rescue for Linux. In an ideal world, you would visit an Amazon Web Services office and receive the key in person. However, more often you download it from a website. In this case, the website is an Amazon Web Services website.

- **gpg2: no ultimately trusted keys found.** This means that the specific key is not "ultimately trusted" by you (or by other people whom you trust).

For more information, see [http://www.gnupg.org](http://www.gnupg.org).

**Work with EC2Rescue for Linux**

The following are common tasks you can perform to get started using this tool.

**Tasks**
- Run EC2Rescue for Linux
- Upload the results
- Create backups
Run EC2Rescue for Linux

You can run EC2Rescue for Linux as shown in the following examples.

Example Example: Run all modules

To run all modules, run EC2Rescue for Linux with no options:

```
./ec2rl run
```

Some modules require root access. If you are not a root user, use `sudo` to run these modules as follows:

```
sudo ./ec2rl run
```

Example Example: Run a specific module

To run only specific modules, use the `--only-modules` parameter:

```
./ec2rl run --only-modules=module_name --arguments
```

For example, this command runs the `dig` module to query the `amazon.com` domain:

```
./ec2rl run --only-modules=dig --domain=amazon.com
```

Example Example: View the results

You can view the results in `/var/tmp/ec2rl`:

```
cat /var/tmp/ec2rl/logfile_location
```

For example, view the log file for the `dig` module:

```
cat /var/tmp/ec2rl/2017-05-11T15_39_21.893145/mod_out/run/dig.log
```
Upload the results

If AWS Support has requested the results or to share the results from an S3 bucket, upload them using the EC2Rescue for Linux CLI tool. The output of the EC2Rescue for Linux commands should provide the commands that you need to use.

Example Example: Upload results to AWS Support

```
./ec2rl upload --upload-directory=/var/tmp/ec2rl/2017-05-11T15_39_21.893145 --support-url="URLProvidedByAWSSupport"
```

Example Example: Upload results to an S3 bucket

```
./ec2rl upload --upload-directory=/var/tmp/ec2rl/2017-05-11T15_39_21.893145 --presigned-url="YourPresignedS3URL"
```

For more information about generating pre-signed URLs for Amazon S3, see [Uploading Objects Using Pre-Signed URLs](#).

Create backups

Create a backup for your instance, one or more volumes, or a specific device ID using the following commands.

Example Example: Back up an instance using an Amazon Machine Image (AMI)

```
./ec2rl run --backup=ami
```

Example Example: Back up all volumes associated with the instance

```
./ec2rl run --backup=allvolumes
```

Example Example: Back up a specific volume

```
./ec2rl run --backup=volumeID
```

Get help

EC2Rescue for Linux includes a help file that gives you information and syntax for each available command.
Example Example: Display the general help

```
./ec2rl help
```

Example Example: List the available modules

```
./ec2rl list
```

Example Example: Display the help for a specific module

```
./ec2rl help module_name
```

For example, use the following command to show the help file for the `dig` module:

```
./ec2rl help dig
```

Develop EC2Rescue modules

Modules are written in YAML, a data serialization standard. A module's YAML file consists of a single document, representing the module and its attributes.

Add module attributes

The following table lists the available module attributes.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the module. The name should be less than or equal to 18 characters in length.</td>
</tr>
<tr>
<td>version</td>
<td>The version number of the module.</td>
</tr>
<tr>
<td>title</td>
<td>A short, descriptive title for the module. This value should be less than or equal to 50 characters in length.</td>
</tr>
<tr>
<td>helptext</td>
<td>The extended description of the module. Each line should be less than or equal to 75 characters in length. If the module consumes</td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td></td>
<td>arguments, required or optional, include them in the helptext value. For example:</td>
</tr>
<tr>
<td></td>
<td>helptext: !!str</td>
</tr>
<tr>
<td></td>
<td>Collect output from <code>ps</code> for system analysis</td>
</tr>
<tr>
<td></td>
<td>Consumes <code>--times=</code> for number of times to repeat</td>
</tr>
<tr>
<td></td>
<td>Consumes <code>--period=</code> for time period between repetition</td>
</tr>
<tr>
<td>placement</td>
<td>The stage in which the module should be run. Supported values:</td>
</tr>
<tr>
<td></td>
<td>• prediagnostic</td>
</tr>
<tr>
<td></td>
<td>• run</td>
</tr>
<tr>
<td></td>
<td>• postdiagnostic</td>
</tr>
<tr>
<td>language</td>
<td>The language that the module code is written in. Supported values:</td>
</tr>
<tr>
<td></td>
<td>• bash</td>
</tr>
<tr>
<td></td>
<td>• python</td>
</tr>
</tbody>
</table>

**Note**

Python code must be compatible with both Python 2.7.9+ and Python 3.2+. 
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remediation</td>
<td>Indicates whether the module supports remediation. Supported values are True or False. The module defaults to False if this is absent, making it an optional attribute for those modules that do not support remediation.</td>
</tr>
<tr>
<td>content</td>
<td>The entirety of the script code.</td>
</tr>
<tr>
<td>constraint</td>
<td>The name of the object containing the constraint values.</td>
</tr>
</tbody>
</table>
| domain | A descriptor of how the module is grouped or classified. The set of included modules uses the following domains:  
- application  
- net  
- os  
- performance |
| class | A descriptor of the type of task performed by the module. The set of included modules uses the following classes:  
- collect (collects output from programs)  
- diagnose (pass/fail based on a set of criteria)  
- gather (copies files and writes to specific file) |
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| distro    | The list of Linux distributions that this module supports. The set of included modules uses the following distributions:  
  - alami (Amazon Linux)  
  - rhel  
  - ubuntu  
  - suse |
| required  | The required arguments that the module is consuming from the CLI options. |
| optional  | The optional arguments that the module can use. |
| software  | The software executables used in the module. This attribute is intended to specify software that is not installed by default. The EC2Rescue for Linux logic ensures that these programs are present and executable before running the module. |
| package   | The source software package for an executable. This attribute is intended to provide extended details on the package with the software, including a URL for downloading or getting further information. |
| sudo      | Indicates whether root access is required to run the module.  
  You do not need to implement sudo checks in the module script. If the value is true, then the EC2Rescue for Linux logic only runs the module when the executing user has root access. |
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>perfimpact</td>
<td>Indicates whether the module can have significant performance impact upon the environment in which it is run. If the value is true and the --perfimpact=true argument is not present, then the module is skipped.</td>
</tr>
<tr>
<td>parallelexclusive</td>
<td>Specifies a program that requires mutual exclusivity. For example, all modules specifying &quot;bpf&quot; run in a serial manner.</td>
</tr>
</tbody>
</table>

**Add environment variables**

The following table lists the available environment variables.

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC2RL_CALLPATH</td>
<td>The path to ec2rl.py. This path can be used to locate the lib directory and use vendored Python modules.</td>
</tr>
<tr>
<td>EC2RL_WORKDIR</td>
<td>The main tmp directory for the diagnostic tool.</td>
</tr>
<tr>
<td></td>
<td>Default value: /var/tmp/ec2rl.</td>
</tr>
<tr>
<td>EC2RL_RUNDIR</td>
<td>The directory where all output is stored.</td>
</tr>
<tr>
<td></td>
<td>Default value: /var/tmp/ec2rl/&lt;date&amp;timestamp&gt;</td>
</tr>
<tr>
<td>EC2RL_GATHEREDDIR</td>
<td>The root directory for placing gathered module data.</td>
</tr>
<tr>
<td>Environment Variable</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Default value: /var/tmp/ec2rl/&lt;date&amp;timestamp&gt;/mod_out/gathered/</td>
<td>Default value: /var/tmp/ec2rl/&lt;date&amp;timestamp&gt;/mod_out/gathered/</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC2RL_NET_DRIVER</td>
<td>The driver in use for the first, alphabetically ordered, non-virtual network interface on the instance.</td>
</tr>
<tr>
<td>Examples:</td>
<td>Examples:</td>
</tr>
<tr>
<td>• xen_netfront</td>
<td>• xen_netfront</td>
</tr>
<tr>
<td>• ixgbevf</td>
<td>• ixgbevf</td>
</tr>
<tr>
<td>• ena</td>
<td>• ena</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC2RL_SUDO</td>
<td>True if EC2Rescue for Linux is running as root; otherwise, false.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC2RL_VIRT_TYPE</td>
<td>The virtualization type as provided by the instance metadata.</td>
</tr>
<tr>
<td>Examples:</td>
<td>Examples:</td>
</tr>
<tr>
<td>• default-hvm</td>
<td>• default-hvm</td>
</tr>
<tr>
<td>• default-paravirtual</td>
<td>• default-paravirtual</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Environment Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EC2RL_INTERFACES</td>
<td>An enumerated list of interfaces on the system. The value is a string containing names, such as eth0, eth1, etc. This is generated via the functions.bash and is only available for modules that have sourced it.</td>
</tr>
</tbody>
</table>

**Use YAML syntax**

The following should be noted when constructing your module YAML files:

- The triple hyphen (---) denotes the explicit start of a document.
- The `!ec2rlcore.module.Module` tag tells the YAML parser which constructor to call when creating the object from the data stream. You can find the constructor inside the `module.py` file.

- The `!!str` tag tells the YAML parser to not attempt to determine the type of data, and instead interpret the content as a string literal.

- The pipe character (`|`) tells the YAML parser that the value is a literal-style scalar. In this case, the parser includes all whitespace. This is important for modules because indentation and newline characters are kept.

- The YAML standard indent is two spaces, which can be seen in the following examples. Ensure that you maintain standard indentation (for example, four spaces for Python) for your script and then indent the entire content two spaces inside the module file.

## Example modules

Example one (`mod.d/ps.yaml`):

```yaml
--- !ec2rlcore.module.Module
# Module document. Translates directly into an almost-complete Module object
name: !!str ps
path: !!str
version: !!str 1.0
title: !!str Collect output from ps for system analysis
helptext: !!str |
    Collect output from ps for system analysis
    Requires --times= for number of times to repeat
    Requires --period= for time period between repetition
placement: !!str run
package:
    - !!str
language: !!str bash
content: !!str |
    #!/bin/bash
    error_trap()
    {
        printf "%0.s" {1..80}
        echo -e "\nERROR: "$BASH_COMMAND" exited with an error on line ${BASH_LINENO[0]}"
        exit 0
    }
    trap error_trap ERR
```

Develop EC2Rescue modules
Use EC2Rescue for Windows Server

EC2Rescue for Windows Server is an easy-to-use tool that you run on an Amazon EC2 Windows Server instance to diagnose and troubleshoot possible problems. It is valuable for collecting log files and troubleshooting issues and also proactively searching for possible areas of concern. It can even examine Amazon EBS root volumes from other instances and collect relevant logs for troubleshooting Windows Server instances using that volume.

EC2Rescue for Windows Server has two different modules: a data collector module that collects data from all different sources, and an analyzer module that parses the data collected against a series of predefined rules to identify issues and provide suggestions.

The EC2Rescue for Windows Server tool only runs on Amazon EC2 instances running Windows Server 2012 and later. When the tool starts, it checks whether it is running on an Amazon EC2 instance.

The AWSSupport-ExecuteEC2Rescue runbook uses the EC2Rescue tool to troubleshoot and, where possible, fix common connectivity issues with the specified EC2 instance. For more information, and to run this automation, see AWSSupport-ExecuteEC2Rescue.

If you are using a Linux instance, see the section called “EC2Rescue for Linux”.

# read-in shared function
source functions.bash
echo "I will collect ps output from this $EC2RL_DISTRO box for $times times every $period seconds."
for i in $(seq 1 $times); do
  ps auxww
  sleep $period
done
constraint:
  requires_ec2: !!str False
domain: !!str performance
class: !!str collect
distro: !!str alami ubuntu rhel suse
required: !!str period times
optional: !!str
software: !!str
sudo: !!str False
perfimpact: !!str False
parallelexclusive: !!str
Contents

- Use EC2Rescue for Windows Server GUI
- Use EC2Rescue for Windows Server with the command line
- Use EC2Rescue for Windows Server with Systems Manager Run Command

Use EC2Rescue for Windows Server GUI

EC2Rescue for Windows Server can perform the following analysis on **offline instances**:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Diagnose and Rescue</td>
<td>EC2Rescue for Windows Server can detect and address issues with the following service settings:</td>
</tr>
<tr>
<td></td>
<td>- System Time</td>
</tr>
<tr>
<td></td>
<td>- <strong>RealTimeisUniversal</strong> - Detects whether the RealTimeisUniversal registry key is enabled. If disabled, Windows system time drifts when the timezone is set to a value other than UTC.</td>
</tr>
<tr>
<td></td>
<td>- Windows Firewall</td>
</tr>
<tr>
<td></td>
<td>- <strong>Domain networks</strong> - Detects whether this Windows Firewall profile is enabled or disabled.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Private networks</strong> - Detects whether this Windows Firewall profile is enabled or disabled.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Guest or public networks</strong> - Detects whether this Windows Firewall profile is enabled or disabled.</td>
</tr>
<tr>
<td></td>
<td>- Remote Desktop</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-------------</td>
</tr>
<tr>
<td>• <strong>Service Start</strong> - Detects whether the Remote Desktop service is enabled.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Remote Desktop Connections</strong> - Detects whether this is enabled.</td>
<td></td>
</tr>
<tr>
<td>• <strong>TCP Port</strong> - Detects which port the Remote Desktop service is listening on.</td>
<td></td>
</tr>
<tr>
<td>• EC2Config (Windows Server 2012 R2 and earlier)</td>
<td></td>
</tr>
<tr>
<td>• <strong>Installation</strong> - Detects which EC2Config version is installed.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Service Start</strong> - Detects whether the EC2Config service is enabled.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Ec2SetPassword</strong> - Generates a new administrator password.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Ec2HandleUserData</strong> - Allows you to run a user data script on the next boot of the instance.</td>
<td></td>
</tr>
<tr>
<td>• EC2Launch (Windows Server 2016 and later)</td>
<td></td>
</tr>
<tr>
<td>• <strong>Installation</strong> - Detects which EC2Launch version is installed.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Ec2SetPassword</strong> - Generates a new administrator password.</td>
<td></td>
</tr>
<tr>
<td>• Network Interface</td>
<td></td>
</tr>
<tr>
<td>• <strong>DHCP Service Startup</strong> - Detects whether the DHCP service is enabled.</td>
<td></td>
</tr>
<tr>
<td>• <strong>Ethernet detail</strong> - Displays information about the network driver version, if detected.</td>
<td></td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>• <strong>DHCP on Ethernet</strong></td>
<td>- Detects whether DHCP is enabled.</td>
</tr>
<tr>
<td>• <strong>Disk signature status</strong></td>
<td></td>
</tr>
<tr>
<td>• <strong>Signature on disk</strong></td>
<td></td>
</tr>
<tr>
<td>• <strong>Signature on disk and Signature on Boot Configuration Database (BCD)</strong></td>
<td>- Detects whether the disk signature and the BCD signature are the same. If the values are different, EC2Rescue attempts to overwrite the disk signature with the signature on BCD.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Restore</th>
<th>Perform one of the following actions:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <strong>Last Known Good Configuration</strong></td>
<td>- Attempts to boot the instance into the last known bootable state.</td>
</tr>
<tr>
<td>• <strong>Restore registry from backup</strong></td>
<td>- Restores the registry from <code>\Windows\System32\config\RegBack</code> .</td>
</tr>
</tbody>
</table>

| Capture Logs                  | Allows you to capture logs on the instance for analysis.                                                                                     |

EC2Rescue for Windows Server can collect the following data from **active and offline instances**:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event Log</td>
<td>Collects application, system, and EC2Config event logs.</td>
</tr>
<tr>
<td>Registry</td>
<td>Collects SYSTEM and SOFTWARE hives.</td>
</tr>
<tr>
<td>Windows Update Log</td>
<td>Collects log files generated by Windows Update.</td>
</tr>
<tr>
<td>Item</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Sysprep Log</td>
<td>Collects log files generated by the Windows System Preparation tool.</td>
</tr>
<tr>
<td>Driver Setup Log</td>
<td>Collects Windows SetupAPI logs (setupapi.dev.log and setupapi.setup.log).</td>
</tr>
<tr>
<td>Boot Configuration</td>
<td>Collects HKEY_LOCAL_MACHINE\BCD00000000 hive.</td>
</tr>
<tr>
<td>Memory Dump</td>
<td>Collects any memory dump files that exist on the instance.</td>
</tr>
<tr>
<td>EC2Config File</td>
<td>Collects log files generated by the EC2Config service.</td>
</tr>
<tr>
<td>EC2Launch File</td>
<td>Collects log files generated by the EC2Launch scripts.</td>
</tr>
<tr>
<td>SSM Agent File</td>
<td>Collects log files generated by SSM Agent and Patch Manager logs.</td>
</tr>
<tr>
<td>EC2 ElasticGPUs File</td>
<td>Collects event logs related to elastic GPUs.</td>
</tr>
<tr>
<td>ECS</td>
<td>Collects logs related to Amazon ECS.</td>
</tr>
<tr>
<td>CloudEndure</td>
<td>Collects log files related to CloudEndure Agent.</td>
</tr>
</tbody>
</table>

**Note**

In Windows Server 2016 and later, the log is collected in Event Tracing for Windows (ETW) format.

EC2Rescue for Windows Server can collect the following additional data from **active instances**:
<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Information</td>
<td>Collects MSInfo32.</td>
</tr>
<tr>
<td>Group Policy Result</td>
<td>Collects a Group Policy report.</td>
</tr>
</tbody>
</table>

**Analyze an offline instance**

The **Offline Instance** option is useful for debugging boot issues with Windows instances.

**To perform an action on an offline instance**

1. From a working Windows Server instance, download the [EC2Rescue for Windows Server](https://s3.amazonaws.com/ec2rescue/windows/EC2Rescue_latest.zip) tool and extract the files.

   You can run the following PowerShell command to download EC2Rescue without changing your Internet Explorer Enhanced Security Configuration (ESC):

   ```powershell
   Invoke-WebRequest https://s3.amazonaws.com/ec2rescue/windows/EC2Rescue_latest.zip -OutFile $env:USERPROFILE\Desktop\EC2Rescue_latest.zip
   ```

   This command will download the EC2Rescue .zip file to the desktop of the currently logged in user.

   **Note**

   If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

   ```powershell
   ```

2. Stop the faulty instance, if it is not stopped already.

3. Detach the EBS root volume from the faulty instance and attach the volume to a working Windows instance that has EC2Rescue for Windows Server installed.
4. Run the EC2Rescue for Windows Server tool on the working instance and choose **Offline Instance**.

5. Select the disk of the newly mounted volume and choose **Next**.

6. Confirm the disk selection and choose **Yes**.

7. Choose the offline instance option to perform and choose **Next**.

The EC2Rescue for Windows Server tool scans the volume and collects troubleshooting information based on the selected log files.

**Collect data from an active instance**

You can collect logs and other data from an active instance.

**To collect data from an active instance**

1. Connect to your Windows instance.

2. Download the **EC2Rescue for Windows Server** tool to your Windows instance and extract the files.

   You can run the following PowerShell command to download EC2Rescue without changing your Internet Explorer Enhanced Security Configuration (ESC):

   ```powershell
   Invoke-WebRequest https://s3.amazonaws.com/ec2rescue/windows/EC2Rescue_latest.zip -OutFile $env:USERPROFILE\Desktop\EC2Rescue_latest.zip
   ```

   This command will download the EC2Rescue .zip file to the desktop of the currently logged in user.

   **Note**

   If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:
3. Open the EC2Rescue for Windows Server application and accept the license agreement.

4. Choose **Next**, **Current instance**, **Capture logs**.

5. Select the data items to collect and choose **Collect**... Read the warning and choose **Yes** to continue.

6. Choose a file name and location for the ZIP file and choose **Save**.

7. After EC2Rescue for Windows Server completes, choose **Open Containing Folder** to view the ZIP file.

8. Choose **Finish**.

### Use EC2Rescue for Windows Server with the command line

The EC2Rescue for Windows Server command line interface (CLI) allows you to run an EC2Rescue for Windows Server plugin (referred as an "action") programmatically.

The EC2Rescue for Windows Server tool has two execution modes:

- **/online**—This allows you to take action on the instance that EC2Rescue for Windows Server is installed on, such as collect log files.
- **/offline:<device_id>**—This allows you to take action on the offline root volume that is attached to a separate Amazon EC2 Windows instance, on which you have installed EC2Rescue for Windows Server.

Download the [EC2Rescue for Windows Server](https://aws.amazon.com/ec2rescue/) tool to your Windows instance and extract the files. You can view the help file using the following command:

```
EC2RescueCmd.exe /help
```

EC2Rescue for Windows Server can perform the following actions on an Amazon EC2 Windows instance:

- **Collect action**
- **Rescue action**
Collect action

Note
You can collect all logs, an entire log group, or an individual log within a group.

EC2Rescue for Windows Server can collect the following data from active and offline instances.

<table>
<thead>
<tr>
<th>Log group</th>
<th>Available logs</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td></td>
<td>Collects all available logs.</td>
</tr>
<tr>
<td>eventlog</td>
<td>• 'Application' • 'System' • 'EC2ConfigService'</td>
<td>Collects application, system, and EC2Config event logs.</td>
</tr>
<tr>
<td>memory-dump</td>
<td>• 'Memory Dump File' • 'Mini Dump Files'</td>
<td>Collects any memory dump files that exist on the instance.</td>
</tr>
<tr>
<td>ec2config</td>
<td>• 'Log Files' • 'Configuration Files'</td>
<td>Collects log files generated by the EC2Config service.</td>
</tr>
<tr>
<td>ec2launch</td>
<td>• 'Logs' • 'Config'</td>
<td>Collects log files generated by the EC2Launch scripts.</td>
</tr>
<tr>
<td>ssm-agent</td>
<td>• 'Log Files' • 'Patch Baseline Logs' • 'InstanceData'</td>
<td>Collects log files generated by SSM Agent and Patch Manager logs.</td>
</tr>
<tr>
<td>sysprep</td>
<td>'Log Files'</td>
<td>Collects log files generated by the Windows System Preparation tool.</td>
</tr>
<tr>
<td>Log group</td>
<td>Available logs</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>registry</td>
<td>'SYSTEM', 'SOFTWARE', 'BCD'</td>
<td>Collects SYSTEM and SOFTWARE hives.</td>
</tr>
<tr>
<td>egpu</td>
<td>'Event Log', 'System Files'</td>
<td>Collects event logs related to elastic GPUs.</td>
</tr>
<tr>
<td>boot-config</td>
<td>'BCDEDIT Output'</td>
<td>Collects HKEY_LOCAL_MACHINE\BCD000000 000 hive.</td>
</tr>
<tr>
<td>windows-update</td>
<td>'Log Files'</td>
<td>Collects log files generated by Windows Update.</td>
</tr>
</tbody>
</table>

**Note**

In Windows Server 2016 and later, the log is collected in Event Tracing for Windows (ETW) format.
EC2Rescue for Windows Server can collect the following additional data from **active instances**.

<table>
<thead>
<tr>
<th>Log group</th>
<th>Available logs</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>system-info</td>
<td>'MSInfo32 Output'</td>
<td>Collects MSInfo32.</td>
</tr>
<tr>
<td>gpresult</td>
<td>'GPResult Output'</td>
<td>Collects a Group Policy report.</td>
</tr>
</tbody>
</table>

The following are the available options:

- **/output:**<outputFilePath> - Required destination file path location to save collected log files in zip format.
- **/no-offline** - Optional attribute used in offline mode. Does not set the volume offline after completing the action.
- **/no-fix-signature** - Optional attribute used in offline mode. Does not fix a possible disk signature collision after completing the action.

**Examples**

The following are examples using the EC2Rescue for Windows Server CLI.

**Online mode examples**

Collect all available logs:

```
EC2RescueCmd /accepteula /online /collect:all /output:<outputFilePath>
```

Collect only a specific log group:

```
EC2RescueCmd /accepteula /online /collect:ec2config /output:<outputFilePath>
```

Collect individual logs within a log group:

```
EC2RescueCmd /accepteula /online /collect:'ec2config.Log Files,driver-setup.SetupAPI Log Files' /output:<outputFilePath>
```
Offline mode examples

Collect all available logs from an EBS volume. The volume is specified by the device_id value.

```
EC2RescueCmd /accepteula /offline:xvd /collect:all /output:<outputFilePath>
```

Collect only a specific log group:

```
EC2RescueCmd /accepteula /offline:xvd /collect:ec2config /output:<outputFilePath>
```

Rescue action

EC2Rescue for Windows Server can detect and address issues with the following service settings:

<table>
<thead>
<tr>
<th>Service group</th>
<th>Available actions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td></td>
<td></td>
</tr>
<tr>
<td>system-time</td>
<td>'RealTimeIsUniversal'</td>
<td>System Time</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>RealTimeIsUniversal</strong>  - Detects whether the RealTimeIsUniversal registry key is enabled. If disabled, Windows system time drifts when the timezone is set to a value other than UTC.</td>
</tr>
<tr>
<td>firewall</td>
<td>'Domain networks' 'Private networks' 'Guest or public networks'</td>
<td>Windows Firewall</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Domain networks</strong> - Detects whether this Windows Firewall profile is enabled or disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Private networks</strong> - Detects whether this Windows Firewall profile is enabled or disabled.</td>
</tr>
<tr>
<td>Service group</td>
<td>Available actions</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>rdp</td>
<td>'Service Start'</td>
<td>Remote Desktop</td>
</tr>
<tr>
<td></td>
<td>'Remote Desktop Connections'</td>
<td></td>
</tr>
<tr>
<td></td>
<td>'TCP Port'</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detects whether the Remote Desktop service is enabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detects whether this is enabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detects which port the Remote Desktop service is listening on.</td>
</tr>
<tr>
<td>ec2config</td>
<td>'Service Start'</td>
<td>EC2Config</td>
</tr>
<tr>
<td></td>
<td>'Ec2SetPassword'</td>
<td></td>
</tr>
<tr>
<td></td>
<td>'Ec2HandleUserData'</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detects whether the EC2Config service is enabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Generates a new administrator password.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Allows you to run a user data script on the next boot of the instance.</td>
</tr>
<tr>
<td>ec2launch</td>
<td>'Reset Administrator Password'</td>
<td>Generates a new Windows administrator password.</td>
</tr>
<tr>
<td>Service group</td>
<td>Available actions</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>----------------------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>network</td>
<td>'DHCP Service Startup'</td>
<td>Network Interface</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>DHCP Service Startup</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Detects whether the DHCP service is enabled.</td>
</tr>
</tbody>
</table>

The following are the available options:

- **/level:<level>** - Optional attribute for the check level that the action should trigger. Allowed values are: *information*, *warning*, *error*, *all*. By default, it is set to *error*.

- **/check-only** - Optional attribute that generates a report but makes no modifications to the offline volume.

**Note**

If EC2Rescue for Windows Server detects a possible disk signature collision, it corrects the signature after the offline process completes by default, even when you use the */check-only* option. You must use the */no-fix-signature* option to prevent the correction.

- **/no-offline** - Optional attribute that prevents the volume from being set offline after completing the action.

- **/no-fix-signature** - Optional attribute that does not fix a possible disk signature collision after completing the action.

**Rescue examples**

The following are examples using the EC2Rescue for Windows Server CLI. The volume is specified using the device_id value.

Attempt to fix all identified issues on a volume:

```
EC2RescueCmd /accepteula /offline:xdff /rescue:all
```

Attempt to fix all issues within a service group on a volume:
EC2RescueCmd /accepteula /offline:xvdf /rescue:firewall

Attempt to fix a specific item within a service group on a volume:

EC2RescueCmd /accepteula /offline:xvdf /rescue:rdp.'Service Start'

Specify multiple issues to attempt to fix on a volume:

EC2RescueCmd /accepteula /offline:xvdf /rescue:'system-time.RealTimeIsUniversal,ec2config.Service Start'

### Restore action

EC2Rescue for Windows Server can detect and address issues with the following service settings:

<table>
<thead>
<tr>
<th>Service Group</th>
<th>Available Actions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restore Last Known Good Configuration</td>
<td>lkgc</td>
<td><strong>Last Known Good Configuration</strong> - Attempts to boot the instance into the last known bootable state.</td>
</tr>
<tr>
<td>Restore Windows registry from latest backup</td>
<td>regback</td>
<td><strong>Restore registry from backup</strong> - Restores the registry from <code>\Windows\System32\config\RegBack</code> .</td>
</tr>
</tbody>
</table>

The following are the available options:

- **/no-offline**—Optional attribute that prevents the volume from being set offline after completing the action.
- **/no-fix-signature**—Optional attribute that does not fix a possible disk signature collision after completing the action.
**Restore examples**

The following are examples using the EC2Rescue for Windows Server CLI. The volume is specified using the `device_id` value.

Restore last known good configuration on a volume:

```
EC2RescueCmd /accepteula /offline:xvdf /restore:lkgc
```

Restore the last Windows registry backup on a volume:

```
EC2RescueCmd /accepteula /offline:xvdf /restore:regback
```

**Use EC2Rescue for Windows Server with Systems Manager Run Command**

AWS Support provides you with a Systems Manager Run Command document to interface with your Systems Manager-enabled instance to run EC2Rescue for Windows Server. The Run Command document is called `AWSSupport-RunEC2RescueForWindowsTool`.

This Systems Manager Run Command document performs the following tasks:

- Downloads and verifies EC2Rescue for Windows Server.
- Imports a PowerShell module to ease your interaction with the tool.
- Runs EC2RescueCmd with the provided command and parameters.

The Systems Manager Run Command document accepts three parameters:

- **Command**—The EC2Rescue for Windows Server action. The current allowed values are:
  - **ResetAccess**—Resets the local Administrator password. The local Administrator password of the current instance will be reset and the randomly generated password will be securely stored in Parameter Store as `/EC2Rescue/Password/<INSTANCE_ID>`. If you select this action and provide no parameters, passwords are encrypted automatically with the default KMS key. Optionally, you can specify a KMS key ID in Parameters to encrypt the password with your own key.
  - **CollectLogs**—Runs EC2Rescue for Windows Server with the `/collect:all` action. If you select this action, Parameters must include an Amazon S3 bucket name to upload the logs to.
- **FixAll**—Runs EC2Rescue for Windows Server with the `/rescue:all` action. If you select this action, **Parameters** must include the block device name to rescue.

- **Parameters**—The PowerShell parameters to pass for the specified command.

### Note

In order for the **ResetAccess** action to work, your Amazon EC2 instance needs to have the following policy attached in order to write the encrypted password to Parameter Store. Please wait a few minutes before attempting to reset the password of an instance after you have attached this policy to the related IAM role.

Using the default KMS key:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:PutParameter"
            ],
            "Resource": [
                "arn:aws:ssm:region:account_id:parameter/EC2Rescue/Passwords/<instanceid>"
            ]
        }
    ]
}
```

Using a custom KMS key:

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ssm:PutParameter"
            ],
            "Resource": [
```
The following procedure describes how to view the JSON for this document in the Amazon EC2 console.

**To view the JSON for the Systems Manager Run Command document**

2. In the navigation pane, expand **Shared Services** and choose **Documents**.
3. In the search bar, set **Owner** as **Owned by Me or Amazon** and set the **Document name prefix** to AWSSupport-RunEC2RescueForWindowsTool.
4. Select the AWSSupport-RunEC2RescueForWindowsTool document, choose **Contents**, and then view the JSON.

**Examples**

Here are some examples on how to use the Systems Manager Run Command document to run EC2Rescue for Windows Server, using the AWS CLI. For more information about sending commands with the AWS CLI, see the [AWS CLI Command Reference](https://aws.amazon.com/cli/).

**Attempt to fix all identified issues on an offline root volume**

Attempt to fix all identified issues on an offline root volume attached to an Amazon EC2 Windows instance:
Collect logs from the current Amazon EC2 Windows instance

Collect all logs from the current online Amazon EC2 Windows instance and upload them to an Amazon S3 bucket:

```bash
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue online log collection to S3" --parameters "Command=CollectLogs, Parameters='YOURS3BUCKETNAME'" --output text
```

Collect logs from an offline Amazon EC2 Windows instance volume

Collect all logs from an offline volume attached to an Amazon EC2 Windows instance and upload them to Amazon S3 with a presigned URL:

```bash
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue offline log collection to S3" --parameters "Command=CollectLogs, Parameters='"-Offline -BlockDeviceName xvdf -S3PreSignedUrl 'YOURS3PRESIGNEDURL'"' --output text
```

Reset the local Administrator password

The following examples show methods you can use to reset the local Administrator password. The output provides a link to Parameter Store, where you can find the randomly generated secure password you can then use to RDP to your Amazon EC2 Windows instance as the local Administrator.

Reset the local Administrator password of an online instance using the default AWS KMS key alias/aws/ssm:

```bash
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue online password reset" --parameters "Command=ResetAccess" --output text
```

Reset the local Administrator password of an online instance using a KMS key:
aws ssm send-command --instance-ids "i-0cb2b964d3e14fd9f" --document-name "AWSSupport-RunEC2RescueForWindowsTool" --comment "EC2Rescue online password reset" --parameters "Command=ResetAccess, Parameters=a133dc3c-a2g4-4fc6-a873-6c0720104bf0" --output text

⚠️ Note
In this example, the KMS key is a133dc3c-a2g4-4fc6-a873-6c0720104bf0.

EC2 Serial Console for Amazon EC2 instances

With the EC2 serial console, you have access to your Amazon EC2 instance's serial port, which you can use to troubleshoot boot, network configuration, and other issues. The serial console does not require your instance to have any networking capabilities. With the serial console, you can enter commands to an instance as if your keyboard and monitor are directly attached to the instance's serial port. The serial console session lasts during instance reboot and stop. During reboot, you can view all of the boot messages from the start.

Access to the serial console is not available by default. Your organization must grant account access to the serial console and configure IAM policies to grant your users access to the serial console. Serial console access can be controlled at a granular level by using instance IDs, resource tags, and other IAM levers. For more information, see Configure access to the EC2 Serial Console.  

The serial console can be accessed by using the EC2 console or the AWS CLI.

The serial console is available at no additional cost.

Topics
- Prerequisites for the EC2 Serial Console
- Configure access to the EC2 Serial Console
- Connect to the EC2 Serial Console
- Disconnect from the EC2 Serial Console
- Troubleshoot your Amazon EC2 instance using the EC2 Serial Console

EC2 Serial Console
Prerequisites for the EC2 Serial Console

To connect to the EC2 Serial Console and use your chosen tool for troubleshooting, the following prerequisites must be in place:

- **AWS Regions**
- **Wavelength Zones and AWS Outposts**
- **Local Zones**
- **Instance types**
- **Grant access**
- **Support for browser-based client**
- **Instance state**
- **Amazon EC2 Systems Manager**
- **Configure your chosen troubleshooting tool**

**AWS Regions**

Supported in all AWS Regions.

**Wavelength Zones and AWS Outposts**

Not supported.

**Local Zones**

Supported in all Local Zones.

**Instance types**

Supported instance types:

- **Linux**
  - All virtualized instances built on the Nitro System.
  - All bare metal instances except:
    - General purpose: a1.metal, mac1.metal, mac2.metal
    - Accelerated computing: g5g.metal
• Memory optimized: u-6tb1.metal, u-9tb1.metal, u-12tb1.metal, u-18tb1.metal, u-24tb1.metal

• **Windows**

   All virtualized instances built on the Nitro System. Not supported on bare metal instances.

---

**Grant access**

You must complete the configuration tasks to grant access to the EC2 Serial Console. For more information, see [Configure access to the EC2 Serial Console](#).

**Support for browser-based client**

To connect to the serial console using the browser-based client, your browser must support WebSocket. If your browser does not support WebSocket, connect to the serial console using your own key and an SSH client.

**Instance state**

Must be running.

You can't connect to the serial console if the instance is in the pending, stopping, stopped, shutting-down, or terminated state.

For more information about the instance states, see [Instance lifecycle](#).

**Amazon EC2 Systems Manager**

If the instance uses Amazon EC2 Systems Manager, then SSM Agent version 3.0.854.0 or later must be installed on the instance. For information about SSM Agent, see [Working with SSM Agent](#) in the [AWS Systems Manager User Guide](#).

**Configure your chosen troubleshooting tool**

To troubleshoot your instance via the serial console, you can use GRUB or SysRq on Linux instances, and Special Admin Console (SAC) on Windows instances. Before you can use these tools, you must first perform configuration steps on every instance on which you'll use them.

Use the instructions for your instance's operating system to configure your chosen troubleshooting tool.
(Linux instances) Configure GRUB

To configure GRUB, choose one of the following procedures based on the AMI that was used to launch the instance.

Amazon Linux 2

To configure GRUB on an Amazon Linux 2 instance

1. Connect to your Linux instance
2. Add or change the following options in /etc/default/grub:
   - Set GRUB_TIMEOUT=1.
   - Add GRUB_TERMINAL="console serial".
   - Add GRUB_SERIAL_COMMAND="serial --speed=115200".

   The following is an example of /etc/default/grub. You might need to change the configuration based on your system setup.

   ```
   GRUB_CMDLINE_LINUX_DEFAULT="console=tty0 console=ttyS0,115200n8 net.ifnames=0 biosdevname=0 nvme_core.io_timeout=4294967295 rd.emergency=poweroff rd.shell=0"
   GRUB_TIMEOUT=1
   GRUB_DISABLE_RECOVERY="true"
   GRUB_TERMINAL="console serial"
   GRUB_SERIAL_COMMAND="serial --speed=115200"
   ```

3. Apply the updated configuration by running the following command.

   ```
   [ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
   ```

Ubuntu

To configure GRUB on an Ubuntu instance

1. Connect to your instance.
2. Add or change the following options in /etc/default/grub.d/50-cloudimg-settings.cfg:
   - Set GRUB_TIMEOUT=1.
- Add GRUB_TIMEOUT_STYLE=menu.
- Add GRUB_TERMINAL="console serial".
- Remove GRUB_HIDDEN_TIMEOUT.
- Add GRUB_SERIAL_COMMAND="serial --speed=115200".

The following is an example of /etc/default/grub.d/50-cloudimg-settings.cfg.
You might need to change the configuration based on your system setup.

```bash
# Cloud Image specific Grub settings for Generic Cloud Images
# CLOUD_IMG: This file was created/modified by the Cloud Image build process

# Set the recordfail timeout
GRUB_RECORDFAIL_TIMEOUT=0

# Do not wait on grub prompt
GRUB_TIMEOUT=1
GRUB_TIMEOUT_STYLE=menu

# Set the default commandline
GRUB_CMDLINE_LINUX_DEFAULT="console=tty1 console=ttyS0
nvme_core.io_timeout=4294967295"

# Set the grub console type
GRUB_TERMINAL="console serial"
GRUB_SERIAL_COMMAND="serial --speed 115200"
```

3. Apply the updated configuration by running the following command.

```
[ec2-user ~]$ sudo update-grub
```

RHEL

To configure GRUB on a RHEL instance

1. Connect to your instance.
2. Add or change the following options in /etc/default/grub:
   - Remove GRUB_TERMINAL_OUTPUT.
• Add GRUB_TERMINAL="console serial".
• Add GRUB_SERIAL_COMMAND="serial --speed=115200".

The following is an example of /etc/default/grub. You might need to change the configuration based on your system setup.

```
GRUB_TIMEOUT=1
GRUB_DISTRIBUTOR="$(sed 's, release .*$,,g' /etc/system-release)"
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_CMDLINE_LINUX="console=tty0 console=ttyS0,115200n8 net.ifnames=0
   rd.blacklist=nouveau nvme_core.io_timeout=4294967295 crashkernel=auto"
GRUB_DISABLE_RECOVERY="true"
GRUB_ENABLE_BLSCFG=true
GRUB_TERMINAL="console serial"
GRUB_SERIAL_COMMAND="serial --speed=115200"
```

3. Apply the updated configuration by running the following command.

```
[ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

CentOS

For instances that are launched using a CentOS AMI, GRUB is configured for the serial console by default.

The following is an example of /etc/default/grub. Your configuration might be different based on your system setup.

```
GRUB_TIMEOUT=1
GRUB_DISTRIBUTOR="$(sed 's, release .*$,,g' /etc/system-release)"
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_TERMINAL="serial console"
GRUB_SERIAL_COMMAND="serial --speed=115200"
GRUB_CMDLINE_LINUX="console=tty0 crashkernel=auto console=ttyS0,115200"
GRUB_DISABLE_RECOVERY="true"
```
(Linux instances) Configure SysRq

To configure SysRq, you enable the SysRq commands for the current boot cycle. To make the configuration persistent, you can also enable the SysRq commands for subsequent boots.

To enable all SysRq commands for the current boot cycle

1. Connect to your instance.
2. Run the following command.

```
[ec2-user ~]$ sudo sysctl -w kernel.sysrq=1
```

Note
This setting will clear on the next reboot.

To enable all SysRq commands for subsequent boots

1. Create the file `/etc/sysctl.d/99-sysrq.conf` and open it in your favorite editor.

```
[ec2-user ~]$ sudo vi /etc/sysctl.d/99-sysrq.conf
```
2. Add the following line.

`kernel.sysrq=1`
3. Reboot the instance to apply the changes.

```
[ec2-user ~]$ sudo reboot
```
4. At the login prompt, enter the user name of the password-based user that you set up previously, and then press Enter.
5. At the Password prompt, enter the password, and then press Enter.
Note

If you enable SAC on an instance, the EC2 services that rely on password retrieval will not work from the Amazon EC2 console. Windows on Amazon EC2 launch agents (EC2Config, EC2Launch v1, and EC2Launch v2) rely on the serial console to execute various tasks. These tasks do not perform successfully when you enable SAC on an instance. For more information about Windows on Amazon EC2 launch agents, see the section called “Configure Windows instances”. If you enable SAC, you can disable it later. For more information, see Disable SAC and the boot menu.

Use one of the following methods to enable SAC and the boot menu on an instance.

PowerShell

To enable SAC and the boot menu on a Windows instance

1. Connect to your instance and perform the following steps from an elevated PowerShell command line.

2. Enable SAC.

   ```
   bcdedit /ems '{current}' on
   bcdedit /emssettings EMSPORT:1 EMSBAUDRATE:115200
   ```

3. Enable the boot menu.

   ```
   bcdedit /set '{bootmgr}' displaybootmenu yes
   bcdedit /set '{bootmgr}' timeout 15
   bcdedit /set '{bootmgr}' bootems yes
   ```

4. Apply the updated configuration by rebooting the instance.

   ```
   shutdown -r -t 0
   ```
Command prompt

To enable SAC and the boot menu on a Windows instance

1. Connect to your instance and perform the following steps from the command prompt.

2. Enable SAC.

   bcdedit /ems {current} on
   bcdedit /emssettings EMSPORT:1 EMSBAUDRATE:115200

3. Enable the boot menu.

   bcdedit /set {bootmgr} displaybootmenu yes
   bcdedit /set {bootmgr} timeout 15
   bcdedit /set {bootmgr} bootems yes

4. Apply the updated configuration by rebooting the instance.

   shutdown -r -t 0

Configure access to the EC2 Serial Console

To configure access to the serial console, you must grant serial console access at the account level and then configure IAM policies to grant access to your users. For Linux instances you must also configure a password-based user on every instance so that your users can use the serial console for troubleshooting.

Before commencing, be sure to check the prerequisites.

Topics

- Levels of access to the EC2 Serial Console
- Manage account access to the EC2 Serial Console
- Configure IAM policies for EC2 Serial Console access
- Set an OS user password on a Linux instance
Levels of access to the EC2 Serial Console

By default, there is no access to the serial console at the account level. You need to explicitly grant access to the serial console at the account level. For more information, see Manage account access to the EC2 Serial Console.

You can use a service control policy (SCP) to allow access to the serial console within your organization. You can then have granular access control at the user level by using an IAM policy to control access. By using a combination of SCP and IAM policies, you have different levels of access control to the serial console.

Organization level

You can use a service control policy (SCP) to allow access to the serial console for member accounts within your organization. For more information about SCPs, see Service control policies in the AWS Organizations User Guide.

Instance level

You can configure the serial console access policies by using IAM PrincipalTag and ResourceTag constructions and by specifying instances by their ID. For more information, see Configure IAM policies for EC2 Serial Console access.

User level

You can configure access at the user level by configuring an IAM policy to allow or deny a specified user the permission to push the SSH public key to the serial console service of a particular instance. For more information, see Configure IAM policies for EC2 Serial Console access.

OS level (Linux instances only)

You can set a user password at the guest OS level. This provides access to the serial console for some use cases. However, to monitor the logs, you don’t need a password-based user. For more information, see Set an OS user password on a Linux instance.

Manage account access to the EC2 Serial Console

By default, there is no access to the serial console at the account level. You need to explicitly grant access to the serial console at the account level.
Grant permission to users to manage account access

To allow your users to manage account access to the EC2 serial console, you need to grant them the required IAM permissions.

The following policy grants permissions to view the account status, and to allow and prevent account access to the EC2 serial console.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:GetSerialConsoleAccessStatus",
                "ec2:EnableSerialConsoleAccess",
                "ec2:DisableSerialConsoleAccess"
            ],
            "Resource": "*"
        }
    ]
}
```

For more information, see Creating IAM policies in the IAM User Guide.

View account access status to the serial console

To view account access status to the serial console (console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. On the left navigation pane, choose EC2 Dashboard.
3. From Account attributes, choose EC2 Serial Console.

   The EC2 Serial Console access field indicates whether account access is Allowed or Prevented.
The following screenshot shows that the account is prevented from using the EC2 serial console.

![EC2 Serial Console](image)

**To view account access status to the serial console (AWS CLI)**

Use the `get-serial-console-access-status` command to view account access status to the serial console.

```bash
aws ec2 get-serial-console-access-status --region us-east-1
```

In the following output, `true` indicates that the account is allowed access to the serial console.

```json
{
   "SerialConsoleAccessEnabled": true
}
```

**Grant account access to the serial console**

**To grant account access to the serial console (console)**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. On the left navigation pane, choose **EC2 Dashboard**.
3. From **Account attributes**, choose **EC2 Serial Console**.
4. Choose **Manage**.
5. To allow access to the EC2 serial console of all instances in the account, select the **Allow** check box.
6. Choose **Update**.

**To grant account access to the serial console (AWS CLI)**

Use the `enable-serial-console-access` command to allow account access to the serial console.

```bash
aws ec2 enable-serial-console-access --region us-east-1
```

In the following output, `true` indicates that the account is allowed access to the serial console.

```json
{
    "SerialConsoleAccessEnabled": true
}
```

**Deny account access to the serial console**

**To deny account access to the serial console (console)**

1. Open the Amazon EC2 console at [https://console.aws.amazon.com/ec2/](https://console.aws.amazon.com/ec2/).
2. On the left navigation pane, choose **EC2 Dashboard**.
3. From **Account attributes**, choose **EC2 Serial Console**.
4. Choose **Manage**.
5. To prevent access to the EC2 serial console of all instances in the account, clear the **Allow** check box.
6. Choose **Update**.

**To deny account access to the serial console (AWS CLI)**

Use the `disable-serial-console-access` command to prevent account access to the serial console.

```bash
aws ec2 disable-serial-console-access --region us-east-1
```

In the following output, `false` indicates that the account is denied access to the serial console.

```json
{
    "SerialConsoleAccessEnabled": false
}
```
Configure IAM policies for EC2 Serial Console access

By default, your users do not have access to the serial console. Your organization must configure IAM policies to grant your users the required access. For more information, see Creating IAM policies in the IAM User Guide.

For serial console access, create a JSON policy document that includes the `ec2-instance-connect:SendSerialConsoleSSHPublicKey` action. This action grants a user permission to push the public key to the serial console service, which starts a serial console session. We recommend restricting access to specific EC2 instances. Otherwise, all users with this permission can connect to the serial console of all EC2 instances.

Example IAM policies

- [Explicitly allow access to the serial console](#)
- [Explicitly deny access to the serial console](#)
- [Use resource tags to control access to the serial console](#)

Explicitly allow access to the serial console

By default, no one has access to the serial console. To grant access to the serial console, you need to configure a policy to explicitly allow access. We recommend configuring a policy that restricts access to specific instances.

The following policy allows access to the serial console of a specific instance, identified by its instance ID.

Note that the `DescribeInstances`, `DescribeInstanceTypes`, and `GetSerialConsoleAccessStatus` actions do not support resource-level permissions, and therefore all resources, indicated by the * (asterisk), must be specified for these actions.

```json
{
   "Version": "2012-10-17",
   "Statement": [
      {
         "Sid": "AllowDescribeInstances",
         "Effect": "Allow",
         "Action": [
            "ec2:DescribeInstances",
            "ec2:DescribeInstanceTypes"
         ]
      }
   ]
}
```
Explicitly deny access to the serial console

The following IAM policy allows access to the serial console of all instances, denoted by the * (asterisk), and explicitly denies access to the serial console of a specific instance, identified by its ID.

```json
{
    "Version": "2012-10-17",
    "Statement": [
        {
            "Sid": "AllowSerialConsoleAccess",
            "Effect": "Allow",
            "Action": [
                "ec2-instance-connect:SendSerialConsoleSSHPublicKey",
                "ec2:DescribeInstances",
                "ec2:DescribeInstanceTypes",
                "ec2:GetSerialConsoleAccessStatus"
            ],
            "Resource": "*"
        },
        {
            "Sid": "DenySerialConsoleAccess",
            "Effect": "Deny",
            "Action": [
                "ec2-instance-connect:SendSerialConsoleSSHPublicKey"
            ],
            "Resource": "arn:aws:ec2:region:account-id:instance/i-0598c7d356e848d7"
        }
    ]
}
```
Use resource tags to control access to the serial console

You can use resource tags to control access to the serial console of an instance.

Attribute-based access control is an authorization strategy that defines permissions based on tags that can be attached to users and AWS resources. For example, the following policy allows a user to initiate a serial console connection for an instance only if that instance's resource tag and the principal's tag have the same SerialConsole value for the tag key.

For more information about using tags to control access to your AWS resources, see Controlling access to AWS resources in the IAM User Guide.

Note that the DescribeInstances, DescribeInstanceTypes, and GetSerialConsoleAccessStatus actions do not support resource-level permissions, and therefore all resources, indicated by the * (asterisk), must be specified for these actions.

```json
{
   "Version": "2012-10-17",
   "Statement": [

      {
         "Sid": "AllowDescribeInstances",
         "Effect": "Allow",
         "Action": [
            "ec2:DescribeInstances",
            "ec2:DescribeInstanceTypes",
            "ec2:GetSerialConsoleAccessStatus"
         ],
         "Resource": "*
      },
      {
         "Sid": "AllowTagBasedSerialConsoleAccess",
         "Effect": "Allow",
         "Action": [
            "ec2-instance-connect:SendSerialConsoleSSHPublicKey"
         ],
         "Condition": {
            "StringEquals": {
               "aws:ResourceTag/SerialConsole": "${aws:PrincipalTag/SerialConsole}"
            }
         }
      }
   ]
}
```
Set an OS user password on a Linux instance

Note
This section applies to Linux instances only.

You can connect to the serial console without a password. However, to use the serial console for troubleshooting a Linux instance, the instance must have a password-based OS user.

You can set the password for any OS user, including the root user. Note that the root user can modify all files, while each OS user might have limited permissions.

You must set a user password for every instance for which you will use the serial console. This is a one-time requirement for each instance.

Note
The following instructions are applicable only if you launched your instance using a Linux AMI provided by AWS because, by default, AMIs provided by AWS are not configured with a password-based user. If you launched your instance using an AMI that already has the root user password configured, you can skip these instructions.

To set an OS user password on a Linux instance

1. Connect to your instance. You can use any method for connecting to your instance, except the EC2 Serial Console connection method.
2. To set the password for a user, use the passwd command. In the following example, the user is root.

   [ec2-user ~]$ sudo passwd root

   The following is example output.
Changing password for user root.
New password:

3. At the New password prompt, enter the new password.
4. At the prompt, re-enter the password.

Connect to the EC2 Serial Console

You can connect to the serial console of your EC2 instance by using the Amazon EC2 console or via SSH. After connecting to the serial console, you can use it for troubleshooting boot, network configuration, and other issues. For more information about troubleshooting, see Troubleshoot your Amazon EC2 instance using the EC2 Serial Console.

Considerations

- Only 1 active serial console connection is supported per instance.
- The serial console connection typically lasts for 1 hour unless you disconnect from it. However, during system maintenance, Amazon EC2 will disconnect the serial console session.
- It takes 30 seconds to tear down a session after you've disconnected from the serial console in order to allow a new session.
- Supported serial console ports: ttyS0 (Linux instances) and COM1 (Windows instances)
- When you connect to the serial console, you might observe a slight drop in your instance's throughput.

Topics

- Connect using the browser-based client
- Connect using your own key and SSH client
- EC2 Serial Console endpoints and fingerprints

Connect using the browser-based client

You can connect to your EC2 instance's serial console by using the browser-based client. You do this by selecting the instance in the Amazon EC2 console and choosing to connect to the serial console. The browser-based client handles the permissions and provides a successful connection.
EC2 serial console works from most browsers, and supports keyboard and mouse input.

Before connecting, make sure you have completed the prerequisites.

To connect to your instance's serial port using the browser-based client (Amazon EC2 console)

1. Open the Amazon EC2 console at https://console.aws.amazon.com/ec2/.
2. In the navigation pane, choose Instances.
3. Select the instance and choose Actions, Monitor and troubleshoot, EC2 Serial Console, Connect.

   Alternatively, select the instance and choose Connect, EC2 Serial Console, Connect.

   An in-browser terminal window opens.

4. Press Enter. If a login prompt returns, you are connected to the serial console.

   If the screen remains black, you can use the following information to help resolve issues with connecting to the serial console:

   • Check that you have configured access to the serial console. For more information, see Configure access to the EC2 Serial Console.

   • (Linux instances only) Use SysRq to connect to the serial console. SysRq does not require that you connect via the browser-based client. For more information, see (Linux instances) Use SysRq to troubleshoot your instance.

   • (Linux instances only) Restart getty. If you have SSH access to your instance, then connect to your instance using SSH, and restart getty using the following command.

     [ec2-user ~]$ sudo systemctl restart serial-getty@ttyS0

   • Reboot your instance. You can reboot your instance by using SysRq (Linux instances), the EC2 console, or the AWS CLI. For more information, see (Linux instances) Use SysRq to troubleshoot your instance (Linux instances) or Reboot your instance.

5. (Linux instances only) At the login prompt, enter the user name of the password-based user that you set up previously, and then press Enter.

6. (Linux instances only) At the Password prompt, enter the password, and then press Enter.

You are now logged onto the instance and can use the serial console for troubleshooting.
Connect using your own key and SSH client

You can use your own SSH key and connect to your instance from the SSH client of your choice while using the serial console API. This enables you to benefit from the serial console capability to push a public key to the instance.

Before connecting, make sure you have completed the prerequisites.

To connect to an instance's serial console using SSH

1. **Push your SSH public key to the instance to start a serial console session**

   Use the `send-serial-console-ssh-public-key` command to push your SSH public key to the instance. This starts a serial console session.

   If a serial console session has already been started for this instance, the command fails because you can only have one session open at a time. It takes 30 seconds to tear down a session after you've disconnected from the serial console in order to allow a new session.

   ```
   aws ec2-instance-connect send-serial-console-ssh-public-key \
   --instance-id i-001234a4bf70dec41EXAMPLE \
   --serial-port 0 \
   --ssh-public-key file://my_key.pub \
   --region us-east-1
   ```

2. **Connect to the serial console using your private key**

   Use the `ssh` command to connect to the serial console before the public key is removed from the serial console service. You have 60 seconds before it is removed.

   Use the private key that corresponds to the public key.

   The user name format is `instance-id.port0`, which comprises the instance ID and port 0. In the following example, the user name is `i-001234a4bf70dec41EXAMPLE.port0`.

   The endpoint of the serial console service is different for each Region. See the EC2 Serial Console endpoints and fingerprints table for each Region's endpoint. In the following example, the serial console service is in the us-east-1 Region.

   ```
   ssh -i my_key i-001234a4bf70dec41EXAMPLE.port0@serial-console.ec2-instance-connect.us-east-1.aws
   ```
3. **(Optional) Verify the fingerprint**

When you connect for the first time to the serial console, you are prompted to verify the fingerprint. You can compare the serial console fingerprint with the fingerprint that's displayed for verification. If these fingerprints don't match, someone might be attempting a "man-in-the-middle" attack. If they match, you can confidently connect to the serial console.

The following fingerprint is for the serial console service in the us-east-1 Region. For the fingerprints for each Region, see [EC2 Serial Console endpoints and fingerprints](#).

**SHA256:dXwn5ma/xadVMebZGErLum2gx+yI5LDiJaLUcz0FMmw**

**Note**

The fingerprint only appears the first time you connect to the serial console.

4. **Press Enter**. If a prompt returns, you are connected to the serial console.

If the screen remains black, you can use the following information to help resolve issues with connecting to the serial console:

- **Check that you have configured access to the serial console.** For more information, see [Configure access to the EC2 Serial Console](#).

- **(Linux instances only)** **Use SysRq to connect to the serial console.** SysRq does not require that you connect via SSH. For more information, see [(Linux instances) Use SysRq to troubleshoot your instance](#).

- **(Linux instances only)** **Restart getty.** If you have SSH access to your instance, then connect to your instance using SSH, and restart getty using the following command.

  ```bash
  [ec2-user ~]$ sudo systemctl restart serial-getty@ttyS0
  ```

- **Reboot your instance.** You can reboot your instance by using SysRq (Linux instances only), the EC2 console, or the AWS CLI. For more information, see [(Linux instances) Use SysRq to troubleshoot your instance](#) (Linux instances only) or [Reboot your instance](#).

5. **(Linux instances only)** At the login prompt, enter the user name of the password-based user that you set up previously, and then press **Enter**.

6. **(Linux instances only)** At the Password prompt, enter the password, and then press **Enter**.
You are now logged onto the instance and can use the serial console for troubleshooting.

**EC2 Serial Console endpoints and fingerprints**

The following are the service endpoints and fingerprints for EC2 Serial Console. To connect programmatically to an instance's serial console, you use an EC2 Serial Console endpoint. The EC2 Serial Console endpoints and fingerprints are unique for each AWS Region.

<table>

</table>
### Disconnect from the EC2 Serial Console

If you no longer need to be connected to your instance's EC2 Serial Console, you can disconnect from it. When you disconnect from the serial console, any shell session running on the instance will continue to run. If you want to end the shell session, you'll need to end it before disconnecting from the serial console.

**Considerations**

- The serial console connection typically lasts for 1 hour unless you disconnect from it. However, during system maintenance, Amazon EC2 will disconnect the serial console session.
- It takes 30 seconds to tear down a session after you've disconnected from the serial console in order to allow a new session.

The way to disconnect from the serial console depends on the client.

**Browser-based client**

To disconnect from the serial console, close the serial console in-browser terminal window.

**Standard OpenSSH client**

To disconnect from the serial console, use the following command to close the SSH connection. This command must be run immediately following a new line.

```
~.
```

The command that you use for closing an SSH connection might be different depending on the SSH client that you're using.
Troubleshoot your Amazon EC2 instance using the EC2 Serial Console

By using EC2 Serial Console, you can troubleshoot boot, network configuration, and other issues by connecting to your instance's serial port.

Use the instructions for your instance's operating system and for the tool you've configured on your instance.

Note

Before commencing, make sure you have completed the prerequisites, including configuring your chosen troubleshooting tool.

(Linux instances) Use GRUB to troubleshoot your instance

GNU GRUB (short for GNU GRand Unified Bootloader, commonly referred to as GRUB) is the default boot loader for most Linux operating systems. From the GRUB menu, you can select which kernel to boot into, or modify menu entries to change how the kernel will boot. This can be useful when troubleshooting a failing instance.

The GRUB menu is displayed during the boot process. The menu is not accessible via normal SSH, but you can access it via the EC2 Serial Console.

You can boot into single user mode or emergency mode. Single user mode will boot the kernel at a lower runlevel. For example, it might mount the filesystem but not activate the network, giving you the opportunity to perform the maintenance necessary to fix the instance. Emergency mode is similar to single user mode except that the kernel runs at the lowest runlevel possible.

To boot into single user mode

1. Connect to the instance's serial console.
2. Reboot the instance using the following command.

   [ec2-user ~]$ sudo reboot

3. During reboot, when the GRUB menu appears, press any key to stop the boot process.
4. In the GRUB menu, use the arrow keys to select the kernel to boot into, and press e on your keyboard.
5. Use the arrow keys to locate your cursor on the line containing the kernel. The line begins with either `linux` or `linux16` depending on the AMI that was used to launch the instance. For Ubuntu, two lines begin with `linux`, which must both be modified in the next step.

6. At the end of the line, add the word `single`.

   The following is an example for Amazon Linux 2.

   ```
   linux /boot/vmlinuz-4.14.193-149.317.amzn2.aarch64 root=UUID=d33f9c9a-\dadd-4499-938d-ebbf42c3e499 ro console=tty0 console=ttyS0,115200n8 net.ifname\s=0 biosdevname=0 nvme_core.io_timeout=4294967295 rd.emergency=poweroff rd.she\ll=0 single
   ```

7. Press **Ctrl+X** to boot into single user mode.

8. At the login prompt, enter the user name of the password-based user that you **set up previously**, and then press **Enter**.

9. At the Password prompt, enter the password, and then press **Enter**.

**To boot into emergency mode**

Follow the the same steps as single user mode, but at step 6, add the word `emergency` instead of `single`.

**(Linux instances) Use SysRq to troubleshoot your instance**

The System Request (SysRq) key, which is sometimes referred to as "magic SysRq", can be used to directly send the kernel a command, outside of a shell, and the kernel will respond, regardless of what the kernel is doing. For example, if the instance has stopped responding, you can use the SysRq key to tell the kernel to crash or reboot. For more information, see [Magic SysRq key](https://en.wikipedia.org/wiki/Magic_SysRq_key) in Wikipedia.

You can use SysRq commands in the EC2 Serial Console browser-based client or in an SSH client. The command to send a break request is different for each client.

To use SysRq, choose one of the following procedures based on the client that you are using.
Browser-based client

**To use SysRq in the serial console browser-based client**

1. **Connect** to the instance's serial console.
2. To send a break request, press CTRL+0 (zero). If your keyboard supports it, you can also send a break request using the Pause or Break key.

   ![CTRL+0](Example)

3. To issue a SysRq command, press the key on your keyboard that corresponds to the required command. For example, to display a list of SysRq commands, press h.

   ![h](Example)

   The h command outputs something similar to the following.

   ```
   [ 1169.389495] sysrq: HELP : loglevel(0-9) reboot(b) crash(c) terminate-all-tasks(e) memory-full-oom-kill(f) kill-all-tasks(i) thaw-filesystems(j) sak(k) show-backtrace-all-active-cpus(l) show-memory-usage(m) nice-all-RT-tasks(n) poweroff(o) show-registers(p) show-all-timers(q) unraw(r) sync(s) show-task-states(t) unmount(u) show-blocked-tasks(w) dump-ftrace-buffer(z)
   ```

SSH client

**To use SysRq in an SSH client**

1. **Connect** to the instance's serial console.
2. To send a break request, press ~B (tilde, followed by uppercase B).

   ![~B](Example)

3. To issue a SysRq command, press the key on your keyboard that corresponds to the required command. For example, to display a list of SysRq commands, press h.

   ![h](Example)

   The h command outputs something similar to the following.
(Windows instances) Use SAC to troubleshoot your instance

The Special Admin Console (SAC) capability of Windows provides a way to troubleshoot a Windows instance. By connecting to the instance's serial console and using SAC, you can interrupt the boot process and boot Windows in safe mode.

Note

The command that you use for sending a break request might be different depending on the SSH client that you're using.

Note

If you enable SAC on an instance, the EC2 services that rely on password retrieval will not work from the Amazon EC2 console. Windows on Amazon EC2 launch agents (EC2Config, EC2Launch v1, and EC2Launch v2) rely on the serial console to execute various tasks. These tasks do not perform successfully when you enable SAC on an instance. For more information about Windows on Amazon EC2 launch agents, see the section called “Configure Windows instances”. If you enable SAC, you can disable it later. For more information, see Disable SAC and the boot menu.

Topics

- Use SAC
- Use the boot menu
- Disable SAC and the boot menu
Use SAC

To use SAC

1. **Connect to the serial console.**

   If SAC is enabled on the instance, the serial console displays the SAC> prompt.

   ![Serial console output]

   Computer is booting, SAC started and initialized.
   Use the "ch -?" command for information about using channels.
   Use the "?" command for general help.

   SAC>?
   EVENT: The CMD command is now available.

2. **To display the SAC commands, enter ?, and then press Enter.**

   **Expected output**

   ![SAC command output]

   SAC>?
   ch  Channel management commands. Use ch -? for more help.
   cmd  Create a Command Prompt channel.
   d  Dump the current kernal log.
   f  Toggle detailed or abbreviated tlist info.
   ? or help  Display this list.
   i  List all IP network numbers and their IP addresses.
   i <#> <ip> <subnet> <gateway> Set IPv4 addr., subnet and gateway.
   l  Display the computer Identification Information.
   k <pid>  Kill the given process.
   l <pid>  Lower the priority of a process to the lowest possible.
   lock  Lock access to Command Prompt channels.
   m <pid> <MB-allow> Limit the memory usage of a process to <MB-allow>.
   p  Toggle paging the display.
   r <pid>  Raise the priority of a process by one.
   s mm/dd/yy hh:mm  Set the current time and date (24 hour clock used).
   t  Tlist.
   restart  Restart the system immediately.
   shutdown  Shutdown the system immediately.
   crashdump  Crash the system. You must have crash dump enabled.

3. **To create a command prompt channel (such as cmd0001 or cmd0002), enter cmd, and then press Enter.**

4. **To view the command prompt channel, press ESC, and then press TAB.**

   **Expected output**
5. To switch channels, press **ESC+TAB+channel number** together. For example, to switch to the cmd0002 channel (if it has been created), press **ESC+TAB+2**.

6. Enter the credentials required by the command prompt channel.

The command prompt is the same full-featured command shell that you get on a desktop, but with the exception that it does not allow the reading of characters that were already output.

PowerShell can also be used from the command prompt.

Note that you might need to set the progress preference to silent mode.
Use the boot menu

If the instance has the boot menu enabled and is restarted after connecting via SSH, you should see the boot menu, as follows.

Boot menu commands

ENTER

Starts the selected entry of the operating system.

TAB

Switches to the Tools menu.
ESC

Cancels and restarts the instance.

ESC followed by 8

Equivalent to pressing **F8**. Shows advanced options for the selected item.

ESC key + left arrow

Goes back to the initial boot menu.

**Note**

The ESC key alone does not take you back to the main menu because Windows is waiting to see if an escape sequence is in progress.

Disable SAC and the boot menu

If you enable SAC and the boot menu, you can disable these features later.
Use one of the following methods to disable SAC and the boot menu on an instance.

**PowerShell**

To disable SAC and the boot menu on a Windows instance

1. **Connect** to your instance and perform the following steps from an elevated PowerShell command line.
2. First disable the boot menu by changing the value to no.
   
   ```
   bcdedit /set '{bootmgr}' displaybootmenu no
   ```
3. Then disable SAC by changing the value to off.
   
   ```
   bcdedit /ems '{current}' off
   ```
4. Apply the updated configuration by rebooting the instance.
   
   ```
   shutdown -r -t 0
   ```

**Command prompt**

To disable SAC and the boot menu on a Windows instance

1. **Connect** to your instance and perform the following steps from the command prompt.
2. First disable the boot menu by changing the value to no.
   
   ```
   bcdedit /set {bootmgr} displaybootmenu no
   ```
3. Then disable SAC by changing the value to off.
   
   ```
   bcdedit /ems {current} off
   ```
4. Apply the updated configuration by rebooting the instance.
   
   ```
   shutdown -r -t 0
   ```

Troubleshoot your instance using the EC2 Serial Console
Send a diagnostic interrupt to your Amazon EC2 instance

⚠️ Warning
Diagnosis interrupts are intended for use by advanced users. Incorrect usage could negatively impact your instance. Sending a diagnostic interrupt to an instance could trigger an instance to crash and reboot, which could lead to the loss of data.

You can send a diagnostic interrupt to an unreachable or unresponsive instance to manually trigger a *kernel panic* for a Linux instance, or a *stop error* (commonly referred to as a *blue screen error*) for a Windows instance.

**Linux instances**

Linux operating systems typically crash and reboot when a kernel panic occurs. The specific behavior of the operating system depends on its configuration. A kernel panic can also be used to cause the instance's operating system kernel to perform tasks, such as generating a crash dump file. You can then use the information in the crash dump file to conduct root cause analysis and debug the instance. The crash dump data is generated locally by the operating system on the instance itself.

**Windows instances**

In general, Windows operating systems crash and reboot when a stop error occurs, but the specific behavior depends on its configuration. A stop error can also cause the operating system to write debugging information, such as a kernel memory dump, to a file. You can then use this information to conduct root cause analysis to debug the instance. The memory dump data is generated locally by the operating system on the instance itself.

Before sending a diagnostic interrupt to your instance, we recommend that you consult the documentation for your operating system and then make the necessary configuration changes.

**Contents**

- [Supported instance types](#)
- [Prerequisites](#)
- [Send a diagnostic interrupt](#)
Supported instance types

Diagnostic interrupt is supported on all Nitro-based instance types, except those powered by AWS Graviton processors. For more information, see instances built on the AWS Nitro System and AWS Graviton.

Prerequisites

Before using a diagnostic interrupt, you must configure your instance’s operating system. This ensures that it performs the actions that you need when a kernel panic (Linux instances) or stop error (Windows instances) occurs.

Linux instances

To configure Amazon Linux 2 to generate a crash dump when a kernel panic occurs

1. Connect to your instance.
2. Install `kexec` and `kdump`.
   ```bash
   [ec2-user ~]$ sudo yum install kexec-tools -y
   ```
3. Configure the kernel to reserve an appropriate amount of memory for the secondary kernel. The amount of memory to reserve depends on the total available memory of your instance. Open the `/etc/default/grub` file using your preferred text editor, locate the line that starts with `GRUB_CMDLINE_LINUX_DEFAULT`, and then add the `crashkernel` parameter in the following format: `crashkernel=memory_to_reserve`. For example, to reserve 160MB, modify the `grub` file as follows:
   ```text
   GRUB_CMDLINE_LINUX_DEFAULT="\n
   GRUB_TIMEOUT=0
   GRUB_DISABLE_RECOVERY="true"
   ```
4. Save the changes and close the `grub` file.
5. Rebuild the GRUB2 configuration file.
   ```bash
   [ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
   ```
6. On instances based on Intel and AMD processors, the send-diagnostic-interrupt command sends an *unknown non-maskable interrupt* (NMI) to the instance. You must configure the kernel to crash when it receives the unknown NMI. Open the /etc/sysctl.conf file using your preferred text editor and add the following.

```
kernel.unknown_nmi_panic=1
```

7. Reboot and reconnect to your instance.

8. Verify that the kernel has been booted with the correct `crashkernel` parameter.

```
$ grep crashkernel /proc/cmdline
```

The following example output indicates successful configuration.

```
BOOT_IMAGE=/boot/vmlinuz-4.14.128-112.105.amzn2.x86_64 root=UUID=a1e1011e-e38f-408e-878b-fed395b47ad6 ro crashkernel=160M console=tt0 console=tt50,115200n8 net.ifnames=0 biosdevname=0 nvme_core.io_timeout=4294967295 rd.emergency=poweroff rd.shell=0
```

9. Verify that the `kdump` service is running.

```
[ec2-user ~]$ systemctl status kdump.service
```

The following example output shows the result if the `kdump` service is running.

```
kdump.service - Crash recovery kernel arming
   Loaded: loaded (/usr/lib/systemd/system/kdump.service; enabled; vendor preset: enabled)
   Active: active (exited) since Fri 2019-05-24 23:29:13 UTC; 22s ago
   Process: 2503 ExecStart=/usr/bin/kdumpctl start (code=exited, status=0/SUCCESS)
Main PID: 2503 (code=exited, status=0/SUCCESS)
```

**Note**

By default, the crash dump file is saved to `/var/crash/`. To change the location, modify the `/etc/kdump.conf` file using your preferred text editor.
To configure Amazon Linux to generate a crash dump when a kernel panic occurs

1. Connect to your instance.

2. Install **kexec** and **kdump**.

   ```
   [ec2-user ~]$ sudo yum install kexec-tools -y
   ```

3. Configure the kernel to reserve an appropriate amount of memory for the secondary kernel. The amount of memory to reserve depends on the total available memory of your instance.

   ```
   $ sudo grubby --args="crashkernel=memory_to_reserve" --update-kernel=ALL
   ```

   For example, to reserve 160MB for the crash kernel, use the following command.

   ```
   $ sudo grubby --args="crashkernel=160M" --update-kernel=ALL
   ```

4. On instances based on Intel and AMD processors, the `send-diagnostic-interrupt` command sends an *unknown non-maskable interrupt* (NMI) to the instance. You must configure the kernel to crash when it receives the unknown NMI. Open the `/etc/sysctl.conf` file using your preferred text editor and add the following.

   ```
   kernel.unknown_nmi_panic=1
   ```

5. Reboot and reconnect to your instance.

6. Verify that the kernel has been booted with the correct `crashkernel` parameter.

   ```
   $ grep crashkernel /proc/cmdline
   ```

   The following example output indicates successful configuration.

   ```
   root=LABEL=/ console=tty1 console=ttyS0 selinux=0 nvme_core.io_timeout=4294967295
   LANG=en_US.UTF-8 KEYTABLE=us crashkernel=160M
   ```

7. Verify that the **kdump** service is running.

   ```
   [ec2-user ~]$ sudo service kdump status
   ```

   If the service is running, the command returns the Kdump is operational response.
Note

By default, the crash dump file is saved to /var/crash/. To change the location, modify the /etc/kdump.conf file using your preferred text editor.

To configure SUSE Linux Enterprise, Ubuntu, or Red Hat Enterprise Linux

On instances based on Intel and AMD processors, the send-diagnostic-interrupt command sends an unknown non-maskable interrupt (NMI) to the instance. You must configure the kernel to crash when it receives the unknown NMI by adjusting the configuration file for your operating system. For information about how to configure the kernel to crash, see the documentation for your operating system:

- SUSE Linux Enterprise
- Ubuntu
- Red Hat Enterprise Linux (RHEL)

Windows instances

To configure Windows to generate a memory dump when a stop error occurs

1. Connect to your instance.
2. Open the Control Panel and choose System, Advanced system settings.
3. In the System Properties dialog box, choose the Advanced tab.
4. In the Startup and Recovery section, choose Settings....
5. In the System failure section, configure the settings as needed, and then choose OK.

For more information about configuring Windows stop errors, see Overview of memory dump file options for Windows.

Send a diagnostic interrupt

After you have completed the necessary configuration changes, you can send a diagnostic interrupt to your instance using the AWS CLI or Amazon EC2 API.
AWS CLI

To send a diagnostic interrupt to your instance (AWS CLI)

Use the `send-diagnostic-interrupt` command and specify the instance ID.

```shell
aws ec2 send-diagnostic-interrupt --instance-id i-1234567890abcdef0
```

PowerShell

To send a diagnostic interrupt to your instance (AWS Tools for Windows PowerShell)

Use the `Send-EC2DiagnosticInterrupt` cmdlt and specify the instance ID.

```powershell
PS C:\> Send-EC2DiagnosticInterrupt -InstanceId i-1234567890abcdef0
```
## Document history

The following table describes important additions to the Amazon EC2 User Guide starting in 2019. We also update the guide frequently to address the feedback that you send us.

<table>
<thead>
<tr>
<th>Change</th>
<th>Description</th>

<td>October 5, 2021</td>
</tr>
<tr>
<td><strong>Hibernation support for Ubuntu 20.04 LTS - Focal</strong></td>
<td>Hibernate your newly-launched instances that were launched from the Ubuntu 20.04 LTS - Focal AMI.</td>
<td>October 4, 2021</td>
</tr>
</tbody>
</table>
EC2 Fleet and targeted On-Demand Capacity Reservations

EC2 Fleet can launch On-Demand Instances into targeted Capacity Reservations.
September 22, 2021

T3 instances on Dedicated Hosts

Support for T3 instances on Amazon EC2 Dedicated Host.
September 14, 2021

Hibernation support for RHEL, Fedora, and CentOS

Hibernate your newly-launched instances that were launched from RHEL, Fedora, and CentOS AMIs.
September 9, 2021

Amazon EC2 Global View

Amazon EC2 Global View enables you to view VPCs, subnets, instances, security groups, and volumes across multiple AWS Regions in a single console.
September 1, 2021

AMI deprecation support for Amazon Data Lifecycle Manager

Amazon Data Lifecycle Manager EBS-backed AMI policies can deprecate AMIs. The AWSDataLifecycleManagerServiceRoleForAMIManagement AWS managed policy has been updated to support this feature.
August 23, 2021

Hibernation support for C5d, M5d, and R5d

Hibernate your newly-launched instances running on C5d, M5d, and R5d instance types.
August 19, 2021

Amazon EC2 key pairs

Amazon EC2 now supports ED25519 keys on Linux and Mac instances.

**History for 2018 and earlier**

The following table describes important additions to the Amazon EC2 User Guide in 2018 and earlier years.

<table>
<thead>
<tr>
<th>Feature</th>
<th>API version</th>
<th>Description</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Partition placement groups</td>
<td>2016-11-15</td>
<td>Partition placement groups spread instances across logical partitions, ensuring that instances in one partition do not share underlying hardware with instances in other partitions. For more information, see Partition placement groups.</td>
<td>20 December 2018</td>
</tr>
<tr>
<td>Hibernate EC2 Linux instances</td>
<td>2016-11-15</td>
<td>You can hibernate a Linux instance if it's enabled for hibernation and it meets the hibernation prerequisites. For more information, see Hibernate your Amazon EC2 instance.</td>
<td>28 November 2018</td>
</tr>
<tr>
<td>Amazon Elastic Inference Accelerators</td>
<td>2016-11-15</td>
<td>You can attach an Amazon E1 accelerator to your instances to add GPU-powered acceleration to reduce the cost of running deep learning inference.</td>
<td>28 November 2018</td>
</tr>
<tr>
<td>Spot console recommends a fleet of instances</td>
<td>2016-11-15</td>
<td>The Spot console recommends a fleet of instances based on Spot best practice (instance diversification) to meet the minimum hardware specifications (vCPUs, memory, and storage) for your application need. For more information, see Create a Spot Fleet request.</td>
<td>20 November 2018</td>
</tr>
<tr>
<td>New EC2 Fleet request type: instant</td>
<td>2016-11-15</td>
<td>EC2 Fleet now supports a new request type, instant, that you can use to synchronously provision capacity across instance</td>
<td>14 November 2018</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>
</tr>
<tr>

<tr>
<td>EC2 Fleet</td>
<td>2016-11-15</td>
<td>You can use EC2 Fleet to launch a group of instances across different EC2 instance types and Availability Zones, and across On-Demand Instance, Reserved Instance, and Spot Instance purchasing models. For more information, see <a href="#">EC2 Fleet</a>.</td>
<td>2 May 2018</td>
</tr>
<tr>
<td>On-Demand Instances in Spot Fleets</td>
<td>2016-11-15</td>
<td>You can include a request for On-Demand capacity in your Spot Fleet request to ensure that you always have instance capacity. For more information, see <a href="#">Spot Fleet</a>.</td>
<td>2 May 2018</td>
</tr>
<tr>
<td>Tag EBS snapshots on creation</td>
<td>2016-11-15</td>
<td>You can apply tags to snapshots during creation.</td>
<td>2 April 2018</td>
</tr>
<tr>
<td>Change placement groups</td>
<td>2016-11-15</td>
<td>You can move an instance in or out of a placement group, or change its placement group. For more information, see <a href="#">Change the placement group for an instance</a>.</td>
<td>1 March 2018</td>
</tr>
<tr>
<td>Longer resource IDs</td>
<td>2016-11-15</td>
<td>You can enable the longer ID format for more resource types.</td>
<td>9 February 2018</td>
</tr>
<tr>
<td>Network performance improvements</td>
<td>2016-11-15</td>
<td>Instances outside of a cluster placement group can now benefit from increased bandwidth when sending or receiving network traffic between other instances or Amazon S3.</td>
<td>24 January 2018</td>
</tr>
<tr>
<td>Tag Elastic IP addresses</td>
<td>2016-11-15</td>
<td>You can tag your Elastic IP addresses. For more information, see <a href="#">Tag an Elastic IP address</a>.</td>
<td>21 December 2017</td>

<tr>
<td>Amazon Time Sync Service</td>
<td>2016-11-1</td>
<td>You can use the Amazon Time Sync Service to keep accurate time on your instance. For more information, see <a href="#">Precision clock and time synchronization on your EC2 instance</a>.</td>
<td>29 November 2017</td>
</tr>
<tr>
<td>T2 Unlimited</td>
<td>2016-11-1</td>
<td>T2 Unlimited instances can burst above the baseline for as long as required. For more information, see <a href="#">Burstable performance instances</a>.</td>
<td>29 November 2017</td>
</tr>
<tr>
<td>Launch templates</td>
<td>2016-11-1</td>
<td>A launch template can contain all or some of the parameters to launch an instance, so that you don't have to specify them every time you launch an instance. For more information, see <a href="#">Launch an instance from a launch template</a>.</td>
<td>29 November 2017</td>
</tr>
<tr>
<td>Spread placement</td>
<td>2016-11-1</td>
<td>Spread placement groups are recommended for applications that have a small number of critical instances that should be kept separate from each other. For more information, see <a href="#">Spread placement groups</a>.</td>
<td>29 November 2017</td>
</tr>
<tr>
<td>Spot Instance hibernation</td>
<td>2016-11-1</td>
<td>The Spot service can hibernate Spot Instances in the event of an interruption. For more information, see <a href="#">Hibernate interrupted Spot Instances</a>.</td>
<td>28 November 2017</td>
</tr>
<tr>
<td>Spot Fleet target tracking</td>
<td>2016-11-1</td>
<td>You can set up target tracking scaling policies for your Spot Fleet. For more information, see <a href="#">Scale Spot Fleet using a target tracking policy</a>.</td>
<td>17 November 2017</td>
</tr>
<tr>
<td>Spot Fleet integrates with Elastic Load Balancing</td>
<td>2016-11-1</td>

<tr>
<td>Recover Elastic IP addresses</td>
<td>2016-11-15</td>
<td>If you release an Elastic IP address for use in a VPC, you might be able to recover it. For more information, see Recover an Elastic IP address.</td>
<td>11 August 2017</td>
</tr>
<tr>
<td>Tag Spot Fleet instances</td>
<td>2016-11-15</td>
<td>You can configure your Spot Fleet to automatically tag the instances that it launches.</td>
<td>24 July 2017</td>
</tr>
<tr>
<td>Tag resources during creation</td>
<td>2016-11-15</td>
<td>You can apply tags to instances and volumes during creation. For more information, see Tag your resources. In addition, you can use tag-based resource-level permissions to control the tags that are applied. For more information see, Grant permission to tag Amazon EC2 resources during creation.</td>
<td>28 March 2017</td>
</tr>
<tr>
<td>Perform modifications on attached EBS volumes</td>
<td>2016-11-15</td>
<td>With most EBS volumes attached to most EC2 instances, you can modify volume size, type, and IOPS without detaching the volume or stopping the instance.</td>
<td>13 February 2017</td>
</tr>
<tr>
<td>Attach an IAM role</td>
<td>2016-11-15</td>
<td>You can attach, detach, or replace an IAM role for an existing instance. For more information, see IAM roles for Amazon EC2.</td>
<td>9 February 2017</td>
</tr>
<tr>
<td>Dedicated Spot Instances</td>
<td>2016-11-15</td>
<td>You can run Spot Instances on single-tenant hardware in a virtual private cloud (VPC). For more information, see Specify a tenancy for your Spot Instances.</td>
<td>19 January 2017</td>
</tr>
<tr>
<td>IPv6 support</td>
<td>2016-11-15</td>
<td>You can associate an IPv6 CIDR with your VPC and subnets, and assign IPv6 addresses to instances in your VPC. For more information, see Amazon EC2 instance IP addressing.</td>
<td>1 December 2016</td>
</tr>

<th>Description</th>
<th>Release date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic scaling for Spot Fleet</td>
<td></td>
<td>You can now set up scaling policies for your Spot Fleet. For more information, see <a href="#">Automatic scaling for Spot Fleet</a>.</td>
<td>1 September 2016</td>
</tr>
<tr>
<td>Elastic Network Adapter (ENA)</td>
<td>2016-04-01</td>
<td>You can now use ENA for enhanced networking. For more information, see <a href="#">Enhanced networking on Amazon EC2 instances</a>.</td>
<td>28 June 2016</td>
</tr>
<tr>
<td>Enhanced support for viewing and modifying longer IDs</td>
<td>2016-04-01</td>
<td>You can now view and modify longer ID settings for other IAM users, IAM roles, or the root user.</td>
<td>23 June 2016</td>
</tr>
<tr>
<td>Copy encrypted Amazon EBS snapshots between AWS accounts</td>
<td>2016-04-01</td>
<td>You can now copy encrypted EBS snapshots between AWS accounts.</td>
<td>21 June 2016</td>
</tr>
<tr>
<td>Capture a screenshot of an instance console</td>
<td>2015-10-01</td>
<td>You can now obtain additional information when debugging instances that are unreachable. For more information, see <a href="#">Capture a screenshot of an unreachable instance</a>.</td>
<td>24 May 2016</td>
</tr>
<tr>
<td>Two new EBS volume types</td>
<td>2015-10-01</td>
<td>You can now create Throughput Optimized HDD (st1) and Cold HDD (sc1) volumes.</td>
<td>19 April 2016</td>
</tr>
<tr>
<td>Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2</td>
<td></td>
<td>Added new NetworkPacketsIn and NetworkPacketsOut metrics for Amazon EC2. For more information, see <a href="#">Instance metrics</a>.</td>
<td>23 March 2016</td>
</tr>
<tr>
<td>CloudWatch metrics for Spot Fleet</td>
<td></td>
<td>You can now get CloudWatch metrics for your Spot Fleet. For more information, see <a href="#">CloudWatch metrics for Spot Fleet</a>.</td>
<td>21 March 2016</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>
</tr>
<tr>
<td>--------------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>Scheduled Instances</td>
<td>2015-10-01</td>
<td>Scheduled Reserved Instances (Scheduled Instances) enable you to purchase capacity reservations that recur on a daily, weekly, or monthly basis, with a specified start time and duration.</td>
<td>13 January 2016</td>
</tr>
<tr>
<td>Longer resource IDs</td>
<td>2015-10-01</td>
<td>We're gradually introducing longer length IDs for some Amazon EC2 and Amazon EBS resource types. During the opt-in period, you can enable the longer ID format for supported resource types.</td>
<td>13 January 2016</td>
</tr>
<tr>
<td>ClassicLink DNS support</td>
<td>2015-10-01</td>
<td>You can enable ClassicLink DNS support for your VPC so that DNS hostnames that are addressed between linked EC2-Classic instances and instances in the VPC resolve to private IP addresses and not public IP addresses.</td>
<td>11 January 2016</td>
</tr>
<tr>
<td>Dedicated hosts</td>
<td>2015-10-01</td>
<td>An Amazon EC2 Dedicated host is a physical server with instance capacity dedicated for your use. For more information, see Amazon EC2 Dedicated Hosts.</td>
<td>23 November 2015</td>
</tr>
<tr>
<td>Spot Instance duration</td>
<td>2015-10-01</td>
<td>You can now specify a duration for your Spot Instances. Spot blocks is not supported (January 2023).</td>
<td>6 October 2015</td>
</tr>
<tr>
<td>Spot Fleet modify request</td>
<td>2015-10-01</td>
<td>You can now modify the target capacity of your Spot Fleet request. For more information, see Modify a Spot Fleet request.</td>
<td>29 September 2015</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------------</td>
</tr>
<tr>
<td>Spot Fleet diversified allocation strategy</td>
<td>2015-04-15</td>
<td>You can now allocate Spot Instances in multiple Spot pools using a single Spot Fleet request. For more information, see <a href="#">Allocation strategies for Spot Instances</a>.</td>
<td>15 September 2015</td>
</tr>
<tr>
<td>Spot Fleet instance weighting</td>
<td>2015-04-15</td>
<td>You can now define the capacity units that each instance type contributes to your application's performance, and adjust the amount you are willing to pay for Spot Instances for each Spot pool accordingly. For more information, see <a href="#">Spot Fleet instance weighting</a>.</td>
<td>31 August 2015</td>
</tr>
<tr>
<td>New reboot alarm action and new IAM role for use with alarm actions</td>
<td>2015-04-15</td>
<td>Added the reboot alarm action and new IAM role for use with alarm actions. For more information, see <a href="#">Create alarms that stop, terminate, reboot, or recover an instance</a>.</td>
<td>23 July 2015</td>
</tr>
<tr>
<td>Spot Fleets</td>
<td>2015-04-15</td>
<td>You can manage a collection, or fleet, of Spot Instances instead of managing separate Spot Instance requests. For more information, see <a href="#">Spot Fleet</a>.</td>
<td>18 May 2015</td>
</tr>
<tr>
<td>Migrate Elastic IP addresses to EC2-Classic</td>
<td>2015-04-15</td>
<td>You can migrate an Elastic IP address that you've allocated for use in EC2-Classic to be used in a VPC.</td>
<td>15 May 2015</td>
</tr>
<tr>
<td>Importing VMs with multiple disks as AMIs</td>
<td>2015-03-01</td>
<td>The VM Import process now supports importing VMs with multiple disks as AMIs. For more information, see <a href="#">Importing a VM as an Image Using VM Import/Export</a> in the VM Import/Export User Guide.</td>
<td>23 April 2015</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------------</td>
</tr>
<tr>
<td>Systems Manager</td>
<td></td>
<td>Systems Manager enables you to configure and manage your EC2 instances.</td>
<td>17 February 2015</td>
</tr>
<tr>
<td>Systems Manager for Microsoft SCVMM 1.5</td>
<td></td>
<td>You can now use Systems Manager for Microsoft SCVMM to launch an instance and to import a VM from SCVMM to Amazon EC2.</td>
<td>21 January 2015</td>
</tr>
<tr>
<td>Automatic recovery for EC2 instances</td>
<td></td>
<td>You can create an Amazon CloudWatch alarm that monitors an Amazon EC2 instance and automatically recovers the instance if it becomes impaired due to an underlying hardware failure or a problem that requires AWS involvement to repair. A recovered instance is identical to the original instance, including the instance ID, IP addresses, and all instance metadata. For more information, see <a href="#">Instance resiliency</a>.</td>
<td>12 January 2015</td>
</tr>
<tr>
<td>ClassicLink</td>
<td>2014-10-01</td>
<td>ClassicLink enables you to link your EC2-Classic instance to a VPC in your account. You can associate VPC security groups with the EC2-Classic instance, enabling communication between your EC2-Classic instance and instances in your VPC using private IP addresses.</td>
<td>7 January 2015</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>Spot Instance termination notices</td>
<td></td>
<td>The best way to protect against Spot Instance interruption is to architect your application to be fault tolerant. In addition, you can take advantage of Spot Instance termination notices, which provide a two-minute warning before Amazon EC2 must terminate your Spot Instance. For more information, see Spot Instance interruption notices.</td>
<td>5 January 2015</td>
</tr>
<tr>
<td>Systems Manager for Microsoft SCVMM</td>
<td></td>
<td>Systems Manager for Microsoft SCVMM provides a simple, easy-to-use interface for managing AWS resources, such as EC2 instances, from Microsoft SCVMM.</td>
<td>29 October 2014</td>
</tr>
<tr>
<td>DescribeVolumes pagination support</td>
<td>2014-09-01</td>
<td>The DescribeVolumes API call now supports the pagination of results with the MaxResults and NextToken parameters. For more information, see DescribeVolumes in the Amazon EC2 API Reference.</td>
<td>23 October 2014</td>
</tr>
<tr>
<td>Added support for Amazon CloudWatch Logs</td>
<td></td>
<td>You can use Amazon CloudWatch Logs to monitor, store, and access your system, application, and custom log files from your instances or other sources. You can then retrieve the associated log data from CloudWatch Logs using the Amazon CloudWatch console, the CloudWatch Logs commands in the AWS CLI, or the CloudWatch Logs SDK.</td>
<td>10 July 2014</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
<td>-------------</td>
<td>--------------</td>
</tr>
<tr>
<td>New <strong>EC2 Service Limits</strong> page</td>
<td></td>
<td>Use the <strong>EC2 Service Limits</strong> page in the Amazon EC2 console to view the current limits for resources provided by Amazon EC2 and Amazon VPC, on a per-region basis.</td>
<td>19 June 2014</td>
</tr>
<tr>
<td>Amazon EBS General Purpose SSD Volumes</td>
<td>2014-05-01</td>
<td>General Purpose SSD volumes offer cost-effective storage that is ideal for a broad range of workloads. These volumes deliver single-digit millisecond latencies, the ability to burst to 3,000 IOPS for extended periods of time, and a base performance of 3 IOPS/GiB. General Purpose SSD volumes can range in size from 1 GiB to 1 TiB.</td>
<td>16 June 2014</td>
</tr>
<tr>
<td>AWS Management Pack</td>
<td></td>
<td>AWS Management Pack now supports for System Center Operations Manager 2012 R2.</td>
<td>22 May 2014</td>
</tr>
<tr>
<td>Amazon EBS encryption</td>
<td>2014-05-01</td>
<td>Amazon EBS encryption offers seamless encryption of EBS data volumes and snapshots, eliminating the need to build and maintain a secure key management infrastructure. EBS encryption enables data at rest security by encrypting your data using AWS managed keys. The encryption occurs on the servers that host EC2 instances, providing encryption of data as it moves between EC2 instances and EBS storage.</td>
<td>21 May 2014</td>
</tr>
<tr>
<td>Amazon EC2 Usage Reports</td>
<td></td>
<td>Amazon EC2 Usage Reports is a set of reports that shows cost and usage data of your usage of EC2.</td>
<td>28 January 2014</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>

<tr>
<td>----------------------------------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>Importing Linux virtual machines</td>
<td>2013-10-15</td>
<td>The VM Import process now supports the importation of Linux instances. For more information, see the <a href="#">VM Import/Export User Guide</a>.</td>
<td>16 December 2013</td>
</tr>
<tr>
<td>Resource-level permissions for RunInstances</td>
<td>2013-10-15</td>
<td>You can now create policies in AWS Identity and Access Management to control resource-level permissions for the Amazon EC2 RunInstances API action. For more information and example policies, see <a href="#">Identity and access management for Amazon EC2</a>.</td>
<td>20 November 2013</td>
</tr>
<tr>
<td>Launching an instance from the AWS Marketplace</td>
<td></td>
<td>You can now launch an instance from the AWS Marketplace using the Amazon EC2 launch wizard. For more information, see <a href="#">Launch an AWS Marketplace instance</a>.</td>
<td>11 November 2013</td>
</tr>
<tr>
<td>New launch wizard</td>
<td></td>
<td>There is a new and redesigned EC2 launch wizard. For more information, see <a href="#">Launch an instance using the old launch instance wizard</a>.</td>
<td>10 October 2013</td>
</tr>
<tr>
<td>Modifying instance types of Reserved Instances</td>
<td>2013-10-01</td>
<td>You can now modify the instance type of Linux Reserved Instances within the same family (for example, M1, M2, M3, C1). For more information, see <a href="#">Modify Reserved Instances</a>.</td>
<td>09 October 2013</td>
</tr>
<tr>
<td>Modifying Amazon EC2 Reserved Instances</td>
<td>2013-08-15</td>
<td>You can now modify Reserved Instances in a Region. For more information, see <a href="#">Modify Reserved Instances</a>.</td>
<td>11 September 2013</td>
</tr>
<tr>
<td>Assigning a public IP address</td>
<td>2013-07-15</td>
<td>You can now assign a public IP address when you launch an instance in a VPC. For more information, see <a href="#">Assign a public IPv4 address during instance launch</a>.</td>
<td>20 August 2013</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>Granting resource-level permissions</td>
<td>2013-06-15</td>
<td>Amazon EC2 supports new Amazon Resource Names (ARNs) and condition keys. For more information, see <a href="https://docs.aws.amazon.com/identity-based-policies/latest/UserGuide/">Identity-based policies for Amazon EC2</a>.</td>
<td>8 July 2013</td>
</tr>
<tr>
<td>Incremental Snapshot Copies</td>
<td>2013-02-01</td>
<td>You can now perform incremental snapshot copies.</td>
<td>11 June 2013</td>
</tr>
<tr>
<td>AWS Management Pack</td>
<td></td>
<td>The AWS Management Pack links Amazon EC2 instances and the Windows or Linux operating systems running inside them. The AWS Management Pack is an extension to Microsoft System Center Operations Manager.</td>
<td>8 May 2013</td>
</tr>
<tr>
<td>New Tags page</td>
<td></td>
<td>There is a new Tags page in the Amazon EC2 console. For more information, see <a href="https://docs.aws.amazon.com/elasticbes#tag_resources">Tag your Amazon EC2 resources</a>.</td>
<td>04 April 2013</td>
</tr>
<tr>
<td>Copy an AMI from one Region to another</td>
<td>2013-02-01</td>
<td>You can copy an AMI from one Region to another, enabling you to launch consistent instances in more than one AWS Region quickly and easily. For more information, see <a href="https://docs.aws.amazon.com/elasticbes#copy_amis">Copy an AMI</a>.</td>
<td>11 March 2013</td>
</tr>
<tr>
<td>Launch instances into a default VPC</td>
<td>2013-02-01</td>
<td>Your AWS account is capable of launching instances into either EC2-Classic or a VPC, or only into a VPC, on a region-by-region basis. If you can launch instances only into a VPC, we create a default VPC for you. When you launch an instance, we launch it into your default VPC, unless you create a nondefault VPC and specify it when you launch the instance.</td>
<td>11 March 2013</td>
</tr>
<tr>
<td>Feature</td>
<td>API version</td>
<td>Description</td>
<td>Release date</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>EBS snapshot copy</td>
<td>2012-12-01</td>
<td>You can use snapshot copies to create backups of data, to create new Amazon EBS volumes, or to create Amazon Machine Images (AMIs).</td>
<td>17 December 2012</td>
</tr>
<tr>
<td>Updated EBS metrics and status checks for Provisioned IOPS SSD volumes</td>
<td>2012-10-01</td>
<td>Updated the EBS metrics to include two new metrics for Provisioned IOPS SSD volumes. Also added new status checks for Provisioned IOPS SSD volumes.</td>
<td>20 November 2012</td>
</tr>
<tr>
<td>Spot Instance request status</td>
<td>2012-10-01</td>
<td>Spot Instance request status makes it easy to determine the state of your Spot requests.</td>
<td>14 October 2012</td>
</tr>
<tr>
<td>Amazon EC2 Reserved Instance Marketplace</td>
<td>2012-08-15</td>
<td>The Reserved Instance Marketplace matches sellers who have Amazon EC2 Reserved Instances that they no longer need with buyers who are looking to purchase additional capacity. Reserved Instances bought and sold through the Reserved Instance Marketplace work like any other Reserved Instances, except that they can have less than a full standard term remaining and can be sold at different prices.</td>
<td>11 September 2012</td>
</tr>
<tr>
<td>Provisioned IOPS SSD for Amazon EBS</td>
<td>2012-07-20</td>
<td>Provisioned IOPS SSD volumes deliver predictable, high performance for I/O intensive workloads, such as database applications, that rely on consistent and fast response times.</td>
<td>31 July 2012</td>
</tr>
<tr>

<tr>
<td>IAM roles on Amazon EC2 instances</td>
<td>2012-06-01</td>
<td>IAM roles for Amazon EC2 provide:</td>
<td>11 June 2012</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• AWS access keys for applications running on Amazon EC2 instances.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Automatic rotation of the AWS access keys on the Amazon EC2 instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Granular permissions for applications running on Amazon EC2 instances that make requests to your AWS services.</td>
<td></td>
</tr>
<tr>
<td>Spot Instance features that make it easier to get started and handle the potential of interruption.</td>
<td></td>
<td>You can now manage your Spot Instances as follows:</td>
<td>7 June 2012</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Specify the amount you are willing to pay for Spot Instances using Auto Scaling launch configurations, and set up a schedule for specifying the amount you are willing to pay for Spot Instances. For more information, see <a href="https://docs.aws.amazon.com/autoscaling/latest/userguide/launch-spot-usersguide.html">Launching Spot Instances in Your Auto Scaling Group</a> in the <em>Amazon EC2 Auto Scaling User Guide</em>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Get notifications when instances are launched or terminated.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Use AWS CloudFormation templates to launch Spot Instances in a stack with AWS resources.</td>
<td></td>

<tr>
<td>EC2 instance export and timestamps for status checks for Amazon EC2</td>
<td>2012-05-01</td>
<td>Added support for exporting Windows Server instances that you originally imported into EC2.</td>
<td>25 May 2012</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Added support for timestamps on instance status and system status to indicate the date and time that a status check failed.</td>
<td></td>
</tr>
<tr>
<td>EC2 instance export, and timestamps in instance and system status checks for Amazon VPC</td>
<td>2012-05-01</td>
<td>Added support for EC2 instance export to Citrix Xen, Microsoft Hyper-V, and VMware vSphere.</td>
<td>25 May 2012</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Added support for timestamps in instance and system status checks.</td>
<td></td>
</tr>
<tr>
<td>AWS Marketplace AMIs</td>
<td>2012-04-01</td>
<td>Added support for AWS Marketplace AMIs.</td>
<td>19 April 2012</td>
</tr>
<tr>
<td>Reserved Instance pricing tiers</td>
<td>2011-12-15</td>
<td>Added a new section discussing how to take advantage of the discount pricing that is built into the Reserved Instance pricing tiers.</td>
<td>5 March 2012</td>
</tr>
<tr>
<td>Elastic Network Interfaces (ENIs) for EC2 instances in Amazon Virtual Private Cloud</td>
<td>2011-12-01</td>
<td>Added new section about elastic network interfaces (ENIs) for EC2 instances in a VPC. For more information, see Elastic network interfaces.</td>
<td>21 December 2011</td>
</tr>
<tr>
<td>New offering types for Amazon EC2 Reserved Instances</td>
<td>2011-11-01</td>
<td>You can choose from a variety of Reserved Instance offerings that address your projected use of the instance.</td>
<td>01 December 2011</td>
</tr>

<tr>
<td>Amazon EC2 instance status</td>
<td>2011-11-01</td>
<td>You can view additional details about the status of your instances, including scheduled events planned by AWS that might have an impact on your instances. These operational activities include instance reboots required to apply software updates or security patches, or instance retirements required where there are hardware issues. For more information, see Monitor the status of your Amazon EC2 instances.</td>
<td>16 November 2011</td>
</tr>
<tr>
<td>Spot Instances in Amazon VPC</td>
<td>2011-07-15</td>
<td>Added information about the support for Spot Instances in Amazon VPC. With this update, users can launch Spot Instances in a virtual private cloud (VPC). By launching Spot Instances in a VPC, users of Spot Instances can enjoy the benefits of Amazon VPC.</td>
<td>11 October 2011</td>
</tr>
<tr>
<td>Simplified VM import process for users of the CLI tools</td>
<td>2011-07-15</td>
<td>The VM Import process is simplified with the enhanced functionality of ImportInstance and ImportVolume, which now will perform the upload of the images into Amazon EC2 after creating the import task. In addition, with the introduction of ResumeImport, users can restart an incomplete upload at the point the task stopped.</td>

<tr>
<td>Support for importing in VHD file format</td>
<td></td>
<td>VM Import can now import virtual machine image files in VHD format. The VHD file format is compatible with the Citrix Xen and Microsoft Hyper-V virtualization platforms. With this release, VM Import now supports RAW, VHD and VMDK (VMware ESX-compatible) image formats. For more information, see the <a href="https://docs.aws.amazon.com/elasticchargeguide/latest/en_us/vm-import-export.html">VM Import/Export User Guide</a>.</td>
<td>24 August 2011</td>
</tr>
<tr>
<td>Update to the Amazon EC2 VM Import Connector for VMware vCenter</td>
<td></td>
<td>Added information about the 1.1 version of the Amazon EC2 VM Import Connector for VMware vCenter virtual appliance (Connector). This update includes proxy support for Internet access, better error handling, improved task progress bar accuracy, and several bug fixes.</td>
<td>27 June 2011</td>
</tr>
<tr>
<td>Spot Instances Availability Zone pricing changes</td>
<td>2011-05-15</td>
<td>Added information about the Spot Instances Availability Zone pricing feature. In this release, we've added new Availability Zone pricing options as part of the information returned when you query for Spot Instance requests and Spot price history. These additions make it easier to determine the price required to launch a Spot Instance into a particular Availability Zone.</td>
<td>26 May 2011</td>
</tr>
<tr>
<td>AWS Identity and Access Management</td>
<td></td>
<td>Added information about AWS Identity and Access Management (IAM), which enables users to specify which Amazon EC2 actions a user can use with Amazon EC2 resources in general. For more information, see <a href="https://docs.aws.amazon.com/IAM/latest/UserGuide/custom-service-policy-example.html">Identity and access management for Amazon EC2</a>.</td>

<tr>
<td>Dedicated instances</td>
<td>Launched within your Amazon Virtual Private Cloud (Amazon VPC), Dedicated Instances are instances that are physically isolated at the host hardware level. Dedicated Instances let you take advantage of Amazon VPC and the AWS cloud, with benefits including on-demand elastic provisioning and pay only for what you use, while isolating your Amazon EC2 compute instances at the hardware level. For more information, see Amazon EC2 Dedicated Instances.</td>
<td>27 March 2011</td>
<td></td>
</tr>
<tr>
<td>Reserved Instances updates to the AWS Management Console</td>
<td>Updates to the AWS Management Console make it easier for users to view their Reserved Instances and purchase additional Reserved Instances, including Dedicated Reserved Instances.</td>
<td>27 March 2011</td>
<td></td>
</tr>
<tr>
<td>Metadata information</td>
<td>Added information about metadata to reflect changes in the 2011-01-01 release. For more information, see Work with instance metadata and Instance metadata categories.</td>
<td>11 March 2011</td>
<td></td>
</tr>
<tr>
<td>Amazon EC2 VM Import Connector for VMware vCenter</td>
<td>Added information about the Amazon EC2 VM Import Connector for VMware vCenter virtual appliance (Connector). The Connector is a plug-in for VMware vCenter that integrates with VMware vSphere Client and provides a graphical user interface that you can use to import your VMware virtual machines to Amazon EC2.</td>

<tr>
<td>Force volume detachment</td>
<td></td>
<td>You can now use the AWS Management Console to force the detachment of an Amazon EBS volume from an instance.</td>
<td>23 February 2011</td>
</tr>
<tr>
<td>Instance termination protection</td>
<td></td>
<td>You can now use the AWS Management Console to prevent an instance from being terminated. For more information, see <a href="#">Enable termination protection</a>.</td>
<td>23 February 2011</td>
</tr>
<tr>
<td>VM Import</td>
<td>2010-11-15</td>
<td>Added information about VM Import, which allows you to import a virtual machine or volume into Amazon EC2. For more information, see the <a href="#">VM Import/Export User Guide</a>.</td>
<td>15 December 2010</td>
</tr>
<tr>
<td>Basic monitoring for instances</td>
<td>2010-08-31</td>
<td>Added information about basic monitoring for EC2 instances.</td>
<td>12 December 2010</td>
</tr>
<tr>
<td>Filters and Tags</td>
<td>2010-08-31</td>
<td>Added information about listing, filtering, and tagging resources. For more information, see <a href="#">Find your Amazon EC2 resources</a> and <a href="#">Tag your Amazon EC2 resources</a>.</td>
<td>19 September 2010</td>
</tr>
<tr>
<td>Idempotent Instance Launch</td>
<td>2010-08-31</td>
<td>Added information about ensuring idempotency when running instances.</td>
<td>19 September 2010</td>
